**propta Seed** - best sown as soon as it is ripe in a cold frame, though it can also be sown in a cold frame in the spring[200]. Prick out the seedlings into individual pots when they are large enough to handle. Well-grown plants can be planted out into their final positions in late summer or the autumn, otherwise grow them on for a further year in pots and plant them out the following summer. Division in late summer or early autumn. Dig up the bulbs when the plants are dormant and divide the small bulblets at the base of the larger bulb. Replant immediately, either in the open ground or in pots in a cold frame. Bulbils - plant out as soon as they are ripe in late summer. The bulbils can be planted direct into their permanent positions, though you get better results if you pot them up and plant them out the following spring.

**nwatta** Prefers a sunny position in a light well-drained soil[1]. Prefers a dry position[45]. Succeeds in clay soils[203]. Tolerates a pH in the range 5.2 to 8.3. The bulbs should be planted fairly deeply[1]. The wild leek is a rare native of Britain, found only in the south-west and Wales, though it should be hardy in most parts of the country. It comes into growth in the autumn, dying down in the summer, and makes a very pleasant winter leaf, either raw or cooked. It is a rather variable plant, especially in the amount of flowers and bulbils produced. The species produces mainly flowers with almost no bulbils, whilst the sub-species *A. ampeloprasum babbingtonii* (Babbington's Leek) produces lots of bulbils and almost no flowers[17]. The cultivated leek (*A. ampeloprasum porrum*) is believed to have been developed from this plant whilst, in Germany and Italy, other forms have been selected for their edible bulbils[142]. *Allium ampeloprasum* comprises several vegetables, of which the most important ones are: leek, elephant garlic or great-headed garlic, pearl onion, kurrat, Egyptian leek or salad leek, and Persian leek (*Allium ampeloprasum ssp. persicum*). The cultivar 'Perizweibel' is often used, the bulbils are solid rather than made up of layers and are popularly used for making pickles[183]. This cultivar does not set seed[183]. Another cultivated form of this plant produces very large, mild-garlic flavoured bulbs that are up to 500g in weight[183]. They are known as elephant garlic[183]. The wild leek grows well with most plants, especially roses, carrots, beet and chamomile, but it inhibits the growth of legumes[18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. Members of this genus are rarely if ever troubled by browsing deer[233]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is a bulb.

### 6.2.17 Allium cernuum

Nodding Onion, New Mexican nodding onion  
5 tin 9 cyuc 5 kcaak 2 tcan 2 dwat 0.5 m hkuc

htuc cyutli hgattcup hwicli hrasjlutnyik hpa7tli flatprikliws hpa7tmwatli xre7t hjonli

**drutta Allium cernuum** is a BULB growing to 0.5 m (1ft 8in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in leaf from February to December, in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil and can tolerate drought. The plant can tolerate maritime exposure.

**kcaakta Edible Parts:** Flowers Leaves Root**Edible Uses:** Bulb - raw or cooked[2, 22, 161]. Strongly flavoured[46, 61, 159], it is mainly used as a flavouring[183, K]. The bulb is about 50mm tall and 15mm wide[235]. Leaves - raw or cooked[62, 85, 159]. A delicious, strong-onion flavour; they are very nice in salads[K]. The leaves are available from spring until the autumn and are one of the most favourite onions we are growing on our Cornish trial grounds[K]. Flowers - raw or cooked. A delicious strong onion flavour, somewhat stronger than the leaves especially if the seeds are starting to set[K]. They make a very decorative and tasty addition to the salad bowl[K].

**tcanta Repellent**The juice of the plant is used as a moth repellent. The whole plant is said to repel insects and moles[20]. The juice can be applied to exposed skin in order to repel biting insects[257].

**dwatta Lithontripic Poultice**The whole plant has mild medicinal activity similar to the action of garlic (*Allium sativum*)[222]. It is used specifically as a poultice on the chest for the treatment of respiratory ailments and the juice has been used in the treatment of kidney stones[222]. The juice of the plant is used in treating colds, croup, sore throats etc[257]. A poultice of the plant is applied externally to various infections such as sore throats, sores, swellings, chest and pleurisy pains[257].

**propta Seed** - sow spring in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle - if you want to produce clumps more quickly then put three plants in each pot. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in spring once they are growing vigorously and are large enough. Division in spring. Very easy, the plants divide successfully at any time in the growing season and the divisions can be planted straight out into their permanent positions if required.

**nwatta** An easily grown plant[203], it prefers a sunny position in a light well-drained soil[1]. Succeeds in clay soils[203]. Established plants are fairly drought tolerant[190]. Plants succeed in maritime gardens[233]. A very ornamental plant, it makes a very decorative edging to flower beds[K]. This species is self-sowing quite freely in our Cornwall garden[K]. The bulbs should be planted fairly deeply[1]. Most members of this genus are intolerant of competition from other growing plants[203], though this species has tolerated considerable neglect in our Cornwall garden[K]. The cultivar 'Major' is a more vigorous form with larger flower clusters[90]. Grows well with most plants, especially roses, carrots, beet and chamomile, but it inhibits the growth of legumes[18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. Members of this genus are rarely if ever troubled by browsing deer[233]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is a bulb.

### 6.2.18 Allium fistulosum

Welsh Onion

5 tin 9 cyuc 5 kcaak 2 tcan 2 dwat 0.6 m hkuc  
htuc cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliws hpa7tmwatli xre7t hjonli

**drutta Allium fistulosum** is a BULB growing to 0.6 m (2ft) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in July.

times supplied under this name. A good companion for most plants, especially aubergines and sweet peppers[201]. Members of this genus are rarely if ever troubled by browsing deer[233]. The plant is heat tolerant in zones 7 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone 11 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

### 6.2.71 Lomatium macrocarpum

Bigsseed Biscuitroot

5 tin 10 cyuc 4 kcaak 2 tcan 2 dwat m hkuc  
htuc cyutli kyucctup hwicli hrasjlutnyik hpa7tli flatprikliws hpa7tmwatli fyfxre7t hjonli

**drutta Lomatium macrocarpum** is a PERENNIAL growing to 0.5 m (1ft 8in). The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

**kcaakta Edible Parts:** Root Seed**Edible Uses:** TeaRoot - raw or cooked[257]. A staple food for a number of native North American Indian tribes[257]. The root is usually peeled before being cooked or eaten[257]. It can be dried and ground into a powder and then used to make cakes etc[105, 161, 183]. Seed - raw or cooked. Very nutritious, they can also be ground into a powder[183] and then used with cereal flours when making bread, cakes etc, or be used as a flavouring in soups etc[257]. The seed is very small, but quite easy to harvest[183, K]. A tea can be made from the leaves, stems and flowers[183].

**tcanta Incentse**The root has been dried then burnt as a ceremonial incense[257].

**dwatta Infertility Pectoral Poultice Sedative Tonic**An infusion of the roots has been used as a general strengthener for a weakened patient[257]. The infusion is also used as a treatment for colds, influenza and bronchitis[257]. The root has been chewed and the juice swallowed as a treatment for sore throats[257]. The root has been eaten by childless couples, especially older people, in order to help them conceive[257]. A poultice made from the boiled root has been used to treat swellings[257]. The leaves have been used as a padding in a child's cradle to encourage it to sleep more[257].

**propta Seed** - best sown as soon as it is ripe in a cold frame. Stored seed can be rather slow to germinate, when sown in the spring it usually takes at least 12 months to germinate. Giving it a period of cold stratification might reduce this time. The seedlings need to be pricked out into individual pots as soon as they are large enough to handle, and should be planted out into their permanent positions in the summer. Fresh seed can be sown immediately in situ. Division may be possible in spring or autumn.

**nwatta** We have almost no information on this species and do not know if it will be hardy in Britain, though judging by its native range it should succeed outdoors in much of the country. It can be assumed that plants will require a dry to moist but well-drained soil in a sunny position. Polymorphic[60]. This is a taxonomically very difficult genus, many of the species now included in it have at times been included in other genera[60]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is a tap root similar to a carrot going directly down [1-2].

### 6.2.72 Crataegus pinnatifida major

Chinese Haw

5 tin 9 cyuc 4 kcaak 2 tcan 3 dwat m hkuc  
hmimhtuc cyutli hgattcuphja7n hwicli hrasjlutnyikfrp hpa7tli flatprikliwslip hpa7tmwatli xre7t hjonli

**drutta Crataegus pinnatifida major** is a deciduous Tree growing to 7.5 m (24ft 7in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Midges. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

**kcaakta Edible Parts:** Fruit**Edible Uses:** Fruit - raw or cooked[3, 105, 177]. A pleasant flavour; it is sold in local markets in China[178]. The fruit can be used in making pies, preserves, etc, and can also be dried for later use. A good size, it is up to 25mm in diameter[200]. There are up to five fairly large seeds in the centre of the fruit, these often stick together and so the effect is of eating a cherry-like fruit with a single seed[K].

**tcanta Wood** - heavy, hard, tough, close-grained. Useful for making tool handles, mallets and other small items[82].

**dwatta Anticholesterolemic Cardiotoxic Hypotensive Stomachic Vasodilator**The fruits and flowers of hawthorns are well-known in herbal folk medicine as a heart tonic and modern research has borne out this use. The fruits and flowers have a hypotensive effect as well as acting as a direct and mild heart tonic[222]. They are especially indicated in the treatment of weak heart combined with high blood pressure[222]. Prolonged use is necessary for it to be efficacious[222]. It is normally used either as a tea or a tincture[222]. The fruits are anticholesterolemic, cardiotoxic, stomachic and vasodilator. Their use improves the blood circulation and lowers blood pressure[176]. The fruits are used in the treatment of dyspepsia, stagnation of fatty foods, abdominal fullness, retention of lochia, amenorrhoea, postpartum abdominal pain, hypertension and coronary heart disease[176].

**propta Seed** - this is best sown as soon as it is ripe in the autumn in a cold frame, some of the seed will germinate in the spring, though most will probably take another year. Stored seed can be very slow and erratic to germinate, it should be warm stratified for 3 months at 15°C and then cold stratified for another 3 months at 4°C[164]. It may still take another 18 months to germinate[78]. Scarifying the seed before stratifying it might reduce this time[80]. Fermenting the seed for a few days in its own pulp may also speed up the germination process[K]. Another possibility is to harvest the seed 'green' (as soon as the embryo has fully developed but before the seedcoat hardens) and sow it immediately in a cold frame. If timed well, it can germinate in the spring[80]. If you are only growing small quantities of plants, it is best to pot up the seedlings as soon as they are large enough to handle and grow them on in individual pots for their first year, planting them out in late spring into nursery beds or their final positions. When growing larger quantities, it might be best to sow them directly outdoors in a seedbed, but with protection from mice and other seed-eating creatures. Grow them on in the seedbed until large enough to plant out, but undercut the roots if they are to be left undisturbed for more than two years.

**nwatta** A very easily grown plant, it prefers a well-drained moisture retentive loamy soil but is not at all fussy[11, 200]. Once established, it succeeds in excessively moist soils and also tolerates drought[200]. It grows well on a chalk soil and also in heavy clay soils[200]. A position in full sun is best when plants are being grown for their fruit, they also succeed in semi-shade though fruit yields and quality will be lower in such a position[11, 200]. Most members of this genus succeed in exposed positions, they also tolerate atmospheric pollution[200]. Hybridizes freely with other members of this genus[200]. Seedling trees take from 5 - 8 years before they start bearing fruit, though grafted trees will often flower heavily in their third year[K]. The flowers have a foetid smell somewhat like decaying fish. This attracts midges which are the main means of fertilization.

should be spaced about 45cm apart each way[208].

dwatta Antibacterial Antidote Antiinflammatory Antiphlogistic Antiviral Astringent Depurative Diuretic Dysentery Emmenagogue Febrifuge Hypoglycaemic Laxative Ophthalmic Women's complaintsThe whole plant is antibacterial, antiinflammatory, antimicrobial, antiphlogistic, antiviral, depurative, diuretic, emmenagogue, febrifuge, hypoglycaemic, laxative and ophthalmic[103, 116, 147, 174, 176, 218, 238, 240, 279]. A decoction is used internally in the treatment of many ailments including cancer, coughs, dysentery, enteritis and fever[218]. Its use is said to strengthen the immune system[176]. Externally, it is used in the treatment of snake bites and skin disorders[238]. The leaves and stems are harvested during the growing season and used fresh in decoctions[238]. The leaf juice is antidote and astringent[218]. A root extract is diuretic[218, 240]. The root is also said to be used in medicinal preparations for certain diseases of women[240, 243]. The rhizomes yield a sterol, resembling sitosterol, which stimulates the secretion of antibiotic substances from a gram-positive spore-forming bacillus[240]. An active substance, effective in the treatment of stomach ulcers, has been extracted from the plant[240].

propta Seed - sow spring in a greenhouse. Prick out the seedlings into individual pots as soon as they are large enough to handle and plant them out in the summer. Division in spring[31, 56]. Very quick and easy, it can be done successfully at almost any time in the growing season[K]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Landscape Uses:Border, Container, Foundation, Ground cover, Massing, Woodland garden. Requires a moist to wet soil or shallow water, partial shade and a sheltered position[1, 31, 56, 238]. Whilst it grows best in a bog garden, it will succeed in moist garden borders[233] and has also grown fairly well in a dry soil in Cornwall[K]. It succeeds in full shade[208]. Plants are hardy to about -15°C[187], the top growth is killed back by frost though the roots are much harder. Even the roots, though, can be killed in severe winters[56]. A very ornamental plant, there are some named varieties[187]. 'Chameleon' has very attractively variegated leaves with the same flavour as the species[K]. The bruised leaves emit a strong citrus smell rather like orange peel[K]. Plants have a widely spreading root system and are very invasive, though they are easier to control in drier soils[200]. Creeps harmlessly between ferns[187]. Cultivated as a salad crop in Vietnam[103] and in W. China[187]. Plants seem to be immune to the predations of rabbits[233]. Plants growing in an area with a high rabbit population were not eaten by them although other plants growing nearby were attacked[K]. Special Features: Attractive foliage, Fragrant foliage, Not North American native, Invasive, Naturalizing, Wetlands plant, Inconspicuous flowers or blooms. The plant is heat tolerant in zones 12 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

## 6.2.70 Artemisia dracunculus

Tarragon, French Tarragon

5 tin 8 cyuc 4 kcaak 3 tcan 2 dwat 0.6 m hkuc hmimhtut cyutli hgaktyuctup hwicli hrasjut hpa7tli prikliwis hpa7tmwatli xre7t hjonli

drutta Artemisia dracunculus is a PERENNIAL growing to 0.6 m (2ft) by 0.3 m (1ft in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from

June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kckahta Edible Parts: Leaves ShootsEdible Uses: Condi- mentLeaves - raw or used as a flavouring in soups etc[2, 4, 14, 21, 37]. Tarragon is a commonly used herbal flavouring that is used in many traditional recipes[244]. It is particularly of value because of its beneficial effect upon the digestion and so is often used with oily foods[244]. The leaves can also be harvested in late summer and dried for later use[4]. The aromatic leaves have a very nice flavour that is somewhat liquorice-like[183, K]. They make an excellent flavouring in salads[K]. The young shoots can also be cooked and used as a potherb[183]. The leaves are used as a flavouring in vinegar[4]. An essential oil from the leaves is used as a flavouring[61].

tcanta Essential RepellentThe leaves contain about 0.3% essential oil, about 70% of which is methyl chavicol[240]. This is used as a food flavouring, in detergents and also medicinally[61, 238]. Both the growing and the dried plant repels insects[99]. Landscape Uses: Container, Seashore. Special Features: Edible, Fragrant foliage, Not North American native, Inconspicuous flowers or blooms. Provides shelter for beneficial invertebrates: insects and other arthropods. A specialist nectary plant [1-2].

dwatta Antiscorbatic Appetizer Diuretic Emmenagogue Febrifuge Hypnotic Ondaontic Stomachic VermifugeTarragon is a bitter warming aromatic herb that stimulates the digestive system and uterus, lowers fevers and destroys intestinal worms[238]. It is little used in modern herbalism, though it is sometimes employed as an appetizer[268]. The leaves (and an essential oil obtained from them) are antiscorbatic, diuretic, emmenagogue, hypnotic and stomachic[21, 146, 179, 238]. An infusion is used in the treatment of indigestion, flatulence, nausea, hiccups etc[244]. The plant is mildly sedative and has been taken to aid sleep[254]. It also has mild emmenagogue properties and can be used to induce a delayed period[254]. A poultice can be used to relieve rheumatism, gout, arthritis and toothache[244]. The plant is harvested in the summer and can be dried for later use[238]. This herb should not be prescribed for pregnant women[238]. The root has been used to cure toothache[4]. The essential oil is used in aromatherapy to treat digestive and menstrual problems[238].

propta Seed - surface sow from late winter to early summer in a greenhouse. Fertile seed is rarely produced from this plant - most if not all seed supplied under this name is of the inferior form, Russian tarragon (*A. dracunculoides*). Therefore, it is best to only propagate by division. Division is very easy in spring or autumn[K]. The divisions can be planted out direct into their permanent positions, though we prefer to pot them up first and grow them on in a cold frame until they have rooted well. Basal cuttings in late spring. Harvest young shoots about 10 - 15c long and pot them up in a lightly shaded place in a greenhouse or cold frame. Plant them out into their permanent positions when well rooted. A very quick and easy method of propagation[K].

nwatta Easily grown in a well-drained circumneutral or slightly alkaline loamy soil, preferring a warm sunny dry position[1, 37, 52, 200]. Plants are not very long-lived when grown in clay soils[190]. Plants are longer lived, more hardy and more aromatic when they are grown in a poor dry soil[245]. Established plants are drought tolerant[190, 200]. Tolerates a pH in the range 6.5 to 7.8. Plants are relatively hardy in Britain, but can be killed in wet winters. It is best to grow tarragon in a dry, rather poor soil since this will produce harder plants[4]. The dry soil will also help to reduce predation by slugs, these creatures are very fond of the young growth and have been known to completely destroy even well-established plants[K]. When well suited, the plants can spread freely at the roots[K]. The flowers do not open in cool summers and viable seed is seldom produced[238]. Often grown in the herb garden, tarragon is also sometimes grown commercially for its edible leaves which are used mainly as a flavouring[46]. There is at least one named variety, 'Epicure' is a new fragrant cultivar[183]. There is a closely related species, *A. dracunculoides* or Russian tarragon, which is quite inferior in flavour, though some-

The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kckahta Edible Parts: Flowers Leaves RootEdible Uses: Bulb - raw or cooked[2]. A strong onion flavour, it can be used in salads, as a cooked vegetable or as a flavouring in cooked foods[22, K]. The bulbs are rather small, usually 10 - 25mm in diameter though they can be up to 45mm[266], and are sometimes used as spring onions[183]. A nutritional analysis is available[218]. Leaves - raw or cooked[2]. They have a mild onion flavour[183] and can be added to salads or cooked as a vegetable[116]. The leaves are often available all through the winter if the weather is not too severe[K]. They contain about 1.4% protein, 0.3% fat, 4.6% carbohydrate, 0.8% ash, some vitamin B1 and moderate levels of vitamin C[179]. Flowers - raw. A pleasant onion flavour, but they are rather on the dry side[K].

tcanta RepellentThe juice of the plant is used as a moth repellent. The whole plant is said to repel insects and moles[20].

dwatta Antibacterial Antifungal Antipyretic Diuretic Expectorant Stomachic Vitamin CThe bulb contains an essential oil that is rich in sulphur compounds[283]. It is antibacterial, antiseptic, diaphoretic, diuretic, galactagogue, stomachic, vermifuge and vulnerary[176, 218]. It is used in the treatment of colds and abdominal coldness and fullness[176]. A tea made from the roots is a children's sedative[218]. Use of the bulb in the diet impedes internal parasites[218]. Externally, the bulb can be made into a poultice to drain pus from sores, boils and abscesses[254].

propta Seed - sow spring in a greenhouse. The seed germinates over a wide range of temperatures, it is faster at higher temperatures[206]. Prick out the seedlings into individual pots when they are large enough to handle. When well-grown, the plants should be ready to be planted out in the summer. If they are not large enough at this time, grow them on in the greenhouse for their first winter and plant them out in late spring. Division of the plants is very easy and can be done at almost any time of the year though the spring is probably best. The divisions can be planted out straight into their permanent positions if required.

nwatta An easily grown plant[203], it prefers a sunny position in a light well-drained soil[1] but tolerates most soils[1, 52] including those that are damp and acid[203]. Prefers a pH in the range 6.5 to 7.5[206], but it tolerates a pH in the range 4.9 to 7.5. A very hardy species, it is related to the cultivated onion (*A. cepa*) and could be of value in breeding programmes. It is sometimes cultivated in the garden for its edible leaves which can be produced throughout the winter if the weather is not too severe[K]. A very popular cultivated vegetable in the Orient[206], it probably arose through cultivation from *A. altaicum*[203]. The oriental forms of this species, known as bunching onions, tend to be hardier and more robust than the Welsh onion[206]. There are two basic forms, multi-stem types and single-stem types. The single-stem types divide less freely than the multi-stems[206]. Plants will often retain their leaves even when covered in snow[206]. They are also tolerant of high temperatures and can be grown in the tropics[206]. The plants are often eaten by slugs[K]. The bulbs should be planted fairly deeply[1]. Most members of this genus are intolerant of competition from other growing plants[203]. Grows well with most plants, especially roses, carrots, beet and chamomile, but it inhibits the growth of legumes[18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. Members of this genus are rarely if ever troubled by browsing deer[233]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is a bulb.

## 6.2.19 Allium schoenoprasum

Chives, Wild chives, Flowering Onion

5 tin 11 cyuc 5 kcaak 3 tcan 2 dwat 0.3 m hkuc

hmimhtut cyutli tcup hwicli hrasjutnykfrisp hpa7tli flatprkli-wisslip hpa7tmwatli fyfibre7t hjonli

drutta Allium schoenoprasum is a BULB growing to 0.3 m (1ft) by 0.3 m (1ft in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in leaf from February to December, in flower from June to July, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kckahta Edible Parts: Flowers Leaves RootEdible Uses: Leaves - raw, cooked or dried for later use. The leaves have a mild onion flavour and are an excellent addition to mixed salads, they can also be used as a flavouring in soups etc[2, 4, 5, 9, 27, 33]. The leaves are often available from late winter and can continue to produce leaves until early the following winter, especially if they are in a warm, sheltered position[K]. A good source of sulphur and iron[201]. A nutritional analysis is available[218]. The bulbs are rather small, and rarely exceed 10mm in diameter[200]. They can be harvested with the leaves still attached and be used as spring onions[K]. They have a pleasant mild onion flavour. The flowers can be used as a garnish in salads etc[183]. The flowers of this species are rather dry and less desirable than the flowers of many other species[K].

tcanta Fungicide RepellentLandscape Uses: Border, Container, Massing, Rock garden, Forest Garden. The juice of the plant is used as an insect repellent, it also has fungicidal properties and is effective against scab, mildew etc[14, 18, 20, 201]. The growing plant is said to repel insects and moles[14, 20, 200]. Dynamic accumulator. Ground cover,nectary, Ground Cover. Aromatic.

dwatta Appetizer Digestive Hypotensive TonicThe whole plant has a beneficial effect on the digestive system and the blood circulation. It improves the appetite, is digestive, hypotensive and tonic[201]. It has similar properties to garlic (*A. sativum*), but in a much milder form, and it is rarely used medicinally[238].

propta Seed - sow spring in a cold frame. Germination is usually free and easy, pot up the seedlings as soon as they are large enough to handle easily and plant out in the following spring. Division can be carried out at almost any time of the year but is probably best done in spring. The clumps should be divided at least every 3 or 4 years in order to maintain vigour[200], the divisions can be planted out direct into their permanent positions.

nwatta An easily grown plant[203], it prefers a sunny position in a rich moist but well-drained soil[14, 37], though it succeeds in most soils[1, 37, 200] and also in light shade[203]. Grows well in heavy clay soils[203]. Tolerates a pH in the range 5.2 to 8.3. Chives are commonly cultivated in the garden for their edible leaves which are available from late winter to the beginning of the following winter[K]. The bulbs divide rapidly and large clumps are quickly formed. There are some named varieties[183, 200, 203]. Chives are very tolerant of heavy harvesting, regular cutting of the leaves ensures a continuous supply of young leaves and prevents the plants flowering[33]. Plants can be moved into a frame or other protected environment in the autumn and will then produce leaves throughout the winter[33]. Do not do this every year or it weakens the plants. The bulbs should be planted fairly deeply[1]. A good bee plant[24]. Grows well with most plants, especially roses, carrots, beet and chamomile, but it inhibits the growth of legumes[18, 20, 54]. Helps to reduce the incidence of scab when it is grown under apple trees[201]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. Members of this genus are rarely if ever troubled by browsing deer[233]. Special Features: North American native, Edible, Fragrant foliage, Invasive, Naturalizing, Attracts butterflies, Suitable for cut flowers, Suitable for dried flowers, Fragrant flowers. The plant is heat tolerant in zones 12 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in

a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is a bulb.

### 6.2.20 Carya illinoensis

Pecan

5 tlin 9 cyuc 4 kcaak 2 tcan 1 dwat 50 m hkuc htut cyutli tcup hwicli hrasjlutnyk hpa7tli frusflatprikliwssilp hpa7tmwatli fyif hjonli

drutta Carya illinoensis is a deciduous Tree growing to 50 m (164ft 1in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf from June to October, in flower from April to May, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and very alkaline soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Leaves Oil SeedEdible Uses: Milk Oil TeaSeed - raw or cooked[46, 82]. Sweet and delicious, they make an excellent dessert and are also often added to ice cream, used in cakes, bread etc[149, 183]. A milk can be made from the seed and is used to thicken soups, season corn cakes, hominy etc[183]. The seed is up to 4cm long and is produced in clusters of 3 -11[82, 229]. The seed ripens in late autumn and, when stored in its shell in a cool place, will keep for at least 6 months[K]. An edible oil is obtained from the seed[177, 183]. The leaves are said to be used as a tea[177, 183]. Carbon farming - Staple Crop: oil.

tcanta Fuel Oil Parasiticide WoodWood - coarse-grained, hard, heavy, brittle, not strong. It weighs 45 lb. per cubic foot. It is not as valuable a timber as other members of this genus and is used mainly for fuel and occasionally to make wagons and agricultural implements[46, 82, 227, 235]. A dynamic accumulator gathering minerals or nutrients from the soil and storing them in a more bioavailable form - used as fertilizer or to improve mulch.

dwatta Astrigent Parasiticide TBThe bark and leaves are astringent[227]. A decoction of the bark has been used to treat TB[257]. The pulverized leaves have been rubbed on the skin to treat ringworm[257].

propta Seed - requires a period of cold stratification. It is best sown in a cold frame as soon as it is ripe[78]. Stored seed should be kept moist (but not wet) prior to sowing and should be sown in a cold frame as soon as possible[78]. Where possible, sow 1 or 2 seeds only in each deep pot and thin to the best seedling. If you need to transplant the seedlings, then do this as soon as they are large enough to handle, once more using deep pots to accommodate the tap root. Put the plants into their permanent positions as soon as possible, preferably in their first summer, and give them some protection from the cold for at least the first winter[78, K]. Seed can also be sown in situ so long as protection is given from mice etc and the seed is given some protection from cold[200] (a plastic bottle with the top and bottom removed and a wire mesh top fitted to keep the mice out is ideal)

nwatta Global Crop Management: Standard Other Systems: Strip intercrop Staple Crop: OilLandscape Uses:Aggressive surface roots possible. Prefers a deep moisture-retentive loam in a sunny sheltered position, requiring a good summer for best development[1, 63, 137, 200]. Tolerates a pH in the range 4.5 to 8.3. Trees are fairly fast growing[200]. Trees do not grow very well in Britain, requiring hotter summers than are normally experienced here in order to fruit and fully ripen their wood[200]. However, a tree at Cambridge botanical gardens was 20 metres tall in 1985. Trees are said to be hardy to about -12°C, the same report also says that they are hardy to zone 5[200], which would experience considerably lower temperatures than this. Trees are probably much harder when grown in areas with

hot summers. In the wild, trees grow best in areas where summer temperatures average 24 - 30°C and the humidity is high[229]. Often cultivated for its edible seed, there are some named varieties[183]. Trees come into bearing when about 20 years old, the best period of production being between the ages of 75 to 225 years old[229]. Mature trees regularly give yields of 225 kilos, whilst yields of 450 kilos have been recorded[229]. A number of cultivars have been developed in N. America that succeed quite far north in that country[200]. These cultivars include:- ‘Carlson 3’. Early maturing, it is being trialled in Canada[183]. ‘Devore’. An early fruiting form with small nuts that have an excellent flavour[183]. ‘Gibson’. Precocious, protandrous, the nuts are of medium size with a good flavour[183]. ‘Green Island’. Amongst the hardiest of cultivars, it has been selected for nut size, flavour and productivity[183]. ‘Mullahy’. Hardy, precocious and very productive, it has ripened in Ontario[183]. Nuts are fairly large with an excellent flavour. ‘Voiles 2’. Usually ripens as far north as Ontario and New York[183]. The wind-blown pollen is a significant cause of hay fever in the United States[274]. This species is the State Tree of Texas[274]. Plants are strongly tap-rooted and should be planted in their permanent positions as soon as possible[1, 137]. Sowing in situ would be the best method so long as the seed could be protected from mice[1, 200]. Trees are late coming into leaf (usually late May to June) and lose their leaves early in the autumn (usually in October)[137]. During this time they cast a heavy shade. These factors combine to make the trees eminently suitable for a mixed woodland planting with shrubs and other trees beneath them[137]. Plants in this genus are notably resistant to honey fungus[200]. Most species in this genus have quite a wide range of distribution and, in order to find trees more suited to this country, seed from the most appropriate provenances should be sought[137]. Most trees growing in Britain at present tend to only produce good seed after hot summers[137]. Trees are self-fertile but larger crops of better quality seeds are produced if cross-pollination takes place[229]. Special Features:North American native, Inconspicuous flowers or blooms. Carbon Farming - Climate: cold temperate subtropical, tropical highlands. Humidity: humid. Cultivation: global crop. Management: standard. Other Systems: strip intercrop. The plant is heat tolerant in zones 9 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of “heat days” experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2]. The root pattern is a tap root similar to a carrot going directly down [1-2].

### 6.2.21 Quercus frainetto

Hungarian Oak, Italian Oak, Forest Green Oak
5 tlin 8 cyuc 4 kcaak 0 tcan 2 dwat 30 m hkuc hminhmtu cyutli tcup hwicli jlutnyik hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta Quercus frainetto is a deciduous Tree growing to 30 m (98ft 5in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: SeedEdible Uses: CoffeeSeed - raw or cooked. The seed is up to 3.5cm long and 1.2cm wide[200]. It can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread[183]. If the seed contains bitter tannins, these can be leached out

year[K]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Succeeds in most soils[1], including dry ones, preferring a rich moist soil[205]. Grows well in heavy clay soils. Succeeding in sun or shade, it produces more flowers in a sunny position though these flowers can be shorter-lived in very sunny positions[205]. Succeeds in short grass if the soil is moist[1]. Prefers a pH between 6 and 7[200]. Hybridizes freely with other members of this genus[200]. The roots have spindle-shaped swellings[205]. The cultivar ‘Major’ is smaller than the type species, but has larger flowers, it is sometimes cultivated for these edible flowers in Japan[205]. There is some doubt as to whether this cultivar really is a form of *H. aurantiaca*[205]. Individual flowers are very short-lived, opening in the morning and withering in the evening[205]. Plants take a year or two to become established after being moved[1]. Plants seem to be immune to the predations of rabbits[233]. The plants are very susceptible to slug and snail damage, the young growth in spring is especially at risk[200]. There is some doubt as to the origins of this plant, it might have arisen in cultivation at Kew[205]. It is cultivated in Japan, where it is believed to have come from China[58]. It is quite possibly a hybrid since it is sterile unless fertilized by another species[233].

### 6.2.67 Campanula fenestrellata

Adriatic Bellflower

5 tlin 9 cyuc 4 kcaak 0 tcan 0 dwat 0.2 m hkuc hminhmtu cyutli tcup hwicli hrasjlut hpa7tli prikliwis hpa7tmwatli fyfxre7t hjonli

drutta Campanula fenestrellata is an evergreen Perennial growing to 0.2 m (0ft 8in) by 0.5 m (1ft 8in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in leaf all year, in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers LeavesEdible Uses: Leaves - raw or cooked[K]. A pleasant sweet flavour[K]. It makes a very acceptable addition to mixed salads in the winter[K]. Flowers - raw. Produced in abundance, they have a pleasant sweet flavour and make a decorative addition to the salad bowl[K].

tcanta None known

dwatta None known

propta Seed - surface sow spring in a cold frame. The seed usually germinates in 2 - 4 weeks at 18°c[138]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Basal cuttings in spring[1]. Harvest the shoots when they are about 10 - 15cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer. Division in spring or autumn[200]. Very easy, the plant can be divided at almost any time of the year[221].

nwatta Prefers a moist but well-drained rich sandy loam and a neutral or alkaline soil in full sun though it also tolerates partial shade[1, 200, 208]. Plants are very drought-tolerant and can be grown on a dry stone wall[200], they also succeed in poor soils[221]. Plants are hardy to at least -15°c[200]. Closely related to *C. garganica*, differing in its larger leaves, longer stems and fewer flowers. The pollen is blue, whilst that of *C. garganica* is yellow[271]. The species in this genus do not often hybridize and so seed can generally be relied upon to come true[221]. The plants are self-fertile[221]. Members of this genus are rarely if ever troubled by browsing deer[233].

### 6.2.68 Peltaria turkmena

5 tlin 9 cyuc 4 kcaak 0 tcan 0 dwat 0.5 m hkuc hminhmtu cyutli tcup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Peltaria turkmena is an evergreen Perennial growing to 0.5 m (1ft 8in) by 0.3 m (1ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in leaf all year, in flower from April to May, and the seeds ripen in June. The species is hermaphrodite (has both male and female organs) and is pollinated by In-sects. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked[K]. A strong flavour, somewhat like a cross between garlic and mustard, the leaves make a reasonable flavouring for salads[K]. The leaves are available for most of the year, even in a severe winter they remain green and lush[K]. At this time they add an especially welcome spiciness to salads[K]. They can become rather bitter in the summer, though, especially if the plants are in a dry sunny position[K]. When flowering in early summer, the plants lose their leaves for a month or two - cutting down the flowering stems at this time will induce new fresh green growth[K]. Flowers - raw. A similar flavour to the leaves, with very little bitterness, they make a very tasty addition to summer salads[K].

tcanta The plants can be used as a ground cover, somewhat slow spreading but they are effective in excluding weeds[K].

dwatta None known
propta Seed - sow spring or autumn in a cold frame[200].

The seed germinates rapidly, prick the seedlings out into individual pots when they are large enough to handle and plant them out into their permanent positions in the summer[K]. Division in spring or autumn. Very easy, it can be done at almost any time of the year so long as the soil is kept moist. Divisions in the winter should be potted up in a greenhouse to allow themselves to establish, they can then be planted out in late spring.

nwatta Prefers a light fertile moist soil in sun or light shade[200], though it is not too fussy[K]. A very easily grown plant that tolerates considerable neglect[K].

### 6.2.69 Houttuynia cordata

Tsi, Chameleon, Rainbow Plant, Chameleon Plant

5 tlin 10 cyuc 4 kcaak 2 tcan 3 dwat 0.6 m hkuc pmchimm cyutli tcuphja7hns6s hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Houttuynia cordata is a PERENNIAL growing to 0.6 m (2ft) by 1 m (3ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in June. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist or wet soil and can grow in water.

kcakta Edible Parts: Fruit Leaves Root ShootsEdible Uses: Teder young shoots and leaves - raw or cooked as a pot-herb[2, 61, 103, 183, 272]. The leaves and young shoots are harvested in the spring when about 8cm long[264]. Strongly aromatic according to one report[183] whilst others say that it is rather smelly and somewhat like rotten fish[105, 178]. Our experience is that the leaves have a delicious orange-like smell and make a marvellous flavouring in salads[K]. One report says that there are two distinct chemotypes of this species. Plants from Japan have an orange scent, whilst those from China have a smell resembling coriander leaves (*Coriandrum sativum*)[238]. Some people seem to really like this leaf, others are indifferent to it or strongly dislike it[K]. It also varies quite considerably according to the time of year. In the spring and summer it has a very acceptable flavour, but by autumn a distinct bitterness has crept in[K]. Root - cooked[177, 183]. Same comments on the smell as for the leaves[105]. Fruit[183]. No further details[K], but the fruit is a capsule that contains many small seeds[200].

tcanta A good ground cover plant[200]. Plants do not form a weed-suppressing cover[K]. A spreading plant, it

dwatta Anthelmintic Antiasthmatic Anticholesterolemic Antiseptic Antispasmodic Cholagogue Diaphoretic Diuretic Expectorant Febrifuge Stimulant Stings Stomachic Tonic Vasodilator This species has the same medicinal virtues as garlic, but in a much milder and less effective form[238]. These virtues are as follows: Garlic has a very long folk history of use in a wide range of ailments, particularly ailments such as ringworm, Candida and vaginitis where its fungicidal, antiseptic, tonic and parasitocidal properties have proved of benefit[218]. It is also said to have anticancer activity[218]. Daily use of garlic in the diet has been shown to have a very beneficial effect on the body, especially the blood system and the heart. For example, demographic studies suggest that garlic is responsible for the low incidence of arteriosclerosis in areas of Italy and Spain where consumption of the bulb is heavy[222]. The bulb is said to be anthelmintic, antiasthmatic, anticholesterolemic, antiseptic, antispasmodic, cholagogue, diaphoretic, diuretic, expectorant, febrifuge, stimulant, stomachic, tonic, vasodilator[4, 9, 14, 21, 46, 165]. The crushed bulb may be applied as a poultice to ease the pain of bites, stings etc[4, 9, 14, 21].

propta Seed - for an early crop, or for larger plants, sow the seed in early spring in a greenhouse and plant out in May. For smaller or later plants, sow April in an outdoor seedbed and plant out as space permits in July or even August.

nwatta Prefers a sunny position in a light well-drained soil[1] but succeeds in most soils[16]. Grows well in heavy clay soils. Prefers an open situation[1, 37]. Does best in a soil that was well fed for a previous crop[1]. Tolerates a pH in the range 5.2 to 8.3. The leek is a widely cultivated vegetable, there are many named varieties[183]. Young plants are often planted quite deeply in the soil (8 - 10cm deep) in order to blanch the lower stem, it is also a common practice to earth up the growing plants in order to blanch right the way up the stems. Whilst this does make the stems more tender, it also results in a loss of minerals and vitamins. Although commonly treated as a biennial, this plant is a true perennial, perennating by means of small lateral growths and often developing a roundish bulb at the base of the main growth[1]. A relatively slow-growing plant, it can be interplanted with faster maturing species such as lettuces[201]. The bulbs should be planted fairly deeply[1]. Grows well with most plants, especially roses, carrots, celery, celariac, beet and chamomile, but it inhibits the growth of legumes[18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 6.2.65 Allium tricoccum

Wood Leek, Ramp

5 tlin 9 cyuc 4 kcaak 3 tcan 2 dwat 0.3 m hkuc hmim htut cytli tcup hwicli hrasjlut hpa7tli flatprklwis hpa7tmwatli xre7t hjonli

drutta Allium tricoccum is a BULB growing to 0.3 m (1ft) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in leaf from March to June, in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kckaata Edible Parts: Flowers Leaves RootEdible Uses: Bulb - raw or cooked[46, 61, 159]. An early Spring vegetable. Used mainly as a flavouring in salads and savoury dishes[238]. This is one of the best N. American wild species for sweetness and flavour[95]. A mild sweet flavour, resembling leeks[183]. The bulb is rather small, it is up to 12mm wide and 50mm tall[235] and is produced in clusters on a rhizome[200]. Leaves - raw or cooked[62]. The unfolding leaves in spring have a mild sweet flavour, resembling leeks[183]. Flowers - raw. Used as a garnish on salads. A hot onion flavour[K].

tcanta Companion RepellentThe juice of the plant is used as a moth repellent. The whole plant is said to repel insects and moles[20]. A good shade plant. Tolerates Juglone (a substance produced by a plant to stunt the growth of another plant).

dwatta EmeticThis species probably has most of the medicinal virtues of garlic (*Allium sativum*) but in a milder form[222, 238]. Traditionally the leaves were used in the treatment of colds and croup, and also as a spring tonic[222, 238]. The warm juice of the leaves and bulb was used externally in the treatment of earaches[222, 238]. A strong decoction of the root is emetic[222].

propta Seed - sow spring in a cold frame. The seed usually germinates within 12 months, but only makes a root and a small bulb in its first year of growth. Top growth is not produced until the second spring[K]. It is quite possible that if the seed can be sown when it is ripe in early summer, or in the autumn, then this will speed up germination times[K]. Sow the seed thinly in the pots so that the young seedlings can be allowed to grow on undisturbed for their first two years. Apply a liquid feed once a month during the growing season to ensure they do not suffer from mineral deficiency. When the plants are dormant at the end of their second years growth, divide them so that there are 2 - 3 small bulbs in each pot. Grow them on for a further year in the greenhouse and then plant them out when they are dormant. Division in spring. Very easy, the divisions can be planted straight out into their permanent positions if required.

nwatta Prefers a sunny position in a light well-drained soil[1]. Grows well in light moist woodland, where the plant forms large clumps and can become invasive[203, 235]. It is probably best grown in the wild garden[203]. Plants are hardy to at least -15°C[238]. The bulbs should be planted fairly deeply[1]. The leaves die down in early summer before the flowers have fully opened. Grows well with most plants, especially roses, carrots, beet and chamomile, but it inhibits the growth of legumes[18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. Members of this genus are rarely if ever troubled by browsing deer[233]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. Ephemeral emerging in spring and dying back by summer every year [1-2]. The root pattern is a bulb.

## 6.2.66 Hemerocallis aurantiaca

5 tlin 9 cyuc 4 kcaak 2 tcan 1 dwat 0.8 m hkuc hmimhtut cytli kyucptuc hwicli hrasjlutnykifrip hpa7tli flatprklwis hpa7tmwatli dyatxre7t hjonli

drutta Hemerocallis aurantiaca is an evergreen Perennial growing to 0.8 m (2ft 7in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in leaf all year, in flower from June to September. The species is hermaphrodite (has both male and female organs). The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kckaata Edible Parts: Flowers Leaves RootEdible Uses: Leaves and young shoots - cooked[105, 177]. They must be consumed when very young or else they become fibrous[K]. Flowers and flower buds - raw or cooked. The tubular flowers are about 7.5cm long and 13cm in diameter[205]. Each stem carries 6 - 8 flowers[205]. The flowers contain carotene and starch[105, 177]. The flower buds contain about 43mg vitamin C per 100g, 983 IU vitamin A and 3.1% protein[205]. Root - raw or cooked. A radish-like flavour but not so sharp[205].

tcanta WeavingThe tough dried foliage is plaited into cord and used for making footwear[205].

dwatta Antidote Diuretic Vitamin CThe juicy of the roots is an effective antidote in cases of arsenic poisoning[205]. A tea made from the boiled roots is used as a diuretic[205].

propta Seed - sow in the middle of spring in a greenhouse. Germination is usually fairly rapid and good. Prick out the seedlings into individual pots when they are large enough to handle. Grow the plants on for their first winter in a greenhouse and plant out in late spring[K]. Seed is only set if the plant is fertilized by another species, thus seedlings will not be true to the species type[233]. Division in spring or after flowering in late summer or autumn[200]. Division is very quick and easy, succeeding at almost any time of the

by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute.

tcanta Buttons Repellent TanninA mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth[20]. The seed cups are used as buttons[95]. The bark is a commercial source of tannin[46, 223]. Tannin is also found in the leaves and wood[223]. Oak galls are excrescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4].

dwatta Astringent DysenteryAny galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4].

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Landscape Uses:Seashore. Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Young plants tolerate reasonable levels of shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. This species thrives in Britain, despite our cooler summers, but it only bears acorns occasionally[11]. The acorns ripen in their first year[200]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. Hybridizes freely with other members of the genus[200]. Plants in this genus are notably resistant to honey fungus[200]. Special Features:Attractive foliage, Not North American native, Inconspicuous flowers or blooms.

## 6.2.22 Vitis rotundifolia

Muscadine Grape, Muscadine, Southern Fox Grape, Scuppernong, Muscadine Grape

5 tlin 9 cyuc 4 kcaak 1 tcan 0 dwat 25 m hkuc hmimhtut cytli kyucptuc hwicli hrasjlutnyk hpa7tli flatprklwis hpa7tmwatli fyfxre7t hjonli

drutta Vitis rotundifolia is a deciduous Climber growing to 25 m (82ft 0in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from June to July, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kckaata Edible Parts: Fruit Leaves ShootsEdible Uses: Fruit - raw or dried for winter use[1, 2, 22, 46]. Thick-skinned[61] with a pleasant musky flavour[11, 200, 219]. Pleasant to eat raw, the fruit is excellent in jellies, pies etc[183]. The fruit is up to 25mm in diameter[200] and is produced in small bunches[235]. Leaves - cooked[55]. Young leaves are wrapped around other foods and then baked, they impart a pleasant flavour. Young tendrils - raw or cooked[55, 85].

tcanta DyeA yellow dye is obtained from the fresh or dried leaves[168].

dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe[K]. Six weeks cold stratification improves the germination rate, and so stored seed is best sown in a cold frame as

soon as it is obtained. Germination should take place in the first spring, but sometimes takes another 12 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant out in early summer. Cuttings of mature wood of the current seasons growth, December/January in a frame. These cuttings can be of wood 15 - 30cm long or they can be of short sections of the stem about 5cm long with just one bud at the top of the section. In this case a thin, narrow strip of the bark about 3cm long is removed from the bottom half of the side of the stem. This will encourage callusing and the formation of roots. Due to the size of these cuttings they need to be kept in a more protected environment than the longer cuttings. Layering.

nwatta Landscape Uses:Arbor. Prefers a deep rich moist well-drained moderately fertile loam[1, 200]. Grows best in a calcareous soil[200]. Succeeds in sun or partial shade though a warm sunny position is required for the fruit to ripen[200]. Prefers a position in full sun[160] Plants climb by means of tendrils[182]. They grow particularly well up elm trees[18]. Cultivated for its edible fruit in N. America[46, 61], there are some named varieties[183]. Most plants are self-fertile[160], but there are some cultivars that only produce female flowers and require pollination[183]. Any pruning should be carried out in winter when the plants are dormant otherwise they bleed profusely[182, 200]. Resistant to Phylloxera disease, a disease that almost destroyed the European grape crops. This species can be used as a rootstock in areas where the disease is prevalent and can also be used in breeding programmes with *V. vinifera* in order to impart resistance to that species[160]. Plants are , however, susceptible to infestation by aphids[160]. Plants in this genus are notably susceptible to honey fungus[200]. Special Features: North American native, Inconspicuous flowers or blooms. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. Woody. Growth habit is a single or multiple shooting vine from a crown [1-2].

## 6.2.23 Sorbus torminalis

Wild Service Tree, Checkertree

5 tlin 9 cyuc 4 kcaak 2 tcan 0 dwat 20 m hkuc hmimhtut cytli tcup hwicli hrasjlutnykifrip hpa7tli flatprklwis hpa7tmwatli xre7t hjonli

drutta Sorbus torminalis is a deciduous Tree growing to 20 m (65ft 7in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in June, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kckaata Edible Parts: FruitEdible Uses: Fruit - raw or cooked[2, 5, 11, 74, 115, 183]. The taste is best after a frost because it turns sweeter. The fruit can also be bleeted if it is going to be eaten raw[3, 183]. This involves storing the fruit in a cool dry place until it is almost but not quite going rotten. At this stage the fruit has a delicious taste, somewhat like a luscious tropical fruit. Rich in vitamin C. The fruit is up to 1.5cm across[200] and is borne in bunches which makes it easier to harvest[K].

tcanta WoodWood - heavy, fine grained, polishes well. Used for turning, wood carving[74, 115].

dwatta Antirheumatic Hypoglycaemic Vitamin CNone known

propta Seed - best sown as soon as it is ripe in a cold frame[78, 80]. If you have sufficient seed it can be sown in an outdoor seedbed[78, 80]. Stored seed germinates better if given 2 weeks warm then 14 - 16 weeks cold stratification[98], so sow it as early in the year as possible. Prick out the seedlings into individual pots when they are large enough to handle. Seedlings are very slow to put on top-growth for their first year or two[11], but they are busy building up a good root system. It is best to keep them in pots in a cold

frame for their first winter and then plant them out into their permanent positions in late spring.

nwatta Succeeds in most reasonably good soils so long as they are not too poor or acid, in an open sunny position[1, 11]. Prefers clay soils[3, 11]. Tolerates moderate shade[188], but does not fruit so well in such a position[K]. Grows best in the eastern half of Britain[121]. Plants are susceptible to firelight[188]. Plants respond well to coppicing[186]. When found in a truly wild situation this species is considered to be an indication of primary woodland[200]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

## 6.2.24 Pinus edulis

Rocky Mountain Piñon, Twoneedle pinyon, Nut Pine, Pinyon Pine, Rocky Mountain Pinyon Pine, Singlelea  
5 tin 8 cyuc 4 kcaak 3 tcan 2 dwat 15 m hkuc  
htut cyutli hqatkyuctcup hwicli hyishrasljut hpa7tli frusflatprik hpa7tmwatli dyat hjonli

drutta Pinus edulis is an evergreen Tree growing to 15 m (49ft 3in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf all year, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Inner bark Seed SeedpodEdible Uses: Condiment Gum TeaSeed - raw or cooked[82, 177]. A slightly resinous flavour, but delicious raw or cooked[2, K]. The seed can be ground into a meal and used in stews, making bread, cakes etc and in making nut butter[183]. The seed is up to 25mm long[160]. Rich in oil, protein[183] and thiamine[160]. The seed contains about 15% protein[213]. An important item of food for the local Indians, it is also sold in local markets of Colorado and New Mexico[61, 82]. About 450,000 kilos of the seeds are sold in American markets each year[229]. The leaves can be brewed into a tea[183, 257]. Immature female cones - roasted. The soft centre forms a sweet syrupy food[183]. Inner bark - cooked. A sweet flavour, it is cut into strips and cooked like spaghetti[183]. Inner bark can also be dried, ground into a powder and used as a thickening in soups or can be mixed with cereal flours when making bread etc[257]. The pitch from the trunk can be hardened and used as a chewing gum[257]. A vanillin flavouring is obtained as a by-product of other resins that are released from the pulpwood[200].

tcanta Adhesive Dye Fuel Gum Herbicide Ink Paint Resin WoodA tan or green dye is obtained from the needles[168]. The needles contain a substance called terpene, this is released when rain washes over the needles and it has a negative effect on the germination of some plants, including wheat[201]. This species yields a resin, but it is not commercially important. Oleo-resins are present in the tissues of all species of pines, but these are often not present in sufficient quantity to make their extraction economically worthwhile[64]. The resins are obtained by tapping the trunk, or by destructive distillation of the wood[4, 64]. In general, trees from warmer areas of distribution give the higher yields[64]. Turpentine consists of an average of 20% of the oleo-resin[64] and is separated by distillation[4, 64]. Turpentine has a wide range of uses including as a solvent for waxes etc, for making varnish, medicinal etc[4]. Rosin is the substance left after turpentine is removed. This is used by violinists on their bows and also in making sealing wax, varnish etc[4]. Pitch can also be obtained from the resin and is used for waterproofing, as a wood preservative etc. The gum (this almost certainly means the resin[K]) is used in waterproofing baskets, canoes etc, for repairing pottery vessels and in making turquoise mosaic[216, 257]. It has also been used as a red paint on jars and bowls[257]. For waterproofing containers, the gum was melted and poured inside the container. The container was then turned round to ensure the gum came

into contact with all parts of the inside. More gum would then be applied to the outside[257]. The resin has been used as a glue for fixing turquoise in jewellery[257]. The gum has been used, with sumac leaves (*Rhus* spp) and yellow ochre to make a black dye and ink[257]. The sumac leaves are boiled until there is a strong mixture. Whilst the sumac was boiling, the ochre was powdered and roasted. The gum was then added to the ochre and the whole roasted again. As the roasting proceeded, the gum melted and finally the mixture was reduced to a black powder. This was then cooled and thrown into the sumac mixture, forming a rich blue-black fluid that was essentially an ink[257]. Wood - light, soft, not strong, brittle. Used for fuel, fencing etc[61, 82]. A charcoal made from the wood is used in smelting[82]. The wood makes a good fuel, burning with few sparks being thrown out[257].

dwatta Antiseptic Depurative Diuretic Emetic Expecto-rant Pectoral Plaster Rubefacient VD VermifugeThe turpentine obtained from the resin of all pine trees is antiseptic, diuretic, rubefacient and vermifuge[4]. It is a valuable remedy in the treatment of kidney, bladder and rheumatic affections, and also in diseases of the mucous membranes and the treatment of respiratory complaints[4]. Externally it is used in the form of liniment plasters and poultices on cuts, boils, burns and various skin problems[4, 257]. The heated pitch has been applied to the face to remove facial hair[257]. The gum is used as a plaster on cuts and sores[216]. An infusion of the leaves has been used as an emetic to cleanse the stomach[257]. The leaves have been chewed in the treatment of venereal diseases[257]. The leaves have been burnt and the smoke inhaled as a treatment for colds[257]. The inner bark is expectorant[257].

propta It is best to sow the seed in individual pots in a cold frame as soon as it is ripe if this is possible otherwise in late winter. A short stratification of 6 weeks at 4°C can improve the germination of stored seed[80]. Plant seedlings out into their permanent positions as soon as possible and protect them for their first winter or two[11]. Plants have a very sparse root system and the sooner they are planted into their permanent positions the better they will grow[K]. Trees should be planted into their permanent positions when they are quite small, between 30 and 90cm[200]. We actually plant them out when they are about 5 - 10cm tall. So long as they are given a very good weed-excluding mulch they establish very well[K]. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200]. Cuttings. This method only works when taken from very young trees less than 10 years old. Use single leaf fascicles with the base of the short shoot. Disbudding the shoots some weeks before taking the cuttings can help. Cuttings are normally slow to grow away[81].

nwatta Management: Standard Staple Crop: Protein-oil Wild Staple CropLandscape Uses:Border, Erosion control, Massing, Screen, Specimen. Thrives in a light well-drained sandy or gravelly loam[1, 11]. Dislikes poorly drained moorland soils[1]. Established plants tolerate drought[200]. Succeeds in a hot dry position[200]. Prefers an acid soil in full sun[160]. A very hardy species, tolerating temperatures down to about -35°C when it is fully dormant[160]. A slow-growing but long-lived tree in the wild[185, 229], it takes about 25 years from seed before it produces seed[117]. It then produces good crops every 3 - 4 years[229]. The cones open and shed their seed whilst still attached to the tree[226]. Trees take about 250 - 350 years to reach full maturity[181]. This species is considered by some botanists to be no more than a form of *P. cembroides*, its main difference from that species is that it has leaves in bundles of two whereas *P. cembroides* usually has bundles of three[200]. Plants are strongly outbreeding, self-fertilized seed usually grows poorly[200]. They hybridize freely with other members of this genus[200]. Leaf secretions inhibit the germination of seeds, thereby reducing the amount of plants that can grow below the tree[18]. Plants in this genus are notably susceptible to honey fungus[200]. Special Features: North American native, Inconspicuous flowers or blooms. The plant is heat tolerant in zones 8 through 5. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological dam-

complaints etc[238]. The oil can cause allergic reactions and irritation to the skin and mucous membranes[238].

propta Seed - sow spring in a cold frame. Seed can also be sown in autumn in a greenhouse. Surface sow or barely cover the seed. Germination can be erratic. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. The seed can keep for three years in normal storage[4]. Division in spring or autumn[200]. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the summer or the following spring. Cuttings of young shoots, 5 - 8cm with a heel, May/June in a frame[200]. Cuttings of half-ripe wood, 5 - 8cm with a heel, July/August in a frame[200]. Layering.

nwatta Landscape Uses:Border, Container, Ground cover, Rock garden. Prefers a light, dry calcareous soil and a sunny position[4, 7, 11, 27, 37]. Succeeds in dry soils, poor soils and tolerates drought once it is established[190]. Plants can be grown on old walls. Thymes dislike wet conditions, especially in the winter. A layer of gravel on the soil around them will help protect the foliage from wet soils[238]. Thyme is hardy to about -15°C[200], though it is even hardier when grown on old walls are in well-drained poor light soils[4]. Thyme is commonly grown in the herb garden, there are many named varieties[182]. It is also harvested commercially for its essential oil[218]. The leaves are very aromatic[190]. It is sometimes grown as an annual from seed when used for culinary purposes[200]. The flowers are rich in nectar and are very attractive to honey bees[4, 7, 200]. Thyme is a good companion for most plants[20, 54], it is said to repel cabbage root flies when grown near brassicas[18, 20]. This is a very difficult genus taxonomically, the species hybridize freely with each other and often intergrade into each other[200]. Special Features: Attractive foliage, Edible, Fragrant foliage, Not North American native. The plant is heat tolerant in zones 9 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone, 11-1 indicates that the plant is heat tolerant in zones 11 through 1. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. A clumping mat former. Forming a dense prostrate carpet with a limited spread [1-2]. The root pattern is a tap root similar to a carrot going directly down [1-2].

## 6.2.63 Gaultheria hispidula

Creeping Snowberry  
5 tin 9 cyuc 4 kcaak 4 tcan 1 dwat 0.1 m hkuc  
hmim cyutli tucphja7n hwicli hrasljut hpa7tli frusflatprik hpa7tmwatli xre7t hjonli

drutta Gaultheria hispidula is an evergreen Shrub growing to 0.1 m (0ft 4in) by 1 m (3ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from May to June, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by In-sects. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in semi-shade (light woodland). It prefers moist or wet soil.

kcakta Edible Parts: Fruit LeavesEdible Uses: TeaFruit - raw or cooked. Pleasantly acid and refreshing[3, 101], with a delicate flavour of wintergreen[183]. An agreeable sub-acid taste, similar to *G. shallon*[2, 11]. They can be made into delicious preserves[183]. The fruit is about 6mm in diameter[200]. Leaves - raw or cooked[207]. The leaves are used to make a tea[2, 95, 161, 257]. A mild flavour of wintergreen[183]. Said to be superior to china tea[207].

tcanta MiscellanyA useful fast growing ground cover plant for shady positions.

dwatta Cancer Cytostatic MiscellanyThe plant is said to remove the cancerous taint from the body[4]. An infusion of the leaves has been used as a tonic for a person who has overeaten[257].

propta The seed requires a period of cold stratification. Pre-chill for 4 - 10 weeks and then surface sow in a lime-free compost in a shady part of the greenhouse and keep the compost moist[78]. The seed usually germinates well, usually within 1 - 2 months at 20°C, but the seedlings are liable to damp off. It is important to water them with care and to ensure that they get plenty of ventilation. Watering them with a garlic infusion can also help to prevent damping off[K]. Prick out the seedlings into individual pots when they are about 25mm tall and grow them on in light shade in the greenhouse for at least their first winter[K]. Plant them out in late spring or early summer. The seedlings are susceptible to spring frosts so might need some protection for their first few years outdoors. The leaves remain very small for the first few years[11]. Cuttings of half-ripe wood 3 - 6cm long, July/August in a frame in a shady position. They form roots in late summer or spring[78]. A good percentage usually take. Division in spring just before new growth begins[200]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring. Layering.

nwatta Prefers a moist but not boggy humus rich soil in shade or semi-shade[11]. A peat and moisture loving species, it requires a lime-free soil[11]. The fruit is sometimes sold in local markets[61]. A fast growing plant[200]. The plant can make a good nesting place for mice, these mice then eat the bark of the stems in winter causing die-back. Plants in this genus are notably resistant to honey fungus[200]. *Gaultheria japonica* bears a close resemblance to *G. hispidula* (L.) Bigelow of N. America and sometimes treated as a variety or subspecies of the latter. *G. japonica*, however, has calyx much longer than the bracteoles, ovate and acute calyx lobes, and shorter anther projections. In *G. hispidula* the calyx is as long as or slightly longer than the bracteoles, the calyx lobes are broadly ovate and obtuse or subacute, and the anthers have distinct projections. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. An evergreen. A clumping mat former. Forming a dense prostrate carpet spreading indefinitely [1-2]. The root pattern is flat with shallow roots forming a plate near the soil surface [1-2]. The root pattern is stoloniferous rooting from creeping stems above the ground [1-2].

## 6.2.64 Allium porrum

Leek, Garden leek  
5 tin 9 cyuc 4 kcaak 0 tcan 2 dwat 0.9 m hkuc  
htut cyutli tcup hwicli hrasljutnyikfripr hpa7tli flatprikwslip hpa7tmwatli xre7t hjonli

drutta Allium porrum is a BULB growing to 0.9 m (3ft). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves RootEdible Uses: The leaves and long white blanched stem are eaten cooked[2, 16, 37, 183]. They can also be cut into thin slices and be added to salads[183]. A mild onion flavour with a delightful sweetness[183, K]. Bulb - raw or cooked. The bulb is produced in the plants second year of growth (that is, after it is normally harvested). The bulb is somewhat larger if the plant is prevented from flowering[K]. Flowers - raw. Used as a garnish on salads, though they are rather on the dry side and less pleasant than many other members of the genus[K].

tcanta RepellentThe juice of the plant is used as a moth repellent. The whole plant is said to repel insects and moles[20].

dwatta Aperient Cholagogue Depurative Diuretic Eczema Hepatic Hypoglycaemic Laxative Miscellany Stomachic Tonic Urinary Vitamin C WartsThe dandelion is a commonly used herbal remedy. It is especially effective and valuable as a diuretic because it contains high levels of potassium salts and therefore can replace the potassium that is lost from the body when diuretics are used[238]. All parts of the plant, but especially the root, are slightly aperient, cholagogue, depurative, strongly diuretic, hepatic, laxative, stomachic and tonic[4, 7, 9, 21, 54, 165, 176, 222, 238]. The root is also experimentally cholagogue, hypoglycaemic and a weak antibiotic against yeast infections[222]. The dried root has a weaker action[222]. The roots can be used fresh or dried and should be harvested in the autumn when 2 years old[4]. The leaves are harvested in the spring when the plant is in flower and can be dried for later use[9]. A tea can be made from the leaves or, more commonly, from the roots[213]. The plant is used internally in the treatment of gall bladder and urinary disorders, gallstones, jaundice, cirrhosis, dyspepsia with constipation, oedema associated with high blood pressure and heart weakness, chronic joint and skin complaints, gout, eczema and acne[238]. The plant has an antibacterial action, inhibiting the growth of *Staphylococcus aureus*, *Pneumococci*, *Meningococci*, *Bacillus dysenteriae*, *B. typhi*, *C. diphtheriae*, *Proteus* etc[176]. The latex contained in the plant sap can be used to remove corns, warts and verrucae[7]. The latex has a specific action on inflammations of the gall bladder and is also believed to remove stones in the liver[7]. A tea made from the leaves is laxative[222]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve *Taraxacum officinale* for dyspepsia, urinary tract infections, liver and gallbladder complaints, appetite loss (see [302] for critics of commission E).

propta Seed - sow spring in a cold frame and either surface-sow or only just cover the seed. Make sure the compost does not dry out. Germination should take place within 2 weeks, though 2 weeks cold stratification may improve germination. Prick out the seedlings into individual pots when they are large enough to handle, choosing relatively deep pots to accommodate the tap root. Plant them out in early summer. Division in early spring as the plant comes into growth.

nwatta A very easily grown plant, it succeeds in most soils[1], though it prefers a well-drained humus-rich neutral to alkaline soil in full sun or light shade[37, 238]. A very hardy plant, tolerating temperatures down to at least -29°C[238]. The dandelion is a common weed of lawns and grassy places. Though it has a bitter flavour, the plant is often cultivated as a salad crop and as a medicinal plant, especially in parts of Europe. There are some named varieties with larger, more tender and less bitter leaves[183]. Dandelions can provide edible leaves all year round, especially if they are given a small amount of protection in the winter[K]. A valuable bee plant and an important food plant for the caterpillars of many butterfly and moth species[4, 24, 30, 54], it grows well in a spring meadow[24]. A deep rooting plant, it has roots up to 1 metre long and brings up nutrients from lower levels of the soil[201]. An excellent plant to grow in lawns, if the lawn is cut no more than fortnightly then the dandelions will provide a good quantity of edible leaves[K]. Grows well with alfalfa[18, 201]. Another report says that it inhibits the growth of nearby plants[54]. This is probably a reference to the fact that the plant gives off ethylene gas, this gas is a hormone that promotes the premature ripening of fruits and also induces the premature fruiting of plants, thereby stunting their growth[14, 18]. *T. officinale* is not a valid name for this species, but no valid name has as yet been ascribed to it[200]. This is actually an aggregate species of many hundreds of slightly differing species. Most seed production is apomictic which means that plants produce seed non-sexually and all seedlings are clones of the parent, thus small differences are maintained. Special Features:Edible, Not North American native, Invasive, Naturalizing, Suitable for dried flowers, Extended bloom season in Zones 9A and above. The plant is heat tolerant in zones 8 through 5. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin

to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is a tap root similar to a carrot going directly down [1-2].

## 6.2.62 Thymus vulgaris

Common Thyme, Garden thyme, Wild Thyme  
5 tlin 11 cyuc 4 kcaak 5 tcan 3 dwat 0.2 m hkuc  
htut cyutli kyuctup hwicli hyishrasljut hpa7tli prikwiw  
hpa7tmwatli xre7t hjonli

drutta *Thymus vulgaris* is an evergreen Shrub growing to 0.2 m (0ft 8in) by 0.3 m (1ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: Flowers Leaves ShootsEdible Uses: Condiment TeaLeaves and flowering tops - raw in salads, used as a garnish or added as a flavouring to cooked foods, going especially well with mushrooms and courgettes[2, 4, 21, 46, 183, 238]. It is an essential ingredient of the herb mix 'bouquet garni'[238]. It retains its flavour well in long slow cooking[200]. The leaves can be used either fresh or dried[183]. If the leaves are to be dried, the plants should be harvested in early and late summer just before the flowers open and the leaves should be dried quickly[200]. A nutritional analysis is available[218]. An aromatic tea is made from the fresh or dried leaves[21, 183]. Pungent and spicy[183].

tcanta Deodorant Disinfectant Essential Fungicide Potpourri RepellentAn essential oil from the leaves is frequently used in perfumery, soaps, toothpastes, mouthwashes, medicinally etc[11, 21, 57, 89, 238]. It has fungicidal properties[171] and is also used to prevent mildew[218]. The leaves are dried and used in pot-pourri[238]. The plant makes an attractive ground cover for a sunny position[201]. Plants are best spaced about 30cm apart each way[208]. The dried flowers are used to repel moths from clothing[4] whilst the growing plant is said to repel cabbage root fly[18, 20].

dwatta Anthelmintic Antiseptic Antispasmodic Aromatherapy Carminative Deodorant Diaphoretic Disinfectant Expectorant Sedative TonicCommon thyme has a very long history of folk use for a wide range of ailments[218]. It is very rich in essential oils and these are the active ingredients responsible for most of the medicinal properties[218]. In particular, thyme is valued for its antiseptic and antioxidant properties, it is an excellent tonic and is used in treating respiratory diseases and a variety of other ailments[254]. The flowering tops are anthelmintic, strongly antiseptic, antispasmodic, carminative, deodorant, diaphoretic, disinfectant, expectorant, sedative and tonic[4, 7, 21, 200, 218]. The plant is used internally in the treatment of dry coughs, whooping cough, bronchitis, bronchial catarrh, asthma, laryngitis, indigestion, gastritis and diarrhoea and enuresis in children[238]. It should not be prescribed for pregnant women[238]. Externally, it is used in the treatment of tonsillitis, gum diseases, rheumatism, arthritis and fungal infections[238]. The plant can be used fresh at any time of the year, or it can be harvested as it comes into flower and either be distilled for the oil or dried for later use[238]. Thyme has an antioxidant effect, thus regular use of this herb improves the health and longevity of individual body cells and therefore prolongs the life of the body[254, K]. The essential oil is strongly antiseptic[4]. The whole herb is used in the treatment of digestive disorders, sore throats, fevers etc[4]. The essential oil is one of the most important oils used in aromatherapy[7, 210]. Its keyword is 'Bacterial'[210]. It is used especially in cases of exhaustion, depression, upper respiratory tract infections, skin and scalp

age. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2]. An evergreen. The root pattern is a tap root similar to a carrot going directly down [1-2].

## 6.2.25 Pinus quadrifolia

Parry Piñon, Parry's Pinyon Pine, Four-leaved Pinyon  
5 tlin 8 cyuc 4 kcaak 0 tcan 2 dwat 15 m hkuc  
htut cyutli hgatyuctup hwicli hyishrasljut hpa7tli flatprik  
hpa7tmwatli dyat hjonli

drutta *Pinus quadrifolia* is an evergreen Tree growing to 15 m (49ft 3in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: SeedEdible Uses: CondimentSeed - raw or cooked[1, 81, 161]. An important food crop for the Indians of Baja California[82, 183], the oil-rich seed has a mild resinous flavour and a pleasant soft texture. A good size, up to 16mm long[200]. The seed contains about 11% protein, 37% fat, 44% carbohydrate[183]. A vanillin flavouring is obtained as a by-product of other resins that are released from the pulpwood[200].

tcanta Adhesive Basketry Cosmetic Dye Fuel Herbicide Roofing WoodA tan or green dye is obtained from the needles[168]. The roots have been used to make baskets[257]. The bark has been used as a roofing material in houses[257]. The needles contain a substance called terpene, this is released when rain washes over the needles and it has a negative effect on the germination of some plants, including wheat[201]. Oleo-resins are present in the tissues of all species of pines, but these are often not present in sufficient quantity to make their extraction economically worthwhile[64]. The resins are obtained by tapping the trunk, or by destructive distillation of the wood[4, 64]. In general, trees from warmer areas of distribution give the higher yields[64]. Turpentine consists of an average of 20% of the oleo-resin[64] and is separated by distillation[4, 64]. Turpentine has a wide range of uses including as a solvent for waxes etc, for making varnish, medicinal etc[4]. Rosin is the substance left after turpentine is removed. This is used by violinists on their bows and also in making sealing wax, varnish etc[4]. Pitch can also be obtained from the resin and is used for waterproofing, as a wood preservative etc. The pitch has been used as a face cream to prevent sunburn[257]. The pitch can be used as an adhesive on pottery etc[257]. Wood - light, soft, close grained[82]. It burns well and gives off a pleasant odour[257].

dwatta Antiseptic Diuretic Pectoral Poultice Rubefacient Vermifuge VulneraryThe turpentine obtained from the resin of all pine trees is antiseptic, diuretic, rubefacient and vermifuge[4]. It is a valuable remedy used internally in the treatment of kidney and bladder complaints and is used both internally and as a rub and steam bath in the treatment of rheumatic affections[4]. It is also very beneficial to the respiratory system and so is useful in treating diseases of the mucous membranes and respiratory complaints such as coughs, colds, influenza and TB[4]. Externally it is a very beneficial treatment for a variety of skin complaints, wounds, sores, burns, boils etc and is used in the form of liniment plasters, poultices, herbal steam baths and inhalers[4].

propta It is best to sow the seed in individual pots in a cold frame as soon as it is ripe if this is possible otherwise in late winter. A short stratification of 6 weeks at 4°C can improve the germination of stored seed[80]. Plant seedlings out into their permanent positions as soon as possible and protect them for their first winter or two[11]. Plants have a very sparse root system and the sooner they are planted into their permanent positions the better they will grow[K].

Trees should be planted into their permanent positions when they are quite small, between 30 and 90cm[200]. We actually plant them out when they are about 5 - 10cm tall. So long as they are given a very good weed-excluding mulch they establish very well[K]. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200]. Cuttings. This method only works when taken from very young trees less than 10 years old. Use single leaf fascicles with the base of the shoot short. Disbudding the shoots some weeks before taking the cuttings can help. Cuttings are normally slow to grow away[81].

nwatta Landscape Uses:Screen, Specimen. Thrives in a light well-drained sandy or gravelly loam[1, 11]. Dislikes poorly drained moorland soils[1]. Established plants tolerate drought, succeeding in a hot dry position[200]. This species is closely related to *P. cembroides* and considered to be no more than a sub-species of it by some botanists[11]. The main difference is that this species has its leaves in bundles of four whilst *P. cembroides* has them in bundles of two or three[200]. Plants are strongly outbreeding, self-fertilized seed usually grows poorly[200]. They hybridize freely with other members of this genus[200]. It extensively hybridizes with *P. californiarum* in most of its range[200]. The cones open and shed their seed whilst still attached to the tree[226]. A slow growing tree, taking 25 years from sowing until it produces a crop of seeds[117]. The tree is long-lived, taking 250 - 350 years to reach maturity[181]. Leaf secretions inhibit the germination of seeds, thereby reducing the amount of plants that can grow under the trees[18]. Plants in this genus are notably susceptible to honey fungus[200]. Special Features: North American native, Inconspicuous flowers or blooms.

## 6.2.26 Acer saccharum grandidentatum

Big-Tooth Maple, Canyon Maple, Rocky Mountain Sugar Maple  
5 tlin 8 cyuc 4 kcaak 0 tcan 0 dwat 12 m hkuc  
hmimhtut cyutli toup hwicli hrsajlutnykfrrip hpa7tli flatprik  
wis hpa7tmwatli hjonli

drutta *Acer saccharum grandidentatum* is a deciduous Tree growing to 12 m (39ft) by 8 m (26ft). See above for USDA hardiness. It is hardy to UK zone 3. It is in flower from April to May, and the seeds ripen in September. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Inner bark Sap SeedEdible Uses: SweetenerThe sap is relatively rich in sugar and can be made into a drink or concentrated into a syrup by boiling off the water[1, 2, 11, 34, 57]. The syrup is used as a sweetener on many foods. It can be harvested in late winter or early spring[[142], the flow is best on a warm sunny day after a frost. Trees on southern slopes in sandy soils give the best yields. It is best to make a hole about 7cm deep and about 1.3 metres above the ground[171]. Yields of 40 - 100 litres per tree can be obtained[142]. The best sap production comes from cold-winter areas with continental climates. Seed - boiled then roasted[62, 105, 159]. The seed is about 6mm long and is produced in small clusters[82]. Inner bark cooked. It is dried, ground into a powder and then used as a thickening in soups etc or mixed with cereals when making bread[105, 161].

tcanta Fuel Preservative WoodThe leaves are packed around apples, rootcrops etc to help preserve them[18, 20]. Wood - close grained, tough, hard, heavy. Used for furniture, ship building, etc[46, 61, 82, 171]. It is a good fuel.

dwatta None known  
propta Seed - best sown as soon as it is ripe in a cold frame, it usually germinates in the following spring. A lot of the seed is non-viable, it is best to cut a few open to see if there is an embryo[113]. An average of 95% germination can be achieved from viable seed[98]. Pre-soak stored seed for 24 hours and then stratify for 2 - 4 months at 1 - 8°C. It can be slow to germinate, sometimes taking two years[125]. The seed can be harvested 'green' (when it has fully devel-

oped but before it has dried and produced any germination inhibitors) and sown immediately. It should germinate in late winter. If the seed is harvested too soon it will produce very weak plants or no plants at all[80, 113]. When large enough to handle, prick the seedlings out into individual pots and grow them on until they are 20cm or more tall before planting them out in their permanent positions. Layering, which takes about 12 months, is successful with most species in this genus. Cuttings of young shoots in June or July. The cuttings should have 2 - 3 pairs of leaves, plus one pair of buds at the base. Remove a very thin slice of bark at the base of the cutting, rooting is improved if a rooting hormone is used. The rooted cuttings must show new growth during the summer before being potted up otherwise they are unlikely to survive the winter.

nwatta Landscape Uses:Firewood, Pest tolerant, Specimen, Street tree. Of easy cultivation, it prefers a good moist well-drained soil but succeeds on most soils[11, 98]. Chlorosis can often develop as a result of iron deficiency when the plants are grown in alkaline soils. Grows well in heavy clay soils. Trees need full light and a lot of space if they are to grow well[98]. Plants are hardy to about -45°C when fully dormant[160]. This species is not a great success in Britain[1], though it does better than once thought[11]. It grows well in Cornwall[59]. Slow growing when young[11]. Plants produce prodigious root growth but very little top growth in first year from seed[133]. A very ornamental tree[1] but a bad companion plant, inhibiting the growth of nearby plants[18, 20]. This species is commercially exploited in America for its sap[1, 11]. Along with *A. saccharum* and the sub-species *A. s. nigrum* it is the major source of maple syrup[11]. There are some named varieties[183]. The sap can be tapped within 10 - 15 years from seed but it does not flow so well in areas with mild winters[160]. Special Features:North American native, Inconspicuous flowers or blooms.

### 6.2.27 Cornus officinalis

Shan Zhu Yu, Asiatic dogwood, Japanese Cornel Dogwood
5 tin 8 cyuc 4 kcaak 0 tcan 3 dwat 10 m hkuc
hmmihtut cyutli hcattcup hwicli hrasjlutnyikfrp hpa7tli flatprikliwissip hpa7tmwatli xre7t hjonli

drutta Cornus officinalis is a deciduous Shrub growing to 10 m (32ft) by 10 m (32ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from February to March, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105, 177]. The fully ripe fruit is quite pleasant but slightly astringent[K]. It is about 1.5cm long[200]. The fruit contains about 8.6% sugars, 2.9% malic acid, 0.74% ash[179].

tcanta None known

dwatta Antibacterial Antifungal Antiperiodic Antiseptic Antitumor Astringent Diuretic Hepatic Hypotensive Malaria Tonic UrinaryShan Zhu Yu has been used for at least 2,000 years in Chinese herbal medicine. It is a herb that “stabilizes and binds” and is used principally to reduce heavy menstrual bleeding and unusually active secretions including copious sweating, excessive urine, spermatorrhoea and premature ejaculation[147, 238, 254]. Like all herbs that suppress bodily fluids (even excessive ones), it will simply prolong or lead to a worsening of symptoms if it is used without tonic or detoxifying herbs[254]. It is, therefore, normally used in combination with herbs such as *Rehmannia glutinosa* and is an ingredient of the “Pill of eight ingredients” which is used in China to “warm up and invigorate the yang of the loins”[254]. The fruit is antibacterial, antifungal, hypotensive, antitumor, astringent, diuretic, hepatic and tonic[116, 147, 176, 178, 238]. The fruit, without the seed, is decocted for the treatment of arthritis, fever and a wide range of other ailments[218, 279]. It is used in the treatment of senile lumbago, diabetes, cystitis, tinnitus etc[174, 254, 279]. The fruit has an antibacterial action, inhibiting the growth of *Bacillus*

dysenteriae and *Staphylococcus*[176]. The fruit is harvested when fully ripe and is dried for later use[238]. The stem bark is astringent, antimalarial and tonic[218]. The plant is antibacterial, diuretic, hypotensive and a urinary antiseptic[218].

propta Seed - best sown as soon as it is ripe in a cold frame or in an outdoors seedbed if there is sufficient seed[80, 113]. The seed must be separated from the fruit flesh since this contains germination inhibitors[80, 164]. Stored seed should be cold stratified for 3 - 4 months and sown as early as possible in the year[164]. Scarification may also help as may a period of warm stratification before the cold stratification[80, 164]. Germination, especially of stored seed, can be very slow, taking 18 months or more[164]. Prick out the seedlings of cold-frame sown seeds into individual pots as soon as they are large enough to handle and grow the plants on for their first winter in a greenhouse, planting out in the spring after the last expected frosts. Cuttings of half-ripe side shoots, July/August in a frame. Cuttings of mature wood of the current year’s growth, taken with a heel if possible, autumn in a cold frame. High percentage[78]. Layering of new growth in June/July. Takes 9 months[78].

nwatta Landscape Uses:Border, Massing, Standard, Specimen, Street tree. An easily grown plant, it succeeds in any soil of good or moderate fertility[1], ranging from acid to shallow chalk[200]. Grows well in heavy clay soils. Succeeds in full sun or light shade[188]. A very ornamental plant[11], it is very closely related to *C. mas*[1, 11] but is more tree-like in its habit[K]. Plants in this genus are notably resistant to honey fungus[200]. Special Features: Attractive flowers or blooms.

### 6.2.28 Pyrus pyrifolia

Sand Pear, Chinese pear
5 tin 9 cyuc 4 kcaak 0 tcan 1 dwat 10 m hkuc
hmmihtut cyutli hgattcup hwicli hrasjlutnyikfrp hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Pyrus pyrifolia is a deciduous Tree growing to 10 m (32ft 10in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in April, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by In-sects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil and can tolerate drought. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. Hard and gritty[11]. Firm crisp and juicy when fully ripe, they are eaten out of hand or used in fruit salads, pies or baked etc[183]. The fruit is up to 3cm long[200]. Up to 5cm in another report[194]. The average yield from wild trees in the Himalayas is 83kg per year, though some trees yield up to 200kg[194]. The fruit contains about 4.9% sugars, 3.2% protein, 0.9% pectin[194].

tcanta None known

dwatta Antiseptic Astringent Febrifuge Nervine PectoralAntiseptic, astringent, febrifuge, nervine, pectoral[178].

propta Seed - best sown in a cold frame as soon as it is ripe in the autumn, it will then usually germinate in mid to late winter. Stored seed requires 8 - 10 weeks cold stratification at 1°C and should be sown as early in the year as possible[200]. Temperatures over 15 - 20°C induce a secondary dormancy in the seed[200]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in a cold frame or greenhouse for their first year. Plant them out in late spring or early summer of the following year.

nwatta Prefers a good well-drained loam in full sun[200]. Grows well in heavy clay soils. Tolerates light shade but does not fruit so well in such a position. Tolerates atmospheric pollution, excessive moisture and a range of soil types if they are moderately fertile[200]. Established plants are drought tolerant[200]. Plants are hardy to at least -15°C[200]. A parent of the cultivated Asian pears[11]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and

kcakta Edible Parts: Root. SeedEdible Uses: Root - raw or cooked[257. It is usually peeled before being eaten[257]. The root can be dried and ground into a powder and then be mixed with cereal flours or added as a flavouring to soups etc[46, 61, 95, 105]. When dug up in the spring it has a parsnip-like flavour[161]. Seed[106]. No more details are given, though it is most likely used as an aromatic flavouring in cooked foods[K].

tcanta None known

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed can be rather slow to germinate, when sown in the spring it usually takes at least 12 months to germinate. Giving it a period of cold stratification might reduce this time. The seedlings need to be pricked out into individual pots as soon as they are large enough to handle, and should be planted out into their permanent positions in the summer. Fresh seed can be sown immediately in situ. Division may be possible in spring or autumn.

nwatta We have almost no information on this species and do not know if it will be hardy in Britain, though judging by its native range it should succeed outdoors in much of the country. It can be assumed that plants will require a dry to moist but well-drained soil in a sunny position. Polymorphic[60]. This is a taxonomically very difficult genus, many of the species now included in it have at times been included in other genera[60]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is a tap root similar to a carrot going directly down [1-2].

### 6.2.60 Gaultheria japonica

Creeping Snowberry
5 tin 9 cyuc 4 kcaak 3 tcan 1 dwat 0.1 m hkuc
hmmi cyutli tcuphja7n hwicli hrasjlut hpa7tli frusflatprik hpa7tmwatli xre7t hjonli

drutta Gaultheria japonica is an evergreen Shrub growing to 0.1 m (0ft 4in) by 1 m (3ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from May to June, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by In-sects. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in semi-shade (light woodland). It prefers moist or wet soil.

kcakta Edible Parts: Fruit. LeavesEdible Uses: TeaFruit - raw or cooked. Pleasantly acid and refreshing[3, 101], with a delicate flavour of wintergreen[183]. An agreeable sub-acid taste, similar to *G. shallon*[2, 11]. They can be made into delicious preserves[183]. The fruit is about 6mm in diameter[200]. Leaves - raw or cooked[207]. The leaves are used to make a tea[2, 95, 161, 257]. A mild flavour of wintergreen[183]. Said to be superior to china tea[207].

tcanta A useful fast growing ground cover plant for shady positions.

dwatta CancerThe plant is said to remove the cancerous taint from the body[4]. An infusion of the leaves has been used as a tonic for a person who has overeaten[257].

propta The seed requires a period of cold stratification. Pre-chill for 4 - 10 weeks and then surface sow in a lime-free compost in a shady part of the greenhouse and keep the compost moist[78]. The seed usually germinates well, usually within 1 - 2 months at 20°C, but the seedlings are liable to damp off. It is important to water them with care and to ensure that they get plenty of ventilation. Watering them with a garlic infusion can also help to prevent damping off[K]. Prick out the seedlings into individual pots when they are about 25mm tall and grow them on in light shade in the greenhouse for at least their first winter[K]. Plant them out in late spring or early summer. The seedlings are susceptible to spring frosts so might need some protection for their first few years outdoors. The leaves remain very small for the first few years[11]. Cuttings of half-ripe wood 3 - 6cm long, July/August in a frame in a shady position. They form roots in late summer or spring[78]. A good percentage usually take. Division in spring just before new growth begins[200]. Larger clumps can be replanted direct into their permanent

positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring. Layering.

nwatta Prefers a moist but not boggy humus rich soil in shade or semi-shade[11]. A peat and moisture loving species, it requires a lime-free soil[11]. A fast growing plant[200]. The plant can make a good nesting place for mice, these mice then eat the bark of the stems in winter causing die-back. Plants in this genus are notably resistant to honey fungus[200]. *Gaultheria japonica* bears a close resemblance to *G. hispiduala* (L.) Bigelow of N. America and sometimes treated as a variety or subspecies of the latter. *G. japonica*, however, has calyx much longer than the bracteoles, ovate and acute calyx lobes, and shorter anther projections. In *G. hispiduala* the calyx is as long as or slightly longer than the bracteoles, the calyx lobes are broadly ovate and obtuse or subacute, and the anthers have distinct projections.

### 6.2.61 Taraxacum officinale

Dandelion - Kukraundha, Kanphool, Common dandelion, Dandelion
5 tin 9 cyuc 4 kcaak 3 tcan 3 dwat 0.5 m hkuc
hmmihtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwissip hpa7tmwatli fyfxre7t hjonli

drutta Taraxacum officinale is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.3 m (1ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from April to May, and the seeds ripen from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects, Apomictic (reproduce by seeds formed without sexual fusion). The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: Flowers. Leaves. RootEdible Uses: Coffee. TeaLeaves - raw or cooked[1, 2, 4, 5, 7, 9, 12, 14, 33, 154]. When used in salads, they are rather bitter, though less so in the winter. Tender young leaves are considerably less bitter than older leaves[K]. The leaves are often blanched (by excluding light from the growing plant) before use[183]. This will make them less bitter, but they will also contain less vitamins and minerals[K]. A very nutritious food, 100g of the raw leaves contain about 2.7g. protein, 9.2g. carbohydrate, 187mg Calcium, 66mg phosphorus, 3.1mg iron, 76mg sodium, 397mg potassium, 36mg magnesium, 14000iu vitamin A, 0.19mg vitamin B1, 0.26mg vitamin B2, 35mg vitamin C[173]. Root - raw or cooked[5, 9, 12, 183]. Bitter. A turnip-like flavour[159]. Flowers - raw or cooked[102, 159]. A rather bitter flavour[K], the unopened flower buds can be used in fritters[183] and they can also be preserved in vinegar and used like capers[7]. Both the leaves and the roots are used to flavour herbal beers and soft drinks such as ‘Dandelion and Burdock’[238]. The roots of 2 year old plants are harvested in the autumn, dried and roasted to make a very good coffee substitute[2, 4, 5, 12, 54, 159]. It is caffeine-free[213]. A pleasant tea is made from the flowers[12, 102]. They are also used to make wine - all green parts should be removed when making wine to prevent a bitter flavour[238]. The leaves and the roots can also be used to make tea.

tcanta Compost Cosmetic Dye Fruit ripening Latex MiscellanyThe flowers are an ingredient of ‘QR’ herbal compost activator[32]. This is a dried and powdered mixture of several herbs that can be added to a compost heap in order to speed up bacterial activity and thus shorten the time needed to make the compost[K]. A liquid plant feed can be made from the root and leaves[54]. A low quality latex, which can be used for making rubber, can be obtained from the roots of this plant. A magenta-brown dye is obtained from the root[141]. The plant releases ethylene gas, this stunts the growth of nearby plants and causes premature ripening of fruits[14, 18]. A distilled water made from the ligules (thin appendages at the base of the leaf blades) is used cosmetically to clear the skin and is particularly effective in fading freckles[7]. A dynamic accumulator gathering minerals or nutrients from the soil and storing them in a more bioavailable form - used as fertilizer or to improve mulch.

cover the seed. Germination can be erratic. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. This species is a hybrid and will not breed true from seed. Division in spring or autumn[200]. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the summer or the following spring. Cuttings of young shoots, 5 - 8cm with a heel, May/June in a frame[200]. Cuttings of half-ripe wood, 5 - 8cm with a heel, July/August in a frame[200]. Layering.

nwatta Landscape Uses:Border, Container, Ground cover, Rock garden. Requires a light well-drained preferably calcareous soil in a sunny position[1, 200]. Succeeds in dry soils. Thymes dislike wet conditions, especially in the winter. A layer of gravel on the soil around them will help protect the foliage from wet soils[238]. Plants are hardy to about -15°c[200]. This is a very difficult genus taxonomically, the species hybridize freely with each other and often intergrade into each other[200]. Often cultivated in the herb garden for its leaves, there are some named varieties. The flowers are rich in nectar and are very attractive to honey bees[200]. A good companion for most plants[54]. Special Features:Edible, Fragrant foliage, Not North American native, Suitable for dried flowers.

### 6.2.57 Gaultheria mucronata

Prickly heath

5 tlin 9 cyuc 4 kcaak 3 tcan 0 dwat m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli nyanhjen hjonli

drutta Gaultheria mucronata is an evergreen Shrub growing to 1.5 m (5ft) by 1.2 m (4ft in). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from May to June, and the seeds ripen from October to December. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[177]. The lilac-coloured fruit does not look tremendously edible, and the texture is somewhat like polystyrene - but the fruit of some forms is juicy, almost melts in the mouth, has a very pleasant slightly sweet flavour and makes a very good dessert fruit[K]. The fruit is up to 12mm in diameter[200].

tcanta Hedge HedgeThe plant can be used to make a low hedge[29]. A good ground cover plant for a sunny position, forming dense thickets[197]. They are best spaced about 60cm apart each way[208]. Plants can be cut back in the spring if they are becoming too lanky and open in growth[208].

dwatta None known

propta The seed requires a period of cold stratification. Pre-chill for 4 - 10 weeks and surface sow in a lime-free compost in a shady part of the greenhouse and keep moist[78]. The seed usually germinates well, usually within 1 - 2 months at 20°c, but the seedlings are liable to damp off. Watering them with care and making sure they get ample ventilation will reduce this risk. Watering them with a garlic infusion can help to prevent damping off[K]. Prick out the seedlings into individual pots when they are about 25mm tall and grow them on in light shade in the greenhouse for at least their first winter[K]. Plant them out in late spring or early summer. The seedlings are susceptible to spring frosts and so it might be wise to give them some protection in their first spring or two outdoors.. Cuttings of half-ripe wood 3 - 6cm long, July/August in a frame in a shady position. They form roots in late summer or spring[78]. A good percentage usually take. Division in spring just before new growth begins. ‘Drop’ the plants 12 months earlier by digging them up and replanting them deeper in the soil so that the branches are buried and

can form roots. This works best in a sandy soil[78]. It is best to pot up the divisions and grow them on in a lightly shaded position in the greenhouse until they are established. Plant them out in the summer. Layering in September/October. Takes 12 months[78].

nwatta Requires a light well-drained lime-free soil[11]. Requires a moist acid soil according to another report[184]. Prefers a sunny position[11] but succeeds in light shade though it fruits less well in such a position[182]. A very hardy plant, tolerating temperatures down to about -20°c[184]. Plants spread quite freely, forming thickets by means of suckers[182]. Plants sometimes have hermaphrodite flowers but are usually dioecious[208] and at least one male plant is required for every 5 or 6 females if fruit is required. A very ornamental shrub, there are many named varieties[182]. ‘Davis’s Hybrids’ is said to be hermaphrodite[182]. Plants in this genus are notably resistant to honey fungus[200].

### 6.2.58 Atriplex nuttallii

Nuttall’s Saltbush

5 tlin 9 cyuc 4 kcaak 0 tcan 0 dwat 0.9 m hkuc htut cyutli kyucutp hwicli hrasjhsrlut hpa7tli flatprikli-wissliphsom hpa7tmwatli nyanhjen hjonli

drutta Atriplex nuttallii is an evergreen Shrub growing to 0.9 m (3ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from July to August. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline and saline soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Leaves SeedEdible Uses: Leaves and stems - cooked[161]. It is usually cooked with wheat[177]. The leaves and stems can be used to add a salty flavour to other cooked foods[257]. Seed - cooked. Used in piñole or ground into a meal and used as a thickener in making bread or mixed with flour in making bread.

tcanta None known

dwatta None known

propta Seed - sow April/May in a cold frame in a compost of peat and sand. The seed usually germinates in 1 - 3 weeks at 13°c[134]. Pot up the seedlings when still small into individual pots, grow on in a greenhouse for the first winter and plant out in late spring or early summer after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame. Very easy. Pot up as soon as they start to root (about 3 weeks) and plant out in their permanent positions late in the following spring[K]. Cuttings of mature wood of the current season’s growth, November/December in a frame. Very easy. Pot up in early spring and plant out in their permanent position in early summer[K].

nwatta Requires a light or medium well-drained but not too fertile soil in a sunny position[11, 200]. Tolerates saline and very alkaline soils[200]. Succeeds in a hot dry position. Some modern works treat this species as a synonym of *Atriplex gardneri* aptera. This plant has more or less annual stems produced from a woody base[11]. Dioecious. Male and female plants must be grown if seed is required.

### 6.2.59 Lomatium cous

Biscuitroot, Cous biscuitroot

5 tlin 12 cyuc 4 kcaak 1 tcan 0 dwat 0.1 m hkuc htut cyutli kyucutp hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyfxre7t hjonli

drutta Lomatium cous is a PERENNIAL growing to 0.1 m (0ft 4in) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 6. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

### 6.2.29 Crataegus azarolus

Azarole

5 tlin 9 cyuc 4 kcaak 0 tcan 2 dwat 10 m hkuc hmimhtut cyutli hgattcuphja7n hwicli hrasjlutnyikfriph hpa7tli flatprikliwssliph hpa7tmwatli xre7t hjonli

drutta Crataegus azarolus is a deciduous Tree growing to 10 m (32ft 10in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in June. The species is hermaphrodite (has both male and female organs) and is pollinated by Midges. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can tolerate drought. The plant can tolerates strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked in pies, preserves etc[1, 2, 3, 11, 34, 183]. The fruit can be used fresh or dried for later use. A pleasant acid taste[89]. In warm temperate areas the fruit develops more fruit sugars and has a fragrant sugary pulp with a slightly acid flavour[183]. It can be eaten out of hand. In cooler zones, however, the fruit does not develop so well and is best cooked or used in preserves[183]. The fruit is very variable in size and colour, it is up to 25mm in diameter[200]. There are up to five fairly large seeds in the centre of the fruit, these often stick together and so the effect is of eating a cherry-like fruit with a single seed[K].

tcanta Wood - heavy, hard, tough, close-grained. Useful for making tool handles, mallets and other small items[82].

dwatta Cardiotonic HypotensiveAlthough no specific mention has been seen for this species, the fruits and flowers of many hawthorns are well-known in herbal folk medicine as a heart tonic and modern research has borne out this use. The fruits and flowers have a hypotensive effect as well as acting as a direct and mild heart tonic[222]. They are especially indicated in the treatment of weak heart combined with high blood pressure[222]. Prolonged use is necessary for it to be efficacious[222]. It is normally used either as a tea or a tincture[222].

propta Seed - this is best sown as soon as it is ripe in the autumn in a cold frame, some of the seed will germinate in the spring, though most will probably take another year. Stored seed can be very slow and erratic to germinate, it should be warm stratified for 3 months at 15°c and then cold stratified for another 3 months at 4°c[164]. It may still take another 18 months to germinate[78]. Scarifying the seed before stratifying it might reduce this time[80]. Fermenting the seed for a few days in its own pulp may also speed up the germination process[K]. Another possibility is to harvest the seed ‘green’ (as soon as the embryo has fully developed but before the seedcoat hardens) and sow it immediately in a cold frame. If timed well, it can germinate in the spring[80]. If you are only growing small quantities of plants, it is best to pot up the seedlings as soon as they are large enough to handle and grow them out in individual pots for their first year, planting them out in late spring into nursery beds or their final positions. When growing larger quantities, it might be best to sow them directly outdoors in a seedbed, but with protection from mice and other seed-eating creatures. Grow them on in the seedbed until large enough to plant out, but undercut the roots if they are to be left undisturbed for more than two years.

nwatta A very easily grown plant, it prefers a well-drained moisture retentive loamy soil but is not at all fussy[11, 200]. Once established, it succeeds in excessively moist soils and also tolerates drought[200]. It grows well on a chalk soil and also in heavy clay soils[200]. A position in full sun is best when plants are being grown for their fruit, they also succeed in semi-shade though fruit yields and quality will be lower in such a position[11, 200]. Most members of this genus succeed in exposed positions, they also tolerate atmospheric pollution[200]. The azarole has long been cultivated for its edible fruit in S. Europe, though it is now going out of favour[3, 11]. There are some named varieties[46].

Seedling trees take from 5 - 8 years before they start bearing fruit, though grafted trees will often flower heavily in their third year[K]. The flowers have a foetid smell somewhat like decaying fish. This attracts midges which are the main means of fertilization. When freshly open, the flowers have more pleasant scent with balsamic undertones[245]. Hawthorns in general hybridize freely with other members of the genus[200]. Seedlings should not be left in a seedbed for more than 2 years without being transplanted[11].

### 6.2.30 Pyrus pyrifolia culta

Asian Pear

5 tlin 9 cyuc 4 kcaak 0 tcan 1 dwat 10 m hkuc hmimhtut cyutli hgattcup hwicli hrasjlutnyikfriph hpa7tli flat-prikliwis hpa7tmwatli xre7t hjonli

drutta Pyrus pyrifolia culta is a deciduous Tree growing to 10 m (32ft 10in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in April. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil and can tolerate drought. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[2, 105]. Crisp, juicy with a fine flavour[178]. The fruit contains about 6 - 9.5% sugar and up to 0.56% fruit acids[179].

tcanta None known

dwatta Antiseptic Astringent Febrifuge Nerveine PectoralAntiseptic, astringent, febrifuge, nerveine, pectoral[178].

propta Seed - best sown in a cold frame as soon as it is ripe in the autumn, it will then usually germinate in mid to late winter. Stored seed requires 8 - 10 weeks cold stratification at 1°c and should be sown as early in the year as possible[200]. Temperatures over 15 - 20°c induce a secondary dormancy in the seed[200]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in a cold frame or greenhouse for their first year. Plant them out in late spring or early summer of the following year. The seed of pear cultivars will not usually breed true to type.

nwatta Prefers a good well-drained loam in full sun[200]. Grows well in heavy clay soils. Tolerates light shade but does not fruit so well in such a position. Tolerates atmospheric pollution, excessive moisture and a range of soil types if they are moderately fertile[200]. Established plants are drought tolerant[200]. Plants are hardy to at least -15°c[200]. Cultivated for its edible fruit in China and Japan, there are many named varieties[183]. A hybrid between this plant and *P. communis* culta is more suitable for warmer climates[11].

### 6.2.31 Actinidia purpurea

Purple hardy kiwi

5 tlin 9 cyuc 4 kcaak 1 tcan 0 dwat 10 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

drutta Actinidia purpurea is a deciduous Climber growing to 10 m (32ft 10in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in June, and the seeds ripen in November. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Bees, insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[3, 105]. Sweet[177, 183, 200]. The fruit is up to 2.5cm long[198]. It contains a number of small seeds, but these are easily eaten with the fruit[K].

tcanta None known

dwatta None known

propta Seed - sow spring in a greenhouse[133]. It is probably best if the seed is given 3 months stratification[113], either sow it in a cold frame as soon as it is ripe in November or as soon as it is received. Fresh seed germinates in 2 - 3 months at 10°C, stored seed can take longer[133]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least their first winter. When the plants are 30cm or more tall, plant them out into their permanent positions in late spring or early summer, after the last expected frosts[K]. Most seedlings are male[126]. The seedlings are subject to damping off, they must be kept well ventilated[113]. Cuttings of softwood as soon as ready in spring in a frame[K]. Cuttings of half-ripe wood, July/August in a frame. Very high percentage[113]. Cuttings of ripe wood, October/November in a frame.

nwatta Prefers a sound loamy neutral soil[1, 200]. Succeeds in semi-shade but full sun is best for fruit production[200]. Prefers a sheltered position[200]. Dormant plants are very hardy but young spring growth is susceptible to frost damage[160]. Fruits are formed on second year wood and also on fruit spurs on older wood[126], any pruning is best carried out in the winter[219]. This is a climbing plant, supporting itself by twining around branches etc[200]. This species is possibly no more than a form of *A. arguta*[198], differing in its longer narrower leaves[126, 200]. It is treated as a synonym of *A. arguta* in the draft Flora of China[266]. At least one named variety has been developed for its edible fruit[183]. Plants in this genus are notably resistant to honey fungus[200]. Dioecious. Male and female plants must be grown if seed is required. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. Woody. Growth habit is a single or multiple shooting vine from a crown [1-2]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

## 6.2.32 Ziziphus jujuba

Jujube  
5 tlin 10 cyuc 4 kcaak 3 tcan 3 dwat 10 m hkuc  
htut cyutli hgatkyucup hwicli hyhshrasjltunyk hpa7tli flat-prikliwslip hpa7tmwatli fyifxre7t hjonli

drutta Ziziphus jujuba is a deciduous Tree growing to 10 m (32ft) by 7 m (23ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from April to May, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. **kcakta Edible Parts:** Fruit LeavesEdible Uses: CoffeeFruit - raw or cooked[1, 2, 3, 100, 158]. Mealy and sweet[46]. A sourish-sweet flavour[174]. The fruit can be eaten fresh, dried like dates or cooked in puddings, cakes, breads, jellies, soups etc[183]. The dried fruit has the nicest taste[11, 132]. The fruits are often left to become wrinkled and spongy, which increases their sweetness, and are then eaten fresh or cooked[238]. The dried fruit can also be ground into a powder. This powder is used in the preparation of 'kochujang', a fermented hot pepper-soybean paste that resembles miso[183]. Fruits contain one or two seeds[238]. Average yields from wild trees in the Himalayas are 9.5kg per year[194]. The fruit contains about 8.7% sugars, 2.6% protein, 1.4% ash, 1.7% pectin and 1.3% tannin[194]. The fruit is about 25mm long, though it can be larger in cultivated varieties[200]. The fruit can be used as a coffee substitute[183]. Leaves - cooked. A famine food, they are only used when all else fails[179]. A nutritional analysis is available[218].

tcanta Charcoal Fuel Hedge Hedge WoodPlants can be grown as a hedge[178]. Wood - dense, hard, compact, tough. Used for turnery, agricultural implements etc[74, 146, 158]. It makes an excellent fuel[146] and a good charcoal[158]. Es-

palier: tree or other plants that is trained to grow flat against a support (such as a trellis or wall).

dwatta Anodyne Antidote Astringent Cancer Diuretic Emollient Expectorant Hypnotic Narcotic Pectoral Poulitice Refrigerant Sedative Skin Stomachic TonicJujube is both a delicious fruit and an effective herbal remedy. It aids weight gain, improves muscular strength and increases stamina[254]. In Chinese medicine it is prescribed as a tonic to strengthen liver function[254]. Japanese research has shown that jujube increases immune-system resistance. In one clinical trial in China 12 patients with liver complaints were given jujube, peanuts and brown sugar nightly. In four weeks their liver function had improved[254]. Antidote, diuretic, emollient, expectorant[11, 61, 174, 178, 194]. The dried fruits contain saponins, triterpenoids and alkaloids[279]. They are anodyne, anticancer, pectoral, refrigerant, sedative, stomachic, styptic and tonic[4, 176, 218]. They are considered to purify the blood and aid digestion[240]. They are used internally in the treatment of a range of conditions including chronic fatigue, loss of appetite, diarrhoea, pharyngitis, bronchitis, anaemia, irritability and hysteria[176, 238, 279]. The seed contains a number of medically active compounds including saponins, triterpenes, flavonoids and alkaloids[279]. It is hypnotic, narcotic, sedative, stomachic and tonic[147, 176, 218]. It is used internally in the treatment of palpitations, insomnia, nervous exhaustion, night sweats and excessive perspiration[176, 238]. The root is used in the treatment of dyspepsia[218]. A decoction of the root has been used in the treatment of fevers[4, 240]. The root is made into a powder and applied to old wounds and ulcers[240]. The leaves are astringent and febrifuge[4, 218]. They are said to promote the growth of hair[218]. They are used to form a plaster in the treatment of strangury[240]. The plant is a folk remedy for anaemia, hypertonia, nephritis and nervous diseases[218]. The plant is widely used in China as a treatment for burns[218].

propta Seed - best sown in a cold frame as soon as it is ripe. Stored seed requires 3 months warm then 3 months cold stratification[113]. Germination should take place in the first spring, though it might take another 12 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for at least their first winter. Plant out in early summer. Root cuttings in a greenhouse in the winter[200]. Best results are achieved if a temperature of 5 - 10°C can be maintained[238]. Cuttings of mature wood of the current season's growth, November to January in a frame[238]. Division of suckers in the dormant season[174]. They can be planted out direct into their permanent positions if required.

nwatta Succeeds in most soils so long as they are well-drained[3, 200]. Prefers an open loam and a hot dry position[1, 3]. Succeeds in an alkaline soil[200]. Plants are fast growing, even in poor soils[146]. Plants are hardy to about -20°C[200]. Another report says that they are hardy to about -30°C when fully dormant[160]. The jujube is often cultivated in warm temperate zones for its edible fruit, there are many named varieties[50, 183]. The trees need a hot dry summer if they are to fruit well, which rather restricts their potential in a country like Britain[238, K]. The tree spreads by root suckers and self-sowing, often forming dense thickets. Where the climate suits it, the plant can escape from cultivation and become an invasive and problematic weed[274]. Trees are resistant to most pests and diseases[160]. Responds well to coppicing[146]. Trees form a deep taproot and should be planted into their permanent positions as soon as possible[200]. Fast growing and quick to mature, it can fruit in 3 - 4 years from seed[200]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. A sprouting standard sending up shoots from the base [1-2]. The root pattern is a tap root similar to a carrot going directly down [1-2]. The root pattern is suckering with new plants from underground runners away from the plant [1-2].

## 6.2.33 Prunus armeniaca

Apricot

5 tlin 7 cyuc 4 kcaak 4 tcan 3 dwat 9 m hkuc  
hmimhtut cyutli tcup hwicli hrasjltut hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

temperate. Humidity: arid to semi-arid. Carbon Farming Solutions - Cultivation: hypothetical - F. Esculentum could be crossed with *F. cymosum*. Management: standard (Describes the non-destructive management systems that are used in cultivation) [1-1].

## 6.2.54 Campanula cochlearifolia

Fairies Thimbles

5 tlin 9 cyuc 4 kcaak 0 tcan 0 dwat 0.2 m hkuc  
htut cyutli tcup hwicli hyhshrasjltut hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Campanula cochlearifolia is a PERENNIAL growing to 0.2 m (0ft 8in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Flowers LeavesEdible Uses: Leaves - raw or cooked. A pleasant mild flavour[K]. Flowers - raw or cooked. Slightly sweet[K].

tcanta None known

dwatta None known

propta Seed - surface sow spring in a cold frame. The seed usually germinates in 2 - 4 weeks at 18°C. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Basal cuttings in spring. Harvest the shoots when they are about 10 - 15cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer. Division in spring or autumn. Very easy[221], larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the summer or following spring.

nwatta A very easily grown plant that succeeds in most situations so long as they are not both hot and dry[221]. In nature, the plant is found in poor soils and rock crevices and, in cultivation, when introduced to the richer conditions of the garden, is apt to spread by means of seeds and a creeping rhizome - indeed some gardeners consider it a pest even though it is beautiful and long-flowering[271]. It is probably best grown in a poor soil, indeed it grows happily in pure gravel and sand[271]. It succeeds on drystone walls where it can become invasive[200]. It does especially well on the top of walls where there are cracks for it to root into[219]. Prefers a moist but well-drained sandy loam and a neutral or alkaline soil in sun or partial shade[1, 200]. Plants are hardy to at least -15°C[200]. The species in this genus do not often hybridize and so seed can generally be relied upon to come true[221]. The plants are self-fertile and often self-sow in the garden[221, 271]. There are several named varieties selected for their ornamental value[200]. 'Elizabeth Oliver' has pleasantly flavoured leaves[K]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 6.2.55 Peltaria alliacea

Garlic Cress

5 tlin 9 cyuc 4 kcaak 3 tcan 0 dwat 0.3 m hkuc  
hmimhtut cyutli tcup hwicli hrasjltut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Peltaria alliacea is an evergreen Perennial growing to 0.3 m (1ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in leaf all year, in flower in June, and the seeds ripen in August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers LeavesEdible Uses: Leaves - raw or cooked[105]. A strong flavour, somewhat

like a cross between garlic and mustard, the leaves make a reasonable flavouring for salads[K]. The leaves are available for most of the year, even in a severe winter they remain green and lush[K]. At this time they add an especially welcome spiciness to salads[K]. They can become rather bitter in the summer, though, especially if the plants are in a dry sunny position[K]. When flowering in early summer, the plants lose their leaves for a month or two - cutting down the flowering stems at this time will induce new fresh green growth[K]. Flowers - raw. A similar flavour to the leaves, with very little bitterness, they make a very tasty addition to summer salads[K].

tcanta The plants can be used as a ground cover, somewhat slow spreading but they are effective in excluding weeds[K].

dwatta None known

propta Seed - sow spring or autumn in a cold frame[200]. The seed germinates rapidly, prick the seedlings out into individual pots when they are large enough to handle and plant them out into their permanent positions in the summer[K]. Division in spring or autumn. Very easy, it can be done at almost any time of the year so long as the soil is kept moist. Divisions in the winter should be potted up in a greenhouse to allow themselves to establish, they can then be planted out in late spring.

nwatta Prefers a light fertile moist soil in sun or light shade[200], though it is not too fussy[K]. A very easily grown plant that tolerates considerable neglect, it produces its best crop of leaves from autumn to spring and is a potentially valuable winter salad plant[K]. The bruised leaves give off a powerful garlic smell which is difficult to remove from the hands[245].

## 6.2.56 Thymus x citriodorus

Lemon Thyme, Creeping Lemon Thyme, Lemon-Scented Thyme

5 tlin 10 cyuc 4 kcaak 5 tcan 2 dwat 0.1 m hkuc  
htut cyutli kyuctcup hwicli hrasjltut hpa7tli prikliwis hpa7tmwatli xre7t hjonli

drutta Thymus x citriodorus is an evergreen Shrub growing to 0.1 m (0ft 4in) by 0.3 m (1ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: LeavesEdible Uses: TeaLeaves - raw in salads or added as a flavouring to cooked foods[105, 183]. A delicious lemon flavour[K]. If the leaves are to be dried, the plants should be harvested in early and late summer just before the flowers open and the leaves should be dried quickly[200]. An aromatic tea is made from the leaves[21]. It has a pleasant lemon-like flavour and is very refreshing[183, 238].

tcanta Deodorant Disinfectant Essential Pot-pourriThe essential oil obtained from the leaves and flowering stems is used in perfumery, as a mouth wash, medicinally etc[200]. The aromatic leaves are dried and used in pot-pourri and herbal pillows[238]. The plant makes an attractive ground cover for a sunny position[201]. They are best spaced about 30cm apart each way[208].

dwatta Antiseptic Aromatherapy Deodorant DisinfectantThe leaves, and especially the essential oil contained in them, are strongly antiseptic, deodorant and disinfectant[200, 238]. The plant can be used fresh at any time of the year, or it can be harvested as it comes into flower and either be distilled for the oil or dried for later use[238]. The leaves contain an antioxidant and regular use of the raw leaves has been shown to increase average life expectancy by about 10%. The essential oil obtained from this plant is thought to be less irritant than other thyme oils and so it is used in aromatherapy to treat asthma and other respiratory complaints, especially in children[238].

propta Seed - sow spring in a cold frame. Seed can also be sown in autumn in a greenhouse. Surface sow or barely

propta Seed - best sown in the autumn in a cold frame[200]. Seeds are short-lived and difficult to germinate. Stored seed requires 1 month warm stratification followed by 2 months cold[113]. When large enough to handle, prick the seedlings out into individual pots of lime-free compost and grow them on in light shade in a greenhouse or cold frame for at least their first winter. Plant out into their permanent positions in late spring or early summer when they are at least 15cm tall. Cuttings of half-ripe wood, July/August in a frame[200]. Layering. Division in spring.

nwatta Requires a lime-free moist peaty soil, thriving in sun or part shade[3, 182, 200]. Plants are hardy to about -15°C[200]. Occasionally cultivated for its edible fruit, there are some named varieties selected for their larger fruits[22, 46]. The small oval leaves are covered with globules on the underside from which a resinous gum is exuded[245]. The plant is heat tolerant in zones 7 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a running thicket former forming a colony from shoots away from the crown spreading indefinitely [1-2]. The root pattern is suckering with new plants from underground runners away from the plant [1-2].

## 6.2.52 Atriplex hortensis

Orach, Garden orache  
5 tlin 9 cyuc 4 kcaak 0 tcan 2 dwat 1.8 m hkuc  
htut cyutli tcup hwicli hrasjlut hpa7tli flatprikwissiphosm hpa7tmwatli hjonli

drutta Atriplex hortensis is a ANNUAL growing to 1.8 m (6ft) by 0.3 m (1ft in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from July to August, and the seeds ripen in September. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline and saline soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcaakta Edible Parts: Leaves SeedEdible Uses: Leaves - raw or cooked[2, 16, 27, 33]. Used like spinach[9], they have a bland flavour and are traditionally mixed with sorrel leaves in order to modify the acidity of the latter[183]. Another report says that the flavour is stronger than spinach[264]. Seed - cooked. It can be ground into a meal and used in soups etc or be mixed with flour when making bread[177, 183]. The seed is said to be a good source of vitamin A[240]. The seed is also said to contain some saponins[240]. See the notes above on toxicity. The seed is small and fiddly to harvest and use.

tcanta Biomass Companion DyeA blue dye is obtained from the seed[74, 100]. The plant is a potential source of biomass. Yields of 14 tonnes per hectare have been achieved in the vicinity of Landskrona and Lund, Sweden. Higher yields might be expected farther south. If the leaf-protein were extracted, this should leave more than 13 tonnes biomass as by-product, for potential conversion to liquid or gaseous fuels[269].

dwatta Antirheumatic Diuretic Emetic PurgativeThe leaves are diuretic, emetic and purgative[100, 269]. They are also said to be a stimulant to the metabolism and an infusion is used as a spring tonic and a remedy for tiredness and nervous exhaustion[9]. They have been suggested as a folk remedy for treating plethora and lung ailments[269]. The leaves are said to be efficacious when used externally in the treatment of gout[4]. The seeds, mixed with wine, are said to cure yellow jaundice. They also excite vomiting[269]. The

fruits are purgative and emetic[269]. Liniments and emollients prepared from the whole plant, like the juice of the plant, are said to be folk remedies for indurations and tumours, especially of the throat[269].

propta Seed - sow March to August in situ, only just covering the seed[134]. Germination is usually good and rapid[K].

nwatta Orach is a very easily grown plant, doing equally well in a wide variety of well-drained soils, though rich, moisture-retentive soils give the quick growth that is necessary for the production of tender leaves[33, 37, 200, 269]. Plants require a position in full sun and are tolerant of saline and very alkaline soils[200]. They thrive in any temperate climate, and are drought resistant[269]. Orach is reported to tolerate an annual precipitation of 30 to 140cm, an average annual temperature in the range of 6 to 24°C, and a pH of 5.0 to 8.2[269]. Orach was formerly cultivated for its edible leaves, there are some named varieties[183]. It can be grown as a warm weather substitute for spinach[183]. Some forms of this species have bronze or deep red leaves and are occasionally grown as ornamental plants, their leaves taste the same as the green-leaved forms[K]. Plants are fast-growing[238] and usually self-sow quite freely if the surrounding soil is disturbed by hoeing etc[K]. They tolerate hot weather well, but soon go to seed so successive sowings at 4 weekly intervals are required during the growing season if a continuous supply of leaves is required[269]. Leaves can be harvested 40 - 60 days after sowing the seed[269]. This species is a poor companion plant for potatoes, inhibiting their growth when growing close to them[20].

## 6.2.53 Fagopyrum spp.

Perennial Buckwheat  
5 tlin 10 cyuc 4 kcaak 2 tcan 3 dwat 1 m hkuc  
hminhtut cyutli tcup hwicli hyihshrasjlutnykifrip hpa7tli flatprikwis hpa7tmwatli hjonli

drutta Fagopyrum spp. is a PERENNIAL growing to 1 m (3ft 3in) by 1 m (3ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Leaves SeedEdible Uses: Leaves - raw or cooked[105, 160, 272]. Boiled or steamed and used like spinach[183]. Of excellent quality according to one report[2], but we have been less than impressed by the flavour, which has a distinct bitterness especially when eaten raw[K]. The leaves are rich in rutin (see below for details of its uses) and so they do make a healthy addition to the diet[K]. Seed - it can be sprouted and eaten raw, or cooked and used as a cereal[4]. Dried and ground into a powder, it can serve as a thickening agent in soups etc. The seed is rich in vitamin B6. Unfortunately, it is not freely produced in Britain[2]. Carbon Farming Solutions - Staple Crop: balanced carb (The term staple crop typically refers to a food that is eaten routinely and accounts for a dominant part of people's diets in a particular region of the world) [1-1].

tcanta Animal feed, An ornamental plant.  
dwatta The whole plant is anodyne, antihelmintic, antiphlogistic, carminative, depurative and febrifuge. It stimulates blood circulation[147]. A decoction is used in the treatment of traumatic injuries, lumbago, menstrual irregularities, purulent infections, snake and insect bites[147]. A decoction of the roots is used in the treatment of insect bites, dysmenorrhoea, inflammation, lumbago, snakebite and traumatic injuries[218]. The leaves are rich in rutin which is a capillary tonic, antioedemic, anti-inflammatory, antispasmodic and hypotensive[218]. Rutin also inhibits carcinogenesis and protects against radiation[218].

propta Seed - sow spring in a greenhouse. Prick out the seedlings when they are large enough to handle and plant them out into their permanent positions in the summer. Division is very easy at almost any time in the growing season, though it is best avoided in early spring because the young growth can be damaged by late frosts. The divisions can be planted out direct into their permanent positions.

nwatta Hypothetical Crop Management: Standard Staple Crop: Balanced carbClimate: boreal to cold

drutta Prunus armeniaca is a deciduous Tree growing to 9 m (29ft) by 6 m (19ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from March to April, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Fruit Oil Oil SeedEdible Uses: Gum Oil OilFruit - raw, cooked or dried for later use[1, 2, 3, 34]. The best forms are soft and juicy with a delicious rich flavour[K]. Wild trees in the Himalayas yield about 47.5kg of fruit per year[194]. The fruit of the wild form contains about 6.3% sugars, 0.7% protein, 2.5% ash, 2.5% pectin. There is about 10mg vitamin C per 100g of pulp[194]. The fruit is about 5cm in diameter and contains one large seed[200]. Seed - raw or cooked[183]. Bitter seeds should be eaten in strict moderation, but sweet ones can be eaten freely[132]. The bitter seeds can be used as a substitute for bitter almonds in making marzipan etc[4]. An edible gum is obtained from the trunk[64]. The seed contains up to 50% of an edible semi-drying oil[4, 57, 61, 183].

tcanta Adhesive Dye Gum Oil Oil WoodAn edible semi-drying oil is obtained from the seed[57]. Used for lighting[194]. The oil has a softening effect on the skin and so it is used in perfumery and cosmetics, and also in pharmaceuticals[4, 61]. A green dye can be obtained from the leaves[168]. A dark grey to green dye can be obtained from the fruit[168]. Wood - handsome, hard, durable. Agricultural implements etc[146, 194]. Espalier: tree or other plants that is trained to grow flat against a support (such as a trellis or wall).

dwatta Analgesic Anthelmintic Antiasthmatic Antidote Antipyretic Antisepctic Antispasmodic Antitussive Demulcent Emetic Emollient Expectorant Laxative Ophthalmic Pectoral Sedative Tonic Vitamin C VulneryaryApricot fruits contain citric and tartaric acid, carotenoids and flavonoids[283]. They are nutritious, cleansing and mildly laxative[254]. They are a valuable addition to the diet working gently to improve overall health. The salted fruit is antiinflammatory and antiseptic[283]. It is used medicinally in Vietnam in the treatment of respiratory and digestive diseases[283]. Antipyretic, antiseptic, emetic, opthalmic[194]. The flowers are tonic, promoting fecundity in women[218]. The bark is astringent[254]. The inner bark and/or the root are used for treating poisoning caused by eating bitter almond and apricot seeds (which contain hydrogen cyanide)[218]. Another report says that a decoction of the outer bark is used to neutralize the effects of hydrogen cyanide[238]. The decoction is also used to soothe inflamed and irritated skin conditions[254]. The seed is analgesic, anthelmintic, antiasthmatic, antispasmodic, antitussive, demulcent, emollient, expectorant, pectoral, sedative and vulnerary[176, 218]. It is used in the treatment of asthma, coughs, acute or chronic bronchitis and constipation[176, 279]. The seed contains 'laetirile', a substance that has also been called vitamin B17[218]. This has been claimed to have a positive effect in the treatment of cancer, but there does not at present seem to be much evidence to support this[K]. The pure substance is almost harmless, but on hydrolysis it yields hydrocyanic acid, a very rapidly acting poison - it should thus be treated with caution[218]. In small amounts this exceedingly poisonous compound stimulates respiration, improves digestion and gives a sense of well-being[238].

propta Seed - requires 2 - 3 months cold stratification and is best sown in a cold frame as soon as it is ripe[200]. Sow stored seed in a cold frame as early in the year as possible[200]. Protect the seed from mice etc. The seed can be rather slow, sometimes taking 18 months to germinate[113]. Prick out the seedlings into individual pots when they are large enough to handle. Grow them on in a greenhouse or cold frame for their first winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood with a heel, July/August in a frame[11, 200]. Difficult[113]. Softwood cuttings from strongly growing plants in spring to early summer in a frame[200]. Difficult. Layering in spring.

nwatta Global Fruit Crop Industrial Crop: Oil Management: Standard Staple Crop: Protein-oilLandscape Uses : Specimen, Espalier. Requires a well-

drained moisture-retentive fertile soil in a warm sunny position[11, 200]. Succeeds in light shade but fruits better in a sunny position[200]. Thrives in a loamy soil, doing well on limestone[11]. Prefers some chalk in the soil but is apt to become chlorotic if too much is present[11]. Prefers a pH in the range 6.5 to 7.5[200]. Dislikes clay soils[37, 61]. Intolerant of saline soils[200]. Trees drop their fruit buds if there is a summer drought[200]. The apricot is widely cultivated for its edible fruit in temperate areas that have long hot summers, there are many named varieties[183, 200]. The tree is perfectly hardy in Britain but it usually flowers very early in the spring and the flowers are then liable to be destroyed by frosts[11]. It really requires a more continental climate (with its clearly defined seasons) than it gets in Britain. However, if given the benefit of a south or west facing wall and some protection from frosts when it is in flower, reasonable crops can usually be produced in southern England[1, 219]. The plants are self-fertile[200], but hand pollination would be advisable since they are normally flowering before many pollinating insects are active. In Britain apricots are usually grown on plum rootstocks, 'St. Julien A' is the most widely used[200]. The dwarfing rootstock 'Pixie' is also a possibility, but this must be double worked with 'St. Julien A' because it is incompatible with apricots[200]. Any pruning should be carried out in the summer to allow rapid healing and therefore less risk of infection[201]. Oats should not be grown near apricots because their roots have an antagonistic effect on the roots of the apricot[201]. Tomatoes and potatoes are also bad companions for apricots[201]. If nasturtiums (Tropaeolum spp) are grown under apricots they will make the fruit less palatable to insects, though this is not detectable by the human palate[201]. Most members of this genus are shallow-rooted and will produce suckers if the roots are damaged[238]. Plants in this genus are notably susceptible to honey fungus[200]. Special Features: Edible, Not North American native, All or parts of this plant are poisonous, Fragrant flowers, Attractive flowers or blooms. The plant is heat tolerant in zones 8 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2].

## 6.2.34 Akebia trifoliata

Akebia, Threelaf Akebia  
5 tlin 8 cyuc 4 kcaak 2 tcan 2 dwat 9 m hkuc  
pcimhmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwis hpa7tmwatli hjonli

drutta Akebia trifoliata is a deciduous Climber growing to 9 m (29ft 6in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in April, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: FruitEdible Uses: TeaFruit - raw. Sweet but insipid[2, 3, 46, 61, 105]. The fruit has a delicate flavour and a soft juicy texture[K]. The flavour can be enhanced by the addition of a little lemon juice. Valued more as a novelty, the fruit looks somewhat like a deep-purple coloured sausage[183]. The fruit is 7 - 13cm long[200]. The dried young leaves are used as a tea substitute[46, 61, 105, 183].

tcanta BasketryThe peeled stems are very pliable. They can be bleached and used in basket making[46, 61]. Landscape Uses: Arbor. The flowers are purple. The flowers have

a sweet scent.

dwatta Analgesic Antibacterial Antifungal Antiinflammatory Antitumor Blood tonic Cardiotoxic Diuretic Emmenagogue Galactagogue UrinaryThe stems are analgesic, antibacterial, antifungal, anti-inflammatory, antitumor. blood tonic, cardiotoxic, diuretic, emmenagogue and galactagogue[147, 176]. Taken internally, it controls gram-positive bacterial and fungal infections and is used in the treatment of urinary tract infections, lack of menstruation, to improve lactation etc[176, 238]. The stems are harvested in the autumn and dried for later use[238].

propta Seed - best sown in a cold frame as soon as it ripe. Surface sow in a light position[133]. The seed usually germinates in 1 - 3 months at 15°C[133]. Stored seed should be given 1 month cold stratification[113, 133] and can be very difficult to germinate. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least their first winter. Plant out in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame[11, 113]. The cuttings can be slow to root[200]. Cuttings can also be taken of soft wood in spring[113]. Root cuttings, December in a warm greenhouse[113]. Layering in early spring[1]. Very easy, the plants usually self-layer and so all you need to do is dig up the new plants and plant them out directly into their permanent positions.

nwatta Requires a well-drained moisture-retentive loamy soil[11, 200]. Succeeds in acid or alkaline soils[200]. Prefers partial shade but succeeds in full sun[3, 200]. Grows well on a north facing wall[219]. Dormant plants are hardy to about -20°C but they can be somewhat tender when young[200]. Another report says that this species is not as hardy as *A. quinata*, only tolerating temperatures down to -10°C. The young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. This species grows very well in S.W. England. Resentful of root disturbance, either grow plants in containers prior to planting them out or plant them out whilst very young[219]. Plants are evergreen in mild winters[11]. Fast growing, it can be invasive. It grows well on deciduous trees[28]. Plants are not normally pruned, if they are growing too large they can be cut back by trimming them with shears in early spring[202]. Plants are shy to fruit, they possibly require some protection in the flowering season, hand pollination is advisable[3, 11]. Plants are probably self-sterile[182], if possible at least 2 plants should be grown, each from a different source. The flowers are sweetly scented[245]. The fruits are sold in local markets in Japan[46]. The ssp. *A. trifoliata australis*. (Diels.)Rehd. is used medicinally in China[176]. Plants in this genus are notably resistant to honey fungus[200]. Special Features: Attractive foliage, Not North American native, Fragrant flowers, Attractive flowers or blooms.

## 6.2.35 Prunus cerasifera

Cherry Plum, Myrobalan Plum, Newport Cherry Plum, Pisard Plum

5 tlin 8 cyuc 4 kcaak 3 tcan 1 dwat 9 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnykfrip hpa7tli flatprik-lwis hpa7tmwatli xre7t hjonli

drutta Prunus cerasifera is a deciduous Tree growing to 9 m (29ft) by 9 m (29ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower in March, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: Fruit SeedEdible Uses: Fruit - raw or cooked in pies, tarts, jams etc[2, 5, 12, 34, 183]. The size of a small plum with a thin skin and a nice sweet flavour[183]. The flesh is somewhat mealy but is also juicy[K]. The fruit can hang on the tree until October[K]. The fruit is about 30mm in diameter and contains one large seed[200]. Seed - raw or cooked. Do not eat the seed if it is too bitter - see the notes above on toxicity.

tcanta Dye Hedge Hedge Rootstock ShelterbeltA green dye can be obtained from the leaves[168]. A dark grey to green dye can be obtained from the fruit[168]. Makes quite a good windbreak hedge though it cannot stand too much exposure[1, 11, 29]. Often used as a rootstock for the cultivated plums, giving them a semi-dwarfing habit[61].

dwatta BachThe plant is used in Bach flower remedies - the keywords for prescribing it are 'Desperation', 'Fear of losing control of the mind' and 'Dread of doing some frightful thing'[209]. It is also one of the five ingredients in the 'Rescue remedy'[209]. Although no specific mention has been seen for this species, all members of the genus contain amygdalin and prunasin, substances which break down in water to form hydrocyanic acid (cyanide or prussic acid). In small amounts this exceedingly poisonous compound stimulates respiration, improves digestion and gives a sense of well-being[238].

propta Seed - requires 2 - 3 months cold stratification and is best sown in a cold frame as soon as it is ripe[200]. Sow stored seed in a cold frame as early in the year as possible[200]. Protect the seed from mice etc. The seed can be rather slow, sometimes taking 18 months to germinate[113]. Prick out the seedlings into individual pots when they are large enough to handle. Grow them on in a greenhouse or cold frame for their first winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood with a heel, July/August in a frame. Softwood cuttings from strongly growing plants in spring to early summer in a frame. Layering in spring. Division of suckers in the dormant season. They can be planted out direct into their permanent positions.

nwatta Landscape Uses:Specimen. Requires a well-drained moisture retentive soil[1, 11]. Succeeds in light shade but fruits better in a sunny position[11, 200]. Thrives in a loamy soil, doing well on limestone[11]. Grows well in heavy clay soils. Prefers some chalk in the soil but apt to become chlorotic if too much is present[1]. A very ornamental plant[1], it is sometimes cultivated for its edible fruit, unfortunately this is not often borne in large quantities in Britain[3, 17], but large crops are produced every 4 years or so[K]. There are some named varieties[183]. Included as a part of *P. divaricata* by some botanists[11] though others include *P. divaricata* as a sub-species under this species[200]. Most members of this genus are shallow-rooted and will produce suckers if the roots are damaged[238]. Plants in this genus are notably susceptible to honey fungus[200]. Special Features:Attractive foliage, Not North American native, All or parts of this plant are poisonous, Blooms are very showy. The plant is heat tolerant in zones 9 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. A sprouting standard sending up shoots from the base [1-2].

## 6.2.36 Pinus cembroides

Mexican Pine Nut, Pinyon Pine

5 tlin 8 cyuc 4 kcaak 4 tcan 2 dwat 8 m hkuc htut cyutli hgatkyuctup hwicli hyishrasjlut hpa7tli flatprik hpa7tmwatli dyat hjonli

drutta Pinus cembroides is an evergreen Tree growing to 8 m (26ft) by 5 m (16ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from May to June, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

back and legs[176]. The fruit of many members of this genus is a very rich source of vitamins and minerals, especially in vitamins A, C and E, flavanoids and other bio-active compounds. It is also a fairly good source of essential fatty acids, which is fairly unusual for a fruit. It is being investigated as a food that is capable of reducing the incidence of cancer and also as a means of halting or reversing the growth of cancers[214]. The seed is used as a haemostat for the control of bleeding, with a special action on the kidneys and sex organs[218]. The root bark is antibacterial, antipyretic, hepatic, hypoglycaemic and vasodilator[176]. It stimulates the parasympathetic nervous system, which controls involuntary bodily functions such as digestive secretions[254]. The root is used in the treatment of pulmonary tuberculosis and pneumonia in small children[147], chronic febrile disease, night sweats, cough and asthma, tuberculosis, hypertension and diabetes mellitus[176]. The root can be harvested at any time of the year but traditionally it is harvested in the spring and can be dried for later use[254]. The root bark contains betaine. This can increase the rate of growth of farm animals and increase the weight and amount of eggs, it is used in the treatment of achlorhydria, atherosclerosis and hepatic diseases[176]. Haemostatic[174].

propta Seed - sow early spring in a greenhouse. Germination is usually good and fairly quick. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse for their first winter. Plant out in late spring or early summer. Pinch out the shoot tips of the young plants in order to encourage bushy growth[78]. Cuttings of half-ripe wood, 5 - 10cm with a heel if possible, July/August in individual pots in a frame. Good percentage[78]. Cuttings of mature wood of the current season's growth, autumn to late winter in a cold frame. High percentage[78, 200]. Division of suckers in late winter. Very easy, the suckers can be planted out direct into their permanent positions. Layering.

nwatta An easily grown plant, it does not require a rich soil, flowering and fruiting better in a well-drained soil of moderate quality[1, 11, 200]. Succeeds in impoverished soils[200]. Requires a sunny position[200]. Tolerates maritime exposure[200]. A very hardy plant, tolerating temperatures down to about -23°C[200]. This species is widely cultivated for its edible young shoots in China. There is much confusion between this species and the closely related *L. barbarum*. Most, if not all, of the plants being grown as *L. chinense* in Britain are in fact *L. barbarum*[11, 50, 200].

## 6.2.50 Abelmoschus esculentus

Okra

5 tlin 11 cyuc 4 kcaak 2 tcan 3 dwat 1 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwlisslip hpa7tmwatli xre7t hjonli

drutta Abelmoschus esculentus is an ANNUAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Fruit Leaves Oil Root SeedEdible Uses: Coffee Oil PectinImmature fruit - cooked on their own or added to soups etc[2, 27]. They can be used fresh or dried[183]. Mucilaginous[133], they are commonly used as a thickening for soups, stews and sauces[183]. The fruits are rich in pectin and are also a fair source of iron and calcium[240]. The fresh fruits contain 740 iu vitamin A[240]. The fruit should be harvested whilst young, older fruits soon become fibrous[133]. The fruit can be up to 20cm long[200]. Seed - cooked or ground into a meal and used in making bread or made into 'tofu' or 'tempeh'[183]. The roasted seed is a coffee substitute[2, 27, 133]. Probably the best of the coffee substitutes[74]. The seed contains up to 22% of an edible oil[55, 74, 177, 183, 240]. The leaves, flower buds, flowers and calyces can be eaten cooked as greens[183]. The leaves can be dried, crushed into a powder and stored for later use[183]. They are also used as a flavouring[133]. Root - it is edible but very fibrous[144]. Mucilaginous, without very much flavour[144].

tcanta Fibre Oil Paper Pectin SizeA fibre obtained from the stems is used as a substitute for jute[57, 61, 74, 169]. It is also used in making paper and textiles[171]. The fibres are about 2.4mm long[189]. When used for paper the stems are harvested in late summer or autumn after the edible seed-pods have been harvested, the leaves are removed and the stems are steamed until the fibres can be stripped off. The fibres are cooked for 2 hours with lye and then put in a ball mill for 3 hours. The paper is cream coloured[189]. A decoction of the root or of the seeds is used as a size for paper[178].

dwatta Antispasmodic Demulcent Diaphoretic Diuretic Emollient Stimulant VulneraryThe roots are very rich in mucilage, having a strongly demulcent action[4, 21]. They are said by some to be better than marsh mallow (*Althaea officinalis*)[4]. This mucilage can be used as a plasma replacement[240]. An infusion of the roots is used in the treatment of syphilis[240]. The juice of the roots is used externally in Nepal to treat cuts, wounds and boils[272]. The leaves furnish an emollient poultice[4, 21, 240]. A decoction of the immature capsules is demulcent, diuretic and emollient[240]. It is used in the treatment of catarrhal infections, ardor urinae, dysuria and gonorrhoea[240]. The seeds are antispasmodic, cordial and stimulant[240]. An infusion of the roasted seeds has sudorific properties[240].

propta Seed - sow early spring in a warm greenhouse. The seed germinates in 27 days at 15°C or 6 days at 35°C[133]. When large enough to handle, prick them out into individual pots and plant them out after the last expected frosts[200].

nwatta Industrial Crop: Fiber Management: Cop-pice Management: Standard Regional Crop Staple Crop: Protein-oilPrefers a well-drained humus rich fertile soil in full sun and a pH around 6 to 6.7[200] but it tolerates a wide range of soil types and pH from 5.5 to 8[200]. It prefers a soil with a high potash content[264]. The plant requires a warm sunny position sheltered from winds[200]. It likes plenty of moisture, both in the soil and in the atmosphere[133]. Okra is commonly cultivated in warm temperate and tropical areas for its edible seedpod, there are many named varieties[183, 200]. Most cultivars require about 4 months from sowing before a crop is produced, though some early maturing varieties can produce a crop in 50 days in the tropics[264]. This species is not very hardy in Britain, it sometimes succeeds outdoors in hot summers but is really best grown in a greenhouse since it prefers daytime temperatures of 25°C or more[260]. Plants also dislike low night temperatures[133]. There are some early-maturing varieties that are more tolerant of cooler temperate conditions and these could be tried outdoors[200]. These include 'Clemson's Spineless', 'Emerald Spineless', 'Long Green' and 'Green Velvet'[200]. The flowers are much visited by bees but they may require syringing in order to improve fertilization when plants are grown in a greenhouse. Plants resent being transplanted[133].

## 6.2.51 Gaylussacia baccata

Black Huckleberry

5 tlin 9 cyuc 4 kcaak 0 tcan 1 dwat 1 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta Gaylussacia baccata is a deciduous Shrub growing to 1 m (3ft 3in) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to June. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[2, 3, 55]. Deliciously spicy and sweet, they can be eaten out of hand or used in pies, preserves etc[183]. They can also be dried for later use[62]. The dried fruit can be ground into a powder then mixed with cereal flours to make bread[257]. The fruit is rather seedy[235]. The fruit is about 8mm in diameter[200].

tcanta MiscellanyNone known

dwatta Astringent Dysentery MiscellanyAn infusion of the leaves, or the bark, has been used in the treatment of dysentery[257]. An infusion of the leaves has been used in the treatment of Bright's disease[257].

neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

**kcakta Edible Parts:** Flowers Fruit**Edible Uses:** Fruit - raw or cooked[145]. A well-flavoured fruit, it has a sweet taste with a blend of acid, though there is a slight bitterness caused by the seeds[194, K]. The fruit is much liked by children[194, K]. It is dried and used like raisins in India[2, 3, 177, 183]. The fruit contains about 2.3% protein, 12% sugars, 2% ash, 0.6% tannin, 0.4% pectin[194]. There is 4.6mg vitamin C per 100ml of juice[194]. The fruit is about 7mm x 4mm[194] - it can be up to 10mm long[200]. Plants in the wild yield about 650g of fruit in 4 pickings[194]. Flower buds - added to sauces[177, 183].

**tcanta Dye Fuel Tannin**A yellow dye is obtained from the root and the stem[46, 61, 272]. An important source of dyestuff and tannin, it is perhaps one of the best tannin dyes available in India[194]. The wood is used as a fuel[146]. The spiny branches are used for making fencing around fields[272].

**dwatta Alternative Antibacterial Antiperiodic Bitter Cancer Deobstruent Diaphoretic Dysentery Laxative Malaria Ophthalmic Tonic Vitamin C**The dried stem, root bark and wood are alternative, antiperiodic, deobstruent, diaphoretic, laxative, ophthalmic and tonic (bitter)[46, 61, 158, 194, 240]. An infusion is used in the treatment of malaria, eye complaints, skin diseases, menorrhagia, diarrhoea and jaundice[240, 243]. Berberine, universally present in rhizomes of Berberis species, has marked antibacterial effects. Since it is not appreciably absorbed by the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not be used with Glycyrrhiza species (Licuorice) because this nullifies the effects of the berberine[218]. Berberine has also shown antitumour activity[218].

**propta Seed** - best sown as soon as it is ripe in a cold frame, it should germinate in late winter or early spring[78]. Seed from over-ripe fruit will take longer to germinate[78]. Stored seed may require cold stratification and should be sown in a cold frame as early in the year as possible[80]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse or cold frame for at least their first winter. Once they are at least 20cm tall, plant them out into their permanent positions in late spring or early summer, after the last expected frosts. The seedlings are subject to damping off, so be careful not to overwater them and keep them well ventilated[113]. Cuttings of half-ripe wood, July/August in a frame. Very difficult, if not impossible. Cuttings of mature wood of the current season's growth, preferably with a heel, October/November in a frame[78]. Very difficult, if not impossible.

**nwatta** Prefers a warm moist loamy soil and light shade but it is by no means fastidious, succeeding in thin, dry and shallow soils[11, 200]. Grows well in heavy clay soils. Plants are very hardy, they survived the severe winters of 1986-1987 without problems in most areas of Britain[K]. Plants can be pruned back quite severely and resprout well from the base[200]. The fruits are sometimes sold in local markets in India[194]. Hybridizes freely with other members of this genus[1]. Most plants cultivated under this name are *B. chitria*, *B. coriaria*, *B. glaucocarpa*. and, more commonly, *B. floribunda*[67, 200].

## 6.2.48 Hydrangea serrata amagiana

5 tlin 9 cyuc 4 kcaak 2 tcan 0 dwat 2 m hkc hmimhtut cyuti tcup hwicli hrasjltunyk hpa7tli frusflatprklwis hpa7tmwatli xre7t hjonli

**drutta** Hydrangea serrata amagiana is a deciduous Shrub growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

**kcakta Edible Parts:** Leaves**Edible Uses:** SweetenerThe young leaves, even without fermentation[174], are very

sweet and are used to make a sweet tea called 'tea of heaven', it is used in Buddhist ceremonies[174]. The leaves contain phellodulcin (its chemical formula is C16 H14 O), a very sweet substance that can be used as a sugar substitute[174]. The older leaves can be dried, powdered and used as a flavouring on foods[174]. The young leaves and shoots are also eaten cooked[174].

**tcanta Hedge Hedge**Can be grown as a low hedge[29], it is quite wind tolerant.

**dwatta None known propta Seed** - surface sow in a greenhouse in spring[113]. Cover the pot with paper until the seed germinates[78]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 8cm long, July/August in a frame. Overwinter in a greenhouse and plant out in late spring[78]. Cuttings of mature wood in late autumn in a frame[200]. Mound layering in spring. Takes 12 months[78]. Leaf-bud cuttings of the current seasons growth in a frame[200].

**nwatta** Tolerates most soil[200], thriving in a well-drained loamy soil[1], but resenting dryness at the roots[11, 200]. Succeeds in full sun or semi-shade[200], but if it is grown in a low rainfall area then it requires shade at the hottest part of the day[11]. Does well on very acid soils with a pH around 4.5[200]. The colour of the flowers reflects the pH of the soil the plant is growing in, the flowers are pink in a neutral to alkaline soil and blue in an acid soil. Best grown in an acid soil, doing well on very acid soils (pH 4.5). There is some confusion over the correct name for this plant. We have used the name in [174] but the Flora of Japan[58] says that the correct name is *H. macrophylla angustata*. Plants are hardy to about -25°C when dormant[200], but the young growth in spring can be killed by late frosts[K]. This species is notably susceptible to honey fungus[200].

## 6.2.49 Lycium chinense

Chinese Boxthorn, Chinese desert-thorn

5 tlin 9 cyuc 4 kcaak 3 tcan 3 dwat 2.5 m hkc htut cyuti tcup hwicli hyhshrasjltunyk hpa7tli flatprklwis hpa7tmwatli xre7t hjonli

**drutta** Lycium chinense is a deciduous Shrub growing to 2.5 m (8ft) by 2 m (6ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerate maritime exposure.

**kcakta Edible Parts:** Fruit Leaves Seed Shoots**Edible Uses:** Coffee TeaFruit - raw, cooked in soups etc or dried for later use[174, 178, 183]. Sweet with an aniseed-like flavour[183]. The fruit is an oblong berry about 15mm long by 8mm wid[266]. Only the fully ripe fruits should be eaten[K]. Leaves and young shoots - raw or cooked[61, 174, 178]. A peppermint-like flavour, the leaves are used in salads or used as a potherb[183]. Rich in vitamin A, the leaves also contain about 3.9% protein, 2.25% carbohydrate, 0.7% fat, 1.4% ash[179]. The roasted seed is a coffee substitute[183]. The dried leaves are a tea substitute[183].

**tcanta Hedge Hedge** Soil stabilizationCan be grown as an informal hedge, succeeding in maritime exposure[200]. Plants have an extensive root system and can be planted to stabilize banks[200].

**dwatta** Antibacterial Antipyretic Cancer Haemostatic Hepatic Hypoglycaemic Infertility Kidney Ophthalmic Tonic VasodilatorChinese boxthorn is a major Chinese tonic herb with a history of almost 2,000 years of medicinal use[254]. Both the berries and the root are used and traditionally the plant is believed to promote long life[254]. The fruit is one of the most popular tonics used in Chinese herbal medicine[176, 218]. A decoction is used to clear the vision, strengthen the kidneys, restore semen and nourish the liver[147]. The fruit protects the liver from damage caused by exposure to toxins[254]. It is also used in the treatment of diabetes mellitus, vertigo, nocturnal emissions and aching

**kcakta Edible Parts:** Inner bark Seed**Edible Uses:** CondimentSeed - the oily seed kernel is eaten raw, roasted, ground into a powder for making bread, cakes etc or made into a nut butter[1, 2, 11, 34, 62, 63, 92, 94, 183]. An excellent flavour[227]. A good size, the seeds are up to 15mm long[200]. Said to be the highest in protein and lowest in starch of all the piñons[183]. The seed contains about 14.6% protein, 62% fat. 17.3% carbohydrate[85]. This species provides a major source of seeds for sale in Mexico[229]. Inner bark - only used in times of dire need[85]. There are no more details but inner bark is often dried, ground into a powder and then used as a thickener in soups etc or added to cereals when making bread. A vanillin flavouring is obtained as a by-product of other resins that are released from the pulpwood[200].

**tcanta Adhesive Dye Herbicide Pitch Wood**A tan or green dye is obtained from the needles[168]. The needles contain a substance called terpene, this is released when rain washes over the needles and it has a negative effect on the germination of some plants, including wheat[201]. A gum pitch is used as a glue for waterproofing and repairing pottery[117, 227]. Oleo-resins are present in the tissues of all species of pines, but these are often not present in sufficient quantity to make their extraction economically worthwhile[64]. The resins are obtained by tapping the trunk, or by destructive distillation of the wood[4, 64]. In general, trees from warmer areas of distribution give the higher yields[64]. Turpentine consists of an average of 20% of the oleo-resin[64] and is separated by distillation[4, 64]. Turpentine has a wide range of uses including as a solvent for waxes etc, for making varnish, medicinal etc[4]. Rosin is the substance left after turpentine is removed. This is used by violinists on their bows and also in making sealing wax, varnish etc[4]. Pitch can also be obtained from the resin and is used for waterproofing, as a wood preservative etc. Wood - soft, light, close-grained[82]. Somewhat fragrant when burnt[227]. Used for fuel and posts, but rarely for lumber[227].

**dwatta Poulitice**The gum exuding from damaged areas of the tree is used to treat sore throats[92, 117]. The turpentine obtained from the resin of all pine trees is antiseptic, diuretic, rubefacient and vermifuge[4]. It is a valuable remedy used internally in the treatment of kidney and bladder complaints and is used both internally and as a rub and steam bath in the treatment of rheumatic affections[4]. It is also very beneficial to the respiratory system and so is useful in treating diseases of the mucous membranes and respiratory complaints such as coughs, colds, influenza and TB[4]. Externally it is a very beneficial treatment for a variety of skin complaints, wounds, sores, burns, boils etc and is used in the form of liniment plasters, poultices, herbal steam baths and inhalers[4].

**propta** It is best to sow the seed in individual pots in a cold frame as soon as it is ripe if this is possible otherwise in late winter. A short stratification of 6 weeks at 4°C can improve the germination of stored seed[80]. Plant seedlings out into their permanent positions as soon as possible and protect them for their first winter or two[11]. Plants have a very sparse root system and the sooner they are planted into their permanent positions the better they will grow[K]. Trees should be planted into their permanent positions when they are quite small, between 30 and 90cm[200]. We actually plant them out when they are about 5 - 10cm tall. So long as they are given a very good weed-excluding mulch they establish very well[K]. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200]. Cuttings. This method only works when taken from very young trees less than 10 years old. Use single leaf fascicles with the base of the short shoot. Disbudding the shoots some weeks before taking the cuttings can help. Cuttings are normally slow to grow away[81].

**nwatta** Management: Standard Regional Crop Staple Crop: Protein-oilLandscape Uses:Pest tolerant, Screen, Specimen. Thrives in a light well-drained sandy or gravelly loam[1, 11]. Dislikes poorly drained moorland soils[1]. Established plants tolerate drought, succeeding in hot, dry positions[200]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°C[200]. Leaf secretions inhibit the germination of seeds, thereby inhibiting the growth of other plants below the tree[18]. A slow growing plant[81, 120], it takes 25 years

from seed before cones are formed[117]. The tree takes 250 - 350 years to reach full maturity[181]. The cones open and shed their seed whilst still attached to the tree[226]. Plants are strongly outbreeding, self-fertilized seed usually grows poorly[200]. They hybridize freely with other members of this genus[200]. This species is sometimes held to include a number of very similar species which are here treated as separate entities[81, 82]. See *P. edulis*, *P. monophylla* and *P. quadrifolia*. These species differ mainly in the number of leaves in a bundle[1]. The sub-species *P. cembroides* *orizabensis*. D. Baill. has larger seeds than the type[200]. Plants in this genus are notably susceptible to honey fungus[200]. Special Features: Attracts birds, North American native, Inconspicuous flowers or blooms.

## 6.2.37 Cydonia oblonga

Quince

5 tlin 9 cyuc 4 kcaak 3 tcan 2 dwat 7.5 m hkc pcimhmimhtut cyuti tcup hwicli hrasjltunyk hpa7tli flatprklwis hpa7tmwatli xre7t hjonli

**drutta** Cydonia oblonga is a deciduous Tree growing to 7.5 m (24ft) by 7 m (23ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower in May, and the seeds ripen in November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

**kcakta Edible Parts:** Flowers Fruit**Edible Uses:** Drink Gum Pectin PectinFruit - raw or cooked[4]. When grown in warm temperate or tropical climates, the fruit can become soft and juicy and is suitable for eating raw[4]. In cooler climates such as Britain, however, it remains hard and astringent and needs to be cooked before being eaten[4]. It is used in jellies, preserves etc[9, 183]. The cooked fruit adds a delicious flavour to cooked apples[3, 37, 46, 61]. Strongly aromatic with a firm but rather gritty flesh[200]. The fruit is rich in pectin[200]. The fruit is about 10m long and 9cm wide, tapering to the stalk[200]. A nutritional analysis is available[218]. A drink can be made by adding the dried crushed seed to water, simmering for 5 minutes and sweetening to taste[183]. Flowers[183]. No further details are given.

**tcanta Gum Pectin Pectin Rootstock** SizeA mucilage obtained from the seed coat is used as a gum arabic substitute to add gloss to material[61, 74]. The seed contains 20% mucilage and 15% fatty oils[74]. The fruit is rich in pectin[200]. Pectin is said to protect the body against radiation[201]. The leaves contain 11% tannin[240].

**dwatta** Antiinflammatory Antivinous Astringent Cardiac Carminative Demulcent Digestive Diuretic Emollient Expectorant Hypotensive Laxative Pectoral Refrigerant Restorative Stimulant TonicThe stem bark is astringent, it is used in the treatment of ulcers[218]. The seed is a mild but reliable laxative, astringent and anti-inflammatory[9]. When soaked in water, the seed swells up to form a mucilaginous mass. This has a soothing and demulcent action when taken internally[4] and is used in the treatment of respiratory diseases, especially in children[240]. This mucilage is also applied externally to minor burns etc[9]. The fruit is antivinous, astringent, cardiac, carminative, digestive, diuretic, emollient, expectorant, pectoral, peptic, refrigerant, restorative, stimulant and tonic[4, 9, 46, 218]. The unripe fruit is very astringent, a syrup made from it is used in the treatment of diarrhoea and is particularly safe for children[4, 254]. The fruit, and its juice, can be used as a mouthwash or gargle to treat mouth ulcers, gum problems and sore throats[254]. The leaves contain tannin and pectin[240]. Tannin can be used as an astringent whilst pectin has a beneficial effect on the circulatory system and helps to reduce blood pressure[K].

**propta** Seed - probably best sown in a cold frame as soon as it is ripe[K], it can also be sown in February[78]. It requires stratification[98], pre-chill the seed for 18 weeks if it is fresh, whilst old seed will require 2 weeks of warm stratification first and then 18 weeks cold treatment[164]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the cold frame for at least their first winter. Plant them out into their permanent

positions in late spring or early summer, after the last expected frosts. Cuttings of mature wood, November in a cold frame[3, 37]. Layering in spring. Takes 1 year[78]. Suckers, removed in spring[200].

nwatta Succeeds in most soils but prefers a light moist fertile soil and a sunny position[3, 37, 200]. Dislikes very dry or waterlogged soils[202]. Succeeds in semi-shade but does not fruit so well in such a position[202]. Plants also tolerate quite deep shade[219], though they will often not fruit at all in such a position[K]. Plants are hardy to about -15°C[202], though the fruit seldom ripens in the north of Britain unless it is grown against a sunny wall[4]. The quince has been cultivated for over two thousand years for its edible fruit and its seed, though it is not a widely grown crop[4, 46, 61, 132]. It is also much used as a dwarfing rootstock for pears and some other fruits[200]. There are some named varieties[200]. Plants require warm summers in order to fully ripen their fruit[200]. The var. 'Maliformis' ripens well in cooler summers[200]. The plant is heat tolerant in zones 9 through 3. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2]. The root pattern is flat with shallow roots forming a plate near the soil surface [1-2].

## 6.2.38 Mespilus germanica

Medlar  
5 tlin 8 cyuc 4 kcaak 1 tcan 1 dwat 6 m hkuc  
hmimhtut cyutil tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli fyixre7t hjonli

drutta Mespilus germanica is a deciduous Tree growing to 6 m (19ft) by 6 m (19ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from May to June, and the seeds ripen in November. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcaakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[2, 3, 5, 7, 12]. The fruit does not always ripen fully in cooler temperate zones such as Britain. However it can be harvested in late autumn (preferably after it has had some frost) whilst still hard and then needs to be bletted before it can be eaten raw. This entails storing it, stalk end up wards, in a cool place for a short while until it is on the point of (but not quite) rotting[200], a state described as incipient decay. At this stage the flesh turns from white to brown, becomes very soft and is quite sweet with an absolutely delicious flavour that somewhat resembles a luscious tropical fruit[K]. The fruit of the wild species is up to 25mm in diameter, though some cultivars can be 65mm or more in diameter[200].

tcanta WoodWood - hard, flexible[100].

dwatta Astringent LaxativeThe pulp of the fruit is laxative[7]. The leaves are astringent[7]. The seed is lithontripic[7]. It is ground up for use, but caution should be employed since the seeds contain the toxin hydrocyanic acid[7]. The bark has been used as a substitute for quinine, but with uncertain results[7].

propta Seed - best sown as soon as it is ripe in late autumn in a cold frame[78]. The seed has a very hard and impermeable seedcoat and will not usually germinate until it has gone through two winters. Commercially, such seeds are soaked for a short while in sulphuric acid to break down the seed coat and allow the seed to take up moisture, this is a

very delicate procedure and difficult to do on a small scale. A home gardener could try soaking the seed for 24 hours in warm water then cold stratifying it for 2 - 3 months at 1 - 5°C before sowing it. Alternatively, if you can harvest the seed green (as soon as it is mature but before the seed coat has dried and hardened), then sow it immediately in a cold frame you might reduce the time needed for it to germinate. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the cold frame for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of mature wood, November in a cold frame. Poor percentage. Layering in autumn or early spring. Takes 18 months[78].

nwatta Succeeds in most soils[11], preferring one that is moist and well-drained[1, 37, 200]. Prefers a sunny position[1, 3] and a fertile soil[188]. Occasionally cultivated for its edible fruit, there are some named varieties[183, 200]. The plant is heat tolerant in zones 9 through 6. (Plant Hardness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

## 6.2.39 Humulus lupulus

Hop, Common hop, European Hop,  
5 tlin 7 cyuc 4 kcaak 3 tcan 5 dwat 6 m hkuc  
hmimhtut cyutil hqatkyuctcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

drutta Humulus lupulus is a PERENNIAL CLIMBER growing to 6 m (19ft 8in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from July to August, and the seeds ripen from September to October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcaakta Edible Parts: Leaves Root ShootsEdible Uses: Drink Rutin TeaYoung leaves and young shoots - cooked[2, 4, 5, 7, 9, 33, 37]. The flavour is unique and, to many tastes, delicious[183]. Young leaves can be eaten in salads[1, 183]. Use before the end of May[12]. The leaves contain rutin[218]. The fleshy rhizomes are sometimes eaten[183]. A tea is made from the leaves and cones[183]. It has a gentle calming effect[4]. The dried flowering heads of female plants are used as a flavouring and preservative in beer[2, 183]. They are also medicinal[2]. The flowering heads are sprinkled with bitter-tasting yellow translucent glands, which appear as a granular substance[4]. This substance prevents gram-negative bacteria from growing in the beer or wort[269]. Much of the hop's use as a flavouring and medicinal plant depends on the abundance of this powdery substance[4]. The seeds contain gamma-linolenic acid, an essential fatty acid that is said to have many important functions in the human body and is rarely found in plant sources[218]. The essential oil in the flowering heads is used as a flavouring in cereal beverages and mineral waters[269]. Extracts from the plant, and the oil, are used as flavouring in non-alcoholic

drutta Prunus angustifolia watsonii is a deciduous Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Fruit SeedEdible Uses: Fruit - raw or cooked[1, 11]. An acid taste, the fruit is often used for making preserves, pies etc[183]. A reasonable size, it is about 14mm x 9mm and contains a single large seed[200]. Seed - raw or cooked. Do not eat the seed if it is too bitter - see the notes above on toxicity.

tcanta DyeA green dye can be obtained from the leaves[168]. A dark grey to green dye can be obtained from the fruit[168]. Wood - heavy, rather soft, not strong[82]. It weighs 43lb per cubic foot[235] and is of little commercial value[229].

dwatta Although no specific mention has been seen for this species, all members of the genus contain amygdalin and prunasin, substances which break down in water to form hydrocyanic acid (cyanide or prussic acid). In small amounts this exceedingly poisonous compound stimulates respiration, improves digestion and gives a sense of well-being[238].

propta Seed - requires 2 - 3 months cold stratification and is best sown in a cold frame as soon as it is ripe[200]. Sow stored seed in a cold frame as early in the year as possible[200]. Protect the seed from mice etc. The seed can be rather slow, sometimes taking 18 months to germinate[113]. Prick out the seedlings into individual pots when they are large enough to handle. Grow them on in a greenhouse or cold frame for their first winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood with a heel, July/August in a frame[11, 200]. Softwood cuttings from strongly growing plants in spring to early summer in a frame[200]. Layering in spring.

nwatta Thrives in a well-drained moisture-retentive loamy soil[1, 200]. Prefers some lime in the soil but is likely to become chlorotic if too much lime is present[1]. Succeeds in sun or partial shade though it fruits better in a sunny position[11, 200]. Unlike the type species, this sub-species thrives in Britain[11]. The flowers, which appear just before the leaves unfold, have a refreshing fruity scent[245]. Most members of this genus are shallow-rooted and will produce suckers if the roots are damaged[238]. Plants in this genus are notably susceptible to honey fungus[200]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a running thicket former forming a colony from shoots away from the crown spreading indefinitely [1-2]. The root pattern is suckering with new plants from underground runners away from the plant [1-2].

## 6.2.46 Hibiscus syriacus

Rose Of Sharon, Althaea, Shrub Althaea, Hardy Hibiscus  
5 tlin 9 cyuc 4 kcaak 2 tcan 2 dwat 3 m hkuc  
hmimhtut cyutil tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Hibiscus syriacus is a deciduous Shrub growing to 3 m (9ft) by 2 m (6ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in September, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Flowers Leaves Oil RootEdible Uses: Oil TeaYoung leaves - raw or cooked[2, 177, 179, 183]. A very mild flavour, though slightly on the tough side, they make an acceptable addition to the salad bowl[K]. A tea is made from the leaves[2, 177, 240] or the flowers[183]. Flowers - raw or cooked[74, 105, 183]. A mild flavour and mucilaginous texture, they are delightful in salads, both for looking at and for eating[K]. Root - it is edible but very fibrous[144]. Mucilaginous, without very much flavour[144].

tcanta Dye Fibre Hair Hedge Hedge OilA low quality fibre is obtained from the stems. It is used for making cordage and paper[74]. The seed contains about 25% oil[74]. No further details are given, but it is likely to be edible. A hair shampoo is made from the leaves[74]. A blue dye is obtained from the flowers[168]. This species is planted as a hedge in S. Europe[50].

dwatta Anthelmintic Antiphlogistic Antipruritic Demulcent Diuretic Dysentery Emollient Expectorant Febrifuge Ophthalmic Skin Stomachic StypticThe leaves are diuretic, expectorant and stomachic[218, 240]. A decoction of the flowers is diuretic, ophthalmic and stomachic[147, 178, 218]. It is also used in the treatment of itch and other skin diseases[240], dizziness and bloody stools accompanied by much gas[147]. The bark contains several medically active constituents, including mucilage, carotenoids, sesquiterpenes and anthocyanidins[279]. A decoction of the root bark is antiphlogistic, demulcent, emollient, febrifuge, haemostatic and vermifuge[218, 240]. It is used in the treatment of diarrhoea, dysentery, abdominal pain, leucorrhoea, dysmenorrhoea[240, 279] and dermatophytosis[147].

propta Seed - sow early spring in a greenhouse. Germination is usually fairly quick. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse for their first year. Plant them out into their permanent positions in late spring or early summer. Some reports say that the seed can be sown in situ outside and that it gives a good rate of germination[78, 80, 113]. Cuttings of half-ripe wood, July/August in a frame. Good percentage[113]. Cuttings of mature wood, early autumn in a frame. Good percentage[113]. Layering in mid summer to early autumn[1].

nwatta Landscape Uses:Border, Container, Foundation, Standard, Seashore, Specimen. Prefers a well-drained humus rich fertile soil in a sheltered position in full sun[200]. Succeeds in any soil of good or moderate quality[111]. Dislikes shade or badly drained soils[111]. Plants grow best with their roots in cool moist soil and their tops in a hot sunny position. This species is hardy to about -20°C[200] but plants only really succeed in the warmer counties of Britain because of their late flowering habit[184]. When planted in colder areas of the country, they will need protection for the first few winters[200]. The flowers only open in sunny weather[219]. Plants rarely require pruning[219], though they respond well to pruning and trimming and this is best carried out in the spring or just after flowering[219]. Plants are late coming into leaf, usually around the end of May or early June[182]. A very ornamental plant[1], there are many named varieties[182]. Special Features:Attracts birds, Not North American native, Naturalizing, Attracts butterflies, Blooms are very showy. The plant is heat tolerant in zones 9 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is multistemmed with multiple stems from the crown [1-2].

## 6.2.47 Berberis aristata

Chitra, Indian Barberry or Tree Turmeric  
5 tlin 9 cyuc 4 kcaak 3 tcan 3 dwat 3.5 m hkuc  
hmimhtut cyutil kyuctcup hwicli hyishrasljutnyikrip hpa7tli flatprikliwis hpa7tmwatli fyixre7t hjonli

drutta Berberis aristata is an evergreen Shrub growing to 3.5 m (11ft 6in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in leaf all year, in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid,

string[61, 82, 227, 257]. The seed has insecticidal properties[222]. A yellow dye is made from the ripe flesh of the fruit[229]. Wood - light, soft, weak, spongy, coarse grained[82]. It weighs 24lb per cubic foot[227]. It is not used commercially[229]. Landscape Uses: Border, Pest tolerant, Specimen, Woodland Forest garden - a good understory tree. Shelter for wildlife [1-2].

dwatta Antiemetic Diuretic Emetic Laxative Narcotic ParasiticideThe fruit is used as a laxative[222]. The leaves are diuretic[222]. They are applied externally to boils, ulcers and abscesses[4, 222]. The seed contains the alkaline asininine, which is emetic and narcotic[222, 227]. They have been powdered and applied to hair to kill lice[222]. The bark is a bitter tonic[4]. It contains the alkaline anolabine, which is used medicinally[227].

propta Seed - best sown as soon as it is ripe in a cold frame[200]. The seed usually germinates in 1 - 3 months at 15°C[134]. Stored seed requires stratification, it has embryo dormancy and an impermeable seedcoat and can take up to 18 months to germinate[113, 134]. Dried seed quickly loses its viability. As soon as the seedlings are large enough to handle, prick them out into individual pots and grow them on in the greenhouse for a least their first winter. If trying them outdoors, plant them into their permanent positions in early summer once the plants are more than 15cm tall. Consider giving them some protection from winter cold for their first winter outdoors. Layering.

nwatta Pawpaw is a forest understory tree. Prefers a rich loamy soil with plenty of moisture and a sunny position[1, 134, 160]. Full sun to part shade. Pawpaw is shade tolerant and would prefer some afternoon shade from other trees or perhaps the shade of a building. Spreads by root suckers to form colonies, so give it room to spread (nfs.unl.edu). Plants are hardy to about -20°C according to one report[184], whilst another says that they are hardy to -35°C when fully dormant[160]. The papaw produces a delicious edible fruit which is a potentially commercial crop[61]. The wild-collected fruit is often sold in local markets in America[82]. The tree commences bearing in 4 - 6 years from seed and yields up to 30 kilos per tree[160]. There are some named varieties[183]. The mature fruit is rarely seen in Britain[182], only ripening after a long hot summer[200]. A small tree growing against a south-facing wall at Bristol Botanical Gardens had a small crop of immature fruit in early September 1996 (following the hot summer of 1995) - this was the first time it had been seen to bear fruit[K]. Flowers are formed in the leaf axils of wood produced the previous summer[82, 229]. Established plants resent root disturbance, the best plants are obtained by planting them out into their permanent positions as young as possible though young plants should be given some protection for their first year or two[200]. The leaves emit a heavy unpleasant odour when crushed[82, 229]. Plants are untroubled by pests or diseases[160]. Special Features:North American native, Attracts butterflies, Inconspicuous flowers or blooms. The plant is heat tolerant in zones 8 through 6. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1). For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is suckering with suckers sent up away from the trunk from rhizomes, roots, or stolons [1-2]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The root pattern is a heart root, dividing from the crown into several primary roots going down and out [1-2]. The root pattern is a tap root similar to a carrot going directly down [1-2]. The root pattern is suckering with new plants from underground runners away from the plant [1-2]. Form: Rounded, Upright or erect. Flowers are strongly protogynous, self-incompatible and require cross-pollination. However, some trees may be self-compatible; it is an excellent idea to plant two or more

trees for cross-pollination.

## 6.2.44 Smilax china

China Root  
5 tlin 9 cyuc 4 kcaak 0 tcan 3 drwat 4.5 m hkuc  
hmimhtut cyutiit tcup hwicli hrasjlutnyik hpa7tli flatprikliw  
hpa7tmwattli nyanhjen hjonli

drudda Smilax china is a deciduous Climber growing to 4.5 m (14ft 9in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in May, and the seeds ripen in October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required) . The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Fruit Leaves RootEdible Uses: Rutin TeaRoot - cooked[4, 105, 177]. Rich in starch[2], the large and fleshy roots can be dried and ground into a powder[11]. The root is harvested by severing larger roots near the crown and leaving the smaller roots to grow on[238]. Young shoots and leaves - raw or cooked[105, 159, 177, 179]. Used as a potherb[183]. The leaves are said to contain rutin, but no details of quantity were given[218]. Fruit - raw. Eaten to quench the thirst[105, 177, 183]. The fruit is about 9mm in diameter[200]. A tea is made from the leaves[177, 179, 183].

tcanta DyeA yellow dye is made from the root and leaves when alum is used as a mordant[4, 178]. With iron sulphate, the colour is brown[4].

dwatta Alterative Antipsoriatic Antiscrophulatic Carmi-native Depurative Diaphoretic Diuretic Skin Tonic Urinary VDThe root is alterative, antiscrophulatic, carminative, depurative, diaphoretic, diuretic and tonic[1, 4, 11, 147, 174, 178, 218]. It is considered useful when taken internally in the treatment of old syphilitic cases and is also used for certain skin diseases, including psoriasis, rheumatoid arthritis, gout, enteritis, urinary tract infections, skin ulcers etc[4, 238]. Large doses can cause nausea and vomiting, which is valuable in weakened and depraved conditions due to a poisoned state of the blood[4]. The root is harvested in the autumn and dried for later use.

propta Seed - sow March in a warm greenhouse[1]. This note probably refers to the tropical members of the genus, seeds of plants from cooler areas seem to require a period of cold stratification, some species taking 2 or more years to germinate[K]. We sow the seed of temperate species in a cold frame as soon as we receive it, and would sow the seed as soon as it is ripe if we could obtain it then[K]. When the seedlings eventually germinate, prick them out into individual pots when they are large enough to handle and grow them on in the greenhouse for at least their first year, though we normally grow them on in pots for 2 years. Plant them out into their permanent positions in early summer. Division in early spring as new growth begins[238]. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer. Cuttings of half-ripe shoots, July in a frame[238].

nwatta Succeeds in most well-drained soils in sun or semi-shade[200]. Hardy to about -15°C[200]. A climbing plant, supporting itself by means of tendrils and thorns as it scrambles through small trees and shrubs. A young plant is growing and thriving close to a west-facing wall at Kew Botanical gardens[K]. This species is not the true 'China root' of medicine, see the record for *S. pseudo-china*[178]. Dioecious. Male and female plants must be grown if seed is required.

## 6.2.45 Prunus angustifolia watsonii

Sand Plum  
5 tlin 9 cyuc 4 kcaak 2 tcan 1 dwat 3 m hkuc  
hmimhtut cyutiit tcup hwicli hrasjlutnyik hpa7tli flatprikliw  
hpa7tmwattli xre7t hjonli

beverages, frozen dairy desserts, candy, baked goods and puddings, with the highest average maximum use level of 0.072% reported for an extract used in baked goods[269].

tcanta Dye Essential Fibre PaperA fine brown dye is obtained from the leaves and flower heads[4, 100, 269]. An essential oil from the female fruiting heads is used in perfumery[213, 238]. Average yields are 0.4 - 0.5%[240]. Extracts of the plant are used in Europe in skin creams and lotions for their alleged skin-softening properties[269]. A fibre is obtained from the stems[46]. Similar to hemp (*Cannabis sativa*)[100] but not as strong[115], it is used to make a coarse kind of cloth[4]. It is sometimes used for filler material in corrugated paper or board products, but is unsuited for corrugated paper because of low pulp yield and high chemical requirement, or for production of high-grade pulp for speciality paper[269]. The fibre is very durable but it is difficult to separate, the stems need to be soaked beforehand for a whole winter[4]. A paper can also be made from the fibre, the stems are harvested in the autumn, the leaves removed and the stems steamed until the fibres can be removed. The fibre is cooked for 2 hours with lye and then hand pounded with mallets or ball milled for 2½ hours. The paper is brown in colour[189].

dwatta Anodyne Antianxiety Antibacterial Antiseptic Antispasmodic Appetizer Diuretic Dysentery Febrifuge Galactogogue Hypnotic Leprosy Nerve Sedative Stomachic TonicHops have a long and proven history of herbal use, where they are employed mainly for their soothing, sedative, tonic and calming effect on the body and the mind. Their strongly bitter flavour largely accounts for their ability to strengthen and stimulate the digestion, increasing gastric and other secretions[254]. The female fruiting body is anodyne, antiseptic, antispasmodic, diuretic, febrifuge, hypnotic, nerve, sedative, stomachic and tonic[4, 9, 21, 46, 165, 192, 218]. Hops are widely used as a folk remedy to treat a wide range of complaints, including boils, bruises, calculus, cancer, cramps, cough, cystitis, debility, delirium, diarrhoea, dyspepsia, fever, fits, hysteria, inflammation, insomnia, jaundice, nerves, neuralgia, rheumatism, and worms[269]. The hairs on the fruits contain lupulin, a sedative and hypnotic drug[213, 218]. When given to nursing mothers, lupulin increases the flow of milk - recent research has shown that it contains a related hormone that could account for this effect[7]. The decoction from the flower is said to remedy swellings and hardness of the uterus[269]. Hop flowers are much used as an infusion or can also be used to stuff pillows where the weight of the head will release the volatile oils[213]. The fruit is also applied externally as a poultice to ulcers, boils, painful swellings etc[4, 218], it is said to remedy painful tumours[269]. The female flowering heads are harvested in the autumn and can be used fresh or dried[238]. Alcoholic extracts of hops in various dosage forms have been used clinically in treating numerous forms of leprosy, pulmonary tuberculosis, and acute bacterial dysentery, with varying degrees of success in China. The female fruiting body contains humulone and lupulone, these are highly bacteriostatic against gram-positive and acid-fast bacteria[240]. A cataplasm of the leaf is said to remedy cold tumours[269]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve *Humulus lupulus* for nervousness and insomnia (see [302] for critics of commission E).

propta Seed - sow spring in a cold frame[37]. Germination is fairly quick. Prick out the seedlings into individual pots as soon as they are large enough to handle and plant out in the summer or following spring. Division in spring as new growth begins[1]. Very easy, you can plant the divisions straight out into their permanent positions if required[K]. Basal cuttings in March. Harvest the shoots when they are about 10 - 15cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Landscape Uses:Ground cover, Screen. Easily grown in a good garden soil in sun or semi-shade[1, 53]. Prefers a deep rich loam[37] and a warm sheltered position[187]. Plants can succeed in dry shade if plenty of humus is incorporated into the soil, once established they are also somewhat drought tolerant[190]. Hops are reported to tolerate an annual precipitation of between 31 and 137cm, an annual temperature in the range of 5.6 to 21.3°C and a pH of 4.5 to 8.2[269]. Plants are very hardy tolerating temperatures down to about -20°C when dormant[187]. The

young shoots in spring, however, can be damaged by any more than a mild frost[269]. A climbing plant, supporting itself by twining around the branches of other plants[219]. Hops are frequently cultivated, both commercially and on a domestic scale, in temperate zones for their seed heads which have many medicinal qualities and are also used as a flavouring and preservative in beer. There are many named varieties[183]. They grow best between the latitudes of 35 - 51°N and 34 - 43°S, with mean summer temperatures of 16 - 18°C[269]. Generally, for beer making, the unfertilized seed heads are preferred and so most male plants are weeded out[4]. Hops are fairly deep rooted, but with a network of shallow feeding roots. These horizontal feeding roots spread out at depth of 20 - 30 cm in the soil and give rise to fibrous roots in upper layers of soil[269]. The vertical roots develop downwards to a depth of about 150 cm with a spread of 183 - 244 cm and have no fibrous roots[269]. The bruised leaves are refreshingly aromatic whilst the flowers cast a pleasing scent[245]. A food plant for many caterpillars[30]. Dioecious. Male and female plants must be grown if seed is required. Special Features: Edible, Invasive, Naturalizing, Attracts butterflies, Suitable for dried flowers, Inconspicuous flowers or blooms. The plant is heat tolerant in zones 8 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1). For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. Growth habit is a single or multiple shooting vine from a crown [1-2]. Herbaceous. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

## 6.2.40 Sambucus nigra

Elderberry - European Elder, Black elderberry, American black elderberry, Blue elderberry, Europea  
5 tlin 7 cyuc 4 kcaak 5 tcan 3 drwat 6 m hkuc  
hmimhtut cyutiit tcup hwicli hrasjlutnyikrip hpa7tli flatprikliw  
hpa7tmwattli xre7t hjonli

drudda Sambucus nigra is a deciduous Shrub growing to 6 m (19ft) by 6 m (19ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in leaf from March to November, in flower from June to July, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure. It can tolerate atmospheric pollution.

kcaakta Edible Parts: Flowers FruitEdible Uses: Colouring TeaFruit - raw or cooked[2, 3, 5, 46, 61]. The flavour of the raw fruit is not acceptable to many tastes, though when cooked it makes delicious jams, preserves, pies and so forth[K]. It can be used fresh or dried, the dried fruit being less bitter[12, 183, 238]. The fruit is used to add flavour and colour to preserves, jams, pies, sauces, chutneys etc, it is also often used to make wine[13, 183]. The fruit is about 8mm in diameter and is borne in large clusters[200]. Some caution is advised, see the notes above on toxicity. Flowers - raw or cooked[2, 5, 12, 53]. They can also be dried for later use[21]. The flowers are crisp and somewhat juicy, they have an aromatic smell and flavour and are delicious raw as a refreshing snack on a summers day, though look out for the insects[K]. The flowers are used to add a muscatel flavour to stewed fruits, jellies and jams (especially gooseberry jam)[238]. They are often used to make a sparkling wine[183]. A sweet tea is made from the dried flowers[21, 183]. The leaves are used to impart a green colouring to oils and fats[183].

tcanta Compost Cosmetic Dye Fungicide Hedge Hedge

Insecticide Litmus Microscope Musical Pioneer Pipes Repellent WoodThe plant is a valuable addition to the compost heap[14, 18], its flowers are an alternative ingredient of 'QR' herbal compost activator[32] and the roots of the plant improve fermentation of the compost heap when growing nearby[18]. The leaves are used as an insect repellent[4, 6, 14, 66], very effective when rubbed on the skin though they do impart their own unique fragrance[K]. They can be powdered and placed amongst plants to act as a deterrent[14], or made into a spray when they act as an insecticide[7]. This is prepared by boiling 3 - 4 handfuls of leaves in a litre of water; then straining and allowing to cool before applying[201]. Effective against many insects, it also treats various fungal infections such as leaf rot and powdery mildew[201]. The dried flowering shoots are used to repel insects, rodents etc[101]. The flowers are used in skin lotions, oils and ointments[238]. Tolerant of salt-laden gales, this species can be grown as a shelter hedge in exposed maritime areas[29, 75], it is rather bare in the winter though[K]. This is an excellent pioneer species to use when re-establishing woodlands. It is very tough and wind-resistant, grows quickly and provides shelter for longer-lived and taller woodland species to establish. It will generally maintain itself in the developing woodland, though usually in the sunnier positions[K]. A dye is obtained from the fruit and the bark[13, 15]. The bark of older branches and the root have been used as an ingredient in dyeing black[4]. A green dye is obtained from the leaves when alum is used as a mordant[4]. The berries yield various shades of blue and purple dyes[4]. They have also been used as a hair dye, turning the hair black[4]. The blue colouring matter from the fruit can be used as a litmus to test if something is acid or alkaline. It turns green in an alkaline solution and red in an acid solution[4]. The pith in the stems of young branches pushes out easily and the hollow stems thus made have been used as pipes for blowing air into a fire[4]. They can also be made into musical instruments[4]. The pith of the wood is used for making microscope slides and also for treating burns and scalds[46, 61, 100]. The mature wood is white and fine-grained. It is easily cut and polishes well[4]. Valued highly by carpenters, it has many uses, for making skewers, mathematical instruments, toys etc[4, 13, 100, 244]. A good forage for animals: mule deer, elk, sheep and small birds. It is classified as nesting habitat for many birds, including hummingbirds, warblers, and vireos. Elderberries are a favorite food for migrating band-tailed pigeons in northern California.

dwatta Antiinflammatory Aperient Diaphoretic Diuretic Emetic Emollient Expectorant Galactogogue Haemostatic Laxative Ophthalmic Purgative Salve StimulantElder has a very long history of household use as a medicinal herb and is also much used by herbalists[4]. The plant has been called 'the medicine chest of country people'[4]. The flowers are the main part used in modern herbalism, though all parts of the plant have been used at times[238]. Stimulant[9, 53, 165]. The inner bark is collected from young trees in the autumn and is best sun-dried[4]. It is diuretic, a strong purgative and in large doses emetic[4, 7]. It is used in the treatment of constipation and arthritic conditions[238]. An emollient ointment is made from the green inner bark[4]. The leaves can be used both fresh or dry. For drying, they are harvested in periods of fine weather during June and July. The leaves are purgative, but are more nauseous than the bark[4]. They are also diaphoretic, diuretic, expectorant and haemostatic[4, 7]. The juice is said to be a good treatment for inflamed eyes[4]. An ointment made from the leaves is emollient and is used in the treatment of bruises, sprains, chilblains, wounds etc[4]. The fresh flowers are used in the distillation of 'Elder Flower Water'. The flowers can be preserved with salt to make them available for distillation later in the season[4]. The water is mildly astringent and a gentle stimulant. It is mainly used as a vehicle for eye and skin lotions[4]. The dried flowers are diaphoretic, diuretic, expectorant, galactogogue and pectoral[4, 7]. An infusion is very effective in the treatment of chest complaints and is also used to bathe inflamed eyes[4]. The infusion is also a very good spring tonic and blood cleanser[4]. Externally, the flowers are used in poultices to ease pain and abate inflammation[4]. Used as an ointment, it treats chilblains, burns, wounds, scalds etc[4]. The fruit is depurative, weakly diaphoretic and gently laxative[4, 7]. A tea made from the dried berries is said to be a good remedy for colic and diarrhoea[4]. The fruit is widely used for making wines, preserves etc., and these are said

to retain the medicinal properties of the fruit[4]. The pith of young stems is used in treating burns and scalds[46, 61, 100]. The root is no longer used in herbal medicine but it formerly had a high reputation as an emetic and purgative that was very effective against dropsy[4]. A homeopathic remedy is made from the fresh inner bark of young branches[4]. It relieves asthmatic symptoms and spurious croup in children[4]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve *Sambucus nigra* for cough and bronchitis, fevers and colds (see [302] for critics of commission E).

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame, when it should germinate in early spring. Stored seed can be sown in the spring in a cold frame but will probably germinate better if it is given 2 months warm followed by 2 months cold stratification first[78, 98, 113]. Prick out the seedlings into individual pots when they are large enough to handle. If good growth is made, the young plants can be placed in their permanent positions during the early summer. Otherwise, either put them in a sheltered nursery bed, or keep them in their pots in a sheltered position and plant them out in spring of the following year. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in a frame[78]. Cuttings of mature wood of the current season's growth, 15 - 20cm with a heel, late autumn in a frame or a sheltered outdoor bed[78]. Division of suckers in the dormant season.

nwatta Industrial Crop: Dye Industrial Crop: Medicinal Management: Standard Minor Global CropLandscape Uses:Border, Container, Massing, Pollard, Standard, Seashore, Specimen. A very easily grown plant, it tolerates most soils and situations[11, 28, 98], growing well on chalk[28, 98, 186], but prefers a moist loamy soil[200]. Grows well in heavy clay soils. Tolerates some shade but fruits better in a sunny position[37, 200]. Tolerates atmospheric pollution and coastal situations[200]. Another report says that it is intolerant of very smoky atmospheres[186]. The elder is very occasionally cultivated for its edible fruit, there are some named varieties though most of these have been developed for their ornamental value[182]. The subspecies *S. nigra alba* has white/green fruits that are nicer than the type species and are quite nice raw[K]. The elder also has a very long history of folk use, both medicinally and for a wide range of other uses. All in all it is a very valuable plant to have in the garden. The leaves often begin to open as early as January and are fully open in April[186]. The leaves fall in October/November in exposed sites, later in sheltered positions[186]. Young stems can be killed by late frosts but they are soon replaced from the ground level[186]. Very tolerant of pruning, plants can be cut back to ground level and will regrow from the base[186]. The flowers have a sweet, almost overpowering smell, not exactly pleasant when inhaled near to for it has fishy undertones, but from a distance its musky scent is appealing[245]. Very resistant to the predations of rabbits[17, 186]. The flowers are very attractive to insects[186]. The fruit is very attractive to birds[186] and this can draw them away from other cultivated fruits[14, 186]. The elder is an early colonizer of derelict land, the seed arriving in the defecations of birds and mammals[186]. It is a very good pioneer species for re-establishing woodlands. Plants in this genus are notably resistant to honey fungus[200]. Special Features:Attractive foliage, Not North American native, Attractive flowers or blooms. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is suckering with new plants from underground runners away from the plant [2-1].

## 6.2.41 Phyllostachys aureosulcata

Yellow-Groove Bamboo

5 tlin 11 cyuc 4 kcaak 2 tcan 0 dwat 6 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Phyllostachys aureosulcata is an evergreen Bamboo growing to 6 m (19ft) by 6 m (19ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly

acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Shoots StemEdible Uses: Young shoots - raw or cooked. They have very little bitterness, even when eaten raw[183, 195]. The canes of plants grown in Britain are about 25mm in diameter[K], though they can reach up to 4cm in diameter[266]. The shoots are harvested in the spring when they are about 8cm above the ground, cutting them about 5cm below soil level. Young culms are green with yellow grooves.

tcanta Plant support WoodThe canes are not of the best quality but make good plant supports[195]. A good screen plant.

dwatta None known

propta Seed - surface sow as soon as it is ripe in a greenhouse at about 20°C. Do not allow the compost to dry out. Germination usually takes place fairly quickly so long as the seed is of good quality, though it can take 3 - 6 months. Grow on in a lightly shaded place in the greenhouse until large enough to plant out. Seed is rarely available. Division in spring as new growth commences. Divisions from the open ground do not transplant well, so will need careful treatment and nurturing under cover in pots until at least late spring[238]. Division is best carried out in wet weather and small divisions will establish better than large clumps[238]. Another report says that you can take large divisions from established clumps and transfer them straight to their permanent positions, misting or drenching them frequently until they are established[200]. Basal cane cuttings in spring.

nwatta Requires a rich damp soil in a sheltered position. One report says that this is a very hardy plant, withstanding temperatures down to about -20°C, whilst another says that it dislikes prolonged exposure to hard frosts[200]. This species is notably resistant to honey fungus[200]. Plants only flower at intervals of many years. When they do come into flower most of the plants energies are directed into producing seed and consequently the plant is severely weakened. They sometimes die after flowering, but if left alone they will usually recover though they will look very poorly for a few years. If fed with artificial NPK fertilizers at this time the plants are more likely to die[122]. This is a good companion species to grow in a woodland because the plants are shallow rooted and do not compete with deep rooted trees[195]. The rootstock is running but only slightly so in the cooler climate of Britain. In warmer climates (e.g. US South West) it can spread indefinitely if not confined with an underground barrier. The bottoms of some culms have large kinks in them, this limits their use for timber etc but makes them more ornamental. Heat zone: 12-3.

## 6.2.42 Crataegus champlainensis

Quebec hawthorn

5 tlin 9 cyuc 4 kcaak 0 tcan 2 dwat 6 m hkuc hmimhtut cyutli hgattcuphja7n hwicli hrasjlutnyikfrp hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta *Crataegus champlainensis* is a deciduous Tree growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. The species is hermaphrodite (has both male and female organs) and is pollinated by Midges. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcaakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. A nice sweet flavour, the fruit is about 1.5cm in diameter[K]. The fruit can be used in making pies, preserves, etc, and can also be dried for later use. There are up to five fairly large seeds in the centre of the fruit, these often stick together and so the effect is of eating a cherry-like fruit with a single seed[K].

tcanta Wood - heavy, hard, tough, close-grained. Useful for making tool handles, mallets and other small items[82].

dwatta Cardiotonic HypotensiveAlthough no specific mention has been seen for this species, the fruits and flowers of many hawthorns are well-known in herbal folk medicine as a heart tonic and modern research has borne out this use.

The fruits and flowers have a hypotensive effect as well as acting as a direct and mild heart tonic[222]. They are especially indicated in the treatment of weak heart combined with high blood pressure[222]. Prolonged use is necessary for it to be efficacious[222]. It is normally used either as a tea or a tincture[222].

propta Seed - this is best sown as soon as it is ripe in the autumn in a cold frame, some of the seed will germinate in the spring, though most will probably take another year. Stored seed can be very slow and erratic to germinate, it should be warm stratified for 3 months at 15°C and then cold stratified for another 3 months at 4°C[164]. It may still take another 18 months to germinate[78]. Scarifying the seed before stratifying it might reduce this time[80]. Fermenting the seed for a few days in its own pulp may also speed up the germination process[K]. Another possibility is to harvest the seed 'green' (as soon as the embryo has fully developed but before the seedcoat hardens) and sow it immediately in a cold frame. If timed well, it can germinate in the spring[80]. If you are only growing small quantities of plants, it is best to pot up the seedlings as soon as they are large enough to handle and grow them on in individual pots for their first year, planting them out in late spring into nursery beds or their final positions. When growing larger quantities, it might be best to sow them directly outdoors in a seedbed, but with protection from mice and other seed-eating creatures. Grow them on in the seedbed until large enough to plant out, but undercut the roots if they are to be left undisturbed for more than two years.

nwatta A very easily grown plant, it prefers a well-drained moisture retentive loamy soil but is not at all fussy[11, 200]. Once established, it succeeds in excessively moist soils and also tolerates drought[200]. It grows well on a chalk soil and also in heavy clay soils[200]. A position in full sun is best when plants are being grown for their fruit, they also succeed in semi-shade though fruit yields and quality will be lower in such a position[11, 200]. Most members of this genus succeed in exposed positions, they also tolerate atmospheric pollution[200]. Hybridizes freely with other members of this genus[200]. Seedling trees take 5 - 8 years before they start bearing fruit, though grafted trees will often flower heavily in their third year[K]. The flowers have a foetid smell somewhat like decaying fish. This attracts midges which are the main means of fertilization. When freshly open, the flowers have more pleasant scent with balsamic undertones[245]. Seedlings should not be left in a seedbed for more than 2 years without being transplanted[11]. Closely related to *C. submollis*[200], and included in that species by some botanists[82]. This species is possibly no more than a part of *C. rotundifolia*[204].

## 6.2.43 Asimina triloba

Papaw

5 tlin 8 cyuc 4 kcaak 3 tcan 2 dwat 4.5 m hkuc hmimhtut cyutli tcup hwicli jlut hpa7tli flatpriklwis hpa7tmwatli dyatxre7t hjonli

drutta *Asimina triloba* is a deciduous Shrub growing to 4.5 m (14ft) by 4 m (13ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from May to June, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs). The plant is not self-fertile. It is noted for attracting wildlife. Suitable for: medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: FruitEdible Uses: Edible fruit - raw or cooked[2, 3, 11, 46, 62, 99]. A very good size, it can be up to 16cm long and 4cm wide[82, 200]. Of variable quality, some forms (with orange skins) are exquisite with the flavour of banana custard whilst others (with yellow, white or dark brown skins) can be unpleasant[57, 85, 183]. Another report says that the white fruits are mildly flavoured and later ripening than the orange fruits[227]. The fruit can also be used for making preserves, pies, ice cream and other sweet desserts[183]. The fruit falls from the tree in autumn and is then stored until fully ripe[227]. The fruit can cause gastrointestinal upsets for some people[274].

tcanta Dye Fibre Insecticide Parasiticide WoodA fibre from the inner bark is used for making strong rope and

are common ingredients in remedies for colds and coughs, either taken internally or used as an inhalant[238]. The leaves and/or the resin are used in folk medicine to treat bronchitis, cystitis, leucorrhoea, ulcers and flatulent colic[268]. The resin is also used externally in bath extracts, rubbing oils etc for treating rheumatic pains and neuralgia[238]. Oil of Turpentine, which is obtained from the trunk of the tree, is occasionally used instead of the leaves or the resin. The oil is also rubeeficant and can be applied externally in the treatment of neuralgia[268].

propta Seed - sow early February in a greenhouse or outdoors in March[78]. Germination is often poor, usually taking about 6 - 8 weeks[78]. Stratification is said to produce a more even germination so it is probably best to sow the seed in a cold frame as soon as it is ripe in the autumn[80, 113]. The seed remains viable for up to 5 years if it is well stored[113]. When large enough to handle, prick the seedlings out into individual pots and grow them on for at least their first winter in pots. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Alternatively, if you have sufficient seed, it is possible to sow in an outdoor seedbed. One report says that it is best to grow the seedlings on in the shade at a density of about 550 plants per square metre[78] whilst another report says that they are best grown on in a sunny position[80].

nwatta Landscape Uses:Screen, Specimen. Prefers a good moist but not water-logged soil[1] though it tolerates most soils except infertile sands and peats[11, 81]. Grows well in heavy clay soils. Prefers a slightly acid soil, with a pH down to about 5, and a north-facing slope[200]. Plants are very shade tolerant and this species has often been used to underplant in forests[11, 81], but growth is slower in dense shade[81]. Intolerant of atmospheric pollution[1]. Requires a generous rainfall and a sheltered position[11, 81]. Intolerant of windy sites[81]. The silver fir is a very hardy plant when dormant but it comes into growth in April and is then susceptible to damage by late frosts and aphids[185, 238]. This species is particularly subject to aphid infestation in many parts of the country[11], and is also prone to dieback and rust caused by fungal infections[238]. Trees are slow growing for the first few years but from the age of around 6 years growth accelerates and height increases of 1 metre a year are not uncommon[185]. Grows best in moist valleys in Scotland[11] and in S.W. England where it often self-sows. This species also thrives in E. Anglia[17]. Another report says that this species is not happy in the hot, dry, Lower Thames Valley, and does not thrive in many low-lying and frosty parts of southern England[11]. It has been planted as a timber tree in northern and western Europe[50]. It is also commonly used as a 'Christmas tree'[61, 200]. This tree is notably resistant to honey fungus[11, 81, 200]. Trees should be planted into their permanent positions when they are quite small, preferably between 30 and 90cm in height. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200]. Unlike most species of conifers, this tree can be coppiced and will regenerate from the stump[126]. Plants are strongly outbreeding, self-fertilized seed usually grows poorly[200]. They hybridize freely with other members of this genus[200]. The cultivar 'Pendula' used to be widely planted for ornament, shelter and timber but because it is now susceptible to damage by *Adelges nordmannianae* it is seldom planted. Research is going on (1975) to find provenances that are resistant[185]. Special Features:Not North American native, There are no flowers or blooms.

## 6.2.240 Quercus petraea

Sessile Oak, Durmast oak

5 tlin 8 cyuc 2 kcaak 0 tcan 3 dwat 40 m hkuc hmimhtut cyutli tucpaha7n hwicli jutnyukfrip hpa7tli frusflatprkwihs hpa7tmwatli hjonli

drutta Quercus petraea is a deciduous Tree growing to 40 m (131ft) by 25 m (82ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from April to May, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. It is noted for attracting wildlife. Suitable for: medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly

acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil. The plant can tolerate strong winds but not maritime exposure.

kckahta Edible Parts: SeedEdible Uses: Coffee GumSeed - cooked[2, 5, 8, 13]. It can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread. The seed contains bitter tannins, these can be leached out by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method would be to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute[21, 61]. An edible gum is obtained from the bark[177].

tcanta Basketry Charcoal Compost Fuel Gum Ink Repellent Tannin WoodA mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth[20, 201]. Oak galls are excrescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4]. The bark is an ingredient of 'Quick Return' herbal compost activator[32]. This is a dried and powdered mixture of several herbs that can be added to a compost heap in order to speed up bacterial activity and thus shorten the time needed to make the compost[K]. The bark is very rich in calcium[13]. An ink is made from the oak galls, mixed with salts of iron[7, 66]. The wood is a source of tar, quaiacol, acetic acid, creosote and tannin[123]. Tannin is extracted commercially from the bark and is also found in the leaves[223]. Wood - hard, tough, durable even under water. It is highly valued for furniture, construction etc[4, 13, 66]. It is also a good fuel and charcoal[6, 61]. Trees can be coppiced to provide material for basket making, fuel, construction etc[23].

dwatta Antiseptic Astringent Bach Decongestant Dysentery Haemostatic TonicThe oak tree has a long history of medicinal use. It is anti-inflammatory, antiseptic, astringent, decongestant, haemostatic and tonic[4, 7, 9, 13, 21, 165]. The bark is the part of the plant that is most commonly used[4], though other parts such as the galls, seeds and seed cups are also sometimes used[7]. A decoction of the bark is useful in the treatment of chronic diarrhoea, dysentery, intermittent fevers, haemorrhages etc[4]. Externally, it is used to bathe wounds, skin eruptions, sweaty feet, piles etc[9]. It is also used as a vaginal douche for genital inflammations and discharge, and also as a wash for throat and mouth infections[9]. The bark is harvested from branches 5 - 12 years old, and is dried for later use[9]. Any galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4]. The plant is used in Bach flower remedies - the keywords for prescribing it are 'Despondency', 'Despair', but never ceasing effort'[209]. A homeopathic remedy is made from the bark. It is used in the treatment of disorders of the spleen and gall bladder[9].

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cold overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Landscape Uses:Specimen, Street tree. Prefers a good deep fertile loam which can be on the stiff side[11]. Dislikes heavy clay[98]. Young plants tolerate reasonable levels of side shade[200]. Found mainly on acid soils in the wild. Thrives in well drained soils but is also tolerant of periodic flooding[186]. Tolerates exposure and strong winds if these are not salt-laden[186]. A very important timber tree

that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

## 6.2.103 Tilia japonica

Japanese Lime

5 tlin 9 cyuc 3 kcaak 0 tcan 1 dwat 20 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyuk hpa7tli flatprkwihs hpa7tmwatli xre7t hjonli

drutta Tilia japonica is a deciduous Tree growing to 20 m (65ft 7in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kckahta Edible Parts: Flowers Fruit LeavesEdible Uses: TeaYoung leaves - raw or cooked[105, 177]. Flowers - parboiled to remove the bitterness and used as greens or added to soups[183]. A tea is made from the flowers[177, 183]. Fruit[105, 183]. No further details are given. This report possibly refers to the fact that the seed and flowers of some species can be made into a chocolate substitute. A very good chocolate substitute is made from a paste of the ground fruits and flowers[2]. Trials on marketing the product failed because the paste decomposes readily[2].

tcanta Fibre WoodA fibre is obtained from the inner bark and used for sandals, cordage etc[46, 61, 189]. Wood - light, soft. Used for boxes, barrels etc[46, 61].

dwatta Antispasmodic Diaphoretic SedativeA tea made from the flowers is antispasmodic, diaphoretic and sedative[226].

propta Seed - much of the seed produced in Britain is not viable, cut a few seedcases open to see if there is a seed inside[80]. If possible, obtain fresh seed that is ripe but has not as yet developed a hard seed coat and sow it immediately in a cold frame. It may germinate in the following spring though it could take 18 months[80]. Stored seed can be very slow to germinate. It has a hard seed coat, embryo dormancy and a hard coat on the pericarp. All these factors mean that the seed may take up to 8 years to germinate[80]. One way of shortening this time is to stratify the seed for 5 months at high temperatures (10°C at night, up to 30°C by day) and then 5 months cold stratification[80]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Layering in spring just before the leaves unfurl. Takes 1 - 3 years[78]. Suckers, when formed, can be removed with as much root as possible during the dormant season and replanted immediately[200].

nwatta Prefers a good moist loamy alkaline to neutral soil but succeeds on slightly acid soils[11, 200]. Grows poorly on any very dry or very wet soil[200]. Dislikes exposed positions[200]. Succeeds in sun or semi-shade[188]. Prefers a continental climate, growing more slowly and not producing fertile seed in areas with cool summers[200]. Lime trees tend to hybridise freely if other members of the genus are growing nearby[238]. If growing plants from seed it is important to ensure the seed came from a wild source or from an isolated clump of the single species[K]. Grows best in a woodland situation, young plants tolerate a reasonable level of side shade[200]. The leaves appear early in the spring and are not troubled by frosts. Trees are usually attacked by aphids which cover the ground and the leaves with a sticky honeydew[188]. Cultivated for its wood in Japan[125]. A very good seed plant[125]. Quite tolerant of root disturbance, semi-mature trees up to 5 metres tall have been transplanted successfully. Plants in this genus are notably resistant to honey fungus[200].

## 6.2.104 Carya cathayensis

Chinese Hickory

5 tlin 9 cyuc 3 kcaak 3 tcan 0 dwat 18 m hkuc

htut cyutli tcup hwicli hrasljutnyuk hpa7tli flatprkwihs hpa7tmwatli fyif hjonli

drutta Carya cathayensis is a deciduous Tree growing to 18 m (59ft 1in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf from June to October, in flower from April to May, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kckahta Edible Parts: Oil SeedEdible Uses: OilSeed - raw or cooked[46, 61, 105, 109]. Rich in oil[266]. It has a sweet flavour and is highly esteemed by the Chinese[137]. The seed ripens in late autumn and, when stored in its shell in a cool place, will keep for at least 6 months[K]. An edible oil from the seed is used in cooking[109]. Carbon Farming - Staple Crop: oil.

tcanta Fuel Fuel Oil Wood WoodWood - hard, tough, elastic. Used for tool handles etc[46, 61, 109]. A very good fuel, burning well and giving off a lot of heat.

dwatta None known

propta Seed - requires a period of cold stratification. It is best sown in a cold frame as soon as it is ripe[78]. Stored seed should be kept moist (but not wet) prior to sowing and should be sown in a cold frame as soon as possible[78]. Where possible, sow 1 or 2 seeds only in each deep pot and thin to the best seedling. If you need to transplant the seedlings, then do this as soon as they are large enough to handle, once more using deep pots to accommodate the tap root. Put the plants into their permanent positions as soon as possible, preferably in their first summer, and give them some protection from the cold for at least the first winter[78, K]. Seed can also be sown in situ so long as protection is given from mice etc and the seed is given some protection from cold[200] (a plastic bottle with the top and bottom removed and a wire mesh pot fitted to keep the mice out is ideal)

nwatta Management: Standard Regional Crop Staple Crop: OilPrefers a deep moisture-retentive loam in a sunny sheltered position, requiring a good summer for best development[1, 63, 137, 200]. Slow growing[200]. Dislikes wind exposure[109]. Plants are intolerant of much frost[109]. Another report says that plants succeeds in climatic zone 6, which suggests that they should tolerate temperatures down to about -15 and -20°C[200]. Cultivated for fod in China[266], the edible seed is often sold in local markets in China[137]. Plants are strongly tap-rooted and should be planted in their permanent positions as soon as possible[1, 137]. Sowing in situ would be the best method so long as the seed could be protected from mice[1, 200]. Trees are late coming into leaf (usually late May to June) and lose their leaves early in the autumn (usually in October)[137]. During this time they cast a heavy shade. These factors combine to make the trees eminently suitable for a mixed woodland planting with shrubs and other trees beneath them[137]. Plants in this genus are notably resistant to honey fungus[200]. Most species in this genus have quite a wide range of distribution and, in order to find trees more suited to this country, seed from the most appropriate provenances should be sought[137]. Most trees growing in Britain at present tend to only produce good seed after hot summers[137]. Trees are self-fertile but larger crops of better quality seeds are produced if cross-pollination takes place[229]. Carbon Farming - Cultivation: regional crop only. Management: standard.

## 6.2.105 Castanea ozarkensis

Ozark Chinkapin

5 tlin 9 cyuc 3 kcaak 0 tcan 0 dwat 18 m hkuc hmimhtut cyutli hgtakycuctcup hwicli hyshrasljutnyuk hpa7tli frusflatprk hpa7tmwatli hjonli

drutta Castanea ozarkensis is a deciduous Tree growing to 18 m (59ft 1in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in July, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Insects. Suitable for: light

(sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: SeedEdible Uses: Seed - raw or cooked[105, 117, 177]. Small but tasty[183]. Eaten raw, there is a distinct astringency, especially if the fleshy inner skin beneath the outer shell of the seed is not removed[K]. When cooked, however, and especially when baked, the seed becomes much sweeter and has a floury texture[K]. It then makes an excellent food and can be used as a staple food in much the same way as potatoes or cereals[K].

tcanta TanninThe bark, leaves, wood and seed husks all contain tannin.

dwatta None known

propta Seed - where possible sow the seed as soon as it is ripe in a cold frame or in a seed bed outdoors[78]. The seed must be protected from mice and squirrels. The seed has a short viability and must not be allowed to become dry. It can be stored in a cool place, such as the salad compartment of a fridge, for a few months if it is kept moist, but check regularly for signs of germination. The seed should germinate in late winter or early spring. If sown in an outdoor seedbed, the plants can be left in situ for 1 - 2 years before planting them out in their permanent positions. If grown in pots, the plants can be put out into their permanent positions in the summer or autumn, making sure to give them some protection from the cold in their first winter[K].

nwatta Prefers a good well-drained slightly acid loam but it also succeeds in dry soils[1, 11, 200]. Once established, it is very drought tolerant[1, 11, 200]. Very tolerant of highly acid, infertile dry sands[200]. Averse to calcareous soils but succeeds on harder limestones[11, 200]. Although it is winter-hardy in most parts of Britain, this species only really thrives in areas with hot summers[200]. An excellent soil-enriching understorey in pine forests[200]. Flowers are produced on wood of the current year's growth[229]. Plants are fairly self-sterile[200]. They hybridize freely with other members of this genus[200]. Plants in this genus are notably resistant to honey fungus[200].

## 6.2.106 Tilia tuan

5 tlin 9 cyuc 3 kcak 0 tcan 1 dwat 16 m hkuc hmimhmtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwis hpa7tmwatli sre7t hjonli

drutta Tilia tuan is a deciduous Tree growing to 16 m (52ft 6in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from June to July, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: TeaYoung leaves - raw. The dried flowers make a refreshing herb tea. A very good chocolate substitute is made from a paste of the ground fruits and flowers[2]. Trials on marketing the product failed because the paste decomposes readily[2].

tcanta Fibre WoodA fibre is obtained from the inner bark and is used in making sandals and cordage[46, 61, 189]. Wood[46]. No more details.

dwatta Antispasmodic Diaphoretic SedativeA tea made from the flowers is antispasmodic, diaphoretic and sedative[226].

propta Seed - much of the seed produced in Britain is not viable, cut a few seedcases open to see if there is a seed inside[80]. If possible, obtain fresh seed that is ripe but has not as yet developed a hard seed coat and sow it immediately in a cold frame. It may germinate in the following spring though it could take 18 months[80]. Stored seed can be very slow to germinate. It has a hard seed coat, embryo dormancy and a hard coat on the pericarp. All these factors mean that the seed may take up to 8 years to germinate[80]. One way of shortening this time is to stratify the seed for 5 months at high temperatures (10°c at night, up to 30°c by day) and then 5 months cold stratification[80]. When they are large

enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Layering in spring just before the leaves unfurl. Takes 1 - 3 years[78]. Suckers, when formed, can be removed with as much root as possible during the dormant season and replanted immediately[200].

nwatta Prefers a good moist loamy alkaline to neutral soil but succeeds on slightly acid soils[11, 200]. Grows poorly on any very dry or very wet soil[200]. Dislikes exposed positions[200]. Succeeds in sun or semi-shade[188]. Prefers a continental climate, growing more slowly and not producing fertile seed in areas with cool summers[200]. Lime trees tend to hybridise freely if other members of the genus are growing nearby[238]. If growing plants from seed it is important to ensure the seed came from a wild source or from an isolated clump of the single species[K]. Grows best in a woodland situation, young plants tolerate a reasonable level of side shade[200]. A good bee plant[125]. Unlike most other members of this genus, this species does not usually become infested with aphis[125]. Quite tolerant of root disturbance, semi-mature trees up to 5 metres tall have been transplanted successfully. Plants in this genus are notably resistant to honey fungus[200].

## 6.2.107 Taxus baccata

Yew, English yew, Common Yew

5 tlin 7 cyuc 3 kcak 4 tcan 4 dwat 15 m hkuc

pcimhmimhtut cyutli hqatkyuctcup hwicli hrasjlutnyikfrip hpa7tli frusflatprikwisslip hpa7tmwatli nyanhjen hjonli

drutta Taxus baccata is an evergreen Tree growing to 15 m (49ft) by 10 m (32ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in leaf all year, in flower from March to April, and the seeds ripen from September to November. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and very alkaline soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: TeaFruit - raw[1, 2, 65, 81, 158]. Very sweet and gelatinous, most people find it delicious though some find it sickly[K]. A number of people who like the flavour do not like the texture which is often described as being ‘snotty’[K]. All other parts of this plant, including the seed, are highly poisonous. When eating the fruit you should spit out the large seed found in the fruit’s centre. Should you swallow the whole seed it will just pass straight through you without harm (UPDATE: this is probably not true: unfortunately, the digestive system of most mammals, including humans, is robust enough to break down the seeds. This will release the toxic taxanes. Birds are able to eat the whole “berry” because they cannot digest the seeds). If it is bitten into, however, you will notice a very bitter flavour and the seed should immediately be spat out or it could cause some problems. The fruit is a fleshy berry about 10mm in diameter and containing a single seed[200]. Some reports suggest using the bark as a tea substitute[158, 183], this would probably be very unwise.

tcanta Fuel Hedge Hedge Insective WoodVery tolerant of trimming, this plant makes an excellent hedge[1, 11, 29]. The plants are often used in topiary and even when fairly old, the trees can be cut back into old wood and will re-sprout[200]. One report says that trees up to 1000 years old respond well to trimming[200]. A decoction of the leaves is used as an insecticide[46, 61]. Some cultivars can be grown as a ground cover when planted about 1 metre or more apart each way[208]. ‘Repandens’ has been recommended[208]. Wood - heavy, hard, durable, elastic, takes a good polish but requires long seasoning. Highly esteemed by cabinet makers, it is also used for bows, tool handles etc[4, 7, 11, 46, 61,

Lam. is the cos lettuce. This has longer, thinner leaves and a more erect habit, it does not form a compact heart. Lettuces are quite a problematic crop to grow. They require quite a lot of attention to protect them from pests such as slugs, aphids and birds. If the weather is hot and dry the plants tend to run very quickly to seed, developing a bitter flavour as they do so. In wet weather they are likely to develop fungal diseases. In addition, the seed needs to be sown at regular intervals of 2- 3 weeks during the growing season in order to provide a regular supply of leaves. Lettuces make a good companion plant for strawberries, carrots, radishes and onions[18, 20, 201]. They also grow well with cucumbers, cabbages and beetroot[201].

## 6.2.238 Abies grandis

Grand Fir, Giant Fir, Lowland White Fir
5 tlin 6 cyuc 2 kcak 0 tcan 2 dwat 75 m hkuc pcimhmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flat-prik hpa7tmwatli hjonli

drutta Abies grandis is an evergreen Tree growing to 75 m (246ft) by 8 m (26ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in leaf all year, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid and neutral soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure. It cannot tolerate atmospheric pollution.

kcakta Edible Parts: Inner barkEdible Uses: Drink Gum Tealnner bark - cooked. It is usually dried, ground into a powder and then used as a thickening in soups etc or mixed with cereals when making bread[161]. It is best used in the spring when it is rich and juicy[213]. An emergency food, it is only used when all else fails[183]. The gum from the trunk is hardened (probably in cold water[K]) and used as a chewing gum[257]. It can also be made into a drink[257]. Young shoot tips are used as a tea substitute[183, 257].

tcanta Baby care Dye Gum Incense Repellent Roofing WoodThe aromatic leaves are used as a moth repellent[169]. The boughs have been used in the home as an incense[257]. A pink dye can be obtained from the bark[226]. The dried and hardened pitch can be chewed as a tooth cleanser[257]. A powder made from the dried and crushed leaves was used as a baby powder by the N. American Indians[226]. The bark can be used as a waterproof covering material for buildings and canoes[257]. Wood - light, soft, coarse grained, not strong, not very durable. Used for interior work, cases, etc[46, 61, 82]. Of little value as a lumber, it is used mainly for pulp and fuel[229, 257].

dwatta Antirheumatic Laxative Ophthalmic Skin Stomachic TB TonicA gum that exudes from the bark is used externally as an ointment[245]. It has also been used as a wash for sore and infected eyes and as a gargle for sore throats[257]. A decoction is laxative and tonic, it is used to treat stomach problems[257]. Externally, the gum is applied as a poultice to cuts and sores[257]. A decoction of the root bark or stem is used in the treatment of stomach problems and TB[257]. A poultice is applied to joints to ease rheumatism or to the chest to treat lung haemorrhages[257]. A decoction of the leaves is used as a tonic and in the treatment of colds[257].

propta Seed - sow early February in a greenhouse or outdoors in March[78]. Germination is often poor, usually taking about 6 - 8 weeks[78]. Stratification is said to produce a more even germination so it is probably best to sow the seed in a cold frame as soon as it is ripe in the autumn[80, 113]. The seed remains viable for up to 5 years if it is well stored[113]. When large enough to handle, prick the seedlings out into individual pots and grow them on for at least their first winter in pots. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Alternatively, if you have sufficient seed, it is possible to sow in an outdoor seedbed. One report says that it is best to grow the seedlings on in the shade at a density of about 550 plants per square metre[78] whilst another report says that they are best grown on in a sunny position[80].

nwatta Landscape Uses:Screen, Specimen. Prefers a good moist but not water-logged soil[1]. Grows well in heavy clay soils and succeeds in poor sandy soils[185]. Very shade tolerant, especially when young, but growth is slower in dense shade[81]. Intolerant of atmospheric pollution[1]. Trees succeeds in very exposed positions, even if the top is blown out by the wind the trees make one or more new tops and continue growing with no loss of vigour[11, 185]. Prefers slightly acid conditions down to a pH of about 5[200]. Prefers growing on a north-facing slope[200]. This species thrives exceedingly well in the moister parts of Britain, where it grows very quickly[11]. It is cultivated for timber in W. and N. Europe[50]. Trees are slow growing for the first few years but they are then quite fast with trees growing 60 - 100cm in height and 8cm in girth per year even when they are quite large[1, 185]. New growth takes place from early May to July[185]. Trees grow best in the Perthshire valleys of Scotland and in the far west of Britain[11]. Some trees have reached heights in excess of 60 metres in 100 years in Wales and Scotland, making them amongst the tallest trees in Europe[200]. A very ornamental plant[1], it is rarely harmed by disease, insects or frost[1]. The crushed leaves have a fruity orange-flavoured aroma[185]. Trees should be planted into their permanent positions when they are quite small, between 30 and 90cm in height. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200]. Plants are strongly outbreeding, self-fertilized seed usually grows poorly[200]. They hybridize freely with other members of this genus[200]. Special Features:North American native, There are no flowers or blooms.

## 6.2.239 Abies alba

Silver Fir, Christmas Tree Fir, European Silver Fir, Silver
5 tlin 8 cyuc 2 kcak 4 tcan 3 dwat 45 m hkuc pcimhmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flat-prik hpa7tmwatli hjonli

drutta Abies alba is an evergreen Tree growing to 45 m (147ft) by 15 m (49ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in leaf all year, in flower from April to May, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid and neutral soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil. It cannot tolerate atmospheric pollution.

kcakta Edible Parts: Inner barkEdible Uses: Inner bark - cooked. It is dried, ground into a powder and then used as a thickening in soups etc or mixed with cereals when making bread[105, 177].

tcanta Essential Lacquer Paint Resin Tannin WoodAn oleo-resin is obtained from blister-like swellings in the bark[64, 100]. It is harvested in the summer and used fresh, dried or distilled for oil[238]. The resin extracted from it is used in perfumery, medicine and for caulking ships[46, 61, 64, 100]. It is called ‘Strasburg Turpentine’[46]. Oil of turpentine is an important solvent in the paint industry[238]. The residue, known as ‘rosin oil’, is used in making varnishes, lacquers and carbon black (for pigments and ink)[238]. Resin is tapped from trees about 60 - 80 years old in the spring and used for the distillation of oil[238]. An essential oil obtained from the leaves is used as a disinfectant and also in medicine and perfumery[46, 61]. It is a common ingredient in many bath products, giving them their familiar pine scent[7]. The bark is a source of tannin[7]. Wood - light, soft, durable, elastic. The timber of this tree is especially sought after for its lightness, it is used for construction, furniture, boxes, pulp etc[7, 46, 61, 89, 101].

dwatta Antibiotic Antirheumatic Antiseptic Astringent Balsamic Diuretic Expectorant Vasoconstrictor VulneraryThe buds are antibiotic, antiseptic and balsamic[7]. The bark is antiseptic and astringent[7]. It can be harvested as required throughout the year[238]. The leaves are expectorant and a bronchial sedative[7]. They are best harvested in the spring and can be dried for later use[238]. The resin is antiseptic, balsamic, diuretic, eupetic, expectorant, vasoconstrictor and vulnerary[7]. Both the leaves and the resin

## 6.2.236 Apium graveolens

Wild Celery. Ajmod, Ajwain-ka-patta (Indian)  
5 tlin 9 cyuc 3 kcaak 0 tcan 3 dwat 0.6 m hkuc  
hmim cyutli tcup hwicli hrasjlutnyk hpa7tli flatprikliwshom  
hpa7tmwatli fyfxre7t hjonli

drutta Apium graveolens is a BIENNIAL growing to 0.6 m (2ft) by 0.3 m (1ft in). See above for USDA hardness. It is hardy to UK zone 6 and is not frost tender. It is in flower from June to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in saline soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: Leaves Oil SeedEdible Uses: CondimentLeaves - raw or cooked[52, 105]. Mainly used as a flavouring in soups etc[5, 7, 9, 46]. They can be eaten raw but have a very strong flavour[52]. They are toxic if consumed in large amounts[238]. Seed - a flavouring. Used in small quantities to flavour soups and stews[238]. An essential oil from the seed is also used as a flavouring[46, 105]. Root - cooked[74].

tcanta EssentialThe growing plant is an insect repellent, it repels the cabbage white butterfly so is a good companion for brassicas[20].

dwatta Antianxiety Antirheumatic Aperient Appetizer Carminative Diuretic Emmenagogue Galactogogue Nervine Stimulant TonicWild celery has a long history of medicinal and food use. It is an aromatic bitter tonic herb that reduces blood pressure, relieves indigestion, stimulates the uterus and is anti-inflammatory[238]. The ripe seeds, herb and root are aperient, carminative, diuretic, emmenagogue, galactogogue, nervine, stimulant and tonic[4, 7, 21, 165]. Wild celery is said to be useful in cases of hysteria, promoting restfulness and sleep and diffusing through the system a mild sustaining influence[4]. The herb should not be prescribed for pregnant women[238]. Seeds purchased for cultivation purposes are often dressed with a fungicide, they should not be used for medicinal purposes[238]. The root is harvested in the autumn and can be used fresh or dried[238]. The whole plant is harvested when fruiting and is usually liqui-dized to extract the juice[238]. The seeds are harvested as they ripen and are dried for later use[238]. An essential oil obtained from the plant has a calming effect on the central nervous system. Some of its constituents have antispasmodic, sedative and anticonvulsant actions. It has been shown to be of value in treating high blood pressure[254]. A homeopathic remedy is made from the herb[9]. It is used in treating rheumatism and kidney complaints[9].

propta Seed - sow spring or autumn in situ. If seed is in short supply it can be sown in a cold frame in spring. The seed can harbour certain diseases of celery, it is usually treated by seed companies before being sold but if you save your own seed you should make sure that only seed from healthy plants is used[1].

nwatta Prefers a rich moist soil in sun or semi-shade[238], but with some shade in the summer[52]. It is tolerant of saline soils[238]. The plants are fairly hardy, though they can be damaged by hard frosts[238]. Wild celery is the parent of the cultivated celery (*A. graveolens dulce*) as well as celery leaf (*A. graveolens secalinum*) and celeriac (*A. graveolens rapaceum*). This entry only deals with the wild celery, the other plants are dealt with separately. A very aromatic plant, the aroma being most noticeable when the foliage is bruised. The growing plant is a good companion for leeks, tomatoes, French beans and brassicas[18].

## 6.2.237 Lactuca sativa

Lettuce, Garden lettuce  
5 tlin 9 cyuc 3 kcaak 1 tcan 3 dwat 0.9 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlut hpa7tli prikliwis  
hpa7tmwatli fyfxre7t hjonli

drutta Lactuca sativa is a ANNUAL/BIENNIAL growing to 0.9 m (3ft) by 0.3 m (1ft in). See above for USDA hardness. It is hardy to UK zone 6 and is not frost tender. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies. The plant is

self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves Oil SeedEdible Uses: Oil- Leaves - raw or cooked[7, 37]. A mild slightly sweet flavour with a crisp texture, lettuce is a very commonly used salad leaf and can also be cooked as a potherb or be added to soups etc[183]. A nutritional analysis is available[218]. Seed - sprouted and used in salads or sandwiches[183]. An edible oil is obtained from the seed[7]. The seed is very small, extraction of the oil on any scale would not be very feasible[K].

tcanta Hair Oil Parasiticide ParasiticideParasiticide[178]. No further details are given, but it is probably the sap of flowering plants that is used. The seed is said to be used to make hair grow on scar tissue[218].

dwatta Anaphrodisiac Anodyne Antispasmodic Carminative Diuretic Emollient Expectorant Febrifuge Galactogogue Hypnotic Hypoglycaemic Narcotic Parasiticide Parasiticide SedativeThe whole plant is rich in a milky sap that flows freely from any wounds. This hardens and dries when in contact with the air[4]. The sap contains 'lactucarium', which is used in medicine for its anodyne, antispasmodic, digestive, diuretic, hypnotic, narcotic and sedative properties[9, 21, 46, 165, 192, 213, 238]. Lactucarium has the effects of a feeble opium, but without its tendency to cause digestive upsets[4], nor is it addictive[7]. It is taken internally in the treatment of insomnia, anxiety, neuroses, hyperactivity in children, dry coughs, whooping cough, rheumatic pain etc[238]. Concentrations of lactucarium are low in young plants and most concentrated when the plant comes into flower[238]. It is collected commercially by cutting the heads of the plants and scraping the juice into china vessels several times a day until the plant is exhausted[4]. The cultivated lettuce does not contain as much lactucarium as the wild species, most being produced when the plant is in flower[4]. An infusion of the fresh or dried flowering plant can also be used[9]. The plant should be used with caution, and never without the supervision of a skilled practitioner. Even normal doses can cause drowsiness whilst excess causes restlessness[238] and overdoses can cause death through cardiac paralysis[7, 9]. Some physicians believe that any effects of this medicine are caused by the mind of the patient rather than by the medicine[213]. The sap has also been applied externally in the treatment of warts[222]. The seed is anodyne and galactogogue[218]. Lettuce has acquired a folk reputation as an anaphrodisiac, anodyne, carminative, diuretic, emollient, febrifuge, hypoglycaemic, hypnotic, narcotic, parasiticide and sedative[218].

propta Seed - sow a small quantity of seed in situ every 2 or 3 weeks from March (with protection in cooler areas) to June and make another sowing in August/September for a winter/spring crop. Only just cover the seed. Germination is usually rapid and good, thin the plants if necessary, these thinnings can be transplanted to produce a slightly later crop (but they will need to be well watered in dry weather). More certain winter crops can be obtained by sowing in a frame in September/October and again in January/February.

nwatta Prefers a light sandy loam[1]. Succeeds in most well-drained, humus-rich soils but dislikes acid conditions[1, 16]. Plants strongly dislike dry conditions, quickly running to seed in such a situation. Early and late sowings are best in a sunny position, but summer crops are best given a position with some shade in order to slow down the plants tendency to go to seed and to prevent the leaves becoming bitter[18, 20]. The garden lettuce is widely cultivated in many parts of the world for its edible leaves and is probably the most commonly grown salad plant. There are many named varieties[183] capable of providing fresh leaves throughout the year if winter protection is given in temperate areas. Over the centuries a number of more or less distinct forms have arisen in cultivation. These forms have been classified as follows. They are treated separately in more detail:- *L. sativa angustana*. L.H.Bailey. is the Celtsuce. The leaves of this form are not of such good quality as the other lettuces and the plant is grown more for its thick central stem which is used in the same ways as celery[1]. *L. sativa capitata*. *L.* is the heading lettuce, it forms a heart in a similar way to cabbages. Examples of this include the Iceberg and Butterhead lettuces. *L. sativa crispa*. *L.* is the curled or leaf lettuce. This does not form a central heart but produces a loose rosette of basal leaves. It can be harvested on a cut and come again basis. *L. sativa longifolia*

66, 146]. It makes a good firewood[6]. The wood is burnt as an incense[146].

dwatta Anticonvulsant Antispasmodic Cancer Car-diotonic Diaphoretic Emmenagogue Epilepsy Expectorant Homeopathy Narcotic PurgativeThe yew tree is a highly toxic plant that has occasionally been used medicinally, mainly in the treatment of chest complaints. Modern research has shown that the plants contain the substance 'taxol' in their shoots. Taxol has shown exciting potential as an anti-cancer drug, particularly in the treatment of ovarian cancers[238]. Unfortunately, the concentrations of taxol in this species are too low to be of much value commercially, though it is being used for research purposes[238]. This remedy should be used with great caution and only under the supervision of a qualified practitioner[21]. See also the notes above on toxicity. All parts of the plant, except the fleshy fruit, are antispasmodic, cardiotoxic, diaphoretic, emmenagogue, expectorant, narcotic and purgative[7, 21]. The leaves have been used internally in the treatment of asthma, bronchitis, hiccup, indigestion, rheumatism and epilepsy[240, 257]. Externally, the leaves have been used in a steam bath as a treatment for rheumatism[257]. A homeopathic remedy is made from the young shoots and the berries[4]. It is used in the treatment of many diseases including cystitis, eruptions, headaches, heart and kidney problems, rheumatism etc[4]. Ingestion of 50-100g of needles can cause death.

propta Seed - can be very slow to germinate, often taking 2 or more years[78, 80]. It is best sown as soon as it is ripe in the autumn when it should germinate 18 months later. Stored seed may take 2 years or more to germinate, 4 months warm followed by 4 months cold stratification may help reduce the germination time[113]. Harvesting the seed 'green' (when fully developed but before it has dried on the plant) and then sowing it immediately has not been found to reduce the germination time because the inhibiting factors develop too early[80]. Prick out the seedlings into individual pots once they are large enough to handle and grow them on in pots in a cold frame. The seedlings are very slow-growing and will probably require at least 2 years of pot cultivation before being large enough to plant out. Any planting out is best done in late spring or early summer, after the last expected frosts[K]. Cuttings of half-ripe terminal shoots, 5 - 8cm long, July/August in a shaded frame. Should root by late September but leave them in the frame over winter and plant out in late spring[78]. High percentage[11]. Cuttings of ripe terminal shoots, taken in winter after a hard frost, in a shaded frame[113].

nwatta Industrial Crop: Medicinal Management: Cop-pice Regional CropLandscape Uses:Espalier, Firewood, Hedge, Screen, Standard, Superior hedge, Specimen. A very easy plant to grow, it is extremely tolerant of cold and heat, sunny and shady positions, wet and dry soils, exposure and any pH[200]. Thrives in almost any soil, acid or alkaline, as long as it is well-drained[1, 11, 200]. Grows well in heavy clay soils. Sensitive to soil compaction by roads etc[186, 200]. Very shade tolerant[17, 81]. Tolerates urban pollution[200]. In general they are very tolerant of exposure, though plants are damaged by severe maritime exposure[K]. A very cold hardy plant when dormant, tolerating temperatures down to about -25°C[200]. The fresh young shoots in spring, however, can be damaged by frosts[186, K]. Plants are dioecious, though they sometimes change sex and monoecious trees are sometimes found[81, 186]. Male and female trees must be grown if fruit and seed is required[K]. The fruit is produced mainly on the undersides of one-year old branches[200]. A very long lived tree[1, 7, 11, 185], one report suggests that a tree in Perthshire is 1500 years old, making it the oldest plant in Britain. Another report says that trees can be up to 4000 years old[11]. It is, however, slow growing and usually takes about 20 years to reach a height of 4.5 metres[186]. Young plants occasionally grow 30cm in a year but this soon tails off and virtually no height increase is made after 100 years[185]. A very ornamental tree, there are many named varieties[200]. Very resistant to honey fungus[8, 88, 200], but susceptible to phytophthora root rot[81, 88]. The bark is very soft and branches or even the whole tree can be killed if the bark is removed by constant friction such as by children climbing the tree[186]. Plants produce very little fibrous root and should be planted in their final positions when still small[200]. The fruit is greatly relished by thrushes[186]. Special Features: Not North American native, All or parts of this plant are poisonous, Inconspicuous flowers or blooms.

## 6.2.108 Crataegus cuneata

Sanzashi, Chinese hawthorn  
5 tlin 9 cyuc 3 kcaak 3 tcan 3 dwat 15 m hkuc  
hmimhtut cyutli hgactcuphja7n hwicli hrasjlutnykvikfrip hpa7tli  
flatprikliwisslip hpa7tmwatli xre7t hjonli

drutta Crataegus cuneata is a deciduous Shrub growing to 15 m (49ft 3in). See above for USDA hardness. It is hardy to UK zone 6 and is not frost tender. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Midges. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked and used in pies, preserves etc[147, 183]. It can also be dried for later use[177, 183]. A pleasant flavour, it is sold in local markets in China and Japan[178]. The fruit contains about 0.44% protein, 1% fat, 22.1% carbohydrate, 0.8% ash, it is rich in vitamin C, fruit acids and pectin[179]. There are up to five fairly large seeds in the centre of the fruit, these often stick together and so the effect is of eating a cherry-like fruit with a single seed[K].

tcanta Wood - heavy, hard, tough, close-grained. Useful for making tool handles, mallets and other small items[82].

dwatta Anodyne Anticholesterolemic Astringent Blood tonic Cardiotonic Dysentery Haemostatic Hypotensive Stom-achic Vitamin CThe fruits and flowers of hawthorns are well-known in herbal folk medicine as a heart tonic and modern research has borne out this use. The fruits and flowers have a hypotensive effect as well as acting as a direct and mild heart tonic[222]. They are especially indicated in the treatment of weak heart combined with high blood pressure[222]. Prolonged use is necessary for it to be efficacious[222]. It is normally used either as a tea or a tincture[222]. The fruit is anodyne, anticholesterolemic, antiarrhythmic, antidiarrhetic, antidiarrhetic, astringent, blood tonic, cardiotoxic, haemostatic and stomachic[61, 147, 176, 218]. It is used in the treatment of dyspepsia, stagnation of fatty food, abdominal fullness, retention of lochia, amenorrhoea, postpartum abdominal pain, hypertension and coronary heart disease[176].

propta Seed - this is best sown as soon as it is ripe in the autumn in a cold frame, some of the seed will germinate in the spring, though most will probably take another year. Stored seed can be very slow and erratic to germinate, it should be warm stratified for 3 months at 15°C and then cold stratified for another 3 months at 4°C[164]. It may still take another 18 months to germinate[78]. Scarifying the seed before stratifying it might reduce this time[80]. Fermenting the seed for a few days in its own pulp may also speed up the germination process[K]. Another possibility is to harvest the seed 'green' (as soon as the embryo has fully developed but before the seedcoat hardens) and sow it immediately in a cold frame. If timed well, it can germinate in the spring[80]. If you are only growing small quantities of plants, it is best to pot up the seedlings as soon as they are large enough to handle and grow them on in individual pots for their first year, planting them out in late spring into nursery beds or their final positions. When growing larger quantities, it might be best to sow them directly outdoors in a seedbed, but with protection from mice and other seed-eating creatures. Grow them on in the seedbed until large enough to plant out, but undercut the roots if they are to be left undisturbed for more than two years.

nwatta A very easily grown plant, it prefers a well-drained moisture retentive loamy soil but is not at all fussy[11, 200]. Once established, it succeeds in excessively moist soils and also tolerates drought[200]. It grows well on a chalk soil and also in heavy clay soils[200]. A position in full sun is best when plants are being grown for their fruit, they also succeed in semi-shade though fruit yields and quality will be lower in such a position[11, 200]. Most members of this genus succeed in exposed positions, they also tolerate atmospheric pollution[200]. Although perfectly cold-hardy in most of Britain when dormant, the young growth of this species might be susceptible to spring frosts[11]. Hybridizes freely with other members of this genus[200]. Seedling trees take from 5 - 8 years before they start bearing fruit, though

grafted trees will often flower heavily in their third year[K]. The flowers have a foetid smell somewhat like decaying fish. This attracts midges which are the main means of fertilization. When freshly open, the flowers have more pleasant scent with balsamic undertones[245]. Seedlings should not be left in a seedbed for more than 2 years without being transplanted[11].

## 6.2.109 Taxus brevifolia

Pacific Yew

5 tlin 9 cyuc 3 kcak 3 tcan 4 dwat 15 m hkuc  
pcimhmimhtu cyutli kyucup hwichi hrsajlutnyik hpa7tli frusflatpriklwisslip hpa7tmwatli hwnhjen hjonli

drutta Taxus brevifolia is an evergreen Tree growing to 15 m (49ft 3in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in leaf all year, in flower from March to May, and the seeds ripen from September to November. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and very alkaline soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw[105, 161, 257]. Very sweet and gelatinous, most people find it delicious though some find it sickly[K]. The fruit is a fleshy berry about 8mm in diameter and containing a single seed[200]. Trees usually produce good crops every year[229]. All other parts of this plant, including the seed, are highly poisonous. When eating the fruit you should spit out the large seed found in the fruit's centre. Should you swallow the whole seed it will just pass straight through you without harm, if the seed has been bitten into, however, it could cause some problems.

tcanta Paint WoodA red paint was made by mixing the woodchips with oil[226]. The roots have been used as the weft in twined basketry[257]. The root is very strong and is particularly good for hopper mortar baskets[257]. Wood-fine-grained, strong, hard, heavy, durable and resilient, taking a very fine polish. Though hard, the wood is easy to carve[226]. It is also used for making paddles, fence posts and various other small articles[46, 61, 82, 226, 229, 257].

dwatta Cancer Diaphoretic Pectoral PoulticeThe Pacific yew is a highly toxic plant but it was employed medicinally by several native North American Indian tribes who used it to treat a variety of complaints[257]. Modern research has shown that it contains the substance 'taxol' in its shoots and bark. Taxol has shown exciting potential as an anti-cancer drug, particularly in the treatment of ovarian cancers[238]. Unfortunately, the concentrations of taxol are rather low and the bark of 6 trees is required to provide enough taxol to treat one patient[238]. This remedy is very toxic and, even when used externally, should only be used under the supervision of a qualified practitioner[238]. See also the notes above on toxicity. All parts of the plant, except the fleshy fruit, are diaphoretic and pectoral[257]. A decoction of the branches and leaves has been used in the treatment of lung problems[257]. An infusion of the crushed leaves has been used externally as a wash to cause perspiration and effect a general improvement in the health[257]. A poultice of the crushed leaves has been applied to wounds[257]. A decoction of small woody pieces has been used in the treatment of internal complaints including stomach pains and blood in the urine[257]. The leaves are harvested in early autumn or spring, the bark from autumn to spring, for commercial extraction of taxol[238]. Ingestion of 50-100g of needles can cause death.

propta Seed - can be very slow to germinate, often taking 2 or more years[78, 80]. It is best sown as soon as it is ripe in the autumn when it should germinate 18 months later. Stored seed may take 2 years or more to germinate. 4 months warm followed by 4 months cold stratification may help reduce the germination time[113]. Harvesting the seed 'green' (when fully developed but before it has dried on the plant) and then sowing it immediately has not been found to reduce the germination time because the inhibiting factors

develop too early[80]. Prick out the seedlings into individual pots once they are large enough to handle and grow them on in pots in a cold frame. The seedlings are very slow-growing and will probably require at least 2 years of pot cultivation before being large enough to plant out. Any planting out is best done in late spring or early summer, after the last expected frosts[K]. Cuttings of half-ripe terminal shoots, 5 - 8cm long, July/August in a shaded frame. Should root by late September but leave them in the frame over winter and plant out in late spring[78]. High percentage[11]. Cuttings of ripe terminal shoots, taken in winter after a hard frost, in a shaded frame[113].

nwatta Management: Coppice Regional CropThrives in almost any soil, acid or alkaline, as long as it is well-drained[1, 200]. Succeeds in dry soils. Plants are very shade tolerant[81]. Dormant plants are very cold-hardy, though the young growth in spring can be damaged by late frosts. A slow-growing but apparently long-lived tree[229]. Plants produce very little fibrous root and should be planted in their final positions when still small[200]. Because of its useful wood, large trees are unscrupulously poached from the wild and, in some areas, the species has been nearly extirpated. Exploitation of the species for medicinal purposes is further threatening it in the wild[270]. Plants in this genus are notably resistant to honey fungus[200]. Dioecious. Male and female plants must be grown if seed is required.

## 6.2.110 Tilia oliveri

5 tlin 9 cyuc 3 kcak 0 tcan 1 dwat 15 m hkuc  
hmimhtu cyutli tcup hwichi hrsajlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Tilia oliveri is a deciduous Tree growing to 15 m (49ft) by 8 m (26ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in June, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: TeaYoung leaves - raw or cooked[179]. A very good chocolate substitute is made from a paste of the ground fruits and flowers[2]. Trials on marketing the product failed because the paste decomposes readily[2].

tcanta FibreA fibre is obtained from the tough inner bark It can be made into diverse items such as mats, shoes and coarse cloth[229].

dwatta Antispasmodic Diaphoretic SedativeA tea made from the flowers is antispasmodic, diaphoretic and sedative[226].

propta Seed - much of the seed produced in Britain is not viable, cut a few seedcases open to see if there is a seed inside[80]. If possible, obtain fresh seed that is ripe but has not as yet developed a hard seed coat and sow it immediately in a cold frame. It may germinate in the following spring though it could take 18 months[80]. Stored seed can be very slow to germinate. It has a hard seed coat, embryo dormancy and a hard coat on the pericarp. All these factors mean that the seed may take up to 8 years to germinate[80]. One way of shortening this time is to stratify the seed for 5 months at high temperatures (10°C at night, up to 30°C by day) and then 5 months cold stratification[80]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Layering in spring just before the leaves unfurl. Takes 1 - 3 years[78]. Suckers, when formed, can be removed with as much root as possible during the dormant season and replanted immediately[200].

nwatta Prefers a good moist loamy alkaline to neutral soil but succeeds on slightly acid soils[11, 200]. Grows poorly on any very dry or very wet soils[200]. Dislikes exposed positions[200]. Succeeds in sun or semi-shade[188] Prefers a continental climate, growing more slowly and not producing fertile seed in areas with cool summers[200]. Lime trees tend to hybridise freely if other members of the genus are

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Bulb - raw or cooked[2]. The bulbs are eaten by the N. American Indians[183]. They are rather small, about 4cm tall and 15mm wide[235]. Leaves - raw or cooked. Flowers - raw. Used as a garnish on salads.

tcanta RepellentThe juice of the plant is used as a moth repellent. The whole plant is said to repel insects and moles[20].

dwatta A sweetened decoction of the root has been taken, mainly by children, as a remedy for colds[257]. Although no other specific mention of medicinal uses has been seen for this species, members of this genus are in general very healthy additions to the diet. They contain sulphur compounds (which give them their onion flavour) and when added to the diet on a regular basis they help reduce blood cholesterol levels, act as a tonic to the digestive system and also tonify the circulatory system[K].

propta Seed - sow spring in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle - if you want to produce clumps more quickly then put three plants in each pot. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in spring once they are growing vigorously and are large enough. Division in spring. Very easy, the plants divide successfully at any time in the growing season and the divisions can be planted straight out into their permanent positions if required.

nwatta Landscape Uses:Border, Container, Massing, Rock garden. An easily grown plant, it prefers a sunny position in a rich moist but well-drained soil[203]. The bulbs should be planted fairly deeply[1]. Most members of this genus are intolerant of competition from other growing plants[203]. There is at least one named variety - 'Album' has white flowers[200]. Grows well with most plants, especially roses, carrots, beet and chamomile, but it inhibits the growth of legumes[18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. Closely allied to A. cernuum and to A. textile[1]. Members of this genus are rarely if ever troubled by browsing deer[233]. Special Features: North American native, Suitable for cut flowers.

## 6.2.233 Osmorhiza chilensis

5 tlin 9 cyuc 3 kcak 0 tcan 0 dwat 0.8 m hkuc  
hmimhtu cyutli tcup hwichi hrsajlutnyik hpa7tli flatpriklwis hpa7tmwatli fyixre7t hjonli

drutta Osmorhiza chilensis is a PERENNIAL growing to 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 6. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. kcakta Edible Parts: RootEdible Uses: Root - raw or cooked. It is considered to be a delicacy[69].

tcanta None known

dwatta None known

propta Seed - we have no information on this species but suggest sowing the seed in a cold frame as soon as it is ripe if this is possible, otherwise sow it in early spring. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts.

nwatta Succeeds in any deep moisture-retentive soil in sun or dappled shade[200]. Plants are hardy to about -20°C[200]. Well suited to naturalistic plantings in a woodland or wild garden[200]. A sweetly aromatic plant[200].

## 6.2.234 Gaultheria ovatifolia

Mountain Checkerberry, Western teaberry

5 tlin 9 cyuc 3 kcak 3 tcan 0 dwat 0.2 m hkuc  
pcimhmim cyutli tcup hwichi hrsajlutnyik hpa7tli frusflatpriklwis hpa7tmwatli xre7t hjonli

drutta Gaultheria ovatifolia is an evergreen Shrub growing to 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from June to

August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[3, 62, 183]. Spicy and delicious[11]. The fruit is up to 6mm in diameter[200].

tcanta A useful ground cover for shady places.

dwatta None known

propta The seed requires a period of cold stratification. Pre-chill for 4 - 10 weeks and then surface sow in a lime-free compost in a shady part of the greenhouse and keep the compost moist[78]. The seed usually germinates well, usually within 1 - 2 months at 20°C, but the seedlings are liable to damp off. It is important to water them with care and to ensure that they get plenty of ventilation. Watering them with a garlic infusion can also help to prevent damping off[K]. Prick out the seedlings into individual pots when they are about 25mm tall and grow them on in light shade in the greenhouse for at least their first winter[K]. Plant them out in late spring or early summer. The seedlings are susceptible to spring frosts so might need some protection for their first few years outdoors. The leaves remain very small for the first few years[11]. Cuttings of half-ripe wood, 7cm with a heel, July/August in a shady frame. Rather slow, it usually takes 12 months for the roots to form[78]. Division in early spring. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring. Layering in September/October. Takes 12 months.

nwatta Prefers a moist but not boggy humus rich soil in shade or semi-shade[11, 182]. This species prefers considerable shade[1]. A peat and moisture loving species, requires a lime-free soil[11, 182]. Closely related to G. humifusa[182]. Reputed to be rather difficult in cultivation[11], it does not grow well in S. England[1]. The plant can make a good nesting place for mice, these mice then eat the bark of the stems in winter causing die-back. Plants in this genus are notably resistant to honey fungus[200].

## 6.2.235 Dentaria laciniata

Cut-Leaved Toothwort

5 tlin 9 cyuc 3 kcak 0 tcan 0 dwat 0.3 m hkuc  
hmim cyutli tcup hwichi hrsajlutnyik hpa7tli flatpriklwisslip hpa7tmwatli xre7t hjonli

drutta Dentaria laciniata is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in April, and the seeds ripen in June. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Root - raw or cooked[46, 61, 161]. A pleasant pungent peppery taste, somewhat like watercress[43, 105, 159, 183]. Added to salads or used as a relish. Leaves - raw or cooked. A peppery flavour[159].

tcanta None known

dwatta None known

propta Seed - sow spring in a cold frame. Germination usually takes place within 1 - 3 weeks at 15°C[175]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in a greenhouse or cold frame for the first two years, planting them out when dormant in late summer. Division in early spring or after the plant dies down in the summer. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta An easily grown plant, preferring a rich light moist soil and the shade of deciduous trees[1, 187]. A very cold-hardy plant, tolerating temperatures down to at least -20°C[187].

and various other Italian dishes[244]. The styles are extremely rich in riboflavin[137]. Water soluble[171]. Yields per plant are extremely low, about 4000 stigmas yield 25g of saffron[89]. Saffron is the world's most expensive spice, it takes 150,000 flowers and 400 hours work to produce 1 kilo of dried saffron[238]. About 25 kilos of styles can be harvested from a hectare of the plant[4]. Fortunately, only very small quantities of the herb are required to impart their colour and flavour to dishes[244]. Because of the cost, saffron is frequently adulterated with cheaper substitutes such as marigold flowers and safflower[244]. The flower styles are used as a tea substitute[183]. Root - cooked[183]. The corms are toxic to young animals[218] so this report of edibility should be treated with some caution[K].

tcanta DyeThe yellow dye obtained from the stigmas has been used for many centuries to colour cloth[4, 7, 14, 21]. It is the favoured colouring for the cloth of Indian swamis who have renounced the material world. A blue or green dye is obtained from the petals[168].

dwatta Abortifacient Anodyne Antispasmodic Aphrodisiac Appetizer Carminative Diaphoretic Emmenagogue Expectorant Narcotic Sedative StimulantSaffron is a famous medicinal herb with a long history of effective use, though it is little used at present because cheaper and more effective herbs are available[4, 7, 254]. The flower styles and stigmas are the parts used, but since these are very small and fiddly to harvest they are very expensive and consequently often adulterated by lesser products[7]. The styles and stigmas are anodyne, antispasmodic, aphrodisiac, appetizer, carminative, diaphoretic, emmenagogue, expectorant, sedative and stimulant[4, 7, 21, 174, 176, 218]. They are used as a diaphoretic for children, to treat chronic haemorrhages in the uterus of adults, to induce menstruation, treat period pains and calm indigestion and colic[4, 254]. A dental analgesic is obtained from the stigmas[7]. The styles are harvested in the autumn when the plant is in flower and are dried for later use[4], they do not store well and should be used within 12 months[238]. This remedy should be used with caution[21], large doses can be narcotic[240] and quantities of 10g or more can cause an abortion[218].

propta Seed - according to some reports this species is a sterile triploid and so does not produce fertile seed[90, 238]. However, if seed is obtained then it is best sown as soon as it is ripe in a cold frame[1]. Stored seed can be sown in the spring in a cold frame[1]. Germination can take 1 - 6 months at 18°c[164]. Unless the seed has been sown too thickly, do not transplant the seedlings in their first year of growth, but give them regular liquid feeds to make sure they do not become deficient. Divide the small bulbs once the plants have died down, planting 2 - 3 bulbs per 8cm pot. Grow them on for another 2 years in a greenhouse or frame and plant them out into their permanent positions when dormant in late summer[K]. It takes 3 years for plants to flower from seed[244]. Division of the clumps in late summer after the plant has died down[1, 4, 14]. The bulbs can be planted out direct into their permanent positions.

nwatta Prefers a well-drained sandy or loamy soil that is free from clay[137]. Prefers a sunny position[238]. Grows well on calcareous soils[27] and on hot sheltered stony banks[42]. Plants are very frost hardy[137]. They also thrive in areas with poor summers, though they usually fail to flower in such conditions[238]. Plants produce less saffron when grown on rich soils[137]. They do not flower very freely in Britain[90]. Saffron has been cultivated for over 4,000 years for the edible dye obtained from the flower stigmas[1]. It was at one time commercially grown in Britain and the town Saffron Walden obtained its name because of this. There is at least one named form. 'Cashmirianus' comes from Kashmir and has large high quality corms. It yields about 27 kilos of rich orange stigmas per hectare[183]. When inhaled near to, the flowers have a delicate perfume[245]. Unlike most members of this genus, the flowers do not close of a night time or in dull weather[245]. The flowers are only produced after hot, dry summers[245]. Plants tend to move considerably from their original planting place because of their means of vegetative reproduction, it is therefore wise not to grow different species in close proximity[1]. Any planting out is best done in late spring or early summer[245]. Plants take 4 - 5 years to come into flowering from seed. The plant is heat tolerant in zones 8 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the

heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2]. The root pattern is a corm swelling at the stem base [1-2].

## 6.2.231 Allium platycaule

Broadstemmed Onion

5 tlin 9 cyuc 3 kcaok 0 tcan 2 dwat 0.1 m hkuc htut cyutli kyuctcup hwicli hrasljut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Allium platycaule is a BULB growing to 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Flowers Leaves Root SeedEdible Uses: Bulb - raw or cooked[177, 257]. The bulbs are formed in clusters on a rhizome and are about 20 - 35mm in diameter[200]. Leaves - raw or cooked. Used as an onion-flavoured relish[257]. Flowers - raw. Used as a garnish on salads. The seed heads can be placed in hot ashes for a few minutes, then the seeds extracted and eaten[257].

tcanta RepellentThe juice of the plant is used as a moth repellent. The whole plant is said to repel insects and moles[20].

dwatta Although no specific mention of medicinal uses has been seen for this species, members of this genus are in general very healthy additions to the diet. They contain sulphur compounds (which give them their onion flavour) and when added to the diet on a regular basis they help reduce blood cholesterol levels, act as a tonic to the digestive system and also tonify the circulatory system[K].

propta Seed - sow spring in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle - if you want to produce clumps more quickly then put three plants in each pot. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in spring once they are growing vigorously and are large enough. Division in spring. The plants divide successfully at any time in the growing season, pot up the divisions in a cold frame or greenhouse until they are growing well and then plant them out into their permanent positions.

nwatta Prefers a sunny position in a light well-drained soil[1]. The bulbs should be planted fairly deeply[1]. Most members of this genus are intolerant of competition from other growing plants[203]. Grows well with most plants, especially roses, carrots, beet and chamomile, but it inhibits the growth of legumes[18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 6.2.232 Allium stellatum

Prairie Onion, Autumn onion

5 tlin 9 cyuc 3 kcaok 0 tcan 2 dwat 0.8 m hkuc htut cyutli tcup hwicli hrasljut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Allium stellatum is a BULB growing to 0.8 m (2ft 7in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

growing nearby[238]. If growing plants from seed it is important to ensure the seed came from a wild source or from an isolated clump of the single species[K]. Grows best in a woodland situation, young plants tolerate a reasonable level of side shade[200]. Closely related to *T. tomentos*[1]. Trees are usually attacked by aphids which cover the ground and the leaves with a sticky honeydew[188]. Quite tolerant of root disturbance, semi-mature trees up to 5 metres tall have been transplanted successfully. Plants in this genus are notably resistant to honey fungus[200].

## 6.2.111 Pyrus balsanae

5 tlin 9 cyuc 3 kcaok 0 tcan 0 dwat 15 m hkuc hmimhtut cyutli hgattcup hwicli hrasljutnykfrrip hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Pyrus balsanae is a deciduous Tree growing to 15 m (49ft 3in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil and can tolerate drought. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. A reasonable size, to 2.5cm[200]. The flesh is rather hard and harsh, though it becomes soft and sweet when bled and then makes a very good dessert fruit[K].

tcanta None known

dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe in the autumn, it will then usually germinate in mid to late winter. Stored seed requires 8 - 10 weeks cold stratification at 1°C and should be sown as early in the year as possible[200]. Temperatures over 15 - 20°C induce a secondary dormancy in the seed[200]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in a cold frame or greenhouse for their first year. Plant them out in late spring or early summer of the following year.

nwatta Prefers a good well-drained loam in full sun[1]. Grows well in heavy clay soils. Tolerates light shade but does not fruit so well in such a position. Tolerates atmospheric pollution, excessive moisture and a range of soil types if they are moderately fertile[200]. Established plants are drought tolerant[200]. Hardy to about -15°C[200]. Plants are growing and fruiting well at Kew Botanical Gardens[K].

## 6.2.112 Rhus punjabensis sinica

5 tlin 9 cyuc 3 kcaok 0 tcan 2 dwat 12 m hkuc htut cyutli tcup hwicli hrasljutnyk hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Rhus punjabensis sinica is a deciduous Tree growing to 12 m (39ft 4in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in June, and the seeds ripen from August to September. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Fruit OilEdible Uses: Drink OilFruit - raw or cooked[2, 105, 145]. The fruit is small with very little flesh, but it is produced in fairly large panicles and so is easily harvested. When soaked for 10 - 30 minutes in hot or cold water it makes a very refreshing lemonade-like drink (without any fizz of course)[K]. The mixture should not be boiled since this will release tannic acids and make the drink astringent.

tcanta Dye Mordant Oil TanninAn oil is extracted from the seeds[4]. It attains a tallow-like consistency on standing and is used to make candles. These burn brilliantly, though

they emit a pungent smoke[4]. The leaves are rich in tannin[145]. They can be collected as they fall in the autumn and used as a brown dye or as a mordant[169].

dwatta Antiseptic Astringent HaemostaticAn excretion produced on the leaf by an insect *Melaphis chinensis* or *M. paitan* is antiseptic, astringent and haemostatic[176]. It is used in the treatment of persistent cough with blood, chronic diarrhoea, spontaneous sweating, night sweats, bloody stool, urorrhoea and bloody sputum. It is used applied externally to burns, bleeding due to traumatic injuries, haemorrhoids and ulcers in the mouth[176].

propta Seed - best sown in a cold frame as soon as it is ripe. Pre-soak the seed for 24 hours in hot water (starting at a temperature of 80 - 90c and allowing it to cool) prior to sowing in order to leach out any germination inhibitors[200]. This soak water can be drunk and has a delicious lemon-flavour. The stored seed also needs hot water treatment and can be sown in early spring in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 10cm with a heel, July/August in a frame[200]. Root cuttings 4cm long taken in December and potted up vertically in a greenhouse. Good percentage[78, 200]. Suckers in late autumn to winter[200].

nwatta Succeeds in a well-drained fertile soil in full sun[11, 200]. The young growth in spring can be damaged by late frosts. This species is closely allied to *R. potaninii*[11]. This is the form of *R. punjabensis* that is most commonly grown in Britain[200]. Plants have brittle branches and these can be broken off in strong winds[200]. Plants are also susceptible to coral spot fungus[11]. Plants in this genus are notably resistant to honey fungus[200]. Many of the species in this genus are highly toxic and can also cause severe irritation to the skin of some people, whilst other species such as this one are not poisonous. It is relatively simple to distinguish which is which, the poisonous species have axillary panicles and smooth fruits whilst non-poisonous species have compound terminal panicles and fruits covered with acid crimson hairs[1, 4]. The toxic species are sometimes separated into their own genus, *Toxicodendron*, by some botanists[200]. Dioecious. Male and female plants must be grown if seed is required.

## 6.2.113 Malus fusca

Oregon Crab, Oregon crab apple

5 tlin 9 cyuc 3 kcaok 0 tcan 2 dwat 12 m hkuc hmimhtut cyutli tcup hwicli hrasljutnykfrrip hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Malus fusca is a deciduous Tree growing to 12 m (39ft 4in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Pectin PectinFruit - raw or cooked[11, 101]. Up to 2cm in diameter[229]. An agreeable sub-acid taste, it can be eaten out of hand or made into jellies, preserves etc[183]. The fruit can be left on the tree until there have been some autumn frosts, this will soften the fruit and make it somewhat less acid[K]. The fruit is rich in pectin so it can be added to pectin-low fruits when making jams or jellies[183, 257]. Pectin is also said to protect the body against radiation[201]. tcanta Pectin Pectin WoodThe fruit is a source of pectin[183]. Wood - larid, close grained, durable. Used for mallets, tool handles and bearings[11, 82, 99, 101, 226].

dwatta Antirheumatic Astringent Diuretic Dysentery Eczema Laxative Ophthalmic Pectoral Skin Stomachic TB TonicOregon crab was employed medicinally by several native North American Indian tribes who used it to treat a variety of complaints[257]. In particular, it gained a reputation with some tribes as a heal-all, especially useful for treating any of the internal organs[257]. It is little, if at all, used in modern herbalism. The trunk, bark and inner

bark are antirheumatic, astringent, blood purifier, cardiac, diuretic, laxative and tonic[257]. A decoction has been used in the treatment of coughs, stomach ulcers, dysentery, diarrhoea, rheumatism and consumption[257]. The shredded bark has been used to treat blood spitting[257]. A poultice of the chewed bark has been applied to wounds[257]. An infusion of the bark is used as an eyewash[257]. A decoction of the bark is used as a wash on cuts, eczema and other skin problems[257]. An infusion of the bark, combined with wild cherry bark (*Prunus* sp.) has been used as a cure-all tonic[257]. The juice scraped from the peeled trunk has been used as an eye medicine[257]. The soaked leaves have been chewed in the treatment of lung problems[257].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. It usually germinates in late winter. Stored seed requires stratification for 3 months at 1°c and should be sown in a cold frame as soon as it is received[200]. It might not germinate for 12 months or more. Prick out the seedlings into individual pots as soon as they are large enough to handle. If given a rich compost they usually grow away quickly and can be large enough to plant out in late summer, though consider giving them some protection from the cold in their first winter. Otherwise, keep them in pots in a cold frame and plant them out in late spring of the following year. Cuttings of mature wood, November in a frame[11].

nwatta An easily grown plant, it succeeds in most fertile soils, preferring a moisture retentive well-drained loamy soil[1, 200]. Grows well in heavy clay soils. Prefers a sunny position but succeeds in partial shade, though it fruits less well in such a situation[200]. A very ornamental plant[1], it is slow-growing in the wild[229]. Hybridizes freely with other members of this genus[200]. The fruit is a good wildlife food source, especially for birds[200]. Plants in this genus are notably susceptible to honey fungus[200].

### 6.2.114 *Rhus punjabensis*

5 tlin 9 cyuc 3 kcaak 0 tcan 2 dwat 12 m hkuc htut cyutli tcup hwicli hrasjlut hpa7tli flatprikliw hpa7tmwatli nyanhjen hjonli

drutta *Rhus punjabensis* is a deciduous Tree growing to 12 m (39ft 4in). See above for USDA hardness. It is hardy to UK zone 6 and is not frost tender. It is in flower in June. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcaakta Edible Parts: Fruit OilEdible Uses: Drink OilFruit - raw or cooked[2, 105, 145]. The fruit is small with very little flesh, but it is produced in fairly large panicles and so is easily harvested. When soaked for 10 - 30 minutes in hot or cold water it makes a very refreshing lemonade-like drink (without any fizz of course)[K]. The mixture should not be boiled since this will release tannic acids and make the drink astringent.

tcanta Dye Mordant OilAn oil is extracted from the seeds[4]. It attains a tallow-like consistency on standing and is used to make candles. These burn brilliantly, though they emit a pungent smoke[4]. The leaves are rich in tannin[145]. They can be collected as they fall in the autumn and used as a brown dye or as a mordant[169].

dwatta Antiseptic Astringent HaemostaticAn excretion produced on the leaf by an insect *Melaphis chinensis* or *M. paitan* is antiseptic, astringent and haemostatic[176]. It is used in the treatment of persistent cough with blood, chronic diarrhoea, spontaneous sweating, night sweats, bloody stool, urorrhoea and bloody sputum. It is used applied externally to burns, bleeding due to traumatic injuries, haemorrhoids and ulcers in the mouth[176].

propta Seed - best sown in a cold frame as soon as it is ripe. Japanese Raisin Tree

5 tlin 9 cyuc 3 kcaak 3 tcan 2 dwat 10 m hkuc htut cyutli tcup hwicli hrasjlut hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Hovenia dulcis* is a deciduous Tree growing to 10 m (32ft) by 7 m (23ft). See above for USDA hardness. It is hardy to UK zone 6 and is not frost tender. It is in flower in July, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcaakta Edible Parts: FruitEdible Uses: SweetenerFruit - raw or cooked[2, 11, 158]. They can be dried when they have the sweet flavour and texture of raisins and can be used similarly[183]. The fruit is sweet and fragrant[105, 147] with a pear-like flavour[218]. Dry and sub-acid[61]. It is not a true fruit but a swollen receptacle[200]. The fruit is up to 3cm long[2], it contains 11.4% glucose, 4.7% fructose and 12.6% sucrose[218]. A sweet extract of the seed, boughs and young leaves is used as a substitute for honey[183]. The seed contains 15% protein and 7.8% fat[218].

tcanta WoodThe wood is hard and fine grained. It is good for making furniture[266].

dwatta Antispasmodic Febrifuge LaxativeAntispasmodic, febrifuge, laxative[147, 178]. The fruit is antispasmodic, febrifuge, laxative and diuretic[218]. The seeds are diuretic and are used in the treatment of alcohol overdose[218]. The seeds are used to relieve intoxication due to wine[240]. The stem bark is used in the treatment of rectal diseases[218].

propta Seed - germinates freely if sown as soon as it is ripe in a cold frame[200]. Stored seed should be scarified and sown in early spring[113], it may not germinate for a year. Prick out the seedlings into individual pots when large enough to handle and grow on for at least their first winter in a greenhouse. Plant out in late spring after the last expected frosts and give some winter protection for their first couple of years outdoors. Cuttings of half-ripe wood, July/August in a frame[200]. Cuttings of mature wood, late autumn in a frame[200].

nwatta Grows well in a fertile sandy loam in a sunny position[200]. Although the dormant plant is hardy to at least -15°c in Britain, it really prefers a continental climate to fully ripen its wood, it is then hardy to about -25°c[200]. The shoot tips are sometimes damaged by winter frosts in Britain[1] and the young growth in spring can also be damaged by late frosts[K]. The Japanese raisin tree is said to grow well in Cornwall[59], though our experience of this plant so far (1995) is that it is very difficult to establish. Perhaps older plants are as hardy as the reports above suggest, but younger plants are quite tender and often die in their first few winters

Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

### 6.2.228 *Allium vineale*

Crow Garlic, Wild garlic, Compact onion, False Garlic, Wild, Onion

5 tlin 8 cyuc 3 kcaak 2 tcan 2 dwat 0.6 m hkuc htut cyutli kyuctcup hwicli hrasjlut hpa7tli flatprikliw hpa7tmwatli fyifxre7t hjonli

drutta *Allium vineale* is a BULB growing to 0.6 m (2ft) by 0.1 m (0ft 4in) at a medium rate. See above for USDA hardness. It is hardy to UK zone 5 and is not frost tender. It is in leaf from October to August, in flower from June to July, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcaakta Edible Parts: Flowers Leaves RootEdible Uses: Leaves - raw or cooked[5, 177]. Rather stringy, they are used as a garlic substitute[2, 12, K]. The leaves are available from late autumn until the following summer, when used sparingly they make a nice addition to the salad bowl[8, 183, K]. Bulb - used as a flavouring[105, 161, 177]. Rather small, with a very strong flavour and odour[183]. The bulbs are 10 - 20mm in diameter[200]. Bulbils - raw or cooked. Rather small and fiddly, they have a strong garlic-like flavour[K].

tcanta RepellentThe juice of the plant is used as a moth repellent. The whole plant is said to repel insects and moles[20]. The juice of the plant can be rubbed on exposed parts of the body to repel biting insects, scorpions etc[257].

dwatta Antiasthmatic Blood purifier Carminative Cathartic Diuretic Expectorant Stimulant VasodilatorThe whole plant is antiasthmatic, blood purifier, carminative, cathartic, diuretic, expectorant, hypotensive, stimulant and vasodilator[20, 257]. A tincture is used to prevent worms and colic in children, and also as a remedy for croup[257]. The raw root can be eaten to reduce blood pressure and also to ease shortness of breath[257]. Although no other specific mention of medicinal uses has been seen for this species, members of this genus are in general very healthy additions to the diet. They contain sulphur compounds (which give them their onion flavour) and when added to the diet on a regular basis they help reduce blood cholesterol levels, act as a tonic to the digestive system and also tonify the circulatory system[K].

propta Plants do not need any encouragement, they are more than capable of propagating themselves. Bulbils are produced in abundance in the summer and are the main means by which the plant spreads.

nwatta Prefers a sunny position in a light well-drained soil[1]. The bulbs should be planted fairly deeply[1]. Grows well with most plants, especially roses, carrots, beet and chamomile, but it inhibits the growth of legumes[18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. This species is a pernicious weed of grassland in Britain[1], spreading freely by means of its bulbils[203]. Members of this genus are rarely if ever troubled by browsing deer[233].

### 6.2.229 *Lactuca perennis*

Perennial Lettuce

5 tlin 9 cyuc 3 kcaak 0 tcan 2 dwat 0.6 m hkuc htut cyutli kyuctcup hwicli hrasjlut hpa7tli flatprikliw hpa7tmwatli fyifxre7t hjonli

drutta *Lactuca perennis* is a PERENNIAL growing to 0.6 m (2ft) by 0.3 m (1ft in). See above for USDA hardness. It is hardy to UK zone 6 and is not frost tender. It is in flower from June to August, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-

fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcaakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked[27, 46, 61, 105, 183]. The leaves are often blanched to reduce any bitterness. They are fairly acceptable raw in salads (even without being blanched), especially in late winter and spring when the flavour is quite mild[K]. The leaves do become much more bitter in the summer, however, especially as the plant comes into flower[K].

tcanta None known

dwatta Although we have seen no specific reports for this species, most if not all members of the genus have a milky sap that contains the substance 'lactucarium' and can probably be used as the report below details[K]. The whole plant is rich in a milky sap that flows freely from any wounds. This hardens and dries when in contact with the air[4]. The sap contains 'lactucarium', which is used in medicine for its anodyne, antispasmodic, digestive, diuretic, hypnotic, narcotic and sedative properties[9, 21, 46, 165, 192, 213, 238]. Lactucarium has the effects of a feeble opium, but without its tendency to cause digestive upsets[4], nor is it addictive[7]. It is taken internally in the treatment of insomnia, anxiety, neuroses, hyperactivity in children, dry coughs, whooping cough, rheumatic pain etc[238]. Concentrations of lactucarium are low in young plants and most concentrated when the plant comes into flower[238]. It is collected commercially by cutting the heads of the plants and scraping the juice into china vessels several times a day until the plant is exhausted[4]. An infusion of the fresh or dried flowering plant can also be used[9]. The plant should be used with caution, and never without the supervision of a skilled practitioner. Even normal doses can cause drowsiness whilst excess causes restlessness[238] and overdoses can cause death through cardiac paralysis[7, 9]. Some physicians believe that any effects of this medicine are caused by the mind of the patient rather than by the medicine[213]. The sap has also been applied externally in the treatment of warts[222].

propta Seed - sow April in a greenhouse, only just covering the seed. Germination is usually fairly quick When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring. It is best to pot up the divisions and keep them in a lightly shaded position in a cold frame until they are growing away well. Plant them out in the summer. Root cuttings in spring[K].

nwatta Prefers a light well-drained sandy loam and a sunny position[187]. Plants are hardy to about -25°c[187]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2].

### 6.2.230 *Crocus sativus*

Saffron

5 tlin 9 cyuc 3 kcaak 2 tcan 3 dwat 0.1 m hkuc hmimhtut cyutli kyuctcup hwicli vyhshrasjlut hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Crocus sativus* is a CORM growing to 0.1 m (0ft 4in) by 0.1 m (0ft 4in). See above for USDA hardness. It is hardy to UK zone 6 and is not frost tender. It is in leaf from October to May, in flower in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, butterflies. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcaakta Edible Parts: RootEdible Uses: Colouring Condiment TeaThe flower styles are commonly used as a flavouring and yellow colouring for various foods such as bread, soups, sauces, rice and puddings[2, 4, 7, 14, 21, 27, 34, 183]. They are an essential ingredient of many traditional dishes such as paella, bouillabaisse, risotto milanese

in small quantities it also aids digestion[254]. It can be applied as a poultice and will relieve any kind of roseola and is effective wherever there are fragile superficial veins[7]. An infusion of the fresh or dried herb can be added to the bath water and its emollient property will help to reduce inflammation - in rheumatic joints for example - and encourage tissue repair[254]. Chickweed is best harvested between May and July, it can be used fresh or be dried and stored for later use[4, 238]. A decoction of the whole plant is taken internally as a post-partum depurative, emmenagogue, galactagogue and circulatory tonic[218]. It is also believed to relieve constipation and be beneficial in the treatment of kidney complaints[244]. The decoction is also used externally to treat rheumatic pains, wounds and ulcers[4, 218, 222]. The expressed juice of the plant has been used as an eyewash[244].

propta Seed

nwatta A perennial herbaceous wildflower for Partial or Dappled Shade. Water Preferences: Mesic (environment or habitat containing a moderate amount of moisture). Soil pH preferences: Slightly acid (6.1 - 6.5). Flowers: White/Showy. Bloom Time: Mar to May. Resistances: Humidity tolerant.

## 6.2.226 Gaultheria pyroloides

5 tin 9 cyuc 3 kcaak 0 tcan 0 dwat 0.3 m hkuc hmim cyutli tcup hwicli hrasjlut hpa7tli frusflatprik hpa7tmwatli xre7t hjonli

drutta Gaultheria pyroloides is an evergreen Shrub growing to 0.3 m (1ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcaakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[3, 11, 183]. A sweet flavour. The fruit is about 10mm in diameter[200].

tcanta None known

dwatta None known

propta The seed requires a period of cold stratification. Pre-chill for 4 - 10 weeks and then surface sow in a lime-free compost in a shady part of the greenhouse and keep the compost moist[78]. The seed usually germinates well, usually within 1 - 2 months at 20°C, but the seedlings are liable to damp off. It is important to water them with care and to ensure that they get plenty of ventilation. Watering them with a garlic infusion can also help to prevent damping off[K]. Prick out the seedlings into individual pots when they are about 25mm tall and grow them on in light shade in the greenhouse for at least their first winter[K]. Plant them out in late spring or early summer. The seedlings are susceptible to spring frosts so might need some protection for their first few years outdoors. The leaves remain very small for the first few years[11]. Cuttings of half-ripe wood 3 - 6cm long, July/August in a frame in a shady position. They form roots in late summer or spring[78]. A good percentage usually take. Division can be carried out at almost any time of the year, but works best in the spring just before new growth begins[K]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Prefers a moist but not boggy humus rich soil in shade or semi-shade[11, 182]. A peat and moisture loving species, it requires a lime-free soil[11, 182]. An easily grown plant, it succeeds in most situations[182]. This species is often confused with *G. pyroloides*[11] and *G. pyrolifolia*[182]. It was mistakenly originally included in *G. pyroloides* though it is in fact quite distinct and is closely related to *G. cuneata*[11, 182]. Further evidence has shown that the original description of *Gaultheria pyroloides* refers to the Japanese species, whilst *Gaultheria pyrolifolia* is a distinct Himalayan species[266]. *Gaultheria miqueliana* is thus a synonym of *G. pyroloides*[266]. A very ornamental plant[11]. The flowers are scented[245]. Plants in this genus are notably resistant to honey fungus[200].

## 6.2.227 Petasites japonicus

Sweet Coltsfoot, Japanese sweet coltsfoot, Butterbur  
5 tin 9 cyuc 3 kcaak 1 tcan 2 dwat 0.6 m hkuc pcmhmmhtut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flatprikwis hpa7tmwatli ynphanjen hjonli

drutta Petasites japonicus is a PERENNIAL growing to 0.6 m (2ft) by 1.5 m (5ft in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in February, and the seeds ripen in March. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcaakta Edible Parts: Flowers StemEdible Uses: Leaf stalks - cooked and used like rhubarb[1, 2, 46, 116]. The stems can be up to 1.2 metres long[104]. They can be boiled and seasoned, pickled and used in winter soups or preserved in miso[183]. They can be boiled, dipped in cold water then peeled and baked - they have a pleasant fragrant taste[206]. Flower buds cooked or used as a flavouring[1, 22, 46, 61, 105]. A slightly bitter yet agreeable flavour[116, 206], they are much prized in Japan[183]. They can be eaten whilst still green with miso or boiled down in soy sauce[183]. The young flowering stems can be eaten cooked[206].

tcanta MiscellanyThe leaves of the sub-species *P. japonicus giganteus* are used as umbrellas by Japanese children[187]. The leaf stalks can be used as walking sticks[206]. Plants can be grown as ground cover in damp shady places[206]. They are too invasive for most gardens and should only be used where they have plenty of room[208].

dwatta Antiasthmatic Antispasmodic Expectorant Miscellany PoulticeThe plant (though the exact part of the plant used is not specified) is antiasthmatic, antispasmodic, expectorant and poultice[147]. A decoction is used in the treatment of chronic coughing and pulmonary 'deficiency', laboured or difficult breathing and asthma, constant sputum formation and pulmonary tuberculosis[147].

propta Seed - we have no information on this species but suggest sowing the seed in a cold frame as soon as it is ripe or in early spring. Only just cover the seed and do not allow the compost to dry out. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division succeeds at almost any time of the year. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Landscape Uses:Container, Ground cover, Massing, Woodland garden. Succeeds in ordinary garden soil[1], but prefers a deep fertile humus-rich soil that is permanently moist but not stagnant, succeeding in shade, semi-shade or full sun[200]. Requires a moist shady position[187]. Plants can be grown in quite coarse grass, which can be cut annually in the autumn[233]. A very invasive plant, too rampant for anything other than the wild garden[187, 200]. Its roots are very difficult to eradicate[200]. The sub-species *P. japonicus giganteus* has huge leaves up to 1.5 metres across on stems 2 metres tall[187]. It has a poorer flavour than the species type[206]. Sometimes cultivated in E. Asia as a food plant[1, 58]. Dioecious, male and female plants must be grown if seed is required. Special Features:Attractive foliage, Not North American native, Invasive, Wetlands plant, Flower characteristics are unknown. Petasites japonicus giganteus (Petasites japonicus subsp. giganteus F.Schmidt ex Kitam) is a larger version of Petasites japonicus commonly know as giant fuki. It can grow in similar hardiness zones to fuki but can grow in wetter conditions and tolerate more sun. It can grow to 5 ft (1.5m). The plant is heat tolerant in zones 9 through 5. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat

outdoors[K]. The Japanese raisin tree is cultivated for its edible fruit in Japan. The small white flowers are scented and are produced in terminal cymes[245]. The plant is heat tolerant in zones 8 through 5. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2].

## 6.2.116 Amelanchier arborea

Downy Serviceberry, Alabama serviceberry, Juneberry, Common Serviceberry, Downy Serviceberry  
5 tin 8 cyuc 3 kcaak 2 tcan 1 dwat 10 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprik hpa7tmwatli fyfxre7t hjonli

drutta Amelanchier arborea is a deciduous Tree growing to 10 m (32ft) by 12 m (39ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower in April, and the seeds ripen from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: FruitEdible Uses: Edible fruit - raw or cooked[101, 227]. The fruit has a few small seeds at the centre, some forms are dry and tasteless[11, 177, 227] whilst others are sweet and juicy[183, 227]. The fruit ripens unevenly over a period of 2 - 3 weeks and is very attractive to birds, this makes harvesting them in quantity rather difficult[229]. The fruit is borne in small clusters and is up to 10mm in diameter[200]. It is rich in iron and copper[226].

tcanta Soil stabilizationThe trees have an extensive root system and can be planted on banks etc for erosion control[200]. Wood - close-grained, hard, strong, tough and elastic. It is one of the heaviest woods in N. America, weighing 49lb per cubic foot[227, 274]. Too small for commercial interest, it is sometimes used for making handles[227, 229].

dwatta Anthelmintic Astringent Tonic VDA compound infusion of the plant has been used as an anthelmintic, in the treatment of diarrhoea and as a spring tonic[257]. An infusion of the bark has been used in the treatment of gonorrhoea[257].

propta Seed - it is best harvested 'green', when the seed is fully formed but before the seed coat has hardened, and then sown immediately in pots outdoors or in a cold frame. If stored seed is obtained early enough in the autumn, it can be given 4 weeks warm stratification before being left out in the winter and it should then germinate in the spring. Otherwise seed can be very slow to germinate, perhaps taking 18 months or more. When large enough to handle, prick the seedlings out into individual pots and grow them on in a sheltered outdoor position, planting them out once they are 20cm or more tall. If there is sufficient seed it is best to sow it thinly in an outdoor seedbed[78, 80]. Grow the seedlings on for two years in the seedbed before planting them out into their permanent positions during the winter. Layering in spring - takes 18 months[78]. Division of suckers in late winter. The suckers need to have been growing for 2 years before you dig them up, otherwise they will not have formed roots. They can be planted out straight into their permanent positions if required.

nwatta Landscape Uses: Specimen, Street tree, Woodland garden. Prefers a rich loamy soil in a sunny position or semi-shade[1, 200] but thrives in any soil that is not too dry or water-logged[11]. Grows well in heavy clay soils. All members of this genus have edible fruits and, whilst this is dry and uninteresting in some species, in many others it is sweet and juicy. Many of the species have potential for

use in the garden as edible ornaments. The main drawback to this genus is that birds adore the fruit and will often completely strip a tree before it is fully ripe[K]. The plant becomes dwarfed when growing in sterile (poor and acid) ground[227]. Hybridises with *A. bartramiana*, *A. canadensis*, *A. humilis* and *A. laevis*. Grafting onto seedlings of *A. lamarckii* or *Sorbus aucuparia* is sometimes practised in order to avoid the potential problem of hybridizing[1]. Special Features:Attracts birds, North American native, Attracts butterflies, Blooms are very showy. The plant is heat tolerant in zones 9 through 4. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is multistemmed with multiple stems from the crown [1-2].

## 6.2.117 Castanea seguinii

Chinese Chinquapin  
5 tin 9 cyuc 3 kcaak 0 tcan 0 dwat 10 m hkuc htut cyutli hgtakyuctup hwicli vyhshrasjlutnyik hpa7tli frusflatprik hpa7tmwatli hjonli

drutta Castanea seguinii is a deciduous Tree growing to 10 m (32ft 10in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in July, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcaakta Edible Parts: SeedEdible Uses: Seed - raw or cooked[105, 177]. Small, but a good flavour[61, 183]. Eaten raw, there is a distinct astringency, especially if the fleshy inner skin beneath the outer shell of the seed is not removed[K]. When cooked, however, and especially when baked, the seed becomes much sweeter and has a floury texture[K]. It then makes an excellent food and can be used as a staple food in much the same way as potatoes or cereals[K].

tcanta TanninThe bark, leaves, wood and seed husks all contain tannin. Wood - hard, strong, light. Used for fence posts etc.

dwatta None known

propta Seed - where possible sow the seed as soon as it is ripe in a cold frame or in a seed bed outdoors[78]. The seed must be protected from mice and squirrels. The seed has a short viability and must not be allowed to become dry. It can be stored in a cool place, such as the salad compartment of a fridge, for a few months if it is kept moist, but check regularly for signs of germination. The seed should germinate in late winter or early spring. If sown in an outdoor seedbed, the plants can be left in situ for 1 - 2 years before planting them out in their permanent positions. If grown in pots, the plants can be put out into their permanent positions in the summer or autumn, making sure to give them some protection from the cold in their first winter[K].

nwatta Prefers a good well-drained slightly acid loam but succeeds in dry soils[1, 11, 200]. Once established, it is very drought tolerant[1, 11, 200]. Very tolerant of highly acid, infertile dry sands[200]. Averse to calcareous soils but succeeds on harder limestones[11, 200]. This species can vary in size from a shrub 4 metres tall to, rarely, a tree 12 metres tall[266]. It is allied to the dwarf N. American species *C. pumila*[11], but unlike that species it has 3 seeds per bur[183]. Valued in breeding programmes because of its dwarf stature and heavy bearing at an early age[183]. Sometimes cultivated for its edible seed in China[266]. Although it is winter-hardy in most of Britain, this species only really thrives in areas with hot summers[200]. An excellent

soil-enriching understorey in pine forests[200]. Flowers are produced on wood of the current year's growth[229]. Plants are fairly self-sterile[200]. They hybridize freely with other members of this genus[200]. Plants in this genus are notably resistant to honey fungus[200].

### 6.2.118 Fraxinus ornus

Manna Ash, Flowering ash

5 tlin 6 cyuc 3 kcaak 0 tcan 3 dwat 9 m hkuc htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

drutta Fraxinus ornus is a deciduous Tree growing to 9 m (29ft) by 6 m (19ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in May, and the seeds ripen from September to December. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerates strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: MannaEdible Uses: Manna - a sweetish exudate is obtained from the stems by incision[2, 4, 11, 114, 171, 183]. The quality is better from the upper stems. A mild sweet taste[114], its main use is as a mild and gentle laxative[171], though it is also used as a sweetener in sugar-free preparations and as an anti-caking agent[238]. The tree trunk must be at least 8cm in diameter before the manna can be harvested[4]. A vertical series of oblique incisions are made in the trunk in the summer once the tree is no longer producing many new leaves[4]. One cut is made every day from July to the end of September. A whitish glutinous liquid exudes from this cut, hardens and is then harvested[2]. Dry and warm weather is essential if a good harvest is to be realised[4]. The tree is harvested for 9 consecutive years, which exhausts the tree. This is then cut down, leaving one shoot to grow back. It takes 4 - 5 years for this shoot to become productive[2]. Average yields of 6 kilos per hectare of top quality manna, plus 80 kilos of assorted manna are achieved[2].

tcanta None known

dwatta Laxative TonicThe manna obtained from the trunk is a gentle laxative and a tonic[4, 46]. It is especially valuable for children and pregnant women[4, 238]. Its action is normally very mild, though it does sometimes cause flatulence and pain[4].

propta The seed is best harvested green - as soon as it is fully developed but before it has fully dried on the tree - and can then be sown immediately in a cold frame[80]. It usually germinates in the spring[80]. Stored seed requires a period of cold stratification and is best sown as soon as possible in a cold frame[200]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant them out into their permanent positions or a nursery bed in late spring or early summer of the following year. If you have sufficient seed then it is possible to sow it directly into an outdoor seedbed, preferably in the autumn. Grow the seedlings on in the seedbed for 2 years before transplanting either to their permanent positions or to nursery beds.

nwatta Landscape Uses:Pollard, Specimen. Prefers a deep loamy soil, even if it is on the heavy side[1, 200]. Most members of this genus are gross feeders and require a rich soil[11, 200]. Succeeds in exposed positions[200] and in alkaline soils[11]. Requires a moist soil according to some reports[1, 11] whilst another says that it succeeds in drier soils[200]. Plants are tolerant of atmospheric pollution[200]. Although the dormant plant is very cold-hardy, the young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. A very ornamental plant[1], the manna ash is cultivated for its edible manna in Sicily and Calabria[89, 142]. The flowers are sweetly scented[245]. Trees have a very dense canopy[11]. Dioecious. Male and female plants must be grown if seed is required. Special Features:Not North American native, Attractive flowers or blooms.

### 6.2.119 Amelanchier interior

Pacific serviceberry

5 tlin 9 cyuc 3 kcaak 0 tcan 0 dwat 9 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Amelanchier interior is a deciduous Tree growing to 9 m (29ft 6in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. A sweet taste[177, K] and a juicy texture[229, K], even before the fruit is fully ripe[K]. The fruit is produced in small clusters and is up to 8mm in diameter[229]. The fruit is rich in iron and copper[226]. This species has been seen fruiting well at Kew where the fruit ripened about 3 weeks later than most of the other species[K].

tcanta None known

dwatta None known

propta Seed - it is best harvested 'green', when the seed is fully formed but before the seed coat has hardened, and then sown immediately in pots outdoors or in a cold frame. If stored seed is obtained early enough in the autumn, it can be given 4 weeks warm stratification before being left out in the winter and it should then germinate in the spring. Otherwise seed can be very slow to germinate, perhaps taking 18 months or more. When large enough to handle, prick the seedlings out into individual pots and grow them on in a sheltered outdoor position, planting them out once they are 20cm or more tall. If there is sufficient seed it is best to sow it thinly in an outdoor seedbed[78, 80]. Grow the seedlings on for two years in the seedbed before planting them out into their permanent positions during the winter. Layering in spring - takes 18 months[78]. Division of suckers in late winter. The suckers need to have been growing for 2 years before you dig them up, otherwise they will not have formed roots. They can be planted out straight into their permanent positions if required.

nwatta We have very little information on this species. We do not know if it will be hardy in Britain, though it is growing and fruiting well at Kew Gardens in London[K] and judging by its native range it should succeed outdoors in most parts of the country. This species is not stoloniferous[43]. The following notes are based on the general needs of the genus. Prefers a rich loamy soil in a sunny position or semi-shade[1, 200] but thrives in any soil that is not too dry or water-logged[11]. Grows well in heavy clay soils. All members of this genus have edible fruits and, whilst this is dry and uninteresting in some species, in many others it is sweet and juicy. Many of the species have potential for use in the garden as edible ornamentals. The main draw-back to this genus is that birds adore the fruit and will often completely strip a tree before it is fully ripe[K]. Hybridizes freely with other members of this genus[200]. Grafting onto seedlings of *A. lamarckii* or *Sorbus aucuparia* is sometimes practised in order to avoid the potential problem of hybridizing[1].

### 6.2.120 Arundinaria gigantea

Canebrake bamboo, Cane Reed, Giant cane

5 tlin 9 cyuc 3 kcaak 4 tcan 1 dwat 9 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Arundinaria gigantea is an evergreen Bamboo growing to 9 m (29ft 6in). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Seed Shoots StemEdible Uses: Young shoots - cooked[11, 22, 46, 105, 183]. Used as a pot-herb[236]. Seed - cooked[46, 61, 161]. It can be used

above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [2-1].

### 6.2.223 Satureja hortensis

Summer Savory

5 tlin 9 cyuc 3 kcaak 3 tcan 2 dwat 0.3 m hkuc htut cyutli hgatkyuctcup hwicli hrasjlut hpa7tli flatprikliwisp hpa7tmwatli fyifxre7t hjonli

drutta Satureja hortensis is a ANNUAL growing to 0.3 m (1ft) by 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: LeavesEdible Uses: Condition TeaLeaves - raw or cooked[1, 2, 20, 27, 34, 37, 52]. An aromatic, slightly peppery flavour, they are used mainly as a flavouring for cooked foods, especially the more difficult to digest foods such as beans where they compliment the flavour and reduce flatulence[183, 244]. They are also used as a garnish for salads etc[183]. The leaves can be used fresh or dried[183]. A herb tea is made from the leaves[14]. The leaves are harvested just before the plant comes into flower[183]. A tangy, marjoram-like flavour[183]. The flowering shoots contain about 0.5% essential oil[7], this is used as a food flavouring[46, 61, 105].

tcanta Essential RepellentThe essential oil from the flowering shoots is used extensively in perfumery, giving a particular quality to the fragrance[7]. When grown near beans it repels insect pests[201]. Dynamic accumulator.

dwatta Antirheumatic Antiseptic Aromatic Carminative Digestive Expectorant Stings StomachicSummer savory is most often used as a culinary herb, but it also has marked medicinal benefits, especially upon the whole digestive system[254]. The plant has a milder action than the closely related winter savory, *S. montana*[254]. The whole herb, and especially the flowering shoots, is antiseptic, aromatic, carminative, digestive, expectorant and stomachic[4, 7, 14, 21]. Taken internally, it is said to be a sovereign remedy for colic and a cure for flatulence[4], whilst it is also used to treat nausea, diarrhoea, bronchial congestion, sore throat and menstrual disorders[238]. It should not be prescribed for pregnant women[238]. A sprig of the plant, rubbed onto bee or wasp stings, brings instant relief[4]. The plant is harvested in the summer when in flower and can be used fresh or dried[238]. The essential oil forms an ingredient in lotions for the scalp in cases of incipient baldness[7]. An ointment made from the plant is used externally to relieve arthritic joints[7].

propta Seed - sow April in situ and only just cover[1]. Germinates in about 2 weeks. The plant strongly resents root disturbance so do not transplant it. In areas with mild winters an autumn sowing will provide an earlier supply of leaves[200].

nwatta A very easily grown plant when given suitable conditions, it prefers a rich light soil with plenty of moisture[1, 4, 14, 27] and succeeds in a hot dry sunny position[200]. It prefers growing in an alkaline soil[200] but is not too fussy. It is very intolerant of soils that remain damp and dislikes shade[200]. Summer savory is often grown as a culinary herb. It is a good companion plant in the garden, where it helps to repel insect pests and grows especially well with onions and beans[14, 18, 20]. A fast-growing plant, it can be harvested within 2 months of sowing the seed[244]. If cut back as the flower buds appear, it will produce a fresh flush of leaves[1]. Summer savory seeds can prevent the germination of nearby seeds[201]. The leaves have an aromatic fragrance[245]. The flowers are very attractive to bees[7, 14]. Members of this genus are rarely if ever troubled by browsing deer[233].

### 6.2.224 Gaylussacia dumosa

Dwarf Huckleberry

5 tlin 9 cyuc 3 kcaak 0 tcan 0 dwat 0.3 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta Gaylussacia dumosa is a deciduous Shrub growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in June. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked and used as a pie filling etc[3, 62, 183]. Juicy and deliciously spicy[183]. Watery and insipid[235], though commonly eaten according to another report[177]. Not much valued[11]. The fruit is about 8mm in diameter[235].

tcanta None known

dwatta None known

propta Seed - best sown in the autumn in a cold frame[200]. Stored seed requires 1 month warm stratification followed by 2 months cold[113]. When large enough to handle, prick the seedlings out into individual pots of lime-free compost and grow them on in light shade in a greenhouse or cold frame for at least their first winter. Plant out into their permanent positions in late spring or early summer when they are at least 15cm tall. Cuttings of half-ripe wood, July/August in a frame[200]. Layering. Division in spring.

nwatta Requires a lime-free moist peaty soil, thriving in sun or part shade[1, 182]. Prefers a sandy soil[11]. Succeeds in wetter soils than other members of this genus[200]. Plants are hardy to about -15°C[200]. A very ornamental[1] and freely suckering shrub[182].

### 6.2.225 Stellaria pubera

Star chickweed

5 tlin 8 cyuc 3 kcaak 3 tcan 1 dwat 0.2 m hkuc pcmihmm cyutli tcup hwicli jlutnyik hpa7tli flatprik hpa7tmwatli hjonli

drutta Stellaria pubera is a PERENNIAL growing to 0.2 m (0ft 8in) by 0.2 m (0ft 8in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. The flowers are pollinated by Bees, Insects. It is noted for attracting wildlife. Suitable for: medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Leaves. Lettuce like greens - good [2-1]. Fresh greens - salad, potherb, dried and added to soups. Seeds sprouted and eaten [318-1]. Probably similar qualities to *Stellaria media*.

tcanta A good medium to high density groundcover [1-2]. Soap - Contains saponins [318-1]. Insectory: The flowers of Star Chickweed attract cuckoo bees (*Nomada* spp.), mason bees (*Osmia* spp.), Halictid bees (*Augochlorella* spp., *Lasioglossum* spp.), Andrenid bees (*Andrena* spp.), the Giant Bee Fly (*Bombilybia* major), Syrphid flies, and other miscellaneous flies. Butterflies and skippers are rare visitors of the flowers. These insects are attracted primarily to the nectar of the flowers, although some of the bees collect pollen for their larvae and some of the flies feed on pollen as adults. Insects that feed on *Stellaria* spp., including possibly this chickweed, are the aphid *Abstrusomyzus phloxae*, the Pale Tortoise Beetle (*Cassida flaveola*), and caterpillars of a moth, *Lobocleta ossularia* (*Drab Brown Wave*) [318-1]. Domestic animal forage: Used to feed chickens [318-1].

dwatta Although no information could be found for this species it is likely to have similar properties to *Stellaria media*. *Stellaria media* (Chickweed) has a very long history of herbal use, being particularly beneficial in the external treatment of any kind of itchy skin condition[238]. It has been known to soothe severe itchiness even where all other remedies have failed[254]. In excess doses chickweed can cause diarrhoea and vomiting[254]. It should not be used medicinally by pregnant women[254]. The whole plant is astringent, carminative, demulcent, diuretic, expectorant, laxative, refrigerant, vulnerary[4, 7, 9, 21, 54, 165, 222]. Taken internally it is useful in the treatment of chest complaints and

without the supervision of a skilled practitioner. Even normal doses can cause drowsiness whilst excess causes restlessness[238] and overdoses can cause death through cardiac paralysis[7, 9]. Some physicians believe that any effects of this medicine are caused by the mind of the patient rather than by the medicine[213]. The sap has also been applied externally in the treatment of warts[222]. The seed is anodyne and galactagogue[218]. Lettuce has acquired a folk reputation as an anaphrodisiac, anodyne, carminative, diuretic, emollient, febrifuge, hypoglycaemic, hypnotic, narcotic, parasiticide and sedative[218].

propta Seed - sow a small quantity of seed in situ every 2 or 3 weeks from March (with protection in cooler areas) to June and make another sowing in August/September for a winter/spring crop. Only just cover the seed. Germination is usually rapid and good, thin the plants if necessary, these thinnings can be transplanted to produce a slightly later crop (but they will need to be well watered in dry weather). More certain winter crops can be obtained by sowing in a frame in September/October and again in January/February.

nwatta Prefers a light sandy loam[1]. Succeeds in most well-drained, humus-rich soils but dislikes acid conditions[1, 16]. Plants strongly dislike dry conditions, quickly running to seed in such a situation. Early and late sowings are best in a sunny position, but summer crops are best given a position with some shade in order to slow down the plants tendency to go to seed and to prevent the leaves becoming bitter[18, 20]. The garden lettuce is widely cultivated in many parts of the world for its edible leaves and is probably the most commonly grown salad plant. This is the curled or leaf lettuce. It does not form a central heart but produces a loose rosette of basal leaves and can be harvested on a cut and come again basis. There are many named varieties[183] capable of providing fresh leaves throughout the year if winter protection is given in temperate areas. Lettuces are quite a problematic crop to grow. They require quite a lot of attention to protect them from pests such as slugs, aphids and birds. If the weather is hot and dry the plants tend to run very quickly to seed, developing a bitter flavour as they do so. In wet weather they are likely to develop fungal diseases. In addition, the seed needs to be sown at regular intervals of 2-3 weeks during the growing season in order to provide a regular supply of leaves. Lettuces make a good companion plant for strawberries, carrots, radishes and onions[18, 20, 201]. They also grow well with cucumbers, cabbages and beetroot[201].

## 6.2.222 Galium odoratum

Sweet Woodruff, Sweetscented bedstraw, Bedstraw

5 tin 9 cyuc 3 kcaak 3 tcan 3 dwat 0.2 m hkuc  
pimhmim cyutli kyucup hwcili hrasjlytnyk hpa7tli frus-  
flatprikwisslip hpa7tmwatli fyfixre7t hjonli

drutta Galium odoratum is a PERENNIAL growing to 0.2 m (0ft 8in) by 0.5 m (1ft 8in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from May to July, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies, bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and very alkaline soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers dry or moist soil. It can tolerate atmospheric pollution.

kcakta Edible Parts: Flowers LeavesEdible Uses: Condiment Drink TeaLeaves - raw or cooked[62]. The leaves are coumarin-scented (like freshly mown hay), they are used as a flavouring in cooling drinks[2, 9, 27] and are also added to fruit salads etc[183, 200]. The leaves are soaked in white wine to make 'Maitrank', an aromatic tonic drink that is made in Alsace[238]. A fragrant and delicious tea is made from the green-dried leaves and flowers[2, 183, 268]. Slightly wilted leaves are used, the tea has a fresh, grassy flavour[200]. The sweet-scented flowers are eaten or used as a garnish[183].

tcanta Dye Pot-pourri Repellent StrewingA red dye is obtained from the root[168]. Soft-tan and grey-green dyes are obtained from the stems and leaves[168]. A good ground-cover plant for growing on woodland edges or in the cool shade of shrubs[24, 200]. It spreads rapidly at the roots[28, 197, 208]. It is an ideal carpeting plant for bulbs to grow

through[K]. Although the fresh plant has very little aroma, as it dries it becomes very aromatic with the scent of newly-mown grass and then retains this aroma for years[2, 200]. It is used in the linen cupboard to protect from moths etc.[4, 14] It was also formerly used as a strewing herb and is an ingredient of pot-pourri[238]. It was also hung up in bunches in the home in order to keep the rooms cool and fragrant during the summertime[245].

dwatta Antispasmodic Cardiac Diaphoretic Diuretic Homeopathy SedativeSweet woodruff was widely used in herbal medicine during the Middle Ages, gaining a reputation as an external application to wounds and cuts and also taken internally in the treatment of digestive and liver problems[4]. In current day herbalism it is valued mainly for its tonic, diuretic and anti-inflammatory effect[254]. The leaves are antispasmodic, cardiac, diaphoretic, diuretic, sedative[9, 13, 21, 200]. An infusion is used in the treatment of insomnia and nervous tension, varicose veins, biliary obstruction, hepatitis and jaundice[9, 238]. The plant is harvested just before or as it comes into flower and can be dried for later use[9]. One report says that it should be used with caution[21] whilst another says that it is entirely safe[9]. Excessive doses can produce dizziness and symptoms of poisoning[268]. The dried plant contains coumarins and these act to prevent the clotting of blood - though in excessive doses it can cause internal bleeding[254]. The plant is grown commercially as a source of coumarin, used to make an anticoagulant drug[268]. Do not use this remedy if you are taking conventional medicine for circulatory problems or if you are pregnant[254]. Both Asperuloside (a terpenoid) and Coumarin (a benzopyrone) occur in some species of Galium. Asperuloside can be converted into prostaglandins (hormone-like compounds that stimulate the uterus and affect blood vessels), making the genus of great interest to the pharmaceutical industry[238]. A homeopathic remedy made from the plant is used in the treatment of inflammation of the uterus[238].

propta Seed - best sown in situ as soon as it is ripe in late summer[200]. The seed can also be sown in spring though it may be very slow to germinate[200]. A period of cold stratification helps reduce the germination time. Lots of leafmold in the soil and the shade of trees also improves germination rates. Division in spring. The plant can also be successfully divided throughout the growing season if the divisions are kept moist until they are established[200]. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring. Cuttings of soft wood, after flowering, in a frame.

nwatta Landscape Uses:Ground cover, Massing, Rock garden, Woodland garden. Prefers a loose moist leafy soil in some shade[200]. Tolerates dry soils but the leaves quickly become scorched when growing in full sun[200]. This species does not thrive in a hot climate[200]. Prefers a moist calcareous soil[9, 13, 14]. Dislikes very acid soils[187]. Tolerates a pH in the range 4.3 to 8.3. This species is very tolerant of atmospheric pollution and grows well in towns[208]. A very cold-hardy plant, tolerating temperatures down to about -25°C[187]. Sweet woodruff is occasionally cultivated in the herb garden for its medicinal and other uses. The dried foliage has the sweet scent of newly mown hay[245]. A very ornamental plant[1] but it spreads rapidly[28] and can be invasive[200]. However, this is rarely to the detriment of other plants since these are normally able to grow through it[200]. It does no harm to any plants more than 60cm tall[208]. Special Features: Attractive foliage, Edible, Fragrant foliage, Not North American native, Naturalizing, Suitable for dried flowers, Fragrant flowers. The plant is heat tolerant in zones 8 through 5. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. In garden design, as well as the

as a wheat substitute[2, 105], for which it is not much inferior[213], but it is rather small and difficult to collect in quantity[159]. The plants only flower at irregular intervals of several years.

tcanta Basketry Fodder Hedge Musical Soil stabilization WeavingAgroforestry Uses: With its extensive running root system, the plant is ideal for helping to control soil erosion, especially along the sides of rivers[352]. The extensive growth of the plant provides streambank stabilization, sediment retention, and bioaccumulation of nutrients and toxins[1050]. So long as it can be restrained, the plant makes an excellent, dense hedge or screen[352]. The canes are used as pipe-stems, are woven into baskets and mats plus a variety of other purposes[169, 236]. The hollow stems can be made into flutes[257]. Carbon Farming Solutions - Industrial Crop: biomass (Crops grown for non-food uses. Industrial crops provide resources in three main categories: materials, chemicals, and energy. Traditional materials include lumber and thatch, paper and cardboard, and textiles) [1-1]. Fodder: bank.

dwatta CatharticThe root is cathartic. A decoction has been used to stimulate the kidneys and 'renew strength'[257].

propta Seed - surface sow as soon as it is ripe in a greenhouse at about 20°C. Do not allow the compost to dry out. Germination usually takes place fairly quickly so long as the seed is of good quality, though it can take 3-6 months. When large enough to handle, prick the seedlings out into individual pots and grow them on in a lightly shaded place in the greenhouse until large enough to plant out. Bamboos only flower at intervals of several years and so seed is rarely available. Division in late spring as new growth commences. Take divisions with at least three canes in the clump, trying to cause as little root disturbance to the main plant as possible. Grow them on in light shade in a greenhouse in pots of a high fertility sandy medium. Mist the foliage regularly until plants are established. Plant them out into their permanent positions when a good root system has developed, which can take a year or more[200]. Rhizome cuttings. Basal cane cuttings.

nwatta Fodder: Bank Management: Managed Multi-stem Wild CropPrefers an open loam of fair quality and a position sheltered from cold drying winds[1, 11, 25]. Succeeds on peaty soils. Requires abundant moisture and plenty of organic matter in the soil. Plants are intolerant of drought[1]. Succeeds in full sun or dappled shade in warm, humid, damp conditions[200]. Some reports say that this plant is only hardy in S.W. England[1, 11, 25] though another report says that the roots are hardy to about -30°C if they are heavily mulched[169]. This plant used to form very extensive stands in much of south-eastern N. America, but it provides a nutritious forage and is very easily destroyed by the continuous grazing of cattle or the rooting of pigs and so has been greatly reduced in the wild[236]. This species is notably resistant to honey fungus[200]. Plants only flower at intervals of many years. When they do come into flower most of the plants energies are directed into producing seed and consequently the plant is severely weakened. They sometimes die after flowering, but if left alone they will usually recover though they will look very poorly for a few years. If fed with artificial NPK fertilizers at this time the plants are more likely to die[122]. The rootstock is running, forming new shoots from late May[25]. Carbon Farming Solutions - Managed bamboo forest sequester more carbon than wild bamboo and the same as fast-growing tropical trees like eucalyptus. Cultivation: minor global crop. Management: managed multistem (Describes the non-destructive management systems that are used in cultivation) [1-1]. The plant is heat tolerant in zones 9 through 5. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. An evergreen. The plant growth habit is a runner spreading indefinitely by rhizomes

or stolons [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

## 6.2.121 Actinidia coriacea

5 tin 9 cyuc 3 kcaak 0 tcan 0 dwat 8 m hkuc  
hmimhtut cyutli tcup hwcili hrasjlytnyk hpa7tli flatprikwiv  
hpa7tmwatli nyanhjen hjonli

drutta Actinidia coriacea is an evergreen Climber growing to 8 m (26ft 3in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in leaf all year, in flower from May to June. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Bees, insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[3, 183]. Small but very juicy and full of seeds[182]. The fruit is up to 2cm long[198]. It contains a number of small seeds, but these are easily eaten with the fruit[K].

tcanta None known

dwatta None known

propta Seed - sow spring in a greenhouse[133]. It is probably best if the seed is given 3 months stratification[113], either sow it in a cold frame as soon as it is ripe in November or as soon as it is received. Fresh seed germinates in 2-3 months at 10°C, stored seed can take longer[133]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least their first winter. When the plants are 30cm or more tall, plant them out into their permanent positions in late spring or early summer, after the last expected frosts[K]. Most seedlings are male[126]. The seedlings are subject to damping off, they must be kept well ventilated[113]. Cuttings of softwood as soon as ready in spring in a frame[K]. Cuttings of half-ripe wood, July/August in a frame. Very high percentage[113]. Cuttings of ripe wood, October/November in a frame.

nwatta Prefers a sound loamy neutral soil[1, 200]. Succeeds in semi-shade but full sun is best for fruit production[200]. Prefers a sheltered position[200]. A fairly hardy plant, succeeding in many parts of the country[1], but young spring growth is susceptible to frost damage[160]. Plants are semi-evergreen in mild winters[219]. Fruits are formed on second year wood and also on fruit spurs on older wood[126], any pruning is best carried out in the winter[219]. The flowers are softly scented[245]. This is a climbing plant, supporting itself by twining around branches etc[200]. Plants are often erroneously labelled A. henryi in British nurseries[219]. Plants in this genus are notably resistant to honey fungus[200]. Dioecious. Male and female plants must be grown if fruit and seed is required.

## 6.2.122 Crataegus pinnatifida

Chinese Haw

5 tin 9 cyuc 3 kcaak 2 tcan 3 dwat 7 m hkuc  
hmimhtut cyutli hgattcuphja7n hwcili hrasjlytkfrip hpa7tli  
flatprikwivslip hpa7tmwatli xre7t hjonli

drutta Crataegus pinnatifida is a deciduous Tree growing to 7 m (23ft) by 7 m (23ft). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in May, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Midges. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105, 177]. A pleasant flavour[178]. The orange fruit

has a mealy texture with an acid taste and a slight bitterness but is fairly nice raw[K]. It ripens fairly late, specimens seen at the end of October 1998 were not quite fully ripe[K]. The fruit can be used in making pies, preserves, etc, and can also be dried for later use. The fruit is about 15mm in diameter[200], though in some forms it can be 25mm in diameter[266]. A nutritional analysis is available[218]. There are up to five fairly large seeds in the centre of the fruit, these often stick together and so the effect is of eating a cherry-like fruit with a single seed[K].

tcanta Wood - heavy, hard, tough, close-grained. Useful for making tool handles, mallets and other small items[82].

dwatta Alternative Antibacterial Anticholesterolic Antidote Antiscurbutic Cardiotoxic Deobstruent Hypotensive Laxative Stimulant Stomachic VasodilatorThe fruit is antibacterial, anticholesterolic, cardiotoxic, hypotensive, stomachic, vasodilator. It contains several medicially active constituents including flavonoids and organic acids[279]. It has been shown to lower blood cholesterol levels and to improve blood circulation[176, 238, 279]. It is used in Korea in the treatment of abdominal distension, pain, diarrhoea and to induce menstruation[279]. The dried fruit is alterative, antiscurbutic, deobstruent, laxative, stimulant and stomachic[218]. The fruits and flowers of hawthorns are well-known in herbal folk medicine as a heart tonic and modern research has borne out this use. The fruits and flowers have a hypotensive effect as well as acting as a direct and mild heart tonic[222]. They are especially indicated in the treatment of weak heart combined with high blood pressure[222]. Prolonged use is necessary for it to be efficacious[222]. It is normally used either as a tea or a tincture[222]. The seed is recommended in the treatment of difficult labour, hernia and swollen genitals[218]. The leaves and twigs are used as an antidote to varnish poisoning (from certain *Rhus* spp)[218]. The root is used in the treatment of nausea and vomiting[218].

propta Seed - this is best sown as soon as it is ripe in the autumn in a cold frame, some of the seed will germinate in the spring, though most will probably take another year. Stored seed can be very slow and erratic to germinate, it should be warm stratified for 3 months at 15°C and then cold stratified for another 3 months at 4°C[164]. It may still take another 18 months to germinate[78]. Scarifying the seed before stratifying it might reduce this time[80]. Fermenting the seed for a few days in its own pulp may speed up the germination process[K]. Another possibility is to harvest the seed 'green' (as soon as the embryo has fully developed but before the seedcoat hardens) and sow it immediately in a cold frame. If timed well, it can germinate in the spring[80]. If you are only growing small quantities of plants, it is best to pot up the seedlings as soon as they are large enough to handle and grow them on in individual pots for their first year, planting them out in late spring into nursery beds or their final positions. When growing larger quantities, it might be best to sow them directly outdoors in a seedbed, but with protection from mice and other seed-eating creatures. Grow them on in the seedbed until large enough to plant out, but undercut the roots if they are to be left undisturbed for more than two years.

nwatta Industrial Crop: Medicinal Management: Standard Minor Global CropA very easily grown plant, it prefers a well-drained moisture retentive loamy soil but is not at all fussy[11, 200]. Once established, it succeeds in excessively moist soils and also tolerates drought[200]. It grows well on a chalk soil and also in heavy clay soils[200]. A position in full sun is best when plants are being grown for their fruit, they also succeed in semi-shade though fruit yields and quality will be lower in such a position[11, 200]. Most members of this genus succeed in exposed positions, they also tolerate atmospheric pollution[200]. Hybridizes freely with other members of this genus[200]. Seedling trees take from 5 - 8 years before they start bearing fruit, though grafted trees will often flower heavily in their third year[K]. The flowers have a foetid smell somewhat like decaying fish. This attracts midges which are the main means of fertilization. When freshly open, the flowers have more pleasant scent with balsamic undertones[245]. Most trees have very few thorns, some forms are thorn-free[202]. A very ornamental plant[1, 11]. The sub-species *C. pinnatifida* major has larger fruit than the type species, it is cultivated for this fruit in China[46, 178, 200] Seedlings should not be left in a seedbed for more than 2 years without being transplanted[11]. For

polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2]. The root pattern is a tap root similar to a carrot going directly down [1-2].

## 6.2.123 Pyrus pyraeaster

5 tlin 9 cyuc 3 kcaak 0 tcan 0 dwat 7 m hkuc  
hminhtut cyutli hgactup hwicli hrasjlutnykfrp hpa7tli flat-prikliwis hpa7tmwatli xre7t hjonli

drutta Pyrus pyraeaster is a deciduous Tree growing to 7 m (23ft) by 5.5 m (18ft). See above for USDA hardiness. It is hardy to UK zone 6. The seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil and can tolerate drought. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[177]. The fruit is often borne in abundance and is up to 35mm in diameter. It ripens in late summer to early autumn. It is rather hard and astringent at first, but blets as soon as it falls from the tree and then has quite a good flavour, becoming soft and quite juicy[K].

tcanta None known  
dwatta None known  
propta Seed - best sown in a cold frame as soon as it is ripe in the autumn, it will then usually germinate in mid to late winter. Stored seed requires 8 - 10 weeks cold stratification at 1°C and should be sown as early in the year as possible[200]. Temperatures over 15 - 20°C induce a secondary dormancy in the seed[200]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in a cold frame or greenhouse for their first year. Plant them out in late spring or early summer of the following year.

nwatta Prefers a good well-drained loam in full sun[200]. Grows well in heavy clay soils. Tolerates light shade but does not fruit so well in such a position. Tolerates atmospheric pollution, excessive moisture and a range of soil types if they are moderately fertile[200]. Established plants are drought tolerant[200]. Plants are hardy to about -15°C[200].

## 6.2.124 Amelanchier huroensis

5 tlin 9 cyuc 3 kcaak 0 tcan 0 dwat 6 m hkuc  
hminhtut cyutli tcup hwicli hrasjlutnykfrp hpa7tli flatprikliwis hpa7tmwatli fyfxre7t hjonli

drutta Amelanchier huroensis is a deciduous Tree growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[177]. The fruit is rich in iron and copper[226].

tcanta None known  
dwatta None known  
propta Seed - it is best harvested 'green', when the seed is fully formed but before the seed coat has hardened, and then sown immediately in pots outdoors or in a cold frame. If stored seed is obtained early enough in the autumn, it can be given 4 weeks warm stratification before being left out in the winter and it should then germinate in the spring. Otherwise seed can be very slow to germinate, perhaps taking 18 months or more. When large enough to handle, prick the seedlings out into individual pots and grow them on in a sheltered outdoor position, planting them out once they are 20cm or more tall. If there is sufficient seed it is best to sow it thinly in an outdoor seedbed[78, 80]. Grow the seedlings on for two years in the seedbed before planting them out into their permanent positions during the winter. Layering in spring -

propta Seed - sow spring in a cold frame. Germination is usually fairly quick. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in the summer. Mentha species are very prone to hybridisation and so the seed cannot be relied on to breed true. Even without hybridisation, seedlings will not be uniform and so the content of medicinal oils etc will vary. When growing plants with a particular aroma it is best to propagate them by division[K]. Division can be easily carried out at almost any time of the year, though it is probably best done in the spring or autumn to allow the plant to establish more quickly. Virtually any part of the root is capable of growing into a new plant. Larger divisions can be planted out direct into their permanent positions. However, for maximum increase it is possible to divide the roots up into sections no more than 3cm long and pot these up in light shade in a cold frame. They will quickly become established and can be planted out in the summer.

nwatta Succeeds in most soils and situations so long as the soil is not too dry[1, 200]. Grows well in heavy clay soils. A sunny position is best for production of essential oils, but it also succeeds in partial shade. This species is somewhat less easy in cultivation than most other mints. It can be lost over winter if the weather is very cold or wet so ensure that it is grown in a warm, well-drained sunny position[K]. A sterile hybrid, the result of a cross between *M. arvensis* and *M. spicata*, though it can back-cross with its parents. There are some named varieties[183], most of which have variegated leaves. A polymorphic species[200]. Most mints have fairly aggressive spreading roots and, unless you have the space to let them roam, they need to be restrained by some means such as planting them in containers that are buried in the soil[K]. The whole plant has a strong minty aroma with a hint of ginger[245]. The flowers are very attractive to bees and butterflies. A good companion plant for growing near cabbages and tomatoes, helping to keep them free of insect pests. Members of this genus are rarely if ever troubled by browsing deer[233].

## 6.2.220 Mahonia nervosa

Oregon Grape, Cascade barberry  
5 tlin 9 cyuc 3 kcaak 3 tcan 2 dwat 0.6 m hkuc  
pcimhminhtut cyutli kyuctcup hwicli hyishrasjlutnykfrp hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Mahonia nervosa is an evergreen Shrub growing to 0.6 m (2ft) by 1 m (3ft 3in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from February to April. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Fruit LeavesEdible Uses: Fruit - raw or cooked[2, 3, 101]. An acid flavour but it is rather nice raw, especially when added to muesli or porridge[K]. Unfortunately, there is relatively little flesh and a lot of seeds[K]. Too acid for most tastes but they are very good in jams, jellies, pies etc[183]. They can also be used to enhance the flavour of bland fruits or made into a refreshing lemon-flavoured drink[183]. The fruit is about 8mm in diameter[200]. Young tender leaves - cooked. Simmered in a small amount of water and eaten as a snack[183].

tcanta DyeA yellow dye is obtained from the inner bark of the stem and roots[98, 101, 257]. Dark green, violet and dark blue-purple dyes are obtained from the fruit[168]. A green dye is obtained from the leaves[168]. Plants can be grown as a ground cover, spaced about 30cm apart each way[208]. They are very slow to spread[208] and so will need weeding for their first few years after planting[K].

dwatta Antiarthritic Antibacterial Antitumor Blood tonic Dysentery Laxative TonicThe root is alterative and tonic[4]. It improves the digestion and absorption and is recommended in the treatment of psoriasis, syphilis and impure blood conditions[4, 257]. A decoction of the peeled and chopped root bark has been used as a wash in treating arthritis and as an eyewash for red itchy eyes[257]. The fruit is an

excellent safe and gentle laxative[257]. Berberine, universally present in rhizomes of Mahonia species, has marked antibacterial effects[218] and is used as a bitter tonic[213]. Since it is not appreciably absorbed by the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not be used with Glycyrrhiza species (Licorice) because this nullifies the effects of the berberine[218]. Berberine has also shown antitumour activity[218]. The root and root bark are best harvested in the autumn[213].

propta Seed - best sown as soon as it is ripe in a cold frame[78]. It usually germinates in the spring[K]. 'Green' seed (harvested when the embryo has fully developed but before the seed case has dried) should be sown as soon as it is harvested and germinates within 6 weeks[K]. Stored seed should be sown as soon as possible in late winter or spring. 3 weeks cold stratification will improve its germination, which should take place in 3 - 6 months at 10°C. Prick out the seedlings when they are large enough to handle and grow them on in a cold frame for at least their first winter. Plant them out in late spring or early summer. Division of suckers in spring[78]. Whilst they can be placed direct into their permanent positions, better results are achieved if they are potted up and placed in a frame until established[11]. Leaf cuttings in the autumn.

nwatta An easily grown plant, it thrives in any good garden soil[11, 200] but also succeeds in poor dry ones. Another report says that it is best on a lime-free soil[182]. Grows well in heavy clay soils. Prefers a sunny position[3] but succeeds in heavy woodland shade[K]. Hybridizes freely with other members of this genus. Plants are growing and fruiting well at Wakehurst Place in Sussex, but they do not generally do well in Britain[11]. Resistant to honey fungus[88].

## 6.2.221 Lactuca sativa crispa

Cutting Lettuce  
5 tlin 9 cyuc 3 kcaak 0 tcan 3 dwat 0.9 m hkuc  
hminhtut cyutli tcup hwicli hrasjlut hpa7tli prikliwis hpa7tmwatli fyfxre7t hjonli

drutta Lactuca sativa crispa is a ANNUAL/BIENNIAL growing to 0.9 m (3ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Leaves - raw or cooked[7, 37]. A mild slightly sweet flavour with a crisp texture, lettuce is a very commonly used salad leaf and can also be cooked as a potherb or be added to soups etc[183]. This variety forms a loose rosette of leaves and can be harvested on a cut and come again basis. Seed - sprouted and used in salads or sandwiches[183]. An edible oil is obtained from the seed[7]. The seed is very small, extraction of the oil on any scale would not be very feasible[K].

tcanta Parasiticide[178]. No further details are given, but it is probably the sap of flowering plants that is used. The seed is said to be used to make hair grow on scar tissue[218].

dwatta The whole plant is rich in a milky sap that flows freely from any wounds. This hardens and dries when in contact with the air[4]. The sap contains 'lactucarium', which is used in medicine for its anodyne, antispasmodic, digestive, diuretic, hypnotic, narcotic and sedative properties[9, 21, 46, 165, 192, 213, 238]. Lactucarium has the effects of a feeble opium, but without its tendency to cause digestive upsets[4], nor is it addictive[7]. It is taken internally in the treatment of insomnia, anxiety, neuroses, hyperactivity in children, dry coughs, whooping cough, rheumatic pain etc[238]. Concentrations of lactucarium are low in young plants and most concentrated when the plant comes into flower[238]. It is collected commercially by cutting the heads of the plants and scraping the juice into china vessels several times a day until the plant is exhausted[4]. The cultivated lettuce does not contain as much lactucarium as the wild species, most being produced when the plant is in flower[4]. An infusion of the fresh or dried flowering plant can also be used[9]. The plant should be used with caution, and never

kcakta Leaves - raw or cooked[7, 37]. A mild slightly sweet flavour with a crisp texture, lettuce is a very commonly used salad leaf and can also be cooked as a potherb or be added to soups etc[183]. The plant forms a head of leaves in a similar way to cabbages. The whole head is usually harvested at one time. Seed - sprouted and used in salads or sandwiches[183]. An edible oil is obtained from the seed[7]. The seed is very small, extraction of the oil on any scale would not be very feasible[K].

tcanta Parasiticide[178]. No further details are given, but it is probably the sap of flowering plants that is used. The seed is said to be used to make hair grow on scar tissue[218].

dwatta The whole plant is rich in a milky sap that flows freely from any wounds. This hardens and dries when in contact with the air[4]. The sap contains 'lactucarium', which is used in medicine for its anodyne, antispasmodic, digestive, diuretic, hypnotic, narcotic and sedative properties[9, 21, 46, 165, 192, 213, 238]. Lactucarium has the effects of a feeble opium, but without its tendency to cause digestive upsets[4], nor is it addictive[7]. It is taken internally in the treatment of insomnia, anxiety, neuroses, hyperactivity in children, dry coughs, whooping cough, rheumatic pain etc[238]. Concentrations of lactucarium are low in young plants and most concentrated when the plant comes into flower[238]. It is collected commercially by cutting the heads of the plants and scraping the juice into china vessels several times a day until the plant is exhausted[4]. The cultivated lettuce does not contain as much lactucarium as the wild species, most being produced when the plant is in flower[4]. An infusion of the fresh or dried flowering plant can also be used[9]. The plant should be used with caution, and never without the supervision of a skilled practitioner. Even normal doses can cause drowsiness whilst excess causes restlessness[238] and overdoses can cause death through cardiac paralysis[7, 9]. Some physicians believe that any effects of this medicine are caused by the mind of the patient rather than by the medicine[213]. The sap has also been applied externally in the treatment of warts[222]. The seed is anodyne and galactagogue[218]. Lettuce has acquired a folk reputation for an anaphrodisiac, anodyne, carminative, diuretic, emollient, febrifuge, hypoglycaemic, hypnotic, narcotic, parastictic and sedative[218].

propta Seed - sow a small quantity of seed in situ every 2 or 3 weeks from March (with protection in cooler areas) to June and make another sowing in August/September for a winter/spring crop. Only just cover the seed. Germination is usually rapid and good, thin the plants if necessary, these thinnings can be transplanted to produce a slightly later crop (but they will need to be well watered in dry weather). More certain winter crops can be obtained by sowing in a frame in September/October and again in January/February.

nwatta Prefers a light sandy loam[1]. Succeeds in most well-drained, humus-rich soils but dislikes acid conditions[1, 16]. Plants strongly dislike dry conditions, quickly running to seed in such a situation. Early and late sowings are best in a sunny position, but summer crops are best given a position with some shade in order to slow down the plants tendency to go to seed and to prevent the leaves becoming bitter[18, 20]. The garden lettuce is widely cultivated in many parts of the world for its edible leaves and is probably the most commonly grown salad plant. This is the heading form of lettuce, including the Iceberg and Butterhead varieties. There are many named varieties[183] capable of providing fresh leaves throughout the year if winter protection is given in temperate areas. Lettuces are quite a problematic crop to grow. They require quite a lot of attention to protect them from pests such as slugs, aphids and birds. If the weather is hot and dry the plants tend to run very quickly to seed, developing a bitter flavour as they do so. In wet weather they are likely to develop fungal diseases. In addition, the seed needs to be sown at regular intervals of 2-3 weeks during the growing season in order to provide a regular supply of leaves. Lettuces make a good companion plant for strawberries, carrots, radishes and onions[18, 20, 201]. They also grow well with cucumbers, cabbages and beetroot[201].

## 6.2.218 *Triteleia peduncularis*

Longray Tripletilly, Long-ray brodiaea  
5 tin 9 cyuc 3 kcaak 0 tcan 0 dwat 0.3 m hkuc

htut cyutli kyuctcup hwicli hrasljut hpa7li flatprikwis hpa7tmwatli xre7t hjonli

drutta *Triteleia peduncularis* is a BULB growing to 0.3 m (1ft) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: RootEdible Uses: Bulb - raw or cooked[105, 161]. Rich in starch, the bulb can be used like potatoes.

tcanta None known  
dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame. Alternatively, the seed can be sown in spring in a cold frame. Germination usually takes place within 1 - 3 months at 15°C. Sow the seed thinly so that there is no need to prick them out and grow the seedlings on in the pot for their first year. Give an occasional liquid feed to ensure that they do not become mineral deficient. Seedlings are prone to damping off so be careful not to overwater them and keep them well ventilated. When they become dormant, pot up the small bulbs placing about 3 in each pot. Grow them on in the greenhouse for another year or two until the bulbs are about 20mm in diameter and then plant them out into their permanent positions when they are dormant in the autumn. Division of flowering size bulbs in autumn. Dig up the clumps of bulbs, replanting the larger ones direct into their permanent positions. It is best to pot up the smaller ones and grow them on in a greenhouse for a year before planting them out when they are dormant in early autumn.

nwatta Requires a rich well-drained sandy loam[1]. Likes plenty of moisture whilst in growth followed by a warm dry period in late summer and autumn[200].

## 6.2.219 *Mentha x gracilis*

Ginger Mint

5 tin 9 cyuc 3 kcaak 0 tcan 2 dwat 0.5 m hkuc  
hmimhtut cyutli tcup hwicli hrasljutkyfrip hpa7li flatprikwis hpa7tmwatli xre7t hjonli

drutta *Mentha x gracilis* is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Condiment TeaLeaves - raw or cooked. They are used as a flavouring in salads or cooked foods[61, 105]. A refreshing odour and taste[183], they are said to go particularly well with melon, tomatoes and fruit salads[238]. The slight ginger scent make them an interesting addition to fresh salads[244]. A herb tea is made from the leaves. An essential oil from the leaves is used as a spearmint flavouring, it is especially used in N. America in chewing gums[183, 238].

tcanta Essential Repellent StrewingThe essential oil obtained from the leaves has a spearmint flavour and is used commercially in N. America[238]. Rats and mice intensely dislike the smell of mint. The plant was therefore used in homes as a strewing herb and has also been spread in granaries to keep the rodents off the grain[244].

dwatta Antiseptic Carminative FebrifugeGinger mint, like many other members of this genus, is often used as a domestic herbal remedy, being valued especially for its antiseptic properties and its beneficial effect on the digestion. Like other members of the genus, it is best not used by pregnant women because large doses can cause an abortion. A tea made from the leaves has traditionally been used in the treatment of fevers, headaches, digestive disorders and various minor ailments[222]. The leaves are harvested as the plant comes into flower and can be dried for later use[238]. The essential oil in the leaves is antiseptic, though it is toxic in large doses[222].

takes 18 months[78]. Division of suckers in late winter. The suckers need to have been growing for 2 years before you dig them up, otherwise they will not have formed roots. They can be planted out straight into their permanent positions if required.

nwatta We have very little information on this species and do not know if it will be hardy in Britain, though judging by its native range it should succeed outdoors in most parts of the country. The following notes are based on the general needs of the genus. Prefers a rich loamy soil in a sunny position or semi-shade[1, 200] but thrives in any soil that is not too dry or water-logged[11]. Grows well in heavy clay soils. All members of this genus have edible fruits and, whilst this is dry and uninteresting in some species, in many others it is sweet and juicy. Many of the species have potential for use in the garden as edible ornamentals. The main drawback to this genus is that birds adore the fruit and will often completely strip a tree before it is fully ripe[K]. Hybridizes freely with other members of this genus[200]. Grafting onto seedlings of *A. lamarckii* or *Sorbus aucuparia* is sometimes practised in order to avoid the potential problem of hybridizing[1].

## 6.2.125 *Crataegus aprica*

5 tin 9 cyuc 3 kcaak 0 tcan 2 dwat 6 m hkuc  
hmimhtut cyutli hgatyuctcuphja7n hwicli hrasljutnyikfrip hpa7li flatprikwisslip hpa7tmwatli xre7t hjonli

drutta *Crataegus aprica* is a deciduous Tree growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in May, and the seeds ripen in November. The species is hermaphrodite (has both male and female organs) and is pollinated by Midges. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry moist or wet soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. A good dessert fruit, it is sweet and rather juicy[82]. The fruit can be used in making pies, preserves, etc, and can also be dried for later use. The fruit is about 12mm in diameter[200]. There are up to five fairly large seeds in the centre of the fruit, these often stick together and so the effect is of eating a cherry-like fruit with a single seed[K].

tcanta Wood - heavy, hard, tough, close-grained. Useful for making tool handles, mallets and other small items[82].

dwatta Cardiotonic HypotensiveAlthough no specific mention has been seen for this species, the fruits and flowers of many hawthorns are well-known in herbal folk medicine as a heart tonic and modern research has borne out this use. The fruits and flowers have a hypotensive effect as well as acting as a direct and mild heart tonic[222]. They are especially indicated in the treatment of weak heart combined with high blood pressure[222]. Prolonged use is necessary for it to be efficacious[222]. It is normally used either as a tea or a tincture[222].

propta Seed - this is best sown as soon as it is ripe in the autumn in a cold frame, some of the seed will germinate in the spring, though most will probably take another year. Stored seed can be very slow and erratic to germinate, it should be warm stratified for 3 months at 15°C and then cold stratified for another 3 months at 4°C[164]. It may still take another 18 months to germinate[78]. Scarifying the seed before stratifying it might reduce this time[80]. Fermenting the seed for a few days in its own pulp may also speed up the germination process[K]. Another possibility is to harvest the seed 'green' (as soon as the embryo has fully developed but before the seedcoat hardens) and sow it immediately in a cold frame. If timed well, it can germinate in the spring[80]. If you are only growing small quantities of plants, it is best to pot up the seedlings as soon as they are large enough to handle and grow them out in individual pots for their first year, planting them out in late spring into nursery beds or their final positions. When growing larger quantities, it might be best to sow them directly outdoors in a seedbed, but with protection from mice and other seed-eating creatures. Grow them on in the seedbed until large enough to plant out, but

undercut the roots if they are to be left undisturbed for more than two years.

nwatta A very easily grown plant, it prefers a well-drained moisture retentive loamy soil but is not at all fussy[11, 200]. Once established, it succeeds in excessively moist soils and also tolerates drought[200]. It grows well on a chalk soil and also in heavy clay soils[200]. A position in full sun is best when plants are being grown for their fruit, they also succeed in semi-shade though fruit yields and quality will be lower in such a position[11, 200]. Most members of this genus succeed in exposed positions, they also tolerate atmospheric pollution[200]. Hybridizes freely with other members of this genus[200]. The flowers have a foetid smell somewhat like decaying fish. This attracts midges which are the main means of fertilization. When freshly open, the flowers have more pleasant scent with balsamic undertones[245]. Seedling trees take from 5 - 8 years before they start bearing fruit, though grafted trees will often flower heavily in their third year[K]. Seedlings should not be left in a seedbed for more than 2 years without being transplanted[11].

## 6.2.126 *Phyllostachys flexuosa*

Zig-Zag Bamboo, Drooping timber bamboo  
5 tin 9 cyuc 3 kcaak 2 tcan 0 dwat 6 m hkuc  
hmim cyutli tcup hwicli hrasljutnyik hpa7li flatprikwis hpa7tmwatli xre7t hjonli

drutta *Phyllostachys flexuosa* is an evergreen Bamboo growing to 6 m (19ft) by 6 m (19ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: Shoots StemEdible Uses: Young shoots - cooked[25, 61, 105, 177]. A delicious flavour[266]. Slightly acrid raw, they are usually boiled in at least one change of water and added to salads etc[183]. The canes are about 10mm in diameter[K]. The shoots, which are generally 2-4cm in diameter, though occasionally up to 7cm[266], are harvested in the spring when they are about 8cm above the ground, cutting them about 5cm below soil level.

tcanta Basketry WoodThe canes are not of the highest quality but can be used for plant supports etc. The medium quality wood is good for all standard bamboo uses for canes of this size[195]. The culms are used as handles of tools[266]. The splints made from the stems are used for weaving articles[266].

dwatta None known

propta Seed - surface sow as soon as it is ripe in a greenhouse at about 20°C. Do not allow the compost to dry out. Germination usually takes place fairly quickly so long as the seed is of good quality, though it can take 3 - 6 months. Grow on in a lightly shaded place in the greenhouse until large enough to plant out. Seed is rarely available. Division in spring as new growth commences. Divisions from the open ground do not transplant well, so will need careful treatment and nurturing under cover in pots until at least late spring[238]. Division is best carried out in wet weather and small divisions will establish better than large clumps[238]. Another report says that you can take large divisions from established clumps and transfer them straight to their permanent positions, misting or drenching them frequently until they are established[200]. Basal cane cuttings in spring.

nwatta Requires a rich damp soil in a sheltered position[200] and plenty of moisture in the growing season[11]. A very hardy plant, tolerating temperatures down to about -17°C. According to another report the plant only suffers minor leaf damage at -22°C[195]. The plants dislike prolonged exposure to hard frosts[200]. This species is notably resistant to honey fungus[200]. Plants only flower at intervals of many years. When they do come into flower most of the plants energies are directed into producing seed and consequently the plant is severely weakened. They sometimes die after flowering, but if left alone they will usually recover though they will look very poorly for a few years. If fed with artificial NPK fertilizers at this time the plants are more likely to die[122]. A plant at Trebah gardens in Cornwall was flowering heavily in May 1995[K]. This is a good companion species to grow in a woodland because the plants are shallow

rooted and do not compete with deep rooted trees[195]. The rootstock is running[25] but not aggressively so, especially in the cooler climate of Britain[200]. New growth appears from late March[25]. This species is closely related to *P. angusta*[266]. Plants need quite a lot of space because the outer culms spread out sideways and arch over[162].

## 6.2.127 Amelanchier weigandii

5 tlin 9 cyuc 3 kcaak 0 tcan 0 dwat 5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Amelanchier weigandii is a deciduous Shrub growing to 5 m (16ft 5in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: FruitEdible Uses: Fruit, raw or cooked. The fruit is rich in iron and copper[226].

tcanta None known  
dwatta None known  
propta Seed - it is best harvested 'green', when the seed is fully formed but before the seed coat has hardened, and then sown immediately in pots outdoors or in a cold frame. If stored seed is obtained early enough in the autumn, it can be given 4 weeks warm stratification before being left out in the winter and it should then germinate in the spring. Otherwise seed can be very slow to germinate, perhaps taking 18 months or more. When large enough to handle, prick the seedlings out into individual pots and grow them on in a sheltered outdoor position, planting them out once they are 20cm or more tall. If there is sufficient seed it is best to sow it thinly in an outdoor seedbed[78, 80]. Grow the seedlings on for two years in the seedbed before planting them out into their permanent positions during the winter. Layering in spring takes 18 months[78]. Division of suckers in late winter. The suckers need to have been growing for 2 years before you dig them up, otherwise they will not have formed roots. They can be planted out straight into their permanent positions if required.

nwatta We have very little information on this species, though it is growing well at Kew Botanical Gardens, where 8 year old plants are about 3 metres tall with multiple stems and lots of side branches[K]. They were flowering well at the end of April 1995[K]. The following notes are based on the general needs of the genus. Prefers a rich loamy soil in a sunny position or semi-shade[1, 200] but thrives in any soil that is not too dry or water-logged[11]. Grows well in heavy clay soils. All members of this genus have edible fruits and, whilst this is dry and uninteresting in some species, in many others it is sweet and juicy. Many of the species have potential for use in the garden as edible ornamentals. The main draw-back to this genus is that birds adore the fruit and will often completely strip a tree before it is fully ripe[K]. Hybridizes freely with other members of this genus[200]. Grafting onto seedlings of *A. lamarckii* or *Sorbus aucuparia* is sometimes practised in order to avoid the potential problem of hybridizing[1].

## 6.2.128 Corylus sieboldiana

Japanese Hazel, Manchurian hazel  
5 tlin 9 cyuc 3 kcaak 1 tcan 0 dwat 5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Corylus sieboldiana* is a deciduous Shrub growing to 5 m (16ft 5in). See above for USDA hardiness. It is hardy to UK zone 6. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcaakta Edible Parts: Oil SeedEdible Uses: OilSeed - raw or cooked[183]. Rich in oil. The seed ripens in mid to late autumn and will probably need to be protected from squirrels[K]. When kept in a cool place, and not shelled, the seed should store for at least 12 months[K]. An edible oil is obtained from the seed[183].

tcanta OilNone known  
dwatta None known  
propta Seed - best sown as soon as it is harvested in autumn in a cold frame[164]. Germinates in late winter or spring. Stored seed should be pre-soaked in warm water for 48 hours and then given 2 weeks warm followed by 3 - 4 months cold stratification[164]. Germinates in 1 - 6 months at 20°C[164]. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame or sheltered place outdoors for their first winter. Plant them out into their permanent positions in late spring or early summer[K]. Layering in autumn. Easy, it takes about 6 months[78, 200]. Division of suckers in early spring. Very easy, they can be planted out straight into their permanent positions.

nwatta Management: Coppice Management: Standard Regional Crop Staple Crop: Protein-oilAn easily grown plant, it succeeds in most soils, but is in general more productive of seeds when grown on soils of moderate fertility[11, 200]. It does less well in rich heavy soils or poor ones[11, 63]. Does well in a loamy soil[11]. Very suitable for an alkaline soil[11], but it dislikes very acid soils[17]. Plants are fairly wind tolerant[1, 11]. Members of this genus bear transplanting well and can be easily moved even when relatively large[11].

## 6.2.129 Crataegomespilus dardarii

Bronvaux Medlar  
5 tlin 9 cyuc 3 kcaak 0 tcan 0 dwat 5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Crataegomespilus dardarii* is a deciduous Tree growing to 5 m (16ft) by 3.5 m (11ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in May. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. There are three distinct sizes of fruit on this tree, though they all have the same flavour[K]. The first is quite large, up to 35mm in diameter, and is just like the medlar, *Mespilus germanica*. The second is slightly smaller, perhaps 25mm in diameter, and once more like a medlar. The third is rather smaller, perhaps 10mm in diameter, and is intermediate between the medlar and the hawthorn, *Crataegus* spp. The fruit does not ripen until very late in the autumn, or even early winter. It will probably need to be harvested before it is fully ripe and stored in a cool but frost-free place where it can continue the ripening process. It is ready to eat when the flesh has turned brown and is very soft. It will then have a delicious, sweet flavour that reminds you of a lush tropical fruit. Care must be taken that the fruit is eaten no later than this stage because it is almost at the point of rotting and will then cause gastric upsets[K].

tcanta None known  
dwatta None known  
propta Seed - this species is a bi-generic graft hybrid and is very unlikely to breed true from seed. Should you want to give it a try, then the seed is best sown as soon as it is ripe in the autumn in a cold frame. Some of the seed will germinate in the spring, though most will probably take another year. Stored seed can be very slow and erratic to germinate, it should be stratified for 3 months at 15°C and then for another 3 months at 4°C[164]. It may still take another 18 months to germinate[78]. Scarifying the seed before stratifying it might reduce this time[80]. Fermenting the seed for a few days in its own pulp may also speed up the germination process[K]. Another possibility is to harvest the seed 'green' (as soon as the embryo has fully developed but before the seedcoat hardens) and sow it immediately in a cold frame. If timed well, it can germinate in the spring[80]. If you are

in their first year. The runners can be planted out direct into their permanent positions.

nwatta Prefers a fertile, well-drained, moisture retentive soil in a sunny position[200]. Tolerates semi-shade though fruit production will be reduced when plants grow in such a position. This species is closely related to *F. vesca*[200]. Plants are sometimes dioecious. In this case, male and female plants will be needed if fruit and seed is required.

## 6.2.215 Viola canina

Dog Violet  
5 tlin 9 cyuc 3 kcaak 0 tcan 1 dwat 0.4 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta *Viola canina* is a PERENNIAL growing to 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Flowers LeavesEdible Uses: TeaY-oung leaves and flower buds - raw or cooked[105, 177]. When added to soups, they thicken them in much the same way as okra[85, 159]. A tea can be made from the leaves[85].

tcanta None known  
dwatta Cathartic EmeticThe flowers and leaves are powerfully cathartic and emetic[4]. The plant has also had a reputation for curing skin diseases[4].

propta Seed - best sown in the autumn in a cold frame. Sow stored seed in early spring in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in the summer. Division in the autumn or just after flowering. Larger divisions can be planted out direct into their permanent positions, though we have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the summer or the following spring.

nwatta Prefers a cool moist well-drained humus-rich soil in partial or dappled shade and protection from scorching winds. Tolerates sandstone and limestone soils but becomes chlorotic if the pH is too high. Prefers a pH between 6 and 6.5[200]. All members of this genus have more or less edible leaves and flower buds, though those species with yellow flowers can cause diarrhoea if eaten in large quantities[62, 85, 159].

## 6.2.216 Lactuca sativa longifolia

Cos Lettuce  
5 tlin 9 cyuc 3 kcaak 0 tcan 3 dwat 0.9 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli prikliwis hpa7tmwatli fyifxre7t hjonli

drutta *Lactuca sativa longifolia* is a ANNUAL/BIENNIAL growing to 0.9 m (3ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Leaves - raw or cooked[7, 37]. A mild slightly sweet flavour with a crisp texture, lettuce is a very commonly used salad leaf and can also be cooked as a potherb or be added to soups etc[183]. A nutritional analysis is available[218]. Seed - sprouted and used in salads or sandwiches[183]. An edible oil is obtained from the seed[7]. The seed is very small, extraction of the oil on any scale would not be very feasible[K].

tcanta Parasiticide[178]. No further details are given, but it is probably the sap of flowering plants that is used. The seed is said to be used to make hair grow on scar tissue[218].

dwatta The whole plant is rich in a milky sap that flows freely from any wounds. This hardens and dries when in contact with the air[4]. The sap contains 'lactucarium', which is used in medicine for its anodyne, antispasmodic, digestive, diuretic, hypnotic, narcotic and sedative properties[9, 21, 46, 165, 192, 213, 238]. Lactucarium has the effects of a feeble opium, but without its tendency to cause digestive upsets[4], nor is it addictive[7]. It is taken internally in the treatment of insomnia, anxiety, neuroses, hyperactivity in children, dry coughs, whooping cough, rheumatic pain etc[238]. Concentrations of lactucarium are low in young plants and most concentrated when the plant comes into flower[238]. It is collected commercially by cutting the heads of the plants and scraping the juice into china vessels several times a day until the plant is exhausted[4]. The cultivated lettuce does not contain as much lactucarium as the wild species, most being produced when the plant is in flower[4]. An infusion of the fresh or dried flowering plant can also be used[9]. The plant should be used with caution, and never without the supervision of a skilled practitioner. Even normal doses can cause drowsiness whilst excess causes restlessness[238] and overdoses can cause death through cardiac paralysis[7, 9]. Some physicians believe that any effects of this medicine are caused by the mind of the patient rather than by the medicine[213]. The sap has also been applied externally in the treatment of warts[222]. The seed is anodyne and galactagogue[218]. Lettuce has acquired a folk reputation as an anaphrodisiac, anodyne, carminative, diuretic, emollient, febrifuge, hypoglycaemic, hypnotic, narcotic, parasiticide and sedative[218].

propta Seed - sow a small quantity of seed in situ every 2 or 3 weeks from March (with protection in cooler areas) to June and make another sowing in August/September for a winter/spring crop. Only just cover the seed. Germination is usually rapid and good, thin the plants if necessary, these thinnings can be transplanted to produce a slightly later crop (but they will need to be well watered in dry weather). More certain winter crops can be obtained by sowing in a frame in September/October and again in January/February.

nwatta Prefers a light sandy loam[1]. Succeeds in most well-drained, humus-rich soils but dislikes acid conditions[1, 16]. Plants strongly dislike dry conditions, quickly running to seed in such a situation. Early and late sowings are best in a sunny position, but summer crops are best given a position with some shade in order to slow down the plants tendency to go to seed and to prevent the leaves becoming bitter[18, 20]. The garden lettuce is widely cultivated in many parts of the world for its edible leaves and is probably the most commonly grown salad plant. This is the cos lettuce, a taller growing plant that has longer, thinner leaves and a more erect habit, it does not form a compact heart. There are many named varieties[183] capable of providing fresh leaves throughout the year if winter protection is given in temperate areas. Lettuces are quite a problematic crop to grow. They require quite a lot of attention to protect them from pests such as slugs, aphids and birds. If the weather is hot and dry the plants tend to run very quickly to seed, developing a bitter flavour as they do so. In wet weather they are likely to develop fungal diseases. In addition, the seed needs to be sown at regular intervals of 2- 3 weeks during the growing season in order to provide a regular supply of leaves. Lettuces make a good companion plant for strawberries, carrots, radishes and onions[18, 20, 201]. They also grow well with cucumbers, cabbages and beetroot[201].

## 6.2.217 Lactuca sativa capitata

Cabbage Lettuce  
5 tlin 9 cyuc 3 kcaak 0 tcan 3 dwat 0.9 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli prikliwis hpa7tmwatli fyifxre7t hjonli

drutta *Lactuca sativa capitata* is a ANNUAL/BIENNIAL growing to 0.9 m (3ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

238]. They have been used internally as an aperient in the treatment of dysentery, and as a remedy for liver and gall bladder complaints[238]. Externally, they have been used as a salve to treat burns and insect stings[238, 268]. They are considered to be virtually obsolete in modern herbalism[4, 238].

propta The seed is seldom produced in Britain[4]. If seed is obtained it would probably be best sown in a cold frame in early spring. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring or autumn[4]. Very easy, it can be done successfully at almost any time of the year. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the summer or the following spring. Basal cuttings in late spring[K]. Harvest the shoots with plenty of underground stem when they are about 8 - 10cm above the ground. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta An easily grown plant, it prefers a sunny warm position[52] in a dry soil[14, 37] but thrives under most conditions[4]. Tolerates a pH in the range 5.0 to 7.6. The leaves emit a soft balsamic odour[4]. The sub-species *T. balsamita tomentosum* is called the camphor plant because of its camphor-scented foliage[238]. Plants produces lot of leaves but no flowers when grown in the shade[4], though this is an advantage when the plant is being grown for its useful leaves[200]. Alecost used to be commonly grown in the herb garden but it has fallen out of favour in recent times[4].

### 6.2.212 Barbarea verna

Land Cress, Early yellowrocket

5 tlin 9 cyuc 3 kcaak 0 tcan 0 dwat 0.3 m hkuc pcmihmhhtut cyutli tcup hwicli hrasljutnyik hpa7tli flat-prikliwis hpa7tmwatli fyifxre7t hjonli

drutta Barbarea verna is a BIENNIAL growing to 0.3 m (1ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from May to July, and the seeds ripen from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies, bees, beetles. The plant is self-fertile. Suitable for; light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves Oil SeedEdible Uses: OilY-oung leaves - raw, cooked or used as a seasoning[1, 2, 33, 37, 52]. A hot, spicy watercress flavour, they are delicious in salads[183, 244]. Leaves can be obtained throughout the year if autumn-sown plants are given a light protection in winter[1]. An edible oil is obtained from the seed[46, 52, 61, 183]. The seed can be sprouted and added to salads etc[183].

tcanta OilNone known

dwatta None known

propta Seed - sow spring to September in situ at 3-weekly intervals to provide a succession of leaves. Germination usually takes place within 2 - 3 weeks.

nwatta Succeeds in sun or shade in a moist well-drained soil,[200] growing well on a north facing wall[33, 52]. The summer crop is best if it is given some shade whilst the winter crop succeeds in sunny positions[1, 200]. Land cress is often cultivated as a salad plant, when it is usually treated as an annual[46]. It can supply leaves all year round from successional sowings[1]. In hot weather plants soon run to seed unless they are kept shaded and moist[183]. The leaves taste much hotter in the summer[K]. Plants usually self-sow freely when growing in a suitable position[K].

### 6.2.213 Claytonia caroliniana

Broad-Leaved Spring Beauty, Carolina springbeauty
5 tlin 9 cyuc 3 kcaak 1 tcan 0 dwat 0.1 m hkuc

htut cyutli tcup hwicli hrasljut hpa7tli flat hpa7tmwatli xre7t hjonli

drutta Claytonia caroliniana is a PERENNIAL growing to 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in March, and the seeds ripen in May. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Root - raw or cooked like potatoes[2, 22, 46, 62, 85, 183, 257]. Rich in starch, it has a pleasant nutty flavour[105, K]. Leaves and stems - raw or cooked[62]. A very mild flavour, they are best mixed with stronger tasting leaves[183].

tcanta None known

dwatta None known

propta Seed - surface sow on a peat based compost in spring in a cold frame. Germination usually takes place within 2 - 4 weeks at 10°c[164]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the cold frame for at least their first winter. Plant them out in late spring or early summer after the last expected frosts. Division of offsets in spring or autumn.

nwatta Prefers a damp peaty soil and a position in full sun[1, 164]. Requires a lime-free soil[164]. The plant is heat tolerant in zones 6 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. Ephemeral emerging in spring and dying back by summer every year [1-2]. A clumping mat former. Forming a dense prostrate carpet spreading indefinitely [1-2]. The root pattern is a corm swelling at the stem base [1-2].

### 6.2.214 Fragaria viridis

Green Strawberry

5 tlin 9 cyuc 3 kcaak 3 tcan 0 dwat 0.3 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

drutta Fragaria viridis is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from April to May, and the seeds ripen from June to July. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[74, 177]. The fruit are greenish-tinged with red and are sweet and succulent with a rich musky pineapple-like flavour[183]. Absolutely delicious, though they are not produced very freely[K].

tcanta An excellent ground cover plant, spreading vigorously by means of surface stolons and forming a dense carpet[K]. It grows well amongst shrubs but can out-compete smaller plants[K].

dwatta None known

propta Seed - sow early spring in a greenhouse. The seed can take 4 weeks or more to germinate. The seedlings are very small and slow-growing at first, but then grow rapidly. Prick them out into individual pots when they are large enough to handle and plant them out during the summer. Division of runners, preferably done in July/August in order to allow the plants to become established for the following years crop[200]. They can also be moved in the following spring if required, though should not then be allowed to fruit

only growing small quantities of plants, it is best to pot up the seedlings as soon as they are large enough to handle and grow them on in individual pots for their first year, planting them out in late spring into nursery beds or their final positions. When growing larger quantities, it might be best to sow them directly outdoors in a seedbed, but with protection from mice and other seed-eating creatures. Grow them on in the seedbed until large enough to plant out, but undercut the roots if they are to be left undisturbed for more than two years. Grafting onto a rootstock of hawthorn, *Crataegus* species.

nwatta Prefers a well-drained, moisture-retentive soil enriched with organic matter, in sun or part shade[200]. Plants are hardy to about -15°c[200]. This tree is a bi-generic graft chimera resulting from a medlar, *Mespilus germanica*, being grafted on a hawthorn, *Crataegus* sp.[11]. Three branches that grew from just beneath the graft were different from each other and also from either of the two species used in the graft. They showed characteristics intermediate between the hawthorn and the medlar[11]. These three forms have been propagated and, in growth, each form tends to produce some branches of the other forms[11]. The first branch that was propagated has received specific status as *C. dardarii*. This is closer to the medlar than the hawthorn, but produces its flowers in clusters like the hawthorn - the fruits are medlar-like but a bit smaller. This tree also produces some branches that are pure medlar[11]. The second branch has cultivar status as 'Jules d'Asnieres'. This is more hawthorn-like, and produces some hawthorn-like spines. It produces fruit that is more hawthorn in size[11]. The third branch, which does not seem to have been named, started off like a pure hawthorn, but towards its extremity changed into the cultivar 'Jules d'Asnieres'[11].

### 6.2.130 Vaccinium formosum

Swamp Highbush Blueberry, Southern blueberry
5 tlin 9 cyuc 3 kcaak 0 tcan 0 dwat 4 m hkuc hmimhtut cyutli tcup hwicli hrasljut hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta Vaccinium formosum is a deciduous Shrub growing to 4 m (13ft 1in). See above for USDA hardiness. It is hardy to UK zone 6. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105, 142]. Well-flavoured[200]. A reasonable size, 7 - 12mm in diameter[200].

tcanta None known

dwatta None known

propta Seed - sow late winter in a greenhouse in a lime-free potting mix and only just cover the seed[78]. Stored seed might require a period of up to 3 months cold stratification[113]. Another report says that it is best to sow the seed in a greenhouse as soon as it is ripe[200]. Once they are about 5cm tall, prick the seedlings out into individual pots and grow them on in a lightly shaded position in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 8cm with a heel, August in a frame[78]. Slow and difficult. Layering in late summer or early autumn[78]. Another report says that spring is the best time to layer[200]. Takes 18 months[78]. Division of suckers in spring or early autumn[113].

nwatta Requires a moist but freely-draining lime free soil, preferring one that is rich in peat or a light loamy soil with added leaf-mould[11, 200]. Prefers a very acid soil with a pH in the range of 4.5 to 6, plants soon become chlorotic when lime is present. Succeeds in full sun or light shade though it fruits better in a sunny position[200]. Requires shelter from strong winds[200]. Often cultivated for its edible fruit[142], there are many named varieties[1]. Spreading by means of suckers, plants often form small colonies[200]. Dislikes root disturbance, plants are best grown in pots until being planted out in their permanent positions[200]. Plants in this genus are notably resistant to honey fungus[200].

### 6.2.131 Pleioblastus simonii

Medake, Simon bamboo

5 tlin 9 cyuc 3 kcaak 4 tcan 0 dwat 4.5 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Pleioblastus simonii is an evergreen Bamboo growing to 4.5 m (14ft 9in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: Seed Shoots StemEdible Uses: Young shoots - cooked[25, 61, 105]. They have a very bitter flavour, this bitterness is considerably reduced by changing the water at least once during the cooking process - though this will also remove quite a few of the nutrients[K]. The new shoots are about 20mm in diameter[K]. Seed cooked. As a grass seed the paper husk must be removed before eating.

tcanta Hedge Hedge Plant support WoodCanes are thin walled but extremely strong, they can be used as plant supports, also for fencing etc[25, 61, 74, 195]. Often used in China for making fan handles, poles and in various handicrafts[195]. Tolerant of maritime exposure and very hardy and vigorous, this plant makes a good screen or hedge[25, 166, 195].

dwatta None known

propta Seed - if possible, surface sow the seed as soon as it is ripe in a greenhouse at about 20°c. Stored seed should be sown as soon as it is received. Do not allow the compost to dry out. Germination usually takes place fairly quickly so long as the seed is of good quality, though it can take 3 - 6 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a lightly shaded place in the greenhouse or cold frame until they are large enough to plant out, which could be a number of years. The plants only flower at intervals of several years and so seed is rarely available. Division in spring as new growth commences. Very easy, single canes can be used. Pot them up in light shade in a greenhouse. Make sure the foliage is not allowed to dry out - misting 2 - 3 times a day for the first couple of weeks following division can be very helpful. Plant out in the summer once they are growing away strongly.

nwatta A very easily grown bamboo, it succeeds in most soils but prefers a good loamy soil in sun or semi-shade[1]. Dislikes drought[1]. Tolerates maritime exposure[166]. A very hardy plant, it can tolerate temperatures down to between -20 and -25°c. The rootstock is running and very invasive[11, 25, 166]. Another report says that it is a vigorous grower but not invasive[195]. New shoots are produced from May[25]. The canes are harvested commercially for their many uses in Japan[195]. It is the third most commonly cultivated species in Japan[195]. This species is notably resistant to honey fungus[200]. Unlike many bamboos, this plant quite often flowers and sets viable seed, the plants do not usually die as a result of this[122]. However, if they are fed with artificial NPK fertilizers at this time they are far less likely to survive[122].

### 6.2.132 Staphylea pinnata

Bladder Nut

5 tlin 9 cyuc 3 kcaak 0 tcan 0 dwat 4.5 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Staphylea pinnata is a deciduous Shrub growing to 4.5 m (14ft) by 4.5 m (14ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to June, and the seeds ripen from September to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: Seed - raw[2, 105, 177]. Said to taste like pistachios, the seeds are eaten by children in Germany[183].

tcanta None known

dwatta None known

propta Seed - this can be very slow to germinate, sometimes taking 18 months or more. It is best sown as soon as it is ripe in a cold frame[200], and some of it at least should then germinate in the spring. Stored seed should be sown as early in the year as possible and given cold stratification - it might not germinate until spring of the following year. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in the greenhouse for their first winter. Plant them out early the following summer. Cuttings of half-ripe wood, 5 - 8cm with a heel, July/August in a frame. Fair to good percentage[78]. Layering in July/August. Takes 15 months. Good percentage[78]. Plants sometimes produce suckers, these can be removed in the dormant season and planted out.

nwatta Tolerant of a wide range of soils so long as they are not too dry[11, 182, 200], it prefers a rich loamy soil in full sun or semi-shade[200]. Prefers a neutral to acid soil but tolerates some alkalinity[202]. A very ornamental plant[1], it is hardy to about -20°C[184]. The plants flower best in years that follow hot summers[200]. Plants in this genus are notably resistant to honey fungus[200].

### 6.2.133 Zanthoxylum simulans

Szechuan Pepper, Chinese-pepper, Prickly Ash  
5 tin 8 cyuc 3 kcaak 0 tcan 2 dwat 4 m hkuc  
pcimhmihmtut cyutli tcup hwicli hrasljutnyik hpa7tli flat-prikkwis hpa7tmwatli nyanhjen hjonli

drutta Zanthoxylum simulans is a deciduous Shrub growing to 4 m (13ft) by 6 m (19ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in June, and the seeds ripen in October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Edible Uses: CondimentThe fruit is dried and used as a condiment[46, 61, 105, 177]. A pepper flavour, it is stronger and more pungent than black pepper[183]. It can be used whole or ground into a powder and used as a table seasoning[183]. A light roasting brings out more of the flavour[206]. It is an ingredient of the famous Chinese 'five spice' mixture[206].

tcanta None known

dwatta Anodyne Anthelmintic Antidote Antiphlogistic Astringent Carminative Diaphoretic Digestive Diuretic Emmenagogue Stimulant Stomachic Tonic VasodilatorAstringent, diaphoretic, emmenagogue[116, 178]. The pericarp is anaesthetic, diuretic, parasiticide and vasodilator[176]. It is used in the treatment of gastralgia and dyspepsia due to cold with vomiting, diarrhoea, abdominal pain, ascariasis and dermal diseases[176]. It has a local anaesthetic action and is parasiticide against the pork tapeworm (*Taenia solium*)[176]. The pericarp contains geraniol. In small doses this has a mild diuretic action, though large doses will inhibit the excretion of urine[176]. There is a persistent increase in peristalsis at low concentration, but inhibition at high concentration[176]. The leaves are carminative, stimulant and sudorific[147, 218]. The fruit is carminative, diuretic, stimulant, stomachic and tonic[147, 218]. The seed is antiphlogistic and diuretic[218]. A decoction of the root is digestive and also used in the treatment of snakebites[218]. The resin contained in the bark, and especially in that of the roots, is powerfully stimulant and tonic[82].

propta Seed - best sown in a greenhouse as soon as it is ripe in the autumn. Stored seed may require up to 3 months cold stratification, though scarification may also help[113]. Sow stored seed in a cold frame as early in the year as possible. Germination should take place in late spring, though it might take another 12 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant them out in early summer. Cuttings of half-ripe wood, July/August in a frame. Root cuttings, 3cm long, planted horizontally in pots in a greenhouse. Good percentage[78]. Suckers, re-

moved in late winter and planted into their permanent positions[113].

nwatta Landscape Uses:Border, Massing. Easily grown in loamy soils in most positions, but prefers a good deep well-drained moisture retentive soil in full sun or semi-shade[1, 11, 200]. A plant has been growing well for many years in deep woodland shade at Cambridge Botanical gardens, it was fruiting heavily in autumn 1996[K]. Cultivated for its seed, which is used as a condiment in China[46, 61]. Flowers are formed on the old wood[206]. The bruised leaves are strongly aromatic[245]. Dioecious. Male and female plants must be grown if seed is required. Special Features:Inconspicuous flowers or blooms, Blooms appear periodically throughout the year.

### 6.2.134 Viburnum nudum

Smooth Withe Rod, Possumhaw, Withe-rod, Swamp Haw, Smooth Witherod, Possum Haw Viburnum, Possum Haw  
5 tin 9 cyuc 3 kcaak 0 tcan 1 dwat 4.5 m hkuc  
hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli frusflatprikkwis hpa7tmwatli dyatre7t hjonli

drutta Viburnum nudum is a deciduous Shrub growing to 4.5 m (14ft 9in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in June, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[3, 105]. It usually has a sweetish flavour[2, 183] but is sometimes bitter[43] and is usually unpalatable[227]. The ovoid fruit is about 8mm long and contains a single large seed[200].

tcanta None known

dwatta Antispasmodic Diuretic TonicA tea made from the bark is antispasmodic, diuretic, tonic and uterine sedative[222].

propta Seed - best sown in a cold frame as soon as it is ripe. Germination can be slow, sometimes taking more than 18 months. If the seed is harvested 'green' (when it has fully developed but before it has fully ripened) and sown immediately in a cold frame, it should germinate in the spring[80]. Stored seed will require 2 months warm then 3 months cold stratification and can still take 18 months to germinate[113]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame or greenhouse. Plant out into their permanent positions in late spring or early summer of the following year. Cuttings of soft-wood, early summer in a frame[200]. Pot up into individual pots once they start to root and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, 5 - 8 cm long with a heel if possible, July/August in a frame[78, 113]. Plant them into individual pots as soon as they start to root. These cuttings can be difficult to overwinter, it is best to keep them in a greenhouse or cold frame until the following spring before planting them out[113]. Cuttings of mature wood, winter in a frame. They should root in early spring - pot them up when large enough to handle and plant them out in the summer if sufficient new growth is made, otherwise keep them in a cold frame for the next winter and then plant them out in the spring. Layering of current seasons growth in July/August. Takes 15 months[78].

nwatta Landscape Uses:Screen, Specimen. An easily grown plant, it succeeds in most soils but is ill-adapted for poor soils and for dry situations[1]. It prefers a deep rich loamy soil in sun or semi-shade[11, 200]. Best if given shade from the early morning sun in spring[200]. Plants often grow in quite acid soils in the wild[227]. Plants are self-incompatible and need to grow close to a genetically distinct plant in the same species in order to produce fruit and fertile seed[11, 200]. This species is closely related to *V. cassinoides*[11]. Special Features: Attracts birds, North American native, Wetlands plant, Fragrant flowers, Attractive flowers or blooms.

the ground seed), poultices or added to the bath water. It is used in the treatment of respiratory infections, arthritic joints, chilblains and skin eruptions etc[238]. At a ratio of 1:3, the seed has an inhibitory action on the growth of fun-gus[176]. Care should be exercised in using this remedy because the seed contains substances that are extremely irritant to the skin and mucous membranes[238]. The leaves are carminative[218].

propta Seed - sown in situ from early spring to late summer. Germination takes place in less than a week. The earlier sowings are for a seed crop, the later sowings are for edible leaves and green manure[82]. When sowing seed for use in mustard and cress, the seed is soaked for about 12 hours in warm water and then placed in a humid position. Traditionally, it is sown in a tray on a thin layer of soil, or on some moist blotting paper, and the tray is placed in a warm dark place for a few days to encourage rapid and rather etiolated growth. The seedlings can then be placed in a lighter position for a couple more days to turn green before being eaten. The mustard seed should be sown about 3 - 4 days later than the cress for them both to be ready at the same time[264].

nwatta Prefers a light well-drained soil[52]. Succeeds on most soils when growing in a sunny position[238]. For best production, it requires high nutrient soils with a high level of nitrogen, but it may be grown on a wide range of soils from light to heavy, growing best on relatively heavy sandy loamy soils[269]. It is not suited to very wet soils[269]. White mustard grows best where the annual precipitation varies from 35 to 179cm, annual temperature from 5.6 to 24.9°C and pH from 4.5 to 8.2[269]. White mustard is a quick-growing long-day annual which prefers temperate climates with some humidity. It is sometimes cultivated, both in the garden and commercially, for its edible seed[4, 183]. The plant can withstand high temperatures, but very hot days during flowering and ripening may reduce seed setting and lower quality of seed[269]. There are some named varieties[183]. It is a very fast growing plant, but requires plenty of moisture for optimum growth[87]. Seed yields are usually a bit less than 1 tonne per hectare, though experimental plantings have suggested that up to 8 tonnes per hectare is possible[269]. White mustard is sometimes also grown as a seed sprout, usually with cress seeds (*Lepidium sativum*) to supply mustard and cress. This is a mixture of the two types of sprouted seeds, used when about 7 - 10 days old[K]. The mustard seed should be sown three days before the cress seed[238]. The plant is not very deep rooted[87], it self-sows freely when in a suitable site[14].

### 6.2.210 Lactuca sativa angustana

Celluce  
5 tin 9 cyuc 3 kcaak 0 tcan 3 dwat 0.6 m hkuc  
hmimhtut cyutli tcup hwicli hrasljut hpa7tli prikkwis hpa7tmwatli fyifxre7t hjonli

drutta Lactuca sativa angustana is a ANNUAL/BIENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Leaves StemEdible Uses: Leaves - raw or cooked[33, 183]. A mild, slightly sweet flavour, they are rather more coarse than ordinary lettuce[206], though they make an acceptable ingredient in mixed salads. Old leaves become coarser and bitter[206]. Stem - raw or cooked. Thick, tender, crisp and juicy, its flavour is variously described as being like lettuce, celery, artichoke, squash, asparagus or chard[33, 183]. It is usually peeled before being used[183, 206]. The stems can be harvested just before the plants flower without them turning bitter, though they might become hollow at this stage[206].

tcanta ParasiticideParasiticide[178]. No further details are given, but it is probably the sap of flowering plants that is used. The seed is said to be used to make hair grow on scar tissue[18].

dwatta Anodyne Antispasmodic Emollient Expectorant Parasiticide SedativeThe whole plant is rich in a milky sap that flows freely from any wounds. This hardens and dries

when in contact with the air[4]. The sap contains 'lactucarium', which is used in medicine for its anodyne, antispasmodic, digestive, diuretic, hypnotic, narcotic and sedative properties[9, 21, 46, 165, 192, 213, 238]. Lactucarium has the effects of a feeble opium, but without its tendency to cause digestive upsets[4], nor is it addictive[7]. It is taken internally in the treatment of insomnia, anxiety, neuroses, hyperactivity in children, dry coughs, whooping cough, rheumatic pain etc[238]. Concentrations of lactucarium are low in young plants and most concentrated when the plant comes into flower[238]. It is collected commercially by cutting the heads of the plants and scraping the juice into china vessels several times a day until the plant is exhausted[4]. The cultivated lettuce does not contain as much lactucarium as the wild species, most being produced when the plant is in flower[4]. An infusion of the fresh or dried flowering plant can also be used[9]. The plant should be used with caution, and never without the supervision of a skilled practitioner. Even normal doses can cause drowsiness whilst excess causes restlessness[238] and overdoses can cause death through cardiac paralysis[7, 9]. Some physicians believe that any effects of this medicine are caused by the mind of the patient rather than by the medicine[213]. The sap has also been applied externally in the treatment of warts[222]. The seed is anodyne and galactagogue[218]. Lettuce has acquired a folk reputation as an anaphrodisiac, anodyne, carminative, diuretic, emollient, febrifuge, hypoglycaemic, hypnotic, narcotic, parasiticide and sedative[218].

propta Seed - sow March to June in situ[206]. Seedlings can be transplanted[206]. Seed becomes dormant at temperatures above 27°C[206].

nwatta Prefers a light sandy loam[1]. Succeeds in most well-drained, humus-rich soils but dislikes acid conditions[1, 16]. Prefers some shade in the summer to slow down the plants tendency to go to seed and to prevent the leaves becoming bitter[18, 20]. Plants can resist some frost, they can also tolerate temperatures in excess of 27°C[206]. They are fairly resistant to bolting, though they can run to seed prematurely in very hot conditions[206]. The celtuce is a form of lettuce with a longer and thicker central stem, it is sometimes cultivated for its edible leaves and stems[206]. There are some named varieties[183]. It takes 3 - 4 months from sowing before the stems are ready to harvest[206]. A surface-rooting plant, the roots can be damaged by hoeing[206]. A good companion for strawberries, carrots, radishes and onions[18, 20].

### 6.2.211 Tanacetum balsamita

Alecost, Costmary  
5 tin 9 cyuc 3 kcaak 0 tcan 2 dwat 0.9 m hkuc  
hmimhtut cyutli kyuctup hwicli hrasljutnyik hpa7tli flat-prikkwis hpa7tmwatli xre7t hjonli

drutta Tanacetum balsamita is a PERENNIAL growing to 0.9 m (3ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcaakta Edible Parts: LeavesEdible Uses: Condiment TeaLeaves - raw or used as a flavouring in soups, beer etc[2, 4, 14, 27, 52, 177, 183]. They can be chopped and added sparingly to salads[183]. They have a very pleasant aroma, but can be overpowering in the food if you are not careful[K]. The leaves were at one time widely used in brewing beer, before being superseded by hops (*Humulus lupulus*)[238]. The whole leaves can be laid in cake trays to flavour the cake whilst it is baking[183]. The flower petals are used for conserves[183]. A delicious tea is made from the dried leaves[14, 21, 183].

tcanta InsecticidePot-pourri StrewingThe plant was traditionally used for its insecticidal properties[200]. The dried leaves retain their fragrance well and so are used in pot-pourri[4, 238], they are also used as a strewing herb[200].

dwatta Antiseptic Astringent Digestive Dysentery LaxativeAlecost is seldom used in herbal medicine, though it does have a beneficial effect upon the digestive system[268]. The leaves are antiseptic, astringent, digestive and laxative[4, 14,

and is pollinated by Flies, bees, beetles. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**ckakta Edible Parts:** Flowers Leaves**Edible Uses:** Young leaves - raw or cooked like spinach[2, 9, 27, 46, 52, 95]. A hot cress-like flavour[183]. Young leaves are chopped up finely and added to salads, older leaves can be used as a potherb but they are rather strong and are best cooked in one or two changes of water[183]. The leaves are available all year round, even in the winter, especially if the weather is mild[95, 115]. To increase the productivity of the plants, remove the flowering stems as they appear (they can be eaten like the leaves[K]) and pick the outer leaves as the plant re-grows[244]. Some caution is advised, see the notes above on toxicity. Young flowering stems - harvested before the flowers open and cooked like broccoli[183].

**tcanta None known**

**dwatta Antiscorbatic Appetizer Diuretic Vulnerary**The leaves are vulnerary and have been used as a poultice for treating wounds[207, 240]. A tea made from the leaves is appetizer, antiscorbatic and diuretic[222].

**propta Seed** - sow spring or autumn in situ. Germination usually takes place within 2 - 3 weeks. Division in spring. his plant is a short-lived perennial, and also usually self-sows freely, so we have not found division to be worthwhile.

**nwatta Succeeds** in sun or shade in a moist well-drained soil[1, 111]. Tolerates a pH in the range 4.8 to 7.5. The plant can continue to grow all winter, especially if the weather is mild[183]. A short-lived perennial[1], though plants usually self-sow freely when in a suitable position[K]. There is at least one named form, developed for its ornamental value. 'Variegata' has variegated leaves and grows less strongly than the type[183]. A good bee plant[108].

## 6.2.208 Geum urbanum

Wood Avens, Bennet's Root - Old man's whiskers, Herb ben-net

5 tlin 9 cyuc 3 kcaak 2 tcان 3 dwat 0.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

**drutta Geum urbanum** is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**ckakta Edible Parts:** Leaves Root**Edible Uses:** Condiment DrinkYoung leaves - cooked. Root - cooked. Used as a spice in soups, stews etc. and also as a flavouring in ale[4, 5, 8, 13, 183]. It is a substitute for cloves with a hint of cinnamon in the flavour[12, 74, 183]. It is best used in spring[12]. The root is also boiled to make a beverage[161]. The root is up to 5cm long[4].

**tcanta Repellent Tannin**The freshly dug root has a clove-like fragrance[4], when dried it is used in the linen cupboard to repel moths[4, 53]. The root contains about 9% tannin[4].

**dwatta Antidiarrhoeal Antiinflammatory Antiseptic Aromatic Astringent Diaphoretic Febrifuge Skin Stomachic Styptic TonicWood avens** is an astringent herb, used principally to treat problems affecting the mouth, throat and gastrointestinal tract. It tightens up soft gums, heals mouth ulcers, makes a good gargle for infections of the pharynx and larynx, and reduces irritation of the stomach and gut[254]. All parts of the plant, but especially the root, are anti-inflammatory, antiseptic, aromatic, astringent, diaphoretic, febrifuge, stomachic, styptic and tonic[4, 9, 21, 165, 238]. An infusion is taken internally in the treatment of diarrhoea, intestinal disorders, stomach upsets, irritable bowel syndrome and liver disorders, it is also applied externally as a wash to haemorrhoids, vaginal discharges etc[238, 254] and to treat various skin affections - it is said to remove spots, freckles and eruptions from the face[4, 9]. The root is best harvested in the spring, since at this time it is most fragrant[4]. Much

of the fragrance can be lost on drying, so the root should be dried with great care then stored in a cool dry place in an airtight container, being sliced and powdered only when required for use[4]. The powdered root had a great reputation as a substitute for quinine in the treatment of intermittent fevers [301].

**propta Seed** - sow spring or autumn in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer' Division in spring or autumn. This should be done every 3 - 4 years in order to maintain the vigour of the plant[200]. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

**nwatta** Easily grown in any moderately good garden soil that is well-drained[1]. Prefers shade[12, 21] and a soil rich in organic matter[200]. This species was widely cultivated as a pot-herb in the 16th century[5]. The bruised or dried root is pleasantly aromatic with a clove-like fragrance[245]. Plants self-sow freely when well-sited[238]. Hybridizes freely with other members of this genus[200]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

## 6.2.209 Sinapis alba

White Mustard

5 tlin 9 cyuc 3 kcaak 0 tcان 3 dwat 0.6 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

**drutta Sinapis alba** is a ANNUAL growing to 0.6 m (2ft) by 0.3 m (1ft in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from June to August, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**ckakta Edible Parts:** Leaves Oil Seed**Edible Uses:** Condiment OilLeaves - raw or cooked[2, 5, 14, 52]. A hot pungent flavour, especially if eaten raw[K]. Young leaves are used as a flavouring in mixed salads, whilst older leaves are used as a potherb[183]. Seed - sprouted and eaten raw[1, 34, 37, 52]. The seed takes about 4 days to be ready[244]. A hot flavour, it is often used in salads. A nutritional analysis is available[218]. The seed can be ground into a powder and used as a food flavouring[17, 34, 89, 171], it is the 'white mustard' of commerce[100, 105]. This is milder than the black mustard obtained from *Brassica nigra*[183]. The pungency of mustard develops when cold water is added to the ground-up seed - an enzyme (myrosin) acts on a glycoside (sinigrin) to produce a sulphur compound. The reaction takes 10 - 15 minutes. Mixing with hot water or vinegar, or adding salt, inhibits the enzyme and produces a mild bitter mustard[238].

**tcanta Green manure Oil**The seed contains up to 35% of a semi-drying oil[74]. It is used as a lubricant and for lighting etc[21, 46, 57, 61]. The plant can be grown as a green manure crop[17, 89]. It is very fast growing, producing a good bulk in just a few weeks from seed, but it is shallow rooted so does not do so well in dry periods[87]. It is also susceptible to all the diseases of the cabbage family such as club-root so is best avoided if this is likely to be a problem[17].

**dwatta Antibacterial Antifungal Antirheumatic Appetizer Carminative Cathartic Diaphoretic Digestive Diuretic Emetic Expectorant Rubefacient Stimulant Vesicant**The seed is antibacterial, antifungal, appetizer, carminative, diaphoretic, digestive, diuretic, emetic, expectorant, rubefacient and stimulant[14, 176, 218, 238]. The seed has a cathartic action due to hydrolytic liberation of hydrogen sulphide[218]. In China it is used in the treatment of coughs with profuse phlegm and tuberculosis, pleurisy[176]. The seed is seldom used internally as a medicine in the west[238]. Externally it is usually made into mustard plasters (using

## 6.2.135 Zanthoxylum alatum

Winged Prickly Ash

5 tlin 9 cyuc 3 kcaak 3 tcان 2 dwat 4 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

**drutta Zanthoxylum alatum** is a deciduous Shrub growing to 4 m (13ft 1in). See above for USDA hardiness. It is hardy to UK zone 6. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). . The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**ckakta Edible Parts:** Edible Uses: CondimentThe seed is ground into a powder and used as a condiment[183]. A pepper substitute, it is widely used in the Orient[105, 132, 158, 183]. A light roasting brings out more of the flavour[206]. The seed is an ingredient of the famous Chinese 'five spice' mixture[206]. The fruit is rather small but is produced in clusters which makes harvesting easy[K]. Each fruit contains a single seed. Young leaves are used as a condiment[105, 158, 183].

**tcanta Miscellany Teeth Wood**The fruit contains 1.5% essential oil[240]. The fruit is used to purify water[146, 158]. Toothbrushes are made from the branches[146, 158]. Wood - heavy, hard, close grained. Used for walking sticks[146, 158].

**dwatta Cholera Miscellany Odontalgic Stimulant Stomachic Tonic**The seeds and the bark are used as an aromatic tonic in the treatment of fevers, dyspepsia and cholera[240]. The fruits, branches and thorns are considered to be carminative and stomachic[46, 61, 146, 158, 240]. They are used as a remedy for toothache[240].

**propta Seed** - best sown in a greenhouse as soon as it is ripe in the autumn. Stored seed may require up to 3 months cold stratification, though scarification may also help[113]. Sow stored seed in a cold frame as early in the year as possible. Germination should take place in late spring, though it might take another 12 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant them out in early summer. Cuttings of half-ripe wood, July/August in a frame. Root cuttings, 3cm long, planted horizontally in pots in a greenhouse. Good percentage[78]. Suckers, removed in late winter and planted into their permanent positions[113].

**nwatta** Prefers a good deep well-drained moisture retentive soil in full sun or semi-shade[1, 11, 200]. This species is closely related to *Z. planispinum*[200]. Flowers are formed on the old wood[206]. Dioecious. Male and female plants must be grown if seed is required.

## 6.2.136 Quercus coccifera

Kermes Oak

5 tlin 9 cyuc 3 kcaak 3 tcان 2 dwat 4 m hkuc hmimhtut cyutli tcup hwicli jlutnyik hpa7tli flatprikliwis hpa7tmwatli hjonli

**drutta Quercus coccifera** is an evergreen Shrub growing to 4 m (13ft) by 4 m (13ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year; in flower from April to June. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

**ckakta Edible Parts:** Seed**Edible Uses:** CoffeeSeed - cooked[2, 63, 105]. It can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread. The seed contains bitter tannins, these can be leached out by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in

a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute.

**tcanta Dye Repellent Tannin Wood**A mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth[20]. Oak galls are ex-crescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4]. The bark is rich in tannin[148]. A black dye can be obtained from the bark[89] and also from the seeds[148].

**dwatta Astringent Dysentery**Any galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4].

**propta Seed** - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

**nwatta** Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Lime tolerant[188]. Young plants tolerate reasonable levels of side shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. A very ornamental plant[1], it thrives in Britain[200]. A shrub growing in dappled woodland shade at Cambridge Botanical Gardens produced a few ripe seeds after the hot summer of 1989, though the vast majority of seeds were aborted[K]. The fruit ripens in its second year[11]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. Any transplanting should be done once growth has commenced in late May or in September[11]. Hybridizes freely with other members of the genus[200]. This species is notably resistant to honey fungus[88, 200].

## 6.2.137 Viburnum cotinifolium

5 tlin 9 cyuc 3 kcaak 3 tcان 0 dwat 3.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikli-wisslip hpa7tmwatli dyatxre7t hjonli

**drutta Viburnum cotinifolium** is a deciduous Shrub growing to 3.5 m (11ft 6in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in June, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**ckakta Edible Parts:** Fruit**Edible Uses:** Fruit - raw or cooked[2, 51, 146, 158]. A sweetish flavour[183]. The ooid fruit is about 12mm long and contains a single large seed[200].

**tcanta Wood**Wood - hard, close grained[146, 158].

**dwatta None known**

**propta Seed** - best sown in a cold frame as soon as it is ripe. Germination can be slow, sometimes taking more than 18 months. If the seed is harvested 'green' (when it has fully developed but before it has fully ripened) and sown immediately in a cold frame, it should germinate in the spring[80]. Stored seed will require 2 months warm then 3 months cold stratification and can still take 18 months to germinate[113]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame or greenhouse. Plant out into their permanent positions in late spring or early summer of the following year. Cuttings of soft-wood, early summer in a frame[200]. Pot up into individual pots once they start to root and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, 5 - 8 cm long with a heel if possi-

ble, July/August in a frame[78, 113]. Plant them into individual pots as soon as they start to root. These cuttings can be difficult to overwinter, it is best to keep them in a greenhouse or cold frame until the following spring before planting them out[113]. Cuttings of mature wood, winter in a frame. They should root in early spring - pot them up when large enough to handle and plant them out in the summer if sufficient new growth is made, otherwise keep them in a cold frame for the next winter and then plant them out in the spring. Layering of current seasons growth in July/August. Takes 15 months[78].

nwatta An easily grown plant, it succeeds in most soils but is ill-adapted for poor soils and for dry situations[1]. It prefers a deep rich loamy soil in sun or semi-shade[11, 200]. Best if given shade from the early morning sun in spring[200]. Hardy to about -15°C[184]. Plants are self-incompatible and need to grow close to a genetically distinct plant in the same species in order to produce fruit and fertile seed[11, 200]. Closely allied to *V. lanтана*[1, 11], but not as hardy as that species[11].

### 6.2.138 *Prunus canescens*

Greyleaf Cherry  
5 tin 9 cyuc 3 kcaak 2 tcan 1 dwat 3 m hku  
hmmihmtt cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Prunus canescens* is a deciduous Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Fruit SeedEdible Uses: Fruit - raw or cooked[183]. A pleasant cherry-like flavour[11]. The fruit is about 10mm in diameter and contains one large seed[200]. Seed - raw or cooked. Do not eat the seed if it is too bitter - see the notes above on toxicity.

tcanta Dye RootstockUsed as a rootstock for cherries. It is compatible with most sweet cherry cultivars and produces small trees with an open growth habit. Suitable for planting at 300 - 500 trees per hectare. The fruit yield tends to be very good[183]. A green dye can be obtained from the leaves[168]. A dark grey to green dye can be obtained from the fruit[168].

dwatta Although no specific mention has been seen for this species, all members of the genus contain amygdalin and prunasin, substances which break down in water to form hydrocyanic acid (cyanide or prussic acid). In small amounts this exceedingly poisonous compound stimulates respiration, improves digestion and gives a sense of well-being[238].

propta Seed - requires 2 - 3 months cold stratification and is best sown in a cold frame as soon as it is ripe[200]. Sow stored seed in a cold frame as early in the year as possible[200]. Protect the seed from mice etc. The seed can be rather slow, sometimes taking 18 months to germinate[113]. Prick out the seedlings into individual pots when they are large enough to handle. Grow them on in a greenhouse or cold frame for their first winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood with a heel, July/August in a frame[11, 200]. Softwood cuttings from strongly growing plants in spring to early summer in a frame[200]. Layering in spring.

nwatta Thrives in a well-drained moisture-retentive loamy soil, growing well on limestone[11, 200]. Prefers some lime in the soil but is likely to become chlorotic if too much lime is present[1]. Succeeds in sun or partial shade though it fruits better in a sunny position[11, 200]. Most members of this genus are shallow-rooted and will produce suckers if the roots are damaged[238]. Plants in this genus are notably susceptible to honey fungus[200].

### 6.2.139 *Sambucus racemosa* var. *racemosa*

Red Coast Elder  
5 tin 9 cyuc 3 kcaak 2 tcan 2 dwat 3 m hku

hmmihmtt cyutli tcup hwicli hrasjlutnyikri hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Sambucus racemosa* var. *racemosa* is a deciduous Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to July, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcaakta Fruit - raw or cooked[61, 105, 257]. The fruit can be made into jams and preserves[257]. It can also be dried for winter use[118]. The fruit is about 5mm in diameter and is borne in large clusters[200]. Some caution is advised, see notes above on toxicity. Flowers - raw or cooked.

tcanta None known  
dwatta The leaves are abortifacient, analgesic, oxytocic and poultice[257]. A decoction of the leaves has been used to terminate a pregnancy and can also be taken during labour to ease the birth[257]. An infusion of the leaves has been used as an antiseptic wash on areas affected by blood poisoning[257]. A poultice of the pounded leaves has been applied to abscess and boils and also to sore joints to help reduce the swelling[257]. A poultice of the cooked shoots has been used to alleviate pain[257]. The bark is cathartic[257]. An infusion of the bark has been used in the treatment of coughs and colds[257]. A poultice of the bark has been applied to sore joints to help reduce the swelling[257]. The fruit has been cooked and eaten as a treatment for stomach problems[257].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame, when it should germinate in early spring. Stored seed can be sown in the spring in a cold frame but will probably germinate better if it is given 2 months warm followed by 2 months cold stratification first[78, 98, 113]. Prick out the seedlings into individual pots when they are large enough to handle. If good growth is made, the young plants can be placed in their permanent positions during the early summer. Otherwise, either put them in a sheltered nursery bed, or keep them in their pots in a sheltered position and plant them out in spring of the following year. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in a frame[78]. Cuttings of mature wood of the current season's growth 15 - 20cm with a heel, late autumn in a frame or a sheltered outdoor bed[78].

nwatta Tolerates most soils, including chalk[200], but prefers a moist loamy soil[11, 200]. Grows well in heavy clay soils. Tolerates some shade but is best in a sunny position[1]. Tolerates atmospheric pollution and coastal situations[200]. Plants in this genus are notably resistant to honey fungus[200].

### 6.2.140 *Viburnum dilatatum*

Linden Viburnum, Linden arrowwood  
5 tin 8 cyuc 3 kcaak 2 tcan 1 dwat 3 m hku  
hmmihmtt cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli dyaxre7t hjonli

drutta *Viburnum dilatatum* is a deciduous Shrub growing to 3 m (9ft) by 2 m (6ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Fruit LeavesEdible Uses: Fruit - raw or cooked[105, 177, 179]. A sweet flavour[178]. The ovoid fruit is about 8mm long and contains a single large seed[200]. Leaves - cooked[105, 177].

tcanta FibreA fibre obtained from the inner bark is used for making ropes[178].

dwatta Anthelmintic Astringent VulneraryA decoction of the leaves is astringent and vermifuge. It is used for washing and healing maggoty sores[178, 218]. The twigs are also

ingestion can be lethal whilst skin contact can cause dermatitis[222, 238].

propta Seed - sow in situ in spring or autumn[169].

nwatta Prefers a sunny position in a well-drained acidic soil of low to moderate fertility[169]. Another report says that it prefers a rich sandy soil in sun or partial shade[238]. The plants neat habit and aromatic foliage make it a good candidate for growing in containers or planting near seats[238].

### 6.2.205 *Mentha requienii*

Corsican Mint, Mint

5 tin 9 cyuc 3 kcaak 3 tcan 2 dwat 0.1 m hku  
hmmihmtt cyutli tcup hwicli hrasjlutnyikri hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Mentha requienii* is a PERENNIAL growing to 0.1 m (0ft 4in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: LeavesEdible Uses: Condiment TeaLeaves - raw or cooked. A very strong peppermint-like aroma, it is used as a flavouring in salads, cooked foods and liqueurs[183]. A herb tea is made from the leaves.

tcanta Essential Repellent StrewingAn essential oil with a strong peppermint scent is obtained from the whole plant. Rats and mice intensely dislike the smell of mint. The plant was therefore used in homes as a strewing herb and has also been spread in granaries to keep the rodents off the grain[244]. An ornamental ground cover plant[183].

dwatta Antiseptic Carminative FebrifugeA tea made from the leaves of most mint species has traditionally been used in the treatment of fevers, headaches, digestive disorders and various minor ailments[222]. The leaves are harvested as the plant comes into flower and can be dried for later use[238]. The essential oil in the leaves is antiseptic, though it is toxic in large doses[222].

propta Seed - sow spring in a cold frame. Germination is usually fairly quick. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in the summer. *Mentha* species are very prone to hybridisation and so the seed cannot be relied on to breed true. Even without hybridisation, seedlings will not be uniform and so the content of medicinal oils etc will vary. When growing plants with a particular aroma it is best to propagate them by division[K]. Division can be easily carried out at almost any time of the year, though it is probably best done in the spring or autumn to allow the plant to establish more quickly. Virtually any part of the root is capable of growing into a new plant. Larger divisions can be planted out direct into their permanent positions. However, for maximum increase it is possible to divide the roots up into sections no more than 3cm long and pot these up in light shade in a cold frame. They will quickly become established and can be planted out in the summer.

nwatta Reaching only 1-3 cm in height. Succeeds in most soils and situations so long as the soil is not too dry[200]. This species of mint will grow in drier soils than the other mints[245]. It also grows well in heavy clay soils. A sunny position is best for production of essential oils, but it also succeeds in partial shade. Prefers a shady position[188]. Fairly tolerant of being walked on, it grows well in the cracks of paving stones and also as a lawn with thyme and camomile[245]. This species is not hardy in all areas of Britain[238]. However, the plant usually self-sows even when the parent plant is killed by frost[238]. The whole plant is strongly aromatic with a peppermint aroma[245]. The flowers are very attractive to bees and butterflies. A good companion plant for growing near cabbages and tomatoes, helping to keep them free of insect pests. Members of this genus are rarely if ever troubled by browsing deer[233]. The plant is heat tolerant in zones 9 through 6. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the

number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. A clumping mat former. Forming a dense prostrate carpet with a limited spread [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2]. The root pattern is stoloniferous rooting from creeping stems above the ground [1-2].

### 6.2.206 *Allium acuminatum*

Hooker's Onion, Tapertip onion  
5 tin 9 cyuc 3 kcaak 0 tcan 2 dwat 0.3 m hku  
htut cyutli kyuctcup hwicli hrasjlut hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Allium acuminatum* is a BULB growing to 0.3 m (1ft) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcaakta Edible Parts: Flowers Leaves Root SeedEdible Uses: Bulb - raw or cooked[105, 177]. Eaten in spring and early summer[161]. A strong flavour[257]. The bulb is 10 - 15mm wide[200]. Leaves - raw or cooked. Used as a relish[257]. Flowers - raw. Used as a garnish on salads. The seed heads can be placed in hot ashes for a few minutes, then the seeds extracted and eaten[257].

tcanta RepellentThe growing plant is said to repel insects and moles[20]. The bulbs can be rubbed on the skin to repel insects[257].

dwatta Although no specific mention of medicinal uses has been seen for this species, members of this genus are in general very healthy additions to the diet. They contain sulphur compounds (which give them their onion flavour) and when added to the diet on a regular basis they help reduce blood cholesterol levels, act as a tonic to the digestive system and also tonify the circulatory system[K].

propta Seed - sow spring in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle - if you want to produce clumps more quickly then put three plants in each pot. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in spring once they are growing vigorously and are large enough. Division in spring. Very easy, the plants divide successfully at any time in the growing season and the divisions can be planted straight out into their permanent positions if required.

nwatta Prefers a sunny position in a light well-drained soil[1]. The bulbs tend to rot when grown in cool wet climates, even if they are given sharp drainage[203]. This species is best in a cold frame and given a dry summer rest[163, 203]. The bulbs should be planted fairly deeply[1]. Most members of this genus are intolerant of competition from other growing plants[203]. Grows well with most plants, especially roses, carrots, beet and chamomile, but it inhibits the growth of legumes[18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. Members of this genus are rarely if ever troubled by browsing deer[233].

### 6.2.207 *Barbarea vulgaris*

Yellow Rocket, Garden yellowrocket  
5 tin 9 cyuc 3 kcaak 0 tcan 1 dwat 0.4 m hku  
hmmihmtt cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli fyfxre7t hjonli

drutta *Barbarea vulgaris* is a PERENNIAL growing to 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from May to August, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs)

drutta Plantago coronopus is a ANNUAL/PERENNIAL growing to 0.3 m (1ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from May to July, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: LeavesEdible Uses: Young leaves - raw or cooked[2, 13, 132, 183]. High yielding[27]. One of the nicer tasting members of this genus, the leaves are fairly tender and have a slight bitterness[K]. Some people blanch the leaves in boiling water for a few seconds before using them in salads in order to make them more tender[183]. This leaf is one of the ingredients of ‘misticanze’, a salad mixture of wild and cultivated leaves that originated in the Marche region of Italy[183].

tcanta Dynamic accumulator.

dwatta Antiperiodic Laxative OphthalmicThe leaves are antiperiodic and ophthalmic. They are used as a remedy for ague and sore eyes[4]. Plantain seeds contain up to 30% mucilage which swells up in the gut, acting as a bulk laxative and soothing irritated membranes[238]. Sometimes the seed husks are used without the seeds[238].

propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in early summer. A sowing can be made outdoors in situ in mid to late spring if you have enough seeds.

nwatta Succeeds in any moderately fertile soil in a sunny position[200]. A polymorphic species[132]. This plant has sometimes been cultivated for its edible leaves[2, 52]. An important food plant for many caterpillars[30].

### 6.2.202 Cirsium foliosum

Elk thistle

5 tin 9 cyuc 3 kcaak 2 tcan 0 dwat 0.6 m hkuc

htut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flatprikwis hpa7tmwatli fyifxre7t hjonli

drutta Cirsium foliosum is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies), beetles. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist or wet soil.

kcakta Edible Parts: Leaves Oil Root StemEdible Uses: OilRoot - cooked[61, 85, 105, 161]. About the size of a carrot, they are sweet and well-flavoured though require long preparation[207]. The root is likely to be rich in inulin, a starch that cannot be digested by humans. This starch thus passes straight through the digestive system and, in some people, ferments to produce flatulence[K]. Plant crown[85]. No more details are given. Stems - peeled[161]. The peeled stems are a sweet herb[207]. Tender with a sweet delicate taste[212].

tcanta OilThe seed of all species of thistles yields a good oil by expression[4]. No details of potential yields etc are given[K].

dwatta None known

propta Seed - sow early spring or autumn in situ. Germination usually takes place within 2 - 8 weeks at 20°c[164]. Division in spring or autumn.

nwatta An easily grown plant, succeeding in any ordinary garden soil in a sunny position[200]. This species should tolerate wet soils[K].

### 6.2.203 Asarum splendens

Chinese Wild Ginger

5 tin 9 cyuc 3 kcaak 3 tcan 0 dwat 0.2 m hkuc

pcimhmim cyutli kyuctcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli hjonli

drutta Asarum splendens is an evergreen Perennial growing to 0.2 m (0ft 8in) by 0.6 m (2ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers dry or moist soil.

kcakta Edible Parts: RootEdible Uses: A ginger-like rhizome with a strong potent flavour [1-2]. They are commonly referred to as wild gingers (not a culinary gingers) as their rhizomes have a similar spicy scent.

tcanta Groundcover - an excellent groundcover for shade and semi-shade. Known to tolerate Juglone (a poisonous product produced by black walnuts Juglans nigra)[1-2]. Attractive leaves - Containers. Ornamental. Food Forest.

dwatta None Known

propta Propagate by seed in containers in a cold frame as soon as ripe. Can also be propagated by division in early spring.

nwatta A semi-evergreen perennial with thick heart-shaped, dark green leaves. Asarum splendens is a showy, vigorous groundcover for shade with a vigorous rhizomatic root that forms a thick mat of foliage. It will remain semi-evergreen through mild winters. Semi shade to full shade. It prefers moist, slightly acidic organic soil in a well-drained site and is ideal for a shady border or a woodland garden. In China it grows on mountain slopes between 800-1,300 m above sea level. Flower Color: Purple. Bloomtime: Early Spring Foliage Color: Variegated. Resistant: Deer Resistant, Rabbit Resistant.. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2]. Known to tolerate Juglone (a poisonous product produced by black walnuts Juglans nigra) [1-2].

### 6.2.204 Hedeoma pulegioides

American Pennyroyal, American false pennyroyal

5 tin 9 cyuc 3 kcaak 0 tcan 3 dwat 0.3 m hkuc

hmimhtut cyutli kyuctcup hwicli hyhisrasjlutnyik hpa7tli frusflatprik hpa7tmwatli xre7t hjonli

drutta Hedeoma pulegioides is a ANNUAL growing to 0.3 m (1ft) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: LeavesEdible Uses: CondimentThe leaves have a very strong mint-like aroma and taste[171], they can be brewed into a refreshing tea that promotes good digestion, or they can be used as a culinary flavouring[183, 238]. An essential oil from the plant is used by the food industry as a flavouring in beverages, ice cream, baked goods etc[183].

tcanta Essential RepellentThe essential oil is used as an ingredient in commercial insect repellents and cleaning products[238]. The plant is used as an insect repellent[169, 171]. When rubbed on the body it is said to repel ticks[207].

dwatta Abortifacient Birthing aid Carminative Diaphoretic Rubefacient StimulantAmerican pennyroyal has a long history of medicinal use by various native North American Indian tribes and has become a traditional household remedy in North America[238]. It is used mainly in the treatment of digestive disorders, colds, whooping cough, painful menstruation and as an aid in childbirth[238]. A tea made from the leaves or flowering stems is carminative, rubefacient, stimulant[46, 61, 171]. It is used to treat colds because it promotes perspiration[207]. A tea with brewers yeast can induce an abortion[213]. The plants are harvested when flowering and can be used fresh or dried[213, 238]. The essential oil is distilled from the plants when they are in flower and used medicinally in the same ways as the leaves. Caution is advised since the pure essential oil is very toxic and

vermifuge whilst the fruits are used as a vermifuge for children[218].

propta Seed - best sown in a cold frame as soon as it is ripe. Germination can be slow, sometimes taking more than 18 months. If the seed is harvested ‘green’ (when it has fully developed but before it has fully ripened) and sown immediately in a cold frame, it should germinate in the spring[80]. Stored seed will require 2 months warm then 3 months cold stratification and can still take 18 months to germinate[113]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame or greenhouse. Plant out into their permanent positions in late spring or early summer of the following year. Cuttings of soft-wood, early summer in a frame[200]. Pot up into individual pots once they start to root and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, 5 - 8 cm long with a heel if possible, July/August in a frame[78, 113]. Plant them into individual pots as soon as they start to root. These cuttings can be difficult to overwinter, it is best to keep them in a greenhouse or cold frame until the following spring before planting them out[113]. Cuttings of mature wood, winter in a frame. They should root in early spring - pot them up when large enough to handle and plant them out in the summer if sufficient new growth is made, otherwise keep them in a cold frame for the next winter and then plant them out in the spring. Layering of current seasons growth in July/August. Takes 15 months[78].

nwatta Landscape Uses:Border, Massing, Screen, Specimen. An easily grown plant, it succeeds in most soils but is ill-adapted for poor soils and for dry situations[1]. It prefers a deep rich loamy soil in sun or semi-shade[11, 200]. Best if given shade from the early morning sun in spring[200]. Plants are self-incompatible and need to grow close to a genetically distinct plant in the same species in order to produce fruit and fertile seed[11, 200]. A very ornamental[1] and polymorphic species[58], there are some named varieties developed for the ornamental value of the fruit[182]. Special Features:Attractive foliage, Not North American native, Fragrant flowers, Attractive flowers or blooms.

### 6.2.141 Viburnum farreri

Culver’s root, Fragrant Viburnum

5 tin 8 cyuc 3 kcaak 0 tcan 0 dwat 3 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwis hpa7tmwatli dyatxre7t hjonli

drutta Viburnum farreri is a deciduous Shrub growing to 3 m (9ft) by 2.5 m (8ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from November to February, and the seeds ripen in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[11]. A sweet flavour, but the fruit is not freely borne in Britain[K].

tcanta None known

dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe. Germination can be slow, sometimes taking more than 18 months. If the seed is harvested ‘green’ (when it has fully developed but before it has fully ripened) and sown immediately in a cold frame, it should germinate in the spring[80]. Stored seed will require 2 months warm then 3 months cold stratification and can still take 18 months to germinate[113]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame or greenhouse. Plant out into their permanent positions in late spring or early summer of the following year. Cuttings of soft-wood, early summer in a frame[200]. Pot up into individual pots once they start to root and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, 5 - 8 cm long with a heel if possible, July/August in a frame[78, 113]. Plant them into individual pots as soon as they start to root. These cuttings can be difficult to overwinter, it is best to keep them in a greenhouse or cold frame until the following spring before planting

them out[113]. Cuttings of mature wood, winter in a frame. They should root in early spring - pot them up when large enough to handle and plant them out in the summer if sufficient new growth is made, otherwise keep them in a cold frame for the next winter and then plant them out in the spring. Layering of current seasons growth in July/August. Takes 15 months[78].

nwatta Landscape Uses:Border, Hedge, Massing, Specimen. An easily grown plant, it succeeds in most soils but is ill-adapted for poor soils and for dry situations[1]. It prefers a deep rich loamy soil in full sun or in semi-shade[11, 200]. Best if given shade from the early morning sun in spring[200]. Requires shelter from N. and E. winds[200]. Plants are hardy to about -20°c[184]. A very ornamental plant[1], it flowers in the winter and the flowers are said to withstand temperatures down to -12°c without damage[11, 200]. The flowers diffuse a sweet and cloying perfume of heliotrope[245]. The fruit, however, is not often produced in this country[K]. This may be due to the plant being self-incompatible and so growing 2 or more different cultivars together may improve fruit set[11, 200]. Hand pollination may also be beneficial as well as siting the plants so that they get the maximum of protection from severe winter weather[K]. A west-facing wall or woodland edge would be ideal for this[K]. The plants flower on terminal and lateral clusters of the current years growth, any pruning is best carried out in the spring[219]. This species has long been known as V. fragrans, but this name is invalid[11]. It is closely related to V. grandiflorum[11]. Special Features:Not North American native, Fragrant flowers, Attractive flowers or blooms.

### 6.2.142 Prunus angustifolia

Chickasaw Plum, Watson’s plum, Hally Jolivetie Cherry
5 tin 9 cyuc 3 kcaak 3 tcan 1 dwat 3 m hkuc
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta Prunus angustifolia is a deciduous Tree growing to 3 m (9ft 10in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in April, and the seeds ripen from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: Fruit SeedEdible Uses: Fruit - raw, cooked or dried for later use[82, 149, 274]. Large and thick-skinned with a soft juicy sweet pulp, it has a delicious flavour and is very good eaten out of hand, whilst it can also be used in pies, preserves etc[183, 274]. The fruit is up to 18mm in diameter[227]. Seed - raw or cooked. Do not eat the seed if it is too bitter - see the notes above on toxicity.

tcanta Dye Shelterbelt Soil stabilization WoodA green dye can be obtained from the leaves[168]. A dark grey to green dye can be obtained from the fruit[168]. This species is sometimes used in shelterbelt planting[227]. It has an extensive root system and often forms thickets, which make it useful for erosion control[229]. Wood - heavy, rather soft, not strong[82]. It weighs 43lb per cubic foot[227] and is of little commercial value[229].

dwatta Although no specific mention has been seen for this species, all members of the genus contain amygdalin and prunasin, substances which break down in water to form hydrocyanic acid (cyanide or prussic acid). In small amounts this exceedingly poisonous compound stimulates respiration, improves digestion and gives a sense of well-being[238].

propta Seed - requires 2 - 3 months cold stratification and is best sown in a cold frame as soon as it is ripe[200]. Sow stored seed in a cold frame as early in the year as possible[200]. Protect the seed from mice etc. The seed can be rather slow, sometimes taking 18 months to germinate[113]. Prick out the seedlings into individual pots when they are large enough to handle. Grow them on in a greenhouse or cold frame for their first winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood with a heel, July/August in a frame[11, 200]. Softwood cuttings from strongly growing plants in spring to early summer in a frame[200]. Layering in spring.

nwatta Landscape Uses:Border, Espalier, Standard, Specimen. Thrives in a well-drained moisture-retentive loamy soil[11, 200]. Prefers some lime in the soil but is likely to become chlorotic if too much lime is present[1]. Succeeds in sun or partial shade though it fruits better in a sunny position[11, 200]. Although it should be hardy in all parts of Britain, it grows better in the warmer areas of the country[11]. A fast-growing but short-lived tree in the wild[229], it has become rather rare in a truly wild state[227], though it is often cultivated for its edible fruit in N. America. There are some named varieties[82, 183]. The fruit is not freely produced in British gardens[11]. The flowers, which appear just before the leaves unfold, have a refreshing fruity scent[245]. Most members of this genus are shallow-rooted and will produce suckers if the roots are damaged[238]. This species suckers freely in the wild, often forming thickets[82]. Plants in this genus are notably susceptible to honey fungus[200]. Special Features: North American native, All or parts of this plant are poisonous, Attracts butterflies, Fragrant flowers, Blooms are very showy. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. A clumping plant, forming a colony from shoots away from the crown but with a limited spread [1-2]. The root pattern is suckering with new plants from underground runners away from the plant [1-2].

### 6.2.143 Berberis lycium

5 tin 9 cyuc 3 kcaak 1 tcan 3 dwat 3 m hkuc hmimhtut cyutil kyuctcup hwicli hysihrasjlutnyikfrrip hpa7tli flatprikklwis hpa7tmwatli fyfkrx7t hjonli

drutta Berberis lycium is an evergreen Shrub growing to 3 m (9ft 10in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in leaf all year, in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcaakta Edible Parts: Fruit LeavesEdible Uses: TeaFruit - raw or cooked and made into preserves[2, 11, 105, 177, 183]. Fairly juicy with a nice slightly acid flavour[K]. The fruits are about 8mm long[200]. Leaves and young shoots - cooked[2, 177, 183]. Leaves are a tea substitute[177, 183]. tcanta DyeA yellow dye is obtained from the root.

dwatta Antibacterial Aperient Cancer Carminative Dysentery Febrifuge OphthalmicThe roots are aperient, carminative, febrifuge and ophthalmic[11, 46, 61, 158, 240]. They are used in the treatment of eye complaints, menorrhagia, chronic diarrhoea and piles[240]. The leaves have been used in the treatment of jaundice[240]. Berberine, universally present in rhizomes of Berberis species, has marked antibacterial effects. Since it is not appreciably absorbed by the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not be used with Glycyrrhiza species (Liquorice) because this nullifies the effects of the berberine[218]. Berberine has also shown antitumour activity[218].

propta Seed - best sown as soon as it is ripe in a cold frame, when it should germinate in late winter or early spring[78]. Seed from over-ripe fruit will take longer to germinate[78], whilst stored seed may require cold stratification and should be sown in a cold frame as early in the year as possible[80]. The seedlings are subject to damping off, so should be kept well ventilated[113]. When the seedlings are large enough to handle, prick them out into individual pots and grow them on in a cold frame. If growth is sufficient, it can be possible to plant them out into their permanent positions in the autumn, but generally it is best to leave them in the cold frame for the winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, July/August in a frame. Cuttings of mature wood of the current season's growth, preferably with a heel, October/November in a frame[78].

nwatta Prefers a warm moist loamy soil and light shade but it is by no means fastidious, succeeding in thin, dry and shallow soils[11, 200]. Grows well in heavy clay soils.

A fairly hardy plant but it suffers some damage in severe winters[1]. Hybridizes freely with other members of this genus[1]. Plants can be pruned back quite severely, they re-sprout well from the base[200].

### 6.2.144 Vaccinium arctostaphylos

Caucasian Whortleberry

5 tin 9 cyuc 3 kcaak 0 tcan 0 dwat 3 m hkuc hmimhtut cyutil tcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta Vaccinium arctostaphylos is a deciduous Shrub growing to 3 m (9ft) by 2 m (6ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to July, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: FruitEdible Uses: TeaFruit - raw or cooked[177]. The fruit is juicy with a slightly acid flavour, it makes an acceptable fruit to nibble on, though it is nothing special[K]. The fruit is usually produced abundantly when the plant is well sited[K]. The pear-shaped fruit is small, about 8 - 10mm in size[183]. The leaves are a tea substitute[183].

tcanta None known

dwatta None known

propta Seed - sow late winter in a greenhouse in a lime-free potting mix and only just cover the seed[78]. Stored seed might require a period of up to 3 months cold stratification[113]. Another report says that it is best to sow the seed in a greenhouse as soon as it is ripe[200]. Once they are about 5cm tall, prick the seedlings out into individual pots and grow them on in a lightly shaded position in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 8cm with a heel, August in a frame[78]. Slow and difficult. Layering in late summer or early autumn[78]. Another report says that spring is the best time to layer[200]. Takes 18 months[78]. Division of suckers in spring or early autumn[113].

nwatta Requires a moist but freely-draining lime free soil, preferring one that is rich in peat or a light loamy soil with added leaf-mould[11, 200]. Prefers a very acid soil with a pH in the range of 4.5 to 6, plants soon become chlorotic when lime is present[11, 200]. Succeeds in full sun or light shade though it fruits better in a sunny position[200]. A plant growing in fairly heavy woodland shade at Westonbirt Arboretum in Gloucester was fruiting very heavily in September 1996, and we have seen several other plants fruiting well in dappled shade[K]. Requires shelter from strong winds[200]. Dislikes root disturbance, plants are best grown in pots until being planted out in their permanent positions[200]. Closely related to *V. padifolium*[182], differing mainly in that species usually being evergreen[11]. Plants in this genus are notably resistant to honey fungus[200].

### 6.2.145 Rubus kuntzeanus

5 tin 9 cyuc 3 kcaak 1 tcan 0 dwat 3 m hkuc hmimhtut cyutil tcup hwicli hrasjlutnyik hpa7tli flatprikklwis hpa7tmwatli xre7t hjonli

drutta Rubus kuntzeanus is a deciduous Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in August, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105]. A good flavour[11, 177]. The orange-red fruit is about 20mm in diameter[200].

tcanta DyeA purple to dull blue dye is obtained from the fruit[168].

dwatta None known

propta Seed - sow spring in greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Basal cuttings in spring. Harvest the shoots when they are about 8 - 10cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Landscape Uses:Alpine garden, Border, Container, Foundation, Massing, Rock garden. Prefers a light dry well-drained moderately fertile humus-rich soil in a sunny sheltered position[200]. Prefers an alkaline soil. Established plants are drought tolerant[190]. A very ornamental plant[1], it is not generally very long-lived though it normally self-sows freely[190]. The sub-species lewisii (which is seen as a separate species by some botanists or as no more than a synonym of this species by others) is more desirable for its fibre and has been cultivated by the N. American Indians for this purpose[155]. Special Features: Naturalizing.

### 6.2.199 Calamintha nepeta

Lesser Calamint

5 tin 9 cyuc 3 kcaak 2 tcan 2 dwat 0.6 m hkuc htut cyutil kyuctcup hwicli hrasjlut hpa7tli prikklwisslip hpa7tmwatli xre7t hjonli

drutta Calamintha nepeta is a PERENNIAL growing to 0.6 m (2ft) by 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from July to September, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil.

kcaakta Edible Parts: Edible Uses: Condiment TeaThe leaves have a strong pennyroyal-like fragrance and are more pungent than calamint (*C. sylvatica*) [183]. They can be used as a flavouring[183]. A sweet and aromatic herb tea is made from the leaves[200].

tcanta Attracts wildlife.

dwatta Aromatic Diaphoretic Expectorant Febrifuge StomachicLesser calamint was commonly used as a medicinal herb in medieval times, though is little used by modern herbalists[238]. It is sometimes cultivated as a medicinal herb for household use. The whole plant is aromatic, diaphoretic, expectorant, febrifuge and stomachic[4, 148]. The leaves are harvested in July as the plant comes into flower and are dried for later use[4]. An infusion is beneficial in cases of flatulent colic and weaknesses of the stomach[4], it is also used to treat depression, insomnia and painful menstruation[238]. It should not be prescribed for pregnant women since in excess it can cause a miscarriage[238].

propta Seed - sow spring in a greenhouse and only just cover the seed. It usually germinates in 2 weeks at 21 °c[138]. Prick out the seedlings when they are large enough to handle and, if they grow sufficiently, plant them out into their permanent positions in the summer otherwise wait until the following spring. Division in spring. Very easy, larger clumps can be planted direct into their permanent positions. It is best to pot up smaller clumps and grow them on in a cold frame until they are well rooted before planting them out in the summer. Basal cuttings in May or June. They should be rooted in a sandy compost[245]. Harvest the shoots when they are about 10 - 15cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Prefers a well-drained dry to moist neutral to alkaline soil and a warm sunny position[200, 238]. Plants are hardy to about -15 °c[187]. This species is very closely related to *C. sylvatica*, and is considered to be no more than a sub-species by some botanists[4]. A very good bee plant[187]. The plant is heat tolerant in zones 9 through 5. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30 °C). At this

temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (120 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2]. The root pattern is stoloniferous rooting from creeping stems above the ground [1-2].

### 6.2.200 Calamintha sylvatica

Calamint, Woodland calamint

5 tin 9 cyuc 3 kcaak 0 tcan 2 dwat 0.6 m hkuc hmimhtut cyutil kyuctcup hwicli hrasjlut hpa7tli flatprikklwisslip hpa7tmwatli xre7t hjonli

drutta Calamintha sylvatica is a PERENNIAL growing to 0.6 m (2ft) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from July to September, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcaakta Edible Parts: Edible Uses: Condiment TeaA sweet and aromatic herb tea is made from the leaves[200]. Very refreshing[4, 200]. Leaves - used as a flavouring in cooked dishes[177]. Pleasantly pungent and strongly aromatic, the flavour is said to resemble a cross between mint and marjoram[183].

tcanta None known

dwatta Aromatic Diaphoretic Expectorant StomachicCalamint was commonly used as a medicinal herb in medieval times, though is little used by modern herbalists[238]. It has very similar properties to lesser calamint (*C. nepeta*) though is milder in its actions[238]. It is sometimes cultivated as a medicinal herb for household use. The whole plant is aromatic, diaphoretic and expectorant[4]. The leaves are harvested in July as the plant comes into flower and are dried for storage[4]. An infusion is beneficial in cases of fevers, flatulent colic and weaknesses of the stomach[4], it is also used to treat depression, insomnia and painful menstruation[238]. Its expectorant action makes it a good cough and cold remedy and it is of value for treating mild respiratory infections[254]. It is best mixed with other herbs, especially yarrow (*Achillea millefolium*) and Thyme (*Thymus vulgaris*) [254]. Calamint should not be prescribed for pregnant women since in excess it can cause a miscarriage[238].

propta Seed - sow spring in a greenhouse and only just cover the seed. It usually germinates in 2 weeks at 21 °c[138]. Prick out the seedlings when they are large enough to handle and, if they grow sufficiently, plant them out into their permanent positions in the summer otherwise wait until the following spring. Division in spring. Very easy, larger clumps can be planted direct into their permanent positions. It is best to pot up smaller clumps and grow them on in a cold frame until they are well rooted before planting them out in the summer. Basal cuttings in May or June. They should be rooted in a sandy compost[245]. Harvest the shoots when they are about 10 - 15cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Succeeds in a well-drained dry to moist neutral to alkaline soil and a sunny position[1]. Likes semi-shade[200]. Succeeds in a woodland garden[200]. Bees love the flowers of this plant[K].

### 6.2.201 Plantago coronopus

Buck's-Horn Plantain

5 tin 9 cyuc 3 kcaak 2 tcan 2 dwat 0.3 m hkuc htut cyutil kyuctcup hwicli hrasjlut hpa7tli flatprikklwis hpa7tmwatli fyfkrx7t hjonli

5 tlin 7 cyuc 3 kcaak 0 tcan 1 dwat 0.2 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flat hpa7tmwatli xre7t hjonli

drutta Claytonia virginica is a PERENNIAL growing to 0.2 m (0ft 8in) by 0.2 m (0ft 8in) at a medium rate. See above for USDA hardness. It is hardy to UK zone 6. It is in flower from March to April, and the seeds ripen in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Root - raw or cooked[2, 55, 62, 85, 257]. Rich in starch, it has a pleasant nutty flavour[105, 183]. A radish-like flavour when raw[159], it tastes like a cross between a potato and a chestnut when cooked[183]. The root is rich in vitamins A and C[159]. The globose tuber is up to 20cm in diameter[270]. Leaves and flowering stems - raw or cooked[62]. Added to salads or used as greens[183]. The leaves are often available in the winter.

tcanta None known

dwatta Antispasmodic ContraceptiveA cold infusion or decoction of the powdered roots has been given to children with convulsions[257]. It has been said that eating the raw plants can permanently prevent conception[257].

propta Seed - surface sow on a peat based compost in spring in a cold frame. Germination usually takes place within 2 - 4 weeks at 10°C[164]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the cold frame for at least their first winter. Plant them out in late spring or early summer after the last expected frosts. Division of offsets in spring or autumn.

nwatta Landscape Uses:Rock garden, Woodland garden. Prefers a damp peaty soil and a position in full sun[1, 164]. Another report says that it requires some shade[188]. Requires a lime-free soil[164]. Special Features:North American native, Naturalizing, Wetlands plant. The plant is heat tolerant in zones 6 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2]. Ephemeral emerging in spring and dying back by summer every year [1-2]. The root pattern is a corm swelling at the stem base [1-2].

### 6.2.197 Vaccinium deliciosum

Alpine Blueberry, Cascade bilberry
5 tlin 9 cyuc 3 kcaak 0 tcan 0 dwat 0.3 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta Vaccinium deliciosum is a deciduous Shrub growing to 0.3 m (1ft). See above for USDA hardness. It is hardy to UK zone 6. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[11, 60, 177, 257]. When fully ripe it is sugary sweet with a delightful aroma and a full rich flavour[183]. Best eaten out of hand[183], the fruit can also be dried for later use[257]. The fruit is about 6mm in diameter[200].

tcanta None known

dwatta None known

propta Seed - sow late winter in a greenhouse in a lime-free potting mix and only just cover the seed[78]. Stored

seed might require a period of up to 3 months cold stratification[113]. Another report says that it is best to sow the seed in a greenhouse as soon as it is ripe[200]. Once they are about 5cm tall, prick the seedlings out into individual pots and grow them on in a lightly shaded position in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 8cm with a heel, August in a frame[78]. Slow and difficult. Layering in late summer or early autumn[78]. Another report says that spring is the best time to layer[200]. Takes 18 months[78]. Division of suckers in spring or early autumn[113].

nwatta Requires a moist but freely-draining lime free soil, preferring one that is rich in peat or a light loamy soil with added leaf-mould[11, 200]. Prefers a very acid soil with a pH in the range of 4.5 to 6, plants soon become chlorotic when lime is present. Succeeds in full sun or light shade though it fruits better in a sunny position[200]. Requires shelter from strong winds[200]. Grows well in a moist position in a rock garden[11]. Plants spread rapidly when growing in a suitable position[200]. Dislikes root disturbance, plants are best grown in pots until being planted out in their permanent positions[200]. This species is closely allied to *V. caespitosum*[11, 182]. Plants in this genus are notably resistant to honey fungus[200].

### 6.2.198 Linum perenne

Perennial Flax, Blue flax, Alpine flax

5 tlin 9 cyuc 3 kcaak 0 tcan 2 dwat 0.3 m hkuc htut cyutli hgaktyucup hwicli hrasjlut hpa7tli flatprikli-wisslip hpa7tmwatli xre7t hjonli

drutta Linum perenne is a PERENNIAL growing to 0.3 m (1ft) by 0.2 m (0ft 8in) at a medium rate. See above for USDA hardness. It is hardy to UK zone 7 and is not frost tender. It is in flower from June to July, and the seeds ripen in August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Oil SeedEdible Uses: OilSeed - cooked[46, 61, 183]. A pleasant nutty taste and very nutritious[94]. The seed has a high oil content and can be eaten on its own or used as a flavouring[161, 183]. It should not be eaten raw because it contains cyanide but this is destroyed in the cooking process[183].

tcanta Cosmetic Fibre Hair Oil PaperA drying oil is obtained from the seed. Used mainly for lighting[178], though it could also be used in all the ways that linseed oil (from *Linum usitatissimum*) is used - in paints, varnishes etc[115]. An infusion of the whole plant is used as a hair and skin wash[257]. It is said to be very beneficial to the skin and also to help prevent hair loss[257]. A good fibre is obtained from the stems, it is inferior to flax (*Linum usitatissimum*)[115] but is used for making cloth, nets, string, baskets, mats etc and in paper making[4, 46, 61, 74, 94, 115]. When used for paper making, the stems are harvested in late summer or autumn when they are two thirds yellow and are then reted[189]. The fibre is then stripped from the stem, cooked for two hours or more with lye and then beaten in a Hollander beater[189].

dwatta Antirheumatic Carminative Emollient Ophthalmic Poultrice StomachicThe plant is antirheumatic, carminative and stomachic[94, 257]. The oil in the seed has soothing and lubricating properties, and is used in medicines to soothe tonsillitis, sore throats, coughs, colds, constipation, gravel and stones[244]. When mixed with an equal quantity of lime water it is used to treat burns and scalds[244]. A poultice of the fresh crushed leaves has been used to treat eye problems[94, 213]. A tincture of the entire plant is used in the treatment of diarrhoea[4]. The fresh herb is boiled and taken internally for the treatment of rheumatic pains, heartburn, colds, coughs and drowsy[4, 257]. A poultice of the plant is applied to bruises to reduce the swelling[257]. The seeds are emollient[240]. An eye medicine is made from them[257]. An infusion of the roots is used as an eye-wash[257].

propta Seed - requires stratification and is best sown in early autumn in a cold frame. Stored seed requires one month stratification at about 3°C and is best sown as early as possible in the year. Prick out the seedlings when they are large enough to handle and grow on in a cold frame. Plant them out into their permanent positions in late spring of the following year. Division in early spring or just before leaf-fall in the autumn[200].

nwatta Easily grown in a good well-drained loamy soil in sun or semi-shade[1, 11, 200]. Closely related to *R. inominatus*[11, 105]. This species is a raspberry with biennial stems, it produces a number of new stems each year from the perennial rootstock, these stems fruit in their second year and then die[200]. The stems have very few prickles[200]. Plants in this genus are notably susceptible to honey fungus[200].

#### 6.2.146 Zanthoxylum planispinum

Winged Prickly Ash

5 tlin 9 cyuc 3 kcaak 0 tcan 2 dwat 3.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli nyanhjen hjonli

drutta Zanthoxylum planispinum is a deciduous Shrub growing to 3.5 m (11ft 6in). See above for USDA hardness. It is hardy to UK zone 6. It is in flower in May, and the seeds ripen in October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). . The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: CondimentSeed - cooked. It can be ground into a powder and used as a condiment[183], a pepper substitute[2, 46, 177]. A light roasting brings out more of the flavour[206]. The seed is an ingredient of the famous Chinese 'five spice' mixture[206]. The peel is also used[105]. Young leaves are eaten[105, 177, 183]. No further details are given.

tcanta None known

dwatta Stimulant Stomachic Tonic VermifugeThe seeds and roots are stomachic and vermifuge[46, 61, 147]. A decoction of 7 - 14 seeds is used in the treatment of abscesses, arthritis, bruises, gastritis, swellings etc[218]. The resin contained in the bark, and especially in that of the roots, is powerfully stimulant and tonic[82].

propta Seed - best sown in a greenhouse as soon as it is ripe in the autumn. Stored seed may requires up to 3 months cold stratification, though scarification may also help[113]. Sow stored seed in a cold frame as early in the year as possible. Germination should take place in late spring, though it might take another 12 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant them out in early summer. Cuttings of half-ripe wood, July/August in a frame. Root cuttings, 3cm long, planted horizontally in pots in a greenhouse. Good percentage[78]. Suckers, removed in late winter and planted into their permanent positions[113].

nwatta Prefers a good deep well-drained moisture retentive soil in full sun or semi-shade[1, 11, 200]. A very ornamental plant[1], it is usually hardy in most parts of Britain but can be damaged in severe winters[11]. Fruits are freely produced after a hot summer[11]. The flowers are formed on the old wood[206]. Dioecious. Male and female plants must be grown if seed is required. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

#### 6.2.147 Viburnum foetens

5 tlin 9 cyuc 3 kcaak 3 tcan 0 dwat 3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli dyatxre7t hjonli

drutta Viburnum foetens is a deciduous Shrub growing to 3 m (9ft) by 3 m (9ft). See above for USDA hardness. It is hardy to UK zone 6. It is in flower from January to March. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[2, 105, 145, 146]. A sweetish flavour[2], but the fruit is not freely borne in Britain[K].

tcanta WoodWood - hard, close grained[146].

dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe. Germination can be slow, sometimes taking more than 18 months. If the seed is harvested 'green' (when it has fully developed but before it has fully ripened) and sown immediately in a cold frame, it should germinate in the spring[80]. Stored seed will require 2 months warm then 3 months cold stratification and can still take 18 months to germinate[113]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame or greenhouse. Plant out into their permanent positions in late spring or early summer of the following year. Cuttings of soft-wood, early summer in a frame[200]. Pot up into individual pots once they start to root and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, 5 - 8 cm long with a heel if possible, July/August in a frame[78, 113]. Plant them into individual pots as soon as they start to root. These cuttings can be difficult to overwinter, it is best to keep them in a greenhouse or cold frame until the following spring before planting them out[113]. Cuttings of mature wood, winter in a frame. They should root in early spring - pot them up when large enough to handle and plant them out in the summer if sufficient new growth is made, otherwise keep them in a cold frame for the next winter and then plant them out in the spring. Layering of current seasons growth in July/August. Takes 15 months[78].

nwatta An easily grown plant, it succeeds in most soils but is ill-adapted for poor soils and for dry situations[1]. It prefers a deep rich loamy soil in sun or semi-shade[11, 200]. Best if given shade from the early morning sun in spring[200]. Requires shelter from northerly and easterly winds[200]. Plants are hardy to about -20°C[184]. A very ornamental plant[1], it flowers in the winter and the flowers are said to withstand temperatures down to -12°C without damage[11, 200]. However fruit is not often produced in this country[K]. This may be due to the plant being self-incompatible and so growing 2 or more different cultivars together may improve fruit set[11, 200]. Hand pollination may also be beneficial as well as siting the plants so that they get the maximum of protection from severe winter weather[K]. A west-facing wall or woodland edge would be ideal for this[K]. Closely allied to *V. grandiflorum* and included in that species by many botanists[11]. This species has a more westerly range, shorter stems and white flowers[200].The crushed leaves have a foetid aroma[182].

#### 6.2.148 Rheum australe

Himalayan Rhubarb

5 tlin 9 cyuc 3 kcaak 2 tcan 3 dwat 3 m hkuc hmimhtut cyutli tcup hwicli jlutnyikfrup hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Rheum australe is a PERENNIAL growing to 3 m (9ft) by 1.5 m (5ft). See above for USDA hardness. It is hardy to UK zone 6. It is in flower from June to July, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: StemEdible Uses: RutinLeaf stem - raw or cooked[22, 105, 183]. An excellent flavour that is something like apples[2, 183] (this is likely to be a cooking apple!). The crop is sometimes blanched by excluding light from the growing stems, this produces an almost white stem

that is free of fibre, crisp and less acid[2]. This species makes an excellent late crop[2]. The stems can also be made into a preserve or be dried and stored for later use[183]. One report says that the plant contains 0.32% rutin[240]. It does not specify which part of the plant, though it is likely to be the leaves[K].

tcanta Dye LiningThe leaves can be up to 1 metre in diameter, they are used as a lining material and also to cover and protect fruit in baskets[2, 37]. A bright yellow dye is obtained from the root[272].

dwatta Digestive Purgative TonicRhubarb has a long and proven history of herbal usage, its main effect being a positive and balancing effect upon the whole digestive system. It is one of the most widely used herbs in Chinese medicine[238]. The main species used is *R. palmatum*. Though the chemistry varies slightly, this species is used interchangeably[238]. The root is anticholesterolemic, anti-septic, antispasmodic, antitumor, aperient, astringent, cholagogue, demulcent, diuretic, laxative, purgative, stomachic and tonic[4, 37, 57, 61, 171, 238, 240]. Small doses act as an astringent tonic to the digestive system, whilst larger doses act as a mild laxative[232]. The root is taken internally in the treatment of chronic constipation, diarrhoea, liver and gall bladder complaints, haemorrhoids, menstrual problems and skin eruptions due to an accumulation of toxins[238]. This remedy is not prescribed for pregnant or lactating women, nor for patients with intestinal obstruction[238]. Externally, the root is used in the treatment of burns[238]. The roots are harvested in October from plants that are at least six years old, they are then dried for later use[4]. A homeopathic remedy is prepared from the dried root[232]. This is used especially in the treatment of diarrhoea in teething children[232].

propta Seed - best sown in autumn in a shaded cold frame[200]. The seed can also be sown in spring in a cold frame. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse or cold frame for their first winter, planting them out in the spring. Division in early spring or autumn[1, 111]. Divide up the rootstock with a sharp spade or knife, making sure that there is at least one growth bud on each division. Larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Prefers a deep, fertile, moderately heavy, humus rich, moisture retentive, well-drained soil in sun or semi-shade[200]. Grows well in heavy clay soils. Plants can be grown in quite coarse grass, which can be cut annually in the autumn[233]. Hardy to about -20°C[200]. Plants in this genus seem to be immune to the predations of rabbits[233]. Hybridizes freely with other members of this genus[200]. The root is sold for medicinal purposes in local markets in the Himalayas[46, 61]. Overgathering of this plant from the wild, both for food and for medicine, is becoming a cause of conservation concern[272]. The plant is heat tolerant in zones 8 through 5. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of “heat days” experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2].

## 6.2.149 Ribes altissimum

5 tlin 9 cyuc 3 kcaak 0 tcan 0 dwat 3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Ribes altissimum is a deciduous Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in May, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is

pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kckaKa Edible Parts: FruitEdible Uses: Fruit - raw or cooked. Small with a thick skin and a pleasant acid taste[74]. The fruit is abundantly produced in the wild[74]. The purplish-black fruit is about 7mm in diameter[266].

tcanta None known dwatta None known

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. Stored seed requires 3 months cold stratification at 0 - 9°C and should be sown as early in the year as possible[113, 164]. Under normal storage conditions the seed can remain viable for 17 years or more. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter, planting them out in late spring of the following year Cuttings of half-ripe wood, July/August in a frame[113]. Cuttings of mature wood of the current year's growth, preferably with a heel of the previous year's growth, November to February in a cold frame or sheltered bed outdoors[78, 200].

nwatta Easily grown in a moisture retentive but well-drained loamy soil of at least moderate quality[11, 200]. Does well in shade though does not fruit so well in such a position[11]. Hardy to about -20°C[200]. Plants can harbour a stage of white pine blister rust, so should not be grown in the vicinity of pine trees[155]. Plants in this genus are notably susceptible to honey fungus[200]. This plant is possibly useful as part of a breeding programme for red currants[74].

## 6.2.150 Berberis x carminea

5 tlin 9 cyuc 3 kcaak 1 tcan 2 dwat 2 m hkuc hmimhtut cyutli tcup hwicli hyishrasjlutnyikfrip hpa7tli flatprikliwsslip hpa7tmwatli fyfjxre7t hjonli

drutta Berberis x carminea is a deciduous Shrub growing to 2 m (6ft) by 2 m (6ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6. The seeds ripen from September to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure.

kckaKa Edible Parts: FruitEdible Uses: Fruit - raw or cooked. A pleasant though strongly acidic flavour, it goes well in a muesli[K]. Most children, and a few adults, really like the fruit raw, but in general most people will prefer to cook it[K]. The fruits are about 10mm in diameter[200].

tcanta DyeA yellow dye is obtained from the root. dwatta Antibacterial Antitumor DysenteryBerberine, universally present in rhizomes of Berberis species, has marked antibacterial effects. Since it is not appreciably absorbed by the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not be used with Glycyrrhiza species (Licorice) because this nullifies the effects of the berberine[218]. Berberine has also shown antitumour activity[218].

propta Seed - best sown as soon as it is ripe in a cold frame, when it should germinate in late winter or early spring[78]. Seed from over-ripe fruit will take longer to germinate[78], whilst stored seed may require cold stratification and should be sown in a cold frame as early in the year as possible[80]. The seedlings are subject to damping off, so should be kept well ventilated[113]. When the seedlings are large enough to handle, prick them out into individual pots and grow them on in a cold frame. If growth is sufficient, it can be possible to plant them out into their permanent positions in the autumn, but generally it is best to leave them in the cold frame for the winter and plant them out in late spring or early summer of the following year. This plant does not breed true from seed because it is a hybrid species. Cuttings of half-ripe wood, July/August in a frame. Cuttings of mature wood of the current season's growth, preferably with a heel, October/November in a frame[78]. Suckers, removed in late

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyfjxre7t hjonli

drutta Smyrnium olusatrum is a BIENNIAL growing to 1.2 m (4ft) by 0.7 m (2ft 4in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from May to June, and the seeds ripen from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure.

kckaKa Edible Parts: Flowers Leaves Root StemEdible Uses: CondimentLeaves and young shoots - raw in salads or cooked in soups, stews etc[2, 5, 8, 12, 27, 37, 115, 183]. The plant comes into growth in the autumn and the leaves are often available throughout the winter[5, 52]. They have a rather strong celery-like flavour and are often blanched (by excluding light from the growing plant) before use[183]. Leafy seedlings can be used as a parsley substitute[183]. Stem - raw or cooked[2, 5, 8, 12, 27, 37, 53, 115]. It tastes somewhat like celery, but is more pungent[17, 244]. The stem is often blanched (by excluding light from the growing plant) before use[183]. Flower buds - raw[12, 52]. Added to salads, they have a celery-like flavour[K]. The spicy seeds are used as a pepper substitute[52, 183]. Root - cooked. Boiled and used in soups, its flavour is somewhat like celery. The root is said to be more tender if it has been kept in a cool place all winter[183].

tcanta A good wildlife plant. Scented. A good plant for food forests/forest gardens.

dwatta Bitter DigestiveThe whole plant is bitter and digestive. It has been used in the past in the treatment of asthma, menstrual problems and wounds, but is generally considered to be obsolete as a medicinal plant[238].

propta Seed - best sown in an outdoor seedbed in autumn and planted into its permanent position in late spring[1, 200]. Germination can be slow[200]. The seed can also be sown in situ in spring.

nwatta Succeeds in most soils but prefers an open sunny position in a well-drained moisture retentive soil[200]. Hardy to about -15°C[200]. At one time this plant was extensively grown for its edible leaves and stems but it has now fallen into virtual disuse, having been replaced by celery[1, 2, 27, 37, 61, 183]. The seeds are highly aromatic with a myrrh-like scent[245]. A good bee plant. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is fleshy. Thick or swollen - fibrous or tap root [2-1].

## 6.2.194 Berberis aggregata

Salmon Barbery  
5 tlin 9 cyuc 3 kcaak 1 tcan 2 dwat 1.5 m hkuc hmimhtut cyutli kyuctcup hwicli hyishrasjlutnyikfrip hpa7tli flatprikliwis hpa7tmwatli fyfjxre7t hjonli

drutta Berberis aggregata is a deciduous Shrub growing to 1.5 m (5ft) by 1.5 m (5ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from June to July, and the seeds ripen from September to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kckaKa Edible Parts: FruitEdible Uses: Fruit - raw or cooked. A fairly acid lemony flavour, it can be eaten in quantity by those who like acid fruits - children seem particularly keen on it[K]. A very reliable cropper, the fruit is borne in abundance along the stems[1, K]. The fruit is about 7mm in diameter[200].

tcanta DyeA yellow dye is obtained from the root. dwatta Antibacterial Cancer DysenteryBerberine, universally present in rhizomes of Berberis species, has marked antibacterial effects. Since it is not appreciably absorbed by

the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not be used with Glycyrrhiza species (Licorice) because this nullifies the effects of the berberine[218]. Berberine has also shown antitumour activity[218].

propta Seed - best sown as soon as it is ripe in a cold frame, when it should germinate in late winter or early spring[78]. Seed from over-ripe fruit will take longer to germinate[78], whilst stored seed may require cold stratification and should be sown in a cold frame as early in the year as possible[80]. The seedlings are subject to damping off, so should be kept well ventilated[113]. When the seedlings are large enough to handle, prick them out into individual pots and grow them on in a cold frame. If growth is sufficient, it can be possible to plant them out into their permanent positions in the autumn, but generally it is best to leave them in the cold frame for the winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, July/August in a frame. Cuttings of mature wood of the current season's growth, preferably with a heel, October/November in a frame[78]. Layering.

nwatta Prefers a warm moist loamy soil but it is by no means fastidious, succeeding in thin, dry and shallow soils[11, 200]. Grows well in heavy clay soils. Succeeds in full sun or light shade[11, 200]. Hybridizes freely with other members of this genus, especially the closely related *B. wilsonae*[1]. The true species is seldom seen in gardens, having been replaced with its hybrid progeny[182]. The seedling 'Sibbertoft Coral' is very closely related to *B. aggregata* and fruits well in Britain[11]. Plants can be pruned back quite severely and will resprout well from the base[200].

## 6.2.195 Smyrnium perfoliatum

5 tlin 9 cyuc 3 kcaak 0 tcan 0 dwat 1.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyfjxre7t hjonli

drutta Smyrnium perfoliatum is a BIENNIAL growing to 1.5 m (5ft) by 0.6 m (2ft in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from June to August, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kckaKa Edible Parts: Flowers Leaves StemEdible Uses: CondimentLeaves and young shoots - raw in salads or cooked in soups, stews etc[2, 5, 8, 12, 27, 37, 115, 183]. The plant commences growth in the autumn and the leaves are often available throughout the winter[5, 52]. They have a rather strong celery-like flavour and are often blanched (by excluding light from the growing plant) before use[183]. Leafy seedlings can be used as a parsley substitute[183]. Stem - raw or cooked[2, 5, 8, 12, 27, 37, 53, 115]. Tasting somewhat like celery[17], it is often blanched (by excluding light) before use[183]. This species is considered to be superior to the related *S. olusatrum* because it not only blanches better but is also more crisp and tender and not so harsh flavoured[183]. Flower buds - raw[12, 52]. A celery-like flavour, they can be added to salads. The spicy seeds are used as a pepper substitute[52, 183]. Root - cooked. Boiled and used in soups. The root is said to be more tender if it has been kept in a cool place all winter[183].

tcanta None known dwatta None known

propta Seed - best sown in an outdoor seedbed in autumn and planted into its permanent position in late spring[1, 200]. Germination can be slow[200]. Can also be sown in situ in spring[188].

nwatta Succeeds in most soils but prefers an open sunny position in a well-drained moisture retentive soil[1, 200]. Self-sows freely with us in our Cornwall garden, in a sunny, sheltered position[K].

## 6.2.196 Claytonia virginica

Spring Beauty, Virginia springbeauty, Hammond's claytonia, Yellow Virginia springbeauty

20°c[200]. Well suited to naturalistic plantings in a woodland or wild garden[200]. A sweetly aromatic plant[200]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is fibrous dividing into a large number of fine roots [1-2]. The root pattern is fleshy. Thick or swollen - fibrous or tap root [1-2].

### 6.2.191 Lilium auratum

Golden-Rayed Lily

5 tlin 9 cyuc 3 kcaak 0 tcan 0 dwat 1.8 m hkuc hmimhtut cyutli tcup hwicli hyishrasjlut hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Lilium auratum is a BULB growing to 1.8 m (6ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from August to September, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Bulb - cooked[4, 46]. Sweet and mucilaginous with a mild flavour that makes them acceptable to people who have never tried them before[2, 183]. The bulbs are used as a vegetable, and can also be boiled, sweetened, powdered and used in dumplings[183]. Large, they can be up to 17cm in diameter[61, 143].

tcanta None known

dwatta None known

propta Seed - delayed hypogeal germination[130]. Best sown as soon as ripe in a cold frame, it should germinate in spring[143]. Stored seed will require a warm/cold/warm cycle of stratification, each period being about 2 months long[163]. Grow on in cool shady conditions. Great care should be taken in pricking out the young seedlings, many people leave them in the seed pot until they die down at the end of their second years growth. This necessitates sowing the seed thinly and using a reasonably fertile sowing medium. The plants will also require regular feeding when in growth. Divide the young bulbs when they are dormant, putting 2 - 3 in each pot, and grow them on for at least another year before planting them out into their permanent positions when the plants are dormant[K]. Division with care in the autumn once the leaves have died down. Replant immediately[200]. Root bulbs - dig up in autumn and pot up in a cold frame for the first year[163]. Bulb scales can be removed from the bulbs in early autumn. If they are kept in a warm dark place in a bag of moist peat, they will produce bulbets. These bulbets can be potted up and grown on in the greenhouse until they are large enough to plant out[200].

nwatta Requires a well-drained lime-free peaty soil in a warm position with its roots in the shade[1, 28, 47, 90, 200]. Enjoys abundant moisture so long as the soil is very well drained[47]. Prefers an open woodland position or growing amongst dwarf evergreens[1]. The plant deteriorates rapidly if grown in much shade[143]. Fertilizers, rich soils and lime are fatal to this plant[143]. Stem rooting, the bulbs should be planted about 25 - 30 cm deep[143, 200]. Early to mid autumn is the best time to plant out the bulbs in cool temperate areas, in warmer areas they can be planted out as late as late autumn[200]. A very ornamental plant[1], but short-lived in cultivation[200]. It grows better in warmer climates than Britain[90]. The variety 'Platyphyllum' has larger flowers than the type and is more amenable to adverse conditions[245]. The flowers have a penetrating spicy aroma[245]. Cultivated for its edible bulb in Japan[2, 163]. The plant should be protected against slugs in early spring. If the shoot tip is eaten out the bulb will not grow in that year and will lose vigour[200].

### 6.2.192 Lilium candidum

Madonna Lily

5 tlin 9 cyuc 3 kcaak 0 tcan 2 dwat 1 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta Lilium candidum is a BULB growing to 1 m (3ft 3in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf from October to July, in flower in July, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Bulb - cooked. The raw bulb contains an acrid principle, but this is destroyed by drying or thorough heating[4]. When cooked the bulb is pulpy, sweet and sugary[4]. Rich in starch, it can be used as a vegetable in similar ways to potatoes (Solanium tuberosum). tcanta EssentialAn essential oil from the flowers is used in perfumery[4, 61].

dwatta Astringent Demulcent Emmenagogue Emollient Epilepsy ExpectorantThe Madonna lily has a long history of herbal use, though it is seldom employed in modern herbalism because of its scarcity[238]. The bulb and the flowers are astringent, highly demulcent, emmenagogue, emollient and expectorant[4, 7, 238]. The plant is mainly used externally, being applied as a poultice to tumours, ulcers, external inflammations etc[4, 238]. The bulb is harvested in August and can be used fresh or dried[4, 238]. The flowers are harvested when fully open and used fresh for making juice, ointments or tinctures[238]. The pollen has been used in the treatment of epilepsy[240].

propta Seed - immediate epigeal germination[130]. Sow thinly in pots from late winter to early spring in a cold frame. Should germinate in 2 - 4 weeks[163]. Great care should be taken in pricking out the young seedlings, many people prefer to leave them in the seed pot until they die down at the end of their second years growth. This necessitates sowing the seed thinly and using a reasonably fertile sowing medium. The plants will also require regular feeding when in growth. Divide the young bulbs when they are dormant, putting 2 - 3 in each pot, and grow them on for at least another year before planting them out into their permanent positions when the plants are dormant[K]. Division with care in the autumn once the leaves have died down. Replant immediately[200]. Bulb scales can be removed from the bulbs in early autumn. If they are kept in a warm dark place in a bag of moist peat, they will produce bulbets. These bulbets can be potted up and grown on in the greenhouse until they are large enough to plant out[200]. Bulbets are formed on the stem just below the soil surface. These should be dug up in the autumn and replanted immediately, preferably in a cold frame for growing on until large enough to plant out into the garden[143, 163]. The formation of bulbils on the stem can be induced by either removing the stem at flowering time and layering it just below the soil surface, or by removing all the flowers before they open.

nwatta Prefers an open free-draining humus-rich fertile loamy soil with its roots in the shade and its head in the sun[90, 200]. Prefers a sunny position[143] but also succeeds in shade[163]. Succeeds in ordinary garden soil[1]. Grows well in acid[42] and limy soils[4, 42, 47, 90], though it prefers a limey soil[200]. A very ornamental plant[1, 7]. It is seen as a symbol of purity and in Christian tradition is devoted to the Virgin Mary, in pre-Christian times it was sacred to Juno, the Goddess of heaven[238]. The flowers have a scent of heather honey[245]. The Madonna lily is generally very hardy and easy to grow[143] but it is unpredictable and does not grow or flower well in all gardens[90, 238]. It is also susceptible to botrytis[143]. Only just cover the bulb with soil[47, 200]. It is best to leave the clumps undisturbed since they resent being moved[143, 238], but if you need to transplant then this is best done in late August to early September, certainly no later than mid-October[143]. Plants produce a basal rosette of over-wintering leaves in the autumn[200], these die off as the plant comes into flower[188]. The plant should be protected against rabbits and slugs in early spring. If the shoot tip is eaten out the bulb will not grow in that year and will lose vigour[200].

### 6.2.193 Smyrniolum olusatrum

Alexanders

5 tlin 9 cyuc 3 kcaak 2 tcan 1 dwat 1.2 m hkuc

autumn/early winter and planted out in situ or potted up and planted out in late spring[200].

nwatta Prefers a warm moist loamy soil and light shade but it is by no means fastidious, succeeding in thin, dry and shallow soils[11, 200]. Grows well in heavy clay soils. Grows well on chalky soils[11]. Plants are hardy to about -15°c[184]. A very ornamental plant[1], there are several named varieties[182]. The cultivar 'Buccaneer' bears very large crops of large fruits, even on small plants[K]. A good bee plant[108], the flowers are very fragrant. Plants can be pruned back quite severely, they resprout well from the base[200].

### 6.2.151 Crambe cordifolia

Flowering sea kale

5 tlin 9 cyuc 3 kcaak 3 tcan 1 dwat 2 m hkuc hmimhtut cyutli hgatykcucup hwicli hyishrasjlutnyik hpa7tli prikklwis hpa7tmwatli xre7t hjonli

drutta Crambe cordifolia is a PERENNIAL growing to 2 m (6ft) by 1.2 m (4ft in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in June, and the seeds ripen in August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in nutritionally poor soil. Suitable pH: neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

kcakta Edible Parts: Leaves RootEdible Uses: Leaves - cooked[2, 105, 177]. Used as a potherb[183]. Young leaves have a pleasant cabbage-like flavour, though older leaves are rather tough[K]. Root - cooked[2, 145, 177].

tcanta Plants can be used for ground cover when planted about 1.2 metres apart each way. They form large clumps[208].

dwatta AntipruriticThe plant is used as a cure for itch[240].

propta Seed - sow March/April in a seedbed outdoors and either thin the plants out or move them to their permanent positions when about 10cm tall[111]. The young plants are very attractive to slugs so some protection will often be needed. Germination can be slow so it is best to sow the seed in pots in a cold frame[164]. Germination usually takes place in 3 - 26 weeks at 15°c[164]. Prick out the seedlings into individual pots as soon as they are large enough to handle and plant out into their permanent positions when they are at least 10cm tall. Division in spring or autumn[1, 111]. Dig up the root clump and cut off as many sections as you require, making sure they all have at least one growing point. The larger of these divisions can be planted out straight into their permanent positions, though small ones are best potted up and grown on in a cold frame until they are established. Root cuttings, 3 - 10 cm long, in spring[104]. These can be planted straight into the open ground or you can pot them up in the greenhouse and plant them out once they are growing strongly.

nwatta An easily grown plant, succeeding in a good loam and an open sunny position[1, 111, 200] but also tolerating some shade[188]. Prefers a slightly alkaline soil in a position sheltered from strong winds[200]. Another place in this report says that the plant tolerates maritime exposure[200]. Tolerates poor and dry soils and some shade[200]. Dislikes acid soils[1]. Established plants are drought tolerant[190]. Plants are hardy to about -20°c[187]. A deep-rooted plant[233], it dislikes root disturbance. The young growth in spring is adored by slugs[K]. Plants can be grown in the summer meadow if the grass is not cut too low, since this would damage the growing point[200]. The flowers emit a delicious wallflower-like scent in hot sunny weather[245].

### 6.2.152 Ribes himalense

5 tlin 9 cyuc 3 kcaak 0 tcan 1 dwat 2 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikklwis hpa7tmwatli xre7t hjonli

drutta Ribes himalense is a deciduous Shrub growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from April to June, and

the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[51, 272]. The fruit is quite large, but so are the seeds[200]. The fruit is red, turning purplish black on maturity and is about 7mm in diameter[266].

tcanta None known

dwatta Astringent Dysentery PoulticeThe juice of the leaf is used in the treatment of diarrhoea and dysentery[272]. A paste of the leaves is applied to cuts and wounds[272].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. Stored seed requires 4 - 5 months cold stratification at between 0 to 9°c and should be sown as early in the year as possible[113, 164]. Under normal storage conditions the seed can remain viable for 17 years or more. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter, planting them out in late spring of the following year. Cuttings of half-ripe wood, 10 - 15cm with a heel, July/August in a frame[78, 113]. Cuttings of mature wood of the current year's growth, preferably with a heel of the previous year's growth, November to February in a cold frame or sheltered bed outdoors[78, 200].

nwatta Easily grown in a moisture retentive but well-drained loamy soil of at least moderate quality[11, 200]. Plants are quite tolerant of shade though do not fruit so well in such a position[11]. Hardy to about -20°c[200]. This species is closely related to *R. petraeum*[200]. Plants can harbour a stage of white pine blister rust, so should not be grown in the vicinity of pine trees[155]. Plants in this genus are notably susceptible to honey fungus[200].

### 6.2.153 Mahonia napaulensis

5 tlin 9 cyuc 3 kcaak 0 tcan 2 dwat 2.5 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprikklwis hpa7tmwatli xre7t hjonli

drutta Mahonia napaulensis is an evergreen Shrub growing to 2.5 m (8ft) by 3 m (9ft). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in leaf all year, in flower from March to April. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[272]. An acid flavour, but it is rather nice raw especially when added to muesli or porridge[K]. Unfortunately, there is relatively little flesh and a lot of seeds[K]. The fruit can also be dried and used as raisins[2, 51, 158, 177]. The ovoid fruit is about 12mm long[200].

tcanta DyeA yellow dye is obtained from the stem and leaves[61].

dwatta Antibacterial Antitumor Dysentery Ophthalmic TonicThe fruits are said to be diuretic and demulcent[240, 272]. They are used in the treatment of dysentery[240]. A decoction of the bark is used as eye drops to treat inflammations of the eyes[272]. Berberine, universally present in rhizomes of Mahonia species, has marked antibacterial effects[218] and is used as a bitter tonic[213]. Since it is not appreciably absorbed by the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not be used with Glycyrrhiza species (Liquorice) because this nullifies the effects of the berberine[218]. Berberine has also shown antitumour activity[218]. The root and root bark are best harvested in the autumn[213].

propta Seed - best sown as soon as it is ripe in a cold frame[78]. It usually germinates in the spring[K]. 'Green' seed (harvested when the embryo has fully developed but before the seed case has dried) should be sown as soon as it is harvested and germinates within 6 weeks[K]. Stored seed should be sown as soon as possible in late winter or spring. 3 weeks cold stratification will improve its germination, which should take place in 3 - 6 months at 10°c. Prick

out the seedlings when they are large enough to handle and grow them on in a cold frame for at least their first winter. Plant them out in late spring or early summer. Cuttings of half ripe wood 15cm long, July in individual pots in a frame[78]. Division of suckers in spring[78]. Whilst they can be placed direct into their permanent positions, better results are achieved if they are potted up and placed in a frame until established[11]. Leaf cuttings in the autumn.

nwatta An easily grown plant, it thrives in any good garden soil[11]. Grows well in heavy clay soils. Prefers a semi-shaded woodland position in a damp slightly acid to neutral humus rich soil[200]. Requires a position sheltered from cold or strong winds[1]. The plant is slightly tender in Britain[1] though it does well in Cornwall[59]. It under performs in areas where temperatures regularly fall below -10°C[200]. The young growth in spring can be damaged by late frosts[K]. Hybridizes freely with other members of this genus. The flowers have a delicate sweet fragrance[245]. At least one named variety has been developed for its ornamental value. 'Maharajah' appears to be harder than the type species[182]. Closely allied to *M. acanthifolia*[11] (which is quoted as a synonym of this species in some books). The differences stated between the two species do not hold true in the wild but in cultivation *M. acanthifolia* has leaflets with a dull surface, flowers in the autumn and is harder than many of the spring flowering introductions of *M. nepaulensis*. Resistant to honey fungus[88].

### 6.2.154 Cynara cardunculus

Cardoon

5 tlin 9 cyuc 3 kcak 1 tcan 5 dwat 2 m hkuc htut cyutli hgatkyuctup hwicli hyhshrasljutnykfrip hpa7tli flatprikwlshsom hpa7tmwatli xre7t hjonli

drutta Cynara cardunculus is a PERENNIAL growing to 2 m (6ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from August to September, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in saline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: Flowers Leaves Root StemEdible Uses: Curdling agentFlower buds - raw or cooked[33, 105]. A globe artichoke substitute[183]. The flower buds are a bit smaller than the globe artichoke and so are even more fiddly to use[K]. The buds are harvested just before the flowers open, they are then usually boiled before being eaten. Only the base of each bract is eaten, plus the 'heart' or base that the petals grow from [K]. The flavour is mild and pleasant and is felt by some people to be more delicate than the globe artichoke[K]. Stems - cooked and used as a celery substitute[2, 27, 33, 46, 61]. It is best to earth up the stems as they grow in order to blanch them and reduce their bitterness[4], these blanched stems can then be eaten cooked or in salads[105, 132, 183]. In Italy raw strips of the stems are dipped into olive oil[183]. We find these stems to be too bitter when eaten raw[K]. Young leaves - raw or cooked. Eaten as a salad by the ancient Romans[183]. Rather bitter[K]. Root - cooked like parsnips[27, 105, 183]. Tender, thick and fleshy, with an agreeable flavour[183]. The dried flowers are a rennet substitute, used for curdling plant milks[105, 183].

tcanta DyeThe plant is said to yield a good yellow dye[4], though the report does not say which part of the plant is used.

dwatta Anticholesterolemic Chologogue Digestive DiureticThe cardoon has become important as a medicinal herb in recent years following the discovery of cynarin. This bitter-tasting compound, which is found in the leaves, improves liver and gall bladder function, stimulates the secretion of digestive juices, especially bile, and lowers blood cholesterol levels[238, 254]. The leaves are anticholesterolemic, antirheumatic, chologagogue, digestive, diuretic, hypoglycaemic and lithontripic[7, 21, 165]. They are used internally in the treatment of chronic liver and gall bladder diseases, jaundice, hepatitis, arteriosclerosis and the early stages of late-onset diabetes[238, 254]. The leaves are best

harvested just before the plant flowers, and can be used fresh or dried[238].

propta Seed - sow early spring in a greenhouse. Germination is usually quick and good, prick out the seedlings into individual pots as soon as they are large enough to handle and plant them out into their permanent positions during the summer. It would be prudent to give the plants some winter protection in their first year. The seed can also be sown in situ in April. Sow the seed 2cm deep, putting 2 or 3 seeds at each point that you want a plant[1]. Protect the seed from mice[1]. Division of suckers. This is best done in November and the suckers overwintered in a cold frame then planted out in April. Division can also be carried out in March/April with the divisions being planted out straight into their permanent positions, though the plants will be smaller in their first year.

nwatta Industrial Crop: Biomass Management: Hay Management: Standard Staple Crop: OilPrefers a light warm soil and an open position in full sun[37, 200]. For best results, this plant requires plenty of moisture in the growing season and a good rich soil[16, 27, 33, 37], though another report says that it is drought tolerant once established[190]. Plants grew very well with us in the hot and very dry summer of 1995, though they were looking very tatty by September[K]. Tolerates most soils including heavy clays of both acid and alkaline nature, especially when grown in heavier or more spartan soils[200]. Plants are reasonably wind resistant[200, K]. This species is hardy to about -10°C[187]. Plants are more likely to require protection from winter cold when they are grown in a heavy soil[190]. Wet winters can do more harm than cold ones[K]. At one time the cardoon was often grown for its edible stems but it has now fallen into virtual disuse[132]. There are some named varieties[183]. It is a very ornamental foliage plant and makes a very attractive feature in the garden. The leaves are long lasting in water and are often used in flower arrangements[233]. Recent taxonomic revisions (1999) have seen the globe artichoke being merged into this species. However, since from the gardener's point of view it is quite a distinctive plant, we have decided to leave it with its own entry in the database under *Cynara scolymus*[K]. Plants seem to be immune to the predations of rabbits[233]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is fleshy. Thick or swollen - fibrous or tap root [2-1].

### 6.2.155 Alcea rosea

Hollyhock

5 tlin 9 cyuc 3 kcak 3 tcan 2 dwat 2.4 m hkuc htut cyutli kyucstup hwicli hrasljutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Alcea rosea is a PERENNIAL growing to 2.4 m (7ft) by 0.6 m (2ft in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from July to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Flowers Leaves Oil Root StemEd Uses: Oil TeaYoung leaves - raw or cooked[2, 55, 177]. A mild flavour, but the texture leaves something to be desired[K]. They have been used as a pot-herb, though they are not particularly palatable[4]. They can also be chopped up finely and added to salads[K]. Inner portion of young stems - raw[101]. Flower petals and flower buds - raw. Added to salads[183]. A nutritious starch is obtained from the root[183]. A refreshing tea is made from the flower petals[183].

tcanta Compost Dye Litmus Oil PaperA fibre obtained from the stems is used in papermaking[189]. The fibres are about 1.9mm long. The stems are harvested in late summer, the leaves are removed and the stems are steamed until the fibres can be removed. The fibres are cooked with lye for 2 hours and then ball milled for 3 hours or pounded with mallets. The paper is light tan in colour[189]. The flowers are an alternative ingredient of 'Quick Return' herbal compost

for bees[108]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is fleshy. Thick or swollen - fibrous or tap root [2-1].

### 6.2.188 Lycium pallidum

Pale Wolfberry, Pale desert-thorn, Rabbit thorn
5 tlin 9 cyuc 3 kcak 3 tcan 2 dwat 1.8 m hkuc htut cyutli kyucstup hwicli hyhshrasljutnyik hpa7tli flatpriklwis hpa7mwatli xre7t hjonli

drutta Lycium pallidum is a deciduous Shrub growing to 1.8 m (6ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw, cooked or dried for later use[[46, 61, 85, 183, 257]. The fruit keeps well when dried and ground into a meal[183]. The fruit should be perfectly ripe if it is eaten raw[95]. The Hopi Indians boiled the fruit, drained off the water and ground the fruit into a mush. Clay was then mixed with water until a thick consistency was achieved, this was mixed with the berries and the whole lot eaten[216]. The fruit is about 10mm in diameter[200].

tcanta Soil stabilizationPlants have an extensive root system and can be planted to stabilize banks[200].

dwatta Cancer OdontalgicThe ground up root has been placed in a tooth cavity to bring relief from toothache[257]. The bark and the dried berries have been used as a 'life medicine'[257]. The fruit of many members of this genus is a very rich source of vitamins and minerals, especially in vitamins A, C and E, flavanoids and other bio-active compounds. It is also a fairly good source of essential fatty acids, which is fairly unusual for a fruit. It is being investigated as a food that is capable of reducing the incidence of cancer and also as a means of halting or reversing the growth of cancers[214].

propta Seed - sow early spring in a greenhouse. Germination is usually good and fairly quick. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse for their first winter. Plant out in late spring or early summer. Pinch out the shoot tips of the young plants in order to encourage bushy growth[78]. Cuttings of half-ripe wood, 5 - 10cm with a heel if possible, July/August in individual pots in a frame. Good percentage[78]. Cuttings of mature wood of the current season's growth, autumn to late winter in a cold frame. High percentage[78, 200]. Division of suckers in late winter. Very easy, the suckers can be planted out direct into their permanent positions. Layering.

nwatta Does not require a rich soil, flowering and fruiting better in a well-drained soil of moderate quality[11]. Succeeds in impoverished soils[200]. Requires a sunny position[200]. Tolerates maritime exposure[200]. Hardy to about -17°C[200]. Plants do not always fruit well in Britain[11], particularly after a cool summer[200].

### 6.2.189 Ribes sativum

Redcurrant

5 tlin 9 cyuc 3 kcak 0 tcan 0 dwat 1 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatpriklwis hpa7mwatli fyfxre7t hjonli

drutta Ribes sativum is a deciduous Shrub growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked in jams, compotes, jellies, puddings, pies etc[183,

200]. An acid taste that many people find too strong to eat raw, the fruit makes an excellent jam or preserves[K]. The fruit is rich in vitamin C[183]. There are rather a lot of seeds in each fruit[K].

tcanta None known

dwatta Vitamin CNone known

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. Stored seed requires 3 months cold stratification at between 0 and 5°C and should be sown as early in the year as possible[113, 164]. Under normal storage conditions the seed can remain viable for 17 years or more. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter, planting them out in late spring of the following year. Cuttings of half-ripe wood, 10 - 15cm with a heel, July/August in a frame[78, 113]. Cuttings of mature wood of the current year's growth, preferably with a heel of the previous year's growth, November to February in a cold frame or sheltered bed outdoors[78, 200].

nwatta Easily grown in a moisture retentive but well-drained loamy soil of at least moderate quality[11, 200]. Plants are quite tolerant of shade, succeeding on an east or even a north-facing wall, though not fruiting so well in such a position[11]. Prefers a pH in the range 5.5 to 6[200]. Hardy to about -20c[200]. There is some confusion in nomenclature with some botanists recognising 2 species of red currants, this species and *R. spicatum* (syn *R. rubrum*), whilst others say that *R. rubrum* is a distinct species[17, 200]. The red currant is sometimes cultivated for its edible fruit, there are some named varieties[183]. Most cultivars are self-fertile and set a good crop on their own[200]. The fruit is produced at the base of one-year old and older wood, plants start to fruit at 3 - 4 years from seed[200]. Red currant fruits are an absolute magnet for birds and so the plants will usually need some protection to allow the crop to ripen[K]. Alternatively, you can put this attraction for the birds to good use by planting red currants specifically for the birds. Whilst they are eating these fruits they will not be eating your other fruits[K]. Plants can harbour a stage of 'white pine blister rust', so should not be grown in the vicinity of pine trees[155]. Plants in this genus are notably susceptible to honey fungus[200].

### 6.2.190 Osmorhiza longistylis

Aniseroot, Longstyle sweetroot

5 tlin 9 cyuc 3 kcak 1 tcan 1 dwat 1.2 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatpriklwis hpa7tmwatli fyfxre7t hjonli

drutta Osmorhiza longistylis is a PERENNIAL growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Condiement TeaRoot - raw or cooked. Very sweet, aromatic and fleshy[222]. A spicy flavour similar to anise, the roots are chewed, made into a tea or used as a flavouring[105, 171, 183]. Leaves and young shoots - raw. An anise flavour, they are added to salads[177, 183]. The green seeds have an anise flavour and are used as a flavouring in salads, the dry seeds are added to cakes etc[183].

tcanta Scented.

dwatta Birthing aid Ophthalmic Poultice StomachicA poultice of the roots are used in the treatment of boils and wounds[207, 222]. A tea made from the roots is stomachic[222]. It has been used in the treatment of stomach complaints, kidney problems, amenorrhoea, general debility, to ease childbirth and also to bathe sore eyes[222, 257].

propta Seed - we have no information on this species but suggest sowing the seed in a cold frame as soon as it is ripe if this is possible, otherwise sow it in early spring. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts.

nwatta Succeeds in any deep moisture-retentive soil in sun or dappled shade[200]. Plants are hardy to about -

hmimhtut cyutli tcup hwicli hrasjlutnyikfripr hpa7tli flatprik-lwis hpa7tmwatli xre7t hjonli

drutta Mentha x smithiana is a PERENNIAL growing to 1 m (3ft 3in) by 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from August to September, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Condiment TeaLeaves - raw or cooked. Used as a flavouring in salads or cooked foods. The sweetly scented leaves can be used in the same ways as spearmint[238]. A good culinary mint, the leaves have an attractive red tinge[244]. A herb tea is made from the fresh or dried leaves[238]. It has a very pleasant and refreshing taste of spearmint, leaving the mouth and digestive system feeling clean[K]. An essential oil from the leaves and flowers is used as a flavouring in sweets, ice cream, drinks etc[238].

tcanta Essential Repellent StrewingAn essential oil is obtained from the whole plant. Rats and mice intensely dislike the smell of mint. The plant was therefore used in homes as a strewing herb and has also been spread in granaries to keep the rodents off the grain[244].

dwatta Antiseptic Febrifuge StomachicRed rariipila mint, like many other members of this genus, is often used as a domestic herbal remedy, being valued especially for its antiseptic properties and its beneficial effect on the digestion. Like other members of the genus, it is best not used by pregnant women because large doses can cause an abortion. A tea made from the leaves of most mint species has traditionally been used in the treatment of fevers, headaches, digestive disorders and various minor ailments[222]. The leaves are harvested as the plant comes into flower and can be dried for later use[238]. The essential oil in the leaves is antiseptic, though it is toxic in large doses[222].

propta Seed - this hybrid is usually sterile, and even if seed is produced it will not breed true[200]. If you do obtain seed, then it can be sown in spring in a cold frame. Germination is usually fairly quick. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in the summer. Division can be easily carried out at almost any time of the year, though it is probably best done in the spring or autumn to allow the plant to establish more quickly. Virtually any part of the root is capable of growing into a new plant. Larger divisions can be planted out direct into their permanent positions. However, for maximum increase it is possible to divide the roots up into sections no more than 3cm long and pot these up in light shade in a cold frame. They will quickly become established and can be planted out in the summer.

nwatta A very easily grown plant, it succeeds in most soils and situations so long as the soil is not too dry[200]. Grows well in heavy clay soils. A sunny position is best for production of essential oils, but it also succeeds in partial shade[4]. Prefers partial shade and a slightly acid soil[4, 16]. This species is a hybrid involving *M. aquatica* x *M. arvensis* x *M. spicata*[200]. It has sweetly mint-scented leaves with similar culinary uses to *M. spicata*. Most mints have fairly aggressive spreading roots and, unless you have the space to let them roam, they need to be restrained by some means such as planting them in containers that are buried in the soil[K]. Hybridizes freely with other members of this genus. The flowers are very attractive to bees and butterflies[24]. A good companion plant for growing near cabbages and tomatoes, helping to keep them free of insect pests[14, 20]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 6.2.187 Cynara scolymus

Globe Artichoke

5 tlin 9 cyuc 3 kcak 2 tcan 5 dwat 1.5 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik-lwishsom hpa7tmwatli xre7t hjonli

drutta Cynara scolymus is a PERENNIAL growing to 1.5 m (5ft) by 1 m (3ft 3in). See above for USDA hardiness. It is

hardy to UK zone 6 and is not frost tender. It is in flower from August to September, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in saline soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: Flowers Leaves StemEdible Uses: Curdling agentFlower buds - raw or cooked[2, 7, 15, 16, 27, 37, 183]. Used before the flowers open[171]. The flavour is mild and pleasant[K]. Gobe artichokes are considered to be a gourmet food but they are very fiddly to eat. The buds are harvested just before the flowers open, they are then usually boiled before being eaten. Only the base of each bract is eaten, plus the 'heart' or base that the petals grow from [K]. Small, or baby artichokes, that are produced on lateral stems can be pickled or used in soups and stews[183]. Plants yield about 5 to 6 main heads per year from their second year onwards[200]. Flowering stems - peeled and eaten raw or cooked. A sweet nutty flavour[183]. Young leaf stems - a celery substitute[200]. They are normally blanched to remove the bitterness and then boiled or eaten raw[183]. We find them too bitter to be enjoyable[K]. Leaves - cooked. A bitter flavour[15, 61]. The dried flowers are a rennet substitute, used for curdling plant milks[4, 183].

tcanta DyeA dark grey dye is obtained from the leaves[7].

dwatta Anticholesterolemic Antirheumatic Appetizer Cholagogue Digestive Diuretic Hypoglycaemic LithontripicThe globe artichoke has become important as a medicinal herb in recent years following the discovery of cynarin. This bitter-tasting compound, which is found in the leaves, improves liver and gall bladder function, stimulates the secretion of digestive juices, especially bile, and lowers blood cholesterol levels[238, 254]. The leaves are anticholesterolemic, antirheumatic, cholagogue, digestive, diuretic, hypoglycaemic and lithontripic[7, 21, 165]. They are used internally in the treatment of chronic liver and gall bladder diseases, jaundice, hepatitis, arteriosclerosis and the early stages of late-onset diabetes[238, 254]. The leaves are best harvested just before the plant flowers, and can be used fresh or dried[238]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve *Cynara scolymus* (*Cynara cardunculus* subsp. *flavescens*) for liver and gallbladder complaints, loss of appetite (see [302] for critics of commission E).

propta Seed - sow early spring in a greenhouse. Germination is usually quick and good, prick out the seedlings into individual pots as soon as they are large enough to handle and plant them out into their permanent positions during the summer. It would be prudent to give the plants some winter protection in their first year. The seed can also be sown in situ in April. Sow the seed 2cm deep, putting 2 or 3 seeds at each point that you want a plant[1]. Protect the seed from mice[1]. Division of suckers. This is best done in November and the suckers overwintered in a cold frame then planted out in April. Division can also be carried out in March/April with the divisions being planted out straight into their permanent positions, though the plants will be smaller in their first year.

nwatta Prefers a light warm soil and an open position in full sun[15, 16, 33, 37]. Requires plenty of moisture in the growing season and a good rich soil[200]. Prefers a sheltered position[200] but plants are reasonably wind resistant[K]. Plants are tolerant of saline conditions[4]. Plants succeed in cool climates though they may need protection in cold winters[200], they are unlikely to thrive in the north of Britain. Wet winters are far more likely to cause problems than cold ones[4, K]. The globe artichoke is often cultivated in the garden and sometimes commercially for its edible flower buds, there are some named varieties[183, 200]. It is best to renew the plants by division of the suckers every 3 years but they do live for a number of years[200]. The plant has recently been reclassified (1999) as not having specific status but being part of *C. cardunculus*. However, since it is distinct enough from the gardener's viewpoint (having a much larger seedhead) we have decided to leave it with its own entry for the time being[K]. Plants seem to be immune to the predations of rabbits[233]. The flowering plant is a magnet

activator[32]. This is a dried and powdered mixture of several herbs that can be added to a compost heap in order to speed up bacterial activity and thus shorten the time needed to make the compost[K]. The seed contains 12% of a drying oil[114, 240]. The red anthocyanin constituent of the flowers is used as a litmus[114]. A brown dye is obtained from the petals[168].

dwatta Antinflammatory Astringent Demulcent Diuretic Dysentery EmollientFebrifugeThe flowers are demulcent, diuretic and emollient[4, 21]. They are useful in the treatment of chest complaints[4], and a decoction is used to improve blood circulation, for the treatment of constipation, dysmenorrhoea, haemorrhage etc[218]. The flowers are harvested when they are open and are dried for later use[238]. The shoots are used to ease a difficult labour[218]. The root is astringent and demulcent[240]. It is crushed and applied as a poultice to ulcers[218]. Internally, it is used in the treatment of dysentery[240]. The roots and the flowers are used in Tibetan medicine, where they are said to have a sweet, acrid taste and a neutral potency[241]. They are used in the treatment of inflammations of the kidneys/womb, vaginal/seminal discharge, and the roots on their own are used to treat loss of appetite[241]. The seed is demulcent, diuretic and febrifuge[240].

propta Seed - sow April/May or August/September in pots or in situ[200, 238]. Easily grown from seed, which usually germinates in about 2 - 3 weeks at 20°C[133, 268]. When large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division after flowering. Only use rust-free specimens. Root cuttings in December. Basal cuttings at almost any time of year.

nwatta Landscape Uses:Border, Container, Foundation, Specimen. Succeeds in most soils[1]. Poor soils should be enriched with organic matter[1, 111]. Prefers a heavy rich soil and a sheltered sunny position[200]. Plants are hardy to about -15°C[200]. A very ornamental plant, it is usually grown as a biennial due to its susceptibility to the fungal disease 'rust'[1, 200]. There are many named varieties[238]. Young plants, and also the young growth in spring, are very attractive to slugs[K]. Special Features:Attracts birds, Attracts butterflies, Suitable for cut flowers, Attractive flowers or blooms. The plant is heat tolerant in zones 10 through 3. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2].

## 6.2.156 Lycium ruthenicum

5 tlin 9 cyuc 3 kcak 3 tcan 2 dwat 2 m hkuc htut cyutli hgatkyuctcup hwicli hyishrasjlutnyik hpa7tli flatprik-lwishsom hpa7tmwatli xre7t hjonli

drutta Lycium ruthenicum is a deciduous Shrub growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 6. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in saline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[146, 177]. Only the fully ripe fruits should be eaten[K].

tcanta Soil stabilizationPlants are very drought tolerant and have an extensive root system. They can be planted to stabilize banks and sandy soils[200, 266].

dwatta Cancer OphthalmicThe plant is used as an ointment to treat blindness in camels[240]. The fruit of many members of this genus is a very rich source of vitamins and

minerals, especially in vitamins A, C and E, flavanoids and other bio-active compounds. It is also a fairly good source of essential fatty acids, which is fairly unusual for a fruit. It is being investigated as a food that is capable of reducing the incidence of cancer and also as a means of halting or reversing the growth of cancers[214].

propta Seed - sow early spring in a greenhouse. Germination is usually good and fairly quick. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse for their first winter. Plant out in late spring or early summer. Pinch out the shoot tips of the young plants in order to encourage bushy growth[78]. Cuttings of half-ripe wood, 5 - 10cm with a heel if possible, July/August in individual pots in a frame. Good percentage[78]. Cuttings of mature wood of the current season's growth, autumn to late winter in a cold frame. High percentage[78, 200]. Division of suckers in late winter. Very easy, the suckers can be planted out direct into their permanent positions. Layering.

nwatta Does not require a rich soil, flowering and fruiting better in a well-drained soil of moderate quality[111]. Succeeds in impoverished and saline soils[200, 266]. Requires a sunny position[200]. Tolerates maritime exposure[200] and drought[266].

## 6.2.157 Zanthoxylum piperitum

Japanese Pepper Tree

5 tlin 9 cyuc 3 kcak 1 tcan 2 dwat 2 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik-lwis hpa7tmwatli nyanhjen hjonli

drutta Zanthoxylum piperitum is a deciduous Shrub growing to 2 m (6ft) by 2 m (6ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from April to June. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Fruit Leaves SeedEdible Uses: CondimentSeed - cooked. It is ground into a powder and used as a condiment, a pepper substitute[1, 2, 11, 34, 183]. The fruit can also be used[116]. It is often heated in order to bring out its full flavour and can be mixed with salt for use as a table condiment[183]. The ground and dry-roasted fruit is an ingredient of the Chinese 'five spice powder'[238]. The bark and leaves are used as a spice[2, 105, 238]. Young leaves - raw or cooked. They are used in soups or as a flavouring in salads[177, 179, 183].

tcanta ParasiticideIn Japan, the thick wood of the tree is traditionally made into a gnarled and rough-hewn wooden pestle, to use with suribachi.

dwatta Antibacterial Antifungal Antiperiodic Antitussive Carminative Diuretic Parasiticide Stimulant StomachicAntiperiodic, antitussive, carminative, diuretic, parasiticide, stimulant[178]. The fruit contains an essential oil, flavonoids and isouquinoline alkaloids[279]. It is antihelmintic, antibacterial, antifungal and stomachic[279]. It inhibits the synthesis of prostaglandin and, in larger doses, is toxic to the central nervous system[279]. It is used in Korea in the treatment of tuberculosis, dyspepsis and internal parasites[279]. The resin contained in the bark, and especially in that of the roots, is powerfully stimulant and tonic[82].

propta Seed - best sown in a greenhouse as soon as it is ripe in the autumn. Stored seed may require up to 3 months cold stratification, though scarification may also help[113]. Sow stored seed in a cold frame as early in the year as possible. Germination should take place in late spring, though it might take another 12 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant them out in early summer. Cuttings of half-ripe wood, July/August in a frame. Root cuttings, 3cm long, planted horizontally in pots in a greenhouse. Good percentage[78]. Suckers, removed in late winter and planted into their permanent positions[113].

nwatta Easily grown in loamy soils in most positions, but prefers a good deep well-drained moisture retentive soil

in full sun or semi-shade[1, 11, 200]. A very ornamental plant[1], it is hardy to about -15°C[184]. Flowers are formed on the old wood[206]. The bruised leaves are amongst the most powerfully aromatic of all leaves[245]. Dioecious. Male and female plants must be grown if seed is required. Self-sown seedlings have occasionally been observed growing in bare soil under the parent plant[K]. A good forest garden plant. Some reports suggest it can grow in deep shade. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. A clumping plant, forming a colony from shoots away from the crown but with a limited spread [1-2]. The root pattern is suckering with new plants from underground runners away from the plant [1-2].

## 6.2.158 Mahonia bealei

Beale's barberry, Leatherleaf Mahonia

5 tin 8 cyuc 3 kcaak 0 tcan 2 dwat 2 m hkuc  
pcimhmhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Mahonia bealei is an evergreen Shrub growing to 2 m (6ft) by 2 m (6ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in leaf all year, in flower from January to March, and the seeds ripen from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. A pleasant acid flavour; it is nice when added to muesli or porridge[K]. Unfortunately, there is relatively little flesh and a lot of seeds[K]. The fruit is about 10mm long and 6mm wide[200], it ripens in April/May and if the plant is in a sheltered position the crops can be fairly heavy[K].

tcanta None known

dwatta Antibacterial Antiphlogistic Antirheumatic Cancer Depurative Dysentery Febrifuge TonicThe leaf is febrifuge and tonic[218]. A decoction of the root and stems is antiphlogistic, antirheumatic, depurative and febrifuge[147, 218]. A decoction is used in the treatment of pulmonary tuberculosis, recurring fever and cough in rundown body systems, rheumatoid arthritis, backache, weak knees, dysentery and enteritis[147]. The root and root bark are best harvested in the autumn[213]. Berberine, universally present in rhizomes of Mahonia species, has marked antibacterial effects[218] and is used as a bitter tonic[213]. Since it is not appreciably absorbed by the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not be used with Glycyrrhiza species (Liquorice) because this nullifies the effects of the berberine[218]. Berberine has also shown antitumour activity[218].

propta Seed - best sown as soon as it is ripe in a cold frame[78]. It usually germinates in the spring[K]. 'Green' seed (harvested when the embryo has fully developed but before the seed case has dried) should be sown as soon as it is harvested and germinates within 6 weeks[K]. Stored seed should be sown as soon as possible in late winter or spring. 3 weeks cold stratification will improve its germination, which should take place in 3 - 6 months at 10°C. Prick out the seedlings when they are large enough to handle and grow them on in a cold frame for at least their first winter. Plant them out in late spring or early summer. Division of suckers in spring[78]. Whilst they can be placed direct into their permanent positions, better results are achieved if they are potted up and placed in a frame until established[11]. Leaf cuttings in the autumn.

nwatta Landscape Uses:Border, Foundation, Pest tolerant, Massing, Rock garden, Specimen, Woodland garden. Thrives in any good garden soil[11]. Grows well in heavy clay soils. Survives under quite heavy tree cover[11], thriving in dense shade[182]. Prefers a semi-shaded woodland position in a damp, slightly acid to neutral humus-rich soil[200]. The fully dormant plant is hardy to about -20°C[184], though the young growth in spring can be damaged by late frosts. Scarcely distinct from *M. japonica*[11, 200], differing mainly

in its broader leaflets which are placed closer together on the stem and its erect flower racemes[245]. It is often treated as a subspecies of *M. japonica*, despite the fact that this species is found in the wild whilst *M. japonica* is a cultigen and not a wild plant[11, 200]. Plants of the two species are often confused in cultivation. The flowers are sweetly scented[245]. Hybridizes freely with other members of this genus. Special Features:Attractive foliage, Not North American native, Extended bloom season in Zones 9A and above, Fragrant flowers, Attractive flowers or blooms.

## 6.2.159 Rubus amabilis

5 tin 9 cyuc 3 kcaak 1 tcan 0 dwat 2 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Rubus amabilis is a deciduous Shrub growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to July, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[1, 11, 61, 105]. Large with a good flavour[46]. A sweet taste[177]. The fruit is about 16mm in diameter[200].

tcanta DyeA purple to dull blue dye is obtained from the fruit[168].

dwatta None known

propta Seed - requires stratification and is best sown in early autumn in a cold frame. Stored seed requires one month stratification at about 3°C and is best sown as early as possible in the year. Prick out the seedlings when they are large enough to handle and grow on in a cold frame. Plant them out into their permanent positions in late spring of the following year. Division in early spring or just before leaf-fall in the autumn[200].

nwatta Easily grown in a good well-drained loamy soil in sun or semi-shade[1, 11, 200].Prefers a humus-rich soil[184]. Hardy to about -20°C[184]. A very ornamental plant[1]. This species is a raspberry with biennial stems, it produces a number of new stems each year from the perennial rootstock, these stems fruit in their second year and then die[200]. Plants in this genus are notably susceptible to honey fungus[200].

## 6.2.160 Calycanthus floridus

Carolina Allspice, Eastern sweetshrub, Strawberry Bush, Sweetshrub, Carolina Allspice

5 tin 10 cyuc 3 kcaak 2 tcan 2 dwat 2.7 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Calycanthus floridus is a deciduous Shrub growing to 2.7 m (8ft) by 2 m (6ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to July, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Edible Uses: CondimentThe aromatic bark is dried and used as a substitute for cinnamon[2, 11, 46, 61, 105, 161, 183]. Some caution is advised, see reports above on toxicity[270].

tcanta Disinfectant RepellentLeaves contain small quantities of camphor. They can be used as an insect repellent, perfume and disinfectant[169, 257].

dwatta Antiperiodic Antispasmodic Cardiac Disinfectant Diuretic Emetic Ophthalmic SkinAntispasmodic, disinfectant[106, 169]. The plant contains an alkaloid that has a powerfully depressant action on the heart[4]. A fluid extract has been used as an antiperiodic[4]. A tea made from the root or bark has been used as a strong emetic and diuretic for kidney and bladder ailments[222, 257]. A cold tea has been used as eye drops in the treatment of failing eyesight[222, 257].

be used with Glycyrrhiza species (Liquorice) because this nullifies the effects of the berberine[218]. Berberine has also shown antitumour activity[218].

propta Seed - best sown as soon as it is ripe in a cold frame, when it should germinate in late winter or early spring[78]. Seed from over-ripe fruit will take longer to germinate[78], whilst stored seed may require cold stratification and should be sown in a cold frame as early in the year as possible[80]. The seedlings are subject to damping off, so should be kept well ventilated[113]. When the seedlings are large enough to handle, prick them out into individual pots and grow them on in a cold frame. If growth is sufficient, it can be possible to plant them out into their permanent positions in the autumn, but generally it is best to leave them in the cold frame for the winter and plant them out in late spring or early summer of the following year. A hybrid species, it will not breed true from seed. Cuttings of half-ripe wood, July/August in a frame. Cuttings of mature wood of the current season's growth, preferably with a heel, October/November in a frame[78].

nwatta Prefers a warm moist loamy soil but it is by no means fastidious, succeeding in thin, dry and shallow soils[11, 200]. Grows well in heavy clay soils. Succeeds in full sun or light shade[11, 200]. This is probably not a true species but a hybrid involving *B. wilsonae* and perhaps *B. aggregata*. There are a number of named varieties selected for their ornamental value, many of these have quite large fruits which are freely borne. The cultivar 'Crawleyensis' has fruits up to 1.5cm long[200]. Hybridizes freely with other members of this genus[1]. Plants can be pruned back quite severely, they resprout well from the base[200].

## 6.2.184 Osmorhiza occidentalis

Western Sweet-Cicely, Western sweetroot

5 tin 9 cyuc 3 kcaak 0 tcan 2 dwat 1 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli fyifxre7t hjonli

drutta Osmorhiza occidentalis is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Root SeedEdible Uses: CondimentThe root has a sweet liquorice or anise flavour and can be dried, ground into a powder and used as a flavouring for biscuits etc[85, 183, 257]. The taste is probably too strong for the whole root to be used as a vegetable[85]. The dried seeds are used as a flavouring[85, 183, 257]. The unripe seed, when still fleshy, can be nibbled raw[85, 183].

tcanta Deodorant Incense InsecticideThe roots have been used by women as a feminine deodorant[257]. They have also been placed in the clothes cupboard to impart a nice smell to clothes and have been used to rinse babies nappies[257]. A decoction of the root has been used as a dip to kill lice in chickens[257].

dwatta Antiseptic Carminative Deodorant Febrifuge Ophthalmic Oxytoxic Pectoral Poultice Skin StomachicWestern sweet-cicely was widely employed medicinally by several native North American Indian tribes who used it particularly to treat digestive disorders and as an antiseptic wash for a range of problems[257]. It is little, if at all, used in modern herbalism. An infusion of the plant is used in the treatment of coughs and colds[61, 257]. The roots are antiseptic, carminative, febrifuge, oxytoxic, pectoral and stomachic[257]. An infusion has been used to induce labour in a pregnant woman and to treat fevers, indigestion, flatulence, stomach aches etc[257]. An infusion of the roots has been applied externally as a treatment for swollen breasts, sores, sore eyes etc[257]. A decoction of the root has been used as a wash on venereal sores and skin rashes[257]. A poultice of the pulped roots has been used in the treatment of cuts, sores, swellings and bruises[257]. The root has been applied to teeth to relieve the pain of toothache[257]. A hot decoction of the root has been used to kill head lice[257].

propta Seed - we have no information on this species but suggest sowing the seed in a cold frame as soon as it is ripe if this is possible, otherwise sow it in early spring. When they

are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts.

nwatta Succeeds in any deep moisture-retentive soil in sun or dappled shade[200]. Plants are hardy to about -20°C[200]. Well suited to naturalistic plantings in a woodland or wild garden[200]. A sweetly aromatic plant[200].

## 6.2.185 Chaenomeles japonica

Dwarf Quince, Maule's quince, Japanese Flowering Quince  
5 tin 8 cyuc 3 kcaak 3 tcan 0 dwat 1 m hkuc  
pcimhmhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Chaenomeles japonica is a deciduous Shrub growing to 1 m (3ft 3in) by 2 m (6ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in April, and the seeds ripen from November to January. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[2, 3, 4, 11, 177, 183]. Very harsh and acid raw but fragrant when cooked, imparting a strong pleasant flavour to jams and jellies[1, 200], it is especially good cooked with apples in apple pies[K]. The fruit is apple-shaped and about 4cm in diameter[200]. The rich aromatic juice, as tart as a lemon, is squeezed and used for culinary purposes[183].

tcanta Plants sucker freely and can be used as a ground cover. The form *C. japonica alpina* grows to about half the size of the species, it is especially suitable and can be planted about 1 metre apart each way[208].

dwatta None known

propta Seed - best sown as soon as it is ripe in a sheltered position outdoors or in a cold frame[200]. Sow stored seed in February in a greenhouse[78]. Germination usually takes place within 6 weeks[78]. Prick out the seedlings into individual pots as soon as they are large enough to handle. If well grown, these seedling can be large enough to plant out in the summer, but give them some protection in their first winter. Otherwise plant them out in late spring of the following year[K]. Cuttings of half-ripe wood, July/August in a frame[11]. Easy[113]. Cuttings of mature wood of the current year's growth, November in a cold frame. Layering in late spring or in autumn. This is a sure and easy method, though it takes 12 months[78, 200]. Division of suckers in late winter[113]. They can be planted out straight into their permanent positions.

nwatta Landscape Uses:Border, Hedge, Massing, Woodland garden. Easily cultivated in any reasonably good soil[11]. Prefers a deep moist well-drained loam[4, 11]. Grows well in heavy clay soils. Tolerates full shade but requires a sunny position for best fruit production[3, 11, 200]. Becomes chlorotic in very alkaline soils[200]. Tolerates atmospheric pollution[200]. A very ornamental plant[1], it is hardy to about -25°C[200] and fruits freely in Britain[11]. Plants are occasionally cultivated for their edible fruit[183]. This species is closely allied to *C. speciosa*[11]. A good bee plant, flowering early in the year and providing pollen and nectar[108]. Plants in this genus are notably resistant to honey fungus[200]. Special Features:Not North American native, Attractive flowers or blooms. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

## 6.2.186 Mentha x smithiana

Red Raripila Mint

5 tin 9 cyuc 3 kcaak 0 tcan 2 dwat 1 m hkuc

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[2, 105, 177]. The relatively large berries are freely borne and are more palatable than most barberries[1, 3, 11]. The fruit is about 12mm in diameter[200].

tcanta DyeA yellow dye is obtained from the root.

dwatta Antibacterial Cancer DysenteryBerberine, universally present in rhizomes of Berberis species, has marked antibacterial effects. Since it is not appreciably absorbed by the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not be used with Glycyrrhiza species (Licquorice) because this nullifies the effects of the berberine[218]. Berberine has also shown antitumour activity[218].

propta Seed - best sown as soon as it is ripe in a cold frame, when it should germinate in late winter or early spring[78]. Seed from over-ripe fruit will take longer to germinate[78], whilst stored seed may require cold stratification and should be sown in a cold frame as early in the year as possible[80]. The seedlings are subject to damping off, so should be kept well ventilated[113]. When the seedlings are large enough to handle, prick them out into individual pots and grow them on in a cold frame. If growth is sufficient, it can be possible to plant them out into their permanent positions in the autumn, but generally it is best to leave them in the cold frame for the winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, July/August in a frame. Cuttings of mature wood of the current season's growth, preferably with a heel, October/November in a frame[78]. Layering.

nwatta Prefers a warm moist loamy soil but it is by no means fastidious, succeeding in thin, dry and shallow soils[11, 200]. Grows well in heavy clay soils. Succeeds in full sun or light shade[200]. Plants can be pruned back quite severely and will respond well from the base[200]. Hybridizes freely with other members of this genus[1]. This species is closely related to B. ludlowii, B. cappilaris and B. parispala[200].

### 6.2.181 Rumex patientia

Herb Patience

5 tlin 10 cyuc 3 kcaak 0 tcan 1 dwat 1.5 m hkuc hmimhnt cyutli tcup hwicli hrasjutnykifrip hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Rumex patientia is a PERENNIAL growing to 1.5 m (5ft) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from June to July, and the seeds ripen in August. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked[1, 2, 5, 37, 177]. Eaten like spinach or made into a delicious puree, they are often mixed with a quarter part of sorrel in order to add flavour to them[183]. A fairly mild flavour[183], they make an excellent vegetable[K]. The leaves are produced very early in the year[27]. Carbon Farming - The hybrid Rumex patientia x tianschanicus is a good staple crop: balanced carb.

tcanta Although no specific mention has been made for this species, dark green to brown and dark grey dyes can be obtained from the roots of many species in this genus. They do not need a mordant[168].

dwatta The juice, and an infusion of the root, has been used as a poultice and salve in the treatment of various skin problems[257]. An infusion of the root has been used in the treatment of constipation[257]. The leaves have been rubbed in the mouth to treat sore throats[257].

propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring.

nwatta Experimental Crop Industrial Crop: Biomass Management: Coppice Management: Standard Staple Crop: Balanced carbA very easily grown plant, it succeeds in most soils, preferring a moist moderately fertile well-drained soil in a sunny position[200]. Formerly cultivated for its edible leaves[1, 2, 37, 50], these can be

available in early February if the winter is mild[K]. An important food plant for the caterpillars of many species of butterfly[30].The hybrid Rumex patientia x tianschanicus (Hybrid sorrel) is a good Carbon Farming plant. Rumex patientia x tianschanicus cultivation: new crop. Management: standard, coppice. Staple Crop: balanced carb. Industrial Crop: biomass.

### 6.2.182 Vaccinium vacillans

Dryland Blueberry

5 tlin 9 cyuc 3 kcaak 0 tcan 0 dwat 1.2 m hkuc hmimhnt cyutli kyuctcup hwicli hrasjut hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta Vaccinium vacillans is a deciduous Shrub growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Fruit - raw or cooked. Very sweet, it is considered to be one of the best tasting blueberries[183]. The fruit is about 5mm in diameter[200].

tcanta None known

dwatta None known

propta Seed - sow late winter in a greenhouse in a lime-free potting mix and only just cover the seed[78]. Stored seed might require a period of up to 3 months cold stratification[113]. Another report says that it is best to sow the seed in a greenhouse as soon as it is ripe[200]. Once they are about 5cm tall, prick the seedlings out into individual pots and grow them on in a lightly shaded position in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 8cm with a heel, August in a frame[78]. Slow and difficult. Layering in late summer or early autumn[78]. Another report says that spring is the best time to layer[200]. Takes 18 months[78]. Division of suckers in spring or early autumn[113].

nwatta Requires a moist, but freely-draining lime free soil, preferring one that is rich in peat or a light loamy soil with added leaf-mould[11, 200]. Prefers a very acid soil with a pH in the range of 4.5 to 6, plants soon become chlorotic when lime is present. Succeeds in full sun or light shade though it fruits better in a sunny position[200]. Requires shelter from strong winds[200]. Plants often form extensive colonies in the wild[200]. Dislikes root disturbance, plants are best grown in pots until being planted out in their permanent positions[200]. Plants in this genus are notably resistant to honey fungus[200].

### 6.2.183 Berberis rubrostilla

5 tlin 9 cyuc 3 kcaak 1 tcan 2 dwat 1.5 m hkuc hmimhnt cyutli kyuctcup hwicli hyishrasjlutnykifrip hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Berberis rubrostilla is a deciduous Shrub growing to 1.5 m (5ft) by 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. Fairly large for a barberry, it is pear shaped with an acid flavour[K]. It can be eaten raw in small quantities, though most people would probably prefer to cook it in pies, preserves etc[K]. The fruits are about 15mm long[200].

tcanta DyeA yellow dye is obtained from the root.

dwatta Antibacterial Cancer DysenteryBerberine, universally present in rhizomes of Berberis species, has marked antibacterial effects. Since it is not appreciably absorbed by the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not

An ooze from the bark has been used to treat children's sores, whilst an infusion has been used to treat hives[257].

propta Seed - best sown in a cold frame as soon as it is ripe. If the seed is harvested 'green' (as soon as it has fully developed but before it has dried on the plant) and sown immediately it can germinate in 3 weeks[113]. Dried seed germinates in 1 - 6 months at 15°c[138]. Stored seed requires between 3 weeks and 3 months cold stratification before sowing in the spring. When large enough to handle, prick out the seedlings into individual pots and grow them on in the greenhouse for their first winter. Plant out in late spring or early summer of the following year. Cuttings of half-ripe wood, July/August in a frame. They can be difficult[113]. Layering in spring. Sever the new plants in a wet spell of weather about 15 months later and then lift them in the autumn[78]. High percentage[78]. Division of suckers in early spring[11]. Very easy, they can be planted straight out into their permanent positions if required.

nwatta Landscape Uses:Border, Pest tolerant, Screen, Specimen. Prefers a light loamy soil that is deep and moist but succeeds in most fertile soils[11, 182]. Requires a well-drained soil[188]. Prefers a sunny position but it tolerates shade when grown in warm temperate zones[11, 200]. Requires a sheltered position, protected from cold winds[245]. Although the dormant plant is hardy to at least -20°c, the tender young growth in the spring can be damaged by late frosts[K]. All parts of the plant are richly fragrant[182]. The flowers have a refreshing scent of ripe apples[245]. The wood, leaves and roots smell strongly of camphor, whilst the bark smells like cinnamon[245]. This species is closely related to C. mohrii[182]. A very ornamental plant, there is at least one named variety developed for its ornamental value. 'Mrs Henry Type' is a large-flowered form[182]. Plants in this genus are notably resistant to honey fungus[200]. Special Features: North American native, Fragrant foliage, All or parts of this plant are poisonous, Wetlands plant, Fragrant flowers, Attractive flowers or blooms. The plant is heat tolerant in zones 9 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. A clumping plant, forming a colony from shoots away from the crown but with a limited spread [1-2]. The root pattern is flat with shallow roots forming a plate near the soil surface [1-2]. The root pattern is suckering with new plants from underground runners away from the plant [1-2].

### 6.2.161 Rheum palmatum tanguticum

Da Huang

5 tlin 9 cyuc 3 kcaak 0 tcan 5 dwat 2 m hkuc hmimhnt cyutli tcup hwicli jlutnykifrip hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Rheum palmatum tanguticum is a PERENNIAL growing to 2 m (6ft) by 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Leaf stem - raw or cooked[2, 7, 105, 183]. The stem is superior in flavour to the common rhubarb and quite tender[2]. An acid flavour, it is sometimes used as a cooked fruit substitute[K].

tcanta None known

dwatta Anticholesterolemic Antiseptic Antispasmodic Antitumor Astringent Cholagogue Diuretic Haemostatic PurgativeRhubarb has a long and proven history of herbal usage, its main effect being a positive and balancing effect upon the whole digestive system. It is one of the most widely

used herbs in Chinese medicine[238]. The root is anticholesterolemic, antiseptic, antispasmodic, antitumor, aperient, astringent, cholagogue, demulcent, diuretic, laxative, purgative, stomachic and tonic[4, 7, 9, 21, 91, 171, 176, 238]. The roots contain anthraquinones, which have a purgative effect, and also tannins and bitters, which have an opposite astringent effect[244]. When taken in small doses, it acts as an astringent tonic to the digestive system, whilst larger doses act as a mild laxative[232, 244]. The root is taken internally in the treatment of chronic constipation, diarrhoea, liver and gall bladder complaints, haemorrhoids, menstrual problems and skin eruptions due to an accumulation of toxins[238]. This remedy is not prescribed for pregnant or lactating women, nor for patients with intestinal obstruction[238]. Externally, the root is used in the treatment of burns[238]. The roots are harvested in October from plants that are at least six years old, they are then dried for later use[4]. A homeopathic remedy is prepared from the dried root[232]. This is used especially in the treatment of diarrhoea in teething children[232].

propta Seed - best sown in autumn in a shaded cold frame[200]. The seed can also be sown in spring in a cold frame. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse or cold frame for their first winter, planting them out in the spring. Division in early spring or autumn[1, 111]. Divide up the rootstock with a sharp spade or knife, making sure that there is at least one growth bud on each division. Larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Prefers a deep, fertile, moderately heavy, humus rich, moisture retentive, well-drained soil in sun or semi-shade[200]. Grows well in heavy clay soils. Plants can be grown in quite coarse grass, which can be cut annually in the autumn[233]. This is a more robust form of the species[200], it is hardy to at least -15°c[238]. This sub-species is favoured for its medicinal properties over the species[244] and is cultivated as a medicinal plant in China[187]. Plants in this genus seem to be immune to the predations of rabbits[233]. Hybridizes freely with other members of this genus[200].

### 6.2.162 Arctostaphylos patula

Greenleaf Manzanita

5 tlin 9 cyuc 3 kcaak 1 tcan 1 dwat 2 m hkuc hmimhnt cyutli tcup hwicli hrasjut hpa7tli frusflat hpa7tmwatli fyifxre7t hjonli

drutta Arctostaphylos patula is an evergreen Shrub growing to 2 m (6ft) by 2 m (6ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from March to May, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Fruit SeedEdible Uses: Fruit - raw or cooked[3, 94, 105, 161]. The fully ripe fruit is pleasantly acid with a flavour resembling green apples[183]. It can be dried, ground into a powder then used in making cakes etc[257]. The fruit can also be used for making jelly and cider[183]. The fruit is about 8 - 10mm in diameter[200]. Seed - ground into a powder and added to soups etc[92]. The seed is very small and would be difficult to separate from the fruit. It would be easier to dry the whole fruit, grind this into a powder and use it in soups etc[K].

tcanta DyeA yellowish-brown dye is obtained from the leaves, it does not require a mordant[168].

dwatta Astringent Poultice VDThe leaves are astringent[94]. They have been used in the treatment of VD[257]. They are also used as a poultice on burns, cuts etc[257].

propta Seed - best sown in a greenhouse as soon as it is ripe. Pre-soak dried seed in boiling water for 10 - 20 seconds or burn some straw on top of them and then stratify at 2 - 5°c for 2 months[11, 200]. The seed usually germinates in 2 - 3 months at 15°c[134]. When large enough to handle, prick the seedlings out into individual pots and grow them on

in a cold frame or greenhouse for at least their first winter. Plant out in late spring or early summer. Cuttings of side shoots of the current season's growth, 5 - 8cm with a heel, August to December in a frame. The cuttings are very slow and can take a year to root[1, 78]. This species is very difficult from cuttings[166]. Division in early spring. Take care because the plant resents root disturbance. Pot the divisions up and keep them in a lightly shaded position in a cold frame or greenhouse until they are growing away actively. Layering in spring[200].

nwatta Requires a deep moist well-drained light or medium lime-free loam in sun or semi-shade[3, 11, 166, 200] but plants produce less fruit when they are grown in the shade[200]. Prefers a soil that is dry in the summer[184]. Plants are not very wind-firm[11]. Plants are hardy to about -10°C[184]. This species was growing well at Chelsea Physic garden after the harsh winter of 1985/86, showing no signs of damage[11]. Highly fire resistant[155], it can regenerate after a forest fire from a mallee-like base[166, 184]. Plants self-layer in nature[155]. A very ornamental plant[1], it grows well in Britain[3]. Plants resent root disturbance and should be placed in their final positions as soon as possible[11, 134].

## 6.2.163 Mahonia japonica

5 tlin 9 cyuc 3 kcaok 0 tcan 2 dwat 2 m hkuc pcmhmimhtut cyutli tcup hwicli hysihras|lutnykfrip hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Mahonia japonica is an evergreen Shrub growing to 2 m (6ft) by 3 m (9ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from February to April, and the seeds ripen from April to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. An acid flavour, but it is rather nice raw especially when added to muesli or porridge[K]. Unfortunately, there is relatively little flesh and a lot of seeds[K]. The ovoid fruit is about 9mm long[200], it ripens in spring and crops can be quite good if the plant is in a sheltered position[K]. The fruit is produced in large clusters and so is easy to harvest[K].

tcanta None known  
dwatta Antibacterial Antirheumatic Antitumor Antitusive Cancer Depurative Dysentery Expectorant Febrifuge TonicThe leaf is febrifuge and is used as a tonic in cases of cancer[218]. The seed is febrifuge and tonic[218]. The roots and stems are antirheumatic, antitussive, depurative, expectorant and febrifuge[147, 218]. A decoction is used in the treatment of bone-breaking fevers, dizziness and tinnitus, backache, weak knees, dysentery and enteritis[147]. The root and root bark are best harvested in the autumn[213]. Berberine, universally present in rhizomes of Mahonia species, has marked antibacterial effects[218] and is used as a bitter tonic[213]. Since it is not appreciably absorbed by the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not be used with Glycyrrhiza species (Licorice) because this nullifies the effects of the berberine[218]. Berberine has also shown antitumour activity[218].

propta Seed - best sown as soon as it is ripe in a cold frame[78]. It usually germinates in the spring[K]. 'Green' seed (harvested when the embryo has fully developed but before the seed case has dried) should be sown as soon as it is harvested and germinates within 6 weeks[K]. Stored seed should be sown as soon as possible in late winter or spring. 3 weeks cold stratification will improve its germination, which should take place in 3 - 6 months at 10°C. Prick out the seedlings when they are large enough to handle and grow them on in a cold frame for at least their first winter. Plant them out in late spring or early summer. Division of suckers in spring[78]. Whilst they can be placed direct into their permanent positions, better results are achieved if they are potted up and placed in a frame until established[11]. Leaf cuttings in the autumn.

nwatta An easily grown shrub, it thrives in any good garden soil[11] including heavy clays. Prefers a semi-shaded

woodland position in a damp, slightly acid to neutral humus-rich soil[200]. Survives under very heavy tree shade[184]. Succeeds in poor soils when the leaves will often become bright red, especially if the plant is in full sun. The fully dormant plant is hardy to about -20°C[184], though the young growth in spring can be damaged by late frosts. Plants are very tolerant of pruning and can be cut right back into old wood if they have outgrown their welcome[182]. This species is closely related to *M. bealei*[11, 200]. It hybridizes freely with other members of the genus. The flowers have a delicious perfume[245]. The form 'Hiemalis' bears larger flower spikes which are almost as strongly scented as Lily of the Valley (*Convallaria majalis*) [245].

## 6.2.164 Arctostaphylos stanfordiana

Stanford's manzanita, Rincon manzanita  
5 tlin 9 cyuc 3 kcaok 1 tcan 0 dwat 1.5 m hkuc hmimhtut cyutli kyuctcup hwicli hras|lutnykfrip hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta Arctostaphylos stanfordiana is an evergreen Shrub growing to 1.5 m (5ft) by 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from March to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. The dried fruit is said to have a better flavour than most members of this genus[183]. The fruit is about 5 - 7mm in diameter[200].

tcanta DyeA yellowish-brown dye is obtained from the leaves, it does not require a mordant[168].

dwatta None known  
propta Seed - best sown in a greenhouse as soon as it is ripe. Pre-soak dried seed in boiling water for 10 - 20 seconds or burn some straw on top of them and then stratify at 2 - 5°C for 2 months[11, 200]. The seed usually germinates in 2 - 3 months at 15°C[134]. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame or greenhouse for at least their first winter. Plant out in late spring or early summer. Cuttings of side shoots of the current season's growth, 5 - 8cm with a heel, August to December in a frame. The cuttings are very slow and can take a year to root[1, 78]. The cuttings of this species usually strike readily[11]. Division in early spring. Take care because the plant resents root disturbance. Pot the divisions up and keep them in a lightly shaded position in a cold frame or greenhouse until they are growing away actively. Layering in spring[200].

nwatta Requires a deep moist well-drained light or medium lime-free loam in sun or semi-shade[3, 11, 166, 200], but plants produce less fruit when they are grown in the shade[200]. Best given a neutral or slightly acid soil[11]. A difficult plant to cultivate, even in its native California[11]. It is best given a sunny position against a wall[11]. Plants resent root disturbance and should be placed in their final positions as soon as possible[11, 134]. There are some named varieties selected for their ornamental value[200].

## 6.2.165 Mentha aquatica

Water Mint  
5 tlin 9 cyuc 3 kcaok 3 tcan 3 dwat 1 m hkuc hmimhtut cyutli tucphja7nhs6s hwicli hras|lutnykfrip hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Mentha aquatica is a PERENNIAL growing to 1 m (3ft 3in) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from July to October, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can grow in water.

neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: LeavesEdible Uses: SweetenerThe young leaves, after fermentation[174], become very sweet and are used to make a sweet tea called 'tea of heaven', it is used in Buddhist ceremonies[11, 46, 61]. The leaves contain phellodulcin (its chemical formula is C16H14O), a very sweet substance that can be used as a sugar substitute[116, 183]. The older leaves can be dried, powdered and used as a flavouring on foods[105, 177]. The young leaves and shoots are also eaten cooked[105, 177].

tcanta Hedge HedgeCan be grown as a low hedge[29], it is quite wind tolerant.

dwatta None known  
propta Seed - surface sow in a greenhouse in spring[113]. Cover the pot with paper until the seed germinates[78]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 8cm long, July/August in a frame. Overwinter in a greenhouse and plant out in late spring[78]. Cuttings of mature wood in late autumn in a frame[200]. Mound layering in spring. Takes 12 months[78]. Leaf-bud cuttings of the current seasons growth in a frame[200].

nwatta Tolerates most soil[200], thriving in a well-drained loamy soil[1], but resenting dryness at the roots[11, 200]. Succeeds in full sun or semi-shade[200], but if it is grown in a low rainfall area then it requires shade at the hottest part of the day[11]. Does well on very acid soils with a pH around 4.5[200]. The colour of the flowers reflects the pH of the soil the plant is growing in, the flowers are pink in a neutral to alkaline soil and blue in an acid soil. Plants are hardy to about -25°C when dormant but the young growth in spring can be killed by late frosts. This species is notably susceptible to honey fungus[200].

## 6.2.178 Chaenomeles x superba

Dwarf Quince, Flowering Quince  
5 tlin 8 cyuc 3 kcaok 3 tcan 0 dwat 1 m hkuc pcmhmimhtut cyutli tcup hwicli hras|lutnykfrip hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Chaenomeles x superba is a deciduous Shrub growing to 1 m (3ft 3in) by 2 m (6ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from February to June, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - very harsh and acid raw but fragrant when cooked. Used for jams, jellies etc and as a flavouring with cooked apples[K]. The fruit can be apple or pear-shaped and up to 6cm long x 6cm wide[200].

tcanta Hedge HedgePlants can be grown to make a medium sized hedge[200]. Some cultivars, such as 'Crimson and Gold' produce suckers prolifically and are suitable for ground cover[182].

dwatta None known  
propta Seed - best sown as soon as it is ripe in a sheltered position outdoors or in a cold frame[200]. Sow stored seed in February in a greenhouse[78]. Germination usually takes place within 6 weeks[78]. Prick out the seedlings into individual pots as soon as they are large enough to handle. If well grown, these seedling can be large enough to plant out in the summer, but give them some protection in their first winter. Otherwise plant them out in late spring of the following year[K]. This species is a hybrid and so will not breed true from seed. Cuttings of half-ripe wood, July/August in a frame[11]. Easy[113]. Cuttings of mature wood of the current year's growth, November in a cold frame. Layering in late spring or in autumn. This is a sure and easy method, though it takes 12 months[78, 200].

nwatta Landscape Uses:Border, Erosion control, Ground cover, Massing, Woodland garden. Easily cultivated in any reasonably good soil[1, 11]. Prefers a deep moist well-drained loam[11]. Grows well in heavy clay soils. Tolerates full shade but requires a sunny position for best fruit production[3, 11, 200]. Becomes chlorotic on very alkaline soils[200]. Tolerates atmospheric pollution[200]. Plants are hardy to about -25°C[200]. A very ornamental plant, there are many named varieties[200, 202]. A good bee plant, flowering early in the year and providing pollen and nectar[108]. Plants in this genus are notably resistant to honey fungus[200]. Special Features:Not North American native, Attractive flowers or blooms. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

## 6.2.179 Impatiens glandulifera

Jewelweed, Ornamental jewelweed  
5 tlin 9 cyuc 3 kcaok 0 tcan 1 dwat 1.5 m hkuc hmimhtut cyutli kyuctcup hwicli hras|lutnykfrip hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Impatiens glandulifera is a ANNUAL growing to 1.5 m (5ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from August to October, and the seeds ripen from September to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves Oil Oil SeedEdible Uses: Oil OilYoung leaves and shoots - cooked[172, 183]. They should not be used on a regular basis, see warning at top of record[172]. Seed - raw[105, 177]. A delicious nutty flavour[183], but difficult to harvest in quantity mainly because of their exploding seed capsules which scatter the ripe seed at the slightest touch[K] An edible oil is obtained from the seed[17, 177, 183].

tcanta Oil OilAn oil from the seed is used for lighting[17, 177].

dwatta BachThe plant is used in Bach flower remedies - the keywords for prescribing it are 'Impatience', 'Irritability' and 'Extreme mental tension'[209]. It is also one of the five ingredients in the 'Rescue remedy'[209].

propta Seed - sow spring in a greenhouse. A period of cold stratification may help to improve germination rates. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. If you have sufficient seed, it is worthwhile trying an outdoor sowing in situ in the spring.

nwatta Succeeds in any reasonably good soil[1]. Grows well in heavy clay soils. Prefers a moist well-drained humus rich soil in a cool site[200]. Self sows in areas where the minimum temperature is no lower than -15°C[200]. This plant has seed capsules that spring open forcibly as the seed ripens to eject the seed a considerable distance. The capsules are sensitive to touch even before the seed is ripe, making seed collection difficult but fun[K].

## 6.2.180 Berberis angulosa

5 tlin 9 cyuc 3 kcaok 1 tcan 2 dwat 1 m hkuc hmimhtut cyutli kyuctcup hwicli hysihras|lutnykfrip hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Berberis angulosa is a deciduous Shrub growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

this is possible, otherwise sow it in early spring. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts.

nwatta Succeeds in any deep moisture-retentive soil in sun or dappled shade[200]. Plants are hardy to about -20°C[200]. Well suited to naturalistic plantings in a woodland or wild garden[200]. A sweetly aromatic plant[200]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is fibrous dividing into a large number of fine roots [1-2]. The root pattern is fleshy. Thick or swollen - fibrous or tap root [1-2].

### 6.2.174 Vaccinium erythrocarpum

Southern Mountain Cranberry
5 tlin 9 cyuc 3 kcaak 0 tcan 0 dwat 1.5 m hkuc
hmmihmtt cyutli tcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta Vaccinium erythrocarpum is a deciduous Shrub growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked and used in jellies etc[183]. The transparent scarlet berries have an excellent flavour[183]. Somewhat sour according to one report[200] whilst another says that they can be inspid or sweetish[161].

tcanta None known
dwatta None known

propta Seed - sow late winter in a greenhouse in a lime-free potting mix and only just cover the seed[78]. Stored seed might require a period of up to 3 months cold stratification[113]. Another report says that it is best to sow the seed in a greenhouse as soon as it is ripe[200]. Once they are about 5cm tall, prick the seedlings out into individual pots and grow them on in a lightly shaded position in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 8cm with a heel, August in a frame[78]. Slow and difficult. Layering in late summer or early autumn[78]. Another report says that spring is the best time to layer[200]. Takes 18 months[78]. Division of suckers in spring or early autumn[113].

nwatta Requires a moist but freely-draining lime free soil, preferring one that is rich in peat or a light loamy soil with added leaf-mould[11, 200]. Prefers a very acid soil with a pH in the range of 4.5 to 6, plants soon become chlorotic when lime is present. Succeeds in full sun or light shade though it fruits better in a sunny position[200]. Requires shelter from strong winds[200]. Dislikes root disturbance, plants are best grown in pots until being planted out in their permanent positions[200]. This plant has been recommended for improvement by cultivation for its edible fruit[183]. Plants in this genus are notably resistant to honey fungus[200].

### 6.2.175 Impatiens noli

Touch-Me-Not

5 tlin 9 cyuc 3 kcaak 0 tcan 2 dwat 1 m hkuc
hmmihmtt cyutli tcup hwicli hrasjlutnyikfrp hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Impatiens noli-tangere is a ANNUAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can

grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Leaves SeedEdible Uses: Young shoots - cooked[105, 172]. See the notes above on toxicity. Seed - raw. A delicious nutty flavour but rather difficult to harvest[172], mainly because of their exploding seed capsules which scatter the ripe seed at the slightest touch[K].

tcanta None known
dwatta Antiseptic Diuretic Emetic LaxativeThe plant is antiseptic, diuretic, strongly emetic, laxative and vulnerary[4, 9, 61]. It has been used in the treatment of stranguary and haemorrhoids[4]. The plant is occasionally used internally in the treatment of haemorrhoids and as a laxative and diuretic, but the dose must be carefully adhered to since large quantities are strongly emetic[9]. The plant is harvested at any time in the summer[9].

propta Seed - sow spring in a greenhouse. A period of cold stratification may help to improve germination rates. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. If you have sufficient seed, it is worthwhile trying an outdoor sowing in situ in the spring or the autumn[4].

nwatta Succeeds in any reasonably good soil[1]. Grows well in heavy clay soils. Prefers a moist well-drained humus rich soil in a cool site[200]. Self sows in areas where the minimum temperature is no lower than -15°C[200]. This plant has seed capsules that spring open forcibly as the seed ripens to eject the seed a considerable distance. The capsules are sensitive to touch even before the seed is ripe, making seed collection difficult but fun[K].

### 6.2.176 Gaylussacia frondosa

Dangleberry, Blue huckleberry
5 tlin 9 cyuc 3 kcaak 0 tcan 0 dwat 1.8 m hkuc
hmmihmtt cyutli kyuctcup hwicli hrasjlutnyik hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta Gaylussacia frondosa is a deciduous Shrub growing to 1.8 m (6ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to July. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcaakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[2, 3, 62]. Sweet and juicy[11, 43, 235], they are good to eat[183]. The fruit is about 8mm in diameter[235].

tcanta None known
dwatta None known

propta Seed - best sown in the autumn in a cold frame[200]. Stored seed requires 1 month warm stratification followed by 2 months cold[113]. When large enough to handle, prick the seedlings out into individual pots of lime-free compost and grow them on in light shade in a greenhouse or cold frame for at least their first winter. Plant out into their permanent positions in late spring or early summer when they are at least 15cm tall. Cuttings of half-ripe wood, July/August in a frame[200]. Layering. Division in spring.

nwatta Requires a lime-free moist peaty soil, thriving in sun or part shade[11, 182]. Prefers partial shade[3]. The fruit is not often produced on plants growing in Britain[11, 182].

### 6.2.177 Hydrangea serrata thunbergii

Tea of heaven, Ama-tsja,
5 tlin 9 cyuc 3 kcaak 2 tcan 0 dwat 1.5 m hkuc
hmmihmtt cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Hydrangea serrata thunbergii is a deciduous Shrub growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid,

kcaakta Edible Parts: LeavesEdible Uses: Condi-ment TeaLeaves - raw or cooked. A strong distinctive peppermint-like fragrance[183]. Used as a flavouring in salads or cooked foods[5]. The leaves are too pungent for most people to use as a flavouring[244]. A herb tea is made from the leaves[21, 183].

tcanta Repellent StrewingThe plant repels flies, mice and rats[14, 20, 244]. It has a pleasant, fresh scent and was formerly used as a strewing herb and has been strewn in granaries to keep mice and rats off the grain[14, 244]. The plant, harvested before flowering, yields about 0.8% essential oil[240]. The fresh or dried plant is very good when used in herbal baths and can also be used in herb pillows[244]. Water garden.

dwatta Anodyne Antidiarrhoeal Antiseptic Antispasmodic Astringent Carminative Cholagogue Diaphoretic Emetic Refrigerant Stimulant Stomachic Tonic VasodilatorThe leaves are anodyne, antiseptic, antispasmodic, astringent, carminative, cholagogue, diaphoretic, emetic, refrigerant, stimulant, stomachic, tonic and vasodilator[4, 9, 21]. A tea made from the leaves has traditionally been used in the treatment of fevers, headaches, digestive disorders and various minor ailments[222]. It is also used as a mouth-wash and a gargle for treating sore throats, ulcers, bad breath etc[9]. The leaves are harvested as the plant comes into flower and can be dried for later use[238]. The essential oil in the leaves is antiseptic, though it is toxic in large doses[222].

propta Seed - sow spring in a cold frame. Germination is usually fairly quick. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in the summer. Mentha species are very prone to hybridisation and so the seed cannot be relied on to breed true. Even without hybridisation, seedlings will not be uniform and so the content of medicinal oils etc will vary. When growing plants with a particular aroma it is best to propagate them by division[K]. Division can be easily carried out at almost any time of the year, though it is probably best done in the spring or autumn to allow the plant to establish more quickly. Virtually any part of the root is capable of growing into a new plant. Larger divisions can be planted out direct into their permanent positions. However, for maximum increase it is possible to divide the roots up into sections no more than 3cm long and pot these up in light shade in a cold frame. They will quickly become established and can be planted out in the summer.

nwatta Succeeds in most soils and situations so long as the soil is not too dry[1, 16, 200]. Grows well in heavy clay soils. A sunny position is best for production of essential oils, but it also succeeds in partial shade. Plants can grow in water up to 15cm deep[24]. Most mints have fairly aggressive spreading roots and, unless you have the space to let them roam, they need to be restrained by some means such as planting them in containers that are buried in the soil[K]. Hybridizes freely with other members of this genus. The whole plant, especially when bruised, has a pungent aroma of bergamot[245]. The flowers are especially attractive to bees and butterflies[24]. A good companion for brassicas[14]. Members of this genus are rarely if ever troubled by browsing deer[233].

### 6.2.166 Amelanchier obovalis

Southern Juneberry, Coastal serviceberry
5 tlin 9 cyuc 3 kcaak 1 tcan 0 dwat 1.5 m hkuc
hmmihmtt cyutli hgattcup hwicli hrasjlutnyikfrp hpa7tli flatpriklwis hpa7tmwatli fyfxre7t hjonli

drutta Amelanchier obovalis is a deciduous Tree growing to 1.5 m (5ft) by 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil and can tolerate drought.

kcaakta Edible Parts: FruitEdible Uses: Fruit, raw or cooked[177]. Sweet and of very good quality, the fruit is eaten out of hand or used in pies, preserves, drinks etc[183]. The fruit is rich in iron and copper[226].

tcanta None known

dwatta None known
propta Seed - it is best harvested 'green', when the seed is fully formed but before the seed coat has hardened, and then sown immediately in pots outdoors or in a cold frame. If stored seed is obtained early enough in the autumn, it can be given 4 weeks warm stratification before being left out in the winter and it should then germinate in the spring. Otherwise seed can be very slow to germinate, perhaps taking 18 months or more. When large enough to handle, prick the seedlings out into individual pots and grow them on in a sheltered outdoor position, planting them out once they are 20cm or more tall. If there is sufficient seed it is best to sow it thinly in an outdoor seedbed[78, 80]. Grow the seedlings on for two years in the seedbed before planting them out into their permanent positions during the winter. Layering in spring - takes 18 months[78]. Division of suckers in late winter. The suckers need to have been growing for 2 years before you dig them up, otherwise they will not have formed roots. They can be planted out straight into their permanent positions if required.

nwatta Prefers a rich loamy soil in a sunny position or semi-shade[1, 200] but thrives in any soil that is not too dry or water-logged[11]. Grows well in heavy clay soils. Plants are stoloniferous[43]. All members of this genus have edible fruits and, whilst this is dry and uninteresting in some species, in many others it is sweet and juicy. Many of the species have potential for use in the garden as edible ornamentals. The main draw-back to this genus is that birds adore the fruit and will often completely strip a tree before it is fully ripe[K]. There is at least one named variety with improved fruits. 'Jennybelle' is a small bush, to 3.5 metres and produces few suckers so is easier to manage[183]. The fruit is up to 12mm in diameter and is sweet even before it is fully ripe. Plants fruit heavily and start to yield when young. They are resistant to drought, frost and high temperatures[183]. Hybridizes freely with other members of this genus[200]. Grafting onto seedlings of A. lamarckii or Sorbus aucuparia is sometimes practised in order to avoid the potential problem of hybridizing[1]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is multistemmed with multiple stems from the crown [1-2].

### 6.2.167 Vaccinium parvifolium

Red Bilberry, Red huckleberry
5 tlin 9 cyuc 3 kcaak 1 tcan 1 dwat 1.8 m hkuc
hmmihmtt cyutli tcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta Vaccinium parvifolium is a deciduous Shrub growing to 1.8 m (6ft) by 1.8 m (6ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: FruitEdible Uses: TeaFruit - raw or cooked and used in making jams, pies, jellies etc[1, 2, 101, 118, 183, 257]. The fruit can also be dried for later use[183]. An acid flavour, but it is very palatable[11]. The fruit makes a very superior jelly[257]. The fruit is about 12mm in diameter[200]. A tea is made from the dried fruit and leaves[118].

tcanta BroomThe long straight green stems and twigs have been used to make brooms[257].

dwatta Antiseptic Astringent Carminative HypoglycaemicAntiseptic, astringent, carminative, hypoglycaemic[172]. A decoction of the bark has been used in the treatment of colds[257].

propta Seed - sow late winter in a greenhouse in a lime-free potting mix and only just cover the seed[78]. Stored seed might require a period of up to 3 months cold stratification[113]. Another report says that it is best to sow the seed in a greenhouse as soon as it is ripe[200]. Once they are about 5cm tall, prick the seedlings out into individual pots and grow them on in a lightly shaded position in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the

last expected frosts. Cuttings of half-ripe wood, 5 - 8cm with a heel, August in a frame[78]. Slow and difficult. Layering in late summer or early autumn[78]. Another report says that spring is the best time to layer[200]. Takes 18 months[78]. Division of suckers in spring or early autumn[113].

nwatta Requires a moist but freely-draining lime free soil, preferring one that is rich in peat or a light loamy soil with added leaf-mould[11, 200]. Prefers a very acid soil with a pH in the range of 4.5 to 6, plants soon become chlorotic when lime is present. Succeeds in full sun or light shade though it fruits better in a sunny position[200]. Requires shelter from strong winds[200]. Dislikes root disturbance, plants are best grown in pots until being planted out in their permanent positions[200]. A very ornamental plant[60]t. This species is closely related to *V. ovalifolium*[182]. Plants in this genus are notably resistant to honey fungus[200].

## 6.2.168 Echinochloa crus

Barnyard Millet, Barnyardgrass,

5 tlin 9 cyuc 3 kcaak 0 tcan 2 dwat 1.2 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwssllp hpa7tmwatli xre7t hjonli

drutta Echinochloa crus-galli is a ANNUAL growing to 1.2 m (4ft) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: Leaves SeedEdible Uses: CoffeeSeed - cooked[35, 55, 105, 171]. Used as a millet, it can be cooked whole or be ground into a flour before use[183, 257]. It has a good flavour[85] and can be used in porridges, macaroni, dumplings etc[183]. The seed is rather small[159], though fairly easy to harvest. It has a somewhat bitter flavour[178]. Young shoots, stem tips and the heart of the culm - raw or cooked[144, 177]. A nutritional analysis is available[218]. The roasted seed is a coffee substitute[177].

tcanta Soil reclamationThe plant is sometimes used, especially in Egypt, for the reclamation of saline and alkaline areas[269].

dwatta Styptic TonicReported to be preventative and tonic, barnyard grass is a folk remedy for treating carbuncles, haemorrhages, sores, spleen trouble, cancer and wounds[269]. The shoots and/or the roots are applied as a styptic to wounds[218, 240]. The plant is a tonic, acting on the spleen[218, 240].

propta Seed - sow early spring in a greenhouse and only just cover the seed. When they are large enough to handle, prick the seedlings out into individual pots and plant them out into their permanent positions in early summer. A sowing in situ in late spring might also succeed but is unlikely to ripen a crop of seed if the summer is cool and wet.

nwatta An easily grown plant, it is adapted to nearly all types of wet places, and is often a common weed in paddy fields, roadsides, cultivated areas, and fallow fields[269]. It succeeds on a variety of wet sites such as ditches, low areas in fertile croplands and wet wastes, often growing in water[269]. It succeeds in cool regions, but is better adapted to areas where the average annual temperature is 14-16°C[269]. Tolerant of most soil types, including saline conditions, plants are not restricted by soil pH[269]. Prefers a rich moist soil[85] but succeeds in ordinary garden soil[1]. The sub-species *E. crus-galli zelayensis* (HBK) Hitchc. is often found growing wild in alkaline soils[236]. The plant is reported to tolerate an annual precipitation in the range of 31 to 250cm, an annual temperature range of 5.7 to 27.8°C and a pH in the range of 4.8 to 8.2[269]. Barnyard millet is sometimes cultivated for its edible seed in India[171]. It has a relatively long growing season and does not always ripen its seed in Britain, though it should do better in the eastern half of the country[K]. The plant is considered to be a very serious weed of many cultivated crops[269].

## 6.2.169 Ephedra nevadensis

Mormon Tea, Nevada jointfir  
5 tlin 9 cyuc 3 kcaak 0 tcan 3 dwat 1.2 m hkuc htut cyutli hगत्युत्cup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

drutta Ephedra nevadensis is an evergreen Shrub growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year; in flower from April to June. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Fruit SeedEdible Uses: TeaFruit - raw. A sweet but very mild flavour[K]. Seed - cooked[22, 46, 105, 161, 257]. A bitter taste[92]. It can be roasted and ground into a powder and used to make a bread or mush[183]. A delicious tea is made by steeping the green or dried twigs in boiling water until they turn an amber or pink colour[21, 92, 95, 105, 161, 183].

tcanta None known  
dwatta Blood purifier Diuretic Febrifuge Poulitice Tonic VDThe stems are blood purifier, diuretic, febrifuge and tonic[22, 46, 61, 257]. They are beneficial in the treatment of urogenital complaints[22, 46, 61]. An infusion has been used in the treatment of kidney problems, gonorrhoea and the first stages of syphilis[257]. A poultice of the powdered stems has been applied to sores[257]. The stems of most members of this genus contain the alkaloid ephedrine and are valuable in the treatment of asthma and many other complaints of the respiratory system[K]. The whole plant can be used at much lower concentrations than the isolated constituents - unlike using the isolated ephedrine, using the whole plant rarely gives rise to side-effects[254]. Ephedra does not cure asthma but in many cases it is very effective in treating the symptoms and thus making life somewhat easier for the sufferer. The stems can be used fresh or dried and are usually made into a tea, though they can also be eaten raw[K]. The young stems are best if eating them raw, though older stems can be used if a tea is made[K]. The stems can be harvested at any time of the year and are dried for later use[238].

propta Seed - best sown as soon as it is ripe in the autumn in a greenhouse[200]. It can also be sown in spring in a greenhouse in a sandy compost[K]. Prick out the seedlings into individual pots as soon as they are large enough to handle and grow them on for at least their first winter in a greenhouse. Plant out in the spring or early summer after the last expected frosts and give some protection in their first winter[K]. Division in spring or autumn[238]. Layering.

nwatta Requires a well-drained loamy soil and a sunny position[1, 11]. Established plants are drought resistant and are also lime tolerant[200]. Dioecious. Male and female plants must be grown if seed is required.

## 6.2.170 Lilium columbianum

Columbia Tiger Lily, Columbia lily, Oregon Lily, Tiger Lily  
5 tlin 10 cyuc 3 kcaak 0 tcan 0 dwat 1.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Lilium columbianum is a BULB growing to 1.5 m (5ft) by 0.3 m (1ft in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Bulb - raw or cooked[61, 105, 161, 213, 257]. The oval-shaped bulb is up to 5cm in diameter and is used as a vegetable in the same way as potatoes (*Solanum tuberosum*) [85, 256]. Starchy, with a slightly sweet taste[85]. The flavour of the cooked bulbs is said to resemble sweet chestnuts but with a slight bitterness[256]. The bulbs were highly prized by various native North American Indian tribes and were used as a staple

food[118, 257].

tcanta None known  
dwatta None known

propta Seed - autumnal hypogeal germination[130]. Best sown as soon as ripe in a cold frame, it should germinate in spring[163]. Stored seed will require a warm/cold/warm cycle of stratification, each period being about 2 months long[163]. Grow on in cool shady conditions. Great care should be taken in pricking out the young seedlings, many people leave them in the seed pot until they die down at the end of their second years growth. This necessitates sowing the seed thinly and using a reasonably fertile sowing medium. The plants will also require regular feeding when in growth. Divide the young bulbs when they are dormant, putting 2 - 3 in each pot, and grow them on for at least another year before planting them out into their permanent positions when the plants are dormant[K]. Division in autumn once the leaves have died down. Replant immediately[200]. Bulb scales can be removed from the bulbs in early autumn. If they are kept in a warm dark place in a bag of moist peat, they will produce bulblets. These bulblets can be potted up and grown on in the greenhouse until they are large enough to plant out[200]. Stem or leaf cuttings[163].

nwatta Landscape Uses:Border, Massing, Rock garden. Requires a moist not too heavy well-drained acid loam in light shade[47, 143]. Succeeds in full sun[143]. Plant bulbs 10 - 15cm deep[143]. Early to mid autumn is the best time to turn out the bulbs in cool temperate areas, in warmer areas they can be planted out as late as late autumn[200]. The plant should be protected against rabbits and slugs in early spring. If the shoot tip is eaten out the bulb will not grow in that year and will lose vigour[200]. Special Features:North American native.

## 6.2.171 Chaerophyllum bulbosum

Turnip-Rooted Chervil  
5 tlin 9 cyuc 3 kcaak 0 tcan 0 dwat 1.2 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyafixre7t hjonli

drutta Chaerophyllum bulbosum is a BIENNIAL growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 6. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Root StemEdible Uses: Root - raw or cooked[2, 33, 34, 37, K]. The raw root is rather tough, but has a nice, aromatic, starchy flavour[K]. When cooked it becomes floury and sweet[27] with a peculiar flavour that is excellent and unlike any other vegetable[183]. Peeling the roots ruins the flavour[183]. The root is about the size of a small carrot[2]. It can be harvested when the foliage dies down, usually in July/August from an autumn sowing, and stored like potatoes for later use[1]. It is best harvested as required[164]. The roots contain about 20% starch and 4% protein[74]. Young stems - raw or cooked[74]. Some caution is advised, see notes at the top of the sheet.

tcanta None known  
dwatta None known

propta Seed - best sown in the autumn in situ[33]. The seed has a very short viability[1] or, according to another report, the seed becomes dormant if allowed to dry out and will not germinate for a year[164]. If stored for a spring sowing it should be kept in damp sand in a cold but frost-free place and then sown in situ in March[1]. Another alternative is to sow the seed in the autumn in a seed tray in a cold frame and then to sow the seed, soil and all, in early April in situ[164].

nwatta An easily grown plant, succeeding in almost any soil[1], though it prefers a moist soil[27]. Tolerates a pH in the range 4.6 to 7. The turnip-rooted chervil is occasionally cultivated for its edible root[46, 61], there is at least one named variety[183]. The sub-species *C. bulbosum prescottii* (synonym *C. prescottii*) is used in Russia[74]. The root of this sub-species contains about 17% starch[74].

## 6.2.172 Lepidium latifolium

Dittander, Broadleaved pepperweed  
5 tlin 9 cyuc 3 kcaak 0 tcan 1 dwat 1.2 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwisom hpa7tmwatli xre7t hjonli

drutta Lepidium latifolium is a PERENNIAL growing to 1.2 m (4ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from June to July, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in saline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: Leaves RootEdible Uses: CondimentYoung leaves - raw or cooked[2, 61, 74]. A very hot cross-like flavour[K]. The leaves are nice when used in small quantities as a flavouring in salads[K]. Some reports also suggest using them as a potherb[183], though they have always seemed to be too strong for us to want to try this[K]. The leaves are available very early in the year[K]. Root - it can be grated and made into a sauce which is used as a horseradish substitute[2, 5, 183]. It has a pungently hot flavour. Seed - used as a condiment[177, 183].

tcanta InsecticideUsed as an insecticide[100]. No further details are given, but it is likely to be a strong infusion of the leaves and stems that is used.

dwatta Antiscorbutic Depurative Hepatic Kidney Resolvent StomachicThe plant is antiscorbutic, depurative and stomachic[61, 240]. An infusion of the plant is used in the treatment of liver and kidney diseases, it increases cardiac amplitude, decreases frequency and regulates the rhythm[240]. It is also used as a resolvent in the treatment of skin diseases[240].

propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the spring. Division in spring. Plant them out direct into their permanent positions. Division is very simple and succeeds at almost any time of the year[K].

nwatta A very easily grown plant, it succeeds in most soils in sun or light shade. Plants have been surviving quite happily with us, and are still spreading freely, in dense grass that is rarely cut[K]. Dittander was formerly cultivated as a food condiment in Britain and in ancient Greece[17, 183]. It is a very invasive plant, capable of spreading more than a metre per year by means of its aggressive root system[K]. It produces new growth early in the year and so can be a useful salad ingredient in late winter[K].

## 6.2.173 Osmorhiza claytonii

Woolly Sweet-Cicely, Clayton's sweetroot  
5 tlin 9 cyuc 3 kcaak 1 tcan 1 dwat 1 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyafixre7t hjonli

drutta Osmorhiza claytonii is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves Root SeedEdible Uses: CondimentRoot - cooked and eaten as a vegetable[46, 105, 183]. Used for putting on weight[61, 161]. Leaf stalks - cooked and used as a vegetable[183]. The aromatic roots and unripe seeds are used as anise-like flavourings[183]. Pleasant to chew[207].

tcanta Scented.

dwatta Ophthalmic PouliticeThe root has been chewed or gargled as a treatment for sore throats[222, 257]. A poultice of the moistened pulverized roots has been applied to boils, cuts, sores etc whilst a tea made from the roots has been used to bathe sore eyes[222, 257].

propta Seed - we have no information on this species but suggest sowing the seed in a cold frame as soon as it is ripe if

in a cold frame in early spring. Division of offsets in September/October[200]. The larger bulbs can be replanted immediately into their permanent positions. It is best to pot up the smaller bulbs and grow them on for a year before planting them out when dormant in late summer.

nwatta An easily grown plant, succeeding in ordinary garden soil[1, 42], thriving in sun or shade[42]. Succeeds in dry soils and, once established, is drought tolerant[190]. Plants are hardy to about -20°c[200]. Grows well in the wild garden[200]. The flowering shoots used to be sold as a food crop in Bath market[183].

### 6.2.394 Cardamine kitaibelii

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 0.2 m hkuc hmimhtut cyutli tucphja7n hwicli hrasjlutnyik hpa7tli flat-priklwis hpa7tmwatli fyifxre7t hjonli

drutta Cardamine kitaibelii is a PERENNIAL growing to 0.2 m (0ft 8in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta Edible Parts: Flowers LeavesEdible Uses: Leaves - raw or cooked[K]. A mild cabbage flavour with a hint of cress[K]. Flowers - raw[K]. A mild cabbage flavour with a hint of cress[K].

tcanta None known
dwatta None known

propta Seed - sow spring in a cold frame. Germination usually takes place within 1 - 3 weeks at 15°c[175]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in a greenhouse or cold frame for the first two years, planting them out when dormant in late summer. Division in early spring or after the plant dies down in the summer. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Prefers a moist humus rich soil in shade or semi-shade[200] but succeeds in most soils that are not dry[1]. This species was seen growing and thriving in well-drained soil in a lightly shaded position at Kew[K].

### 6.2.395 Arctostaphylos nevadensis

Pine-Mat Manzanita
5 tlin 9 cyuc 2 kcaak 0 tcan 1 dwat 0.1 m hkuc hmimhtut cyutli tucp hwicli hrasjlut hpa7tli frusflat hpa7tmwatli fyifxre7t hjonli

drutta Arctostaphylos nevadensis is an evergreen Shrub growing to 0.1 m (0ft 4in) by 1 m (3ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: Fruit SeedEdible Uses: Seed - ground into a powder and added to soups etc[92]. The seed is very small and would be difficult to separate from the fruit. It would be easier to dry the whole fruit, grind this into a powder and use it in soups etc[K]. Fruit[92, 105, 161]. The fruit can be eaten fresh or dried and stored for later use[257]. It can also be pulverised and made into a drink[257].

tcanta DyeA yellowish-brown dye is obtained from the leaves, it does not require a mordant[168]. A good ground-cover plant for steep sandy banks[28, 200]. A carpeting plant, growing quite rapidly and rooting as it spreads[208].

dwatta Astringent SkinThe leaves are used in the treatment of diarrhoea[257]. The whole plant is used as an

antidote for poisoning by poison oak, Toxicodendron diversiloba[257]. It was probably applied externally to the skin[K].

propta Seed - best sown in a greenhouse as soon as it is ripe. Pre-soak dried seed in boiling water for 10 - 20 seconds or burn some straw on top of them and then stratify at 2 - 5°c for 2 months[11, 200]. The seed usually germinates in 2 - 3 months at 15°c[134]. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame or greenhouse for at least their first winter. Plant out in late spring or early summer. Cuttings of side shoots of the current season's growth, 5 - 8cm with a heel, August to December in a frame. Takes one year[1, 78]. Division in early spring. Take care because the plant resents root disturbance. Pot the divisions up and keep them in a lightly shaded position in a cold frame or greenhouse until they are growing away actively. Layering in spring[200].

nwatta Requires a deep moist well-drained light or medium lime-free loam in sun or semi-shade but plants produce less fruit when grown in the shade[200]. Prefers a position in full sun[11]. Grows well in shade[28]. Plants at Kew were growing very well in a shady position on a NE slope in 1990[K]. Grows well in a sandy seashore garden[208]. This species is closely related to A. uva-ursi[11, 60]. Plants resent root disturbance and should be placed in their final positions as soon as possible[134].

### 6.2.396 Lycoris sanguinea

Spider Lily
5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 0.5 m hkuc htut cyutli tucp hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Lycoris sanguinea is a BULB growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Bulb - cooked. It is used as a source of starch[105, 177]. The bulb is 2.5cm in diameter[200]. Caution is advised, see the notes above on toxicity.

tcanta None known
dwatta None known

propta The seed is best sown as soon as it is ripe in a greenhouse and should germinate in the spring[200]. Sow the seed thinly so that it does not need to be disturbed for its first year of growth. Give an occasional liquid feed during the growing season to ensure the plants do not become nutrient deficient. Pot up the small bulbs when the plants become dormant, placing 2 bulbs in each pot. Grow them on for another 2 years in the greenhouse before planting them out when they are dormant. Division of offsets in the dormant season[200].

nwatta Requires a deep well-drained sandy soil rich in organic matter in full sun[200]. This species is hardy to at least -15°c[200]. Other reports say that the bulb tolerates soil temperatures down to about -5°c[214, 260]. This is a difficult plant to grow outdoors in temperate areas, the plant comes into growth in late summer, flowers in the autumn and the leaves then persist until the following summer when the plant will have a short period of dormancy. These leaves can be killed by hard frosts and, should this happen often, the bulb will be weakened and killed[200, 260]. Plants therefore require a sheltered position to avoid damage to the growing leaves in the winter[200]. Plants need a warm period in late summer in order to ripen the bulbs and induce flowering in the following year[188]. Plants are attractive to slugs and need to be protected from them[200]. Very sensitive to root disturbance, the bulbs can take some years to become well established[200].

### 6.2.397 Vaccinium japonicum

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 0.7 m hkuc hmimhtut cyutli tucp hwicli hrasjlut hpa7tli frusflat hpa7tmwatli xre7t hjonli

in Britain, it is also a food plant for the caterpillars of many species of butterfly[30], there are 284 insect species associated with this tree[24]. Trees were often coppiced or pollarded in the past for their wood[186], though this is best done on a long rotation of perhaps 50 years. The tree flowers on new growth produced in spring, the seed ripening in its first year[200, 229]. Older trees have a thick corky bark and this can protect them from forest fires, young trees will often regenerate from the base if cut down or killed back by a fire[186]. Trees transplant badly unless moved regularly[11]. Hybridizes freely with other members of the genus[200]. Immune to attacks by the Tortix moth[1]. This species is notably resistant to honey fungus[88, 200]. Special Features:Not North American native, Inconspicuous flowers or blooms.

#### 6.2.241 Fraxinus excelsior

Ash, European ash, Common Ash
5 tlin 8 cyuc 2 kcaak 3 tcan 2 dwat 30 m hkuc htut cyutli tucphja7n hwicli hrasjlutnyik hpa7tli frusflatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Fraxinus excelsior is a deciduous Tree growing to 30 m (98ft) by 20 m (65ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in leaf from May to October, in flower from April to May, and the seeds ripen from September to January. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It cannot grow in the shade. It prefers moist or wet soil. The plant can tolerate maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: Manna Oil SeedEdible Uses: Oil Tealmmature seed - usually pickled by steeping in salt and vinegar, and then used as a condiment for other foods[2, 8, 66, 183]. The leaves are sometimes used as an adulterant for tea[2, 177, 183]. A manna is obtained from the tree[183]. No further details are given. An edible oil similar to sunflower (Helianthus annuus) oil is obtained from the seed[7].

tcanta Dye Fuel Oil Shelterbelt String Tannin WoodA green dye is obtained from the leaves[7]. The bark is a source of tannin[4]. A tying material can be obtained from the wood[6] (does this mean the bark?). Very tolerant of extreme exposure and relatively fast growing, though often windshaped in exposed positions, it can be grown as a shelterbelt tree[49, 200]. However, it is late coming into leaf and also one of the first trees to lose its leaves in the autumn and this makes it less suitable in a shelter belt. Wood - hard, light, flexible, strong, resilient. A very valuable wood, it is much used for tool handles, oars, furniture, posts etc[4, 6, 7, 13, 46, 66]. An excellent fuel, burning well even when green[6]. There is some doubt over how well the green wood burns with several people claiming that it needs to be properly seasoned[K].

dwatta Antiperiodic Astringent Carminative Cathartic Diaphoretic Diuretic Laxative Purgative TonicThe leaves are astringent, cathartic, diaphoretic, mildly diuretic, laxative and purgative[4, 7, 9, 13, 21, 165, 254]. The have been used as a laxative, making a mild substitute for senna pods[254]. The leaves should be gathered in June, well dried and stored in airtight containers[4]. The bark is antiperiodic, astringent and a bitter tonic[4, 240]. Little used in modern herbalism, it is occasionally taken in the treatment of fevers[254]. The seeds, including their wings, have been used as a carminative[4]. They will store for 12 months if gathered when ripe[4].

propta The seed is best harvested green - as soon as it is fully developed but before it has fully dried on the tree - and can then be sown immediately in a cold frame[80]. It usually germinates in the spring[80]. Stored seed requires a period of cold stratification and is best sown as soon as possible in a cold frame[200]. Approximately 5% of stored seed will germinate in the first year, the remainder germinating in the second year[186]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant them out into their permanent positions or a nursery bed in

late spring or early summer of the following year. If you have sufficient seed then it is possible to sow it directly into an outdoor seedbed, preferably in the autumn. Grow the seedlings on in the seedbed for 2 years before transplanting either to their permanent positions or to nursery beds. Cuttings of mature wood, placed in a sheltered outdoor bed in the winter, sometimes strike.

nwatta Landscape Uses:Firewood, Pollard, Specimen. Prefers a deep loamy soil, even if it is on the heavy side[1, 200]. Most members of this genus are gross feeders and require a rich soil[1, 200]. Plants can succeed in very exposed positions, including maritime exposure, though they can become wind-shaped[49]. Thrives in alkaline soils[11] but not in shallow soils over chalk. Tolerates a pH as low as 4.5, but prefers a base-rich soil above 5.5[186]. Trees are surprisingly tolerant of seasonally water-logged soils[186]. Dislikes dryness at the roots, especially in late spring[186]. Very intolerant of shade, young plants fail to develop properly in such a position and often die. Although the dormant plant is very cold-hardy, the young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. A fast growing tree, it is sometimes cultivated for its valuable timber. Very tolerant of cutting, ash was also at one time frequently coppiced for its wood[186]. However, modern use of plastics have reduced its economic values. There are many named varieties, selected for their ornamental value[11]. Trees have a light canopy and cast little shade[186]. A food plant for many insect species, there are 41 associated insect species[24, 30]. Trees can be male, female, monoecious or hermaphrodite, they can also change sex from year to year[11]. Trees take 30 - 40 years to flower from seed[186]. The flowers are produced on one-year old wood[7]. This species is notably resistant to honey fungus[200]. Special Features: Not North American native, Inconspicuous flowers or blooms. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

### 6.2.242 Pinus wallichiana

Himalayan Blue Pine, Bhutan pine, Himalayan Pine
5 tlin 7 cyuc 2 kcaak 0 tcan 2 dwat 25 m hkuc htut cyutli hgatkycutcup hwicli hyishrasjlutnyikprik hpa7tli flatprik hpa7tmwatli dyat hjonli

drutta Pinus wallichiana is an evergreen Tree growing to 25 m (82ft) by 10 m (32ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from May to June, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: Manna SeedEdible Uses: CondimentSeed - raw or cooked[183]. It has a very resinous flavour and so is not much relished[158]. The seed is quite small, to 7mm long[200]. The honyewood from aphid infested leaves is eaten as a manna[51, 146, 158]. Another report says that a manna-like substance that exudes from the leaves and twigs is eaten or used like honey[183]. A vanillin flavouring is obtained as a by-product of other resins that are released from the pulpwood[200].

tcanta Dye Fuel Herbicide Lighting Pitch Shelterbelt Stuffing WoodA commercial source of turpentine and tar. It is said to be superior to P roxburghii but not produced so freely[64, 146, 158]. Oleo-resins are present in the tissues of all species of pines, but these are often not present in sufficient quantity to make their extraction economically worthwhile[64]. The resins are obtained by tapping the trunk, or by destructive distillation of the wood[4, 64]. In general, trees from warmer areas of distribution give the higher yields[64]. Turpentine consists of an average of 20% of the oleo-resin[64] and is separated by distillation[4, 64]. Tur-

pentine has a wide range of uses including as a solvent for waxes etc, for making varnish, medicinal etc[4]. Rosin is the substance left after turpentine is removed. This is used by violinists on their bows and also in making sealing wax, varnish etc[4]. Pitch can also be obtained from the resin and is used for waterproofing, as a wood preservative etc. The leaves are used as a stuffing for pillows etc[158]. A tan or green dye is obtained from the needles[168]. The needles contain a substance called terpene, this is released when rain washes over the needles and it has a negative effect on the germination of some plants, including wheat[201]. Wood - moderately hard, durable, highly resinous. Used in construction, carpentry etc[46, 51, 146, 158, 272]. A good firewood but it gives off a pungent resinous smoke[51]. The wood is rich in resin. It can be splintered and used as a torch[145, 158].

dwatta Antiseptic Diaphoretic Diuretic Rubefacient Stimulant VermifugeThe turpentine obtained from the resin of all pine trees is antiseptic, diuretic, rubefacient and vermifuge[4]. It is a valuable remedy used internally in the treatment of kidney and bladder complaints and is used both internally and as a rub and steam bath in the treatment of rheumatic affections[4]. It is also very beneficial to the respiratory system and so is useful in treating diseases of the mucous membranes and respiratory complaints such as coughs, colds, influenza and TB[4]. Externally it is a very beneficial treatment for a variety of skin complaints, wounds, sores, burns, boils etc and is used in the form of liniment plasters, poultices, herbal steam baths and inhalers[4]. The wood is diaphoretic and stimulant[240]. It is useful in treating burning of the body, cough, fainting and ulcers[240].

propta It is best to sow the seed in individual pots in a cold frame as soon as it is ripe if this is possible otherwise in late winter. A short stratification of 6 weeks at 4°C can improve the germination of stored seed[80]. Plant seedlings out into their permanent positions as soon as possible and protect them for their first winter or two[11]. Plants have a very sparse root system and the sooner they are planted into their permanent positions the better they will grow[K]. Trees should be planted into their permanent positions when they are quite small, between 30 and 90cm[200]. We actually plant them out when they are about 5 - 10cm tall. So long as they are given a very good weed-excluding mulch they establish very well[K]. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200]. Cuttings. This method only works when taken from very young trees less than 10 years old. Use single leaf fascicles with the base of the short shoot. Disbudding the shoots some weeks before taking the cuttings can help. Cuttings are normally slow to grow away[81].

nwatta Industrial Crop: Hydrocarbon Management: Standard Regional CropLandscape Uses:Specimen. Thrives in a light well-drained sandy or gravelly loam[1, 11]. Dislikes poorly drained moorland soils or shade[1, 11]. Established plants tolerate drought[200]. Prefers sandy or clay soils rather than limestone[146]. A very hardy but relatively short-lived tree in cultivation[11]. The Himalayan blue pine succeeds in exposed positions but it looks much better when grown in a sheltered position[11, 81]. It is a very fast growing tree when young, with new shoots up to 1metre long per year[11] and 30 year old trees 20 metres tall. New growth takes place from April to mid-July[185]. Growth in height diminishes rapidly when trees are 25 metres tall, probably due to their dislike of exposure at that height[185]. Cultivated for timber in Italy[50]. Plants are strongly outbreeding, self-fertilized seed usually grows poorly[200]. They hybridize freely with other members of this genus[200]. Cones open and shed their seed whilst still on the tree[1]. Leaf secretions inhibit the germination of seeds, thereby reducing the amount of plants that can grow under the trees[18]. Plants in this genus are notably susceptible to honey fungus[200]. Special Features: Attractive foliage, Not North American native, Inconspicuous flowers or blooms.

## 6.2.243 Aesculus x carnea

Red Horse Chestnut, Ruby Red Horsechestnut  
5 tlin 9 cyuc 2 kcaak 0 tcan 1 dwat 25 m hkuc  
pcimhmhtut cyutli tcup hwicli hrasjltunyk hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Aesculus x carnea is a deciduous Tree growing to 25 m (82ft 0in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower in July, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: SeedEdible Uses: We have no details for this species, but the following notes almost certainly apply to it. Seed - cooked. It can be dried, ground into a flour and used as a gruel. The seed is quite large, about 20mm in diameter, and is also easily harvested. Unfortunately, it is rich in saponins and these toxins need to be removed before the seed can be eaten. See also the notes above on toxicity. The following notes apply to *A. californica*, but are probably also relevant here: - The seed needs to be leached of toxins before it becomes safe to eat - the Indians would do this by slow-roasting the nuts (which would have rendered the saponins harmless) and then cutting them into thin slices, putting them into a cloth bag and rinsing them in a stream for 2 - 5 days[213]. Most of the minerals etc would also have been leached out by this treatment[K].

tcanta SoapSaponins in the seed are a soap substitute[169]. The saponins can be easily obtained by chopping the seed into small pieces and infusing them in hot water. This water can then be used for washing the body, clothes etc. Its main drawback is a lingering odour of horse chest-nuts[K].

dwatta BachThe plant is used in Bach flower remedies - the keywords for prescribing it are 'Excessive fear' and 'Anxiety for others'[209].

propta Seed - best sown outdoors or in a cold frame as soon as it is ripe[11, 80]. The seed germinates almost immediately and must be given protection from severe weather[130]. The seed has a very limited viability and must not be allowed to dry out. Stored seed should be soaked for 24 hours prior to sowing and even after this may still not be viable[80, 113]. It is best to sow the seed with its 'scar' downwards[130]. If sowing the seed in a cold frame, pot up the seedlings in early spring and plant them out into their permanent positions in the summer. This species is a garden hybrid though it breeds relatively true from seed[200].

nwatta Landscape Uses:Pest tolerant, Pollard, Specimen, Street tree. Prefers a deep loamy well-drained soil but is not too fussy[1, 11]. The dormant tree tolerates temperatures down to at least -15°C[200], though the young growth in spring can be damaged by late frosts. It prefers a continental climate, growing best in eastern and south-eastern England[200]. There are some named forms selected for their ornamental value[11, 200]. Most members of this genus transplant easily, even when fairly large[11]. Abnormal cell development in this species may result in eruptions on trunks over 30cm in diameter - these ultimately decay[200]. Although a hybrid species, it breeds true from seed due to a doubling of the chromosomes[11, 17]. Special Features:Attractive foliage, Not North American native, Blooms are very showy.

## 6.2.244 Abies lasiocarpa

Subalpine Fir, Alpine Fir  
5 tlin 6 cyuc 2 kcaak 0 tcan 2 dwat 25 m hkuc  
pcimhmimhtut cyutli tcup hwicli hyishrasjltunykifrip hpa7tli flatprik hpa7tmwatli hjonli

drutta Abies lasiocarpa is an evergreen Tree growing to 25 m (82ft) by 4 m (13ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in leaf all year, and the seeds ripen in September. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid and neutral soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Inner bark Seed SeedpodEdible Uses: Gum Gum TeaThe shoot tips are used as a tea substitute[177, 183]. The cones can be ground into a fine powder, then mixed with fat and used as a confection[257]. It is

nwatta Succeeds in any good soil[187]. Prefers a well-drained light rich or peaty soil[1, 200]. Requires a moist peaty soil and a sunny position[111, 134]. A good bee plant[50, 74]. The flower of many members of this genus can trap insects between its anther cells, the struggles of the insect in escaping ensure the pollination of the plant[207]. Many members of this genus seem to be particularly prone to damage by slugs. The young growth in spring is especially vulnerable, but older growth is also attacked and even well-established plants have been destroyed in wet years[K]. Plants resent root disturbance and are best planted into their final positions whilst small[134].

## 6.2.390 Gaultheria pyrolifolia

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 0.2 m hkuc  
pcimhmim cyutli tcup hwicli hrasjltut hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta Gaultheria pyrolifolia is an evergreen Shrub growing to 0.2 m (0ft 8in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from May to July, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcaakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. The fruit is about 8mm in diameter[200].

tcanta None known  
dwatta None known

propta The seed requires a period of cold stratification. Pre-chill for 4 - 10 weeks and then surface sow in a lime-free compost in a shady part of the greenhouse and keep the compost moist[K]. The seed usually germinates well, usually within 1 - 2 months at 20°C, but the seedlings are liable to damp off. It is important to water them with care and to ensure that they get plenty of ventilation. Watering them with a garlic infusion can also help to prevent damping off[K]. Prick out the seedlings into individual pots when they are about 25mm tall and grow them out in light shade in the greenhouse for at least their first winter[K]. Plant them out in late spring or early summer. The seedlings are susceptible to spring frosts so might need some protection for their first few years outdoors. The leaves remain very small for the first few years[11]. Cuttings of half-ripe wood 3 - 6cm long, July/August in a frame in a shady position. They form roots in late summer or spring[78]. A good percentage usually take. Division in spring just before new growth begins. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Prefers a moist but not boggy humus rich soil in shade or semi-shade[11, 182]. A peat and moisture loving species, it requires a lime-free soil[11, 182]. Plants in this genus are notably resistant to honey fungus[200]. This species has been confused in the past with *G. pyroloides*, a distinct species from Japan[266].

## 6.2.391 Atraphaxis spinosa

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 0.6 m hkuc  
htut cyutli tcup hwicli hyishras hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Atraphaxis spinosa is a deciduous Shrub growing to 0.6 m (2ft) by 1.2 m (4ft in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from August to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. It cannot grow in the shade. It prefers moist soil.

kcaakta Edible Parts: MannaEdible Uses: The plant is a source of a yellowish-white manna-like substance that is eaten as a food or used in making sweetmeats[183].

tcanta None known  
dwatta None known

propta Seed - sow spring in a greenhouse[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Seedlings are prone to damp off so should be watered with care and kept well ventilated[200]. Cuttings of soft wood in early summer in a frame[200]. Layering in spring[200].

nwatta Requires a sunny position in a light well-drained soil of low to moderate fertility[182, 200]. Succeeds in the rock garden or on a sunny stony bank[200]. Plants are hardy to at least -10°C so long as the soil is not wet over the winter[200]. The tiny flowers have long lasting petals[182]. This species is closely related to *A. frutescens*[200]. Any pruning should be restricted to the removal of branch tips every second or third year during the spring in order to maintain a neat compact habit[200]. Established specimens resent root disturbance[200].

## 6.2.392 Samolus valerandi

Brookweed, Seaside brookweed

5 tlin 9 cyuc 2 kcaak 0 tcan 1 dwat 0.3 m hkuc  
htut cyutli tcupha7nhs6w hwicli hrasjltunyk hpa7tli prikliwis hpa7tmwatli fyifxre7t hjonli

drutta Samolus valerandi is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to August, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist or wet soil and can grow in water. The plant can tolerate maritime exposure.

kcaakta Edible Parts: LeavesEdible Uses: Young leaves - raw or cooked[46, 61]. A rather bitter flavour[K].

tcanta None known  
dwatta AntiscorbuticThe leaves are antiscorbutic[46, 61].

propta Seed - surface sow in a cold frame in the spring, standing the pot in about 3cm of water. Prick out the seedlings when they are large enough to handle and gradually increase the depth of water as the plants grow until it is level with the tops of the pots. Plant out in the summer if there has been sufficient growth, otherwise plant out in late spring of the following year. Division in spring.

nwatta Succeeds in ordinary garden soil in a wet position or in shallow water[1, 200]. Dislikes shade or acid soils.

## 6.2.393 Ornithogalum pyrenaicum

Bath Asparagus, Pyrenees star of Bethlehem  
5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 0.6 m hkuc  
hmimhtut cyutli tcup hwicli hrasjltunyk hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Ornithogalum pyrenaicum is a BULB growing to 0.6 m (2ft) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to July, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. kcaakta Edible Parts: Leaves StemEdible Uses: Young shoots - cooked[1, 5, 46, 61]. The young, unexpanded flowering shoots are cooked and served like asparagus[2, 4, 17, 177, 183].

tcanta None known  
dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame[200]. Sow the seed thinly and leave the seedlings undisturbed in the pots for their first dormancy, but apply liquid feed at intervals, especially in their second year of growth. Divide the bulbs at the end of their second year of growth, putting 2 - 3 bulbs in each pot. Grow them on for one more year and then plant them out into their permanent positions whilst they are dormant. The seed can also be sown

shade in the greenhouse for at least their first winter. Plant them out when large enough in late spring. Division in spring or autumn. Plants are slow to increase[200]. It is best to pot the divisions up and keep them in light shade in the greenhouse until they are growing away strongly.

nwatta Prefers a rich moist neutral to acid soil in woodland or a shady position in the rock garden[1, 200]. Plants are found on alkaline soils in the wild[43]. Plants are hardy to at least -15°C[200]. The flowers are malodorous and are pollinated by flies[200]. Plants often self-sow when growing in a suitable position[200].

## 6.2.388 Sedum spectabile

Ice Plant

5 tlin 9 cyuc 2 kcaak 3 tcan 1 dwat 0.4 m hkuc htut cyutli hgtakuyctcup hwicli hyhisrasjltunyk hpa7tli flatprikliw hpa7tmwatli fyfixre7t hjonli

drutta Sedum spectabile is a PERENNIAL growing to 0.4 m (1ft 4in) by 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from September to October, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kckaata Edible Parts: LeavesEdible Uses: Leaves - raw or cooked[105]. The leaves are very mucilaginous but have a fairly bland flavour[K].

tcanta Plants can be grown as a ground cover when planted about 30cm apart each way[208].

dwatta Antiphlogistic Depurative SialagogueThe plant is antiphlogistic, depurative, sialagogue[147].

propta Seed - surface sow in spring in well-drained soil in a sunny position in a greenhouse. Do not allow the soil to dry out. Prick out the seedlings into individual pots when they are large enough to handle. If sufficient growth is made, it is possible to plant them out during the summer, otherwise keep them in a cold-frame or greenhouse for their first winter and plant them out in early summer of the following year[K]. Division is very easy and can be carried out at almost any time in the growing season, though is probably best done in spring or early summer. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer. Cuttings at almost any time in the growing season. Very easy, even a single leaf will produce roots and form a new plant.

nwatta A very easily grown and tolerant plant, it succeeds in most soils[188] but prefers a fertile well-drained soil in a sunny position[200]. Tolerates poor soils[233]. Established plants are drought tolerant[200], they can also tolerate considerable neglect, surviving even in the dense growth of weeds[K]. Plants are hardy to about -20°C[187]. This species has pink flowers[200]. All members of this genus are said to have edible leaves, though those species that have yellow flowers can cause stomach upsets if they are eaten in quantity[62, 85]. The flowers have a honey-like smell similar to Buddleias[245]. A very ornamental plant[1], there are some named varieties[187]. The flowers are very attractive to bees and lepidoptera[30]. Plants in this genus seem to be immune to the predations of rabbits[233]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is fleshy. Thick or swollen - fibrous or tap root [2-1].

## 6.2.389 Asclepias pumila

Low Milkweed, Plains milkweed

5 tlin 9 cyuc 2 kcaak 0 tcan 1 dwat 0.4 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjltunyk hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Asclepias pumila is a PERENNIAL growing to 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects, Lepidoptera (Moths and Butterflies). It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kckaata Edible Parts: Flowers Leaves Oil Oil Seed See Uses: Gum Oil Oil SweetenerThe following reports refer to other members of this genus and are possibly also appropriate for this species[K]. Unopened flower buds - cooked. They taste somewhat like peas. They are used like broccoli[183]. Flowers and young flower buds - cooked. Used as a flavouring and a thickener in soups etc[55, 102]. The flower clusters can be boiled down to make a sugary syrup[2, 85]. The flowers are harvested in the early morning with the dew still on them[95]. When boiled up it makes a brown sugar[95]. Young shoots - cooked. An asparagus substitute[2, 4, 43, 55, 62, 95, 183]. They should be used when less than 20cm tall[159]. A slightly bitter taste[159]. Tips of older shoots are cooked like spinach[85, 183]. Young seed pods, 3 - 4 cm long, cooked[2, 43, 55, 85]. They are very appetizing. Best used when about 2 - 4cm long and before the seed floss forms, on older pods remove any seed floss before cooking them[85, 159]. If picked at the right time, the pods resemble okra[183]. The sprouted seeds can be eaten[183]. An edible oil is obtained from the seed[55, 171]. The latex in the stems is made into a chewing gum[46, 61]. It is found mainly in the leaves and is destroyed by frost[112]. Yields are higher on dry soils[112].

tcanta Fibre Gum Latex Oil Oil Pollution Stuffing Wick-The following reports refer to other members of this genus and are possibly also appropriate for this species[K]. A good quality fibre is obtained from the bark, used in making twine, cloth, paper etc[95, 112, 169]. It is of poor quality in wet seasons[112]. It is easily harvested in late autumn after the plant has died down by simply pulling the fibres off the dried stems[169]. The seed floss is used to stuff pillows etc or is mixed with other fibres to make cloth[112, 159, 169, 171]. It is a Kapok substitute, used in Life Jackets or as a stuffing material[112]. Very water repellent, it can yield up to 550 kilos per hectare[112]. The floss has also been used to mop up oil spills at sea. Candlewicks can be made from the seed floss[112, 207]. Rubber can be made from latex contained in the leaves and the stems[46, 57, 102, 159]. It is found mainly in the leaves and is destroyed by frost[112]. Yields are higher on dry soils[112]. Pods contain an oil and a wax which are of potential importance. The seed contains up to 20% of an edible semi-drying oil[74, 112]. It is also used in making liquid soap[74].

dwatta AstringentAn infusion of the leaves is used in the treatment of diarrhoea, the remedy can be given to children[257].

propta Seed - best sown in a greenhouse as soon as it is ripe in the autumn or in late winter[134, 169]. We have also had good results from sowing the seed in the greenhouse in early spring[K], though stored seed might need 2 - 3 weeks cold stratification[134]. Germination usually takes place in 1 - 3 months at 18°C[134]. As soon as the seedlings are large enough to handle, prick them out into individual pots and grow them on in the greenhouse for their first winter. Plant out when they are in active growth in late spring or early summer and give them some protection from slugs until they are growing away strongly. Division in spring. With great care since the plant resents root disturbance. Pot the divisions up and place them in a lightly shaded position in the greenhouse until they are growing away strongly, then plant them out in the summer, giving them some protection from slugs until they are established.. Basal cuttings in late spring. Use shoots about 10cm long with as much of their white underground stem as possible. Pot them up individually and place them in a lightly shaded position in a greenhouse until they are rooting and growing actively. If the plants grow sufficiently, they can be put into their permanent positions in the summer, otherwise keep them in the greenhouse until the following spring and when they are in active growth plant them out into their permanent positions. Give them some protection from slugs until they are established.

said to be a delicacy and an aid to the digestion[257]. The resin from the trunk is used as a chewing gum[257]. It is said to treat bad breath[257]. Inner bark[257]. No more information is given, but inner bark is often dried, ground into a powder and then used with cereal flours when making bread etc[K]. Seeds[257]. No more information is given, but the seeds are very small and fiddly to use. Seeds of this genus are generally oily with a resinous flavour and can be eaten raw or cooked[K].

tcanta Baby care Deodorant Gum Gum Hair Incense Miscellany Repellent WoodThe fragrant young leaves and twigs are used to repel moths or are burnt as an incense[46, 61, 169, 257]. They were also ground into a powder and used to make a baby powder and perfumes[226, 257]. A gum is obtained from the bark. It is antiseptic[46, 61] and was chewed by the N. American Indians in order to clean the teeth[226]. It was also used to plug holes in canoes[226]. An infusion of the leaves is used as a hair tonic[257]. The leaves can also be placed in the shoes as a foot deodorant[257]. Wood - light, soft, not strong. It is little used except as a fuel and for pulp[46, 61, 82]. The native North American Indians used it for making chairs and insect-proof storage boxes[257]. It was also used as a fuel and was said to burn for a long time[257].

dwatta Antihalitosis Antiseptic Deodorant Emetic Foot care Laxative Miscellany Poultice TB TonicAntiseptic[46, 61]. The gummy exudate that appears on the bark was soaked in water until soft and then applied to wounds[213]. An infusion of the resin has been used as an emetic to cleanse the insides[257]. The resin has also been chewed to treat bad breath[257]. A decoction of the bark is used as a tonic and in the treatment of colds and flu[257]. A poultice of the leaves has been used to treat chest colds and fevers[257]. An infusion has been taken to treat the coughing up of blood, which can be the first sign of TB, and as a laxative[257].

propta Seed - sow early February in a greenhouse or outdoors in March[78]. Germination is often poor, usually taking about 6 - 8 weeks[78]. Stratification is said to produce a more even germination so it is probably best to sow the seed in a cold frame as soon as it is ripe in the autumn[80, 113]. The seed remains viable for up to 5 years if it is well stored[113]. When large enough to handle, prick the seedlings out into individual pots and grow them on for at least their first winter in pots. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Alternatively, if you have sufficient seed, it is possible to sow in an outdoor seedbed. One report says that it is best to grow the seedlings on in the shade at a density of about 550 plants per square metre[78] whilst another report says that they are best grown on in a sunny position[80].

nwatta Landscape Uses:Screen, Specimen. Prefers a good moist but not water-logged soil[1]. Grows well in heavy clay soils. Very shade tolerant, especially when young, but growth is slower in dense shade[81]. Intolerant of atmospheric pollution[1]. Prefers slightly acid conditions down to a pH of about 5[200]. Prefers growing on a north-facing slope[200]. Occasionally planted for timber in N. Europe[50] but this species does not thrive in Britain[11]. It is a very cold-hardy tree but the milder winters of this country make it susceptible to damage by aphid and late frosts[1, 11, 81]. The sub-species A. lasiocarpa arizonica. (Merriam.) Lemmon. is growing somewhat better here[185]. Trees should be planted into their permanent positions when they are quite small, between 30 and 90cm in height. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200]. Plants are strongly outbreeding, self-fertilized seed usually grows poorly[200]. They hybridize freely with other members of this genus[200]. The crushed foliage has a balsam aroma[185]. Special Features:North American native, There are no flowers or blooms.

## 6.2.245 Liquidambar styraciflua

Sweet Gum, Red Gum, American Sweet Gum, Red Sweet Gum,

5 tlin 9 cyuc 2 kcaak 3 tcan 3 dwat 25 m hkuc htut cyutli tcup hwicli hrasjltunyk hpa7tli flatprik hpa7tmwatli hjonli

drutta Liquidambar styraciflua is a deciduous Tree growing to 25 m (82ft) by 15 m (49ft) at a fast rate. See

above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in May, and the seeds ripen from October to November. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers moist soil.

kckaata Edible Parts: Edible Uses: GumA chewing gum and a stabilizer for cakes etc is obtained from the resin[102, 105, 149, 159]. It can also be chewed to sweeten the breath[183].

tcanta Adhesive Gum Incense Parasiticide Resin Teeth WoodThe aromatic resin 'Storax' is obtained from the trunk of this tree[46, 57, 61, 64]. It forms in cavities of the bark and also exudes naturally. It is harvested in autumn[181, 238]. Production can be stimulated by beating the trunk in the spring[171, 238]. The resin has a wide range of uses including medicinal, incense, perfumery, soap and as an adhesive[149]. It is also chewed and used as a tooth cleaner[183]. Wood - heavy, fairly hard, fine-grained, not strong, light, tough, resilient. It weighs about 37lb per cubic foot[227]. The wood takes a high polish and can be stained then used as a cherry, mahogany or walnut substitute[171]. It is also used for furniture, flooring, fruit dishes, veneer etc[46, 61, 82, 149, 227].

dwatta Antiseptic Astringent Carminative Cholera Diuretic Dysentery Expectorant Parasiticide Poultice Salve Sedative Stimulant VulneraryA resin obtained from the trunk of the tree (see 'Uses notes' below) is antiseptic, carminative, diuretic, expectorant, parasiticide, poultice, salve, sedative, stimulant, vulnerary[21, 46, 57, 61, 149, 171, 213, 218, 222, 238]. It is chewed in the treatment of sore throats, coughs, asthma, cystitis, dysentery etc[222, 238, 257]. Externally, it is applied to sores, wounds, piles, ringworm, scabies etc[222, 238]. The resin is an ingredient of 'Friar's Balsam', a commercial preparation based on Styrax benzoin that is used to treat colds and skin problems[238]. The mildly astringent inner bark is used in the treatment of diarrhoea and childhood cholera[222].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. Harvest the seed capsules at the end of October or November, dry in a warm place and extract the seed by shaking the capsule. Stored seed requires 1 - 3 months stratification and sometimes takes 2 years to germinate. Sow it as early in the year as possible. Germination rates are often poor. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame or greenhouse for their first winter. Since they resent root disturbance, it is best to plant them out into their permanent positions in early summer of their second year and give them some protection from cold for their first winter outdoors[K]. Cuttings of half-ripe wood, July/August in a frame. Suckers in early spring. Layering in October/November. Takes 12 months.

nwatta Landscape Uses:Aggressive surface roots possible, Specimen, Street tree. Prefers a moist but not swampy loam in a sunny sheltered position[11, 200]. Succeeds in light shade[188]. Prefers a neutral to acid soil[130]. Plants grow poorly in shallow soils overlying chalk[188]. Young plants are susceptible to damage from late frosts. A highly ornamental plant, especially in its autumn foliage[1, 227], it grows well in Cornwall[59] and S. England but does not do well in the north[98]. A fast-growing and long lived tree, it is fairly free from pests and diseases and has the potential to be a re-afforestation tree in cutover lands[227]. Trees commence flowering when about 20 - 25 years old[229]. The leaves emit a balsam-like fragrance when they fall in the autumn, this is retained until the leaves are quite withered[245]. Plants in the north of their range do not produce much resin[183]. Resists honey fungus[88]. This species resents root disturbance, young plants should be pot-grown and be placed in their permanent positions as soon as possible[200]. Special Features:Attractive foliage, North American native, Invasive, Naturalizing, Inconspicuous flowers or blooms. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is flat with shallow roots spreading near the soil surface [2-1].

## 6.2.246 Corylus chinensis

Chinese Hazel

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 24 m hkuc hmimhtut cyutli hgattcup hwicli hrasjlutnyik hpa7tli flatprikli-wisslip hpa7tmwatli fyif hjonli

drutta Corylus chinensis is a deciduous Tree growing to 24 m (78ft 9in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from April to May, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: Oil SeedEdible Uses: OilSeed - raw or cooked[63, 105, 177, 183]. Rich in oil. A shrub at Kew was 2 metres tall and 2 metres wide in July 1996 with a reasonable crop of immature fruit[K]. The seed ripens in mid to late autumn and will probably need to be protected from squirrels[K]. When kept in a cool place, and not shelled, the seed should store for at least 12 months[K]. An edible oil is obtained from the seed,

tcanta OilNone known

dwatta None known

propta Seed - best sown as soon as it is harvested in autumn in a cold frame[164]. Germinates in late winter or spring. Stored seed should be pre-soaked in warm water for 48 hours and then given 2 weeks warm followed by 3 - 4 months cold stratification[164]. Germinates in 1 - 6 months at 20°C[164]. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame or sheltered place outdoors for their first winter. Plant them out into their permanent positions in late spring or early summer[K]. Layering in autumn. Easy, it takes about 6 months[78, 200]. Division of suckers in early spring. Very easy, they can be planted out straight into their permanent positions.

nwatta An easily grown plant, it succeeds in most soils, but is in general more productive of seeds when grown on soils of moderate fertility[11, 200]. It does less well in rich heavy soils or poor ones[11, 63]. Does well in a loamy soil[11]. Very suitable for an alkaline soil[11], but it dislikes very acid soils[17]. Plants are fairly wind tolerant[1, 11]. Once established, this species is drought resistant[183]. It does not produce suckers[183]. A very ornamental tree[1], it is closely allied to *C. colurna*[11]. It has become very rare in China where it is considered to be at risk of extinction[266]. Members of this genus bear transplanting well and can be easily moved even when relatively large[11]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2].

## 6.2.247 Quercus nigra

Water Oak

5 tlin 9 cyuc 2 kcaak 0 tcan 2 dwat 20 m hkuc hmimhtut cyutli tcup hwicli jlutnyik hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta Quercus nigra is a deciduous Tree growing to 20 m (65ft) by 8 m (26ft). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from April to May, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: SeedEdible Uses: CoffeeSeed - cooked[61, 105, 161]. A staple food for some native North American Indian tribes[257]. The seed is about 15cm long and wide[82, 200], it can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for

making bread. The seed contains bitter tannins, these can be leached out by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute[257].

tcanta Fuel Repellent Tannin Woodd mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth[20]. Oak galls are excrescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4]. Wood - heavy, hard, strong, close-grained[61, 82, 227, 235]. It weighs 45lb per cubic foot[235]. It is used for cross-ties and poles[227], but is little valued except as a fuel[61, 82].

dwatta Astringent DysenteryAny galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4].

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Lime tolerant[188]. Young plants tolerate reasonable levels of side shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. Prefers warmer summers than are usually experienced in Britain, trees often grow poorly in this country and fail to properly ripen their wood resulting in frost damage overwinter[200]. A fast-growing tree in its native habitat, it does not bear seeds until about 20 years old[229]. Seed production is cyclic, a year of high yields being followed by a year of low yields[229]. The tree flowers on new growth produced in spring, the seed taking two summers to ripen[229]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. Hybridizes freely with other members of the genus[200]. Plants in this genus are notably resistant to honey fungus[200].

## 6.2.248 Aesculus turbinata

Japanese Horse Chestnut

5 tlin 7 cyuc 2 kcaak 0 tcan 0 dwat 20 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Aesculus turbinata is a deciduous Tree growing to 20 m (65ft) by 12 m (39ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in June, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves SeedEdible Uses: Young leaves cooked[177]. Some caution is advised on this entry since the leaves are likely to contain toxic saponins (see notes above on toxicity). Seed - cooked. It can be dried, ground into a flour and used as a gruel. The starch is extracted and eaten[177]. The seed is quite large, about 25 - 30mm in diameter, and is easily harvested. Unfortunately it is also rich in saponins and these need to be removed before the seed can be eaten. See also the notes above on toxicity. The following notes apply to *A. californica*, but are probably also relevant

interesting chemistry, but it is seldom used in modern practice[238]. The whole plant is antiphlogistic, antipyretic, antitussive and expectorant[9, 61, 147, 178, 218]. An overdose of the plant is said to easily precipitate an abortion[218]. The fruit is aperient, strongly diuretic and lithontrpic[4, 7, 9, 218]. It is used internally in the treatment of gravel, suppression of urine etc and is highly recommended in fevers and in gout[4, 238]. The fruit is harvested when fully ripe and can be used fresh, juiced or dried[238]. The calyx should be removed[238]. The leaves and stems are febrifuge and slightly tonic[4]. They are used in the treatment of the malaise that follows malaria, and for weak or anaemic people[4]. The fresh leaves have been used externally in the treatment of skin inflammations[238]. The seed is used to promote early labour[218]. A homeopathic remedy is made from the fruit. It is used in the treatment of kidney and bladder disorders[9].

propta Seed - sow March/April in a greenhouse only just covering the seed. Germination usually takes place quickly and freely. Prick out the seedlings into individual pots of fairly rich soil when they are large enough to handle and plant them out in early summer. Diurnal temperature fluctuations assist germination[170]. Division in spring[111]. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer. Basal cuttings in early summer[111]. Harvest the shoots with plenty of underground stem when they are about 8 - 10cm above the ground. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Succeeds in any well-drained soil in full sun or light shade[111, 200]. The fully dormant plant is hardy in most of Britain, though the young growth in spring can be damaged by late frosts. A very ornamental plant[1] though it can be invasive[200]. This sub-species, which is sometimes treated as a separate species, is a more vigorous form of *P. alkekengi* with larger fruits[200]. Slugs are very fond of the new growth in spring and can destroy even quite large clumps[K].

## 6.2.385 Salvia verbenaca

Wild Clary

5 tlin 9 cyuc 2 kcaak 0 tcan 2 dwat 0.6 m hkuc htut cyutli hgatkuyctcup hwicli hrasjlut hpa7tli priklwis hpa7tmwatli fyifxre7t hjonli

drutta Salvia verbenaca is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to September, and the seeds ripen from July to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Cleistogomy (self-pollinating without flowers ever opening). The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: Flowers LeavesEdible Uses: Condiment TeaLeaves - raw or cooked. They are most often used as a flavouring in cooked foods. They are aromatic. The young leaves can be eaten fried or candied[183]. A herb tea is made from the leaves, it is said to improve the digestion. Flowers - raw. A flavouring in salads[177, 183].

tcanta None known

dwatta OphthalmicThe seed forms a thick mucilage when it is soaked for a few minutes in water. This is efficacious in removing small particles of dust from the eyes[4].

propta Seed - sow March/April in a greenhouse. Germination usually takes place within 2 weeks. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in early summer. In areas where the plant is towards the limits of its hardiness, it is best to grow the plants on in a greenhouse for their first winter and plant them out in late spring of the following year. Division in spring.

nwatta Requires a very well-drained light sandy soil in a sunny position[200]. Prefers a rich soil[1]. Plants can be killed by excessive winter wet[200]. This species is

well suited to the wild garden, growing well in the summer meadow[200]. A good bee plant[200]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 6.2.386 Bidens tripartita

Burr Marigold, Threelobe beggarticks

5 tlin 9 cyuc 2 kcaak 0 tcan 2 dwat 0.6 m hkuc htut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Bidens tripartita is a ANNUAL growing to 0.6 m (2ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, hover-flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist or wet soil.

kcakta Edible Parts: LeavesEdible Uses: Young leaves - cooked[105, 177, 183].

tcanta Dye RepellentYields a black dye[178]. The part of the plant that is used is not specified. The burning herb repels insects and flies[268]. The flowers yield a yellow dye of indifferent quality when alum is used as a mordant[4, 115, 268].

dwatta Antiseptic Aperient Astringent Diuretic Emmenagogue Febrifuge Narcotic Sedative StypticBurr marigold is little used as a medicine nowadays, but it was once esteemed for its styptic properties being used to quickly staunch blood flow - it was often used to treat uterine haemorrhage and conditions producing blood in the urine[254]. The whole plant is antiseptic, aperient, astringent, diuretic, emmenagogue, febrifuge, narcotic, sedative, styptic and sudorific[4, 61, 165, 218]. It is an excellent remedy for ruptured blood vessels and bleeding of any kind, and is of benefit to people with consumption[4]. It is used internally to treat bladder and kidney problems, blood in the urine, uterine bleeding, ulcerative colitis and peptic ulcers[238, 254]. Externally, it is used in the treatment of alopecia[238]. It is usually combined with a carminative herb such as ginger when used to treat digestive tract ailments[254]. The plant is harvested as it comes into flower and is dried for later use[238].

propta Seed - sow in situ during early spring and only just cover the seed. So long as the soil does not dry out, the seed usually germinates in 2 - 3 weeks at 15°C[134].

nwatta Succeeds in any moderately fertile damp to wet soil in full sun[200, 238]. The flowering heads smell like rosin or cedar when they are burnt[4]. The seed coats have reflexed prickles which allow them to adhere to clothing, animal fur etc[4]. When growing on the edge a pond, these seeds have been known to kill goldfish by adhering to their gills[4].

## 6.2.387 Asarum reflexum

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 0.2 m hkuc pcimhmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Asarum reflexum is a PERENNIAL growing to 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: Edible Uses: CondimentThe underground stem is a ginger substitute. The root has a pungent, aromatic smell like mild pepper and ginger mixed, but more strongly aromatic[245]. It is usually harvested in the autumn[159, 177] and can be dried for later use[K].

tcanta None known

dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe in the summer[134]. Stored seed will require 3 weeks cold stratification and should be sown in late winter[134]. The seed usually germinates in the spring in 1 - 4 or more weeks at 18°C[134]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light

## 6.2.381 *Arum italicum*

Italian lords and ladies, Italian Arum  
5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 0.4 m hkuc  
pcimhmimhtut cyutli kyuctupc hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli hjonli

drutta *Arum italicum* is a PERENNIAL growing to 0.4 m (1ft 4in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from April to May. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: RootEdible Uses: Tuber - cooked and used as a vegetable[2, 177]. An arrowroot can be extracted from the dried root[105]. The root must be thoroughly dried or cooked before being eaten, see the notes above on toxicity.

tcanta None known  
dwatta None known  
propta Seed - best sown in a greenhouse or cold frame as soon as it is ripe[134]. The seed usually germinates in 1 - 6 months at 15°C[134]. Stored seed should be sown in the spring in a greenhouse and can be slow to germinate, sometimes taking a year or more. A period of cold stratification might help to speed up the process. Sow the seed thinly, and allow the seedlings to grow on without disturbance for their first year, giving occasional liquid feeds to ensure that they do not become mineral deficient. When the plants are dormant in the autumn, divide up the small corms, planting 2 - 3 in each pot, and grow them on in light shade in the greenhouse for a further year, planting out when dormant in the autumn. Division of the corms in summer after flowering[200]. Larger corms can be planted out direct into their permanent positions, though it is best to pot up the smaller corms and grow them on for a year in a cold frame before planting them out.

nwatta Landscape Uses:Border, Container, Rock garden, Woodland garden. Prefers a humus rich soil and abundant water in the growing season[1]. Succeeds in sun or dry shade[90], preferring a shady position[4, 17, 31] and growing well in woodland conditions[1]. A polymorphic species[200], the British form has been separated off by some botanists as *A. neglectum*[17]. The leaves appear in the autumn, the plant staying green all winter[1, K]. The inflorescence has the remarkable ability to heat itself above the ambient air temperature to such a degree that it is quite noticeable to the touch[4]. This probably protects the flowers from damage by frost, or allows it to penetrate frozen ground. Members of this genus are rarely if ever troubled by browsing deer[233]. Special Features:Attractive foliage, Naturalizing, All or parts of this plant are poisonous.

## 6.2.382 *Ribes ambiguum*

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 0.6 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Ribes ambiguum* is a deciduous Shrub growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in May, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[2, 177]. An acid flavour[105], they are commonly eaten in areas where they grow wild[2]. A reasonable size, the green fruit can be 12mm in diameter[2, 266].

tcanta None known  
dwatta None known  
propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. Stored seed requires 3 months cold stratification at 0 - 9°C and should be sown as early in the year as possible[113, 164]. Under normal storage conditions the seed can remain viable for 17 years or more. Prick out

the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter, planting them out in late spring of the following year Cuttings of half-ripe wood, July/August in a frame[113]. Cuttings of mature wood of the current year's growth, preferably with a heel of the previous year's growth, November to February in a cold frame or sheltered bed outdoors[78, 200].

nwatta Easily grown in a moisture retentive but well-drained loamy soil of at least moderate quality[11, 200]. Quite tolerant of shade though not fruiting so well in such a position[11]. Prefers a cool sheltered position in a leafy soil[11]. Hardy to about -20°C[200]. Plants can harbour a stage of 'white pine blister rust', so they should not be grown in the vicinity of pine trees[155]. Plants in this genus are notably susceptible to honey fungus[200].

## 6.2.383 *Athamantha turbith*

Candy Carrot  
5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 0.6 m hkuc  
htut cyutli tcup hwicli hrasjlut hpa7tli flatprikliw hpa7tmwatli fyifxre7t hjonli

drutta *Athamantha turbith* is a PERENNIAL growing to 0.6 m (2ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Root[2, 105, 177]. No more details are given.

tcanta None known  
dwatta None known  
propta Seed - sow spring in a cold frame[1]. Germination usually takes place within 3 - 6 weeks at 13°C[134]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. The seed can also be sown in situ as soon as the soil is workable in the spring[134]. Division in spring, with care[200].

nwatta An easily grown plant, succeeding in most well drained fertile soils in a sunny position[1, 200, 233]. The long tap root is susceptible to rot in wet winters[200].

## 6.2.384 *Physalis alkekengi franchetii*

Winter Cherry  
5 tlin 9 cyuc 2 kcaak 0 tcan 2 dwat 0.5 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Physalis alkekengi franchetii* is a PERENNIAL growing to 0.5 m (1ft 8in) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Fruit LeavesEdible Uses: Fruit - raw or cooked[1, 2, 4, 7, 105]. The plant conveniently wraps up each fruit in its own 'paper bag' (botanically, the calyx) to protect it from pests and the elements. This calyx is toxic and should not be eaten[34, 65]. Rich in vitamins[100], with twice the vitamin C of lemons[179], but not much taste[178]. We have found them to be bitter and rather unpleasant[K]. Young leaves - cooked[105, 170, 179]. Caution is advised, the leaves are almost certainly poisonous, at least when raw.

tcanta Plants spread rapidly by their roots and can be grown as a ground cover[208]. They are best spaced about 1 metre apart each way[208].

dwatta Aperient Diuretic Expectorant Febrifuge Malaria Vitamin CThe plant has a long history of herbal use, and an

here:- The seed needs to be leached of toxins before it becomes safe to eat - the Indians would do this by slow-roasting the nuts (which would have rendered the saponins harmless) and then cutting them into thin slices, putting them into a cloth bag and rinsing them in a stream for 2 - 5 days[213]. Most of the minerals etc would also have been leached out by this treatment[K].

tcanta Soap WoodSaponins in the seed are a soap substitute[169]. The saponins can be easily obtained by chopping the seed into small pieces and infusing them in hot water. This water can then be used for washing the body, clothes etc. Its main drawback is a lingering odour of horse chestnuts[K]. Wood - weak, nicely grained. Used for house fittings, domestic items etc[11].

dwatta None known  
propta Seed - best sown outdoors or in a cold frame as soon as it is ripe[11, 80]. The seed germinates almost immediately and must be given protection from severe weather[130]. The seed has a very limited viability and must not be allowed to dry out. Stored seed should be soaked for 24 hours prior to sowing and even after this may still not be viable[80, 113]. It is best to sow the seed with its 'scar' downwards[130]. If sowing the seed in a cold frame, pot up the seedlings in early spring and plant them out into their permanent positions in the summer.

nwatta Landscape Uses:Specimen. Prefers a deep loamy well-drained soil but is not too fussy[1, 11]. The dormant plant is very cold-hardy, though the young growth in spring can be damaged by late frosts. It prefers growing in a continental climate, doing best in eastern and south-eastern England[200]. Most members of this genus transplant easily, even when fairly large[11]. Special Features:Attractive foliage, Not North American native, Blooms are very showy.

## 6.2.249 *Juniperus excelsa*

Grecian Juniper  
5 tlin 9 cyuc 2 kcaak 3 tcan 1 dwat 20 m hkuc  
htut cyutli hgatkyuctup hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli nyanhjen hjonli

drutta *Juniperus excelsa* is an evergreen Tree growing to 20 m (65ft 7in). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, and the seeds ripen in October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. A liquid is obtained from the fruit[146] (used for drinking?). The cones are about 7 - 12mm in diameter and take 2 years to mature[200].

tcanta Fuel Incense Miscellany Roofing WoodThe bark is used for roofing[146]. Wood - moderately hard, close and even grained, fragrant, good quality. Used for construction, fuel and it is also burnt as an incense[1, 146, 158]. The crushed foliage emits a warm resinous scent[185].

dwatta MiscellanyThe smoke from the branches is used in India to treat the delirium of fevers[240].

propta The seed requires a period of cold stratification. The seed has a hard seedcoat and can be very slow to germinate, requiring a cold period followed by a warm period and then another cold spell, each of 2 - 3 months duration[78, 81]. Soaking the seed for 3 - 6 seconds in boiling water may speed up the germination process[11]. The seed is best sown as soon as it is ripe in a cold frame. Some might germinate in the following spring, though most will take another year. Another possibility is to harvest the seed 'green' (when the embryo has fully formed but before the seedcoat has hardened). The seedlings can be potted up into individual pots when they are large enough to handle. Grow on in pots until large enough, then plant out in early summer. When stored dry, the seed can remain viable for several years[1]. Cuttings of mature wood, 5 - 10cm with a heel, September/October in a cold frame. Plant out in the following autumn[1, 78]. Layering in September/October. Takes 12 months[78].

nwatta Succeeds in dry soils. Succeeds in most soils if they are well drained, preferring a neutral or slightly alkaline soil[11] and succeeding on chalk[200]. Plants are tender when young, they require a sheltered position[1]. The crushed foliage emits a warm resinous scent[185]. Plants are usually dioecious though sometimes they are monoecious[11]. Male and female plants must be grown if seed is required. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is flat with shallow roots spreading near the soil surface [2-1].

## 6.2.250 *Ampelopsis brevipedunculata*

Porcelain Berry, Amur peppervine, Blueberry Climber, Porcelain Berry Vine  
5 tlin 8 cyuc 2 kcaak 1 tcan 2 dwat 20 m hkuc  
hmimhtut cyutli tcup hwicli hyishrasjlutnyik hpa7tli flatprikliw hpa7tmwatli hjonli

drutta *Ampelopsis brevipedunculata* is a deciduous Climber growing to 20 m (65ft 7in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from July to August, and the seeds ripen from October to November. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Fruit LeavesEdible Uses: Leaf buds - cooked[105]. Leaves and stems - cooked[2, 105, 177]. Fruit - raw or cooked[105, 177]. The fruit is 6 - 8mm in diameter[200] and is carried in small bunches like grapes[K]. Not very palatable[K].

tcanta An ornamental plant. Landscape Uses: Arbor, Container, Pollard.

dwatta Antiphologistic Depurative FebrifugeThe fresh fruits, roots and leaves are antiphologistic, depurative and febrifuge. Resolves clots[147]. It is used externally in the treatment of boils, abscesses and ulcers, traumatic bruises and aches[147].

propta Seed - sow in pots in a cold frame in the autumn or stratify for 6 weeks at 5°C and sow in the spring[200]. Germination can be quite slow, sometimes taking more than a year. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. When they are more than 20cm tall, they can be planted out into their permanent positions, preferably in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm long, July/August in a frame[78]. Cuttings or eyes in late autumn or winter. Either place them in the ground in a greenhouse or cold frame, or put them in pots. An eye cutting is where you have just one bud at the top and a short length of stem with a small part of the bark removed. These normally root well and grow away vigorously, being ready to plant into their permanent positions the following autumn. Layering into pots in late summer. Partially sever the stem in spring and then lift the new plants in the autumn[78].

nwatta Landscape Uses:Arbor, Container, Pollard. Prefers a deep rich loam in a warm sheltered position in full sun[11, 200]. Succeeds in poor soils[182]. Does well on a south wall[11, 219]. A very ornamental plant, there are some named varieties[182]. Most forms of this species, especially the sub-species *A. brevipedunculata maximowiczii*. (Reg.)Rehd. (syn *A. heterophylla*. Sieb. and Zucc.), are very hardy in Britain when dormant, but the cultivar 'Elegans' is frost-tender and usually grown as a pot plant[200]. The draft Flora of China has a different treatment for these plants, it recognises *A. heterophylla* as the correct name for *A. brevipedunculata maximowiczii* and reduces this species to a subspecies as *A. heterophylla brevipedunculata*[266]. The young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. Plants rarely fruit in Britain except after a long hot summer[200]. Another report

says that if the plant is growing in a poor soil on a south facing wall then it fruits quite regularly[182]. Plants fruit better if their roots are restricted, this can be achieved by root pruning in the winter or by putting the plant into a large container and then placing this in the soil[200]. Growth, especially in good soils, can be very vigorous and this is usually at the expense of the fruits[202]. Any pruning is best carried out in the winter[219]. The shoots have sticky pads and are self-supporting on walls[11]. Other reports say that plants climb by means of coiling tendrils but large plants often need tying in to support the weight of foliage[200, 219]. Special Features: Attracts birds, Attractive foliage, Not North American native, Invasive, Inconspicuous flowers or blooms.

### 6.2.251 Celtis caucasica

Caucasian hackberry

5 tin 9 cyuc 2 kcaak 0 tcan 0 dwat 20 m hkuc htut cyutli hgatkyuctup hwicli hyishrasljut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Celtis caucasica is a deciduous Tree growing to 20 m (65ft 7in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in April, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcaakta Edible Parts: FruitEdible Uses: Fruit - raw[3, 105]. A mealy pleasant taste[74]. The fruit is about 4 - 5mm in diameter, it has a thin, dry, sweet flesh with a pleasant flavour but a slight astringency[K]. The trees often produce large crops of fruit in Britain, but there is so little that is edible on each fruit that it is scarcely worthwhile[K].

tcanta Fuel WoodWood - very tough, elastic, durable, of high quality[74, 146]. An excellent fuel[146].

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame[200]. Stored seed is best given 2 - 3 months cold stratification and then sown February/March in a greenhouse[78, 200]. Germination rates are usually good, though the stored seed might take 12 months or more to germinate. The seed can be stored for up to 5 years[113]. As soon as they are large enough to handle, prick the seedlings out into individual pots. The leaves of seedlings often have a lot of white patches without chlorophyll, this is normal and older plants produce normal green leaves. Grow the seedlings on in a cold frame for their first winter, and plant them out in the following late spring or early summer[K]. Give them some protection from the cold for their first winter outdoors. Cuttings

nwatta Succeeds in any reasonably good soil, preferring a good fertile well-drained loamy soil[1, 11, 200]. Succeeds on dry gravels and on sandy soils[200]. Established plants are very drought resistant[74, 200]. Trees prefer hotter summers and more sunlight than are normally experienced in Britain, they often do not fully ripen their wood when growing in this country and they are then very subject to die-back in winter[1, 11, 200]. Trees can be very long-lived, perhaps to 1000 years[200]. This species is closely allied to *C. australis* but it is much hardier and is more likely to thrive in Britain than most other species in this genus[11, 200]. A tree at Kew in September 1989 was 12 metres tall though it was not bearing fruit[K]. Coppices well[146]. Plants in this genus are notably resistant to honey fungus[200].

### 6.2.252 Quercus phellos

Willow Oak

5 tin 9 cyuc 2 kcaak 0 tcan 2 dwat 20 m hkuc hmimhtut cyutli tcup hwicli jlutnyik hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta Quercus phellos is a deciduous Tree growing to 20 m (65ft) by 10 m (32ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from April to May, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated

by Wind. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure.

kcaakta Edible Parts: SeedEdible Uses: CoffeeSeed - cooked[2, 63, 105]. Rather small, it is only 1cm long[11, 200]. The seed can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread. The seed contains bitter tannins, these can be leached out by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute.

tcanta Buttons Charcoal Repellent Tannin WoodA mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth[20]. Oak galls are excrescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4]. The bark contains about 10% tannin and is a commercial source of that material[223]. Tannin is also found in the leaves and wood[223]. The seedcups are used as buttons[95]. Wood - close-grained, strong, not hard, heavy, not durable[46, 61, 82, 171, 227]. It weighs 46lb per cubic foot[227]. Of rather low quality for an oak but it is sufficiently abundant to be harvested commercially. The wood is used for construction, fellies of wheels and charcoal[46, 61, 82, 171, 227].

dwatta Analgesic Astringent Dysentery SalveA decoction of the wood chips or bark has been applied externally as an analgesic and as a bath for aches, pains, sores, cuts and haemorrhoids[257]. Any galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4].

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Landscape Uses:Firewood, Pest tolerant, Aggressive surface roots possible, Specimen, Street tree. Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Lime tolerant[188]. Young plants tolerate reasonable levels of side shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. Although it prefers warmer summers than are usually experienced in Britain[200], this species thrives in this country[11], though it rarely sets seed here[80]. Trees commence to bear seeds when about 20 years old in the wild and good crops are usually produced annually[229]. The tree flowers on new growth produced in spring, the seed taking two summers to ripen[229]. A very ornamental plant[1]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. Hybridizes freely with other members of the genus[200]. This species is notably resistant to honey fungus[88, 200]. Special Features:Attracts birds, North American native, Inconspicuous flowers or blooms.

### 6.2.253 Ulmus parvifolia

Chinese Elm, Lacebark Elm

5 tin 10 cyuc 2 kcaak 0 tcan 1 dwat 18 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Ulmus parvifolia is a deciduous Tree growing to 18 m (59ft) by 18 m (59ft) at a medium rate. See above for

hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli fyfjxre7t hjonli

drutta Cardaria draba is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: LeavesEdible Uses: CondimentYoung leaves and shoots - raw in salads or cooked as a potherb[2, 61, 105, 183]. A report says that the young leaves contain the toxin hydrogen cyanide, though does not give any more details[240]. In small quantities this substance is fairly harmless, and has even been recommended as having health benefits, but caution is suggested if you eat these leaves[K]. The pungent leaves are used as a seasoning[183]. The seed is used as a condiment, it is a pepper substitute[2, 17, 61, 74, 148, 183].

tcanta None known

dwatta Antiscorbatic CarminativeThe plant is antiscorbatic[240]. The seeds have been used as a cure for flatulence and fish poison[240]. It is assumed that this report is referring to food poisoning caused by eating suspect fish[K].

propta Seed - sow in situ in spring. There is very little need to encourage this plant, it is a rapidly spreading weed in Britain. Division in spring.

nwatta Succeeds in a sunny position in most soils.

### 6.2.378 Gastrodia elata

Tien Ma

5 tin 9 cyuc 2 kcaak 0 tcan 3 dwat 1 m hkuc pcmhmim cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Gastrodia elata is a PERENNIAL growing to 1 m (3ft 3in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcaakta Edible Parts: RootEdible Uses: Root - raw or roasted[61, 178]. Large[178].

tcanta None known

dwatta Analgesic Antispasmodic Aphrodisiac Carminative Cholagogue Epilepsy Sedative TonicThis species has been used in Chinese herbal medicine for over 1,500 years[238]. The root contains a number of phenolic compounds with medicinal actions[279]. It is a sweet, acrid, herb that is analgesic, anticonvulsive, antispasmodic, carminative, cholagogue, sedative and tonic[147, 174, 176, 238, 279]. It is used internally in the treatment of convulsive illnesses (such as epilepsy and tetanus), rheumatoid arthritis, vertigo and numbness associated with liver disharmony[238]. The root is harvested in the autumn and dried for later use[238]. The stem is aphrodisiac and tonic[218].

propta Seed - surface sow, preferably as soon as it is ripe, into the plants natural habitat near existing colonies, or onto a bed of Quercus wood inoculated with the fungus *Armillaria mellea* (introduce this fungus into your land with extreme caution since it kills trees and there is no known preventative[K]). The seed of this species is extremely simple, it has a minute embryo surrounded by a single layer of protective cells. It contains very little food reserves and depends upon a symbiotic relationship with a species of soil-dwelling fungus. The fungal hyphae invade the seed and enter the cells of the embryo. The orchid soon begins to digest the fungal tissue and this acts as a food supply for the plant. Division in autumn. The plant is very intolerant of root disturbance, any moving or dividing should be attempted in the autumn, keep a large ball of soil around the plant[1].

nwatta A saprophytic herb, it is without green parts and is entirely dependant upon a fungus for its nutrition[238]. This makes it very difficult to cultivate outside its native range. As well as its fungal host, it also requires a damp humus-rich soil in a sheltered woodland position[238]. The plants are very hardy, tolerating tempera-

tures down to at least -15˚c[238]. This plant is becoming increasingly rare in the wild, due to over-collection as a medicinal plant[238]. Methods of cultivating it have now been devised in China[238]. Orchids are, in general, shallow-rooting plants of well-drained low-fertility soils. Their symbiotic relationship with a fungus in the soil allows them to obtain sufficient nutrients and be able to compete successfully with other plants. They are very sensitive to the addition of fertilizers or fungicides since these can harm the symbiotic fungus and thus kill the orchid[230].

### 6.2.379 Lonicera venulosa

5 tin 9 cyuc 2 kcaak 0 tcan 0 dwat 1.5 m hkuc htut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Lonicera venulosa is a deciduous Shrub growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcaakta Edible Parts: FruitEdible Uses: The following report is for the closely related *L. villosa*, it would be worthwhile experimenting with this plant to check on edibility[K]. Fruit - raw or preserved[43, 105, 200]. A milder flavour than most edible honeysuckles, they can be eaten raw but are mainly used in making jams, jellies and refreshing drinks[183].

tcanta None known

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed requires 2 months cold stratification[113] and should be sown as soon as possible in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm with or without a heel, July/August in a frame. Good percentage[78]. Cuttings of mature wood of the current season's growth, 15 - 20cm with or without a heel, November in a cold frame. Good percentage[78]. Layering in autumn[200].

nwatta Grows best in a good moist soil in a sunny position, it does not fruit so well in the shade[200]. Closely related to *L. caerulea*[200].

### 6.2.380 Cirsium eriophorum

Wooly Thistle

5 tin 9 cyuc 2 kcaak 0 tcan 0 dwat 1.5 m hkuc htut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli fyfjxre7t hjonli

drutta Cirsium eriophorum is a BIENNIAL growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies), beetles. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcaakta Edible Parts: Flowers Leaves Oil StemEdible Uses: OilYoung leaves - raw[4, 183]. Young stems - raw or cooked. An asparagus or rhubarb substitute[4, 12, 183]. The stems are peeled and soaked in water to remove the bitterness, they are then said to be excellent eating[4, 183]. Flower buds - cooked. A globe artichoke substitute[2, 177, 183] but much smaller and even more fiddly.

tcanta Oil TinnerThe seed fluff is used as a tinder[106]. The seed of all species of thistles yields a good oil by expression[4]. No details of potential yields etc are given[K].

dwatta None known

propta Seed - sow early spring or autumn in situ. Germination usually takes place within 2 - 8 weeks at 20˚c.

nwatta An easily grown plant, succeeding in any ordinary garden soil in a sunny position[200].

propta Seed - sow spring in a cold frame. Only just cover the seed and do not allow the compost to become dry. Prick out the seedlings into individual pots when they are large enough to handle, and grow them on for their first winter in pots. Plant them out into their permanent positions in spring or early summer. Division in spring or autumn. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Landscape Uses:Border, Container, Foundation, Seashore, Specimen, Woodland garden. Succeeds in any moderately fertile moisture retentive soil in sun or semi-shade[200]. Grows well in heavy clay soils. A rather greedy plant, it is apt to impoverish the soil[1]. The flowers attract butterflies and moths[30]. The plant also attracts various beneficial insects such as ladybirds, lacewings and hoverflies to the garden, these insects will help to control insect pests in the garden[201, 238]. Special Features: Attractive foliage, North American native, Naturalizing, Suitable for cut flowers, Suitable for dried flowers.

### 6.2.375 *Dendranthema x grandiflorum*

Chrysanthemum, Cut Mum, Garden Mum, Pot Mum, Florist's Chrysanthemum

5 tlin 10 cyuc 2 kcaak 0 tcan 3 dwat 1.5 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprklwix hpa7tmwatli xre7t hjonli

drutta *Dendranthema x grandiflorum* is a PERENNIAL growing to 1.5 m (5ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcaakta Edible Parts: Flowers LeavesEdible Uses: TeaThe flower heads or petals[46, 116, 179] are parboiled and served as a salad with tofu and seasoned with vinegar or soya sauce[183]. They can also be prepared as tempura, pickled, dried or added to soups[183]. The petals contain about 1.9% protein, 0.9% fat, 5.3% carbohydrate, 0.7% ash[179]. Leaves - cooked[46, 105, 179]. Used as fritters, they are aromatic[183]. Some varieties have been selected for their low bitterness[116]. An aromatic tea is made from the leaves[183]. A tangy aromatic tea is made from the flowers or flower petals[179]. For a sweeter tea only the petals are used[183].

tcanta PollutionPlants have been grown indoors in pots in order to help remove toxins from the atmosphere. It is especially good at removing chemical vapours, especially formaldehyde, benzene and ammonia[259].

dwatta Antibacterial Antifungal Carminative Depurative Diaphoretic Febrifuge Ophthalmic Refrigerant SedativeChrysanthemum flowers, known in China as Ju Hua, are a bitter aromatic herb that has been used for thousands of years in Chinese medicine[238, 254]. The flower heads are drunk as a refreshing tisane and are used to improve vision, soothe sore eyes, relieve headaches, counter infections etc[254]. They are antibacterial, antifungal, anti-inflammatory, carminative, depurative, diaphoretic, febrifuge, ophthalmic, refrigerant and sedative[116, 147, 176, 218, 238]. Taken internally they dilate the coronary artery, thus increasing the flow of blood to the heart, and so are used in the treatment of hypertension, coronary heart diseases and angina[238]. The flowers are harvested when fully open in the autumn and are dried for later use[238]. In China they are steamed before being dried to make them less bitter[238]. The leaf juice is smeared onto wounds[218].

propta Seed - sow spring to early summer in a greenhouse and only just cover the seed. It usually germinates in 10 - 18 days at 15°C but if it does not germinate within 4 weeks then try chilling the seed for 3 weeks in the salad compartment of a fridge[164]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. This is a hybrid species and so will not breed true from seed. Division in spring. Larger

clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Landscape Uses:Border, Container, Foundation, Massing, Specimen. Succeeds in most well-drained fertile soils in a sunny position[1, 200]. This species is not fully hardy in Britain, many of its cultivars requiring greenhouse protection in the colder areas of the country[1]. The chrysanthemum is widely cultivated as an ornamental flowering plant[200], there are many named varieties. It is also occasionally grown in the Orient for its edible leaves, a number of cultivars have been developed with leaves that are low in bitterness[116]. It has been proposed (1999) to restore this species to *Chrysanthemum* as *C. x morifolium* Ramat. since the plant is so widely known under this name. Special Features:Attractive foliage, Fragrant foliage, Attracts butterflies, Suitable for cut flowers, Suitable for dried flowers, Fragrant flowers, Attractive flowers or blooms, Seldomly re-blooms.

### 6.2.376 *Ferula gummosa*

Galbanum

5 tlin 9 cyuc 2 kcaak 0 tcan 2 dwat 1 m hkuc htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatprklwix hpa7tmwatli fyfxre7t hjonli

drutta *Ferula gummosa* is a PERENNIAL growing to 1 m (3ft 3in) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to June, and the seeds ripen from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcaakta Edible Parts: Edible Uses: CondimentThe gum resin obtained from the root is used as a celery-like food flavouring[177, 238].

tcanta The aromatic gum resin 'Galbanum' is obtained from wounds made in the stem[4]. It is collected by removing soil from around the top of the root and then cutting a slice off the root[64, 238] and can also be obtained from incisions made in the stem[238]. It is used medicinally and is also an ingredient of incense[1, 64, 171, 238]. It was an important ingredient of the incense used by the Israelites[268].

dwatta Antispasmodic Carminative Expectorant StimulantThe whole plant, but especially the root, contains the gum resin 'galbanum'[4]. This is antispasmodic, carminative, expectorant and stimulant[4, 46, 64, 238]. It is used internally in the treatment of chronic bronchitis, asthma and other chest complaints[4, 238]. It is a digestive stimulant and antispasmodic, reducing flatulence, griping pains and colic[254]. Externally it is used as a plaster for inflammatory swellings, ulcers, boils, wounds and skin complaints[4, 238].

propta Seed - best sown as soon as the seed is ripe in a greenhouse in autumn[1]. Otherwise sow in April in a greenhouse. Prick out the seedlings into individual pots as soon as they are large enough to handle. Plant them out into their permanent positions whilst still small because the plants dislike root disturbance[1]. Give the plants a protective mulch for at least their first winter outdoors. Division in autumn. This may be inadvisable due to the plants dislike of root disturbance.

nwatta Succeeds in most soils[1]. Requires a deep fertile soil in a sunny position[200]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°C[200]. Another report says that it tolerates temperatures down to at least -15°C and should therefore succeed outdoors in most parts of the country[238]. Plants are intolerant of root disturbance due to their long taproot[200]. They should be planted into their final positions as soon as possible. The flowers have an unpleasant smell[245].

### 6.2.377 *Cardaria draba*

Hoary Cress, Whitetop

5 tlin 9 cyuc 2 kcaak 0 tcan 1 dwat 1 m hkuc

USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in leaf from March to January, in flower from September to October, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure.

kcaakta Edible Parts: Fruit Inner bark LeavesEdible Uses: Leaves - raw or cooked[105, 177]. Immature fruits, used just after they are formed - raw or cooked[105, 132]. An aromatic, unusual flavour, leaving the mouth feeling fresh and the breath smelling pleasant[132]. It contains about 34.4% protein, 28.2% fat, 17% carbohydrate, 5% ash[132]. Inner bark - cooked. A mucilaginous texture[105, 177]. No more details are given but inner bark is often dried, ground into a powder and then used as a thickening in soups etc or mixed with cereals when making bread[K].

tcanta Shelterbelt WoodFairly resistant to maritime exposure, it can be grown in a shelter belt[K].

dwatta Antidote Demulcent Diuretic Expectorant Febrifuge Hypnotic LithotropicThe leaves are antidote and lithotropic[218]. The stem bark is demulcent, diuretic, expectorant, febrifuge, hypnotic and lithotropic[178, 218]. The flowers are used in the treatment of fevers and neuritis[218].

propta Seed - if sown in a cold frame as soon as it is ripe, it usually germinates within a few days[200]. Stored seed does not germinate so well and should be sown in early spring[200]. One to two months stratification can improve germination rates. The seed can also be harvested 'green' (when it has fully developed but before it dries on the tree) and sown immediately in a cold frame. It should germinate very quickly and will produce a larger plant by the end of the growing season[80]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Plants should not be allowed to grow for more than two years in a nursery bed since they form a tap root and will then move badly. Layering of suckers or coppiced shoots[200].

nwatta Landscape Uses:Aggressive surface roots possible, Pollard, Specimen, Street tree. Easily grown in any soil of at least moderate quality so long as it is well drained[1]. Fairly tolerant of maritime exposure, it succeeds outdoors in a very exposed position at Rosewarne in N. Cornwall[K]. Resistant to 'Dutch elm disease', a disease that has destroyed the greater part of all the elm trees growing in Britain. The disease is spread by a beetle. There is no effective cure (1992) for the problem, but most E. Asian, though not Himalayan, species are resistant (though not immune) to the disease so the potential exists to use these resistant species to develop new resistant hybrids with the native species[200]. The various species hybridize freely, the pollen stores well and can be kept for use with species that flower at different times[200]. Trees retain their leaves until early in the new year[11] and in areas with mild winters will often retain them until new leaves are formed in the spring[188]. A good companion for grapes[18]. There are some named forms, developed for their ornamental value. 'Frosty' and 'Geisha' are small bushes whilst 'Pumila' is a minute bush for the rock garden. Special Features: Not North American native, Inconspicuous flowers or blooms.

### 6.2.254 *Celtis laevigata*

Sugarberry, Netleaf hackberry, Texan sugarberry, Sugar Hackberry

5 tlin 10 cyuc 2 kcaak 3 tcan 1 dwat 18 m hkuc htut cyutli hgatkyuctcup hwicli hyishrasjlutnyik hpa7tli flatprklwix hpa7tmwatli xre7t hjonli

drutta *Celtis laevigata* is a deciduous Tree growing to 18 m (59ft 1in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in April, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally

poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcaakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[61, 105, 257]. The flesh is thin, dry and sweetish, covering a single large seed[149, 183]. The fruit, which is orange to brown or red when fully ripe, is 5 - 8mm in diameter[235, 270].

tcanta Fuel Miscellany WoodWood - soft, not strong, close grained. It weighs 49lb per cubic foot and is used for cheap furniture, fencing, fuel[61, 82, 227].

dwatta Miscellany VDA decoction of the bark has been used in the treatment of sore throats[257]. It has also been used, mixed with powdered shells, as a treatment for VD[257].

propta Seed - best sown as soon as it is ripe in a cold frame[200]. Stored seed is best given 2 - 3 months cold stratification and then sown February/March in a greenhouse[78, 200]. Germination rates are usually good, though the stored seed might take 12 months or more to germinate. The seed can be stored for up to 5 years[113]. As soon as they are large enough to handle, prick the seedlings out into individual pots. The leaves of seedlings often have a lot of white patches without chlorophyll, this is normal and older plants produce normal green leaves. Grow the seedlings on in a cold frame for their first winter, and plant them out in the following late spring or early summer[K]. Give them some protection from the cold for their first winter outdoors. Cuttings

nwatta Landscape Uses:Erosion control, Pest tolerant, Aggressive surface roots possible, Street tree, Woodland garden. Succeeds in any reasonably good soil, preferring a good fertile well-drained loamy soil[1, 11, 200]. Succeeds on dry gravels and on sandy soils[200]. Plants are usually found on clay soils in the wild[229]. Established plants are very drought resistant[200]. Trees prefer hotter summers and more sunlight than are normally experienced in Britain, they often do not fully ripen their wood when growing in this country and they are then very subject to die-back in winter[1, 11, 200]. A very variable species, according to some botanists these merit varietal status whilst other botanists say that the differences are too slight[227]. Trees are moderate to fast-growing, probably living no more than 125 - 150 years[229]. They can be very long-lived according to another report, perhaps surviving for 1000 years[200]. Trees fruit heavily most years[229]. Plants in this genus are notably resistant to honey fungus[200]. Special Features:North American native, Naturalizing, Wetlands plant, Attracts butterflies, Inconspicuous flowers or blooms. The plant is heat tolerant in zones 9 through 3. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone, 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2]. The root pattern is flat with shallow roots forming a plate near the soil surface [1-2].

### 6.2.255 *Celtis jessoensis*

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 15 m hkuc htut cyutli hgatkyuctcup hwicli hyishrasjlut hpa7tli flatprklwix hpa7tmwatli xre7t hjonli

drutta *Celtis jessoensis* is a deciduous Tree growing to 15 m (49ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in April, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw[105, 177]. We have no further information, but the fruit is liable to consist of a thin, sweet, though dry and mealy flesh around a large seed[K].

tcanta None known

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame[200]. Stored seed is best given 2 - 3 months cold stratification and then sown February/March in a greenhouse[78, 200]. Germination rates are usually good, though the stored seed might take 12 months or more to germinate. The seed can be stored for up to 5 years[113]. As soon as they are large enough to handle, prick the seedlings out into individual pots. The leaves of seedlings often have a lot of white patches without chlorophyll, this is normal and older plants produce normal green leaves. Grow the seedlings on in a cold frame for their first winter, and plant them out in the following late spring or early summer[K]. Give them some protection from the cold for their first winter outdoors. Cuttings

nwatta Succeeds in any reasonably good soil, preferring a good fertile well-drained loamy soil[1, 11, 200]. Succeeds on dry gravels and on sandy soils[200]. Established plants are very drought resistant[200]. Trees prefer hotter summers and more sunlight than are normally experienced in Britain, they often do not fully ripen their wood when growing in this country and they are then very subject to die-back in winter[1, 11, 200]. Trees can be very long-lived, perhaps to 1000 years[200]. This species is closely related to *C. bungeana*[11]. Plants in this genus are notably resistant to honey fungus[200].

### 6.2.256 Carya texana

Black Hickory

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 15 m hkuc

htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyif hjonli

drutta Carya texana is a deciduous Tree growing to 15 m (49ft 3in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf from June to October, in flower from April to May. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: Seed - raw or cooked[105, 177]. A sweet flavour, but the seed is small with a very thick shell[149, 227]. Another report says that the kernel has a bitter flavour[274]. The seed is up to 4cm long[229]. The seed ripens in late autumn and, when stored in its shell in a cool place, will keep for at least 6 months[K].

tcanta Fuel WoodWood - close grained, tough, strong, brittle[82, 149]. It weighs 50lb per cubic foot[235]. Used mainly for fuel, it burns well giving off a lot of heat[82, 149].

dwatta None known

propta Seed - requires a period of cold stratification. It is best sown in a cold frame as soon as it is ripe[78]. Stored seed should be kept moist (but not wet) prior to sowing and should be sown in a cold frame as soon as possible[78]. Where possible, sow 1 or 2 seeds only in each deep pot and thin to the best seedling. If you need to transplant the seedlings, then do this as soon as they are large enough to handle, once more using deep pots to accommodate the tap root. Put the plants into their permanent positions as soon as possible, preferably in their first summer, and give them some protection from the cold for at least the first winter[78, K]. Seed can also be sown in situ so long as protection is given from mice etc and the seed is given some protection from cold[200] (a plastic bottle with the top and bottom removed and a wire mesh top fitted to keep the mice out is ideal)

nwatta Prefers a deep moisture-retentive loam in a sunny sheltered position, requiring a good summer for best development[1, 63, 137, 200]. Slow growing[200]. There is some confusion over the naming of this species, with two separate authors of the name being cited. *C. texana*. Buckl. is used by some authorities as the correct name and *C. buckleyi* (q.v.) is given as a synonym of that species[11, 137].

However, other authorities cite *C. texana*. DC. as the correct name, in this case *C. buckleyi* remains as a separate species[82]. Plants are strongly tap-rooted and should be planted in their permanent positions as soon as possible[1, 137]. Sowing in situ would be the best method so long as the seed could be protected from mice[1, 200]. Trees are late coming into leaf (usually late May to June) and lose their leaves early in the autumn (usually in October)[137]. During this time they cast a heavy shade. These factors combine to make the trees eminently suitable for a mixed woodland planting with shrubs and other trees beneath them[137]. Plants in this genus are notably resistant to honey fungus[200]. Most species in this genus have quite a wide range of distribution and, in order to find trees more suited to this country, seed from the most appropriate provenances should be sought[137]. Most trees growing in Britain at present tend to only produce good seed after hot summers[137]. Trees are self-fertile but larger crops of better quality seeds are produced if cross-pollination takes place[229].

### 6.2.257 Bumelia lanuginosa

Chittamwood

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 15 m hkuc

htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwishsom hpa7tmwatli xre7t hjonli

drutta Bumelia lanuginosa is a deciduous Tree growing to 15 m (49ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in saline soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: FruitEdible Uses: Gum GumFruit - usually pickled[161, 177]. Not very tasty according to one report[61] whilst another says that large quantities can cause stomach upsets[149]. The fruit is between 1 - 2cm in diameter[200]. A clear viscid gum is obtained from the cut wood[82]. It also exudes freely from wounds on the trunk and branches[227]. The dried and ground up bark is used like chicla as a chewing gum[61, 177].

tcanta Gum Gum Shelterbelt WoodWood - heavy, rather soft, not strong, close grained[82, 149]. It weighs about 40lb per cubic foot[227]. Used for tool handles, cabinet making etc[82, 149].

dwatta None known

propta Seed - we have no details on this species but would suggest that if ripe seed can be obtained it should be sown straight away in a cold greenhouse. Stored seed can be sown in late winter or early spring in a greenhouse. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter, planting them out into their permanent positions in late spring or early summer, after the last expected frosts.

nwatta Succeeds in a warm sunny site in any freely draining moderately fertile soil[200]. Tolerates salt spray[82]. This species is probably hardy in the milder areas of the country[1, 11]. Another report says that plants are cut back by temperatures below about -15°c but that they can regenerate freely from the base[200]. The flowers are an excellent source of honey[274].

### 6.2.258 Fagus lucida

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 15 m hkuc

pcimhmimhtut cyutli kyucctup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Fagus lucida is a deciduous Tree growing to 15 m (49ft 3in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from April to June, and the seeds ripen from October to November. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils.

nwatta Requires a lime-free humus-rich moist soil in sun or light shade[182]. Prefers moderate shade, especially on the roots[1, 200], but it can also succeed in full sun[11]. Grows well in a woodland garden[200]. Dormant plants are hardy to about -20°c[200]. The young growth in spring is susceptible to damage by late frosts but the plants are otherwise of easy cultivation[182]. Flowers are produced on the previous years wood[200]. Plants in this genus are notably resistant to honey fungus[200].

### 6.2.372 Prunus glandulosa

Korean Cherry, Dwarf Flowering Almond

5 tlin 8 cyuc 2 kcaak 0 tcan 1 dwat 1 m hkuc

htut cyutli kyucctup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Prunus glandulosa is a deciduous Shrub growing to 1 m (3ft 3in) by 1 m (3ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from April to May, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Fruit SeedEdible Uses: Fruit - preserved or pickled[74, 177, 183]. The fruit is about 10mm in diameter and contains one large seed[200]. Seed - raw or cooked. Do not eat the seed if it is too bitter - see the notes above on toxicity.

tcanta DyeA green dye can be obtained from the leaves[168]. A dark grey to green dye can be obtained from the fruit[168].

dwatta Although no specific mention has been seen for this species, all members of the genus contain amygdalin and prunasin, substances which break down in water to form hydrocyanic acid (cyanide or prussic acid). In small amounts this exceedingly poisonous compound stimulates respiration, improves digestion and gives a sense of well-being[238].

propta Seed - requires 2 - 3 months cold stratification and is best sown in a cold frame as soon as it is ripe[200]. Sow stored seed in a cold frame as early in the year as possible[200]. Protect the seed from mice etc. The seed can be rather slow, sometimes taking 18 months to germinate[113]. Prick out the seedlings into individual pots when they are large enough to handle. Grow them on in a greenhouse or cold frame for their first winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood with a heel, July/August in a frame[11, 200]. Softwood cuttings from strongly growing plants in spring to early summer in a frame[200]. Layering in spring.

nwatta Thrives in a well-drained moisture-retentive loamy soil[11, 200]. Prefers some lime in the soil but is likely to become chlorotic if too much lime is present[1]. Succeeds in sun or partial shade though it fruits better in a sunny position[11, 200]. Plants flower best when grown against a south or west-facing wall[188]. A very ornamental plant[1]. Most members of this genus are shallow-rooted and will produce suckers if the roots are damaged[238]. Plants in this genus are notably susceptible to honey fungus[200]. Special Features: Not North American native, Fragrant flowers, Attractive flowers or blooms.

### 6.2.373 Phalaris canariensis

Canary Grass, Annual canarygrass

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 1 m hkuc

htut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Phalaris canariensis is a ANNUAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf from May to October, in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist or wet soil.

kcakta Edible Parts: Leaves SeedEdible Uses: Seed - cooked. Widely grown as a food for caged birds, the seed

is rather small but can also be used as a cereal for making porridge etc[2]. It can be ground into a flour and used for making cakes, puddings etc[2, 22, 46, 61, 74, 115]. Leaves - cooked[106]. The young plant is used[177].

tcanta None known

dwatta None known

propta Seed - sow spring in situ[162].

nwatta An easily grown plant, succeeding in an ordinary garden soil[1]. It is tolerant of most conditions, dry or wet[200]. Cultivated for its seed which is commonly used in wild bird food mixes[1].

### 6.2.374 Solidago canadensis

Canadian Goldenrod, Shorthair goldenrod, Harger's goldenrod, Rough Canada goldenrod, Common Goldenrod
5 tlin 10 cyuc 2 kcaak 0 tcan 2 dwat 1.8 m hkuc
hminhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli fyfxxre7t hjonli

drutta Solidago canadensis is a PERENNIAL growing to 1.8 m (6ft) by 1 m (3ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 3. It is in flower from August to October, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves Oil SeedEdible Uses: Oil TeaYoung leaves and flowering stems - cooked[172]. Seed[22, 46, 61, 105, 161, 183]. Used as a thickener in soups[172]. The seed is very small[K] and is only used as a survival food when all else fails[222]. A tea can be made from the flowers and/or the leaves[172, 183].

tcanta Dye OilMustard, orange and brown dyes can be obtained from the whole plant[168]. The source of 'Canadian goldenrod' oil[46]. We have no further details, but it is likely to be an essential oil.

dwatta Antiseptic Haemostatic Kidney Salve Styptic UrinaryHaemostatic, styptic[168, 172]. The root is applied as a poultice to burns[168, 172, 222]. An infusion of the dried powdered herb can be used as an antiseptic[168, 172]. The blossoms are analgesic, astringent and febrifuge[257]. They have been chewed and the juice slowly swallowed to treat sore throats[213, 222]. A tea made from the flowers is used in the treatment of diarrhoea, body pains, fevers and snakebites[222, 257]. The plant contains quercetin, a compound that is reportedly useful in the treatment of haemorrhagic nephritis[222]. This plant is said to have similar medicinal properties to *S. virgaurea*. These are: Goldenrod is a safe and gentle remedy for a number of disorders. In particular, it is a valuable astringent remedy treating wounds and bleeding, whilst it is particularly useful in the treatment of urinary tract disorders, being used both for serious ailments such as nephritis and for more common problems such as cystitis[254]. The plant contains saponins that are antifungal and act specifically against the *Candida* fungus which is the cause of vaginal and oral thrush[238, 254]. It also contains rutin which is used to treat capillary fragility, and phenolic glycosides which are anti-inflammatory[238]. The leaves and flowering tops are anthelmintic, anti-inflammatory, antiseptic, aromatic, astringent, carminative, diaphoretic, mildly diuretic, febrifuge and stimulant[4, 7, 9, 21, 147, 165]. A good vulnerary herb, it has also proved of value when used internally in the treatment of urinary infections, chronic catarrh, skin diseases, influenza, whooping cough, bladder and kidney stones etc[4, 238]. Due to its mild action, goldenrod is used to treat gastro-enteritis in children[254]. It makes an excellent mouthwash in the treatment of thrush[7]. The plant is gathered in the summer and dried for later use[7]. The seed is anticoagulant, astringent and carminative[1218]. A homeopathic remedy is made from the plant[9]. It is used in the treatment of kidney and bladder disorders, rheumatism and arthritis[9]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve *Solidago canadensis* for infections of the urinary tract, and kidney and bladder stones (see [302] for critics of commission E).

propta Seed - sow March/April in a greenhouse and only just cover the seed. Germination usually takes place in 1 - 3 months at 15°c[134]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. When the plants are large enough to handle, plant them out into their permanent positions in late spring or early summer. Division in early spring or autumn[111].

nwatta Succeeds in ordinary garden soil, tolerating partial shade[200]. Requires a well-drained soil and a sheltered position[42]. Prefers a deep rich sandy loamy soil[1, 111]. Prefers a soil that is not too rich and a sunny position[200]. Grows well on hot dry banks and in thin grass[42, 200]. Established plants are drought tolerant[190]. Plants are hardy to about -15°c[187]. Plants seem to be immune to the predations of rabbits[233].

### 6.2.370 Lavandula x intermedia

Lavender, Lavandin

5 tlin 9 cyuc 2 kcaak 5 tcan 2 dwat 1.2 m hkuc hmimhtut cyutli hcatkytucup hwicli hrasjlutnyik hpa7tli flatpriklwissilpwni hpa7tmwatli xre7t hjonli

drutta Lavandula x intermedia is an evergreen Shrub growing to 1.2 m (4ft) by 1 m (3ft 3in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf all year, in flower from July to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline and saline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

kcakta Edible Parts: Edible Uses: Condiment TeaThe following uses are for *L. angustifolia*, they should also apply to this hybrid:- Leaves, petals and flowering tips - raw. Used as a condiment in salads, soups, stews etc[2, 15, 183]. They provide a very aromatic flavour[7] and are too strong to be used in any quantity[K]. The fresh or dried flowers are used as a tea[183]. The fresh flowers are also crystallized or added to jams, ice-creams, vinegars etc as a flavouring[238]. An essential oil from the flowers is used as a food flavouring[183].

tcanta Companion Essential Hedge Incent Pot-pourri RepellentThe following uses are for the closely related *L. angustifolia*, they should also apply to this hybrid:- The essential oil that is obtained from the flowers is exquisitely scented and has a very wide range of applications, both in the home and commercially. It is commonly used in soap making, in making high quality perfumes (it is also used in 'Eau de Cologne'), it is also used as a detergent and cleaning agent, a food flavouring etc[21, 46, 57, 171, 238] and as an insect repellent[201]. Yields of 0.8 - 1% of the oil are obtained[7]. When growing the plant for its essential oil content, it is best to harvest the flowering stems as soon as the flowers have faded[245]. The aromatic leaves and flowers are used in pot-pourri[238] and as an insect repellent in the linen cupboard etc[14, 18, 20]. They are also said to repel mice[20]. The flowering stems, once the flowers have been removed for use in pot-pourri etc, can be tied in small bundles and burnt as incense sticks[245]. Can be grown as a low hedge, responding well to trimming[29].

dwatta Antihalitosis Antiseptic Antispasmodic Aromatherapy Aromatic Carminative Chologogue Diuretic Nervine Sedative Stimulant Stomachic TonicThe following uses are for *L. angustifolia*, they should also apply to this hybrid:- Lavender is a commonly used household herbal remedy. An essential oil obtained from the flowers is antihalitosis, antiseptic, antispasmodic, aromatic, carminative, chologogue, diuretic, nervine, sedative, stimulant, stomachic and tonic[4, 7, 9, 21, 165, 238]. It is not often used internally, though it is a useful carminative and nervine[4]. It is mainly used externally where it is an excellent restorative and tonic - when rubbed into the temples, for example, it can cure a nervous headache, and it is a delightful addition to the bath-water[4]. Its antiseptic properties also make it useful in the treatment of burns, sunburn, scalds, bites, vaginal discharge, anal fissure etc, where it also soothes the affected part of the body and can prevent the formation of

permanent scar tissue[4, 238]. The essential oil is used in aromatherapy. Its keyword is 'Immune system'[210].

propta Seed - sow spring in a greenhouse and only just cover the seed[4]. It usually germinates in 1 - 3 months at 15°c. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse or cold frame for their first winter, planting them out in late spring after the last expected frosts. This species is a hybrid and will not come true from seed. Cuttings of half-ripe wood 7 - 10cm with a heel, July/August in a frame. Usually very east, a high percentage will root within a few weeks[78]. Grow them on in the greenhouse for their first winter and plant them out in late spring after the last expected frosts. Cuttings 7cm with a heel succeed at almost any time of the year[1]. Layering.

nwatta Landscape Uses:Alpine garden, Border, Container, Ground cover, Massing, Rock garden, Seashore, Specimen. Succeeds in almost any soil so long as it is well-drained and not too acid[1, 200]. Prefers a sunny position in a neutral to alkaline soil[1, 4, 14]. Prefers a light warm dry soil[37]. When grown in rich soils the plants tend to produce more leaves but less essential oils[4]. Established plants are drought tolerant[190]. Very tolerant of salt wind exposure[K]. When growing for maximum essential oil content, the plant must be given a very warm sunny position and will do best in a light sandy soil, the fragrance being especially pronounced in a chalky soil[245]. Plants are hardy to between -10 and -15°c[184]. Lavender is a very ornamental plant that is often grown in the herb garden and is also grown commercially for its essential oil[1, 4]. This species is a very variable hybrid between the two main species of lavender, *L. angustifolia* and *L. latifolia*[200], There are several named varieties[200, 238]. Not a very long-lived plant, it can be trimmed to keep it tidy but is probably best replaced every 10 years[200]. Any trimming is best done in spring and should not be done in the autumn since this can encourage new growth that will not be very cold-hardy[200]. A good bee plant, also attracting butterflies and moths[7, 24, 30]. Lavender makes a good companion for most plants[54], growing especially well with cabbages[14]. Special Features: Attractive foliage, Fragrant foliage, Not North American native, Attracts butterflies, Suitable for cut flowers, Suitable for dried flowers, Extended bloom season in Zones 9A and above, Fragrant flowers, Attractive flowers or blooms.

### 6.2.371 Menziesia ferruginea

False Huckleberry, Rusty menziesia
5 tlin 9 cyuc 2 kcaak 0 tcan 1 dwat 1.8 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta Menziesia ferruginea is a deciduous Shrub growing to 1.8 m (6ft). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from May to June. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Fruit NectarEdible Uses: Fruit - fresh or dried[61, 105, 183]. The fruit is about 5 - 7mm in diameter[200]. The nectar has been sucked from the flowers to sweeten the mouth[257].

tcanta None known
dwatta Cardiac Poulitce StomachicThe leaves are cardiac[257]. They have been chewed to relieve heart pain and treat stomach problems[257]. A poultice of the heated leaves has been applied to sores and swellings[257].

propta Seed - best sown in a shady position in a cold frame in the autumn[200] but it can also be sown in late winter [78]. Surface sow and do not allow the compost to become dry. Germination is variable and can take 1 - 2 months at 15°c[78]. Keep the seedlings heavily shaded and prick them out into individual pots when they are 12 months old[78]. Plant them out into their permanent positions in the summer once they are more than 15cm tall. Cuttings of semi-ripe wood, 2 - 5cm with a heel, May/June in a frame. Keep them shaded. The cuttings are very slow to root but usually a good percentage will succeed[78]. Division in early spring just before active growth begins[78]. Layering.

It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Leaves Oil SeedEdible Uses: Coffee OilYoung leaves - raw. A very nice mild flavour, but the leaves quickly become tough so only the youngest should be used. New growth is usually produced for 2 periods of 3 weeks each year, one in spring and one in mid-summer. Edible seed - raw or cooked[105, 177]. Rich in oil. The seed should not be eaten in large quantities. It can be dried and ground into a powder, then used with cereal flours in making bread, cakes etc. An edible semi-drying oil is obtained from the seed[105, 177]. The roasted seed is a coffee substitute.

tcanta OilNone known

dwatta None known

propta Seed - the seed has a short viability and is best sown as soon as it is ripe in the autumn in a cold frame. Protect the seed from mice. Germination takes place in the spring. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. The seedlings are slow growing for the first few years and are very susceptible to damage by late frosts. The seed can also be sown in an outdoor seedbed in the autumn. The seedlings can be left in the open ground for three years before transplanting, but do best if put into their final positions as soon as possible and given some protection from spring frosts.

nwatta Thrives on a light or medium soil[11], doing well on chalk[1], but ill-adapted for heavy wet soils[1]. Young trees are very shade tolerant, but are subject to frost damage so are best grown in a woodland position which will protect them[200]. Although very cold hardy, this species requires hotter summers than are normally experienced in Britain so is not usually a success here and is very slow growing[200]. Trees have surface-feeding roots and also cast a dense shade. This greatly inhibits the growth of other plants and, especially where a number of the trees are growing together, the ground beneath them is often almost devoid of vegetation.

### 6.2.259 Magnolia hypoleuca

Whitebark Magnolia
5 tlin 9 cyuc 2 kcaak 0 tcan 2 dwat 15 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwiss hpa7tmwatli xre7t hjonli

drutta Magnolia hypoleuca is a deciduous Tree growing to 15 m (49ft) by 6 m (19ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in June. The species is hermaphrodite (has both male and female organs) and is pollinated by Beetles. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. It can tolerate atmospheric pollution.

kcakta Edible Parts: LeavesEdible Uses: CondimentThe young leaves and flower buds are boiled and eaten as a vegetable[183]. Older leaves are powdered and sprinkled on food as a flavouring[183]. Whole dried leaves are placed on a barbecue, filled with miso, leeks, daikon and shitake then broiled[183]. The delightful aroma of the leaves permeates the miso mixture which is then served with rice[183].

tcanta WoodWood - soft, fine grained, easily worked. Used for furniture, engraving, utensils etc[11, 46, 61, 178].

dwatta Anthelmintic Antiemetic Appetizer Deobstruent Emmenagogue Expectorant Ophthalmic Sedative Stomachic TonicAnthelmintic, antiemetic, appetizer, deobstruent, emmenagogue, expectorant, ophthalmic, sedative, stomachic, tonic[174, 178]. This plant is contra-indicated for pregnant women[174].

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed must be kept cold over the winter and should be sown in late winter in a cold frame[200]. The seed usually germinates in the spring but it can take 18 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in a cold frame or greenhouse for at least their first winter. They can be planted out into their permanent positions when they are more than 15cm tall, though should be well mulched and

given some protection from winter cold for their first winter or two outdoors. Layering in early spring[200].

nwatta Landscape Uses:Specimen. Best grown in a warm position in a moderately rich free soil of an open texture[1]. Dislikes alkaline soils[202]. Tolerates alkaline soils so long as they are deep and rich in humus[188]. The branches are brittle so a sheltered position is required[200]. Very tolerant of atmospheric pollution[200]. Hardy to about -20°c[200]. The fleshy roots are easily damaged and any transplanting is best done during a spell of mild moist weather in late spring[182]. A very ornamental plant[1]. The flowers are powerfully scented[245]. Cultivated for its medicinal bark in Japan[178]. Special Features: Not North American native, Fragrant flowers, Attractive flowers or blooms.

### 6.2.260 Morus cathayana

Hua Sang
5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 15 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwiss hpa7tmwatli hjonli

drutta Morus cathayana is a deciduous Tree growing to 15 m (49ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to June, and the seeds ripen from August to September. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Fruit LeavesEdible Uses: TeaFruit - raw or cooked[177]. The fruit is about 25mm in diameter[200]. Leaves - cooked[177]. A tea is made from the leaves[177].

tcanta None known

dwatta None known

propta The seed germinates best if given 2 - 3 months cold stratification[80, 98]. Sow the seed as soon as it is ripe if possible, otherwise in February in a cold frame. The seed usually germinates in the first spring, though it sometimes takes another 12 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the cold frame for their first winter. Plant them out in late spring or early summer after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in a frame. Plant out in spring. A good percentage take, though they sometimes fail to thrive[78, 113]. Cuttings of mature wood of the current season's growth, 25 - 30cm with a heel of 2 year old wood, autumn or early spring in a cold frame or a shady bed outside[78, 113, 200]. Bury the cuttings to threequarters of their depth. Layering in autumn[200].

nwatta Prefers a warm well-drained loamy soil in a sunny position[1, 11]. Two trees at Kew in mid-July 1994 had reasonable crops of fairly long thin fruits with a pleasant flavour[K]. Mulberries have brittle roots and so need to be handled with care when planting them out[238]. Any pruning should only be carried out in the winter when the plant is fully dormant because mulberries bleed badly when cut[238]. Ideally prune only badly placed branches and dead wood[238]. Plants in this genus are notably resistant to honey fungus[200].

### 6.2.261 Sinofranchetia chinensis

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 15 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwiss hpa7tmwatli nyanhjen hjonli

drutta Sinofranchetia chinensis is a deciduous Climber growing to 15 m (49ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in May, and the seeds ripen in October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). . The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can

grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw[105, 177]. Inspid[109]. The size of a grape[182]. The fruit is about 2cm in diameter[200].

tcanta None known

dwatta None known

propta Seed - can be sown as soon as it is ripe or in late winter in a cold frame. Prick out the seedlings into individual pots once they are large enough to handle and grow them on in the cold frame for their first winter. Plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, July/August in a frame. Layering of new shoots in summer.

nwatta Succeeds in any ordinary garden soil in sun or shade[1, 200]. Prefers semi-shade[188, 219]. The young growth in spring can be damaged by late frosts. A fast-growing climbing plant[200], supporting itself by twining around other plants etc[219]. Any pruning is best carried out after the plant has finished flowering[219]. Dioecious, but female plants can produce fruits in the absence of male plants[11, 200]. The report does not say if this fruit contains viable seed, so it is best to assume that male and female plants must be grown if seed is required[K].

### 6.2.262 Pyrus calleryana

Callery Pear

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 15 m hkuc hmimhtut cyutli hgattcup hwicli hraşljutnyikfripr hpa7tli frusflatprikrlwis hpa7tmwatli xre7t hjonli

drutta Pyrus calleryana is a deciduous Tree growing to 15 m (49ft) by 15 m (49ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf from April to November, in flower in May, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil and can tolerate drought. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105]. Best used after it has been exposed to frost[177, 183], since this will soften and sweeten the flesh[K]. The fruit is about 25mm in diameter[200].

tcanta Rootstock WoodThis species is widely used as a rootstock[183], especially for cultivars of Pyrus pyrifolia[266]. It is said to induce earlier bearing[160]. The wood of this species is hard and close-grained, and is sometimes used for making furniture and stools[266].

dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe in the autumn, it will then usually germinate in mid to late winter. Stored seed requires 8 - 10 weeks cold stratification at 1°c and should be sown as early in the year as possible[200]. Temperatures over 15 - 20°c induce a secondary dormancy in the seed[200]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in a cold frame or greenhouse for their first year. Plant them out in late spring or early summer of the following year.

nwatta Landscape Uses:Espalier, Firewood, Screen, Specimen, Street tree. Prefers a good well-drained loam in full sun[200]. Grows well in heavy clay soils. Tolerates light shade but does not fruit so well in such a position. Tolerates atmospheric pollution, excessive moisture and a range of soil types if they are moderately fertile[200]. Established plants are drought tolerant[200]. Grows well on acid soils[160]. Plants are hardy to about -40°c when they are fully dormant[160]. There are many named forms selected for their ornamental value[200]. The cultivar 'Bradford' is resistant to fireblight[188]. Resists fireblight, collar rot, root aphid, pear psylla and root lesion nematodes[160]. Trees have a short dormancy period and lose their leaves late in the season[160]. Special Features: Not North American native, Naturalizing, Blooms are very showy.

### 6.2.263 Arbutus arizonica

Arizona Maderone

5 tlin 9 cyuc 2 kcaak 0 tcan 1 dwat 15 m hkuc hmimhtut cyutli kyuctcup hwicli hyishrasljut hpa7tli flat hpa7tmwatli fyfjxre7t hjonli

drutta Arbutus arizonica is an evergreen Tree growing to 15 m (49ft 3in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower in May, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw. The fruit is about 8mm in diameter with a thin sweetish flesh[82]. tcanta Charcoal WoodWood - heavy, soft, close-grained, brittle[82]. It produces a fine grade of charcoal[229].

dwatta AstringentThe bitter principles in the bark and leaves can be used as an astringent[229].

propta Seed - best surface sown in a cold frame as soon as it is ripe. Stored seed should be soaked for 5 - 6 days in warm water and then surface sown in a shady position in a greenhouse[78]. Do not allow the compost to become dry. 6 weeks cold stratification helps[134]. The seed usually germinates well in 2 - 3 months at 20°c[134]. Seedlings are prone to damp off[184], they are best transplanted to individual pots as soon as they are large enough to handle and should be kept well ventilated. Grow them on in a greenhouse for their first winter and then plant out in late spring after the last expected frosts[K]. Basal cuttings in late winter[200]. Cuttings of mature wood of the current season's growth, November/December in a frame. Poor percentage[78]. Layering of young wood - can take 2 years[1, 200].

nwatta Requires a lime-free nutrient-rich well-drained moisture-retentive soil in sun or semi-shade and shelter from cold drying winds, especially when young[200]. Succeeds in dry soils[82]. Plants are hardy to about -15°c[166, 200]. A slow-growing tree[229].

### 6.2.264 Cornus controversa

Giant Dogwood, Wedding Cake Tree,

5 tlin 8 cyuc 2 kcaak 0 tcan 1 dwat 15 m hkuc hmimhtut cyutli tcup hwicli hraşljutnyikfripr hpa7tli flatprikrlwissliip hpa7tmwatli xre7t hjonli

drutta Cornus controversa is a deciduous Tree growing to 15 m (49ft) by 15 m (49ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from June to July, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Fruit. OilEdible Uses: OilFruit[105, 177]. No more details are given. The fruit is about 6mm in diameter[200].

tcanta OilThe fruit provides an oil used in the lubricating and soap industry[266].

dwatta AntiphlogisticThe leaves are used in folk remedies to relieve pain and reduce swelling[266].

propta Seed - best sown as soon as it is ripe in a cold frame or in an outdoors seedbed if there is sufficient seed[80, 113]. The seed must be separated from the fruit flesh since this contains germination inhibitors[80, 164]. Stored seed should be cold stratified for 3 - 4 months and sown as early as possible in the year[164]. Scarification may also help as may a period of warm stratification before the cold stratification[80, 164]. Germination, especially of stored seed, can be very slow, taking 18 months or more[164]. Prick out the seedlings of cold-frame sown seeds into individual pots as soon as they are large enough to handle and grow the plants on for their first winter in a greenhouse, planting out in the spring after the last expected frosts. Cuttings of half-ripe side shoots, July/August in a frame. Cuttings of mature wood of the current year's growth, taken with a heel if possible,

kcakta Edible Parts: Flowers Leaves Oil Oil StemEdible Uses: Colouring Oil OilFlower buds - cooked. A globe arctihoke substitute[2, 4, 9, 115, 183], though they are much smaller and very fiddly to use[K]. Stems - cooked. Used as a vegetable, they are a cardoon (Cynara cardunculus) substitute[2, 4]. The stems are cooked in water like asparagus or rhubarb[12]. They are best if the rind is removed[4, 115, 183]. Leaves and young plants - cooked[9, 105]. They are harvested before the flowers develop and the prickles must be removed prior to cooking[9]. The petals are an adulterant for saffron[46, 61, 105, 183], used as a yellow food colouring and flavouring. A good quality edible oil is obtained from the seed[2, 4, 183]. The seed contains about 25% oil[4].

tcanta Oil Oil StuffingThe stem hairs are sometimes collected and used to stuff pillows[4]. An oil obtained from the seed is used as a fuel for lamps[4].

dwatta Astringent Cancer CardiotoxicThe flowering plant is cardiotoxic[9]. It is used in some proprietary heart medicines[9]. The juice of the plant has been used with good effect in the treatment of cancers and ulcers[4]. A decoction of the root is astringent[4]. It is used to diminish discharges from mucous membranes[4].

propta Seed - sow spring in situ[200]. The seed can also be sown in situ in autumn[200]. If the seed is in short supply then it can be sown in a pot in the greenhouse in the spring. Prick out the seedlings into individual pots as soon as they are large enough to handle and plant them out into their permanent positions in early summer.

nwatta An easily grown plant, it succeeds in almost any ordinary garden soil[1, 111]. Requires a well-drained soil, preferably in full sun though it tolerates light shade[200]. Prefers a slightly alkaline soil[200]. Grows very well in poor soils, succeeding in hot dry situations and tolerating drought when it is established[190]. A slow-growing plant[188]. Hardy to about -15°c[200]. A very ornamental plant[1], the flowers are very attractive to bees[200]. Plants are prone to slug and snail damage[188]. Often self-sows, sometimes to the point of nuisance, though the seedlings can easily be hoed out and can also be transplanted if they are moved whilst still small[200].

### 6.2.367 Gaylussacia ursina

Bear Huckleberry

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 1.8 m hkuc hmimhtut cyutli tcup hwicli hraşljutnyik hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta Gaylussacia ursina is a deciduous Shrub growing to 1.8 m (6ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to June. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[46, 61, 183, 257]. Inspid[11].

tcanta None known

dwatta None known

propta Seed - best sown in the autumn in a cold frame[200]. Stored seed requires 1 month warm stratification followed by 2 months cold[113]. When large enough to handle, prick the seedlings out into individual pots of lime-free compost and grow them on in light shade in a greenhouse or cold frame for at least their first winter. Plant out into their permanent positions in late spring or early summer when they are at least 15cm tall. Cuttings of half-ripe wood, July/August in a frame[200]. Layering. Division in spring.

nwatta Requires a lime-free moist peaty soil, thriving in sun or part shade[11, 182].

### 6.2.368 Phytolacca esculenta

5 tlin 9 cyuc 2 kcaak 0 tcan 2 dwat 1 m hkuc hmimhtut cyutli tcup hwicli hraşljutnyik hpa7tli flatprikrlwis hpa7tmwatli xre7t hjonli

drutta Phytolacca esculenta is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from July to August, and the seeds ripen from August to September. The

species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Leaves - they must be cooked and are used as a spinach[1, 58, 105, 174, 183]. Only the young leaves should be used since they become toxic with age. Root - cooked[105, 183].

tcanta InkA red ink is obtained from the fruit[57].

dwatta Abortifacient Antiasthmatic Antibacterial Antifungal Antinflammatory Antiphlogistic Antitussive Diuretic Expectorant Hypotensive PurgativeThe roots contain saponins[279]. They are abortifacient, antiasthmatic, antibacterial, antifungal, antiinflammatory, antiphlogistic, antitussive, diuretic, expectorant, hypotensive and purgative[147, 174, 176, 279]. A decoction is used in the treatment of oedema, beri-beri, lumbago, rheumatism, abdominal distension and numbness of the throat[147, 176, 279]. Use with caution, see the notes above on toxicity[176].

propta Seed - sow autumn or spring in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. If you have sufficient seed, it might be worthwhile trying an outdoor sowing in a seed bed in early spring. Grow the plants on in the seedbed for their first year and plant them out the following spring. Division in March or October. Use a sharp spade or knife to divide the rootstock, making sure that each section has at least one growth bud. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta An easily grown plant, succeeding in most soils[1], though preferring a moisture retentive soil in full sun or partial shade[200]. We have found the plants to be very tolerant of drought[K]. Plants can be grown in quite coarse grass, which can be cut annually in the autumn[233]. The young growth in spring can be damaged by late frosts. There is sme disagreement over the correct name for this species with some authorities saying that it is no more than a synonym for *P. acinosa*[266], whilst others give it specific status[200]. There are reports that there is a white flowered plant, which could either be this species or a form of *P. acinosa* which is said to be non-toxic and to have an edible root[K]. See *P. acinosa* for more details. Plants seem to be immune to the predations of rabbits[233].

### 6.2.369 Asphodelus albus

Asphodel, Gamón-blanco

5 tlin 9 cyuc 2 kcaak 0 tcan 1 dwat 1 m hkuc hmimhtut cyutli hgatkyuctcup hwicli hyishrasljut hpa7tli flatprikrlwis hpa7tmwatli xre7t hjonli

drutta Asphodelus albus is a PERENNIAL growing to 1 m (3ft 3in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: RootEdible Uses: The root was at one time eaten as a food bud, since it contains the alkaloid asphodeline, this is not really very advisable[7].

tcanta AlcoholAn alcohol can be obtained from the fermented roots[7].

dwatta Antidermatotic Detergent Emollient Vulnerary-The tubers are antidermatotic, detergent, emollient and vulnerary[7]. They are mainly used externally in the treatment of skin conditions and for lightening freckles[7]. They have also been employed internally as a cough remedy[7]. The tubers are harvested in the spring and dried for later use[7]. Use internally with caution, especially if you are suffering from nephritis or gastritis[7].

dwatta Antiasthmatic Antispasmodic Antitussive Antiviral Diaphoretic Diuretic Febrifuge Miscellany Nervine Tonic VasoconstrictorMembers of this genus contain various medicinally active alkaloids (but notably ephedrine) and they are widely used in preparations for the treatment of asthma and catarrh[238]. The whole plant can be used at much lower concentrations than the isolated constituents - unlike using the isolated ephedrine, using the whole plant rarely gives rise to side-effects[254]. The plant also has antiviral effects, particularly against influenza[238]. The stems are a pungent, bitter, warm herb that dilates the bronchial vessels whilst stimulating the heart and central nervous system[238]. The stems are also antitussive, diuretic, diaphoretic, febrifuge, hypertensive, nerve, tonic and vasoconstrictor[4, 21, 174, 238]. They are used internally in the treatment of asthma, hay fever and allergic complaints[238]. They are also combined with a number of other herbs and used in treating a wide range of complaints[238]. This herb should be used with great caution, preferably under the supervision of a qualified practitioner[238]. It should not be prescribed to patients who are taking monoamine oxidase inhibitors, or suffering from high blood pressure, hyperthyroidism or glaucoma[238]. Ephedrine is seen as a performance-boosting herb and, as such, is a forbidden substance in many sporting events such as athletics[K]. The stems can be harvested at any time of the year and are dried for later use[238].

propta Seed - best sown as soon as it is ripe in the autumn in a greenhouse[200]. It can also be sown in spring in a greenhouse in a sandy compost[K]. Prick out the seedlings into individual pots as soon as they are large enough to handle and grow them on for at least their first winter in a greenhouse. Plant out in the spring or early summer after the last expected frosts and give some protection in their first winter[K]. Division in spring or autumn[238]. Layering.

nwatta Requires a well-drained loamy soil and a sunny position[11]. Established plants are drought resistant and are also lime tolerant[200]. Plants are hardy to at least -15°c[200]. This species does not flower or fruit well in Britain[11]. Dioecious. Male and female plants must be grown if seed is required.

### 6.2.364 Gaultheria x wisleyensis

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 1 m hkuc pcmimhm cyutli tcup hwicli hrasjlt hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta Gaultheria x wisleyensis is an evergreen Shrub growing to 1 m (3ft 3in) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[11]. Not much flavour but reasonably palatable[K].

tcanta A good ground cover for shady situations[197], the plants spread by suckers and form dense thickets[208].

dwatta None known

propta The seed requires a period of cold stratification. Pre-chill for 4 - 10 weeks and then surface sow in a lime-free compost in a shady part of the greenhouse and keep the compost moist[78]. The seed usually germinates well, usually within 1 - 2 months at 20°c, but the seedlings are liable to damp off. It is important to water them with care and to ensure that they get plenty of ventilation. Watering them with a garlic infusion can also help to prevent damping off[K]. Prick out the seedlings into individual pots when they are about 25mm tall and grow them on in light shade in the greenhouse for at least their first winter[K]. Plant them out in late spring or early summer. The seedlings are susceptible to spring frosts so might need some protection for their first few years outdoors. The leaves remain very small for the first few years[11]. This is a hybrid species and will not breed true. Cuttings of half-ripe wood 3 - 6cm long, July/August in a frame in a shady position. They form roots in late summer or spring[78]. A good percentage usually take. Division in spring when new growth is about 7cm tall. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow

them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Prefers a cool moist but not boggy humus rich soil in shade or semi-shade[11, 200]. A peat and moisture loving species, it requires a lime-free soil[11]. This species has not as yet got a valid name, having recently been moved from the genus *Gaulnettya*[200]. Plants are hardy to about -20°c[184]. Plants in this genus are notably resistant to honey fungus[200].

### 6.2.365 Berberis fendleri

Colorado Barberry

5 tlin 9 cyuc 2 kcaak 0 tcan 2 dwat 1.5 m hkuc hmimhtut cyutli kyuctcup hwicli hyishrasjltutnyikfrip hpa7tli flatprikwis hpa7tmwatli fyifxre7t hjonli

drutta Berberis fendleri is a deciduous Shrub growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105, 161, 177, 257]. The fruits are about 5mm long[200].

tcanta DyeA yellow dye is obtained from the root.

dwatta Antibacterial Cancer DysenteryBerberine, universally present in rhizomes of Berberis species, has marked antibacterial effects. Since it is not appreciably absorbed by the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not be used with Glycyrrhiza species (Liquorice) because this nullifies the effects of the berberine[218]. Berberine has also shown antitumour activity[218].

propta Seed - best sown as soon as it is ripe in a cold frame, when it should germinate in late winter or early spring[78]. Seed from over-ripe fruit will take longer to germinate[78], whilst stored seed may require cold stratification and should be sown in a cold frame as early in the year as possible[80]. The seedlings are subject to damping off, so should be kept well ventilated[113]. When the seedlings are large enough to handle, prick them out into individual pots and grow them on in a cold frame. If growth is sufficient, it can be possible to plant them out into their permanent positions in the autumn, but generally it is best to leave them in the cold frame for the winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, July/August in a frame. Cuttings of mature wood of the current season's growth, preferably with a heel, October/November in a frame[78].

nwatta Prefers a warm moist loamy soil but is by no means fastidious, succeeding in thin, dry and shallow soils[11, 200]. Grows well in heavy clay soils. Succeeds in full sun or light shade[11, 200]. Hybridizes freely with other members of this genus[1]. Plants can be pruned back quite severely, they resprout well from the base[200].

### 6.2.366 Onopordum acanthium

Scotch Thistle, Scotch cottonthistle

5 tlin 9 cyuc 2 kcaak 0 tcan 1 dwat 1.5 m hkuc hmimhtut cyutli kyuctcup hwicli hyishrasjltutnyik hpa7tli flatprikwis hpa7tmwatli fyifxre7t hjonli

drutta Onopordum acanthium is a BIENNIAL growing to 1.5 m (5ft) by 1 m (3ft 3in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

autumn in a cold frame. High percentage[78]. Layering of new growth in June/July. Takes 9 months[78].

nwatta Landscape Uses:Pest tolerant, Woodland garden.

An easily grown plant, it succeeds in any soil of good or moderate fertility[1], ranging from acid to shallow chalk[200]. Grows well in heavy clay soils. Succeeds in full sun or light shade[188]. A very ornamental plant[1, 11], it is hardy to about -20°c[184]. This species is unusual in having alternate leaves whilst almost all other members of this genus have opposite leaves[182]. Closely related to *C. alternifolia*[200]. Plants in this genus are notably resistant to honey fungus[200]. Special Features: Not North American native, Attractive flowers or blooms.

### 6.2.265 Picea breweriana

Weeping Spruce, Brewer spruce

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 15 m hkuc

htut cyutli tcup hwicli hyishrasjltutnyik hpa7tli frusflatprik hpa7tmwatli hjonli

drutta Picea breweriana is an evergreen Tree growing to 15 m (49ft) by 5 m (16ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower in May, and the seeds ripen from October to November. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure. It cannot tolerate atmospheric pollution.

kcakta Edible Parts: Flowers Inner bark SeedEdible Uses: TeaYoung male catkins - raw or cooked. Used as a flavouring[172]. Immature female cones - cooked. The central portion, when roasted, is sweet and syrupy[172]. The cones are up to 10cm long[82]. Inner bark - dried, ground into a powder and then used as a thickener in soups etc or added to cereals when making bread[172]. An emergency food when all else fails. Seed - raw. The seed is about 2 - 4mm long[229] and is too small and fiddly to be worthwhile unless you are desperate[172]. A refreshing tea, rich in vitamin C, can be made from the young shoot tips[172].

tcanta WoodWood - soft, heavy, close grained[82]. It is valued for its use in the pulp industry to make paper[171].

dwatta Vitamin CNone known

propta Seed - stratification will probably improve germination so sow fresh seed in the autumn in a cold frame if possible[80]. Sow stored seed as early in the year as possible in a cold frame[78]. A position in light shade is probably best[78]. Seed should not be allowed to dry out and should be stored in a cool place[80]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse or cold frame for their first winter. They can be planted out into their permanent positions in early summer of the following year, or be placed in an outdoor nursery bed for a year or so to increase in size. They might need protection from spring frosts. Cuttings of semi-ripe terminal shoots, 5 - 8cm long, August in a frame. Protect from frost. Forms roots in the spring[78]. Cuttings of mature terminal shoots, 5 - 10cm long, September/October in a cold frame. Takes 12 months[78]. Cuttings of soft to semi-ripe wood, early summer in a frame. Slow but sure.

nwatta Likes abundant moisture at the roots, if grown in drier areas it must be given a deep moist soil[11]. Tolerates poor peaty soils[200]. Succeeds in wet cold and shallow soils but is not very wind-firm in shallow soils[1]. Prefers a pH between 4 to 6[200]. Dislikes shade[200]. Intolerant of atmospheric pollution[11]. Resists wind exposure to some degree[200]. In some upland areas, especially over granitic or other base-poor soils, growth rate and health have been seriously affected by aluminium poisoning induced by acid rain[200]. Plants are strongly outbreeding, self-fertilized seed usually grows poorly[200]. They hybridize freely with other members of this genus[200]. Closely related to and often confused with *P. smithiana*. Very slow growing when young, plants are often no more than 1 metre tall when 10 years old. Growth increases somewhat with age and can average 30cm a year in older trees[185]. Increase in the

girth of trees grown in the open can be quite fast, averaging 3cm a year[185]. Trees should be planted into their permanent positions when they are quite small, between 30 and 90cm. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200]. The crushed shoots have a resinous aroma[245].

### 6.2.266 Rhamnus carolinianus

Indian Cherry, Oak, Carolina Buckthorn

5 tlin 9 cyuc 2 kcaak 0 tcan 1 dwat 12 m hkuc hmimhtut cyutli tcup hwicli hrasjltutnyik hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta Rhamnus carolinianus is a deciduous Tree growing to 12 m (39ft 4in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in May, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. The fruit has a thin rather dry flesh[82] with a sweet and agreeable flavour[2, 11, 105, 229]. The fruit is about 7 - 10mm in diameter and contains 2 - 4 small seeds[229]. Some caution is advised, see the notes above on toxicity.

tcanta WoodWood - rather hard, light, close grained, not strong[82]. It weighs 34lb per cubic foot[227]. Too small to be of commercial value[229].

dwatta HepaticA tea made from the bark is emetic and strongly laxative[222]. It is used in the treatment of constipation with nervous or muscular atony of the intestines[222]. An infusion of the wood has been used in the treatment of jaundice[257].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. Stored seed will require 1 - 2 months stratification at 5°c and should be sown as early in the year as possible in a cold frame[200]. Prick out the seedlings into individual pots when they are large enough to handle, and grow them on in the greenhouse or cold frame for their first winter. Plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, July/August in a frame[113]. Cuttings of mature wood of the current year's growth, autumn in a frame. Layering in early spring[4].

nwatta Landscape Uses:Border, Erosion control, Pest tolerant, Standard, Specimen. Succeeds in any reasonably good soil[11], whether moderately acid or alkaline[149]. Prefers a moist moderately fertile soil in sun or partial shade[200]. One report suggests that the plant might not be very hardy in Britain[11], whilst another says that it is in climatic zone 6 and thus tolerates temperatures down to about -15°c[200]. A slow-growing and usually short-lived plant in the wild[229]. Plants are susceptible to ‘crown rust’ of oats[149]. The species in this genus are notably resistant to honey fungus[200]. This species is closely related to *R. purshiana*[11]. Special Features: North American native, Inconspicuous flowers or blooms.

### 6.2.267 Celtis reticulata

Paloblanco, Netleaf hackberry

5 tlin 9 cyuc 2 kcaak 0 tcan 1 dwat 12 m hkuc htut cyutli hgatkuyctcup hwicli hyishrasjltut hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta Celtis reticulata is a deciduous Tree growing to 12 m (39ft 4in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in April, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[46, 61, 105, 161, 257]. Sweet and fleshy. The fruit can also be made into a jelly or used as a seasoning for savoury foods[183]. It can be dried and stored for winter

use[257]. The fruit is about 10mm in diameter[200], it has a thin flesh with a single large seed[K].

tcanta WoodA brown or red dye can be obtained from the leaves and branches[257]. Wood - heavy but soft and weak, it is not commercially important[229]. It can be used as a firewood[257].

dwatta StomachicThe plant has been used in the treatment of indigestion[257].

propta Seed - best sown as soon as it is ripe in a cold frame[200]. Stored seed is best given 2 - 3 months cold stratification and then sown February/March in a greenhouse[78, 200]. Germination rates are usually good, though the stored seed might take 12 months or more to germinate. The seed can be stored for up to 5 years[113]. As soon as they are large enough to handle, prick the seedlings out into individual pots. The leaves of seedlings often have a lot of white patches without chlorophyll, this is normal and older plants produce normal green leaves. Grow the seedlings on in a cold frame for their first winter, and plant them out in the following late spring or early summer[K]. Give them some protection from the cold for their first winter outdoors. Cuttings

nwatta Succeeds in any reasonably good soil, preferring a good fertile well-drained loamy soil[1, 11, 200]. Succeeds on dry gravels and on sandy soils[200]. Established plants are very drought resistant[200]. A moderate to slow-growing tree in the wild[229]. It prefers hotter summers and more sunlight than are normally experienced in Britain, so it often does not fully ripen its wood when growing in this country and is then very subject to die-back in winter[1, 11, 200]. Trees can be very long-lived, perhaps to 1000 years[200]. Considered by some botanists to be no more than a subspecies of *C. laevigata*[149]. Plants in this genus are notably resistant to honey fungus[200].

### 6.2.268 Berchemia racemosa

5 tlin 9 cyuc 2 kcak 0 tcan 0 dwat 12 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Berchemia racemosa is a deciduous Climber growing to 12 m (39ft 4in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August, and the seeds ripen from June to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Fruit LeavesEdible Uses: TeaFruit[177]. The ripe fruit is eaten[183]. The fruit is about 8mm in diameter[200]. Leaves - cooked and used as a vegetable[105, 177, 183]. The leaves are a tea substitute[177, 183].

tcanta None known dwatta None known

propta Seed - sow spring or autumn in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame[200]. Cuttings of mature wood of the current season's growth, November to January in a frame. Root cuttings in winter[200]. Layering of young stems in winter[200].

nwatta Requires a good moist well-drained loam, succeeding in full sun if the soil does not dry out otherwise it is best in light shade[11, 200]. Plants are hardy to about -15°c[200]. Plants climb by means of twining around supports[182]. They are useful for covering walls, fences and tree stumps[188]. The fruit takes about one year to ripen[275]. It is only produced in Britain after a hot summer[182, 219]. Plants do not normally require pruning[219].

### 6.2.269 Koelreuteria paniculata

Golden Rain Tree, Varnish Tree

5 tlin 8 cyuc 2 kcak 0 tcan 1 dwat 10 m hkuc htut cyutli kyuctcup hwicli hyishrasjlnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Koelreuteria paniculata is a deciduous Tree growing to 10 m (32ft) by 10 m (32ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from July to August, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: Leaves SeedEdible Uses: Berries - roasted[2, 177]. Leaves and young shoots - cooked[2, 105, 177, 179].

tcanta Beads DyeA yellow dye is obtained from the flowers.[46, 61, 178]. A black dye is obtained from the leaves[178]. The seeds are used as beads in necklaces etc[46, 61, 178].

dwatta OphthalmicThe flowers are ophthalmic[178, 218]. They are used in the treatment of conjunctivitis and epiphora[218].

propta The seed requires a period of cold stratification. It is probably best sown as soon as it is ripe in a cold frame[200]. Pre-soak stored seed for 24 hours in warm water. If it swells up then sow it in a cold frame. If it does not swell then soak it for a further 24 hours in hot water prior to sowing. This should cause the seed to swell but, should this fail, scarification (taking care not to damage the seed embryo) followed by a further 24 hours in warm water should do the trick[80]. Germination is usually good[78], though the seedlings are very variable[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Consider giving the plants some protection from the cold for their first winter outdoors[78]. Root cuttings, 4cm taken in December. Plant horizontally in individual pots in a warm greenhouse[78].

nwatta Landscape Uses:Pest tolerant, Specimen. Succeeds in any good loamy soil[1, 11] and in dry soils. Prefers a sunny sheltered position[1, 11]. A wind resistant plant, but it does not like salt-laden winds[200]. Tolerates atmospheric pollution[200]. This species is hardy to about -10°c when fully dormant[200], though the young growth in spring can be damaged by late frosts. Grows best in areas with long hot summers, it is fast growing in such conditions[200]. A short-lived tree[11]. A good bee plant[108]. Plants are susceptible to coral spot fungus, especially if the wood is not properly ripened due to insufficient summer heat[11]. This species is notably resistant to honey fungus[200]. Special Features: Not North American native, Blooms are very showy.

### 6.2.270 Pyrus amygdaliformis

5 tlin 9 cyuc 2 kcak 0 tcan 0 dwat 10 m hkuc hmimhtut cyutli hgattcup hwicli hrasjlnyikfrip hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Pyrus amygdaliformis is a deciduous Tree growing to 10 m (32ft) by 8 m (26ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil and can tolerate drought. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[177]. The fruit is up to 3cm in diameter[200].

tcanta None known dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe in the autumn, it will then usually germinate in mid to late winter. Stored seed requires 8 - 10 weeks cold stratification at 1°c and should be sown as early in the year as possible[200]. Temperatures over 15 - 20°c induce a secondary dormancy in the seed[200]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in a cold frame or greenhouse for their

mid spring in a cold frame. Only just cover the seed. When large enough to handle, prick the seedlings out into individual pots and plant them out in summer[K] Division in spring or summer[162]. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to put up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Staple Crop: Balanced carb Wild-collected as FoodAn easily grown plant, it succeeds in most soils, preferring a sandy soil[1] and a sunny position[162]. Established plants are very drought tolerant[190]. A very invasive plant, spreading by means of its wide-ranging roots[1, 187]. Cultivated in Japan for making mats etc[46, 61]. The Viking settlers of Iceland cultivated this plant until the beginning of the 20th century for its edible seed[183].

### 6.2.362 Lavandula angustifolia

English Lavender, True Lavender

5 tlin 8 cyuc 2 kcak 5 tcan 3 dwat 1.2 m hkuc htut cyutli hgatkyuctup hwicli hrasjlnyik hpa7tli flatpriklwissliphsom hpa7tmwatli xre7t hjonli

drutta Lavandula angustifolia is an evergreen Shrub growing to 1.2 m (4ft) by 1 m (3ft 3in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf all year, in flower from July to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline and saline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

kcakta Edible Parts: Edible Uses: Condiment TeaLeaves, petals and flowering tips - raw. Used as a condiment in salads, soups, stews etc[2, 15, 183]. They provide a very aromatic flavour[7] and are too strong to be used in any quantity[K]. The fresh or dried flowers are used as a tea[183]. The fresh flowers are also crystallized or added to jams, ice-creams, vinegars etc as a flavouring[238]. An essential oil from the flowers is used as a food flavouring[183].

tcanta Companion Essential Hedge Incense Pot-pourri RepellentThe essential oil that is obtained from the flowers is exquisitely scented and has a very wide range of applications, both in the home and commercially. It is commonly used in soap making, in making high quality perfumes (it is also used in 'Eau de Cologne'), it is also used as a detergent and cleaning agent, a food flavouring etc[21, 46, 57, 171, 238] and as an insect repellent[201]. When growing the plant for its essential oil content, it is best to harvest the flowering stems as soon as the flowers have faded[245]. Yields of 0.8 - 1% of the oil are obtained[7]. The aromatic leaves and flowers are used in pot-pourri[238] and as an insect repellent in the linen cupboard etc[14, 18, 20]. They have been used in the past as a strewing herb in order to impart a sweet smell to rooms and to deter insects[244]. The leaves are also added to bath water for their fragrance and therapeutic properties[244]. They are also said to repel mice[20]. The flowering stems, once the flowers have been removed for use in pot-pourri etc, can be tied in small bundles and burnt as incense sticks[245]. Lavender can be grown as a low hedge, responding well to trimming[29]. There are several varieties, such as 'Hidcote Variety', 'Loddon Pink' and 'Folgate Blue' that are suitable for using as dwarf hedges 30 - 50cm tall[245].

dwatta Antianxiety Antihalitosis Antiseptic Antispasmodic Appetizer Aromatherapy Aromatic Carminative Cholagogue Diuretic Nervine Sedative Stimulant Stomachic TonicLavender is a commonly used household herb, though it is better known for its sweet-scented aroma than for its medicinal qualities[254]. However, it is an important relaxing herb, having a soothing and relaxing affect upon the nervous system[254]. The flowering spikes can be dried and used internally in a tincture, though the extracted essential oil is more commonly used. The essential oil is much more gentle in its action than most other essential oils and can be safely applied direct to the skin as an antiseptic to help heal wounds, burns etc[254]. An essential oil obtained from the flowers is antihalitosis, powerfully antiseptic, antispasmodic, aromatic,

carminative, cholagogue, diuretic, nervine, sedative, stimulant, stomachic and tonic[4, 7, 9, 21, 165, 238]. It is not often used internally, though it is a useful carminative and nervine[4]. It is mainly used externally where it is an excellent restorative and tonic - when rubbed into the temples, for example, it can cure a nervous headache, and it is a delightful addition to the bath-water[4]. Its powerful antiseptic properties are able to kill many of the common bacteria such as typhoid, diphtheria, streptococcus and Pneumococcus, as well as being a powerful antitode to some snake venoms[244]. It is very useful in the treatment of burns, sunburn, scalds, bites, vaginal discharge, anal fissure etc, where it also soothes the affected part of the body and can prevent the formation of permanent scar tissue[4, 238]. The essential oil is used in aromatherapy. Its keyword is 'Immune system'[210]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve *Lavandula angustifolia* for loss of appetite, nervousness and insomnia, circulatory disorders, dyspeptic complaints (see [302] for critics of commission E).

propta Seed - sow spring in a greenhouse and only just cover the seed[4]. It usually germinates in 1 - 3 months at 15°c. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse or cold frame for their first winter, planting them out in late spring after the last expected frosts. Cuttings of half-ripe wood 7 - 10cm with a heel, July/August in a frame. Usually very east, a high percentage will root within a few weeks[78]. Grow them on in the greenhouse for their first winter and plant them out in late spring after the last expected frosts. Cuttings 7cm with a heel succeed at almost any time of the year[1]. Layering.

nwatta Landscape Uses:Alpine garden, Border, Container, Ground cover, Massing, Rock garden, Seashore, Specimen. Succeeds in almost any soil so long as it is well-drained and not too acid[1, 200]. Prefers a sunny position in a neutral to alkaline soil[1, 4, 14]. Prefers a light warm dry soil[37]. When grown in rich soils the plants tend to produce more leaves but less essential oils[4]. Established plants are drought tolerant[190]. Plants are very tolerant of salt wind exposure[K]. When growing for maximum essential oil content, the plant must be given a very warm sunny position and will do best in a light sandy soil, the fragrance being especially pronounced in a chalky soil[245]. Plants are hardy to between -10 and -15°c[184]. Lavender is a very ornamental plant that is often grown in the herb garden and is also grown commercially for its essential oil[1, 4]. There are several named varieties[182, 183]. Not a very long-lived plant, it can be trimmed to keep it tidy but is probably best replaced every 10 years[200]. Any trimming is best done in spring and should not be done in the autumn since this can encourage new growth that will not be very cold-hardy[200]. A good bee plant, also attracting butterflies and moths[7, 24, 30]. Lavender makes a good companion for most plants[54], growing especially well with cabbages[14]. Special Features: Attractive foliage, Fragrant foliage, Not North American native, Attracts butterflies, Suitable for cut flowers, Suitable for dried flowers, Fragrant flowers, Attractive flowers or blooms.

### 6.2.363 Ephedra distachya

Sea Grape, Jointfir

5 tlin 9 cyuc 2 kcak 0 tcan 4 dwat 1 m hkuc htut cyutli hgatkyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Ephedra distachya is an evergreen Shrub growing to 1 m (3ft 3in) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower in July. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). . The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw[2, 105, 177]. A sweet but rather insipid flavour[K]. The fruit is about 6mm in diameter[200].

tcanta MiscellanyPlants can be used for ground cover, spaced about 60cm apart each way[208].

possible to divide the roots up into sections no more than 3cm long and pot these up in light shade in a cold frame. They will quickly become established and can be planted out in the summer.

**nwatta Landscape Uses:**Border, Ground cover, Specimen. A very easily grown plant, it succeeds in most soils and situations so long as the soil is not too dry[1, 200]. Grows well in heavy clay soils. A sunny position is best for production of essential oils, but plants also succeed in partial shade. Often cultivated as a pot herb[50]. There are some named varieties[200]. The flowers have a sickly sweet smell[50]. A very invasive plant, spreading freely at the roots[200]. Unless you have the space to let it roam, it needs to be restrained by some means such as planting it in a container that is buried in the soil[K]. It is said to be a good companion for cabbages and tomatoes, its aromatic leaves repelling insect pests, though its aggressive root system also needs to be taken into account here. The whole plant has a mint-like aroma. The flowers are very attractive to bees and butterflies. Members of this genus are rarely if ever troubled by browsing deer[233]. Hybridizes freely with other members of this genus. **Special Features:** Attractive foliage, Edible, Fragrant foliage, Not North American native, Invasive, Naturalizing, Suitable for cut flowers, Suitable for dried flowers. The plant is heat tolerant in zones 9 through 5. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2]. The root pattern is stoloniferous rooting from creeping stems above the ground [1-2].

## 6.2.360 *Mentha longifolia*

Horsemint

5 tin 9 cyuc 2 kcaak 0 tcan 2 dwat 1 m hkuc hmimhtut cyutli tcup hwicli hrasjltunykfrip hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Mentha longifolia* is a PERENNIAL growing to 1 m (3ft 3in) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from August to September, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

**ckakta Edible Parts:** LeavesEdible Uses: Condition TeaLeaves - raw or cooked. Peppermint-scented, they are used as a flavouring in salads, chutneys and cooked foods[183, 238]. A herb tea is made from the leaves[183]. An essential oil obtained from the leaves and flowering tops is used as a food flavouring in sweets etc[183]. A peppermint-like taste[183].

**tcanta Essential Repellent Strewing**The leaves contain about 0.57% essential oil[240]. It is sometimes used as a substitute for peppermint oil in confectionery[238]. Rats and mice intensely dislike the smell of mint. The plant was therefore used in homes as a strewing herb and has also been spread in granaries to keep the rodents off the grain[244].

**dwatta Antiasthmatic Antiseptic Antispasmodic Carminative Stimulant**Horsemint, like many other members of this genus, is often used as a domestic herbal remedy, being valued especially for its antiseptic properties and its beneficial effect on the digestion. Like other members of the genus, it is best not used by pregnant women because large doses can cause an abortion. The leaves and flowering stems are

antiasthmatic, antispasmodic, carminative and stimulant[4, 148, 240]. A tea made from the leaves has traditionally been used in the treatment of fevers, headaches, digestive disorders and various minor ailments[222]. The leaves are harvested as the plant comes into flower and can be dried for later use[238]. The essential oil in the leaves is antiseptic, though it is toxic in large doses[222].

**propta Seed** - sow spring in a cold frame. Germination is usually fairly quick. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in the summer. *Mentha* species are very prone to hybridisation and so the seed cannot be relied on to breed true. Even without hybridisation, seedlings will not be uniform and so the content of medicinal oils etc will vary. When growing plants with a particular aroma it is best to propagate them by division[K]. Division can be easily carried out at almost any time of the year, though it is probably best done in the spring or autumn to allow the plant to establish more quickly. Virtually any part of the root is capable of growing into a new plant. Larger divisions can be planted out direct into their permanent positions. However, for maximum increase it is possible to divide the roots up into sections no more than 3cm long and pot these up in light shade in a cold frame. They will quickly become established and can be planted out in the summer.

**nwatta** An easily grown plant, it succeeds in most soils and situations so long as the soil is not too dry[1, 200]. Grows well in heavy clay soils. A sunny position is best for production of essential oils, but the plants also succeed in partial shade. There is some confusion over the name of this plant, it appears in the British flora[17] but according to Flora Europaea it is not found in Britain[50]. Sometimes cultivated for its leaves, there are some named varieties[183]. Most mints have fairly aggressive spreading roots and, unless you have the space to let them roam, they need to be restrained by some means such as planting them in containers that are buried in the soil[K]. Hybridizes freely with other members of this genus. The whole plant has a mint-like aroma. The flowers are very attractive to bees and butterflies. A good companion plant for growing near cabbages and tomatoes, helping to keep them free of insect pests. Members of this genus are rarely if ever troubled by browsing deer[233].

## 6.2.361 *Leymus arenarius*

Lyme Grass, Sand ryegrass

5 tin 9 cyuc 2 kcaak 0 tcan 0 dwat 1.2 m hkuc htut cyutli hgatkuyctcup hwicli hyishrasjltunyk hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Leymus arenarius* is a PERENNIAL growing to 1.2 m (4ft 3in) by 2 m (6ft 7in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from May to July, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

**ckakta Edible Parts:** SeedEdible Uses: Seed - cooked[2, 105]. It can be ground into a flour and used to make bread[13]. A delicious taste[183] but very fiddly to use, the seed is small and hard to extract[K]. When cooked like rice, it can be used as a sweet or savoury dish. Mixed 50/50 with wheat flour it adds a richness to biscuits etc[183]. The protein content of this grain is said to rival that of red beans or salmon[183]. (This report seems somewhat surprising, protein levels are not usually anywhere near that high in a cereal[K].)

**tcanta Fibre Soil stabilization Weaving**The leaves are used for making mats, rope, paper etc[46, 61]. The plants have a very extensive root system and so they are often planted near the coast in order to stabilize sand dunes[190, 200]. They can also be used as a ground cover for sandy open spaces but can be invasive[200, 208].

**dwatta None known**

**propta Seed** - sow mid spring in situ and only just cover the seed[162]. Germination should take place within 2 weeks. If the supply of seed is limited, it can also be sown in

first year. Plant them out in late spring or early summer of the following year.

**nwatta** Prefers a good well-drained loam in full sun[200]. Grows well in heavy clay soils. Tolerates light shade but does not fruit so well in such a position. Tolerates atmospheric pollution, excessive moisture and a range of soil types if they are moderately fertile[200]. Established plants are drought tolerant[200]. Plants are hardy to at least -15°C[200].

## 6.2.271 *Pyrus nivalis*

Snow Pear

5 tin 9 cyuc 2 kcaak 0 tcan 0 dwat 10 m hkuc hmimhtut cyutli hgatkuyctcup hwicli hrasjltunykfrip hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Pyrus nivalis* is a deciduous Tree growing to 10 m (32ft 10in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in April. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought. It can tolerate atmospheric pollution.

**ckakta Edible Parts:** FruitEdible Uses: Fruit - raw or cooked[177]. A sour flavour, it is usually cooked or brewed into cider or perry[183, 200]. The fruit matures late in the season and is 3 - 5cm long[200].

**tcanta None known**

**dwatta None known**

**propta Seed** - best sown in a cold frame as soon as it is ripe in the autumn, it will then usually germinate in mid to late winter. Stored seed requires 8 - 10 weeks cold stratification at 1°C and should be sown as early in the year as possible[200]. Temperatures over 15 - 20°C induce a secondary dormancy in the seed[200]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in a cold frame or greenhouse for their first year. Plant them out in late spring or early summer of the following year.

**nwatta** Prefers a good well-drained loam in full sun[200]. Grows well in heavy clay soils. Tolerates light shade but does not fruit so well in such a position. Tolerates atmospheric pollution, excessive moisture and a range of soil types if they are moderately fertile[200]. Established plants are drought tolerant[200]. Plants are hardy to at least -15°C[200]. A very ornamental plant[1].

## 6.2.272 *Vitis acerifolia*

Bush Grape, Mapleleaf grape

5 tin 9 cyuc 2 kcaak 0 tcan 0 dwat 10 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjltunyk hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Vitis acerifolia* is a deciduous Climber growing to 10 m (32ft 10in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to July, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

**ckakta Edible Parts:** Fruit LeavesEdible Uses: Fruit - raw or dried for winter use. A sweet flavour[177]. The fruit is about 16mm in diameter[200]. Young leaves are wrapped around other foods and then baked, they impart a pleasant flavour. Young tendrils - raw or cooked.

**tcanta DyeA** yellow dye is obtained from the fresh or dried leaves[168].

**dwatta None known**

**propta Seed** - best sown in a cold frame as soon as it is ripe[K]. Six weeks cold stratification improves the germination rate, and so stored seed is best sown in a cold frame as soon as it is obtained. Germination should take place in the first spring, but sometimes takes another 12 months. Prick out the seedlings into individual pots when they are large

enough to handle and grow them on in a cold frame for their first winter. Plant out in early summer. Cuttings of mature wood of the current seasons growth, December/January in a frame. These cuttings can be of wood 15 - 30cm long or they can be of short sections of the stem about 5cm long with just one bud at the top of the section. In this case a thin, narrow strip of the bark about 3cm long is removed from the bottom half of the side of the stem. This will encourage callusing and the formation of roots. Due to the size of these cuttings they need to be kept in a more protected environment than the longer cuttings. Layering.

**nwatta** Prefers a deep rich moist well-drained moderately fertile loam[1, 200]. Grows best in a calcareous soil[200]. Succeeds in sun or partial shade though a warm sunny position is required for the fruit to ripen[200]. Plants climb by means of tendrils[182]. Any pruning should be carried out in winter when the plants are dormant, otherwise they bleed profusely[182, 200]. This species is closely related to *V. rupestris*[43]. Plants in this genus are notably susceptible to honey fungus[200].

## 6.2.273 *Sorbus austriaca*

5 tin 9 cyuc 2 kcaak 0 tcan 0 dwat 10 m hkuc hmimhtut cyutli tcup hwicli hrasjltunyk hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Sorbus austriaca* is a deciduous Tree growing to 10 m (32ft 10in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from May to June, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

**ckakta Edible Parts:** FruitEdible Uses: Fruit - raw or cooked in preserves etc[K]. Rather mealy but a pleasant semi-sweet flavour when fully ripe[K]. The fruits are about 13mm across[200] and are borne in fairly large bunches making harvesting easy[K].

**tcanta None known**

**dwatta None known**

**propta Seed** - best sown as soon as it is ripe in a cold frame[78, 80]. If you have sufficient seed it can be sown in an outdoor seedbed[78, 80]. Stored seed germinates better if given 2 weeks warm then 14 - 16 weeks cold stratification[98], so sow it as early in the year as possible. Prick out the seedlings into individual pots when they are large enough to handle. Seedlings are very slow to put on top-growth for their first year or two[11], but they are busy building up a good root system. It is best to keep them in pots in a cold frame for their first winter and then plant them out into their permanent positions in late spring.

**nwatta** Succeeds in most reasonably good soils in an open sunny position[11]. Tolerates light shade[188], though it fruits better in a sunny position[K]. This species is closely related to *S. intermedia*[200]. Plants are susceptible to fire-blight[188]. Trees seen at Wisley and at Cambridge Botanical Gardens in September 1993 were bearing very good crops of fruit[K]. The name of this species might have been mis-spelt, it could be *S. austriaca*[200].

## 6.2.274 *Malus prattii*

Pratt apple

5 tin 9 cyuc 2 kcaak 0 tcan 0 dwat 10 m hkuc hmimhtut cyutli tcup hwicli hrasjltunykfrip hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Malus prattii* is a deciduous Tree growing to 10 m (32ft) by 10 m (32ft). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in May, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline)

soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105]. Gritty[1]. The fruit is 10 - 15mm in diameter[200].

tcanta None known  
dwatta None known

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. It usually germinates in late winter. Stored seed requires stratification for 3 months at 1°C and should be sown in a cold frame as soon as it is received[200]. It might not germinate for 12 months or more. Prick out the seedlings into individual pots as soon as they are large enough to handle. If given a rich compost they usually grow away quickly and can be large enough to plant out in late summer, though consider giving them some protection from the cold in their first winter. Otherwise, keep them in pots in a cold frame and plant them out in late spring of the following year. Cuttings of mature wood, November in a frame[11].

nwatta An easily grown plant, it succeeds in most fertile soils, preferring a moisture retentive well-drained loamy soil[1, 200]. Grows well in heavy clay soils. Prefers a sunny position but succeeds in partial shade though it fruits less well in such a situation[1, 200]. Plants fruit regularly at Kew[11]. The fruit is a good wildlife food source, especially for birds[200]. Hybridizes freely with other members of this genus[200]. Plants in this genus are notably susceptible to honey fungus[200].

### 6.2.275 *Carya buckleyi*

Black hickory

5 tlin 9 cyuc 2 kcak 0 tcan 0 dwat 10 m hkuc  
htut cyutli tcup hwicli hras|lutnyik hpa7tli flatprik|wis hpa7tmwatli fyif hjonli

drutta *Carya buckleyi* is a deciduous Tree growing to 10 m (32ft 10in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf from June to October, in flower from April to May. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: Seed - raw or cooked[105]. A sweet flavour[1, 82]. The seed ripens in late autumn and, when stored in its shell in a cool place, will keep for at least 6 months[K].

tcanta Fuel WoodWood - hard and brittle. Used mainly for fuel[82].

dwatta None known

propta Seed - requires a period of cold stratification. It is best sown in a cold frame as soon as it is ripe[78]. Stored seed should be kept moist (but not wet) prior to sowing and should be sown in a cold frame as soon as possible[78]. Where possible, sow 1 or 2 seeds only in each deep pot and thin to the best seedling. If you need to transplant the seedlings, then do this as soon as they are large enough to handle, once more using deep pots to accommodate the tap root. Put the plants into their permanent positions as soon as possible, preferably in their first summer, and give them some protection from the cold for at least the first winter[78, K]. Seed can also be sown in situ so long as protection is given from mice etc and the seed is given some protection from cold[200] (a plastic bottle with the top and bottom removed and a wire mesh top fitted to keep the mice out is ideal)

nwatta Prefers a deep moisture-retentive loam in a sunny sheltered position, requiring a good summer for best development[1, 63, 137, 200]. Slow growing, especially when young[11]. Succeeds outdoors at Kew[11]. Plants are strongly tap-rooted and should be planted in their permanent positions as soon as possible[1, 137]. Sowing in situ would be the best method so long as the seed could be protected from mice[1, 200]. Trees are late coming into leaf (usually late May to June) and lose their leaves early in the autumn (usually in October)[137]. During this time they cast a heavy shade. These factors combine to make the trees eminently suitable for a mixed woodland planting with shrubs and other trees beneath them[137]. Plants in this genus are

notably resistant to honey fungus[200]. Most species in this genus have quite a wide range of distribution and, in order to find trees more suited to this country, seed from the most appropriate provenances should be sought[137]. Most trees growing in Britain at present tend to only produce good seed after hot summers[137]. There is some confusion over the correct name of this species, some authorities place it under *C. texana*. Buckl.[137] whilst others say that *C. buckleyi* is the correct name and that there is also a distinct species *C. texana*. DC[11, 82]. According to the Flora of N. America, *C. buckleyi* Dewey. Is a synonym for *C. brunnescens* subsp. *Sphaerostachya*, whilst *C. buckleyi* Durand. Is a synonym for *C. texana*[270]. Trees are self-fertile but larger crops of better quality seeds are produced if cross-pollination takes place[229].

### 6.2.276 *Vitis romanetii*

5 tlin 9 cyuc 2 kcak 0 tcan 0 dwat 10 m hkuc  
htut cyutli kyuctcup hwicli hras|lutnyik hpa7tli flatprik|wis hpa7tmwatli xre7t hjonli

drutta *Vitis romanetii* is a deciduous Climber growing to 10 m (32ft 10in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from June to July, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Fruit LeavesEdible Uses: Fruit - raw or dried for winter use[105, 177]. The fruit is about 8 - 12mm in diameter[200] and is borne in small bunches. Young leaves are wrapped around other foods and then baked, they impart a pleasant flavour. Young tendrils - raw or cooked.

tcanta DyeA yellow dye is obtained from the fresh or dried leaves[168].

dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe[K]. Six weeks cold stratification improves the germination rate, and so stored seed is best sown in a cold frame as soon as it is obtained. Germination should take place in the first spring, but sometimes takes another 12 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant out in early summer. Cuttings of mature wood of the current seasons growth, December/January in a frame. These cuttings can be of wood 15 - 30cm long or they can be of short sections of the stem about 5cm long with just one bud at the top of the section. In this case a thin, narrow strip of the bark about 3cm long is removed from the bottom half of the side of the stem. This will encourage callusing and the formation of roots. Due to the size of these cuttings they need to be kept in a more protected environment than the longer cuttings. Layering.

nwatta Prefers a deep rich moist well-drained moderately fertile loam[1, 200]. Grows best in a calcareous soil[200]. Requires a position in full sun[200]. This species is not hardy in the colder areas of the country[219]. Young growths and thin wood can be cut back by frosts[219]. Plants climb by means of tendrils[182]. Closely related to *V. davidii*[219]. Plants are rather tender in Britain when they are young, though older plants are hardy in most parts of the country[11]. Any pruning should be carried out in winter when the plants are dormant otherwise they bleed profusely[182, 200]. Plants in this genus are notably susceptible to honey fungus[200].

### 6.2.277 *Vitis baileyana*

Graybark Grape

5 tlin 9 cyuc 2 kcak 0 tcan 0 dwat 10 m hkuc  
hmmhtut cyutli kyuctcup hwicli hras|lutnyik hpa7tli flatprik|wis hpa7tmwatli xre7t hjonli

drutta *Vitis baileyana* is a deciduous Climber growing to 10 m (32ft 10in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to July, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is

drutta *Eremurus spectabilis* is a PERENNIAL growing to 1 m (3ft 3in) by 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: LeavesEdible Uses: GumYoung shoots - cooked[46, 61, 74]. Considered to be a delicacy in Siberia, the flavour is intermediate between purslane and spinach[2]. It is by no means a disagreeable vegetable[2].

tcanta Adhesive Gum SizeThe root contains about 30% gum (an arabic acid derivative) and this makes a good quality glue[74]. The bulb is dried and powdered and then used for sizing cloth, bookbinding etc[114].

dwatta None known

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame[200]. Sow stored seed in a greenhouse as soon as it is obtained. Germination is slow and could take 1 - 12 months at 15°C. Prick out the seedlings into individual pots as soon as they are large enough to handle and grow on for their first winter in a greenhouse. Plant out into their permanent positions in late spring after the last expected frosts. Do not plant deeply in the soil, the crown of the plant should be slightly exposed[245]. Division after the plant dies down in late summer. Great care must be taken because the plants resent root disturbance[200]. Only divide the plants when it is really necessary, and no more frequently than once every 6 years, being careful not to break the brittle roots[245]. It is probably best to pot up the divisions and grow them on in the greenhouse until they are established.

nwatta Prefers a very well drained, very rich, light sandy loam in a warm sunny sheltered position[90, 200]. A covering of sharp sand helps the plant to survive wet winters. Plants can also be mulched overwinter with organic matter in the autumn in order to give them extra protection, but this mulch must be removed in the spring otherwise it might encourage the new growth to rot[200]. Some protection should be given to the young shoots in spring in areas subject to late frosts[200]. Keep plants dry in summer after they have flowered[90]. A very ornamental plant[1] and a good bee plant[74]. Plants resent root disturbance and so should be placed in their final positions as soon as possible[200]. This species, in part at least, is also known as *E. caucasicus* Stephen[50]. Tubers should be planted 15cm deep[1]. The edible young shoots are sold in local markets in Siberia[46]. Plants require some cold stratification in winter in order to flower well in the following summer[200]. Slugs are very attracted to this plant so some protection must be given.

### 6.2.358 *Ephedra americana andina*

5 tlin 9 cyuc 2 kcak 0 tcan 3 dwat 1.8 m hkuc  
htut cyutli hgatkuyctcup hwicli hras|lut hpa7tli flatprik|wis hpa7tmwatli nyanhjen hjonli

drutta *Ephedra americana andina* is an evergreen Shrub growing to 1.8 m (6ft). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in leaf all year, in flower from June to July. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw[11, 177]. A sweet flavour, but fairly boring[K]. The fruit is about 8mm in diameter[200].

tcanta Plants can be used for ground cover, spaced about 60cm apart each way[208].

dwatta Depurative DiureticThe stems are depurative and diuretic[46]. The stems of most members of this genus contain the alkaloid ephedrine and are valuable in the treatment of asthma and many other complaints of the respiratory system[K]. The whole plant can be used at much lower concentrations than the isolated constituents - unlike using the isolated ephedrine, using the whole plant rarely gives rise

to side-effects[254]. Ephedra does not cure asthma but in many cases it is very effective in treating the symptoms and thus making life somewhat easier for the sufferer. The stems can be used fresh or dried and are usually made into a tea, though they can also be eaten raw[K]. The young stems are best if eating them raw, though older stems can be used if a tea is made[K]. The stems can be harvested at any time of the year and are dried for later use[238].

propta Seed - best sown as soon as it is ripe in the autumn in a greenhouse[200]. It can also be sown in spring in a greenhouse in a sandy compost[K]. Prick out the seedlings into individual pots as soon as they are large enough to handle and grow them on for at least their first winter in a greenhouse. Plant out in the spring or early summer after the last expected frosts and give some protection in their first winter[K]. Division in spring or autumn[238]. Layering.

nwatta Requires a well-drained loamy soil and a sunny position[11]. Established plants are drought resistant and are also lime tolerant[200]. One report says that this species is frost-tender[200], but this is not our experience[K]. It succeeds outdoors at Cambridge Botanical Gardens and we have been growing it outdoors successfully since 1988[K]. Plants do not flower profusely or regularly in Britain[11]. Our plants have been producing reasonable crops since 1991[K]. Dioecious. Male and female plants must be grown if seed is required.

### 6.2.359 *Mentha suaveolens*

Round-Leaved Mint, Apple mint, Pineapple Mint

5 tlin 10 cyuc 2 kcak 2 tcan 2 dwat 1 m hkuc  
hmmhtut cyutli tcup hwicli hras|lutnyikrip hpa7tli flatprik|wis hpa7tmwatli xre7t hjonli

drutta *Mentha suaveolens* is a PERENNIAL growing to 1 m (3ft 3in) by 0.8 m (2ft 7in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Condition TeaLeaves - raw or cooked as a potherb[50]. Used as a flavouring in salads or cooked foods[183]. The leaves have a similar flavour to spearmint, and are considered to be superior in flavour to that species but are also hairy, which makes them less suitable for garnishing[238]. A herb tea is made from the leaves[183].

tcanta Essential Repellent StrewingAn essential oil is obtained from the whole plant. Rats and mice intensely dislike the smell of mint. The plant was therefore used in homes as a strewing herb and has also been spread in granaries to keep the rodents off the grain[244].

dwatta Antiseptic Carminative FebrifugeRound leafed mint, like many other members of this genus, is often used as a domestic herbal remedy, being valued especially for its antiseptic properties and its beneficial effect on the digestion. Like other members of the genus, it is best not used by pregnant women because large doses can cause an abortion. A tea made from the leaves of most mint species has traditionally been used in the treatment of fevers, headaches, digestive disorders and various minor ailments[222]. The leaves are harvested as the plant comes into flower and can be dried for later use[238]. The essential oil in the leaves is antiseptic, though it is toxic in large doses[222].

propta Seed - sow spring in a cold frame. Germination is usually fairly quick. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in the summer. *Mentha* species are very prone to hybridisation and so the seed cannot be relied on to breed true. Even without hybridisation, seedlings will not be uniform and so the content of medicinal oils etc will vary. When growing plants with a particular aroma it is best to propagate them by division[K]. Division can be easily carried out at almost any time of the year, though it is probably best done in the spring or autumn to allow the plant to establish more quickly. Virtually any part of the root is capable of growing into a new plant. Larger divisions can be planted out direct into their permanent positions. However, for maximum increase it is

usually germinates in 2 - 6 weeks at 15°c[138]. Division in spring[200]. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the summer or following spring.

nwatta Landscape Uses: Border, Foundation, Ground cover, Massing, Specimen. Easily grown in a damp to wet soil in full sun or shade[162, 200]. Members of this genus are rarely if ever troubled by browsing deer[233]. Special Features:Attractive foliage, Wetlands plant, Inconspicuous flowers or blooms.

### 6.2.354 Lilium species

5 tin 9 cyuc 2 kcak 0 tcan 0 dwat 1 m hkuc hmimhtut cyutli tcup hwicli hrasljut hpa7tli flatprikklwis hpa7tmwatli xre7t hjonli

drutta Lilium species is a BULB growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Bulb - cooked. Rich in starch, it can be used as a vegetable in similar ways to potatoes. The flavour can range from very mild to very bitter[K]

tcanta None known

dwatta None known

propta Seed. Sow thinly in pots from late winter to early spring in a cold frame. The seed should germinate in 2 - 4 weeks[163]. Great care should be taken in pricking out the young seedlings, many people prefer to leave them in the seed pot until they die down at the end of their second years growth. This necessitates sowing the seed thinly and using a reasonably fertile sowing medium. The plants will also require regular feeding when in growth. Divide the young bulbs when they are dormant, putting 2 - 3 in each pot, and grow them on for at least another year before planting them out into their permanent positions when the plants are dormant[K]. Division with care in the autumn once the leaves have died down. Replant immediately[200]. Bulb scales can be removed from the bulbs in early autumn. If they are kept in a warm dark place in a bag of moist peat, they will produce bulblets. These bulblets can be potted up and grown on in the greenhouse until they are large enough to plant out[200].

nwatta Prefers an open free-draining humus-rich loamy soil with its roots in the shade and its head in the sun[200]. Protect against slugs in early spring, if the shoot tip is eaten out the bulb will not grow in that year and will lose vigour[200]. Bulbs are best planted out into their permanent positions in early to mid-autumn in cool temperate zones and up to late autumn in warmer areas, this allows them to become established before new top growth commences in spring[200].

### 6.2.355 Osmunda japonica

Zenmai

5 tin 9 cyuc 2 kcak 0 tcan 0 dwat 1 m hkuc hmimhtut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli frusflatprikklwis hpa7tmwatli hjonli

drutta Osmunda japonica is a FERN growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta Edible Parts: Leaves RootEdible Uses: Young fronds - cooked[105, 177]. An edible starch is obtained from the rhizome[105, 177].

tcanta None known

dwatta None known

propta Spores - they very quickly lose their viability (within 3 days) and are best sown as soon as they are ripe on the surface of a humus-rich sterilized soil in a lightly shaded place in a greenhouse. Keep the compost moist, preferably by putting a plastic bag over the pot. Plants develop very

rapidly, pot on small clumps of plantlets as soon as they are large enough to handle and keep humid until they are well established. Do not plant outside until the ferns are at least 2 years old. Cultivars usually come true to type[200]. Division of the rootstock in the dormant season. This is a very strenuous exercise due to the mass of wiry roots[200].

nwatta Likes a soil of swamp mud and loamy or fibrous peat, sand and loam[1]. Succeeds in most moist soils, preferring acid conditions[200]. Requires a constant supply of water, doing well by ponds, streams etc[1]. Plants thrive in full sun so long as there is no shortage of moisture in the soil and also in shady situations beneath shrubs etc[200]. Plants are hardy to at least -20°c, they are evergreen in warm winter areas but deciduous elsewhere[200]. Members of this genus are rarely if ever troubled by browsing deer[233]. Closely related to *O. regalis*[1].

### 6.2.356 Lilium henryi

Henry's lily

5 tin 8 cyuc 2 kcak 0 tcan 0 dwat 1.8 m hkuc

hmimhtut cyutli tcup hwicli hrasljut hpa7tli flatprikklwis hpa7tmwatli xre7t hjonli

drutta Lilium henryi is a BULB growing to 1.8 m (6ft) by 0.3 m (1ft in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Bulb - cooked[163]. The bulb is about 7cm in diameter[266]. A rather bitter flavour[K]. Rich in starch, it can be used as a vegetable in similar ways to potatoes (*Solanum tuberosum*).

tcanta None known

dwatta None known

propta Seed - immediate epigeal germination[130]. Sow thinly in pots from late winter to early spring in a cold frame. Should germinate in 2 - 4 weeks[163]. Great care should be taken in pricking out the young seedlings, many people prefer to leave them in the seed pot until they die down at the end of their second years growth. This necessitates sowing the seed thinly and using a reasonably fertile sowing medium. The plants will also require regular feeding when in growth. Divide the young bulbs when they are dormant, putting 2 - 3 in each pot, and grow them on for at least another year before planting them out into their permanent positions when the plants are dormant[K]. Division with care in the autumn once the leaves have died down. Replant immediately[200]. Bulb scales can be removed from the bulbs in early autumn. If they are kept in a warm dark place in a bag of moist peat, they will produce bulblets. These bulblets can be potted up and grown on in the greenhouse until they are large enough to plant out[200].

nwatta Landscape Uses:Border, Foundation, Screen. Prefers an open free-draining humus-rich loamy soil with its roots in the shade and its head in the sun[200]. Prefers a limey soil[200]. Succeeds in acid and limey soils according to one report[90], whilst another says that it does not tolerate acid soil conditions[245]. A very ornamental plant[1], it is very easily grown and is one of the most virus-tolerant of lilies[90]. It is also a fast-growing plant, onion-sized flowering bulbs can be obtained in 2 years from seed[K]. The flowers have a pleasant sweet perfume[245]. Early to mid autumn is the best time to plant out the bulbs in cool temperate areas, in warmer areas they can be planted out as late as late autumn[200]. The plant should be protected against rabbits and slugs in early spring. If the shoot tip is eaten out the bulb will not grow in that year and will lose vigour[200]. Special Features: Attractive foliage, Not North American native, Suitable for cut flowers, Attractive flowers or blooms.

### 6.2.357 Eremurus spectabilis

5 tin 9 cyuc 2 kcak 0 tcan 0 dwat 1 m hkuc

htut cyutli hgatkuyctcup hwicli hrasljut hpa7tli flatprikklwis hpa7tmwatli xre7t hjonli

pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Fruit LeavesEdible Uses: Fruit - raw or dried for winter use[177, 257]. The fruit is about 4 - 7mm in diameter[200] and is borne in bunches. Leaves - raw or cooked. They can be chewed to allay thirst. Young leaves are wrapped around other foods and then baked, they impart a pleasant flavour. Young tendrils - raw or cooked.

tcanta DyeA yellow dye is obtained from the fresh or dried leaves[168].

dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe[K]. Six weeks cold stratification improves the germination rate, and so stored seed is best sown in a cold frame as soon as it is obtained. Germination should take place in the first spring, but sometimes takes another 12 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant out in early summer. Cuttings of mature wood of the current seasons growth, December/january in a frame. These cuttings can be of wood 15 - 30cm long or they can be of short sections of the stem about 5cm long with just one bud at the top of the section. In this case a thin, narrow strip of the bark about 3cm long is removed from the bottom half of the side of the stem. This will encourage callusing and the formation of roots. Due to the size of these cuttings they need to be kept in a more protected environment than the longer cuttings. Layering.

nwatta Prefers a deep rich moist well-drained moderately fertile loam[1, 200]. Grows best in a calcareous soil[200]. Succeeds in sun or partial shade though a warm sunny position is required for the fruit to ripen[200]. Plants climb by means of tendrils[182]. Any pruning should be carried out in winter when the plants are dormant otherwise they bleed profusely[182, 200]. This species is closely related to *V. vulpina*[43]. Plants in this genus are notably susceptible to honey fungus[200].

### 6.2.278 Pyrus regellii

5 tin 9 cyuc 2 kcak 0 tcan 0 dwat 9 m hkuc

hmimhtut cyutli hgatkuyctcup hwicli hrasjlutnyikfrip hpa7tli flatprikklwis hpa7tmwatli xre7t hjonli

drutta Pyrus regellii is a deciduous Tree growing to 9 m (29ft 6in). See above for USDA hardiness. It is hardy to UK zone 6. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[177]. The fruit is about 3cm in diameter[200].

tcanta RootstockUsed as a rootstock[74].

dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe in the autumn, it will then usually germinate in mid to late winter. Stored seed requires 8 - 10 weeks cold stratification at 1°c and should be sown as early in the year as possible[200]. Temperatures over 15 - 20°c induce a secondary dormancy in the seed[200]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in a cold frame or greenhouse for their first year. Plant them out in late spring or early summer of the following year.

nwatta Prefers a good well-drained loam in full sun[200]. Grows well in heavy clay soils. Tolerates light shade but does not fruit so well in such a position. Tolerates atmospheric pollution, excessive moisture and a range of soil types if they are moderately fertile[200]. Established plants are very drought resistant[74]. Plants are hardy to at least -15°c[200]. Cultivated for its edible fruit in China and Japan, there are many named varieties. A hybrid between this plant and *P. communis* culta is more suitable for warmer climates. The leaves are remarkably variable in shape[11]. Trees are used in the re-afforestation of arid areas[74].

### 6.2.279 Aralia spinosa

Hercule's Club, Aralia spinosa, American Angelica Tree, Hercules' Club, Devil's Walking Stick

5 tin 9 cyuc 2 kcak 0 tcan 2 dwat 9 m hkuc

pcimhmmhtu cyutli tcup hwicli hyishrasjlutnyik hpa7tli flatprikklwis hpa7tmwatli xre7t hjonli

drutta Aralia spinosa is a deciduous Tree growing to 9 m (29ft 6in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from August to September, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young leaves - cooked[105, 177]. The leaves usually have a number of slender prickles, they must be gathered before the prickles harden[159] and are then chopped finely and used as a potherb[183].

tcanta WoodWood - close-grained, weak, light, soft, brittle[82, 227]. Of little economic value[229].

dwatta Alterative Analgesic Diaphoretic Ophthalmic Sialogogue StimulantAnalgesic[46, 61]. The bark, especially of the roots[82] is the part most commonly used medicinally, though other parts of the plant, including the fruit[82], also possess medicinal properties[4]. The fresh bark is strongly emetic, opthalmic, purgative and sialogogue[4, 46, 61, 222, 257], when dried it is a stimulating alterative and is diaphoretic[82]. A tincture of the berries is used in the treatment of toothache and rheumatism[4, 222, 257]. A poultice of the roots is applied to boils, skin eruptions, varicose veins, old sores and swellings[222, 257]. A cold infusion of the roots is used as drops for sore eyes[257].

propta Seed - best sown as soon as ripe in a cold frame. Stored seed requires 3 - 5 months of cold stratification. Germination usually takes place within 1 - 4 months at 20°c[134]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in a greenhouse for at least their first winter. Once the plants are 25cm or more tall, they can be planted out into their permanent positions, late spring or early summer being the best time to do this. Root cuttings 8cm long, December in a cold frame[11, 78]. Store the roots upside down in sand and pot up in March/April. High percentage[78]. Division of suckers in late winter[11]. Very easy, the suckers can be planted out direct into their permanent positions if required.

nwatta Landscape Uses:Border, Massing, Specimen, Woodland garden. Prefers a good deep loam and a semi-shady position[1]. Requires a sheltered position[1]. A fast-growing but short-lived tree in its native zone[229], this species is of little value in Britain[1]. It is generally a single-stemmed plant, often spreading freely by means of suckers[182, 229]. Plants make finer foliage when growing in rich soils but are generally healthier and longer-lived in a comparatively poor soil[11]. The young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. Special Features:North American native, Naturalizing, All or parts of this plant are poisonous, Attracts butterflies, Attractive flowers or blooms.

### 6.2.280 Ilex aquifolium

Holly, English holl, Christmas Holly, Common Holly, English Holly

5 tin 9 cyuc 2 kcak 4 tcan 2 dwat 9 m hkuc

pcimhmimhtut cyutli hgatkuyctcup hwicli hyishrasjlutnyikfrip hpa7tli frusflatprikklwis hpa7tmwatli nyanhjen hjonli

drutta Ilex aquifolium is an evergreen Shrub growing to 9 m (29ft) by 5 m (16ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in leaf all year, in flower from May to June, and the seeds ripen from November to March. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Bees. The plant is not self-fertile. It is noted for attracting wildlife.

Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure. It can tolerate atmospheric pollution.

**ckaakta Edible Parts:** Edible Uses: TeaThe leaves have been used as a tea substitute[4]. The roasted fruit has been used as a coffee substitute[7]. Some caution is advised here, since the fruit can be purgative and emetic[K].

**tcanta Fuel Hedge Hedge Wood**An excellent hedge plant, tolerating hard clipping and maritime exposure and forming a dense stock-proof shelter[4, 11, 29, 75, 186]. Plants are fairly slow growing however[11]. The cultivar 'Pendula' makes a very good carpeting ground cover plant when grown as a cutting on its own roots[208]. It can be planted up to 1.2 metres apart each way, but is fairly slow to cover the ground[208]. Wood - strong, hard and dense, it polishes well, though it must be well dried and seasoned or else it warps badly. It is beautifully white, except at the centre of very old trees, and is highly regarded by cabinet makers though it must be well seasoned[4, 7, 46, 61]. The heartwood of mature trees is used for printing blocks, engravings, turnery etc[1, 115]. The wood makes a good fuel, burning well even when green[6]. **Landscape Uses:** Border, Screen, Standard, Specimen.

**dwatta Astringent Bach Diaphoretic Diuretic Emetic Expectorant Febrifuge Purgative**Holly is little used in modern herbalism. The leaves are diaphoretic, expectorant, febrifuge and tonic[4, 9, 21]. They can be use fresh at almost any time of the year or can be harvested in late spring and dried for later use[4, 9]. They are used in the treatment of intermittent fevers, rheumatism, catarrh, pleurisy etc[4, 238, 254]. The juice of the fresh leaves has been successfully used in the treatment of jaundice[4]. The berries are violently emetic and purgative[4, 7]. They have been used in the treatment of dropsy and as a powder they have been used as an astringent to check bleeding[4]. The berries are toxic, especially to children, and should not be used medicinally except under professional supervision[254]. The root has been used as a diuretic, though there are more effective diuretics available[7]. The plant is used in Bach flower remedies - the keywords for prescribing it are 'Hatred', 'Envy', 'Jealousy' and 'Suspicion'[209].

**propta Seed** - best sown as soon as it is ripe in the autumn in a cold frame. It can take 18 months to germinate. Stored seed generally requires two winters and a summer before it will germinate and should be sown as soon as possible in a cold frame. Scarification, followed by a warm stratification and then a cold stratification may speed up the germination time[78, 80]. The seedlings are rather slow-growing. Pot them up into individual pots when they are large enough to handle and grow them on in light shade in a cold frame for their first year. It is possible to plant them out into a nursery bed in late spring of the following year, but they should not be left here for more than two years since they do not like being transplanted. Alternatively, grow them on in their pots for a second season and then plant them out into their permanent positions in late spring or early summer. Give them a good mulch and some protection for their first winter outdoors. Cuttings of almost ripe wood with a heel, August in a shaded position in a cold frame. Leave for 12 months before potting up. Layering in October. Takes 2 years.

**nwatta** Succeeds in most soils, including peat, chalk, gravels, sand and shales[186], so long as they are not waterlogged, though wild plants are occasionally found in situations with standing winter water[186]. Grows well in heavy clay soils[186]. Established plants are fairly drought tolerant[186]. Dislikes dry soils according to one report[31] whilst another says that it succeeds in dry shade[188]. Tolerates a pH range from 3.5 to 7.2[186]. Succeeds in full sun or fairly dense shade[17, 28, 31], self-sown seedlings from woods and shady places making the most shade tolerant plants[28]. Tolerant of maritime exposure[75] though in such a situation it may lose some or all its leaves in the winter[186]. Plants require a minimum July temperature of 12°C for good fruit production[186]. They tolerate short periods in winter down to -15°C[184]. Severe frosts can kill whole branches, especially if they are open to the sky[186]. The young growth in spring can be damaged by

late frosts. A very ornamental plant, there are many named varieties[182]. Flowers and fruits are formed on wood of the previous year's growth[229]. A good bee plant[108], the minute flowers are sweetly scented[245]. The fruit is a valuable winter food source for birds. Resents root disturbance, especially as the plants get older[11]. It is best to place the plants into their permanent positions as soon as possible, perhaps giving some winter protection for their first year or two[K]. Only move the plants in May or, preferably, in September[1]. Plants are quite slow growing, even when in good soils and situations[11, 75]. Trees are usually dioecious but hermaphrodite forms are available. Male and female plants must usually be grown if seed is required. Plants are capable of regenerating from the main stem both above and below ground level and, although the top may be killed in a fire, the plants will usually regrow from the base[186]. Rabbits are particularly fond of this species and will quickly remove the bark. This species is notably resistant to honey fungus[200]. **Special Features:** Attractive foliage, Not North American native, Naturalizing, Fragrant flowers, Inconspicuous flowers or blooms. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

## 6.2.281 *Vitis flexuosa*

5 tlin 9 cyuc 2 kcaak 0 tcan 1 dwat 8 m hkuc hmimhmtu cyutli kyuctup hwicli hrasjlutnyik hpa7tli flat-prikkwis hpa7tmwatli xre7t hjonli

**drutta Vitis flexuosa** is a deciduous Climber growing to 8 m (26ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to July, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

**ckaakta Edible Parts:** Fruit Leaves SapEdible Uses: Fruit - raw or dried for winter use[105, 177]. The fruit is about 7mm in diameter[200] and is carried in bunches. Some forms of this plant have edible leaves[177] - it is unlikely that the leaves of any forms are poisonous, but perhaps some are more palatable than others[K]. Young leaves are wrapped around other foods and then baked, they impart a pleasant flavour. Young tendrils - raw or cooked. Sap - a sweet taste[178], it can be made into a drink[105, 177].

**tcanta Dye**A yellow dye is obtained from the fresh or dried leaves[168].

**dwatta Restorative Tonic**The fruit is restorative, strengthening and tonic[218]. The sap is used to restore youth and black hair[218]. The root is said to be warming to the sinews[218].

**propta Seed** - best sown in a cold frame as soon as it is ripe[K]. Six weeks cold stratification improves the germination rate, and so stored seed is best sown in a cold frame as soon as it is obtained. Germination should take place in the first spring, but sometimes takes another 12 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant out in early summer. Cuttings of mature wood of the current seasons growth, December/January in a frame. These cuttings can be of wood 15 - 30cm long or they can be of short sections of the stem about 5cm long with just one bud at the top of the section. In this case a thin, narrow strip of the bark about 3cm long is removed from the bottom half of the side of the stem. This will encourage callusing and the formation of roots. Due to the size of these cuttings they need to be kept in a more protected environment than the longer cuttings. Layering.

**nwatta** Prefers a deep rich moist well-drained moderately fertile loam[1, 200]. Grows best in a calcareous soil[200]. Succeeds in sun or partial shade though a warm sunny position is required for the fruit to ripen[200]. A very ornamental plant[1], it climbs by means of tendrils[182]. Any pruning should be carried out in winter when the plants are

the ravages of slugs. The young shoots in spring are particularly at risk, though older growth is also eaten[K].

## 6.2.351 *Salvia sclarea*

Clary, Europe sage, Clary Sage

5 tlin 9 cyuc 2 kcaak 0 tcan 2 dwat 1 m hkuc htut cyutli kyuctup hwicli hrasjlutnyik hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

**drutta Salvia sclarea** is a BIENNIAL/PERENNIAL growing to 1 m (3ft 3in) by 0.6 m (2ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in August, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

**ckaakta Edible Parts:** Flowers Leaves OilEdible Uses: Condiment OilLeaves - raw or cooked. A strong, warm, aromatic taste and odour[244]. They are used mainly as a flavouring in cooked foods[2, 27, 37, 105], they are similar to sage (*S. officinalis*)[1]. The leaves can be dipped in batter and cooked to make delicious fritters[183, 244]. Flowers - raw. A pleasant taste, they can be sprinkled on chopped salads[183, 238], or made into a tea[238]. The plant is sometimes used as a hop substitute in flavouring beer, imparting considerable bitterness and intoxicating properties[4] - it either makes people dead drunk or insanely exhilarated[244]. The leaves have also been used to adulterate wine and give it a muscatel flavour[244].

**tcanta Essential Oil**An essential oil is obtained from the flowering stems. Called 'Muscatel oil', it has an ambergris aroma and is used in soaps, cosmetics, as a fixative in perfumery etc[1, 46, 74, 171, 238]. A drying oil is obtained from the seed, it is used in varnishes, paints etc[74].

**dwatta Antispasmodic Appetizer Aromatherapy Aromatic Astringent Balsamic Carminative Ophthalmic Pectoral Tonic**Clary has been perceived both as a weaker version of sage (*Salvia officinalis*) and also as a significant herb in its own right[254]. An antispasmodic and aromatic plant, it is used mainly to treat digestive problems such as wind and indigestion[254]. It is also regarded as a tonic, calming herb that helps relieve period pain and pre-menstrual problems. Owing to its oestrogen-stimulating action, it is most effective when levels of this hormone are low[254]. The whole plant, and especially the leaves, is antispasmodic, appetizer, aromatic, astringent, balsamic, carminative, pectoral and tonic[4]. It is useful in treating disorders of the stomach and kidneys and is a valuable remedy for complaints associated with the menopause, particularly hot flushing[4, 254]. It should not be prescribed for pregnant women[238]. The leaves can be used fresh or dried, for drying they are harvested before the plant comes into flower[238]. The seed forms a thick mucilage when it is soaked for a few minutes in water. This is efficacious in removing small particles of dust from the eyes[4, 238]. The essential oil is used in aromatherapy. Its keyword is 'Euphoric'[210].

**propta Seed** - can be sown in situ during spring[1]. Alternatively seed can be sown in August/September to overwinter, it will then produce larger plants Thinnings can be transplanted[1]. The seed remains viable for 3 years[1].

**nwatta Landscape Uses:**Border, Seashore. Requires a very well-drained light sandy soil in a sunny position[200]. Thrives on any ground that is not too wet[4]. Plants can be killed by excessive winter wet[200]. Hardy to about -20°C[187]. A biennial or short-lived perennial[187]. The flowers can be air-dried and used as everlasting flowers[200]. A very ornamental plant, it is strongly aromatic and is sometimes cultivated for its essential oil, there are some named varieties[74, 183]. When bruised, the leaves release a deliciously pungent and refreshing smell of fresh grapefruit[245]. The flowers are very attractive to bees[245]. Members of this genus are rarely if ever troubled by browsing deer[233]. **Special Features:** Attractive foliage, Edible, Fragrant foliage, Not North American native, Naturalizing, Attracts butterflies, Suitable for cut flowers, Fragrant flowers.

## 6.2.352 *Lilium callosum*

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 1 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

**drutta Lilium callosum** is a BULB growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**ckaakta Edible Parts:** RootEdible Uses: Bulb - cooked[105, 177]. The bulb is up to 3cm in diameter[266]. Rich in starch, it can be used as a vegetable in similar ways to potatoes (*Solanum tuberosum*).

**tcanta None known dwatta None known**

**propta Seed** - immediate epigeal germination[130]. Sow thinly in pots from late winter to early spring in a cold frame. Should germinate in 2 - 4 weeks[163]. Great care should be taken in pricking out the young seedlings, many people prefer to leave them in the seed pot until they die down at the end of their second years growth. This necessitates sowing the seed thinly and using a reasonably fertile sowing medium. The plants will also require regular feeding when in growth. Divide the young bulbs when they are dormant, putting 2 - 3 in each pot, and grow them on for at least another year before planting them out into their permanent positions when the plants are dormant[K]. Division with care in the autumn once the leaves have died down. Replant immediately[200]. Bulb scales can be removed from the bulbs in early autumn. If they are kept in a warm dark place in a bag of moist peat, they will produce bulblets. These bulblets can be potted up and grown on in the greenhouse until they are large enough to plant out[200]. Bulblets are formed on the stem just below the soil surface. These should be dug up in the autumn and replanted immediately, preferably in a cold frame for growing on until large enough to plant out into the garden[143, 163].

**nwatta** Prefers an open free-draining humus-rich loamy soil with its roots in the shade and its head in the sun[200]. Lime tolerant[143, 200]. Plants are quite hardy if they are grown in full sun[143]. Stem rooting, the bulbs should be planted 15cm deep[143]. Early to mid autumn is the best time to plant out the bulbs in cool temperate areas, in warmer areas they can be planted out as late as late autumn[200]. Closely allied to *L. plumulum*[143]. The plant should be protected against slugs in early spring. If the shoot tip is eaten out the bulb will not grow in that year and will lose vigour[200].

## 6.2.353 *Carex elata*

Tufted Sedge, Golden Variegated Sedge, Tufted Sedge 5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 1.2 m hkuc hmimhtut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flat-prikkwisslip hpa7tmwatli hjonli

**drutta Carex elata** is an evergreen Perennial growing to 1.2 m (4ft) by 1.5 m (5ft in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from May to June, and the seeds ripen from July to August. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

**ckaakta Edible Parts:** Root SeedEdible Uses: Root - cooked[172]. Seed[172]. No further details are given, but the seed is small and fiddly to use[K].

**tcanta Bedding**The leaves are used for bedding[61]. Plants form impenetrably dense clumps and when planted close together in drifts make an excellent ground cover[200].

**dwatta None known**

**propta Seed** - sown in situ in the spring in a moist soil in light shade. If seed is in short supply it can be sown in a cold frame and be planted out in the summer. The seed

Root - cooked with other foods[177, 183]. This probably means that it is used as a flavouring[K].

tcanta EssentialYields an essential oil[46]. No more details are given.

dwatta Antibacterial Antispasmodic Astringent Cardiac Depurative Diaphoretic Diuretic Eczema Emmenagogue Hypnotic Nervine Oxytoxic Stimulant Stomachic TonicChinese motherwort is unusual amongst Chinese herbs in that it is often prescribed for use on its own and not in a mixture with other plants[238]. The whole plant is antibacterial, antispasmodic, astringent, cardiac, depurative, diaphoretic, diuretic, emmenagogue, hypnotic, nervine, oxytotic, stomachic, tonic, uterine stimulant[4, 9, 21, 46, 165, 174, 178, 192, 279]. The seeds have a similar action to the plant, but are a less effective diuretic and depurative[238]. The plant is used in the treatment of painful and excessive menstruation, post-partum bleeding, oedema, kidney complaints, kidney stones, eczema and abscesses[238, 240]. A tincture is used in the treatment of rheumatic fever[192]. The plant stimulates uterine contractions and should not therefore be used when in the earlier stages of pregnancy[240]. The plant is harvested when in flower but before the seeds have set, and is dried for later use[238]. The plant contains about 0.05% of an alkaloid called leonurine[240]. This has a curare-like effect on the motor-endings of the nervous system, acting in small doses as a stimulant to the respiratory system but in large doses causing respiratory paralysis[240].

propta Seed - sow late spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer.

nwatta Prefers a well-drained moist soil in sun or partial shade[238]. Prefers a poor soil[108]. Plants are hardy to at least -15°C[238]. There is some confusion over the correct name for this species, it should quite probably be called *L. japonicus*.

### 6.2.349 *Artemisia dracunculoides*

Russian Tarragon, Tarragon, French Tarragon

5 tlin 8 cyuc 2 kcaak 0 tcan 1 dwat 1 m hkuc hmimhtut cyutli hgtakuyctcup hwicli hrasjlut hpa7tli flat-priklwis hpa7tmwatli xre7t hjonli

drutta *Artemisia dracunculoides* is a PERENNIAL growing to 1 m (3ft 3in) by 0.5 m (1ft 8in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 3. It is in flower in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Leaves SeedEdible Uses: Leaves - raw or cooked[46, 61, 105, 161]. The N. American Indians would bake the leaves between hot stones and then eat them with salt water[183, 216]. The leaves can also be eaten raw in salads but are inferior to *A. dracunculus* (Tarragon)[183]. The flavour is said to improve as the plant matures[200, 268]. Seed - raw or cooked. An oily texture[46, 61, 161, 183]. The seed is very small and fiddly to use[K].

tcanta RepellentBoth the growing and the dried plant repels insects[99].

dwatta Antiscorbutic Diuretic Emmenagogue Hypnotic StomachicThe herb is antiscorbutic, diuretic, emmenagogue, hypnotic and stomachic[21, 46, 179]. The fresh herb is eaten to promote the appetite[268].

propta Seed - surface sow from late winter to early summer in a greenhouse. When large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring or autumn. Very easy, the divisions can be planted out direct into their permanent positions if required. Basal cuttings in late spring. Harvest the shoots when 10 - 15cm long, pot them up in a greenhouse and plant out when well rooted. Very easy.

nwatta Landscape Uses:Container, Seashore. Easily grown in a well-drained circumneutral or slightly alkaline loamy soil, preferring a sunny position[1, 200]. Established plants are drought tolerant[200]. Plants are longer lived, more hardy and more aromatic when they are grown in a poor dry soil[245]. Nomenclature is somewhat confused for this species. It is considered by some botanists to be a hardier

form of *A. dracunculus* but with an inferior flavour[4, 200], whilst some consider it to be part of *A. glauca*[43]. It is very similar to *A. dracunculus*, but is more vigorous and hardier, its leaves have a pungent and less pleasant flavour than that species[238]. Members of this genus are rarely if ever troubled by browsing deer[233]. Special Features: Edible, Fragrant foliage, Not North American native, Inconspicuous flowers or blooms.

### 6.2.350 *Codonopsis pilosula*

Dang Shen, Bellflower

5 tlin 9 cyuc 2 kcaak 0 tcan 3 dwat 1.7 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta *Codonopsis pilosula* is a PERENNIAL CLIMBER growing to 1.7 m (5ft 7in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from June to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Root - raw or cooked[105, 177].

tcanta None known

dwatta Adaptogen Appetizer Digestive Galactagogue Sialagogue Stomachic TonicDang Shun is an important herb in Chinese medicine, it is a gentle tonic that increases energy levels and helps the body adapt to stress[254]. The root contains saponins, triterpenes and steroids[279], it is similar in action to ginseng (*Panax* species), but it is milder and has a shorter-lasting effect[4, 116, 174, 176, 218, 238, 254]. It is a sweet, warm, soothing herb that is taken as an energy tonic[238]. It acts mainly on the spleen, lungs and stomach, raising secretion of body fluids and blood sugar levels, and stimulating the immune system[238]. Research has shown that it increases haemoglobin and red blood cell levels and lowers the blood pressure. It also helps increase endurance to stress and promotes alertness[254]. The root and the whole plant are adaptogen, appetizer, digestive, galactagogue, sialagogue, stomachic and tonic[116, 147, 174, 176, 238, 254]. It is taken internally in the treatment of low energy, poor appetite and digestion, anaemia, shallow breathing and debility after illness[238, 254]. It is often cooked with rice until it is glutinous and used as a tonic food[238]. The dried root is decocted with other herbs and used to treat a wide range of ailments[218]. The roots of plants at least three years old are harvested in the autumn and can be used fresh or dried[238].

propta Seed - surface sow in spring to early summer in an ericaceous compost in a greenhouse. Do not allow the compost to dry out. The seed usually germinates in 1 - 6 weeks at 20°C[164]. Prick out the seedlings into individual pots as soon as they are large enough to handle and grow them on in a greenhouse for their first winter. Plant out in late spring or early summer and protect them from slugs until the plants are well established[K]. Division in spring, with care, since the plant resents root disturbance[200]. We have found it best to take small divisions that are teased out from the sides of the main clump so as to cause the least possible disturbance to the plants and to avoid having to dig up the clump. These small divisions need to be potted up and placed in light shade in a greenhouse until they are rooting well. They can be planted out into their permanent positions in the summer if they are large enough, otherwise in the following spring[K].

nwatta Prefers a well-drained fertile light soil in full sun or semi shade[1, 200]. Plants only succeed in full sun if the soil remains moist during the growing season[200]. Prefers a slightly acid soil[164]. Although quite cold-hardy when dormant, the young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. A climbing plant, supporting itself by twining and scrambling over other plants[219]. The plant resents root disturbance and should be planted out into its permanent position as soon as possible[164]. It is best grown on a high bank in order to give a good view of the flowers[1]. Plants are very susceptible to

dormant otherwise they bleed profusely[182, 200]. Plants in this genus are notably susceptible to honey fungus[200].

### 6.2.282 *Morus bombycis*

Kuwa

5 tlin 9 cyuc 2 kcaak 0 tcan 2 dwat 8 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyif hjonli

drutta *Morus bombycis* is a deciduous Tree growing to 8 m (26ft) by 6 m (19ft). See above for USDA hardiness. It is hardy to UK zone 6. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or used in preserves[183]. The fruit is about 1cm in diameter[266].

tcanta FibreThe bark fibers are used for making paper[266].

dwatta Diuretic PectoralThe root bark is diuretic and pectoral[147]. A decoction is used in the treatment of 'hot' pulmonary coughing, asthma, excessive sputum production, oedematous face and difficult urination[147].

propta The seed germinates best if given 2 - 3 months cold stratification[80, 98]. Sow the seed as soon as it is ripe if possible, otherwise in February in a cold frame. The seed usually germinates in the first spring, though it sometimes takes another 12 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the cold frame for their first winter. Plant them out in late spring or early summer after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in a frame. Plant out in spring. A good percentage take, though they sometimes fail to thrive[78, 113]. Cuttings of mature wood of the current season's growth, 25 - 30cm with a heel of 2 year old wood, autumn or early spring in a cold frame or a shady bed outside[78, 113, 200]. Bury the cuttings to threequarters of their depth. Layering in autumn[200].

nwatta Prefers a warm well-drained loamy soil in a sunny position[1, 11]. There is some doubt over the validity of this name. [183] lists it as a synonym of *M. alba stylosa* (which we list as a synonym of *M. australis*) whilst [200] lists it as a synonym of *M. alba*. A plant seen at Hilliers Arboretum, Hampshire at the end of October 1996 seemed to be quite distinct from *M. alba* - it was still clothed in the lush green growth of early summer and was also still making new growth[K]. According to the Flora of China, this name is only a synonym for *M. australis*[266], though we are maintaining it as a separate species for the time being because we have seen specimens growing at Hilliers Arboretum that appear to be distinct[K]. Mulberries have brittle roots and so need to be handled with care when planting them out[238]. Any pruning should only be carried out in the winter when the plant is fully dormant because mulberries bleed badly when cut[238]. Ideally prune only badly placed branches and dead wood[238]. Plants in this genus are notably resistant to honey fungus[200].

### 6.2.283 *Quercus libani*

Lebanon Oak

5 tlin 9 cyuc 2 kcaak 0 tcan 2 dwat 8 m hkuc hmimhtut cyutli kyuctcup hwicli jlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta *Quercus libani* is a deciduous Tree growing to 8 m (26ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: SeedEdible Uses: CoffeeSeed - cooked. The seed is about 2.5cm in diameter[200], it can be

dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread. The seed contains bitter tannins, these can be leached out by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute.

tcanta Repellent tanninA mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth[20]. Oak galls are excrescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4].

dwatta Astringent DysenteryAny galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4].

propta Seed - it is quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Young plants tolerate reasonable levels of shade[200]. Prefers warmer summers than are usually experienced in Britain[200]. The seed ripens in its second year[200] and is frequently produced in Britain[11]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. Hybridizes freely with other members of the genus[200]. Plants in this genus are notably resistant to honey fungus[200].

### 6.2.284 *Vitis parvifolia*

5 tlin 9 cyuc 2 kcaak 0 tcan 1 dwat 8 m hkuc

hmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flat-priklwis hpa7tmwatli xre7t hjonli

drutta *Vitis parvifolia* is a deciduous Climber growing to 8 m (26ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to July, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Fruit LeavesEdible Uses: Drink-Fruit - raw or dried for winter use[105, 177]. The fruit is about 7mm in diameter[200] and is carried in bunches. Some forms of this plant have edible leaves[177] - it is unlikely that the leaves of any forms are poisonous, but perhaps some are more palatable than others[K]. Young leaves are wrapped around other foods and then baked, they impart a pleasant flavour. Young tendrils - raw or cooked. Sap - a sweet taste[178], it can be made into a drink[105, 177].

tcanta DyeA yellow dye is obtained from the fresh or dried leaves[168].

dwatta OphthalmicThe fruit is restorative, strengthening and tonic[218]. The sap is used to restore youth and black hair[218]. The root is said to be warming to the sinews[216].

propta Seed - best sown in a cold frame as soon as it is ripe[K]. Six weeks cold stratification improves the germination rate, and so stored seed is best sown in a cold frame as soon as it is obtained. Germination should take place in the first spring, but sometimes takes another 12 months. Prick out the seedlings into individual pots when they are large

enough to handle and grow them on in a cold frame for their first winter. Plant out in early summer. Cuttings of mature wood of the current seasons growth, December/January in a frame. These cuttings can be of wood 15 - 30cm long or they can be of short sections of the stem about 5cm long with just one bud at the top of the section. In this case a thin, narrow strip of the bark about 3cm long is removed from the bottom half of the side of the stem. This will encourage callusing and the formation of roots. Due to the size of these cuttings they need to be kept in a more protected environment than the longer cuttings. Layering.

nwatta Prefers a deep rich moist well-drained moderately fertile loam[1, 200]. Grows best in a calcareous soil[200]. Succeeds in sun or partial shade though a warm sunny position is required for the fruit to ripen[200]. A very ornamental plant[1], it climbs by means of tendrils[182]. Any pruning should be carried out in winter when the plants are dormant otherwise they bleed profusely[182, 200]. Plants in this genus are notably susceptible to honey fungus[200].

## 6.2.285 Malus sikkimensis

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 7 m hkuc hmimhtut cyutil tcup hwicli hrasjlutnyikfrp hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Malus sikkimensis is a deciduous Tree growing to 7 m (23ft). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in May, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105, 177]. The fruit is up to 15mm in diameter[200] and is freely produced in Britain[11].

tcanta None known  
dwatta None known

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. It usually germinates in late winter. Stored seed requires stratification for 3 months at 1°C and should be sown in a cold frame as soon as it is received[200]. It might not germinate for 12 months or more. Prick out the seedlings into individual pots as soon as they are large enough to handle. If given a rich compost they usually grow away quickly and can be large enough to plant out in late summer, though consider giving them some protection from the cold in their first winter. Otherwise, keep them in pots in a cold frame and plant them out in late spring of the following year. Cuttings of mature wood, November in a frame[11].

nwatta An easily grown plant, it succeeds in most fertile soils, preferring a moisture retentive well-drained loamy soil[1, 200]. Grows well in heavy clay soils. Prefers a sunny position but succeeds in partial shade, though it fruits less well in such a situation[200]. Closely related to *M. baccata*[1]. The fruit, which is freely produced in Britain[11], is a good wildlife food source, especially for birds[200]. Hybridizes freely with other members of this genus[200]. Plants in this genus are notably susceptible to honey fungus[200].

## 6.2.286 Malus bracteata

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 7 m hkuc hmimhtut cyutil tcup hwicli hrasjlutnyikfrp hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Malus bracteata is a deciduous Tree growing to 7 m (23ft). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105]. The fruit is about 3cm in diameter[200].

tcanta None known

dwatta None known

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. It usually germinates in late winter. If given a rich compost they usually grow away quickly and can be large enough to plant out in late summer, though consider giving them some protection from the cold in their first winter. Otherwise, keep them in pots in a cold frame and plant them out in late spring of the following year. Cuttings of mature wood, November in a frame[11].

nwatta An easily grown plant, it succeeds in most fertile soils, preferring a moisture retentive well-drained loamy soil[1, 200]. Grows well in heavy clay soils. Prefers a sunny position but succeeds in partial shade though it fruits less well in such a situation[1, 200]. The fruit is a good wildlife food source, especially for birds[200]. There is some confusion over the correct name of this species, [43] lists this name as a synonym of *M. coronaria lancifolia* whilst [200] treats it as a species in its own right. This species is closely related to *M. ioensis*[200]. It hybridizes freely with other members of the genus[200]. Plants in this genus are notably susceptible to honey fungus[200].

## 6.2.287 Morus microphylla

Texas Mulberry

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat m hkuc hmimhtut cyutil tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

drutta Morus microphylla is a deciduous Tree growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in May, and the seeds ripen in July. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). . The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw. Small and dry[149, 161, 177]. Sweet and palatable[82, 200]. The fruits can be sweet or sour[227]. The fruit can be dried for later use[257]. It is up to 15mm in diameter[200].

tcanta WoodThe twigs have been split in half lengthways and used to make serviceable baskets[257]. Wood - heavy, hard, elastic, close grained. Used for carpentry[149], but it is too small to be commercially important[229].

dwatta None known

propta The seed germinates best if given 2 - 3 months cold stratification[80, 98]. Sow the seed as soon as it is ripe if possible, otherwise in February in a cold frame. The seed usually germinates in the first spring, though it sometimes takes another 12 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the cold frame for their first winter. Plant them out in late spring or early summer after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in a frame. Plant out in spring. A good percentage take, though they sometimes fail to thrive[78, 113]. Cuttings of mature wood of the current season's growth, 25 - 30cm with a heel of 2 year old wood, autumn or early spring in a cold frame or a shady bed outside[78, 113, 200]. Bury the cuttings to threequarters of their depth. Layering in autumn[200].

nwatta Prefers a warm well-drained loamy soil in a sunny position[1, 11]. Formerly cultivated for its edible fruit by the North American Indians[149]. Mulberries have brittle roots and so need to be handled with care when planting them out[238]. Any pruning should only be carried out in the winter when the plant is fully dormant because mulberries bleed badly when cut[238]. Ideally prune only badly paced branches and dead wood[238]. Plants in this genus are notably resistant to honey fungus[200]. Dioecious, male and female plants must be grown if seed is required[227].

nwatta Easily grown in a good well-drained loamy soil in sun or semi-shade[1, 11, 200]. This species is a blackberry with biennial stems, it produces a number of new stems each year from the perennial rootstock, these stems fruit in their second year and then die[200]. A parent of many cultivated forms of blackberry in N. America, the cultivar 'Kitatinny' has been available in Britain[11]. The plant produces apomictic flowers, these produce fruit and viable seed without fertilization, each seedling is a genetic copy of the parent[200] Plants in this genus are notably susceptible to honey fungus[200].

## 6.2.345 Dendranthema lavandulifolium

5 tlin 9 cyuc 2 kcaak 0 tcan 2 dwat 1.5 m hkuc htut cyutil tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Dendranthema lavandulifolium is a PERENNIAL growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta The following uses are for the closely related *D. indica*. They quite possibly also apply to this species. The flower heads are pickled in vinegar[46, 61, 177, 183]. Young leaves - cooked[105, 177, 183]. An aromatic tea is made from the leaves[183]. Seed[183]. No more details are given but it is very small and would be rather fiddly to use.

tcanta The following uses are for the closely related *D. indicum*. They quite possibly also apply to this species. The seed contains about 16% of a semi-drying oil, but no information is given as to its uses[240]. The seed is rather small, commercial extraction is probably not viable[K].

dwatta EczemaThe flowers are hypotensive and vasodilator[176]. They have an antibacterial action, inhibiting the growth of *Staphylococcus*, *E. coli*, *streptococcus*, *C. diphtheriae*, *Bacillus dysenteriae*[176]. The flowers are used in the treatment of furuncle, scrofula, deep-rooted boils, inflammation of the throat, eyes and cervix, eczema, itchiness of the skin and hypertension[176].

propta Seed - sow spring to early summer in a greenhouse and only just cover the seed[200]. It usually germinates in 10 - 18 days at 15°C but if it does not germinate within 4 weeks then try chilling the seed for 3 weeks in the salad compartment of a fridge[164]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Succeeds in most well-drained fertile soils in a sunny position[1, 200]. This species is closely related to *D. indicum*. When bruised, the foliage has a pungent refreshing fragrance that is somewhat lemon-like and reminiscent of chamomile[245].

## 6.2.346 Rheum ribes

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 1.5 m hkuc hmimhtut cyutil cyুক্তcp hwicli jlutnyikfrp hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Rheum ribes is a PERENNIAL growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to July, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: StemEdible Uses: Leaf stem - cooked[2, 93, 105]. Eaten raw by the local people[187].

tcanta None known

dwatta None known

propta Seed - best sown in autumn in a shaded cold frame[200]. The seed can also be sown in spring in a cold frame. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse or cold frame for their first winter, planting them out in the spring. Division in early spring or autumn[1, 111]. Divide up the rootstock with a sharp spade or knife, making sure that there is at least one growth bud on each division. Larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Prefers a deep, fertile, moderately heavy, humic rich, moisture retentive, well-drained soil in sun or semi-shade[200]. Grows well in heavy clay soils. Best grown in a dry position, where it can be very long-lived[187]. Hardy to about -20°C according to one report[200] whilst another says that plants are somewhat tender in Britain[1]. Plants in this genus seem to be immune to the predations of rabbits[233]. Hybridizes freely with other members of this genus[200].

## 6.2.347 Adenophora remotiflora

5 tlin 9 cyuc 2 kcaak 0 tcan 1 dwat 1 m hkuc htut cyutil tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Adenophora remotiflora is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Root - raw or cooked[105, 177, 179]. Buds - cooked[177]. We do not know if this report refers to the flowers or the leaves[K].

tcanta None known

dwatta Antidote Demulcent ExpectorantThe root is antidote, demulcent, expectorant[174, 178, 218]. The root is used in the treatment of poisonous bites and medicinal poisoning[174, 178].

propta Seed - best sown in a cold frame as soon as it is ripe[200]. The seed can also be sown in spring. Surface sow 2 - 3 seeds per pot in the spring in order to avoid transplanting[133]. We have found that if transplanted when very small seedlings grow away without difficulty[K]. Germinates in 1 - 3 months at 10°C[133]. Plant out into their permanent positions whilst young. Basal cuttings in spring[K]. Division in spring - very difficult because the plant dislikes root disturbance[1].

nwatta Prefers a light rich slightly alkaline soil that is not too dry, and a warm sunny position[1, 200]. Plants are intolerant of root disturbance[1]. The young growth is extremely attractive to slugs, they have been known to destroy even mature plants[K]. There is some confusion over this name. Some reports, especially [105] and [179] refer to *A. remotifolia*. Miq. We assume that this is a mis-spelling for this species but we could be wrong[K].

## 6.2.348 Leonurus sibiricus

Chinese Motherwort, Honeyweed

5 tlin 9 cyuc 2 kcaak 0 tcan 3 dwat 1 m hkuc hmimhtut cyutil tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Leonurus sibiricus is a ANNUAL/BIENNIAL growing to 1 m (3ft 3in) by 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to September, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Young shoots - cooked[105, 177, 183]. A sweetish flavour[179].

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli frusflatprikwis hpa7tmwatli xre7t hjonli

drutta Hydrangea serrata is a deciduous Shrub growing to 2 m (6ft) by 1 m (3ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: LeavesEdible Uses: Young leaves and shoots - cooked[105]. These leaves do not become sweet like those of sssp thunbergii or amagiana or those of H. macrophylla[174].

tcanta Hedge HedgeCan be grown as a low hedge[29], it is quite wind tolerant.

dwatta None known

propta Seed - surface sow in a greenhouse in spring[113]. Cover the pot with paper until the seed germinates[78]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 8cm long, July/August in a frame. Overwinter in a greenhouse and plant out in late spring[78]. Cuttings of mature wood in late autumn in a frame[200]. Mound layering in spring. Takes 12 months[78]. Leaf-bud cuttings of the current seasons growth in a frame[200].

nwatta Landscape Uses:Container, Seashore, Specimen. Tolerates most soil[200], thriving in a well-drained loamy soil[1], but resenting dryness at the roots[11, 200]. Succeeds in full sun or semi-shade[200], but if it is grown in a low rainfall area then it requires shade at the hottest part of the day[11]. Does well on very acid soils with a pH around 4.5[200]. Tolerates alkaline soils, but it may become chlorotic on shallow soils over chalk[200]. The colour of the flowers reflects the pH of the soil the plant is growing in, the flowers are pink in a neutral to alkaline soil and blue in an acid soil[200]. Plants are hardy to about -25°C when dormant but the young growth in spring can be killed by late frosts. A very ornamental plant, there are many named varieties[182]. Considerable difficulties exist in the nomenclature for this species and H. macrophylla. They are treated here in accordance with "Bean's Manual of Trees and Shrubs", though many botanists view H. serrata as no more than a sub-species of H. macrophylla. This species is notably susceptible to honey fungus[200]. Special Features: Not North American native, Blooms are very showy.

## 6.2.342 Ribes inerme

Whitestem Gooseberry, Klamath gooseberry

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 2 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta Ribes inerme is a deciduous Shrub growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 6. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[101, 105, 161, 257]. A gooseberry[161]. The fruit is about 8mm in diameter[200].

tcanta None known

dwatta None known

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. Stored seed requires 4 - 6 months cold stratification at 0°C and should be sown as early in the year as possible[113, 164]. Under normal storage conditions the seed can remain viable for 17 years or more. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter, planting them out in late spring of the following year. Cuttings of half-ripe wood, 10 - 15cm with a heel, July/August

in a frame[78, 113]. Cuttings of mature wood of the current year's growth, preferably with a heel of the previous year's growth, November to February in a cold frame or sheltered bed outdoors[78, 200].

nwatta Easily grown in a moisture retentive but well-drained loamy soil of at least moderate quality[11, 200]. Prefers a sunny position[11]. Hardy to about -20°C[200]. Some botanists include this species as part of R. divaricatum as R. divaricatum inerme. (Rydb.)McMinn.[71]. The stems are occasionally thorned or smooth[200]. Plants can harbour a stage of 'white pine blister rust', so they should not be grown in the vicinity of pine trees[155]. Plants in this genus are notably susceptible to honey fungus[200].

## 6.2.343 Rubus thibetanus

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 2.5 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta Rubus thibetanus is a deciduous Shrub growing to 2.5 m (8ft) by 3 m (9ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[K]. The purplish black or dark red fruit is about 16mm in diameter[200].

tcanta DyeA purple to dull blue dye is obtained from the fruit[168].

dwatta None known

propta Seed - requires stratification, is best sown in early autumn in a cold frame. Sow stored seed as early as possible in the year in a cold frame and stratify for a month at 3°C if sowing later than February. Prick out the seedlings when they are large enough to handle and grow on in a cold frame. Plant them out into their permanent positions in late spring of the following year. Tip layering in July. Plant out in autumn. Division in early spring.

nwatta Easily grown in a good well-drained loamy soil in sun or semi-shade[1, 11, 200]. Spreads by means of suckers[182]. Plants in this genus are notably susceptible to honey fungus[200].

## 6.2.344 Rubus bellobatus

Kittatiny Blackberry

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 2 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwis hpa7tmwatli fyfxfre7t hjonli

drutta Rubus bellobatus is a deciduous Shrub growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 6. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects, Apomictic (reproduce by seeds formed without sexual fusion). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105, 177]. The oblong fruit is about 30mm long[200].

tcanta DyeA purple to dull blue dye is obtained from the fruit[168].

dwatta None known

propta Seed - requires stratification and is best sown in early autumn in a cold frame. Stored seed requires one month stratification at about 3°C and is best sown as early as possible in the year. Prick out the seedlings when they are large enough to handle and grow on in a cold frame. Plant them out into their permanent positions in late spring of the following year. Cuttings of half-ripe wood, July/August in a frame[200]. Tip layering in July. Plant out in autumn. Division in early spring or just before leaf-fall in the autumn[200].

## 6.2.288 Vaccinium melanocarpum

Georgia Blueberry

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat m hkuc

hmimhtut cyutli tcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta Vaccinium melanocarpum is a deciduous Shrub growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[1, 3, 105, 161]. The fruit is about 8 - 10mm in diameter[200].

tcanta None known

dwatta None known

propta Seed - sow late winter in a greenhouse in a lime-free potting mix and only just cover the seed[78]. Stored seed might require a period of up to 3 months cold stratification[113]. Another report says that it is best to sow the seed in a greenhouse as soon as it is ripe[200]. Once they are about 5cm tall, prick the seedlings out into individual pots and grow them on in a lightly shaded position in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 8cm with a heel, August in a frame[78]. Slow and difficult. Layering in late summer or early autumn[78]. Another report says that spring is the best time to layer[200]. Takes 18 months[78]. Division of suckers in spring or early autumn[113].

nwatta Requires a moist but freely-draining lime free soil, preferring one that is rich in peat or a light loamy soil with added leaf-mould[11, 200]. Prefers a very acid soil with a pH in the range of 4.5 to 6, plants soon become chlorotic when lime is present. Succeeds in full sun or light shade though it fruits better in a sunny position[200]. Requires shelter from strong winds[200]. This species is closely related to V. neglectum[11]. Dislikes root disturbance, plants are best grown in pots until being planted out in their permanent positions[200]. Plants in this genus are notably resistant to honey fungus[200].

## 6.2.289 Thamnocalamus aristatus

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 6 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta Thamnocalamus aristatus is an evergreen Bamboo growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Seed StemEdible Uses: Young shoots - cooked[177]. The new shoots are about 15mm in diameter[K]. Seed - used as a cereal[177]. The plants only flower and produce seed at intervals of several years.

tcanta Basketry Hedge Hedge Plant supportThe canes are used for making walking sticks, baskets and pipes[25, 46, 51, 272]. They can also be used as plant supports[146]. Valuable for screen planting in wet areas[200].

dwatta None known

propta Seed - surface sow as soon as it is ripe in a greenhouse at about 20°C. Do not allow the compost to dry out. Germination usually takes place fairly quickly so long as the seed is of good quality, though it can take 3 - 6 months. Grow on in a lightly shaded place in the greenhouse until large enough to plant out. Seed is rarely available. Division in spring as new growth commences. Take divisions with at least three canes in the clump, trying to cause as little root disturbance to the main plant as possible. Grow them on in light shade in a greenhouse in pots of a high fertility sandy medium. Mist the foliage regularly until plants are established. Plant them out into their permanent positions when

a good root system has developed, which can take a year or more[200]. Basal cane cuttings.

nwatta Succeeds in most soils in sun or shade so long as the soil is moist[200]. Prefers a good loamy soil in a semi-shaded position[1, 11, 25], the leaves curling up when the plant grows in strong sunlight. Dislikes drought[1]. Requires a position sheltered from cold winds[25]. This species is only hardy in the milder areas of Britain. Plants are hardy to about -20°C according to another report. This species is notably resistant to honey fungus[200]. Plants only flower at intervals of many years. When they do come into flower most of the plants energies are directed into producing seed and consequently the plant is severely weakened. They sometimes die after flowering, but if left alone they will usually recover though they will look very poorly for a few years. If fed with artificial NPK fertilizers at this time the plants are more likely to die[122]. The rootstock is caespitose[25]. Closely related to T. spathiflorus[200].

## 6.2.290 Erodium moschatum

Musk Storksbill

5 tlin 9 cyuc 2 kcaak 0 tcan 1 dwat m hkuc

htut cyutli kyucutp hwicli hrasjlut hpa7tli prikklwis hpa7tmwatli xre7t hjonli

drutta Erodium moschatum is a ANNUAL/BIENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked[161, 177]. Added to salads or used as a potherb[183]. tcanta DyeA green dye can be obtained from the whole plant. It does not require a mordant[168].

dwatta Astringent Dysentery FebrifugeThe plant is febrifuge[240]. A tincture of the plant is used in the treatment of dysentery[240].

propta Seed - sow in situ as soon as the seed is ripe in the late summer. The seed can also be sown in situ in late spring[1]. It usually germinates readily[200].

nwatta Prefers a sunny well-drained position and a limy soil or at least one that is not acid[1]. The bruised leaves emit a strong scent of musk[245].

## 6.2.291 Cornus florida

Flowering Dogwood

5 tlin 9 cyuc 2 kcaak 3 tcan 2 dwat 6 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Cornus florida is a deciduous Shrub growing to 6 m (19ft) by 8 m (26ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in May, and the seeds ripen in November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Edible Uses: DrinkFruit - cooked. The fruit is not poisonous, but is almost inedible raw[226]. When the seed is removed and the flesh is mashed, it can be mixed with other fruits and made into jams, jellies etc[226]. The fruit, when infused in 'Eau de Vie' makes a bitter but acceptable drink[4]. One report says that the fruit is poisonous for humans[229]. The fruit is borne in clusters, each fruit being up to 15mm in diameter with a thin mealy bitter flesh[229]. The fruit is high in lipids, up to 35% of dry weight[274].

tcanta Brush Dye Ink Repellent Teeth WoodA red dye is obtained from the fibrous root[4, 95]. The peeled twigs are used as toothbrushes, they are good for whitening the teeth[4, 95, 102]. The juice from the twigs preserves and hardens the gums[4]. The twigs can also be chewed to make

natural paintbrushes[102]. A black ink can be made from the bark mixed with gum arabic and iron sulphate[4]. The bark is very bitter, could it be used to make an insect or bird repellent[K]? Wood - hard, heavy, strong, close grained, durable, takes a good polish and is extremely shock-resistant. It weighs 51lb per cubic foot and is used for making wheel hubs, tool handles, the heads of golf clubs, bearings, turnery etc[4, 46, 61, 82, 102, 171, 227]. A dynamic accumulator gathering minerals or nutrients from the soil and storing them in a more bioavailable form - used as fertilizer or to improve mulch.

dwatta Anthelmintic Antidiarrhoeal Antiperiodic Appetizer Astringent Bitter Diaphoretic Malaria Poultice Stimulant TonicFlowering dogwood was employed medicinally by a number of native North American Indian tribes who valued it especially for its astringent and antiperiodic properties[257]. It is little used in modern herbalism. The dried root-bark is antiperiodic, astringent, diaphoretic, mildly stimulant and tonic[4, 46, 61, 95, 257]. The flowers are said to have similar properties[4]. A tea or tincture of the astringent root bark has been used as a quinine substitute to treat malaria[95, 222, 257] and also in the treatment of chronic diarrhoea[222]. The bark has also been used as a poultice on external ulcers, wounds etc[222, 257]. The glycoside 'cornin' found in the bark has astringent properties[213]. The inner bark was boiled and the tea drunk to reduce fevers and to restore a lost voice[213, 257]. A compound infusion of the bark and the root has been used in the treatment of various childhood diseases such as measles and worms[257]. It was often used in the form of a bath[257]. The fruits are used as a bitter digestive tonic[222]. A tincture of them has been used to restore tone to the stomach in cases of alcoholism[4].

propta Seed - best sown as soon as it is ripe in a cold frame or in an outdoors seedbed if there is sufficient seed[80, 113]. The seed must be separated from the fruit flesh since this contains germination inhibitors[80, 164]. Stored seed should be cold stratified for 3 - 4 months and sown as early as possible in the year[164]. Scarification may also help as may a period of warm stratification before the cold stratification[80, 164]. Germination, especially of stored seed, can be very slow, taking 18 months or more[164]. Prick out the seedlings of cold-frame sown seeds into individual pots as soon as they are large enough to handle and grow the plants on for their first winter in a greenhouse, planting out in the spring after the last expected frosts. Cuttings of half-ripe side shoots, July/August in a frame[188]. Cuttings of mature wood of the current year's growth, taken with a heel if possible, autumn in a cold frame. High percentage[78]. Layering of new growth in June/July. Takes 9 months[78].

nwatta Landscape Uses:Border, Specimen, Woodland garden. An easily grown plant, it succeeds in any soil of good or moderate fertility[1], ranging from acid to shallow chalk[200]. Dislikes shallow clay soils and chalky soils[98, 182]. Requires a neutral to acid soil according to another report[202]. Prefers a rich loamy well-drained soil[98]. Succeeds in full sun or light shade[188]. Plants can be trained to grow against a wall when they prefer a position in light shade[202]. Plants are very hardy, tolerating temperatures down to about -25°C. but they are subject to damage by late frosts and are rarely successful away from the warmer counties of Britain[11, 200]. They require a long hot humid summer if they are to grow well, doing best in the east or south-east of Britain[182, 200] in areas that are not subject to late or early frosts. They do not generally do very well in the south-west, where the flower bracts are often damaged by frosts[200]. Medium to fast growing when young, but slowing with age[202]. Trees are short-lived[229]. A very ornamental plant, there are many named varieties[200, 202]. It is the state flower of Virginia[212]. Plants in this genus are notably resistant to honey fungus[200]. Special Features: Attracts birds, North American native, Attracts butterflies, Blooms are very showy. The plant is heat tolerant in zones 8 through 3. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-

ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2]. The root pattern is flat with shallow roots forming a plate near the soil surface [1-2]. The root pattern is a heart root, dividing from the crown into several primary roots going down and out [1-2]. The root pattern is fibrous dividing into a large number of fine roots [1-2].

## 6.2.292 Cardamine macrophylla

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat m hkuc hmimhtut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flat-prikkwiss hpa7tmwatli fyfxfre7t hjonli

drutta Cardamine macrophylla is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in June, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

ckakta Edible Parts: LeavesEdible Uses: Leaves and young shoots - cooked[105, 177].

tcanta None known dwatta None known propta Seed - sow outdoors in a seedbed in a shady position in April. Plant out in autumn or spring. Division in the spring. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them out in a cold frame until they are rooting well. Plant them out in the summer or following spring.

nwatta Succeeds in most soils[1]. Prefers a moist humus rich soil in shade or semi-shade[200]. Best grown in cool places by water[1]. A very ornamental plant[1], it is hardy to about -15°C[187].

## 6.2.293 Plantago media

Hoary Plantain

5 tlin 9 cyuc 2 kcaak 2 tcan 2 dwat m hkuc htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flat-prikkwisslip hpa7tmwatli fyfxfre7t hjonli

drutta Plantago media is a PERENNIAL growing to 0.1 m (0ft 4in) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from May to August, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind, flies, beetles, bees. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

ckakta Edible Parts: Flowers LeavesEdible Uses: Young leaves - raw or cooked[7]. The very young leaves have a fairly mild flavour but with a slight bitterness[K]. Used in salads before they become tough[7]. The inflorescence is sweet and is sucked by children[177, 183].

tcanta FungicideThe leaves are a cure for blight on fruit trees[14]. An important food plant for the caterpillars of many species of butterflies[30]. The flowers are sweetly scented[245]. Dynamic accumulator.

dwatta Astringent Demulcent Deobstruent Depurative Diuretic Expectorant Haemostatic Laxative Odontalgic Ophthalmic RefrigerantThe leaves, flowering stems and roots are somewhat astringent, deobstruent, depurative, diuretic, expectorant, haemostatic, refrigerant and vulnerary[4, 7]. They are applied externally to skin inflammations, malignant ulcers, cuts etc[4, 7]. A mouthwash made from the leaves helps to relieve toothache and a distilled water is a good eye-wash[7]. The seeds are demulcent and laxative[4, 7]. Plantain seeds contain up to 30% mucilage which swells up in the gut, acting as a bulk laxative and soothing irritated membranes[238]. Sometimes the seed husks are used without the seeds[238].

## 6.2.338 Oemleria cerasiformis

Oso Berry, Indian plum

5 tlin 9 cyuc 2 kcaak 0 tcan 1 dwat 2.5 m hkuc hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flat-prikkwiss hpa7tmwatli nyanhjen hjonli

drutta Oemleria cerasiformis is a deciduous Shrub growing to 2.5 m (8ft) by 4 m (13ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from March to April. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

ckakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[46, 61, 118, 183]. A poor flavour[106]. The fruit looks like a small plum but is very bitter with an almond flavour[11]. The fully ripe fruit loses most of its bitterness[256]. The fruit only has a thin layer of flesh[200]. The fruit can be dried and stored for winter use[257]. Some caution is advised, see the notes above on toxicity.

tcanta None known dwatta Laxative Poultice TBThe bark is mildly laxative[257]. A decoction has been used in the treatment of tuberculosis[257]. A poultice of the chewed burned plant, mixed with oil, has been used to treat sore parts of the body[257].

propta The seed requires 4 months stratification at 4°C. It is probably best sown in a cold frame as soon as it is ripe in the autumn. Sow stored seed as early in the year as possible. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the cold frame for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame. Layering in spring. Takes 6 months[78]. Suckers, taken at any time in the dormant season[188].

nwatta Succeeds in an ordinary well-drained garden soil[11, 200], but becomes chlorotic on shallow soils over chalk[200]. Prefers a well-drained moisture retentive soil in a shady position[200]. Requires a sunny position according to another report[182]. Plants are hardy to about -20°C[184]. This species grows well in a woodland garden or in a damp shady border[200]. The plants often sucker freely and can form dense thickets[188]. Old plants can be rejuvenated by cutting them back hard into the old wood in late winter, they will resprout freely from the base[200]. Growth can be restricted by removing suckers and cutting old shoots back or down to the base in late winter[188]. Some, if not all plants are dioecious. Male and female plants must be grown if seed is required.

## 6.2.339 Rubus adenophorus

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 2.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flat-prikkwiss hpa7tmwatli xre7t hjonli

drutta Rubus adenophorus is a deciduous Shrub growing to 2.5 m (8ft 2in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to June, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

ckakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[1, 11, 105]. The fruit is about 12mm in diameter[200].

tcanta DyeA purple to dull blue dye is obtained from the fruit[168].

dwatta None known propta Seed - requires stratification and is best sown in early autumn in a cold frame. Stored seed requires one month stratification at about 3°C and is best sown as early as possible in the year. Prick out the seedlings when they are large enough to handle and grow on in a cold frame. Plant

them out into their permanent positions in late spring of the following year. Division in early spring or just before leaf-fall in the autumn[200].

nwatta Easily grown in a good well-drained loamy soil in sun or semi-shade[1, 11, 200]. This species is a raspberry with biennial stems[200]. New shoots are produced from the roots each year, these flower and fruit in their second year and then die[200]. Plants in this genus are notably susceptible to honey fungus[200].

## 6.2.340 Lilium pardalinum

Panther Lily, Leopard lily, Pitkin Marsh lily, Vollmer's lilyShasta lily, Wiggins' lily  
5 tlin 9 cyuc 2 kcaak 2 tcan 0 dwat 2 m hkuc hmimhtut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flat-prikkwiss hpa7tmwatli xre7t hjonli

drutta Lilium pardalinum is a BULB growing to 2 m (6ft) by 0.3 m (1ft in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in July, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, butterflies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil. The plant can tolerate strong winds but not maritime exposure.

ckakta Edible Parts: RootEdible Uses: Bulb - cooked[143, 257]. Rich in starch, it can be used as a vegetable in similar ways to potatoes (*Solanum tuberosum*).

tcanta Landscape Uses: Border, Container, Massing, Seashore, Specimen. Ornamental. Hardy bulb. US native to moist meadows and streambeds.

dwatta None known propta Seed - autumnal hypogaeal germination. Best sown as soon as ripe in a cold frame, it should germinate in spring[163]. Stored seed will require a warm/cold/warm cycle of stratification, each period being about 2 months long[163]. Grow on in cool shady conditions. Great care should be taken in pricking out the young seedlings, many people leave them in the seed pot until they die down at the end of their second years growth. This necessitates sowing the seed thinly and using a reasonably fertile sowing medium. The plants will also require regular feeding when in growth. Divide the young bulbs when they are dormant, putting 2 - 3 in each pot, and grow them on for at least another year before planting them out into their permanent positions when the plants are dormant[K]. Division in autumn once the leaves have died down. Replant immediately[200]. Bulb scales can be removed from the bulbs in early autumn. If they are kept in a warm dark place in a bag of moist peat, they will produce bulblets. These bulblets can be potted up and grown on in the greenhouse until they are large enough to plant out. Bulbils - gather in late summer when they start to fall off the stems and pot up immediately. Grow on in a greenhouse until large enough to go outside[163].

nwatta Succeeds in almost any soil that is moist but not water-logged[47, 143]. Prefers a wet soil on a slope or a well-drained soil with a high water table[90]. Tolerates lime[47, 90, 163]. Succeeds in full sun but rapidly deteriorates if grown in deep shade[143]. Fairly wind resistant but is best grown in a sheltered position[47, 143]. Very ornamental and easily grown[1], the plant is rhizomatous, forming clumps[47]. The plant increases rapidly by division, each bulb producing 5 new bulbs per year[143]. Early to mid autumn is the best time to plant out the bulbs in cool temperate areas, in warmer areas they can be planted out as late as late autumn[200]. A very variable plant, it is divided into a number of sub-species[270]. The plant should be protected against rabbits and slugs in early spring. If the shoot tip is eaten out the bulb will not grow in that year and will lose vigour[200]. Special Features: North American native, Naturalizing, Attracts butterflies, Suitable for cut flowers, Fragrant flowers. Heat Zone: 8-5.

## 6.2.341 Hydrangea serrata

Hydrangea, Mountain Hydrangea, Sawtooth Hydrangea  
5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 2 m hkuc

(has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Fruit Seed StemEdible Uses: TeaFruit - raw or cooked[118, 183]. It is used to make jams and jellies, it is also used to make a pleasant tasting fruity-flavoured tea[177, 183]. The fruit is about 13mm in diameter[200], but there is only a thin layer of flesh surrounding the many seeds[K]. Some care has to be taken when eating this fruit, see the notes above on known hazards. The seed is a good source of vitamin E, it can be ground into a powder and mixed with flour or added to other foods as a supplement[102, 183]. Be sure to remove the seed hairs[102]. The shoots can be used to make a tea-like beverage[257]. Young tender shoots - peeled and eaten in the spring[257].

tcanta None known

dwatta Astringent Cancer Foot care VD Women’s complaintsA decoction of the roots has been used in the treatment of sore throats and syphilis[257]. An infusion of the bark has been taken by a mother just after childbirth[257]. A decoction of the branches, combined with chokecherry (*Prunus virginiana*) and red willow (*Salix bonplandiana*), has been used in the treatment of various women’s complaints, diarrhoea and vomiting[257]. The leaves have been placed in the shoes as a protection from athletes foot[257]. The fruit of many members of this genus is a very rich source of vitamins and minerals, especially in vitamins A, C and E, flavanoids and other bio-active compounds. It is also a fairly good source of essential fatty acids, which is fairly unusual for a fruit. It is being investigated as a food that is capable of reducing the incidence of cancer and also as a means of halting or reversing the growth of cancers[214].

propta Seed. Rose seed often takes two years to germinate. This is because it may need a warm spell of weather after a cold spell in order to mature the embryo and reduce the seedcoat[80]. One possible way to reduce this time is to scarify the seed and then place it for 2 - 3 weeks in damp peat at a temperature of 27 - 32°c (by which time the seed should have imbibed). It is then kept at 3°c for the next 4 months by which time it should be starting to germinate[80]. Alternatively, it is possible that seed harvested 'green' (when it is fully developed but before it has dried on the plant) and sown immediately will germinate in the late winter. This method has not as yet(1988) been fully tested[80]. Seed sown as soon as it is ripe in a cold frame sometimes germinates in spring though it may take 18 months. Stored seed can be sown as early in the year as possible and stratified for 6 weeks at 5°c[200]. It may take 2 years to germinate[200]. Prick out the seedlings into individual pots when they are large enough to handle. Plant out in the summer if the plants are more than 25cm tall, otherwise grow on in a cold frame for the winter and plant out in late spring. Cuttings of half-ripe wood with a heel, July in a shaded frame. Overwinter the plants in the frame and plant out in late spring[78]. High percentage[78]. Cuttings of mature wood of the current seasons growth. Select pencil thick shoots in early autumn that are about 20 - 25cm long and plant them in a sheltered position outdoors or in a cold frame[78, 200]. The cuttings can take 12 months to establish but a high percentage of them normally succeed[78]. Division of suckers in the dormant season. Plant them out direct into their permanent positions. Layering. Takes 12 months[11].

nwatta Succeeds in most soils[11], preferring a circumneutral soil and a sunny position[200]. Grows well in heavy clay soils. Dislikes water-logged soils[200]. Grows well with alliums, parsley, mignonette and lupins[18, 20]. Garlic planted nearby can help protect the plant from disease and insect predation[18, 20]. Grows badly with boxwood[18]. Hybridizes freely with other members of this genus[80]. Plants in this genus are notably susceptible to honey fungus[200].

### 6.2.337 Gossypium hirsutum

Upland Cotton

5 tlin 10 cyuc 2 kcaak 4 tcan 1 dwat 2 m hkuc htut cyuti tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta Gossypium hirsutum is a SHRUB growing to 2 m (6ft) by 2 m (6ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil. The plant is not wind tolerant.

kcakta Edible Parts: Oil SeedEdible Uses: OilSeed - cooked. The seeds contain up to 40% protein, they have a nutty flavour when roasted and can be eaten as a snack[301 ]. They are also boiled and used like rice in casseroles and soups[301 ]. Ground into a powder, they can be added to flour when making bread, cakes etc[301 ]. They can also be made into a spread similar to peanut butter[301 ]. Some forms of this plant produce seeds containing the toxin gossypol, which needs to be removed before the seed is eaten[301 ]. The seeds of glandless cultivars do not contain this toxin[301 ]. An oil obtained from the seed is used for salads, in cooking and to make margarine etc[301 , 418 ]. Carbon Farming - Staple Crop: oil.

tcanta OilAgroforestry Uses: Low-grade seed cake, after the oil has been expressed, is used as manure[418 ]. Other Uses A good quality fibre is obtained from the seed floss[46 ]. Cotton fibres have a wide range of use including making clothes; rubber-tyre fabrics; stuffing material for pillows, cushions etc; surgical dressings; making twine and ropes; carpets etc[46 ]. An oil is obtained from the seed. Low-grades of the oil are used in the manufacture of soap, lubricants, sulphonated oils and protective coatings[418 ]. The seed hulls and the dry stalks are used as fuel[418 ]. Carbon Farming. Industrial Crop: fiber. Other Systems: strip intercrop.

dwatta The boiled leaves are applied to skin rashes on children[348 ].

propta Seed. In zones 8-10 it can be sown directly after the last frost. In zones 5-7, treat like tomatoes. Seed germinates in 7-21 days at 70 F. Plant 18-30 in. apart in rows 5 ft. apart. Plants start flowering in mid-summer.

nwatta Industrial Crop: Fiber Management: Coppice Management: Standard Other Systems: Strip intercrop Regional Crop Staple Crop: OilSea Island cotton can be grown in the dry to moist tropics and subtropics, where it is found at elevations up to 1,250 metres. For commercial production it requires a climate that has a long, hot growing season with abundant moisture, followed by a drier period for harvesting the seed floss[200 ]. Low temperature increases the production of vegetative branches and extends the cropping period, while high temperature increases the number of fruiting branches and reduces the cropping period. It grows best in areas where annual daytime temperatures are within the range 22 - 36°c, but can tolerate 15 - 42°c[418 ]. It prefers a mean annual rainfall in the range 750 - 1,200mm, but tolerates 450 - 1,500mm[418 ]. Prefers a very sunny position in a light, fertile soil[200 ]. Plants can tolerate a range of well-drained soils, including moderate levels of salt[418 ]. Prefers a pH in the range 6 - 7.5, tolerating 5 - 9.5[418 ]. Requires a position sheltered from strong winds[418 ]. The plant is usually cultivated as an annual, taking 150 - 220 days to mature a crop[418 ]. Seed-cotton yields vary between 0.8 - 3 tonnes/ha, or 0.2 - 1.1 tonnes/ha of fibre[418 ]. Carbon Farming - Cultivation: regional crop. Management: standard, coppice. Perennial cotton has longer fibres and is considered superior to annual cottons. Perennial cottons are suited to arid and humid conditions while annual cottons were bred for colder climates and for mechanical harvesting. Perennial cottons are cultivated in the tropics on a smaller scale and include *Gossypium arboreum burmanicum*, *Gossypium arboreum indicum*, *Gossypium arboreum soudanense*, *Gossypium barbadense braziliense*, *Gossypium barbadense darwinii*, *Gossypium herbaceum acerifolium*, *Gossypium herbaceum africanum*, *Gossypium hirsutum marie-galante*, *Gossypium hirsutum punctatum*, *Gossypium hirsutum taitense*. Currently perennial cottons are harvested by hand. Researching perennial cottons varieties and production methods would help develop them as good carbon farming plants and help to alleviate the terrible problems caused by annual cottons.

propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in early summer. A sowing can be made outdoors in situ in mid to late spring if you have enough seeds.

nwatta Succeeds in any moderately fertile soil in a sunny position[200]. Grows well in the spring meadow[24].

### 6.2.294 Liriope muscari

Lilyturf, Big blue lilyturf, Border Grass, Blue Lilyturf, Liriope 5 tlin 10 cyuc 2 kcaak 0 tcan 1 dwat m hkuc hmimhtut cyuti hgatyuctpuc hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Liriope muscari is an evergreen Perennial growing to 0.3 m (1ft) by 0.5 m (1ft 8in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from September to October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: RootEdible Uses: Root - cooked[105, 177]. Candied and used medicinally[61]. The roots sometimes have a fleshy, tuberous part near their tip[266].

tcanta A good drought tolerant evergreen ground cover plant[200, 208]. Rather slow to spread though, needing weeding for the first year or two[197]. Plants should be spaced about 30cm apart each way[208].

dwatta Antiinflammatory Aphrodisiac Pectoral Stimulant TonicThe root is antiinflammatory, antiallergic, aphrodisiac, pectoral and stimulant[61, 279]. It is used as a tonic in Korea to increase stamina and also as an expectorant[279].

propta Seed - we have no information on this species but suggest sowing it in a cold frame or greenhouse as soon as the seed is ripe if possible, if not then sowing the stored seed in early spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring. Very easy, the larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Landscape Uses:Border, Container, Ground cover, Massing, Rock garden, Seashore, Specimen, Woodland garden. Prefers a sandy soil[1]. Succeeds in full sun so long as the soil does not dry out in the summer, otherwise it should be grown in partial shade in any moderately fertile well-drained soil[200]. Requires a sunny position[208]. Established plants are fairly drought tolerant[190, 200], they succeed in dry shade[190]. Hardy to at least -15°c[200]. A very ornamental plant, there are many named varieties[200]. Slow to settle down after being planted but then grows away well[190]. Members of this genus are rarely if ever troubled by browsing deer[233]. There is a lot of confusion between this species and *L. graminifolia*, most of the plants being grown as *L. graminifolia* actually being this species[200]. Apart from its use as a ground cover plant, all the entries on this plant’s uses actually belong to *L. graminifolia* but, because of the confusion, it is quite possible that they also apply to this species[K]. This species has thick dark tubers whilst *L. graminifolia* is rhizomatous[200]. Special Features:Attractive foliage, Not North American native, Naturalizing, Suitable for cut flowers, Inconspicuous flowers or blooms.

### 6.2.295 Quercus michauxii

Swamp Chestnut Oak

5 tlin 9 cyuc 2 kcaak 3 tcan 2 dwat m hkuc hmimhtut cyuti tcuphja7n hwicli jlutnyik hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta Quercus michauxii is a deciduous Tree growing to 30 m (98ft 5in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender.

The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: SeedEdible Uses: CoffeeSeed - cooked[2, 46, 161]. The seed is large, up to 35mm long and 30mm wide[82], but contains bitter tannins[183]. Other reports say that the acorns are sweet and edible[82, 235]. The seed can be roasted then dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread[183]. The bitter tannins can be leached out by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute.

tcanta Repellent Tannin WoodAgroforestry Uses: The tree has been used in restoring degraded bottomland hardwood forests of the Southeastern USA[1050 ]. Other Uses: The leaves of most species in this genus are more or less rich in tannins. A much of the partially decayed leaves can be placed around vulnerable plants in order to repel slugs, snails, grubs etc, and these will in time break down to add humus and nutrients to the soil. Fresh leaves should be used with caution, however, since as these decay they utilize some of the nitrogen in the soil and thus can inhibit plant growth[20 , K ]. Oak galls are excrecences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff and is also used by many cultures to make ink[4 , 331 ]. The bark of oak trees is also usually rich in tannins and can be used as a dyestuff and for waterproofing rope[331 , K ]. The wood is heavy, hard, very strong, tough, dense, durable, easy to split[82 , 171 , 235 ]. It weighs 50lb per cubic foot[235 ]. It machines well, but is subject to checking and warping if not dried properly. It i is largely used for flooring, furniture, boxes, barrels, boat making and veneer[229 , 1050 ]. The wood is a favoured fuel - burning well and giving off a lot of heat[331 , 229 ].

dwatta Astringent DysenteryAny galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4].

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Landscape Uses:Firewood, Pest tolerant, Aggressive surface roots possible, Specimen, Street tree. Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Young plants tolerate reasonable levels of side shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. Prefers warmer summers than are usually experienced in Britain, trees often grow poorly in this country and fail to properly ripen their wood resulting in frost damage overwinter[200]. Closely related to *Q. prinus*[11]. This species is often confused with *Q. prinus*, *Q. prinoides* and *Q. muehlenbergii*[200]. The tree flowers on new growth produced in spring, the seed ripening in its first year[200, 229]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. Hybridizes freely with other members of the genus[200]. Plants in this genus are notably resistant to honey fungus[200]. Special Features:Attracts birds, North American native, Wetlands plant, Inconspicuous flowers or

blooms. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2].

### 6.2.296 Sorbus sambucifolia

Siberian mountain ash

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat m hkuc hmimhht cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Sorbus sambucifolia is a deciduous Shrub. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105, 161]. Sweet tasting[11].

tcanta None known

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame[78, 80]. If you have sufficient seed it can be sown in an outdoor seedbed[78, 80]. Stored seed germinates better if given 2 weeks warm then 14 - 16 weeks cold stratification[98], so sow it as early in the year as possible. Prick out the seedlings into individual pots when they are large enough to handle. Seedlings are very slow to put on top-growth for their first year or two[11], but they are busy building up a good root system. It is best to keep them in pots in a cold frame for their first winter and then plant them out into their permanent positions in late spring.

nwatta Succeeds in most reasonably good soils in an open sunny position[11]. Tolerates light shade[188], though it fruits better in a sunny position[K]. Plants are susceptible to fireblight[188]. There is considerable confusion over the naming of this species, trees grown under this name have included *S. decora*., *S. matsumurana*., *S. scopulina*. and *S. sitchensis*[1].

### 6.2.297 Sambucus melanocarpa

Black Elder, Rocky Mountain elder

5 tlin 9 cyuc 2 kcaak 0 tcan 2 dwat m hkuc

hmimhht cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Sambucus melanocarpa is a deciduous Shrub growing to 4 m (13ft 1in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to July, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: Flowers FruitEdible Uses: Fruit - raw or cooked[105, 161]. Low in pectin, it is best mixed with crab-apples or other pectin-rich fruits if used in making jams, jellies etc[183]. The fruit is about 6mm in diameter and is borne in large clusters[200]. Some caution is advised, see the notes above on toxicity. Flowers - raw or cooked.

tcanta None known

dwatta Astringent Dysentery Poultrice Salve TBThe dried ripe berries have been eaten as a treatment for diarrhoea[257]. A decoction of the roots has been used in the treatment of diarrhoea and dysentery[257]. A poultice of the boiled, mashed roots has been used as a treatment for caked breasts, cuts and wounds[257]. A decoction of the flowers has been used in the treatment of tuberculosis, coughs and colds[257]. It has also been given to children as a spring tonic[257]. A poultice of the crushed leaves has been used to treat bruises and bleeding wounds[257].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame, when it should germinate in early spring. Stored seed can be sown in the spring in a cold frame but will probably germinate better if it is given 2 months warm followed by 2 months cold stratification first[78, 98, 113]. Prick out the seedlings into individual pots when they are large enough to handle. If good growth is made, the young plants can be placed in their permanent positions during the early summer. Otherwise, either put them in a sheltered nursery bed, or keep them in their pots in a sheltered position and plant them out in spring of the following year. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in a frame[78]. Cuttings of mature wood of the current season’s growth, 15 - 20cm with a heel, late autumn in a frame or a sheltered outdoor bed[78].

nwatta Tolerates most soils, including chalk[200], but prefers a moist loamy soil[11, 200]. Grows well in heavy clay soils. Tolerates some shade but is best in a sunny position[1]. Tolerates atmospheric pollution and coastal situations[200]. Plants in this genus are notably resistant to honey fungus[200].

### 6.2.298 Crataegus nigra

Hungarian Hawthorn

5 tlin 9 cyuc 2 kcaak 0 tcan 2 dwat 6 m hkuc

hmimhht cyutli hgattcuphja7n hwicli hrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Crataegus nigra is a deciduous Tree growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Midges. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[177]. A soft flesh[200]. The fruit can be used in making pies, preserves, etc, and can also be dried for later use. The fruit is about 1cm in diameter[200]. There are up to five fairly large seeds in the centre of the fruit, these often stick together and so the effect is of eating a cherry-like fruit with a single seed[K].

tcanta Wood - heavy, hard, tough, close-grained. Useful for making tool handles, mallets and other small items[82].

dwatta Cardiotonic HypotensiveAlthough no specific mention has been seen for this species, the fruits and flowers of many hawthorns are well-known in herbal folk medicine as a heart tonic and modern research has borne out this use. The fruits and flowers have a hypotensive effect as well as acting as a direct and mild heart tonic[222]. They are especially indicated in the treatment of weak heart combined with high blood pressure[222]. Prolonged use is necessary for it to be efficacious[222]. It is normally used either as a tea or a tincture[222].

propta Seed - this is best sown as soon as it is ripe in the autumn in a cold frame, some of the seed will germinate in the spring, though most will probably take another year. Stored seed can be very slow and erratic to germinate, it should be warm stratified for 3 months at 15°C and then cold stratified for another 3 months at 4°C[164]. It may still take another 18 months to germinate[78]. Scarifying the seed before stratifying it might reduce this time[80]. Fermenting the seed for a few days in its own pulp may also speed up the germination process[K]. Another possibility is to harvest the seed ‘green’ (as soon as the embryo has fully developed but before the seedcoat hardens) and sow it immediately in a cold frame. If timed well, it can germinate in the spring[80]. If you are only growing small quantities of plants, it is best to pot up the seedlings as soon as they are large enough to handle and grow them on in individual pots for their first year, planting them out in late spring into nursery beds or their final positions. When growing larger quantities, it might be best to sow them directly outdoors in a seedbed, but with protection from mice and other seed-eating creatures. Grow them on in the seedbed until large enough to plant out, but undercut the roots if they are to be left undisturbed for more than two years.

### 6.2.333 Berberis amurensis

5 tlin 9 cyuc 2 kcaak 0 tcan 2 dwat 3.5 m hkuc hmimhht cyutli kyuctcup hwicli hyishrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Berberis amurensis is a deciduous Shrub growing to 3.5 m (11ft 6in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: Fruit LeavesEdible Uses: Fruit - cooked. Used in preserves[177]. The oblong fruit is about 10mm long[200]. Leaves[177]. No more details.

tcanta Hedge HedgePlants are very amenable to trimming and can be grown as an almost impenetrable formal or informal hedge[200].

dwatta Antibacterial Antirheumatic Cancer Dysentery-The root is antirheumatic[218]. Berberine, universally present in rhizomes of Berberis species, has marked antibacterial effects. Since it is not appreciably absorbed by the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not be used with Glycyrrhiza species (Licquorice) because this nullifies the effects of the berberine[218]. Berberine has also shown antitumour activity[218].

propta Seed - best sown as soon as it is ripe in a cold frame, when it should germinate in late winter or early spring[78]. Seed from over-ripe fruit will take longer to germinate[78], whilst stored seed may require cold stratification and should be sown in a cold frame as early in the year as possible[80]. The seedlings are subject to damping off, so should be kept well ventilated[113]. When the seedlings are large enough to handle, prick them out into individual pots and grow them on in a cold frame. If growth is sufficient, it can be possible to plant them out into their permanent positions in the autumn, but generally it is best to leave them in the cold frame for the winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, July/August in a frame. Cuttings of mature wood of the current season’s growth, preferably with a heel, October/November in a frame[78]. Layering.

nwatta Prefers a warm moist loamy soil and light shade but it is by no means fastidious, succeeding in thin, dry and shallow soils[11, 200]. Grows well in heavy clay soils. This species is closely allied to *B. vulgaris*, it hybridizes freely with other members of the genus[1]. There are some named forms selected for their ornamental value[200]. Plants can be pruned back quite severely and will resprout well from the base[200].

### 6.2.334 Berberis parisepala

5 tlin 9 cyuc 2 kcaak 0 tcan 2 dwat 3 m hkuc hmimhht cyutli kyuctcup hwicli hyishrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Berberis parisepala is a deciduous Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: FruitEdible Uses: The following report is for the closely related *B. angulosa* - it quite possibly can also be applied to this species[K]. Fruit - raw or cooked. The relatively large berries are freely borne and are more palatable than most barberries. The fruit is about 15mm long and 8mm wide[200].

tcanta DyeA yellow dye is obtained from the root. dwatta Antibacterial Cancer DysenteryBerberine, universally present in rhizomes of Berberis species, has marked antibacterial effects. Since it is not appreciably absorbed by

the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not be used with Glycyrrhiza species (Licquorice) because this nullifies the effects of the berberine[218]. Berberine has also shown antitumour activity[218].

propta Seed - best sown as soon as it is ripe in a cold frame, when it should germinate in late winter or early spring[78]. Seed from over-ripe fruit will take longer to germinate[78], whilst stored seed may require cold stratification and should be sown in a cold frame as early in the year as possible[80]. The seedlings are subject to damping off, so should be kept well ventilated[113]. When the seedlings are large enough to handle, prick them out into individual pots and grow them on in a cold frame. If growth is sufficient, it can be possible to plant them out into their permanent positions in the autumn, but generally it is best to leave them in the cold frame for the winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, July/August in a frame. Cuttings of mature wood of the current season’s growth, preferably with a heel, October/November in a frame[78]. Layering.

nwatta Prefers a warm moist loamy soil but it is by no means fastidious, succeeding in thin, dry and shallow soils[11, 200]. Grows well in heavy clay soils. Succeeds in full sun or light shade[200]. Plants can be pruned back quite severely and will resprout well from the base[200]. This species comes into leaf very early in the spring[11]. Hybridizes freely with other members of this genus[1]. This species is closely related to *B. angulosa*[200].

### 6.2.335 Eleutherococcus divaricatus

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 3.5 m hkuc

hmimhht cyutli tcup hwicli hyishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Eleutherococcus divaricatus is a deciduous Shrub growing to 3.5 m (11ft 6in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from August to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. It can tolerate atmospheric pollution.

kcakta Edible Parts: LeavesEdible Uses: Condiment TeaLeaves - cooked[105, 177]. They are parboiled, then dried and used as a winter vegetable[183]. The leaves are used as a condiment[183]. The dried leaves are a tea substitute[177, 183].

tcanta None known

dwatta None known

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame[200]. It can be slow to germinate. Stored seed requires 6 months warm followed by 3 months cold stratification[113] and can be very slow to germinate[133]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in a cold frame or greenhouse for at least the first winter. Plant out in late spring or early summer. Cuttings of half-ripe wood, July/August in a frame[113, 200]. Cuttings of ripe wood of the current season’s growth, 15 - 30cm long in a cold frame[238]. Root cuttings in late winter[200]. Division of suckers in the dormant season[200].

nwatta Succeeds in an open loamy soil[1], preferring a well-drained humus-rich soil in full sun[200]. Tolerates poor soils and atmospheric pollution[200]. Plants are hardy to at least -10 to -15°C if they are sheltered from cold winds[200]. A spineless form, *Eleutherococcus divaricatus inermis* (Nakai) H. Ohashi, has been reported[275].

### 6.2.336 Rosa pisocarpa

Cluster Rose, Ahart’s cluster rose

5 tlin 9 cyuc 2 kcaak 0 tcan 2 dwat 2.5 m hkuc

hmimhht cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Rosa pisocarpa is a deciduous Shrub growing to 2.5 m (8ft 2in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to July, and the seeds ripen from August to October. The species is hermaphrodite

and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**kcakta** Edible Parts: Edible Uses: CondimentThe leaves, root and bark are dried and used as a substitute for cinnamon[177]. Some caution is advised, see reports above on toxicity[270].

tcanta None known

dwatta Diuretic Emmenagogue UrinaryEmmenagogue[61]. An infusion of the bark has been used to treat urinary problems[257].

propta Seed - best sown in a cold frame as soon as it is ripe. If the seed is harvested 'green' (as soon as it has fully developed but before it has dried on the plant) and sown immediately it can germinate in 3 weeks[113]. Dried seed germinates in 1 - 6 months at 15°C[138]. Stored seed requires between 3 weeks and 3 months cold stratification before sowing in the spring. When large enough to handle, prick out the seedlings into individual pots and grow them on in the greenhouse for their first winter. Plant out in late spring or early summer of the following year. Cuttings of half-ripe wood, July/August in a frame. They can be difficult[113]. Layering in spring. Sever the new plants in a wet spell of weather about 15 months later and then lift them in the autumn[78]. High percentage[78]. Division of suckers in early spring[11]. Very easy, they can be planted straight out into their permanent positions if required.

nwatta Prefers a light loamy soil that is deep and moist but it succeeds in most fertile soils[11, 182]. Prefers a sunny position but it tolerates shade when grown in warm temperate zones[11, 200]. Requires a sheltered position, protected from cold winds[245]. A very ornamental plant, it is often confused with the closely related *C. floridus* and is perhaps no more than a sub-species of that species[11]. The leaves smell strongly of cinnamon[245]. The seed only ripens in Britain after a hot summer[11]. Plants in this genus are notably resistant to honey fungus[200].

### 6.2.331 *Oplopanax japonicus*

5 tlin 9 cyuc 2 kcaak 0 tcan 1 dwat 3 m hkcuc pcmhmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Oplopanax japonicus* is a deciduous Shrub growing to 3 m (9ft 10in). See above for USDA hardness. It is hardy to UK zone 6 and is not frost tender. It is in flower in June. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil. The plant can tolerate maritime exposure.

**kcakta** Edible Parts: Leaves RootEdible Uses: Young shoots - peeled and then cooked[46, 61, 105, 106]. Only the very young shoots are used[172]. The roots can be chewed after peeling[105, 106, 161].

tcanta None known

dwatta Analgesic Antiphlogistic Antirheumatic Hypoglycaemic TonicThe root bark and stems are analgesic, antiphlogistic, antirheumatic, hypoglycaemic and tonic[172].

propta Seed - best sown in a cold frame as soon as it is ripe in the autumn[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division of suckers in the dormant season. Root cuttings in a greenhouse in the winter[188].

nwatta Requires a cool moist soil[11, 200]. Prefers a position in light shade[182]. Prefers dense shade and is probably best if grown in moist woodland[1, 11]. Tolerates maritime exposure[200]. (Rather a strange report for a plant that needs to be grown in dense shade[K]) A very hardy plant, tolerating temperatures down to at least -15°C, but the young shoots in spring can be damaged by late frosts[11, 200]. It is therefore best not grown in a frost pocket[182]. This species used to be included in *O. horridus* as the Japanese form of that species, but it has recently (1991) been recognised as

a distinct species[200]. A very ornamental plant, but it is densely armed with spikes[60]. It transplants easily and also tolerates pruning[200]. The leaves and stems are excessively spiny[182].

### 6.2.332 *Dioscorea villosa*

Wild Yam

5 tlin 9 cyuc 2 kcaak 0 tcan 4 dwat 3 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

drutta *Dioscorea villosa* is a PERENNIAL CLIMBER growing to 3 m (9ft 10in). See above for USDA hardness. It is hardy to UK zone 6. It is in flower from September to October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). . The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

**kcakta** Edible Parts: RootEdible Uses: Tuber - cooked[177]. Some caution should be exercised with this plant. See 'Medicinal Uses' for more information.

tcanta None known

dwatta Antiinflammatory Antirheumatic Antispasmodic Cholagogue Contraceptive Diaphoretic Homeopathy VasodilatorWild yam roots, and the roots of many other members of the genus, contains diosgenin[222]. This is widely used in modern medicine in order to manufacture progesterone and other steroid drugs. These are used as contraceptives and in the treatment of various disorders of the genitourinary organs as well as in a host of other diseases such as asthma and arthritis[222, 254]. The roots are anti-inflammatory, antispasmodic, cholagogue, diaphoretic and vasodilator[165, 238]. They are also a visceral relaxant[165]. This plant affords one of the best and fastest cures for bilious colic, it is especially helpful in treating the nausea of pregnant women[4] and has been used to ease the pain of childbirth[257]. It is also taken internally in the treatment of arthritis, irritable bowel syndrome, gastritis, gall bladder complaints, painful menstruation etc[238]. The root is harvested in the autumn and dried for later use[238]. The root should not be stored for longer than 1 year, since it is likely to lose its medicinal virtues[4]. Caution is advised in the use of this plant, when taken fresh it can cause vomiting and other side effects[222]. The root, harvested in September, is used to make a homeopathic remedy[232]. Its main use is in the treatment of infant colic[232].

propta Seed - sow March to April in a sunny position in a warm greenhouse and only just cover. It germinates in 1 - 3 weeks at 20°C[175]. Prick out the seedlings as soon as they are large enough to handle and grow on in a greenhouse for their first year. Plant out in late spring as the plant comes into new growth. Basal stem cuttings in the summer[37]. Division in the dormant season, never when in growth[1]. The plant will often produce a number of shoots, the top 5 - 10 cm of the root below each shoot can be potted up to form a new plant whilst the lower part of the root can possibly be eaten[K]. Tubercles (baby tubers) are formed in the leaf axils. These are harvested in late summer and early autumn when about the size of a pea and coming away easily from the plant. They should be potted up immediately in individual pots in a greenhouse or cold frame. Plant out in early summer when in active growth[K].

nwatta An easily grown plant, succeeding in a fertile well-drained soil in a sunny position or light shade[200]. Prefers a rich light soil[1]. Plants are hardy to at least -15°C[238]. Plants produce tubercles (small tubers that are formed in the leaf axils of the stems), and can be propagated by this means[K]. A climbing plant that supports itself by twining around the branches of other plants[219]. This is a highly polymorphic species, some botanists dividing it up into several species[235, 270]. Dioecious. Male and female plants must be grown if seed is required.

nwatta A very easily grown plant, it prefers a well-drained moisture retentive loamy soil but is not at all fussy[11, 200]. Once established, it succeeds in excessively moist soils and also tolerates drought[200]. It grows well on a chalk soil and also in heavy clay soils[200]. A position in full sun is best when plants are being grown for their fruit, they also succeed in semi-shade though fruit yields and quality will be lower in such a position[11, 200]. Most members of this genus succeed in exposed positions, they also tolerate atmospheric pollution[200]. Hybridizes freely with other members of this genus[200]. Seedling trees take from 5 - 8 years before they start bearing fruit, though grafted trees will often flower heavily in their third year[K]. The flowers have a foetid smell somewhat like decaying fish. This attracts midges which are the main means of fertilization. When freshly open, the flowers have more pleasant scent with balsamic undertones[245]. Seedlings should not be left in a seedbed for more than 2 years without being transplanted[11].

### 6.2.299 *Oxalis magellanica*

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Oxalis magellanica* is a PERENNIAL. See above for USDA hardness. It is hardy to UK zone 6 and is not frost tender. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerate strong winds but not maritime exposure.

**kcakta** Edible Parts: Flowers LeavesEdible Uses: Leaves - raw or cooked[173, 177]. A pleasant acid flavour, but the leaves are rather small and they are also a bit chewy[K]. Use in moderation, see notes at top of sheet, Flowers - raw[K]. A pleasant and decorative addition to the salad bowl[K].

tcanta None known

dwatta None known

propta Seed - best sown as soon as ripe in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in late spring or early summer. Division in spring. Larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Easily grown in a sandy soil in a warm dry position in sun or light shade[1, 200]. Succeeds in the well-drained interstices of paving stones[200]. Plants can become a pest in the garden[200].

### 6.2.300 *Juglans microcarpa*

Texas Walnut, Little walnut, Stewart's little walnut  
5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat m hkuc htut cyutli hgattcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyif hjonli

drutta *Juglans microcarpa* is a deciduous Tree growing to 10 m (32ft) by 10 m (32ft). See above for USDA hardness. It is hardy to UK zone 6. It is in flower from May to June, and the seeds ripen from October to December. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil and can tolerate drought.

**kcakta** Edible Parts: Oil SeedEdible Uses: OilSeed - raw. The seed is sweet and oily but it is rather small and has a thick shell[2, 62, 105, 183, 227]. The seed is the smallest of this genus[82]. An edible oil is obtained from the seed, it tends to go rancid quickly.

tcanta Herbicide Oil Rootstock WoodSometimes used as a rootstock[183]. Plants produce chemicals which can inhibit the growth of other plants. These chemicals are dis-

solved out of the leaves when it rains and are washed down to the ground below, reducing the growth of plants under the tree[18, 20, 159]. The roots of many members of this genus produce substances that are toxic to many plant species, especially apples (*Malus* species), members of the Ericaceae, *Potentilla* spp and the white pines (certain *Pinus* spp.)[200]. Wood - heavy, hard, not strong. It makes a beautiful veneer and has been very over-exploited in the wild for this purpose[82]. It is also used in cabinet making, furniture etc[82, 149].

dwatta None known

propta The seed is best sown as soon as it is ripe in individual deep pots in a cold frame[80]. You need to protect it from mice, birds, squirrels etc. The seed usually germinates in late winter or the spring. Plant out the seedlings into their permanent positions in early summer and give some protection from the cold for their first winter or two. The seed can also be stored in cool moist conditions (such as the salad compartment of a fridge) over the winter and sown in early spring but it may then require a period of cold stratification before it will germinate[78, 80, 113].

nwatta Requires a deep well-drained loam and a sunny position sheltered from strong winds[1, 11]. Prefers a slightly alkaline soil[200]. This species often experiences drought in its native range[229]. Plants produce a deep taproot and they are intolerant of root disturbance[1, 11]. Seedlings should be planted out into their permanent positions as soon as possible and given some protection for their first winter or two since they are somewhat tender when young[1, 11]. Flower initiation depends upon suitable conditions in the previous summer[200]. The flowers and young growths can be destroyed by even short periods down to -2°C, but fortunately plants are usually late coming into leaf[200]. Any pruning should only be carried out in late summer to early autumn or when the plant is fully dormant otherwise wounds will bleed profusely and this will severely weaken the tree[200]. Trees have a dense canopy which tends to reduce plant growth below them. We have no specific information for this species, but the roots of several members of this genus produce substances that are toxic to many plant species, especially apples (*Malus* species), members of the Ericaceae, *Potentilla* spp and the white pines (certain *Pinus* spp.)[200]. The leaves of many species also secrete substances that have an inhibitory effect on plants growing underneath them. All in all this is not a very good companion plant[K]. Closely related to *J. major*, and hybridizes with that species where their ranges overlap[229].

### 6.2.301 *Cornus macrophylla*

Large-Leaf Dogwood  
5 tlin 9 cyuc 2 kcaak 0 tcan 2 dwat m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikrip hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Cornus macrophylla* is a deciduous Tree growing to 15 m (49ft) by 10 m (32ft). See above for USDA hardness. It is hardy to UK zone 6. It is in flower from July to August, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**kcakta** Edible Parts: FruitEdible Uses: Fruit - raw or cooked[2, 105, 146, 158, 200, 218]. The fruit is about 6mm in diameter[200].

tcanta Charcoal WoodWood - hard, close grained, warps badly[158]. It makes a good charcoal[146, 158].

dwatta Anodyne Astringent Dysentery TonicAnodyne, astringent, tonic[178]. The wood is anodyne and a uterosedative[218]. The stem bark is used in the treatment of dysentery[218].

propta Seed - best sown as soon as it is ripe in a cold frame or in an outdoors seedbed if there is sufficient seed[80, 113]. The seed must be separated from the fruit flesh since this contains germination inhibitors[80, 164]. Stored seed should be cold stratified for 3 - 4 months and sown as early as possible in the year[164]. Scarification may also help as may a period of warm stratification before the cold stratification[80, 164]. Germination, especially of stored seed, can

be very slow, taking 18 months or more[164]. Prick out the seedlings of cold-frame sown seeds into individual pots as soon as they are large enough to handle and grow the plants on for their first winter in a greenhouse, planting out in the spring after the last expected frosts. Cuttings of half-ripe side shoots, July/August in a frame[188]. Cuttings of mature wood of the current year's growth, taken with a heel if possible, autumn in a cold frame. High percentage[78]. Layering of new growth in June/July. Takes 9 months[78].

nwatta An easily grown plant, it succeeds in any soil of good or moderate fertility[1], ranging from acid to shallow chalk[200]. Grows well in heavy clay soils. Succeeds in full sun or light shade[1188]. A very ornamental tree[1]. There is some confusion between this species and *C. controversa*[11]. Plants usually fruit heavily in Britain[11]. The flowers have a soft sweet perfume[245]. Plants in this genus are notably resistant to honey fungus[200].

### 6.2.302 Crithum maritimum

Rock Samphire

5 tlin 9 cyuc 2 kcaak 0 tcan 2 dwat m hkuc htut cyutli kyuctcup hwicli hyhshras hpa7tli flatprikliwssliph-som hpa7tmwatli fyfxre7t hjonli

drutta Crithum maritimum is a PERENNIAL growing to 0.3 m (1ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to August, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline and saline soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: Leaves SeedpodEdible Uses: Leaves - raw or cooked[2, 4, 5, 7, 12, 27, 37]. Vaguely reminiscent of fennel, but the taste is more bitter and brackish[132]. A powerful salty flavour, it has been described by one person as tasting like 'a mixture of celery and kerosene'[238]. The leaves are used as a flavouring in salads etc[132]. Gathered in spring, the young leaves when sprinkled with salt and boiled make a very good pickle[4]. The leaves are rich in vitamin C[238]. Seed pods[4, 5, 7, 12]. They are used to make a warm aromatic pickle[2].

tcanta EssentialAn essential oil from the plant is used in perfumery[7].

dwatta Carminative Depurative Digestive Diuretic Vitamin CRock samphire is little used in herbal medicine, though it is a good diuretic and holds out potential as a treatment for obesity[254]. It has a high vitamin C and mineral content and is thought to relieve flatulence and to act as a digestive remedy[254]. The young growing tips are carminative, depurative, digestive and diuretic[7, 238]. They are gathered when in active growth in the spring and used fresh[7, 238]. The leaves have the reputation for helping people lose weight and so are used in treating cases of obesity as well kidney complaints and sluggishness[238]. The essential oil is a digestive, a few drops being sprinkled on the food[7].

propta Seed - best sown as soon as it is ripe in the autumn[1]. Sow in a cold frame and only just cover the seed[164]. Germination usually takes place within 3 - 6 weeks at 15°c[164]. One report says that the seed only has a short viability and should be sown as soon as it is ripe[238], but it has germinated well with us when sown in April in a cold frame[K]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in early summer. Division in spring[238].

nwatta Prefers a moist light sandy or gravelly soil, doing very well between stones or by a south-east facing wall[37]. Requires a warm dry well-drained sunny position and shade from the midday sun[1, 200]. Requires saline conditions[200]. Plants are best grown in moist salty soil or a very well-drained poor dry soil. When grown away from the coast, this plant requires a warm sheltered position and some protection in cold winters[238]. At one time this plant was sometimes cultivated in the vegetable garden[2], though it is quite difficult to do this successfully[1, 37]. It is difficult to grow outside its natural habitat[164].

### 6.2.303 Arum maculatum

Cuckoo Pint

5 tlin 9 cyuc 2 kcaak 0 tcan 1 dwat m hkuc pcmhmmihtut cyutli tcup hwicli hrasjlutnyik hpa7tli flat-prikliwis hpa7tmwatli hjonli

drutta Arum maculatum is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from April to May, and the seeds ripen from July to August. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Tuber - cooked and used as a vegetable[2, 177]. A mild flavour, the root contains about 25% starch[74]. A farina can be extracted from the root[2]. Roots can be harvested at any time of the year, though they are best when the plant is dormant[K]. At one time, the tubers of this plant were commonly harvested and used for food, but they are very rarely used nowadays[268, K]. The root must be thoroughly dried or cooked before being eaten, see the notes above on toxicity. Leaves - must be well cooked[177]. Available from late winter. Caution is advised, see the notes above on toxicity.

tcanta StarchStarch from the root has been used as a laundry starch for stiffening clothes[4, 66, 100]. Its use is said to be very harsh on the skin, producing sores and blisters on the hands of the laundresses who have to use it[66, 100], though another report says that the powdered root makes a good and innocent cosmetic that can be used to remove freckles[4].

dwatta Antirheumatic Diaphoretic Diuretic Expectorant Homeopathy Purgative VermifugeCuckoo pint has been little used in herbal medicine and is generally not recommended for internal use[268]. The shape of the flowering spadix has a distinct sexual symbolism and the plant did have a reputation as an aphrodisiac, though there is no evidence to support this[268]. The root is diaphoretic, diuretic, expectorant, strongly purgative and vermifuge[4, 9, 19, 21]. It should be harvested in the autumn or before the leaves are produced in the spring[4]. It can be stored fresh in a cellar in sand for up to a year or can be dried for later use[4]. The plant should be used with caution[9], see notes above on toxicity. The bruised fresh plant has been applied externally in the treatment of rheumatic pain[268]. A liquid from the boiled bark (of the stem?K) has been used in the treatment of diarrhoea[213]. A homeopathic remedy is prepared from the root and leaves[4]. It has been used in the treatment of sore throats[4, 268].

propta Seed - best sown in a greenhouse or cold frame as soon as it is ripe[134]. The seed usually germinates in 1 - 6 months at 15°c[134]. Stored seed should be sown in the spring in a greenhouse and can be slow to germinate, sometimes taking a year or more. A period of cold stratification might help to speed up the process. Sow the seed thinly, and allow the seedlings to grow on without disturbance for their first year, giving occasional liquid feeds to ensure that they do not become mineral deficient. When the plants are dormant in the autumn, divide up the small corms, planting 2 - 3 in each pot, and grow them on in light shade in the greenhouse for a further year, planting out when dormant in the autumn. Division of the corms in summer after flowering[200]. Larger corms can be planted out direct into their permanent positions, though it is best to pot up the smaller corms and grow them on for a year in a cold frame before planting them out.

nwatta Prefers a humus rich soil and abundant water in the growing season[1, 13]. Prefers a shady damp calcareous soil[13, 31]. Succeeds in sun or shade[90]. Plants are very shade tolerant[17] and grow well in woodland conditions[1]. The inflorescence has the remarkable ability to heat itself above the ambient air temperature to such a degree that it is quite noticeable to the touch[4]. Temperature rises of 11°c have been recorded[245]. At the same time, the flowers emit a foul and urinous smell in order to attract midges for pollination[245]. The smell disappears once the flower has been pollinated[245]. Members of this genus are rarely if ever troubled by browsing deer[233].

frame[200]. Tip layering in July. Plant out in autumn. Division in early spring or just before leaf-fall in the autumn[200]. Plant them out direct into their permanent positions.

nwatta Easily grown in a good well-drained loamy soil[1, 11, 200]. Succeeds in acid and calcareous soils[186]. Succeeds in sun or semi-shade[1, 11, 200], though it fruits less well in the shade[202]. Established plants are drought resistant[132]. Hardy to about -15°c[202]. This species has biennial stems, it produces a number of new stems each year from the perennial rootstock, these stems fruit in their second year and then die[200]. Plants in this genus are notably susceptible to honey fungus[200].

### 6.2.327 Chimonobambusa quadrangularis

Square Bamboo

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 3 m hkuc hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Chimonobambusa quadrangularis is an evergreen Bamboo growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: StemEdible Uses: Young shoots - cooked. An excellent relish. The canes are up to 20mm in diameter[K].

tcanta Hedge Hedge Plant support WoodThe canes make good plant supports and are excellent material for handicrafts[195]. Can be grown as a hedge or screen[200].

dwatta None known

propta Seed - surface sow as soon as it is ripe in a greenhouse at about 20°c. Do not allow the compost to dry out. Germination usually takes place fairly quickly so long as the seed is of good quality, though it can take 3 - 6 months. Grow on in a lightly shaded place in the greenhouse until large enough to plant out. Seed is rarely available. Division in spring as new growth commences. Take divisions with at least three canes in the clump, trying to cause as little root disturbance to the main plant as possible. Grow them on in light shade in a greenhouse in pots of a high fertility sandy medium. Mist the foliage regularly until plants are established. Plant them out into their permanent positions when a good root system has developed, which can take a year or more[200]. Basal cane cuttings. Rhizome cuttings.

nwatta Prefers a good loamy soil. Succeeds in most soils so long as they do not dry out. Dislikes drought. Prefers a position sheltered from cold north and east winds. Plants are only reliably hardy in the mildest areas of Britain. Another report says that the plants are generally hardy, although severe winters may damage the leaves the plant itself can withstand temperatures down to about -15°c[200]. The square bamboo is cultivated for its edible stems in China and Japan. This species is notably resistant to honey fungus[200]. Plants only flower at intervals of many years. When they do come into flower most of the plants energies are directed into producing seed and consequently the plant is severely weakened. They sometimes die after flowering, but if left alone they will usually recover though they will look very poorly for a few years. If fed with artificial NPK fertilizers at this time the plants are more likely to die[122]. The rootstock is running but it does not produce many new shoots and is not overly invasive[195]. The plant is rampant in its native range and other warm temperate areas, but it does not spread much in colder areas such as Britain[200]. The shoots are wide spaced and are produced from late May. Canes can be snapped off the plant. A plant at Trebah gardens in Cornwall had new shoots 3 metres long in mid-April 1995[K].

### 6.2.328 Forestiera neomexicana

Wild Olive

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 3 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flat-prikliwis hpa7tmwatli hjonli

drutta Forestiera neomexicana is a deciduous Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from April to May, and the seeds ripen from July to September. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit[105, 257]. Although only 4 - 8mm long[227], it has been suggested as a substitute for the true olive, *Olea europaea*[105, 177, 183].

tcanta MiscellanyPlants growing in the wild are used as indicators of underground water[257].

dwatta MiscellanyNone known

propta Seed - best sown as soon as it is ripe in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame[11, 200]. Easy. Cuttings of mature wood, November to February in a frame or sheltered outdoor bed.

nwatta Succeeds in most soils[1, 11, 182]. Requires a sunny position and a well-drained soil[200]. Tolerates dry sites[200]. Flowers are produced in the axils of the previous years leaves[227]. Plants do not fruit well in Britain, probably due to a lack of sunshine[11].

### 6.2.329 Chrysolepis sempervirens

Dwarf Golden Chinquapin, Bush chinquapin

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 3 m hkuc hmim cyutli tcup hwicli hrasjlut hpa7tli frusflatprik hpa7tmwatli hjonli

drutta Chrysolepis sempervirens is an evergreen Shrub growing to 3 m (9ft) by 5 m (16ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower in July. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: Seed - raw or cooked[257]. Very sweet and much appreciated, tasting somewhat like a hazel nut[183]. The small seed is up to 13mm wide[270].

tcanta None known

dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe, the seed must be protected from mice etc[200]. The seed has a short viability and should not be allowed to dry out. If stored overwinter it should be kept cool and moist. As soon as they are large enough to handle, prick the seedlings out into individual pots and grow them on in a greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts, and consider giving them some protection from the cold for their first winter outdoors.

nwatta Requires a lime-free soil[1]. Prefers a sheltered semi-shaded position and a light deep moist soil[1, 11]. Plants can only be grown in oceanic and Mediterranean climates, better in Britain[200]. In N. America this plant grows thriving at low elevations than C. chrysophylla. A specimen at Edinburgh Botanical Gardens is 3.5 metres tall and 6 metres across[11]. A very ornamental shrub[183].

### 6.2.330 Calycanthus floridus glaucus

Eastern Sweetshrub

5 tlin 9 cyuc 2 kcaak 0 tcan 1 dwat 3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Calycanthus floridus glaucus is a deciduous Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to July,

hpa7tmwatli fyfxre7t hjonli

drutta Amelanchier ovalis integrifolia is a deciduous Shrub growing to 4 m (13ft 1in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Edible fruit, raw or cooked[74]. The fruit is rich in iron and copper[226].

tcanta None known
dwatta None known

propta Seed - it is best harvested 'green', when the seed is fully formed but before the seed coat has hardened, and then sown immediately in pots outdoors or in a cold frame. If stored seed is obtained early enough in the autumn, it can be given 4 weeks warm stratification before being left out in the winter and it should then germinate in the spring. Otherwise seed can be very slow to germinate, perhaps taking 18 months or more. When large enough to handle, prick the seedlings out into individual pots and grow them on in a sheltered outdoor position, planting them out once they are 20cm or more tall. If there is sufficient seed it is best to sow it thinly in an outdoor seedbed[78, 80]. Grow the seedlings on for two years in the seedbed before planting them out into their permanent positions during the winter. Layering in spring - takes 18 months[78]. Division of suckers in late winter. The suckers need to have been growing for 2 years before you dig them up, otherwise they will not have formed roots. They can be planted out straight into their permanent positions if required.

nwatta Prefers a rich loamy soil in a sunny position or semi-shade[1, 200] but thrives in any soil that is not too dry or water-logged[11]. Grows well in heavy clay soils. Often found on calcareous soils in the wild. All members of this genus have edible fruits and, whilst this is dry and uninteresting in some species, in many others it is sweet and juicy. Many of the species have potential for use in the garden as edible ornamentals. The main draw-back to this genus is that birds adore the fruit and will often completely strip a tree before it is fully ripe[K]. Considered to be part of *A. ovalis* by some botanists, whilst others give it specific status. Hybridizes freely with other members of this genus[200]. Grafting onto seedlings of *A. lamarckii* or *Sorbus aucuparia* is sometimes practised in order to avoid the potential problem of hybridizing[1].

### 6.2.324 Vaccinium oldhamii

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 3.5 m hkuc
hmimhtut cyutli tcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli dyatxre7t hjonli

drutta Vaccinium oldhamii is a deciduous Shrub growing to 3.5 m (11ft 6in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in June, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[1, 11, 105, 177]. The fruit is about 6mm in diameter[200].

tcanta None known
dwatta None known

propta Seed - sow late winter in a greenhouse in a lime-free potting mix and only just cover the seed[78]. Stored seed might require a period of up to 3 months cold stratification[113]. Another report says that it is best to sow the seed in a greenhouse as soon as it is ripe[200]. Once they are about 5cm tall, prick the seedlings out into individual pots and grow them on in a lightly shaded position in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 8cm with a heel, August in a frame[78]. Slow and difficult. Layering in late summer or early autumn[78]. Another report says that

spring is the best time to layer[200]. Takes 18 months[78]. Division of suckers in spring or early autumn[113].

nwatta Requires a moist but freely-draining lime free soil, preferring one that is rich in peat or a light loamy soil with added leaf-mould[11, 200]. Prefers a very acid soil with a pH in the range of 4.5 to 6, plants soon become chlorotic when lime is present. Succeeds in full sun or light shade though it fruits better in a sunny position[200]. Requires shelter from strong winds[200]. Self-sterile, at least two plants from different sources must be grown if fruit is required. Dislikes root disturbance, plants are best grown in pots until being planted out in their permanent positions[200]. Plants in this genus are notably resistant to honey fungus[200].

### 6.2.325 Rubus buergeri

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 3 m hkuc
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Rubus buergeri is a deciduous Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105, 177]. The fruit is about 25mm in diameter[200]. tcanta DyeA purple to dull blue dye is obtained from the fruit[168].

dwatta None known

propta Seed - requires stratification and is best sown in early autumn in a cold frame. Stored seed requires one month stratification at about 3°C and is best sown as early as possible in the year. Prick out the seedlings when they are large enough to handle and grow on in a cold frame. Plant them out into their permanent positions in late spring of the following year. Cuttings of half-ripe wood, July/August in a frame[200]. Tip layering in July. Plant out in autumn. Division in early spring or just before leaf-fall in the autumn[200].

nwatta Easily grown in a good well-drained loamy soil in sun or semi-shade[1, 11, 200]. Plants in this genus are notably susceptible to honey fungus[200].

### 6.2.326 Rubus species

Hybrid Berries

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 3 m hkuc
hmimhtut cyutli hgattcup hwicli hrasjlutnyik hpa7tli frusflat-priklwisslip hpa7tmwatli fyfxre7t hjonli

drutta Rubus species is a deciduous Shrub growing to 3 m (9ft 10in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to September, and the seeds ripen from July to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects, Apomictic (reproduce by seeds formed without sexual fusion). The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil and can tolerate drought. The plant can tolerates strong winds but not maritime exposure.

kcakta Fruit - raw or cooked[200].

tcanta None known

dwatta None known

propta Seed - requires stratification and is best sown in early autumn in a cold frame. Stored seed requires one month stratification at about 3°C and is best sown as early as possible in the year. Prick out the seedlings when they are large enough to handle and grow on in a cold frame. Plant them out into their permanent positions in late spring of the following year. This plant is a cultivar and will not breed true from seed. Cuttings of half-ripe wood, July/August in a

### 6.2.304 Quercus mongolica

Mongolian oak

5 tlin 8 cyuc 2 kcaak 0 tcan 2 dwat m hkuc
hmimhtut cyutli tcup hwicli jlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Quercus mongolica is a deciduous Tree growing to 30 m (98ft 5in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 3 and is not frost tender. It is in flower from May to June, and the seeds ripen from October to November. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: SeedEdible Uses: CoffeeSeed - cooked[63, 105]. The seed is about 2cm long[200], it can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread. The seed contains bitter tannins, these can be leached out by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute.

tcanta Charcoal Repellent Tannin WoodA mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth[20]. Oak galls are excrescences that are sometimes produced in good numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4]. Wood. Used for construction and charcoal[46, 61].

dwatta Astringent DysenteryAny galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4].

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Landscape Uses:Specimen, Street tree. Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Young plants tolerate reasonable levels of side shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. Prefers warmer summers than are usually experienced in Britain, trees often grow poorly in this country and fail to properly ripen their wood resulting in frost damage overwinter[200]. The seed ripens in its first year[200]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. Hybridizes freely with other members of the genus[200]. Plants in this genus are notably resistant to honey fungus[200]. Special Features:Not North American native, Inconspicuous flowers or blooms.

### 6.2.305 Lindera obtusiloba

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 6 m hkuc
hmim cyutli tcup hwicli hrasjlutnyik hpa7tli frusflatprik hpa7tmwatli nyanhjen hjonli

drutta Lindera obtusiloba is a deciduous Shrub growing to 6 m (19ft) by 6 m (19ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from March to April. The species is dioecious (individual flowers are either male

or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: Leaves OilEdible Uses: Oil TeaThe young buds and leaves are used as a tea substitute[177, 183]. Young leaves are fried and used as a Buddhist ceremonial dish[183].

tcanta OilAn oil obtained from the plant is used as a hair oil[151]. It is probably obtained from the oil[K].

dwatta None known

propta Seed - best sown as soon as it is ripe in the autumn in a greenhouse. The seed has a short viability and should not be allowed to dry out[200]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in early summer. Cuttings of half-ripe wood, July in a frame[200]. Layering.

nwatta Requires a lime-free rather moist soil[200]. Prefers partial shade or dappled sunlight in a fertile moisture-retentive soil enriched with leafmould[200]. Plants can be pruned right back to the base if required, though any drastic pruning is best spread over several seasons[200]. Plants in this genus are notably resistant to honey fungus[200]. Dioecious, male and female plants must be grown if seed is required[188].

### 6.2.306 Pseudocyonia sinensis

Chinese Quince, Quince

5 tlin 8 cyuc 2 kcaak 0 tcan 1 dwat 6 m hkuc
htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Pseudocyonia sinensis is a deciduous Tree growing to 6 m (19ft) by 6 m (19ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from April to May, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - eaten as a sweetmeat, candied, preserved in syrup or made into a liqueur[46, 183]. The juice can also be mixed with ginger and made into a beverage[183]. The fruit is very large, up to 18cm long[105, 179].

tcanta Pot-pourri WoodThe fruits are very aromatic and are placed in a bowl to impart a delightful spicy scent to a room[46]. Wood - hard, dark red. Used for picture frames[174].

dwatta AntitussiveThe fruit is antitussive[174, 279]. It contains several medically active constituents including organic acids plus the flavonoids rutin and quercetin[279]. It is used in Korea to treat asthma, the common cold, sore throats, mastitis and tuberculosis[279].

propta Seed - best sown in a cold frame as soon as it is ripe in the autumn[200]. Stored seed requires 3 months cold stratification and should be sown as early in the year as possible[113]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Layering.

nwatta Landscape Uses:Specimen. Requires a sunny position[1, 11], succeeding in any reasonably good soil that is well-drained but not dry[1, 200]. Trees are very hardy when grown in a continental climate with long hot summers but in the cooler climate of Britain where they do not always ripen their wood they are only reliably hardy to about -5°C[200]. They grow well on a south-facing wall[11, 200] and this is the only way to ensure that they fruit well in Britain[1]. A plant growing in a sunny position on the south side of tree cover at Kew was 3.5 metres tall in spring 1995 and looked healthy[K]. Occasionally cultivated, especially in China[46], for its edible fruit, there are some named varieties[183]. There is a disagreement over the correct name for this species, with

some authorities using *Pseudocycdonia sinensis*[11, 200] and others *Chaenomeles sinensis*[266]. Flowers are produced on year-old wood[200]. Special Features: Not North American native, Fragrant flowers, Attractive flowers or blooms.

### 6.2.307 *Fuchsia magellanica*

*Fuchsia*, Hardy *fuchsia*

5 tlin 7 cyuc 2 kcaak 0 tcan 1 dwat m hkuc hmimhtut cyutli tcup hwicli hrasjlnutyikfrip hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Fuchsia magellanica* is a deciduous Shrub growing to 3.6 m (11ft) by 2 m (6ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from July to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw. A juicy berry[K], it is not very palatable[105, 177].

tcanta Dye Hedge HedgeA black dye is obtained from the wood[46, 61]. Very resistant of maritime exposure and tolerant of trimming it makes a good informal hedge in mild maritime areas[29, 75, 166]. The variety 'Riccartonii' is commonly used[200]. The cultivar 'Prostrata' forms a carpet of growth and can be used as a ground cover when planted about 60cm apart each way[208].

dwatta Diuretic FebrifugeDiuretic, febrifuge[46].

propta Seed - best sown as soon as it is ripe[200] though it can also be sown in the spring[1]. Surface sow the seed in pots in a warm greenhouse and do not allow the compost to dry out[200]. Germination should take place in less than 6 weeks. Prick out the seedlings into individual pots when they are large enough to handle, and grow them on in the greenhouse for at least their first winter. Plant out in late spring or early summer, after the last expected frosts. Inter-nodal cuttings of greenwood, 5 - 8cm long, May/June in a frame. Quick and easy, a high percentage take[78, K]. Overwinter in the greenhouse for the first year and plant out after the last expected frosts. Inter-nodal cuttings of half-ripe wood, July/August in a frame. Very quick and easy, treat as greenwood cuttings above[K]. Cuttings usually succeed at any time during the growing season[K].

nwatta Landscape Uses:Border, Container, Ground cover, Specimen. Succeeds in any fertile well-drained circum-neutral soil, preferring one that is rich in humus[1, 200]. Grows well in heavy clay soils. Prefers cool moist conditions and some shade[1, 15]. Succeeds in a good loam if leafmold and sand are added[1]. This species is very resistant to maritime exposure, it can be grown right on the coast[75, 166]. The top growth is hardy to about -10°c[184], this can be cut right back to the ground in severe winters but the plants usually recover well, growing away quickly in the late spring and flowering by late summer[200]. The young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. The sub-species *F. magellanica myrtifolia* often bears a very large crop of fruit[K]. The cultivar 'Riccartonii' can be hardy fairly well north in Britain. A lovely specimen 3 metres tall was seen growing in dappled shade of trees in the Monastery Gardens in York[K]. A very ornamental plant, it is a parent of most of the hardy ornamental *fuchsia* varieties[1]. Plants seem to be immune to the predations of rabbits[233]. Plants are pollinated by humming birds in the wild, they are good bee plants in Britain[108]. Special Features: Extended bloom season in Zones 9A and above, Blooms are very showy.

### 6.2.308 *Thamnocalamus spathiflorus*

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 6 m hkuc

hmimhtut cyutli tcup hwicli hrasjlnutyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Thamnocalamus spathiflorus* is an evergreen Bamboo growing to 6 m (19ft 8in). See above for USDA

hardiness. It is hardy to UK zone 6. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Seed StemEdible Uses: Young shoots - cooked[177]. Seed - cooked and used as a cereal[177]. The plants only flower and produce seed at intervals of several years.

tcanta Basketry Hedge Plant supportA valuable plant for screen planting in wet areas[200]. The canes are used for making baskets and pipes[25, 46, 51, 195]. They can also be used as plant supports[146]. The canes are quite brittle and so are not very useful for weaving, in their native range they are only used when better species are not available[220].

dwatta None known

propta Seed - surface sow as soon as it is ripe in a greenhouse at about 20°C. Do not allow the compost to dry out. Germination usually takes place fairly quickly so long as the seed is of good quality, though it can take 3 - 6 months. Grow on in a lightly shaded place in the greenhouse until large enough to plant out. Seed is rarely available. Division in spring as new growth commences. Take divisions with at least three canes in the clump, trying to cause as little root disturbance to the main plant as possible. Grow them on in light shade in a greenhouse in pots of a high fertility sandy medium. Mist the foliage regularly until plants are established. Plant them out into their permanent positions when a good root system has developed, which can take a year or more[200]. Basal cane cuttings.

nwatta Succeeds in most soils in sun or shade so long as the soil is moist[200]. Prefers a good loamy soil in a semi-shaded position[1, 11, 25], the leaves curling up when the plant grows in strong sunlight. Dislikes drought[1]. Requires a position sheltered from cold winds[25, 195]. When grown outdoors, this species is only hardy in the milder areas of Britain[195]. Plants are hardy to about -20°C according to another report. This species is notably resistant to honey fungus[200]. A clump-forming species, it does not hinder the regeneration of tree growth in its native range and is also a very valuable species for providing food and shelter for wildlife[267]. Plants only flower at intervals of many years. When they do come into flower most of the plants energies are directed into producing seed and consequently the plant is severely weakened. They sometimes die after flowering, but if left alone they will usually recover though they will look very poorly for a few years. If fed with artificial NPK fertilizers at this time the plants are more likely to die[122]. The rootstock is caespitose[25]. Closely related to *T. aristatus*[200].

### 6.2.309 *Cakile maritima*

Sea Rocket, European searocket

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat m hkuc htut cyutli tcup hwicli hyishras hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Cakile maritima* is a ANNUAL growing to 0.3 m (1ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from June to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles, Lepidoptera (Moths and Butterflies). Suitable for: light (sandy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: Flowers Leaves Oil Root. Seedpod Uses: Condiment OilLeaves, stems, flower buds and immature seedpods - raw or cooked. They are rich in vitamin C but have a very bitter taste[4, 66]. Used mainly as a flavouring[132]. Very young leaves can be added to salads whilst older leaves can be mixed with milder tasting leaves and used as a potherb[183, K]. Root - dried and ground into a powder, then mixed with cereal flours and used to make bread[2]. A famine food, it is only used in times of scarcity[183]. The seed contains a fatty oil[74]. No more details are given.

individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant them out in early summer. Cuttings of half-ripe wood, July/August in a frame. Root cuttings, 3cm long, planted horizontally in pots in a greenhouse. Good percentage[78]. Suckers, removed in late winter and planted into their permanent positions[113].

nwatta Uses: Clearstem tree, multi-stem tree, specimen tree, specimen shrub; Parks, tree containers, cemeteries, roof gardens, large gardens. Prefers a good deep well-drained moisture retentive soil in full sun or semi-shade[1, 11, 200]. Flowers are formed on the old wood[206]. Dioecious. Male and female plants must be grown if seed is required. Self-sown seedlings have occasionally been observed growing in bare soil in the shade of the parent plant[K].

### 6.2.321 *Celtis tenuifolia*

Small Hackberry, Dwarf hackberry

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 4.5 m hkuc htut cyutli hgatkycup hwicli hyishrasjlt hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Celtis tenuifolia* is a deciduous Tree growing to 4.5 m (14ft 9in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in April, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw. Sweet but thin fleshed[227]. The thin flesh has a sweet, mealy pleasant taste[K]. The fruit is small, up to 10mm in diameter, with a single large seed[82, K]. The trees often produce large crops of fruit in Britain, but there is so little that is edible on each fruit that it is scarcely worthwhile[K].

tcanta Wood - very tough, pliable, durable. Of no commercial value[229]. The flexible thin shoots are used as walking sticks, the wood is also an excellent fuel.

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame[200]. Stored seed is best given 2 - 3 months cold stratification and then sown February/March in a greenhouse[78, 200]. Germination rates are usually good, though the stored seed might take 12 months or more to germinate. The seed can be stored for up to 5 years[113]. As soon as they are large enough to handle, prick the seedlings out into individual pots. The leaves of seedlings often have a lot of white patches without chlorophyll, this is normal and older plants produce normal green leaves. Grow the seedlings on in a cold frame for their first winter, and plant them out in the following late spring or early summer[K]. Give them some protection from the cold for their first winter outdoors. Cuttings

nwatta Succeeds in any reasonably good soil, preferring a good fertile well-drained loamy soil[1, 11, 200]. Succeeds on dry gravels and on sandy soils[200]. Established plants are very drought resistant[200]. Trees prefer hotter summers and more sunlight than are normally experienced in Britain, they often do not fully ripen their wood when growing in this country and they are then very subject to die-back in winter[1, 11, 200]. This species is very closely related to *C. occidentalis*, and it is considered to be no more than a sub-species by many authorities[200]. Trees can be very long-lived, perhaps surviving for 1000 years in the wild[200]. Plants in this genus are notably resistant to honey fungus[200].

### 6.2.322 *Pseudosasa japonica*

Metake - Bamboo

5 tlin 9 cyuc 2 kcaak 0 tcan 1 dwat 4.5 m hkuc pcmhmimhtut cyutli tcuphja7n hwicli hyishrasjlnutyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Pseudosasa japonica* is an evergreen Bamboo growing to 4.5 m (14ft) by 3 m (9ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year.

The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist or wet soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: Seed StemEdible Uses: Young shoots - cooked[2, 105, 177]. Harvested in the late spring when about 8 - 10cm above ground level, cutting the stems 5cm or more below soil level. They have a rather bitter flavour[K]. Seed - used as a cereal[105]. Small quantities of seed are produced in many years but it is seldom viable.

tcanta Hedge Hedge Plant support Soil stabilization-Plants can be grown along the river edge to protect the banks from erosion[195]. Canes are fairly thin walled but make very good plant supports[25, 75, 195]. Smaller canes can be plaited together and used as screens or as lathes for walls and ceilings[195]. Tolerant of maritime exposure, it can be grown as a screen or windbreak hedge in very exposed positions[75, 166]. The culms make an excellent wind filter, slowing its speed without creating turbulence. The leaves may look somewhat tattered by the end of the winter but plants will soon produce new leaves[K].

dwatta Abortifacient Anthelmintic Antivinous Aphrodisiac Stimulant TonicAnthelmintic, antinivous, stimulant, tonic[178]. Used orally in Chinese medicine for asthma, coughs and gallbladder disorders. In India leaves are used for spasmodic disorders of the stomach and to arrest bleeding [301]. Leaves used as a aphrodisiac [301].

propta Seed - if possible, surface sow the seed as soon as it is ripe in a greenhouse at about 20°C. Stored seed is best sown as soon as it is obtained. Do not allow the compost to dry out. Germination usually takes place fairly quickly so long as the seed is of good quality, though it can take 3 - 6 months. Prick out the seedlings when they are large enough to handle and grow them on in a lightly shaded place in the greenhouse until they are large enough to plant out, which might take a few years. Plants only flower at intervals of several years and so seed is rarely available. Division in late spring as new growth commences. Very easy, single canes of the current years growth can be used. Pot them up in light shade in a greenhouse. Make sure the foliage is not allowed to dry out - misting 2 - 3 times a day for the first couple of weeks following division can be very helpful. Plant out in the summer once they are growing away strongly. Cane layering in May. Detach individual canes and lay them horizontally in trenches 15cm deep. New shoots should arise from each joint. Rhizome cuttings.

nwatta One of the easiest bamboos to grow in Britain, it prefers an open loam of fair quality and a position sheltered from cold drying winds[1, 11, 29] but it tolerates maritime exposure[75, 166]. Succeeds on peaty soils[11]. Succeeds in soils that are half earth and half stone[195]. Requires abundant moisture and plenty of organic matter in the soil[200]. Endures near-saturated soil conditions[200]. Dislikes drought[1]. A very ornamental plant[1], it is said to be the hardest bamboo[25], tolerating temperatures down to about -15°c[200]. Down to -24°c according to another report. In warmer parts of Britain plants can attain a height of 6 metres or more. The rootstock is running and very invasive[25]. It is fairly easy to control, however, if any new shoots that are not wanted are broken off whilst they are still small and brittle. New shoots appear from April[25]. This species is notably resistant to honey fungus[200]. Plants often flower lightly for a number of years without dying out though they seldom produce viable seed[122]. Occasionally the plants can produce an abundance of flowers and this severely weakens, though does not usually kill, the plants. They can take some years to recover. If fed with artificial NPK fertilizers at this time the plants are more likely to die[122]. Many plants flowered heavily in the late 1980's and are only slowly recovering.

### 6.2.323 *Amelanchier ovalis integrifolia*

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 4 m hkuc

hmimhtut cyutli tcup hwicli hrasjlnutyikfrip hpa7tli flatprik

sunny position is required for the fruit to ripen[200]. Plants climb by means of tendrils[182]. Any pruning should be carried out in winter when the plants are dormant otherwise they bleed profusely[182, 200]. Plants in this genus are notably susceptible to honey fungus[200].

### 6.2.317 *Malus glabrata*

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 5 m hkuc  
hmmihmtut cyutli tcup hwicli hrasjlutnykfrip hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Malus glabrata* is a deciduous Tree growing to 5 m (16ft 5in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105, 177]. Up to 3cm in diameter[200].

tcanta None known  
dwatta None known

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. It usually germinates in late winter. Stored seed requires stratification for 3 months at 1°C and should be sown in a cold frame as soon as it is received[200]. It might not germinate for 12 months or more. Prick out the seedlings into individual pots as soon as they are large enough to handle. If given a rich compost they usually grow away quickly and can be large enough to plant out in late summer, though consider giving them some protection from the cold in their first winter. Otherwise, keep them in pots in a cold frame and plant them out in late spring of the following year. Cuttings of mature wood, November in a frame[11].

nwatta An easily grown plant, it succeeds in most fertile soils, preferring a moisture retentive well-drained loamy soil[1, 200]. Grows well in heavy clay soils. Prefers a sunny position but succeeds in partial shade though it fruits less well in such a situation[1, 200]. The fruit is a good wildlife food source, especially for birds[200]. This species is closely related to *M. glaucescens*[200]. It hybridizes freely with other members of the genus[200]. Plants in this genus are notably susceptible to honey fungus[200].

### 6.2.318 *Pyrocydonia danielii*

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 5 m hkuc  
hmmihmtut cyutli hgattcup hwicli hrasjlutnykfrip hpa7tli flatprikliw hpa7tmwatli dyatxre7t hjonli

drutta *Pyrocydonia danielii* is a deciduous Tree growing to 5 m (16ft 5in). See above for USDA hardiness. It is hardy to UK zone 6. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil and can tolerate drought. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[K]. Fully ripe fruits are crisp and juicy and the flavour is rather pear-like, though of inferior quality to most pears[K].

tcanta None known  
dwatta None known

propta Seed. A bigeneric hybrid, it will not breed true from seed even if fertile seed is produced. If by chance you do obtain seed, then it is best sown in the autumn in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the cold frame for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of softwood in early summer, treated with rooting hormone and rooted in a closed case with bottom heat[200]. Grafting onto *Pyrus communis*.

nwatta Prefers a good well-drained loam in full sun[200]. Grows well in heavy clay soils. Tolerates light shade but does

not fruit so well in such a position. Tolerates atmospheric pollution, excessive moisture and a range of soil types if they are moderately fertile[200]. Established plants are drought tolerant[200].

### 6.2.319 *Asparagus verticillatus*

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 4 m hkuc  
hmmihmtut cyutli tcup hwicli hrasjlutnyk hpa7tli flatprikliw hpa7tmwatli nyanhjen hjonli

drutta *Asparagus verticillatus* is a PERENNIAL growing to 4 m (13ft 1in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: StemEdible Uses: Young shoots - cooked[2, 105, 177].

tcanta None known  
dwatta None known

propta Seed - pre-soak for 12 hours in warm water and then sow in spring or as soon as the seed is ripe in early autumn in a greenhouse. It usually germinates in 3 - 6 weeks at 25°C[134]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a sunny position in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer[K]. Division in early spring as the plant comes into growth.

nwatta Easily grown in any good garden soil[200]. Prefers a rich sandy loam[1]. Dormant plants are hardy to about -20°C[200]. The young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. Dioecious. Male and female plants must be grown if seed is required.

### 6.2.320 *Zanthoxylum schinifolium*

Peppertree

5 tlin 9 cyuc 2 kcaak 0 tcan 2 dwat 4 m hkuc  
hmmihmtut cyutli tcup hwicli hrasjlutnyk hpa7tli flatprikliw hpa7tmwatli dyat hjonli

drutta *Zanthoxylum schinifolium* is a deciduous Shrub growing to 4 m (13ft 1in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August, and the seeds ripen in October. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: LeavesEdible Uses: Condi- mentSeed - cooked. It is used as a condiment, a pepper substitute[151]. Young leaves[105]. No more details are given.

tcanta ParasiticideNone known

dwatta Anaesthetic Diuretic Parasiticide Stimulant Tonic VasodilatorThe pericarp is anaesthetic, diuretic, parasiticide and vasodilator[176]. It is used in the treatment of gastralgia and dyspepsia due to cold with vomiting, diarrhoea, abdominal pain, ascariasis and dermal diseases[176]. It has a local anaesthetic action and is parasiticide against the pork tapeworm (*Taenia solium*) [176]. The pericarp contains geraniol. In small doses this has a mild diuretic action, though large doses will inhibit the excretion of urine[176]. There is a persistent increase in peristalsis at low concentration, but inhibition at high concentration[176]. The resin contained in the bark, and especially in that of the roots, is powerfully stimulant and tonic[82].

propta Seed - best sown in a greenhouse as soon as it is ripe in the autumn. Stored seed may require up to 3 months cold stratification, though scarification may also help[113]. Sow stored seed in a cold frame as early in the year as possible. Germination should take place in late spring, though it might take another 12 months. Prick out the seedlings into

tcanta OilNone known  
dwatta Vitamin CNone known  
propta Seed - sown late spring or early autumn in situ. Germination is usually rapid.

nwatta Prefers a light well-drained soil and a sunny position[1, 200]. Plants are easily grown in a garden situation and can self-sow if the ground is disturbed by hoeing etc[K]. This species is closely related to *C. edentula*, which is native to N. America[17]. The seed is often dispersed by floating in sea water[17].

### 6.2.310 *Amelanchier ovalis*

Snowy Mespilus, Dwarf Garden Serviceberry  
5 tlin 7 cyuc 2 kcaak 0 tcan 0 dwat 5 m hkuc  
htut cyutli tcup hwicli hrasjlutnykfrip hpa7tli flatprikliw hpa7tmwatli fyifxre7t hjonli

drutta *Amelanchier ovalis* is a deciduous Shrub growing to 5 m (16ft 5in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in May, and the seeds ripen in July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Edible fruit - raw or cooked. Not very palatable, but it can be used for preserves etc[183]. The fruit is rich in iron and copper[226].

tcanta WoodWood - fine grained, hard, very heavy, reddish. Used for small articles[74].

dwatta None known

propta Seed - it is best harvested 'green', when the seed is fully formed but before the seed coat has hardened, and then sown immediately in pots outdoors or in a cold frame. If stored seed is obtained early enough in the autumn, it can be given 4 weeks warm stratification before being left out in the winter and it should then germinate in the spring. Otherwise seed can be very slow to germinate, perhaps taking 18 months or more. When large enough to handle, prick the seedlings out into individual pots and grow them on in a sheltered outdoor position, planting them out once they are 20cm or more tall. If there is sufficient seed it is best to sow it thinly in an outdoor seedbed[78, 80]. Grow the seedlings on for two years in the seedbed before planting them out into their permanent positions during the winter. Layering in spring - takes 18 months[78]. Division of suckers in late winter. The suckers need to have been growing for 2 years before you dig them up, otherwise they will not have formed roots. They can be planted out straight into their permanent positions if required.

nwatta Prefers a rich loamy soil in a sunny position or semi-shade[1, 200] but thrives in any soil that is not too dry or water-logged[11]. Grows well in heavy clay soils. Fairly lime tolerant[200]. Hardy to about -20°C[184]. All members of this genus have edible fruits and, whilst this is dry and uninteresting in some species, in many others it is sweet and juicy. Many of the species have potential for use in the garden as edible ornamentals. The main drawback to this genus is that birds adore the fruit and will often completely strip a tree before it is fully ripe[K]. A very ornamental plant[74]. Hybridizes freely with other members of this genus[200]. Grafting onto seedlings of *A. lamarckii* or *Sorbus aucuparia* is sometimes practised in order to avoid the potential problem of hybridizing[1]. Special Features:Not North American native, Blooms are very showy.

### 6.2.311 *Quercus acutissima*

Sawthorn Oak

5 tlin 9 cyuc 2 kcaak 3 tcan 2 dwat 5 m hkuc  
hmmihmtut cyutli tcup hwicli jlutnykfrip hpa7tli flatprikliw hpa7tmwatli hjonli

drutta *Quercus acutissima* is a deciduous Tree growing to 5 m (16ft) by 15 m (49ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium

(loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: Leaves SeedEdible Uses: Seed - cooked[105, 177]. The seed is up to 25mm long[200]. It can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread. The seed contains bitter tannins, these can be leached out by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. Young leaves - cooked. A famine food when all else fails[177]. The roasted seed is a coffee substitute.

tcanta Charcoal Dye Fodder Fuel Repellent Tannin WoodA mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth. Oak galls are excrescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4]. A black dye is obtained from the seed cups[109]. Wood - used for boat building and construction[109]. The wood is also used for fuel and charcoal[11, 109].

dwatta Astringent DysenteryThe stem bark is used to clean foul sores[218]. The seeds are used in the treatment of diarrhoea, menorrhagia and gastrointestinal hypertrophy[218]. The cupule (seed cup) is astringent[218]. Any galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4].

propta Seed - quickly loses viability if allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed but must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Fodder: Mast Industrial Crop: Tannin Management: Standard Regional Crop Staple Crop: Balanced carbLandscape Uses:Aggressive surface roots possible, Specimen, Street tree. Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Lime tolerant[188]. Young plants tolerate reasonable levels of shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. Prefers warmer summers than are usually experienced in Britain, trees often grow poorly in this country and fail to properly ripen their wood resulting in frost damage overwinter[200]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. The seed ripens in its second year[200]. This species is closely related to *Q. variabilis*[1]. Often cultivated in China as a coppiced tree for fuel and charcoal[109]. Hybridizes freely with other members of the genus[200]. Plants in this genus are notably resistant to honey fungus[200]. Special Features:Not North American native, Attractive flowers or blooms. The plant is heat tolerant in zones 8 through 3. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit

and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2].

### 6.2.312 Viburnum erubescens gracilipes

5 tlin 9 cyuc 2 kcaok 0 tcan 0 dwat 5 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Viburnum erubescens gracilipes is a deciduous Shrub growing to 5 m (16ft 5in). See above for USDA hardness. It is hardy to UK zone 6. It is in flower in July, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

ckakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. A sweet flavour but there is very little flesh in relation to the size of the single large seed[K].

tcanta WoodWood - soft to hard, close and even grained. The wood is hardest in the cooler parts of its range, the Himalayan form is a possible Boxwood (Buxus spp) substitute[146].

dwatta None known  
propta Seed - best sown in a cold frame as soon as it is ripe. Germination can be slow, sometimes taking more than 18 months. If the seed is harvested 'green' (when it has fully developed but before it has fully ripened) and sown immediately in a cold frame, it should germinate in the spring[80]. Stored seed will require 2 months warm then 3 months cold stratification and can still take 18 months to germinate[113]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame or greenhouse. Plant out into their permanent positions in late spring or early summer of the following year. Cuttings of soft-wood, early summer in a frame[200]. Pot up into individual pots once they start to root and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, 5 - 8 cm long with a heel if possible, July/August in a frame[78, 113]. Plant them into individual pots as soon as they start to root. These cuttings can be difficult to overwinter, it is best to keep them in a greenhouse or cold frame until the following spring before planting them out[113]. Cuttings of mature wood, winter in a frame. They should root in early spring - pot them up when large enough to handle and plant them out in the summer if sufficient new growth is made, otherwise keep them in a cold frame for the next winter and then plant them out in the spring. Layering of current seasons growth in July/August. Takes 15 months[78].

nwatta An easily grown plant, it succeeds in most soils but is ill-adapted for poor soils and for dry situations[1]. It prefers a deep rich loamy soil in sun or semi-shade[11, 200]. Best if given shade from the early morning sun in spring[200]. Not all forms of this species are hardy in Britain[11]. Plants are self-incompatible and need to grow close to a genetically distinct plant in the same species in order to produce fruit and fertile seed[11, 200]. A polymorphic species[11]. This form of *V. erubescens* fruits freely in Britain[200].

### 6.2.313 Aesculus pavia

Red Buckeye

5 tlin 9 cyuc 2 kcaok 0 tcan 1 dwat 5 m hkuc pcmhmmhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Aesculus pavia is a deciduous Shrub growing to 5 m (16ft) by 3 m (9ft) at a fast rate. See above for USDA hardness. It is hardy to UK zone 5 and is not frost tender. It is in flower in June, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

ckakta Edible Parts: SeedEdible Uses: Seed - cooked. It can be dried and ground into a powder and used as a gruel. The seed is quite large, about 25mm in diameter[27], and is easily harvested. Unfortunately, the seed is also rich in saponins and these need to be removed before it can be eaten. See also the notes above on toxicity. The following notes apply to *A. californica*, but are probably also relevant here:- The seed needs to be leached of toxins before it becomes safe to eat - the Indians would do this by slow-roasting the nuts (which would have rendered the saponins harmless) and then cutting them into thin slices, putting them into a cloth bag and rinsing them in a stream for 2 - 5 days[213]. Most of the minerals etc would also have been leached out by this treatment[K].

tcanta Soap WoodSaponins in the seed and roots are a soap substitute[149, 169]. The saponins can be easily obtained by chopping the seed into small pieces and infusing them in hot water. This water can then be used for washing the body, clothes etc. Its main drawback is a lingering odour of horse chestnuts[K].

dwatta Cancer Hypnotic Odontalgic SalveThe powdered bark is hypnotic and odontalgic. It is used in the treatment of ulcers[149, 192, 227]. A poultice of the powdered seeds has been used in the treatment of cancer tumours and infections, and as a salve for sores[257]. An infusion of the roots has been used as a bath in the treatment of dyspepsia[257].

propta Seed - best sown outdoors or in a cold frame as soon as it is ripe[11, 80]. The seed germinates almost immediately and must be given protection from severe weather[130]. The seed has a very limited viability and must not be allowed to dry out. Stored seed should be soaked for 24 hours prior to sowing and even after this may still not be viable[80, 113]. It is best to sow the seed with its 'scar' downwards[130]. If sowing the seed in a cold frame, pot up the seedlings in early spring and plant them out into their permanent positions in the summer. Division of suckers in the dormant season[200]. The suckers can be planted out straight into their permanent positions if required.

nwatta Landscape Uses:Specimen, Street tree, Woodland garden. Prefers a deep loamy well-drained soil but is not too fussy[1, 11]. Very shade tolerant, it also succeeds in a sunny position[200]. A very ornamental shrub, when dormant it is hardy to about -15°C[184] though the young growth in spring can be damaged by late frosts. It prefers a continental climate, growing best in eastern and south-eastern England[200]. Trees are fast-growing in the wild, though they are also short-lived[229]. They can commence flowering when only 1 metre tall[229]. Plants spread by means of suckers[200]. There are a number of named varieties, developed for their ornamental value. Var. 'Humilis' is a low growing form[182]. Most members of this genus transplant easily, even when fairly large[11]. Special Features: Attractive foliage, North American native, All or parts of this plant are poisonous, Attracts butterflies, Blooms are very showy.

### 6.2.314 Viburnum erubescens

5 tlin 9 cyuc 2 kcaok 0 tcan 1 dwat 5 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Viburnum erubescens is a deciduous Shrub growing to 5 m (16ft 5in). See above for USDA hardness. It is hardy to UK zone 6. It is in flower in July, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

ckakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[272]. A sweet flavour but there is very little flesh in relation to the size of the single large seed[K].

tcanta Miscellany WoodWood - soft to hard, close and even grained. The wood is hardest in the cooler parts of its range, the Himalayan form is a possible Boxwood (Buxus spp) substitute[146].

dwatta MiscellanyThe juice of the roots is used in the treatment of coughs[272].

propta Seed - best sown in a cold frame as soon as it is ripe. Germination can be slow, sometimes taking more than 18 months. If the seed is harvested 'green' (when it has fully

developed but before it has fully ripened) and sown immediately in a cold frame, it should germinate in the spring[80]. Stored seed will require 2 months warm then 3 months cold stratification and can still take 18 months to germinate[113]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame or greenhouse. Plant out into their permanent positions in late spring or early summer of the following year. Cuttings of soft-wood, early summer in a frame[200]. Pot up into individual pots once they start to root and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, 5 - 8 cm long with a heel if possible, July/August in a frame[78, 113]. Plant them into individual pots as soon as they start to root. These cuttings can be difficult to overwinter, it is best to keep them in a greenhouse or cold frame until the following spring before planting them out[113]. Cuttings of mature wood, winter in a frame. They should root in early spring - pot them up when large enough to handle and plant them out in the summer if sufficient new growth is made, otherwise keep them in a cold frame for the next winter and then plant them out in the spring. Layering of current seasons growth in July/August. Takes 15 months[78].

nwatta An easily grown plant, it succeeds in most soils but is ill-adapted for poor soils and for dry situations[1]. It prefers a deep rich loamy soil in sun or semi-shade[11, 200]. Best if given shade from the early morning sun in spring[200]. Not all forms of this species are hardy in Britain[11]. Plants are self-incompatible and need to grow close to a genetically distinct plant in the same species in order to produce fruit and fertile seed[11, 200]. The flowers are deliciously scented[245]. A polymorphic species[11]. The sub-species *V. erubescens gracilipes*. Rehd. fruits freely in Britain[11].

### 6.2.315 Prunus emarginata

Bitter Cherry

5 tlin 9 cyuc 2 kcaok 0 tcan 2 dwat 5 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Prunus emarginata is a deciduous Tree growing to 5 m (16ft 5in) at a medium rate. See above for USDA hardness. It is hardy to UK zone 6. It is in flower in May, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

ckakta Edible Parts: Fruit SeedEdible Uses: Fruit - raw or cooked[229]. Intensely bitter[1, 11, 82, 99]. Some native North American Indian tribes saw the fruit as a great delicacy and an important food source, though others only ate it occasionally because of its bitter taste[257]. The fruit is 8 - 15mm in diameter with a thick flesh, and contains one large seed[229]. Seed - raw or cooked. Do not eat the seed if it is too bitter - see the notes above on toxicity.

tcanta Basketry Dye Fuel Plaster String WoodA green dye can be obtained from the leaves[168]. A dark grey to green dye can be obtained from the fruit[168]. The bark is used to ornament baskets and is also split into strips and used for making baskets that are watertight and resist decay[99, 257]. The bark is both strong and flexible as well as being ornamental[257]. The thin outer bark can be peeled off the tree in the same way as birch trees[226]. It has been used to make baskets, mats, ropes and as an ornament on bows, arrows etc[226, 257]. The bark can also be made into a string[257]. Wood - close-grained, soft, brittle[82]. It is sometimes used for furniture because it takes a high polish[229]. An excellent fuel[99].

dwatta Blood purifier Cardiac Contraceptive Eczema Laxative Plaster TB TonicBitter cherry was employed medicinally by several native North American Indian tribes who used it to treat a variety of complaints[257]. It is little, if at all, used in modern herbalism. The bark is blood purifier, cardiac, laxative and tonic[257]. An infusion of the bark has been used in the treatment of tuberculosis and eczema[257]. A decoction of the root and inner bark has been taken daily as a treatment for heart troubles[257]. An infusion of the

bark, combined with crab apple bark (*Malus* spp) has been used as a cure-all tonic in treating colds and various other ailments[257]. The bark, stuck on with resin, has been used as a dressing for wounds, swellings etc[226, 257]. An infusion of the rotten wood has been used as a contraceptive[257]. Although no specific mention has been seen for this species, all members of the genus contain amygdalin and prunasin, substances which break down in water to form hydrocyanic acid (cyanide or prussic acid). In small amounts this exceedingly poisonous compound stimulates respiration, improves digestion and gives a sense of well-being[238].

propta Seed - requires 2 - 3 months cold stratification and is best sown in a cold frame as soon as it is ripe[200]. Sow stored seed in a cold frame as early in the year as possible[200]. Protect the seed from mice etc. The seed can be rather slow, sometimes taking 18 months to germinate[113]. Prick out the seedlings into individual pots when they are large enough to handle. Grow them on in a greenhouse or cold frame for their first winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood with a heel, July/August in a frame[11, 200]. Softwood cuttings from strongly growing plants in spring to early summer in a frame[200]. Layering in spring.

nwatta Thrives in a well-drained moisture-retentive loamy soil[11, 200]. Prefers some lime in the soil but is likely to become chlorotic if too much lime is present[1]. Succeeds in sun or partial shade though it fruits better in a sunny position[11, 200]. This species is unable to tolerate much shade competition from other trees[229]. A fast-growing but short-lived species in the wild[229]. The flowers diffuse a soft honey scent[245]. Most members of this genus are shallow-rooted and will produce suckers if the roots are damaged[238]. Plants in this genus are notably susceptible to honey fungus[200].

### 6.2.316 Vitis arizonica

Canyon Grape

5 tlin 9 cyuc 2 kcaok 0 tcan 0 dwat 5 m hkuc hmimhtut cyutli kyuctcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Vitis arizonica is a deciduous Climber growing to 5 m (16ft 5in). See above for USDA hardness. It is hardy to UK zone 6. It is in flower from June to July, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

ckakta Edible Parts: Fruit LeavesEdible Uses: Fruit - raw or dried for winter use[161, 177, 257]. The fruit is fairly small, but it is quite luscious[2]. The fruit is about 10mm in diameter[200] and is borne in bunches. Leaves - raw. Chewed to allay thirst. Young leaves are wrapped around other foods and then baked, they impart a pleasant flavour. Young tendrils - raw or cooked.

tcanta DyeA yellow dye is obtained from the fresh or dried leaves[168].

dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe[K]. Six weeks cold stratification improves the germination rate, and so stored seed is best sown in a cold frame as soon as it is obtained. Germination should take place in the first spring, but sometimes takes another 12 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant out in early summer. Cuttings of mature wood of the current seasons growth, December/January in a frame. These cuttings can be of wood 15 - 30cm long or they can be of short sections of the stem about 5cm long with just one bud at the top of the section. In this case a thin, narrow strip of the bark about 3cm long is removed from the bottom half of the side of the stem. This will encourage callusing and the formation of roots. Due to the size of these cuttings they need to be kept in a more protected environment than the longer cuttings. Layering.

nwatta Prefers a deep rich moist well-drained moderately fertile loam[1, 200]. Grows best in a calcareous soil[200]. Succeeds in sun or partial shade though a warm

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked[2, 177]. Used as a vegetable in soups[183]. There is a distinctive bitterness in the flavour[K].

tcanta Plants can be used for ground cover[190]. They are best spaced about 30cm apart each way[208].

dwatta None known

propta Seed - surface sow in spring in well-drained soil in a sunny position in a greenhouse. Do not allow the soil to dry out. Prick out the seedlings into individual pots when they are large enough to handle. If sufficient growth is made, it is possible to plant them out during the summer, otherwise keep them in a cold-frame or greenhouse for their first winter and plant them out in early summer of the following year[K]. Division is very easy and can be carried out at almost any time in the growing season, though is probably best done in spring or early summer. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta An easily grown plant, it succeeds in most soils[188] but prefers a fertile well-drained soil[200]. Dislikes lime[50]. Shade tolerant[83], though it prefers a sunny position[K]. Established plants are drought tolerant[190]. Hardy to at least -15°c[200]. Spreads rapidly at the roots, but it is easily controlled[83]. All members of this genus are said to have edible leaves, though those species that have yellow flowers can cause stomach upsets if they are eaten in quantity[62, 85]. Plants in this genus seem to be immune to the predations of rabbits[233].

### 6.2.564 Hydrocotyle vulgaris

Pennywort

5 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 0.1 m hkuc hmimhtut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli frusflatprikkwis hpa7tmwatli fyifxre7t hjonli

drutta Hydrocotyle vulgaris is a PERENNIAL growing to 0.1 m (0ft 4in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from June to August, and the seeds ripen from July to October. The species is hermaphrodite (has both male and female organs). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves - cooked. A strong carroty taste[183], they cannot be eaten in quantity[144].

tcanta None known

dwatta None known

propta Seed - we have no information on this species but suggest sowing it in early spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. If you have sufficient seed it would probably be worthwhile sowing the seed outdoors in situ in the spring. Division of rooted runners. Probably best done in spring but can be done at any time in the growing season if the plants are kept moist.

nwatta Requires a permanently moist position in sun or light shade[200]. Plants can be very invasive, though they are fairly easy to control by pulling out the rooted stems[200].

### 6.2.565 Plantago asiatica

Che Qian Zi

5 tlin 9 cyuc 1 kcaak 2 tcan 3 dwat 0.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikkwis hpa7tmwatli fyifxre7t hjonli

drutta Plantago asiatica is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can

grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves SeedEdible Uses: Young leaves - raw or cooked[218]. Rather fibrous, unless they are very young, they have a slightly bitter flavour[K].

tcanta Dynamic accumulator.

dwatta Antibacterial Antiinflammatory Antiseptic Antitussive Cardiac Diuretic Expectorant Haemostatic LaxativeThe leaves and the seed are anti-inflammatory, antiseptic, antitussive, cardiac, diuretic, expectorant, haemostatic. Assists the repair of joints[174, 176, 238]. The seed is used internally in the treatment of a variety of ailments including asthma, bladder problems, bronchitis, fever, hypertension and rheumatism[218, 238, 279]. The leaves are also used for these purposes, though they are considered to be less powerful than the seed[218]. The leaves can be harvested at any time in the growing season, and are used fresh or dried[238]. A decoction of the roots is used in the treatment of coughs[218]. Plantain seeds contain up to 30% mucilage which swells up in the gut, acting as a bulk laxative and soothing irritated membranes[238]. Sometimes the seed husks are used without the seeds[238]. Extracts of the plant have antibacterial activity[218].

propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in early summer A sowing can be made outdoors in situ in mid to late spring if you have enough seeds.

nwatta Succeeds in any moderately fertile soil in a sunny position[200]. This species is hardy to at least -15°c[238]. Closely related to P. major and included as a sub-species of that plant by some botanists[238].

### 6.2.566 Tricyrtis hirta

Toad Lily, Japanese Toad Lily

5 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 0.8 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Tricyrtis hirta is a PERENNIAL growing to 0.8 m (2ft 7in) by 0.5 m (1ft 8in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves and young shoots - cooked.

tcanta None known

dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe. Stored seed requires 12 weeks stratification at 5°c[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division just before growth starts in spring to single crowns[175]. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the summer or the following spring.

nwatta Landscape Uses:Border, Container, Rock garden, Woodland garden. Prefers a humus-rich fertile well-drained but moisture-retentive acid or neutral light sandy loam in partial shade[175, 200]. Prefers the dappled shade of a woodland garden but tolerates full sun if the soil is reliably moist throughout the growing season, flowering earlier in such a position[200]. Plants also require a sunnier position in the northern parts of Britain[233]. This species is hardy to about -20°c, but if prolonged cold weather is not accompanied by snow cover the plants will appreciate a good mulch of organic matter[187]. Plants are very susceptible to attacks by slugs[175]. Special Features:Attractive foliage, Suitable for cut flowers.

drutta Vaccinium japonicum is a deciduous Shrub growing to 0.7 m (2ft 4in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in July, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. An acid flavour[105, 177]. The fruit is about 6mm in diameter[200].

tcanta None known

dwatta None known

propta Seed - sow late winter in a greenhouse in a lime-free potting mix and only just cover the seed[78]. Stored seed might require a period of up to 3 months cold stratification[113]. Another report says that it is best to sow the seed in a greenhouse as soon as it is ripe[200]. Once they are about 5cm tall, prick the seedlings out into individual pots and grow them on in a lightly shaded position in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 8cm with a heel, August in a frame[78]. Slow and difficult. Layering in late summer or early autumn[78]. Another report says that spring is the best time to layer[200]. Takes 18 months[78]. Division of suckers in spring or early autumn[113].

nwatta Requires a moist but freely-draining lime free soil, preferring one that is rich in peat or a light loamy soil with added leaf-mould[11, 200]. Prefers a very acid soil with a pH in the range of 4.5 to 6, plants soon become chlorotic when lime is present. Succeeds in full sun or light shade though it fruits better in a sunny position[200]. Requires shelter from strong winds[200]. Dislikes root disturbance, plants are best grown in pots until being planted out in their permanent positions[200]. Plants in this genus are notably resistant to honey fungus[200].

### 6.2.398 Cakile edentula

Sea Rocket, American searocket, Harper's searocket

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 0.6 m hkuc htut cyutli kyuctcup hwicli hyishras hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

drutta Cakile edentula is a ANNUAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles, Lepidoptera (Moths and Butterflies). Suitable for: light (sandy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: Leaves Root StemEdible Uses: Leaves and young stems - raw or cooked[61, 172, 177]. The younger leaves are used in salads whilst older leaves are mixed with milder tasting leaves and used as a potherb[183]. A horseradish flavour[43]. Root - dried and ground into a powder; then mixed with cereal flours and used to make bread[61, 161, 172, 183]. A famine food, only used when all else fails[207].

tcanta None known

dwatta None known

propta Seed - sow late spring or early autumn in situ. Germination is usually rapid.

nwatta Prefers a light well-drained soil and a sunny position[1, 200]. This species is closely related to C. maritima[50].

### 6.2.399 Callirhoe leiocarpa

Tall Poppy-Mallow

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 0.9 m hkuc htut cyutli kyuctcup hwicli hras hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

drutta Callirhoe leiocarpa is a ANNUAL growing to 0.9 m (3ft). See above for USDA hardiness. It is hardy to UK zone

6. It is in flower in August, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: RootEdible Uses: Root - cooked[2, 22, 46, 61, 105]. Parsnip-shaped[161].

tcanta None known

dwatta None known

propta Seed - sow outdoors or in a cold frame. Plants resent root disturbance so the seed is best sown in situ in April[138], though the slugs will have a field day if you do not protect the plants[K]. If seed is in short supply then sow it in pots in a cold frame, putting a few seeds in each pot, and plant the pots out in early summer once the plants have put on at least 15cm of growth. Germination usually takes place within 1 - 6 months at 15°c[138].

nwatta Prefers a light rich sandy loam and a sunny position[1]. This species is hardy to about -15°c[200]. A polymorphic species[1]. Plants resent root disturbance and should be planted into their final positions as soon as possible[138]. Slugs are strongly attracted to this plant and can destroy even established plants by eating out all the young shoots in spring[K].

### 6.2.400 Gaylussacia brachycera

Box Huckleberry

5 tlin 9 cyuc 2 kcaak 2 tcan 0 dwat 0.5 m hkuc pcmhmmhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta Gaylussacia brachycera is an evergreen Shrub growing to 0.5 m (1ft 8in) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from May to June. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[3, 62]. Not really regarded[183]. Tasteless[177, 200]. The fruit is about 12mm in diameter[200].

tcanta A good ground cover plant[200]. Spreading quite freely, it should be spaced about 30cm apart each way[208].

dwatta None known

propta Seed - best sown in the autumn in a cold frame[200]. Stored seed requires 1 month warm stratification followed by 2 months cold[113]. When large enough to handle, prick the seedlings out into individual pots of lime-free compost and grow them on in light shade in a greenhouse or cold frame for at least their first winter. Plant out into their permanent positions in late spring or early summer when they are at least 15cm tall. Cuttings of half-ripe wood, July/August in a frame[200]. Layering. Division in spring.

nwatta Requires a lime-free moist peaty soil, thriving in sun or part shade[182, 200]. Prefers a position in partial or full shade[208]. Plants are hardy to about -15°c[200]. This species rarely sets viable seed[200]. There is a colony in New Jersey that covers 3.8 hectares of land, it is estimated to be 10,000 years old and to have originated vegetatively from one single mother plant[200]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. An evergreen. A clumping mat former. Forming a dense prostrate carpet spreading indefinitely [1-2].

### 6.2.401 Potentilla nepalensis

Nepal Cinquefoil, Cinquefoil

5 tlin 10 cyuc 2 kcaak 0 tcan 1 dwat 0.6 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikkwis hpa7tmwatli fyifxre7t hjonli

drutta Potentilla nepalensis is a PERENNIAL growing to 0.6 m (2ft) by 0.6 m (2ft in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from July to August. The species is

hermaphrodite (has both male and female organs) and is pollinated by insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Root - cooked. Starchy[177].

tcanta None known

dwatta DepurativeThe root is depurative[240]. The ashes are mixed with oil and applied to burns[240].

propta Seed - sow early spring or autumn in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring. Larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Landscape Uses:Alpine garden, Border, Container, Ground cover, Rock garden, Specimen. A very tolerant and easily grown plant, surviving considerable neglect[K]. It grows best in a well-drained loam, preferring a position in full sun but tolerating shade[1]. Prefers an alkaline soil but tolerates a slightly acid soil[200]. There are many named forms selected for their ornamental value[187]. Members of this genus are rarely if ever troubled by browsing deer[233]. Special Features: Attractive foliage, Suitable for cut flowers.

## 6.2.402 Sinapis arvensis

Charlock, Charlock mustard, Wild mustard
5 tin 9 cyuc 2 kcaak 0 tcan 1 dwat 0.8 m hkuc htut cyutli tcup hwicli hrasjlutnykrip hpa7tli flatprikwlisslip hpa7tmwatli xre7t hjonli

drutta Sinapis arvensis is a ANNUAL growing to 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from May to July, and the seeds ripen from May to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: Flowers Leaves Oil Oil SeedEdible Uses: Condiment Oil OilLeaves - raw or cooked[2, 4, 5, 12, 74]. Somewhat hot, the young leaves are used as a flavouring in salads, where they add a piquant flavour[9, 183]. Older leaves are used as a potherb[183]. It is best to use just the young shoots and leaves in the spring, older leaves are bitter[9]. Flowering stems - cooked[9, 74]. A pleasant, cabbage/radish flavour, they can be used as a broccoli substitute before the flowers open[183]. The stems should be lightly steamed for no more than 5 minutes[9]. The flowers can also be cooked as a vegetable or used as a garnish[183]. Seed - it can be sprouted and eaten raw[12]. A hot flavour, it can be added to salads and sandwiches[183]. The seed can be ground into a powder and used as a food flavouring. It has a hot mustard flavour[4, 9, 46, 115]. An edible oil is obtained from the seed[1, 57, 74].

tcanta Oil OilAn edible semi-drying oil is obtained from the seed. It is also used in making soap[74] and burns well so can be used for lighting[4].

dwatta BachThe plant is used in Bach flower remedies - the keywords for prescribing it are 'Black depression', 'Melancholia' and 'Gloom'[209].

propta Seed - germinates in spring and autumn in the wild. It should not really need much encouragement.

nwatta Usually found on heavy alkaline soils in the wild[17]. Succeeds on moist soils. Dislikes shade. The plant harbours an eelworm that attacks other crops[13]. It is therefore best not to grow it in a garden setting.

## 6.2.403 Asarum shuttleworthii

Asarabacca, Mottled Wild Ginger
5 tin 9 cyuc 2 kcaak 2 tcan 0 dwat 0.1 m hkuc pcmhmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Asarum shuttleworthii is an evergreen Perennial growing to 0.1 m (0ft 4in) by 0.3 m (1ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: Edible Uses: CondimentThe following note is for the related A. caudatum, it quite possibly also applies to this species[K]. The root can be used as a ginger substitute[183]. The root has a pungent, aromatic smell like mild pepper and ginger mixed, but more strongly aromatic[245]. It can be harvested all year round, but is best in the autumn[K]. It can also be dried for later use[K]. Leaves are a tea substitute[177, 183].

tcanta A useful ground-cover plant for shady positions so long as the soil is not dry[197], spreading by its roots[208].

dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe in the summer[134]. Stored seed will require 3 weeks cold stratification and should be sown in late winter[134]. The seed usually germinates in the spring in 1 - 4 or more weeks at 18°C[134]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least their first winter. Plant them out when large enough in late spring. Division in spring or autumn. Plants are slow to increase[200]. It is best to pot the divisions up and keep them in light shade in the greenhouse until they are growing away strongly.

nwatta Landscape Uses:Border, Ground cover, Rock garden, Woodland garden. Prefers a rich moist neutral to acid soil in woodland or a shady position in the rock garden[1, 200]. Plants are hardy to at least -15°C[200]. The flowers are malodorous and are pollinated by flies[200]. Plants often self-sow when growing in a suitable position[200]. Special Features:Attractive foliage, North American native, Fragrant foliage, Inconspicuous flowers or blooms. The plant is heat tolerant in zones 9 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. An evergreen. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

## 6.2.404 Duchesnea indica

Mock Strawberry, Indian strawberry
5 tin 11 cyuc 2 kcaak 3 tcan 2 dwat 0.1 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Duchesnea indica is an evergreen Perennial growing to 0.1 m (0ft 4in) by 1 m (3ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in leaf all year, in flower from May to October, and the seeds ripen from July to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

hmimhtut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Hydrocotyle sibthorpioides is a PERENNIAL growing to 0.1 m (0ft 4in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to September, and the seeds ripen from June to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta Edible Parts: LeavesEdible Uses: The whole plant is eaten raw or cooked as a potherb[61, 105, 183]. It has a parsley-like aroma[183].

tcanta None known

dwatta Depurative FebrifugeDepurative, febrifuge. Resolves mucus formation[147]. The juice of the plant is used in the treatment of fevers[272]. A paste made from the plant is applied externally to wounds and boils[272]. The plant is decocted and used in the treatment of abscesses, boils, bruises, cirrhosis, colds, coughs, hepatitis, hepatoma, influenza, itcha, jaundice, sinusitis and sore throat[218]. It is a Chinese herbal drug for hepatoma[218].

propta Seed - we have no information on this species but suggest sowing it in early spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division of rooted runners. Probably best done in spring but can be done at any time in the growing season if the plants are kept moist.

drutta Requires a permanently moist position in sun or light shade[200]. Plants are occasionally found as weeds in damp lawns[1].

## 6.2.560 Cochlearia danica

Danish Scurvy Grass
5 tin 9 cyuc 1 kcaak 0 tcan 1 dwat 0.2 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli priklwshsom hpa7tmwatli fyifxre7t hjonli

drutta Cochlearia danica is a ANNUAL growing to 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to June, and the seeds ripen from June to August. The species is hermaphrodite (has both male and female organs). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: neutral and basic (mildly alkaline) soils and can grow in saline soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked[100, 105, 177]. Used as a flavouring in salads, it is considered to be superior to C. officinalis[183]. The leaves are rich in vitamin C[100], though very few people will actually enjoy the pungent flavour[K].

tcanta None known

dwatta Antiscorbatic Vitamin CThe leaves are a rich source of vitamin C and are used as an antiscorbatic[100].

propta Seed - sow spring or autumn in situ. Germination usually takes place within 2 - 3 weeks at 15°C[164].

nwatta Prefers a damp well-drained soil. Avoids acid soils in the wild. Prefers a sandy or gritty well-drained soil[200]. Hybridizes with C. officinalis[17].

## 6.2.561 Asplenium trichomanes

Maidenhair Spleenwort, Dense spleenwort, Toothed spleenwort, Brightgreen spleenwort

5 tin 9 cyuc 1 kcaak 0 tcan 1 dwat 0.4 m hkuc pcmhmim cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Asplenium trichomanes is an evergreen Fern growing to 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, and the seeds ripen from May to October. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It

can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: Edible Uses: TeaThe dried fronds have been used as a tea substitute[4].

tcanta None known

dwatta Demulcent Emmenagogue Expectorant LaxativeA tea made from the fronds is sweet, demulcent, expectorant and laxative[4, 240]. It has been used in the treatment of chest complaints[4] and to promote menstruation[257].

propta Spores - best sown as soon as they are ripe on the surface of a humus-rich sterilized soil. Keep the compost moist, preferably by putting a plastic bag over the pot. The spores usually germinate in the spring[1]. Spring sown spores germinate in 1 - 3 months at 15°C[134]. Pot on small clumps of plantlets as soon as they are large enough to handle and grow them on in light shade in a greenhouse. Keep the plants humid until they are well established. Once the plants are 15cm or more tall, plant them out into their permanent positions in the spring.

nwatta Requires a well-drained position and lots of old mortar rubble in the soil[1]. Requires a humid atmosphere and some shade[28, 31]. A good plant for growing on a shady part of an old dry-stone or brick wall[K]. Plants are hardy to about -30°C[200]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 6.2.562 Calystegia soldanella

Sea Bindweed, Seashore false bindweed
5 tin 9 cyuc 1 kcaak 0 tcan 1 dwat 0.6 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Calystegia soldanella is a PERENNIAL CLIMBER growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young shoots - cooked as a vegetable or pickled and used as a samphire substitute[2, 105]. Caution is advised since the plant might have a purgative effect[173].

tcanta StringThe stems are very flexible and are used as a string for tying[66]. Fairly strong but not long-lasting[K].

dwatta Antiscorbatic Diuretic Febrifuge Irritant Purgative VermifugeAntiscorbatic, diuretic, febrifuge, irritant, purgative and vermifuge[218].

propta Seed - sow spring in a cold frame in a free draining compost and only just cover. The seed usually germinates in 1 - 3 months at 15°C[138]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in early spring whilst dormant[200].

nwatta Easily grown in ordinary well-drained garden soil in a sunny position[1, 200]. This species is very difficult to establish successfully in the garden[1].

## 6.2.563 Sedum anacampseros

Loce Restorer
5 tin 9 cyuc 1 kcaak 0 tcan 0 dwat 0.1 m hkuc hmimhtut cyutli hgatkyuctcup hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli fyifxre7t hjonli

drutta Sedum anacampseros is a PERENNIAL growing to 0.1 m (0ft 4in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

drutta Spiraea pyramidata is a deciduous Shrub growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Edible Uses: TeaA tea is made by boiling the stems, leaves and flowers[161, 183, 257].

tcanta None known

dwatta TonicA decoction of the plant has been drunk as a tonic[257].

propta Seed - we have no information for this species but suggest sowing the seed as soon as it is ripe in a cold frame if possible. It is likely to require stratification before it germinates, so stored seed should be sown in a cold frame as early in the year as you receive it. Prick out the seedlings into individual pots when they are large enough to handle, and grow them on in a cold frame for their first winter. Plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, July/August in a light sandy soil a frame. Cuttings of mature wood of the current seasons growth, 15cm long, October/November in an outdoor frame[200]. Another report says that September is a good time to do this[11]. Division of suckers in early spring[200]. They can be planted out straight into their permanent positions.

nwatta An easily grown plant, it tolerates most soils[200], but prefers a good loamy soil, abundant moisture and full sunlight[11, 200]. This species is probably a natural hybrid, *S. betulifolia* x *S. douglasii* menziesii[11, 204]. It hybridizes freely with other members of this genus[11].

### 6.2.557 Eremurus stenophyllus aurantiacus

Foxtail Lily

5 tlin 10 cyuc 1 kcak 0 tcan 0 dwat 1.5 m hkuc htut cyuthi hgatkuyctcup hwicli hrasjlut hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta Eremurus stenophyllus aurantiacus is a PERENNIAL growing to 1.5 m (5ft) by 0.6 m (2ft in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from July to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: LeavesEdible Uses: Leaves - cooked[105, 177].

tcanta None known

dwatta None known

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame[200]. Sow stored seed in a greenhouse as soon as it is obtained. Germination is slow and could take 1 - 12 months at 15°C. Prick out the seedlings into individual pots as soon as they are large enough to handle and grow on for their first winter in a greenhouse. Plant out into their permanent positions in late spring after the last expected frosts. Do not plant deeply in the soil, the crown of the plant should be slightly exposed[245]. Division after the plant dies down in late summer. Great care must be taken because the plants resent root disturbance[200]. Only divide the plants when it is really necessary, and no more frequently than once every 6 years, being careful not to break the brittle roots[245]. It is probably best to pot up the divisions and grow them on in the greenhouse until they are established.

nwatta Landscape Uses:Border, Seashore, Specimen. Prefers a very well drained, very rich, light sandy loam in a warm sunny sheltered position[90, 200]. A covering of sharp sand helps the plant to survive wet winters[90]. Plants can also be mulched overwinter with organic matter in the autumn in order to give them extra protection, but this mulch must be removed in the spring otherwise it might encourage the new growth to rot[200]. Some protection should be given to the young shoots in spring in areas subject to late frosts[200]. Keep plants dry in summer after they have flowered[90]. A very ornamental plant[233], it is said to be an im-

portant food source in Afghanistan[177]. Plants resent root disturbance and so should be placed in their final positions as soon as possible[200]. Plants require some cold stratification in winter in order to flower well in the following summer[200]. Slugs are very attracted to this plant so some protection must be given[90]. Special Features: Suitable for cut flowers, Attractive flowers or blooms.

## 6.2.558 Iris cristata

Crested Iris, Dwarf crested iris
5 tlin 9 cyuc 1 kcak 0 tcan 1 dwat 0.2 m hkuc hmimhtut cyuthi tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli fyifxre7t hjonli

drutta Iris cristata is a PERENNIAL growing to 0.2 m (0ft 8in) by 0.5 m (1ft 8in) at a medium rate. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Root - used as a spice[2, 105]. Frequently chewed by local people to alleviate thirst[177, 207]. When first chewed the roots have a pleasant sweet taste, within a few minutes this changes to a burning sensation far more pungent than capsicums[207]. Caution is advised, see the notes above on toxicity.

tcanta None known

dwatta Hepatic PoultriceAn ointment made from the roots is applied to cancerous ulcers[222, 257]. A tea made from the roots is used in the treatment of hepatitis[222, 257].

propta Seed - best sown as soon as it is ripe in a cold frame. It does not require cold stratification. Stored seed should be sown as early in the year as possible in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse or cold frame for their first year. Plant out into their permanent positions in late spring or early summer. Division in July/August[42]. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Landscape Uses:Alpine garden, Container, Ground cover, Massing, Rock garden, Woodland garden. Requires a light or gravelly[42] lime-free[79] soil of a woodland nature in partial shade[42, 79, 127] or full sun[42]. Likes plenty of moisture in summer but the soil must be well-drained[127]. Grows well on a peat bank[188]. Plants are hardy to about -20°C[187]. Another report says that it is best if the plants are lifted intact in October, stored in sand and planted out in March[1]. Members of this genus are rarely if ever troubled by browsing deer and rabbits[233]. Plants require protection from slugs[187]. Frequent division and transplanting every other year is necessary if the plant is to thrive and persist[187]. Special Features:North American native, Naturalizing, All or parts of this plant are poisonous, Suitable for cut flowers. The plant is heat tolerant in zones 10 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. A clumping mat former. Forming a dense prostrate carpet spreading indefinitely [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

## 6.2.559 Hydrocotyle sibthorpioides

Water Pennywort, Lawn marshpennywort

5 tlin 9 cyuc 1 kcak 0 tcan 2 dwat 0.1 m hkuc

kcakta Edible Parts: Fruit LeavesEdible Uses: Fruit - raw[105, 177]. Dry and insipid[17]. Certainly rather tasteless, but it is not dry[K]. A flavour somewhat like a water melon according to some people, but this is possibly the product of a strained imagination[K].The fruit contains about 3.4% sugar, 1.5% protein, 1.6% ash[194]. Vitamin C is 6.3mg per 100ml of juice[194]. The fruit is about 10mm in diameter with the appearance and texture of a strawberry but very little flavour[K]. A clump 2.5m<sup>2</sup> yields about 150g of fruit annually[194]. Leaves - cooked[179].

tcanta A good ground cover plant, spreading quickly[197] by means of runners[214]. It is rather bare in winter though[K] and should not be grown with small plants since it will drop them out[208]. A good cover for bulbous plants[214]. Perennial groundcover for zone 2 firebreaks. The US government has created a system of firebreaks for areas prone to wildfires, theses are separated into concentric zones surrounding buildings. Zone 2 is the second away from the house. These low-level groundcovers provide little fuel.

dwatta Anticoagulant Antiphlogistic Antiseptic Depurative Eczema Febriifuge Poultrice Skin Vitamin CThe whole plant is anticoagulant, antiseptic, depurative and febrifuge[147, 178]. It can be used in decoction or the fresh leaves can be crushed and applied externally as a poultice[147]. It is used in the treatment of boils and abscesses, weeping eczema, ringworm, stomatitis, laryngitis, acute tonsillitis, snake and insect bites and traumatic injuries[147]. A decoction of the leaves is used in the treatment of swellings[147, 178, 218]. An infusion of the flowers is used to activate the blood circulation[218]. The fruit is used to cure skin diseases[218]. A decoction of the plant is used as a poultice for abscesses, boils, burns etc[218].

propta Seed - sow spring in a sunny position in a greenhouse. Germination usually takes place within 1 - 6 weeks or more at 15°C. A period of cold stratification may speed up germination. When large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division of runners in spring or late summer. Very easy, they can be planted out straight into their permanent positions.

nwatta Prefers a moist but well-drained soil in a sunny position[175]. Plants are at their best in semi-shade, though they are not too fussy[214] and can succeed in quite dense shade[208, 214]. They also grow well in a rock garden[1]. Plants are hardy to about -20°C[200]. A very ornamental plant[1] but it can be invasive, spreading freely by means of runners[187]. Plants are more or less evergreen, though they can be browned by severe frosts[214]. Plants sometimes self-sow in British gardens[214]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is suckering with new plants from runners away from the plant [2-1]. Heat Zone: 8-6.

## 6.2.405 Calendula arvensis

Field Marigold

5 tlin 9 cyuc 2 kcak 0 tcan 3 dwat 0.3 m hkuc htut cyuthi tcup hwicli hyishrasjlutnyik hpa7tli flatprikwis hpa7tmwatli hjonli

drutta Calendula arvensis is a ANNUAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from June to November, and the seeds ripen from August to November. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Flowers LeavesEdible Uses: Young shoots and leaves - raw or cooked[105, 177, 183, 217]. The leaves are very rich in vitamins and minerals, they are similar to Taraxacum officinale (Dandelion) in nutritional value[179]. Flower heads - pickled[177, 183].

tcanta None known

dwatta Antiphlogistic Antiseptic Antispasmodic Aperient Astringent Cholagogue Diaphoretic Emmenagogue

Homeopathy Skin Stimulant Vulnerary WartsThe leaves are diaphoretic[61, 240]. The flowers are said to be antispasmodic, emmenagogue and stimulant[240]. The plant seems to have similar therapeutic properties to pot marigold, *C. officinalis*[254]. These properties are:- Pot marigold is one of the best known and versatile herbs in Western herbal medicine and is also a popular domestic remedy[4, 254]. It is, above all, a remedy for skin problems and is applied externally to bites and stings, sprains, wounds, sore eyes, varicose veins etc[4, 254]. It is also a cleansing and detoxifying herb and is taken internally in treating fevers and chronic infections[4, 254]. Only the common deep-orange flowered variety is considered to be of medicinal value[4]. The whole plant, but especially the flowers and the leaves, is antiphlogistic, antiseptic, antispasmodic, aperient, astringent, cholagogue, diaphoretic, emmenagogue, skin, stimulant and vulnerary[4, 7, 9, 21, 46, 165, 201]. The leaves can be used fresh or dried, they are best harvested in the morning of a fine sunny day just after the dew has dried from them[4]. The flowers are also used fresh or dried, for drying they are harvested when fully open and need to be dried quickly in the shade[4]. A tea of the petals tones up the circulation and, taken regularly, can ease varicose veins[201]. An application of the crushed stems to corns and warts will soon render them easily removable[7]. The leaves, blossoms and buds are used to make a homeopathic remedy[232]. It is used internally in order to speed the healing of wounds[232].

propta Seed - sow in situ from spring to early summer and again in September. The seed germinates best in darkness and usually within 1 - 2 weeks at 21°C[138].

nwatta An easily grown and very ornamental plant, it succeeds in any well-drained soil[200], though it prefers a good loam and does best in a sunny or at least partially sunny position[4, 15, 200]. The plant flowers best when it is grown in a poor soil. Plants usually self-sow quite freely in the garden.

## 6.2.406 Hyssopus officinalis

Hyssop

5 tlin 10 cyuc 2 kcak 5 tcan 3 dwat 0.6 m hkuc

htut cyuthi kuyctcup hwicli hrasjlut hpa7tli prikklwis hpa7tmwatli fyifxre7t hjonli

drutta Hyssopus officinalis is an evergreen Shrub growing to 0.6 m (2ft) by 0.6 m (2ft in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from July to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Flowers Leaves Oil ShootsEdible Uses: Condiment OilLeaves and young shoot tips - raw or used as a flavouring in soups, salads etc[4, 14, 183]. A strongly aromatic flavour, somewhat like a cross between sage and mint, it has fallen out of favour in recent years[4, 238]. It can be used fresh or dried[21]. Flowers - raw. Added to salads[183]. An essential oil from the plant is used as a food flavouring[183].

tcanta Essential Fungicide Hedge Hedge Oil Pot-pourri Repellent StrewingHyssop can be grown as a dwarf hedge, it responds well to trimming in the spring[14, 52, 182]. The growing plant attracts cabbage white butterflies away from brassicas[14, 18, 20]. Another report says that hyssop attracts cabbage white butterflies and should not be grown near cabbages[201]. An essential oil from the leaves is antiseptic and also used in perfumery and as a food flavouring[200, 201]. It has a particularly fine odour and is much valued by perfumers[4]. Average yields of the oil are about 0.6%[7]. Yields from the blue-flowered variety are 1 - 1.5% essential oil, the red-flowered variety yields about 0.8%, whilst the white-flowered form yields 0.5% essential oil[240]. The plant was formerly used as a strewing herb[4, 200] and is also used in pot-pourri[245]. A tea made from the leaves is useful for controlling bacterial plant diseases[201]. Plants can be grown for ground cover when spaced about 45cm apart each way[208].

dwatta Antiseptic Aromatherapy Astringent Carminative Diaphoretic Emmenagogue Expectorant Pectoral Stimulant Stomachic Tonic VasodilatorHyssop has a long history of medicinal use and was so highly esteemed in the past that it was considered to be a virtual cure-all[254]. Currently an undervalued herb, it is often used as a household remedy, particularly as an expectorant and stomach tonic[4, 254]. It has a positive effect when used to treat bronchitis and respiratory infections, especially where there is excessive mucous production[254]. Hyssop can irritate the mucous membranes, so it is best given after an infection has peaked, when the herb's tonic action encourages a general recovery[254]. The plant should not be used by pregnant women, however, since in large quantities it can induce a miscarriage[7]. The leaves and flowering tops are antiseptic, antitussive, astringent, carminative, diaphoretic, emmenagogue, expectorant, pectoral, sedative, stimulant, stomachic, tonic and vasodilator[4, 7, 9, 21, 165, 238]. The plant can be harvested when in full flower and dried for later use[4]. A tea made from the leaves is used in the treatment of flatulence, stomach-aches, upper respiratory tract infections, coughs in children etc[222, 238]. A poultice made from the fresh herb is used to heal wounds[4, 238]. The essential oil is used in aromatherapy. Its keywords is 'Stability'[210]. This oil should not be used on people who are highly strung as it can cause epileptic symptoms[7, 254]. The essential oil should not be used internally except under professional supervision[254].

propta Seed - sow spring in a cold frame and only just cover the seed. Very easy, the seed germinates quickly. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 7 cm with a heel, June/July in a frame[11, 78]. Fairly easy, the cuttings root quite quickly. Grow on the plants in the greenhouse for their first winter and plant out in late spring. Cuttings of greenwood, 5 - 7 cm with a heel, April/May in a frame[1]. Plant out in the summer. Division in spring or autumn[1, 4].

nwatta Landscape Uses:Border, Specimen. Prefers a light, dry calcareous soil and a sunny position[1, 14, 37, 52]. A very cold-hardy plant, when dormant it can tolerate temperatures down to about -25°C[187]. Hyssop has very aromatic leaves and is commonly grown in the herb garden where it makes a good edging plant to a border[4]. There are some named varieties[183]. The plant needs to be trimmed regularly to keep it in shape, untrimmed plants will soon degenerate. Spring is the best time to trim the plants[238]. It is probably best to replace the plants every few years. The flowers have a rich aromatic fragrance[245]. Hyssop is a very good plant for attracting bees and butterflies to the garden[4, 20]. It is a good companion plant to grow with grapes, but it grows badly with radishes[14, 18, 20]. Special Features:Edible, Fragrant foliage, Not North American native, Naturalizing, Attracts butterflies, Suitable for cut flowers, Suitable for dried flowers, Attractive flowers or blooms. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is fibrous dividing into a large number of fine roots [2-1].

## 6.2.407 Bassia scoparia

Summer Cypress, Burningbush  
5 tin 9 cyuc 2 kcaak 1 tcan 2 dwat 0.3 m hkuc  
htut cyutli tcup hwicli hrasljut hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta Bassia scoparia is a ANNUAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in September, and the seeds ripen in October. The flowers are pollinated by Wind. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcaakta Edible Parts: Leaves SeedEdible Uses: Young leaves - cooked[105, 177]. A delicious taste, they are used as a vegetable[179]. A nutritional analysis is available[218]. Some caution is advised, see the notes above on toxicity. Seed - dried and ground into a powder then mixed with ce-

reals when making bread, biscuits etc[61, 105, 177]. Very small and fiddly to use, it is also not a very reliable crop in Britain due to its late season of flowering[K]. On a zero moisture basis, the seed contains 20.4 - 27.5% protein, 8.8 - 16% fat and 3.4 - 9.4% ash[218]. In Japan the seeds are used a food garnish called tonburi.

tcanta Broom FodderThe whole plant is used as a broom[61, 151]. The green form is used[1]. An ornamental for its red fall foliage. It has also been useful in erosion control on denuded soils. It has been suggested as an agent of phytoremediation, because it is a hyperaccumulator of chromium, lead, mercury, selenium, silver, zinc, and uranium. Bassia scoparia contains higher levels of protein and oxalate than most grasses and fodder plants, thus it also serves as a good forage crop for livestock. When grown as ornamental plant, it is a good choice as evergreen foliage plant for landscapes.

dwatta Antibacterial Antifungal Antiphlogistic Astringent Cardiotonic Diuretic Dysentery Eczema Skin UrinaryAntibacterial, antifungal[178]. The leaves and fruits are cardiotonic and diuretic[218, 240]. The stems are used in the treatment of dysentery, diarrhoea and dyspepsia[218]. The seed is antiphlogistic, astringent and diuretic[176, 218]. It is used to treat skin infections such as eczema ad scabies, and diseases of the urinary tract[176, 218, 279]. The seed contains harmine, which can have adverse effects upon the gastro-intestinal tract and the central nervous system[279].

propta Seed - sow spring in a greenhouse and plant out in May. The seed can also be sown in situ in late April or early May.

nwatta An easily grown plant[200], it succeeds in ordinary garden soil[1]. Succeeds in any reasonably fertile light well-drained but moisture retentive soil in a sunny position[200]. A frost tender plant, it is grown as a spring-sown annual in Britain[1]. This species is cultivated in Korea for its use as a broom[151]. The subspecies B. scoparia trichophylla. (Schmeiss,)Schinz. and Thell. is the form most often found in cultivation in Britain[200].

## 6.2.408 Ophrys insectifera

Fly Orchid

5 tin 9 cyuc 2 kcaak 0 tcan 2 dwat 0.5 m hkuc  
hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Ophrys insectifera is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies, bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: RootEdible Uses: Root - cooked. It is a source of 'salep', a fine white to yellowish-white powder that is obtained by drying the tuber and grinding it into a powder[200]. Salep is said to be very nutritious and is made into a drink or added to other cereals and used in bread etc[183]. One ounce of salep is said to be enough to sustain a person for a day[100, 115]. The salep can also be made into a drink[100].

tcanta None known  
dwatta Demulcent NutritiveSalep (see above for more details) is very nutritive and demulcent[4]. It has been used as a diet of special value for children and convalescents, being boiled with water, flavoured and prepared in the same way as arrowroot[4]. Rich in mucilage, it forms a soothing and demulcent jelly that is used in the treatment of irritations of the gastro-intestinal canal[4]. One part of salep to fifty parts of water is sufficient to make a jelly[4]. The tuber, from which salep is prepared, should be harvested as the plant dies down after flowering and setting seed[4].

propta Seed - surface sow, preferably as soon as it is ripe, in the greenhouse and do not allow the compost to dry out. The seed of this species is extremely simple, it has a minute embryo surrounded by a single layer of protective cells. It contains very little food reserves and depends upon a symbiotic relationship with a species of soil-dwelling fungus. The fungal hyphae invade the seed and enter the cells of the embryo. The orchid soon begins to digest the fungal tissue and this acts as a food supply for the plant until it is able

soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcaakta Edible Parts: LeavesEdible Uses: Drink TeaYoung leaves and shoots - cooked as a vegetable[272]. The roots are chewed, used as a flavouring in liqueurs or made into a tea[183].

tcanta None known  
dwatta Antibacterial Antiinflammatory Antiseptic Aphrodisiac Cardiotonic Diuretic Expectorant Haemostatic Hypoglycaemic StimulantThe roots and the flowers are antibacterial, anti-inflammatory, antiseptic, aphrodisiac, cardiotonic, diuretic, expectorant, haemostatic, hypoglycaemic and stimulant[176, 238, 272]. The root is used internally in the treatment of indigestion, vomiting, coronary heart disease and angina[238, 272]. The roots are also used both internally and externally in the treatment of nosebleeds, haemorrhages from the lungs, digestive tract and uterus, and injuries[238]. The roots are harvested in the autumn, preferably from plants 6 - 7 years old, and can be used fresh or dried[238]. The flowers are used to treat vertigo and dizziness[238].

propta Seed - sow in a shady position in a cold frame preferably as soon as it is ripe, otherwise as soon as the seed is obtained. It can be very slow and erratic to germinate. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a shady position in the greenhouse or frame for at least their first winter. Make sure the pots are deep enough to accommodate the roots. Plant out into their permanent positions in late summer. Division in spring.

nwatta Requires a moist humus rich soil in a shady position in a woodland[200]. Plants are hardy to at least -15°C[238]. Nomenclature of this genus is rather confused with some botanists recognising *P. ginseng* as a variable plant that includes this species. Other botanists divide it into 4 or even 5 distinct species, giving this plant specific status. This plant has been grossly over-collected from the wild for its use as a medicinal plant and it is rapidly approaching extinction in most parts of its range[238]. The sub-species *P. pseudo-ginseng notoginseng*. (Burkill.)Hoo. and Tseng. is the form used medicinally in China[176], this plant is given a separate entry in this database[K].

## 6.2.554 Iris pseudacorus

Yellow Flag, Paleyellow iris  
5 tin 8 cyuc 1 kcaak 2 tcan 2 dwat 1.5 m hkuc  
hmimhtut cyutli tcuphja7nhs6s hwicli hrasljut hpa7tli flatprikliwis hpa7tmwatli fyfjxre7t hjonli

drutta Iris pseudacorus is a PERENNIAL growing to 1.5 m (5ft) by 2 m (6ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from May to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, hoverflies. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can grow in water. The plant can tolerate strong winds but not maritime exposure.

kcaakta Edible Parts: Edible Uses: CoffeeThe seed is said to make an excellent coffee substitute as long as it is well roasted[2, 7, 61, 105, 115, 244]. Caution is advised, it might be poisonous[177].

tcanta Dye Essential Ink TanninA beautiful yellow dye is obtained from the flowers[4]. A good black dye is obtained from the root if it is mixed with iron sulphate[4, 115]. It is brown otherwise[141]. The root is a source of tannin[61] and has been used in making ink[4]. A delicately scented essential oil, obtained from the roots, has been used to adulterate the oil of *Acorus calamus*[245].

dwatta Astringent Cathartic Emetic Emmenagogue OdontalgicThe fresh root is astringent, cathartic, emetic, emmenagogue and odontalgic[4, 7, 61]. A slice of the root held against an aching tooth is said to bring immediate relief[244]. It was at one time widely used as a powerful cathartic but is seldom used nowadays because of its extremely acrid nature[4]. It can also cause violent vomiting and diarrhoea[244]. When dried the root loses its acidity and then only acts as an astringent[4].

propta Seed - best sown as soon as it is ripe in a cold frame[4]. Stored seed should be sown as early in the year as possible in a cold frame. A period of cold stratification improves germination time and rates. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse or cold frame for their first year. Plant out into their permanent positions in late spring or early summer. Division in March or October. Early autumn is best[200]. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Landscape Uses:Container, Specimen. Prefers a humus rich soil[79]. Succeeds in water up to 15cm deep[24]. Requires a moist soil, especially in early summer. Prefers a position in semi-shade[188]. Plants can be grown in quite coarse grass, which can be cut annually in the autumn[233]. A delicately scented essential oil is obtained from the dried roots[245]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. Some named forms have been selected for their ornamental value[187]. Special Features: Attractive foliage, Not North American native, Invasive, Naturalizing, All or parts of this plant are poisonous, Wetlands plant, Attracts butterflies, Suitable for cut flowers. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [2-1].

## 6.2.555 Vaccinium smallii

5 tin 9 cyuc 1 kcaak 0 tcan 0 dwat 1.5 m hkuc  
hmimhtut cyutli tcup hwicli hrasljut hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta Vaccinium smallii is a deciduous Shrub growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked.[105, 177]. The fruit is about 6mm in diameter[200].

tcanta None known  
dwatta None known

propta Seed - sow late winter in a greenhouse in a lime-free potting mix and only just cover the seed[78]. Stored seed might require a period of up to 3 months cold stratification[113]. Another report says that it is best to sow the seed in a greenhouse as soon as it is ripe[200]. Once they are about 5cm tall, prick the seedlings out into individual pots and grow them on in a lightly shaded position in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 8cm with a heel, August in a frame[78]. Slow and difficult. Layering in late summer or early autumn[78]. Another report says that spring is the best time to layer[200]. Takes 18 months[78]. Division of suckers in spring or early autumn[113].

nwatta Requires a moist but freely-draining lime free soil, preferring one that is rich in peat or a light loamy soil with added leaf-mould[11, 200]. Prefers a very acid soil with a pH in the range of 4.5 to 6, plants soon become chlorotic when lime is present. Succeeds in full sun or light shade though it fruits better in a sunny position[200]. Requires shelter from strong winds[200]. Dislikes root disturbance, plants are best grown in pots until being planted out in their permanent positions[200]. Plants in this genus are notably resistant to honey fungus[200].

## 6.2.556 Spiraea pyramidata

Spirea  
5 tin 9 cyuc 1 kcaak 0 tcan 1 dwat 1 m hkuc  
hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

without the supervision of a skilled practitioner. Even normal doses can cause drowsiness whilst excess causes restlessness[238] and overdoses can cause death through cardiac paralysis[7, 9]. Some physicians believe that any effects of this medicine are caused by the mind of the patient rather than by the medicine[213]. The sap has also been applied externally in the treatment of warts[222]. A homeopathic remedy is made from the plant[9]. It is used in the treatment of chronic catarrh, coughs, swollen liver, flatulence and ailments of the urinary tract[9].

propta Seed - sow spring or autumn in situ and only just cover the seed. Germination is usually fairly quick.

nwatta Prefers a light sandy loam and a sunny position[1]. The wild lettuce is cultivated as a medicinal plant in many areas of Europe[4, 46, 61].

### 6.2.551 Spiraea nervosa angustifolia

5 tlin 9 cyuc 1 kcaok 0 tcan 0 dwat 1.5 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwattli xre7t hjonli

drutta Spiraea nervosa angustifolia is a deciduous Shrub growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcaakta Edible Parts: Edible Uses: TeaThe leaves are used as a tea[177, 183].

tcanta None known dwatta None known

propta Seed - we have no information for this species but suggest sowing the seed as soon as it is ripe in a cold frame if possible. It is likely to require stratification before it germinates, so stored seed should be sown in a cold frame as early in the year as you receive it. Prick out the seedlings into individual pots when they are large enough to handle, and grow them on in a cold frame for their first winter. Plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, July/August in a light sandy soil a frame. Cuttings of mature wood of the current seasons growth, 15cm long, October/November in an outdoor frame[200]. Another report says that September is a good time to do this[11]. Division of suckers in early spring[200]. They can be planted out straight into their permanent positions.

nwatta Tolerates most soils[200], but prefers a good loamy soil, abundant moisture and full sunlight[11, 200]. This species has not proved to be very hardy in Britain, it is often killed back to ground level in harsh winters but usually resprouts from the base[11]. Hybridizes freely with other members of this genus[11].

### 6.2.552 Paeonia delavayi

Tree Peony, Dian mu dan 5 tlin 9 cyuc 1 kcaok 0 tcan 3 dwat 1.6 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfripr hpa7tli flatprikliwissip hpa7tmwattli fyfxre7t hjonli

drutta Paeonia delavayi is a deciduous Shrub growing to 1.6 m (5ft) by 3 m (9ft). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: FlowersEdible Uses: The following use is for *P. suffruticosa*. It quite probably also applies to this closely-related species.[K - see 214]. Flowers - cooked[46, 61, 177]. The fallen flower petals are parboiled and sweetened for a teatime delicacy, or can be cooked in various dishes[183].

tcanta None known

dwatta Analgesic Antibacterial Antiinflammatory Antispasmodic Cholera DysenteryThe bark obtained from the

root has an antimicrobial effect upon various bacteria, including *Escherichia coli*, typhoid, cholera, *Staphylococcus aureus*, streptococcus hemolyticus and *Pneumococci*[250]. The root is also anti-inflammatory and has been used with success in the treatment of arthritic joint swelling[250]. The root is also analgesic, sedative and anticonvulsant, it has a high success rate in the treatment of dysentery and can also be used to treat allergic rhinitis[250]. The plant is used internally in the treatment of fevers, boils, menstrual disorders, nosebleeds, ulcers, irritability and gastro-intestinal infections[238]. This remedy should only be used under the supervision of a qualified practitioner[238]. The herb acts as a synergist when used with liquorice (*Glycyrrhiza spp*) [218]. A tea made from the dried crushed petals of various peony species has been used as a cough remedy, and as a treatment for haemorrhoids and varicose veins[250].

propta Seed - best sown as soon as it is ripe in a cold frame[250]. When sown fresh, the seed produces a root about 6 weeks after sowing with shoots formed in the spring[200]. Stored seed is much slower, it should be sown as soon as possible in a cold frame but may take 18 months or more to germinate[200]. The roots are very sensitive to disturbance, so many growers allow the seedlings to remain in their pots for 2 growing seasons before potting them up. This allows a better root system to develop that is more resilient to disturbance[250]. If following this practice, make sure you sow the seed thinly, and give regular liquid feeds in the growing season to ensure the plants are well fed. We usually prick out the seedlings into individual pots as soon as they are large enough to handle, and then grow them on in a cold frame for at least two growing seasons before planting them out when they are in growth in the spring[K].

nwatta An easily grown and undemanding plant[250], it prefers a deep rich soil, preferably neutral or slightly alkaline[1], doing quite well in sun or light shade[1]. Prefers a limy soil and a sheltered position[200]. Grows well in heavy clay soils and on chalk[184].Plants are tolerant of a wide range of soil conditions, but will not survive if the soil becomes waterlogged or is too dry[250]. Plants grown on sandy soils tend to produce more leaves and less flowers, whilst those growing on clay take longer to become established but produce better blooms[250]. Hardy to about -20°C[184], plants do better in the north of Britain than they do in the south and are generally best if given an open northerly aspect[11]. A very ornamental and long-lived plant[1], it grows rapidly and produces lots of lateral shoots[250]. It grows best in areas with long hot summers[1] and requires an airy position because it is very subject to fungal attack[11]. Plants in this genus are notably susceptible to honey fungus[200]. This species comes into growth early in the year but unlike *P. suffruticosa* it does not seem to be subject to damage by late frosts[11]. It is probably best still given a position sheltered from the early morning sun. The branches are brittle and very subject to wind damage, especially when young[200]. This species is closely related to *P. lutea*[11]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. A very greedy plant inhibiting the growth of nearby plants, especially legumes. The plant does not really need much pruning apart from removing dead or diseased stems. It is, however, very tolerant of pruning and can be cut right back to ground level if it requires rejuvenation[200]. Strongly resents root disturbance, taking some time to recover after being divided[1]. Peony species are usually self-fertile, though they will also hybridise with other species if these flower nearby at the same time[250]. This species will often self-sow freely when well sited[250]. Plants take 4 - 5 years to flower from seed[200]. They generally breed true from seed[1]. Cultivated in China as a medicinal plant[214].

### 6.2.553 Panax pseudoginseng

Ginseng, Japanese ginseng 5 tlin 9 cyuc 1 kcaok 0 tcan 3 dwat 1 m hkuc pcmhmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwattli xre7t hjonli

drutta Panax pseudoginseng is a PERENNIAL growing to 1 m (3ft 3in) by 0.7 m (2ft 4in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline)

to obtain nutrients from decaying material in the soil[200]. It is best to use some of the soil that is growing around established plants in order to introduce the fungus, or to sow the seed around a plant of the same species and allow the seedlings to grow on until they are large enough to move. This species only rarely forms new offsets and so division is seldom feasible, the following methods can be tried, however[230]. Division of the tubers as the flowers fade[230]. This species produces a new tuber towards the end of its growing season. If this is removed from the plant as its flowers are fading, the shock to the plant can stimulate new tubers to be formed. The tuber should be treated as being dormant, whilst the remaining plant should be encouraged to continue in growth in order to give it time to produce new tubers[230]. Division can also be carried out when the plant has a fully developed rosette of leaves but before it comes into flower[230]. The entire new growth is removed from the old tuber from which it has arisen and is potted up, the cut being made towards the bottom of the stem but leaving one or two roots still attached to the old tuber. This can often be done without digging up the plant. The old tuber should develop one or two new growths, whilst the new rosette should continue in growth and flower normally[230].

nwatta Plants can be grown in a lawn, but the lawn must not be cut until the plants have set seed[200]. Orchids are, in general, shallow-rooting plants of well-drained low-fertility soils. Their symbiotic relationship with a fungus in the soil allows them to obtain sufficient nutrients and be able to compete successfully with other plants. They are very sensitive to the addition of fertilizers or fungicides since these can harm the symbiotic fungus and thus kill the orchid[230]. This symbiotic relationship makes them very difficult to cultivate, though they will sometimes appear uninvited in a garden and will then thrive. Transplanting can damage the relationship and plants might also thrive for a few years and then disappear, suggesting that they might be short-lived perennials[230]. The flowers resemble a female insect and also emit a scent similar to female pheromones, they are pollinated by a male insect of that species attempting to copulate with the flower[200]. Plants are rather sparingly visited by bees and flies, setting seed only if visited[17]. Tubers should be planted out whilst they are dormant, this is probably best done in the autumn[200]. They should be planted at least 5cm below soil level[200].

### 6.2.409 Adenophora nikoensis

5 tlin 9 cyuc 2 kcaok 0 tcan 0 dwat 0.3 m hkuc htut cyutli tcup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwattli xre7t hjonli

drutta Adenophora nikoensis is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from August to September, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcaakta Edible Parts: Leaves RootEdible Uses: Root-cooked[105, 177]. Best if boiled in two lots of water, it then makes excellent eating[179]. Leaves and young shoots - cooked[105, 177, 179].

tcanta None known dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe[200]. The seed can also be sown in spring. Surface sow 2 - 3 seeds per pot in the spring in order to avoid transplanting[133]. We have found that if transplanted when very small seedlings grow away without difficulty[K]. Germinates in 1 - 3 months at 10°C[133]. Plant out into their permanent positions whilst young. Basal cuttings in spring[K]. Division in spring - very difficult because the plant dislikes root disturbance[1]..

nwatta Prefers a light rich slightly alkaline soil that is not too dry, and a warm sunny position[1, 200]. Plants are intolerant of root disturbance[1]. A polymorphic species[58]. *Adenophora nikoensis* is sometimes separated into two different species, in which the plant with calyx lobes serrate is named *A. nipponica* and that with entire ones as *A. nikoensis*. These two forms, however, are often observed in the

same place and cannot really be separated[275]. The young growth is extremely attractive to slugs, they have been known to destroy even mature plants[K].

### 6.2.410 Tanacetum parthenium

Feverfew, Matricaria 5 tlin 8 cyuc 2 kcaok 2 tcan 5 dwat 0.6 m hkuc htut cyutli kyuctup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwattli fyfxre7t hjonli

drutta Tanacetum parthenium is a PERENNIAL growing to 0.6 m (2ft) by 0.3 m (1ft in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerates strong winds but not maritime exposure.

kcaakta Edible Parts: Edible Uses: Condiment TeaThe dried flowers are used as a flavouring in cooking certain pastries[177, 183]. The plant is used in cooking to impart a deliciously aromatic bitter taste to certain foods[7]. A tea is made from the dried flowers[183].

tcanta Essential RepellentThe dried flower buds are a source of an insecticide. They are said to have the same properties as pyrethrum (obtained mainly from *T. cinerariifolia*) [61, 100, 201]. Steep 1 cupful of the dried flowers in one litre of hot soapy water for an hour. Strain, then allow to cool slightly before use[201]. An essential oil from the plant is used in perfumery[7].

dwatta Antiechymotic Antiinflammatory Antirheumatic Antispasmodic Aperient Bitter Crminative Emmenagogue Sedative Stimulant Stings Stomachic Vasodilator Vermifuge-Feverfew has gained a good reputation as a medicinal herb and extensive research since 1970 has proved it to be of special benefit in the treatment of certain types of migraine headaches and rheumatism[238, K]. It is also thought of as a herb for treating arthritis and rheumatism[254]. The leaves and flowering heads are anti-inflammatory, antispasmodic, aperient, bitter, crminative, emmenagogue, sedative, stimulant, stings, stomachic, vasodilator and vermifuge[4, 7, 21, 36, 46, 53, 100, 165]. The plant is gathered as it comes into flower and can be dried for later use[7]. Use with caution[165], the fresh leaves can cause dermatitis and mouth ulcers if consumed[238]. This remedy should not be prescribed for pregnant women[238]. A tea made from the whole plant is used in the treatment of arthritis, colds, fevers etc. It is said to be sedative and to regulate menses[222, 238]. An infusion is used to bathe swollen feet[257]. Applied externally as a tincture, the plant is used in the treatment of bruises etc[7]. Chewing 1 - 4 leaves per day has proven to be effective in the treatment of some migraine headaches[222].

propta Seed - sow spring in a greenhouse. Only just cover the seed and do not allow the pot to dry out. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in early summer, after the last expected frosts. If you have sufficient seed it can be sown outdoors in situ during the spring. Plants usually self-sow freely and so, once you have the plant, further sowing is usually unnecessary[K]. Division in spring. Since the plants are quite short-lived, this method is not really very serviceable[K].

nwatta Landscape Uses:Border, Container, Foundation, Massing, Rock garden. A very easily grown plant, it succeeds in an ordinary garden soil[1]. Thrives in any kind of soil[7], plants can even be grown in walls[219]. Often grown in the flower garden, feverfew is a short lived perennial but usually self-sows prolifically[7, K]. There are many named varieties selected for their ornamental value[238]. The cultivar 'Golden' (syn 'Yellow') has yellow tinted leaves[183]. The leaves have a refreshing aromatic aroma[245]. Special Features:Attractive foliage, Edible, Fragrant foliage, Not North American native, Attracts butterflies, Suitable for cut flowers, Suitable for dried flowers. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for

their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

### 6.2.411 Calamintha grandiflora

Large-Flowered Calamint

5 tlin 8 cyuc 2 kcaak 0 tcan 2 dwat 0.6 m hkuc hmimhtut cyutli hगत्युctup hwicli hrasjlut hpa7tli flatprikliws hpa7tmwatli xre7t hjonli

drutta Calamintha grandiflora is a PERENNIAL growing to 0.6 m (2ft) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to September, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Edible Uses: Condiment TeaA sweet and aromatic herb tea is made from the leaves[183]. Very refreshing. The leaves are harvested as the plant comes into flower and are dried for later use[244]. Leaves - used as a flavouring. A pleasant mint-like fragrance and flavour[183].

tcanta Plants can be used for ground cover, planted about 45cm apart each way they form spreading clumps[208].

dwatta Aromatic Diaphoretic ExpectorantThe leaves are aromatic, diaphoretic and expectorant[244]. An infusion is used in the treatment of jaundice, nervous complaints, convulsions and cramps[244]. A warm poultice of the leaves may help soothe bruises and rheumatic pains[244].

propta Seed - sow spring in a greenhouse. Only just cover the seed. Germination usually takes place within 2 weeks at 21°C. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse. Plant them out into their permanent positions in the summer if they are large enough, otherwise plant them out the following spring. The seed can also be sown outdoors in a dry soil in April[244]. Division in spring or autumn[244]. Very easy, larger clumps can be planted direct into their permanent positions. It is best to pot up smaller clumps and grow them on in a cold frame until they are well rooted before planting them out in the summer. Basal cuttings in May or June[244]. They should be rooted in a sandy compost[245]. Harvest the shoots when they are about 10 - 15cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Landscape Uses:Border, Ground cover, Rock garden, Woodland garden. Prefers a well-drained soil and a sunny position[208]. Succeeds in any good soil in sun or partial shade[187]. Established plants are drought tolerant[190], preferring a soil on the dry side[208]. The plant is pleasantly fragrant when bruised[187]. The flowers have a delicious minty scent[245]. Plants often self-sow in gardens if they are well-sited[208]. Special Features: Attractive foliage, Edible, Fragrant foliage, Not North American native, Invasive, Suitable for dried flowers.

### 6.2.412 Monarda citriodora

Lemon Bergamot, Lemon beebalm, Lemon Mint

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 0.6 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliws hpa7tmwatli fyfjxre7t hjonli

drutta Monarda citriodora is a ANNUAL/PERENNIAL growing to 0.6 m (2ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Condi- ment TeaLeaves - raw or cooked. They are used as a flavouring in salads and cooked foods[46, 105, 161, K] and also as a tea[183]. They have a pleasant lemon flavour[238].

tcanta Essential RepellentAn essential oil in the leaves contains a phenol and a citral[4]. No more information is given, though the oil is likely to have medicinal activity and perhaps be suitable for perfumery etc[K]. The essential oil citronellal, used as an insect repellent and in perfumery, is obtained from this plant[274].

dwatta None known  
propta Seed - sow mid to late spring in a cold frame. Germination usually takes place within 10 - 40 days at 20°C. When large enough to handle, prick the seedlings out into individual pots and plant them out into their permanent positions in early summer. The seed can also be sown in situ in late summer in areas where the winters are not too severe and will produce larger plants. Cuttings of soft basal shoots in spring. Harvest the shoots with plenty of underground stem when they are about 8 - 10cm above the ground. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer. Division in spring or autumn.

nwatta Landscape Uses:Border, Massing, Specimen. An easily grown plant, succeeding in ordinary garden soil so long as it is not too dry[1]. Requires a moist soil and a sunny position[1, 200]. Likes some shade. Prefers a sandy rather acidic soil[200]. This species is closely related to *M. pectinata*[235]. Said to be a perennial in some books and an annual in others, it has acted as an annual with us so far[K]. A good bee plant[200]. Subject to mildew in dry summers[200]. Special Features: Attracts birds, North American native, Edible, Fragrant foliage, Attracts butterflies.

### 6.2.413 Cerastium fontanum

Chickweed, Common mouse-ear chickweed, Big chickweed  
5 tlin 10 cyuc 2 kcaak 0 tcan 0 dwat 0.3 m hkuc hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliws hpa7tmwatli xre7t hjonli

drutta Cerastium fontanum is a ANNUAL/PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from April to June, and the seeds ripen from May to July. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked[177]. Leaves and young stems - cooked[105].

tcanta None known  
dwatta None known  
propta Seed - we have no information on this species but suggest sowing the seed in spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out into their permanent positions in the summer. Division in spring might be possible.

nwatta We have very little information on this species and do not know if it will be hardy in Britain, though judging by its native range it should succeed outdoors in many parts of this country. The subspecies *C. fontanum grandiflorum* is an annual, though subspecies *C. fontanum vulgare* is a short-lived perennial[266]. It is likely to require a moist soil in light shade.

### 6.2.414 Podophyllum hexandrum

Himalayan May Apple

5 tlin 9 cyuc 2 kcaak 0 tcan 4 dwat 0.5 m hkuc pcmhmim cyutli tcup hwicli hrasjlut hpa7tli flatprikliws hpa7tmwatli dyatxre7t hjonli

drutta Podophyllum hexandrum is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from May to June, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs). The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained

kcakta Edible Parts: LeavesEdible Uses: Young leaves - cooked[177]. Some caution is advised, see the notes above on toxicity.

tcanta None known  
dwatta None known  
propta Seed - best sown as soon as it is ripe in a cold frame[164, 200]. Sow stored seed as soon as it is obtained in a cold frame. Pre-soak the seed for 12 hours in warm water and remove as much of the tail and outer coat as possible[164]. A period of cold stratification is beneficial[164]. The seed germinates in 1 - 9 months or more at 20°C[164]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for the first winter. Plant out in late spring or early summer, after the last expected frosts. Internodal cuttings of soft to semi-ripe wood, late spring in sandy soil in a frame[200]. Layering of old stems in late winter or early spring[200]. Layering of current seasons growth in early summer[200].

nwatta Prefers a deep moist soil with its roots in the shade and its shoots growing up to the light[164]. Dislikes poorly-drained heavy clay soils, but grows well in clay if grit is added for drainage[11, 200]. Dislikes light sandy soils[11]. Does well on chalk[11]. Succeeds in acid as well as alkaline soils[200]. A twining plant[182], the stems will often die right back in the winter[273]. The leafstalks wrap themselves around twigs and branches for support. When a side of the stalk touches an object, the growth on that side slows down whilst the other side grows at its normal rate - this causes the leaf stalk to entwine the object it is touching[212]. Flowers are formed from lateral buds produced the previous season. Any pruning should consist of removing any dead or weak growth in early spring and reducing the remainder down to the strongest pair of lateral buds[273]. Plants in this genus are notably resistant to honey fungus[200]. When planting out, in order to avoid the disease 'clematis wilt', it is best to plant the rootball about 8cm deeper in the soil. This will also serve to build up a good root crown of growth buds[200]. Plants seem to be immune to the predations of rabbits[233]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

### 6.2.548 Vaccinium hirtum

5 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 1 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta Vaccinium hirtum is a deciduous Shrub growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. The seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105, 177]. The fruit is about 7mm in diameter[200].

tcanta None known  
dwatta None known  
propta Seed - sow late winter in a greenhouse in a lime-free potting mix and only just cover the seed[78]. Stored seed might require a period of up to 3 months cold stratification[113]. Another report says that it is best to sow the seed in a greenhouse as soon as it is ripe[200]. Once they are about 5cm tall, prick the seedlings out into individual pots and grow them on in a lightly shaded position in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 8cm with a heel, August in a frame[78]. Slow and difficult. Layering in late summer or early autumn[78]. Another report says that spring is the best time to layer[200]. Takes 18 months[78]. Division of suckers in spring or early autumn[113].

nwatta Requires a moist but freely-draining lime free soil, preferring one that is rich in peat or a light loamy soil with added leaf-mould[11, 200]. Prefers a very acid soil with a pH in the range of 4.5 to 6, plants soon become chlorotic when lime is present. Succeeds in full sun or light shade though it fruits better in a sunny position[200]. Requires shelter from strong winds[200]. Dislikes root disturbance, plants are best grown in pots until being planted out in their

permanent positions[200]. Plants in this genus are notably resistant to honey fungus[200].

### 6.2.549 Potentilla bicolor

5 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 1 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliws hpa7tmwatli fyfjxre7t hjonli

drutta Potentilla bicolor is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Root - cooked[61].

tcanta None known  
dwatta None known  
propta Seed - sow early spring or autumn in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. This is a hybrid species and it will not come true from seed. Division in spring. Larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta An easily grown plant, succeeding in a well-drained loam, preferring a position in full sun but tolerating shade[1]. It prefers an alkaline soil but tolerates a slightly acid soil[200]. Members of this genus are rarely if ever troubled by browsing deer[233].

### 6.2.550 Lactuca virosa

Wild Lettuce, Bitter lettuce

5 tlin 9 cyuc 1 kcaak 0 tcan 3 dwat 1.8 m hkuc htut cyutli tcup hwicli hrasjlut hpa7tli flatprikliws hpa7tmwatli xre7t hjonli

drutta Lactuca virosa is a ANNUAL/BIENNIAL growing to 1.8 m (6ft). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from July to September, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Leaves OilEdible Uses: OilLeaves - raw or cooked[52]. Very tender[5]. Caution is advised, see the notes above on toxicity. A mild flavoured oil, used in cooking, is obtained from the seeds[4].

tcanta OilNone known  
dwatta Anodyne Antispasmodic Digestive Homeopathy Hypnotic Narcotic Sedative Tonic UrinaryThe whole plant is rich in a milky sap that flows freely from any wounds. This hardens and dries when in contact with the air[4]. The sap contains 'lactucarium', which is used in medicine for its anodyne, antispasmodic, digestive, diuretic, hypnotic, narcotic and sedative properties[9, 21, 46, 165, 192, 213, 238]. Lactucarium has the effects of a feeble opium, but without its tendency to cause digestive upsets[4], nor is it addictive[7]. It is taken internally in the treatment of insomnia, anxiety, neuroses, hyperactivity in children, dry coughs, whooping cough, rheumatic pain etc[238]. Concentrations of lactucarium are low in young plants and most concentrated when the plant comes into flower[238]. It is collected commercially by cutting the heads of the plants and scraping the juice into china vessels several times a day until the plant is exhausted[4]. This species is probably the richest supply of lactucarium[4]. The plant also contains 'hyoscyamine', a powerful depressant of the parasympathetic nervous system[213]. An infusion of the fresh or dried flowering plant can also be used[9]. The plant should be used with caution, and never

hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Sabatia angularis is an ANNUAL/BIENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Edible Uses: TeaA tonic tea is obtained from the plant[4, 61]. The part of the plant is not specified.

tcanta None known

dwatta Antiperiodic TonicAntiperiodic, tonic[4, 61]. Used as a bitter stomachic, similar in its action to *Gentiana lutea*[207]. An infusion of the plant has been used to treat period pains[257].

propta Seed - best sown as soon as it is ripe in late summer or early autumn. Sow in a peaty soil in a moist shady border or sow in pots in a shady part of the cold frame and keep the soil moist by standing the pot in 2 - 3cm of water[1].

nwatta Requires a moist soil[200]. This species provides an excellent cut flower[200].

## 6.2.545 Ephedra intermedia

Zhong Ma Huang

5 tlin 9 cyuc 1 kcaak 0 tcan 4 dwat 1 m hkuc

htut cyutli hgatkyuctcup hwicli hrasljut hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Ephedra intermedia is an evergreen Shrub growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). . The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. The fruit is about 7mm in diameter[200].

tcanta None known

dwatta Antiasthmatic Antidote Antihydrotic Diaphoretic Diuretic Vasoconstrictor VasodilatorMembers of this genus contain various medicinally active alkaloids (but notably ephedrine) and they are widely used in preparations for the treatment of asthma and catarrh[238]. Ephedrine has a similar effect to adrenaline in the body[176]. It acts promptly to reduce swellings of the mucous membranes and has antispasmodic properties, thus making it valuable in the treatment of asthma[4]. This species contains between 0.7 and 2.33% alkaloids, of which 10% is ephedrine[240]. The whole plant can be used at much lower concentrations than the isolated constituents - unlike using the isolated ephedrine, using the whole plant rarely gives rise to side-effects[254]. The plant also has antiviral effects, particularly against influenza[238]. The stems are a pungent, bitter, warm herb that dilates the bronchial vessels whilst stimulating the heart and central nervous system[238]. The stems are also antidote, diaphoretic, diuretic, vasoconstrictor and vasodilator[176, 238]. They are used internally in the treatment of asthma, hay fever and allergic complaints[238]. They are also combined with a number of other herbs and used in treating a wide range of complaints[238]. This herb should be used with great caution, preferably under the supervision of a qualified practitioner[238]. It should not be prescribed to patients who are taking monoamine oxidase inhibitors, or suffering from high blood pressure, hyperthyroidism or glaucoma[238]. Ephedrine is seen as a performance-boosting herb and, as such, is a forbidden substance in many sporting events such as athletics[K]. The stems can be harvested at any time of the year and are dried for later use[238]. The root is antihydrotic, it lowers blood pressure and dilates the peripheral blood vessels[176]. It is used in the treatment of night sweating and spontaneous sweating[176].

propta Seed - best sown as soon as it is ripe in the autumn in a greenhouse[200]. It can also be sown in spring in a greenhouse in a sandy compost[K]. Prick out the seedlings

into individual pots as soon as they are large enough to handle and grow them on for at least their first winter in a greenhouse. Plant out in the spring or early summer after the last expected frosts and give some protection in their first winter[K]. Division in spring or autumn[238]. Layering.

nwatta Requires a well-drained loamy soil and a sunny position[11]. Established plants are drought resistant and are also lime tolerant[146]. Dioecious. Male and female plants must be grown if seed is required. Some forms are monoecious[11].

## 6.2.546 Crinum bulbispermum

Hardy swamplily

5 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 1 m hkuc

htut cyutli tcup hwicli hrasljut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Crinum bulbispermum is a BULB growing to 1 m (3ft 3in) by 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Root?? A number of species in this genus have edible bulbs. Although no records have been seen for this species, it is fairly hardy in Britain and the root can be as large as a football. It is worthy of investigation[K].

tcanta None known

dwatta None known

propta Seed - best sown as soon as it is ripe, placing 2 - 3 seeds in individual pots in a greenhouse. Do not cover the seed. Sow stored seed April/May in a warm greenhouse. Once they have germinated, you can thin each pot to just one plant if required, though we have not found this to be necessary. Give an occasional liquid feed to ensure that the plants do not suffer nutritional deficiencies. Grow them on in the greenhouse for at least their first 2 years, planting them out into their permanent positions in the spring. Division of offsets in April/May or in September. When divided in the spring, the bulbs can be planted out direct into their permanent positions, if done in September, however, they should be potted up and overwintered in the greenhouse.

nwatta Easily grown in a moist soil or the garden border[90]. Requires a rich well-drained soil in a warm sheltered sunny position[188]. Plants are only hardy in the milder areas of the country, tolerating temperatures down to about -10°C[90]. It is probable that the plants may require winter protection with dry leaves or bracken[90]. Bulbs are sensitive to transplanting and may take several years to establish[200]. After this, they will usually reproduce rapidly from offsets to produce the overcrowded conditions that stimulate them to flower freely[200]. The bulbs should be planted with their necks above soil level[233]. This conflicts with another report which says that they should be planted quite deeply in the soil[1]. Only plant out good sized bulbs and do so at the end of May[1]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. The flowers emit a sweet, somewhat spicy odour which is especially pronounced at nightfall[245].

## 6.2.547 Clematis brachyura

5 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 1 m hkuc

hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatpriklwisslip hpa7tmwatli xre7t hjonli

drutta Clematis brachyura is a deciduous Climber growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw. It must only be eaten when it is fully ripe[1, 2, 61, 105]. Juicy but insipid[130]. The fruit is about 5cm long[200]. The leaves are edible according to one report but this must be treated with some caution, see notes on toxicity above[183].

tcanta A medicinal resin is obtained from the plant. It is extracted with alcohol[64].

dwatta Antirheumatic Cancer Cholagogue Cytostatic PurgativeThe whole plant, but especially the root, is cholagogue, cytostatic and purgative. The plant contains podophyllin, which has an antimiotic effect (it interferes with cell division and can thus prevent the growth of cells). It is, therefore, a possible treatment for cancer, and has been used especially in the treatment of ovarian cancer[46, 51, 57, 64, 65, 124, 244]. However, alopecia is said to be a common side-effect of this treatment[244]. This species contains about twice the quantity of active ingredient than *P. peltatum*[211]. The roots contain several important anti-cancer lignans, including podophyllin and berberine[218]. The roots are also antirheumatic[218]. The root is harvested in the autumn and either dried for later use or the resin is extracted[238]. This plant is highly poisonous and should only be used under the supervision of a qualified practitioner[238]. It should not be prescribed for pregnant women[238].

propta Seed - best sown as soon as it is ripe in a cold frame. Sow stored seed in a cold frame in early spring. The seed germinates in 1 - 4 months at 15°C. Prick out the seedlings into individual pots when they are large enough to handle and grow on in a shady part of the greenhouse for at least 2 growing seasons. Plant them out into their permanent positions in the winter when the plants are dormant. Division in March/April[111].

nwatta Prefers a moist peaty soil and filtered light or shade[111, 187]. Grows well in a moist open woodland[28, 31, 200]. Hardy to about -20°C[187], it takes some years to become established[124] but is very long lived in a suitable habitat[130]. Young leaves may be damaged by late frosts but otherwise the plants are quite hardy[130]. Over collection of the plant from the wild is becoming a cause for concern as local populations are being endangered[272]. Young plants only produce one leaf each year, older plants have 2 or 3 leaves each year[211]. Plants in this genus have excited quite a lot of interest for the compounds found in their roots which have been shown to have anti-cancer activity[124]. There are various research projects under way (as of 1990)[124]. The sub-species *P. hexandrum chinense*. Wall. has larger flowers and more deeply divided leaves[187].

## 6.2.415 Asclepias ovalifolia

Oval-leaf milkweed

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 0.6 m hkuc

hmimhtut cyutli kyuctcup hwicli hrasljut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Asclepias ovalifolia is a PERENNIAL growing to 0.6 m (2ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects, Lepidoptera (Moths and Butterflies). It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Flowers Leaves Oil Seed SeedpodEdible

Uses: Gum Oil Oil SweetenerThe following reports refer to the closely related *A. syriaca*, and are probably also appropriate for this species[K]. Unopened flower buds - cooked. They taste somewhat like peas. They are used like broccoli[183]. Flowers and young flower buds - cooked. Used as a flavouring and a thickener in soups etc[55, 102]. The flower clusters can be boiled down to make a sugary syrup[2, 85]. The flowers are harvested in the early morning with the dew still on them[95]. When boiled up it makes a brown sugar[95]. Young shoots - cooked. An asparagus substitute[2, 4, 43, 55, 62, 95, 183]. They should be used when less than 20cm tall[159]. A slightly bitter taste[159]. Tips of

older shoots are cooked like spinach[85, 183]. Young seed pods, 3 - 4 cm long, cooked[2, 43, 55, 85]. They are very appetizing. Best used when about 2 - 4cm long and before the seed floss forms, on older pods remove any seed floss before cooking them[85, 159]. If picked at the right time, the pods resemble okra[183]. The sprouted seeds can be eaten[183]. An edible oil is obtained from the seed[55, 171]. The latex in the stems is made into a chewing gum[46, 61]. It is found mainly in the leaves and is destroyed by frost[112]. Yields are higher on dry soils[112].

tcanta Fibre Gum Latex Oil Oil Pollution Stuffing Wick-The following reports refer to the closely related *A. syriaca*, and are probably also appropriate for this species[K]. A good quality fibre is obtained from the bark and is used in making twine, cloth, paper etc[95, 112, 169]. It is of poor quality in wet seasons[112]. It is easily harvested in late autumn after the plant has died down by simply pulling the fibres off the dried stems[169]. The seed floss is used to stuff pillows etc or is mixed with other fibres to make cloth[112, 159, 169, 171]. It is a Kapok substitute, used in Life Jackets or as a stuffing material[112]. Very water repellent, it can yield up to 550 kilos per hectare[112]. The floss has also been used to mop up oil spills at sea. Candlewicks can be made from the seed floss[112, 207]. Rubber can be made from latex contained in the leaves and the stems[46, 57, 102, 159]. It is found mainly in the leaves and is destroyed by frost[112]. Yields are higher on dry soils[112]. Pods contain an oil and a wax which are of potential importance. The seed contains up to 20% of an edible semi-drying oil[74, 112]. It is also used in making liquid soap[74].

dwatta None known

propta Seed - best sown in a greenhouse as soon as it is ripe in the autumn or in late winter[134, 169]. We have also had good results from sowing the seed in the greenhouse in early spring[K], though stored seed might need 2 - 3 weeks cold stratification[134]. Germination usually takes place in 1 - 3 months at 18°C[134]. As soon as the seedlings are large enough to handle, prick them out into individual pots and grow them on in the greenhouse for their first winter. Plant out when they are in active growth in late spring or early summer and give them some protection from slugs until they are growing away strongly. Division in spring. With great care since the plant resents root disturbance. Pot the divisions up and place them in a lightly shaded position in the greenhouse until they are growing away strongly, then plant them out in the summer, giving them some protection from slugs until they are established.. Basal cuttings in late spring. Use shoots about 10cm long with as much of their white underground stem as possible. Pot them up individually and place them in a lightly shaded position in a greenhouse until they are rooting and growing actively. If the plants grow sufficiently, they can be put into their permanent positions in the summer, otherwise keep them in the greenhouse until the following spring and when they are in active growth plant them out into their permanent positions. Give them some protection from slugs until they are established.

nwatta Succeeds in any good soil[187]. Prefers a well-drained light rich or peaty soil[1, 200]. Requires a moist peaty soil and a sunny position[111, 134]. This species is closely related to *A. syriaca*[200]. A good bee plant[50, 74]. The flower of many members of this genus can trap insects between its anther cells, the struggles of the insect in escaping ensure the pollination of the plant[207]. Many members of this genus seem to be particularly prone to damage by slugs. The young growth in spring is especially vulnerable, but older growth is also attacked and even well-established plants have been destroyed in wet years[K]. Plants resent root disturbance and are best planted into their final positions whilst small[134].

## 6.2.416 Lamium album

White Dead Nettle

5 tlin 9 cyuc 2 kcaak 3 tcan 3 dwat 0.6 m hkuc

hmimhtut cyutli tcup hwicli hrasljutnyikrip hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Lamium album is a PERENNIAL growing to 0.6 m (2ft) by 1 m (3ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from May to December, and the seeds ripen from July to December. The species is hermaphrodite (has

both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: TeaYoung leaves - raw or cooked[2, 5, 7, 13, 54]. They can be added to salads or mixed with other leaves and cooked as a potherb[183]. They can also be dried for later use[12]. The leaves are a good source of vitamin A[240]. A pleasant herb tea is made from the flowers[238].

tcanta The plant has a creeping rootstock and makes a good groundcover plant for woodland edges[24].

dwatta Antiflatulent Antispasmodic Astringent Cancer Chologogue Depurative Diuretic Expectorant Homeopathy Hypnotic Ophthalmic Pectoral Resolvent Sedative Styptic Tonic Vasoconstrictor VulneraryWhite dead nettle is an astringent and demulcent herb that is chiefly used as a uterine tonic, to arrest inter-menstrual bleeding and to reduce excessive menstrual flow. It is a traditional treatment for abnormal vaginal discharge and is sometimes taken to relieve painful periods[254]. The flowering tops are antispasmodic, astringent, chologogue, depurative, diuretic, expectorant, haemostatic, hypnotic, pectoral, resolvent, sedative, styptic, tonic, vasoconstrictor and vulnerary[4, 7, 9, 13, 21, 46, 61, 165, 238, 240]. An infusion is used in the treatment of kidney and bladder complaints[9], diarrhoea, menstrual problems, bleeding after childbirth, vaginal discharges and prostatitis[238, 254]. Externally, the plant is made into compresses and applied to piles, varicose veins and vaginal discharges[7, 238, 254]. A distilled water from the flowers and leaves makes an excellent and effective eye lotion to relieve ophthalmic conditions[7]. The plant is harvested in the summer and can be dried for later use[9]. A homeopathic remedy is made from the plant[9]. It is used in the treatment of bladder and kidney disorders and amenorrhoea[9].

propta Seed - this species usually self sows freely and should not require human intervention. When required it can be sown in situ as soon as it is ripe. Division in spring. Division succeeds at almost any time in the growing season[K]. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Landscape Uses:Ground cover. A very easily grown plant, it tolerates most soils and conditions[200]. Grows well in heavy clay soils. Prefers a sunny position, though it also does well in partial shade[238]. Plants are hardy to about -25°c[187]. The white dead nettle is too weedy to be grown in the flower garden, but it does well in the wild garden and self-sows when well sited[200]. Plants seem to be immune to the predations of rabbits[233]. A good bee plant[4, 24] and a good companion plant, helping any vegetables growing nearby[14, 18]. Special Features: Attractive foliage, Invasive, Suitable for cut flowers. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [2-1].

### 6.2.417 Mimulus guttatus

Yellow Monkey Flower; Seep monkeyflower
5 tlin 9 cyuc 2 kcak 0 tcan 2 dwat 0.6 m hkuc hmimhmtt cyutli tcuphja7nhs6s hwicli hrasjlutnyikfrip hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta Mimulus guttatus is a PERENNIAL growing to 0.6 m (2ft) by 0.6 m (2ft in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to September. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can grow in water.

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked[94, 105, 155, 172]. A slightly bitter flavour; they are added to salads[161, 183]. The leaves are used as a lettuce substitute[257].

tcanta None known

dwatta Astringent Bach Poultice VulneraryThe plant is astringent, poultice and vulnerary[94, 172, 257]. A decoction of the leaves and stems has been used as a herbal steam bath for chest and back soreness[257]. A poultice of the crushed leaves has been applied to wounds, rope burns etc[257]. The plant is used in Bach flower remedies - the keywords for prescribing it are 'Fear or anxiety of a known origin'[209].

propta Seed - sow spring in a greenhouse and only lightly cover the seed[200]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. If you have sufficient seed it can also be sown in situ in late spring after the last expected frosts[200]. Division in spring[200]. Very easy, large divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer. Cuttings of softwood, 5cm long in spring or summer[200].

nwatta Prefers rather moist places such as damp borders, margins of streams and boggy spots[1, 111]. Grows well in heavy clay soils. Thrives in full sun so long as the soil does not dry out[200], otherwise it is best grown in partial shade[187]. Grows well in shallow water, but it can be invasive[200]. Hardy to at least -20°c[187]. There is some confusion over the naming of this plant, the entry on edibility may refer to *M. luteus*, which is closely related to this species.

### 6.2.418 Fragaria nubicola

Indian Strawberry

5 tlin 9 cyuc 2 kcak 0 tcan 1 dwat 0.2 m hkuc hmimhmtt cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Fragaria nubicola is a PERENNIAL growing to 0.2 m (0ft 8in) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from April to May, and the seeds ripen from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw[272]. A very pleasant strawberry flavour[K].

tcanta None known

dwatta AstringentThe juice of the plant is used in the treatment of profuse menstruation[272]. The unripe fruit is chewed to treat blishemes on the tongue[272].

propta Seed - sow early spring in a greenhouse. The seed can take 4 weeks or more to germinate. The seedlings are very small and slow-growing at first, but then grow rapidly. Prick them out into individual pots when they are large enough to handle and plant them out during the summer. Division of runners, preferably done in July/August in order to allow the plants to become established for the following years crop[200]. They can also be moved in the following spring if required, though should not then be allowed to fruit in their first year. The runners can be planted out direct into their permanent positions.

nwatta We have very little information on this species and do not know if it will be hardy in Britain. However, judging by its native range, it is likely to succeed outdoors in many areas of the country. The following notes are based on the general needs of the genus. Prefers a fertile, well-drained, moisture retentive soil in a sunny position[200]. Tolerates semi-shade though fruit production will be reduced[38]. Likes a mulch of pine or spruce leaves[18, 24].

### 6.2.419 Panax ginseng

Ginseng, Chinese ginseng

5 tlin 9 cyuc 2 kcak 0 tcan 5 dwat 0.8 m hkuc pcmhmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Panax ginseng is a PERENNIAL growing to 0.8 m (2ft 7in) by 0.7 m (2ft 4in). See above for USDA hardiness.

about 5° and should be sown as early in the year as possible in a cold frame or outdoor seedbed[200]. Prick out the seedlings into individual pots when they are large enough to handle, and grow them on in the greenhouse or cold frame for their first winter. Plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, July/August in a frame[113]. Cuttings of mature wood of the current year's growth, autumn in a frame. Layering in early spring[4].

nwatta Succeeds in any reasonably good soil[11]. Closely related to *R. parvifolius*[109]. The species in this genus are notably resistant to honey fungus[200].

### 6.2.541 Dryopteris crassirhizoma

Crown Wood-Fern

5 tlin 9 cyuc 1 kcak 0 tcan 4 dwat 1 m hkuc hmim cyutli hgattcup hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli hjonli

drutta Dryopteris crassirhizoma is a FERN growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland). It prefers moist soil and can tolerate drought.

kcakta Edible Parts: LeavesEdible Uses: Young fronds[177]. No further details, but we would advise caution. See the notes above on toxicity.

tcanta None known

dwatta Analgesic Depurative Haemostatic Resolvent VermifugeThe root stalks are analgesic, antibacterial, anti-inflammatory, antiviral, astringent, febrifuge, haemostatic, vermifuge and vulnerary[238, 279]. A decoction of the dried root is depurative and resolvent[218]. The root contains 'filicin', a substance that paralyses tapeworms and other internal parasites and has been used as a worm expellent for humans and also in veterinary medicine[218, 238]. It is one of the most effective treatments known for tapeworms - its use should be immediately followed by a non-oily purgative such as magnesium sulphate in order to expel the worms from the body[238]. An oily purge, such as castor oil, increases the absorption of the fern root and can be dangerous[238]. The root is also taken internally in the treatment of internal haemorrhage, uterine bleeding, mumps and feverish illnesses[238]. The root is harvested in the autumn and can be dried for later use, it should not be stored for longer than 12 months[238]. This remedy should be used with caution and only under the supervision of a qualified practitioner[238]. The root is toxic and the dosage is critical[238]. See also the notes above on toxicity. Externally, the root is used in the treatment of abscesses, boils, carbuncles and sores[238].

propta Spores - can be sown at any time of the year in a greenhouse. Surface sow on a sterilised compost and keep moist, possibly by placing the pot in a plastic bag. Germinates in 1 - 3 months at 20°C. Pot up small clumps of the plants when they are large enough to handle and grow on in a shady part of the greenhouse until large enough to plant out. Division in spring. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Prefers an acid to neutral soil, succeeding in ordinary fertile soil in a shady position[175, 200]. Prefers a moist soil[188], but is drought tolerant when well established[200]. Members of this genus are rarely if ever troubled by browsing deer[233].

### 6.2.542 Rumex hydrolapathum

Great Water Dock

5 tlin 9 cyuc 1 kcak 0 tcan 1 dwat 1.8 m hkuc hmimhmtt cyutli tcuphja7nhs6s hwicli hrasjlutnyik hpa7tli prikliwis hpa7tmwatli xre7t hjonli

drutta Rumex hydrolapathum is a PERENNIAL growing to 1.8 m (6ft). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from July to September, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and

heavy (clay) soils. Suitable pH: neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can grow in water.

kcakta Edible Parts: Leaves SeedEdible Uses: Young leaves - cooked[2, 105, 183]. Seed - raw or cooked. It can be ground into a powder and used as a flour[102]. The seed is small and rather fiddly to harvest.

tcanta Dye Tannin TeethThe roots contain tannin. In cultivated plants, those grown on dry land contained 6 - 8% tannin whilst those grown in water contained 12.4 - 21.6%[223]. The dried and powdered root makes a good tooth cleaner[4]. Dark green to brown and dark grey dyes can be obtained from the roots of many species in this genus, They do not need a mordant[168].

dwatta Antiscorbatic Astringent OphthalmicThe root is antiscorbatic and strongly astringent[4]. It is harvested in early spring and dried for later use[4]. The green leaves are said to be an excellent application for ulcers of the eyes[4]. propta Seed - sow spring in situ. Division in spring.

nwatta Requires a moist or wet soil, also succeeding in shallow water. Avoids acid conditions in the wild. A very important food plant for the caterpillars of many species of butterfly[30].

### 6.2.543 Pennisetum alopecuroides

Chinese Fountain Grass, Fountain Grass, Swamp Foxtail Grass, Chinese Fountain Grass

5 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 1.5 m hkuc htut cyutli hgatkyuctcup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Pennisetum alopecuroides is a deciduous Perennial growing to 1.5 m (5ft) by 0.5 m (1ft 8in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: SeedEdible Uses: Seed - cooked. It can be ground into a powder and used as a flour[105]. An emergency food, used when all else fails[177].

tcanta Plants form impenetrably dense clumps and when planted close together in drifts make an excellent ground cover[200]. They are best spaced about 45cm apart each way[208].

dwatta None known

propta Seed - sow spring in a greenhouse and only just cover the seed. Germination usually takes place within 3 weeks. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring. Larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Landscape Uses:Border, Container, Foundation, Ground cover, Massing, Rock garden, Seashore, Specimen. Requires a light well-drained soil in a sunny position[162]. Succeeds in dry soils and, once established, tolerates drought[190]. This species is only hardy in the mild areas of Britain[162]. Plants are growing well at Cambridge botanical gardens, which is certainly not one of the milder areas of the country[K]. There are many named varieties selected for their ornamental value[200]. Plants do not flower freely in Britain except in warm sunny autumns[208]. Older clumps are more shy of flowering than young clumps[208]. Special Features:Attracts birds, Attractive foliage, Not North American native, Invasive, Naturalizing, Suitable for cut flowers, Attractive flowers or blooms.

### 6.2.544 Sabatia angularis

Bitter Bloom, Rosepink

5 tlin 9 cyuc 1 kcak 0 tcan 1 dwat 1 m hkuc

drutta Euphorbia lathyris is a ANNUAL/BIENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to June, and the seeds ripen from July to August. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Oil SeedEdible Uses: OilThe seed has been used as a substitute for capers. It is very acidic and requires long steeping in salt and water, and afterwards in vinegar[2]. Great caution is advised, see the notes above on toxicity.

tcanta Biomass Latex Oil RepellentA fine clear oil is obtained from the seed[4, 74]. Yields of 42% have been obtained[240]. The oil rapidly goes rancid and acquires a dangerous acrimony[4]. It is a violent poison, producing violent purging and irritation to the intestines[4]. It can be used medicinally when fresh[4]. A latex in the leaves can be converted into vehicle fuel[160]. Reports suggest potential yields of fuel ranging from 5 to 125 barrels per hectare[218]. The growing plant is said to repel mice and moles, this is said to be most effective in its second year of growth though lots of reports cast doubt on this ability[18, 21, 54, 160]. Dynamic accumulator.

dwatta Abortifacient Antiseptic Cancer Diuretic Emetic Purgative WartsCaper spurge was used in the past as a violent purgative, whilst the rubefacient action of the leaves was employed by beggars to raise unsightly sores on their skins to elicit pity and thereby obtain more money[254]. All parts of the plant are emetic and purgative[4, 7, 21] and the plant is nowadays considered to be far too toxic for it to be used medicinally[238]. The latex in the stems has been used externally as a depilatory and to remove corns, but it is too irritant to be used safely[7, 254]. The seed is diuretic, parasiticide and purgative[176, 218]. It has been used in the treatment of dropsy, oedema, tumours, amenorrhoea, schistosomiasis, scabies and snake bites[176, 240]. The fresh seed has an antitumor action, effective against acute lymphocytic and granulocytic leukaemia[176]. The plant has anticancer activity[218]. It is also antiseptic, cathartic, emetic and purgative[218]. Use the plant with caution[4, 7, 21]. One seed capsule is said to cause catharsis, several to cause an abortion[207].

propta Seed - sow spring in situ. Germination usually takes place within 2 - 3 weeks at 20°C.

nwatta Prefers a light well-drained soil in an open position[200]. Prefers a dry soil but grows almost anywhere[1]. Often self-sows freely[1, 17]. Formerly cultivated for its fruit[17] - for the oil contained in the fruit according to another report[74]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. This genus has been singled out as a potential source of latex (for making rubber) for the temperate zone, though no individual species has been singled out[141].

## 6.2.538 Salix arenaria

5 tlin 9 cyuc 1 kcaak 3 tcan 2 dwat 1 m hkuc htut cyutli tcuphja7n hwicli hrasjlutnykrip hpa7tli flatprikliw hpa7tmwatli nyanhjen hjonli

drutta Salix arenaria is a deciduous Shrub growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers moist or wet soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: Inner bark LeavesEdible Uses: Inner bark - raw or cooked. It can be dried, ground into a powder and then added to cereal flour for use in making bread etc. A very bitter flavour; it is a famine food that is only used when all else fails[172]. Young shoots - raw or cooked. They are not very palatable[172].

tcanta Soil stabilizationThe plant has a spreading root system and is an effective soil binder on sand dunes[200]. Dynamic accumulator.

dwatta Anodyne FebrifugeThe fresh bark of all members of this genus contains salicin[226], which probably decomposes into salicylic acid (closely related to aspirin) in the human body[213]. This is used as an anodyne and febrifuge[226].

propta Seed - must be surface sown as soon as it is ripe in late spring. It has a very short viability, perhaps as little as a few days. Cuttings of mature wood of the current year's growth, November to February in a sheltered outdoor bed or planted straight into their permanent position and given a good weed-suppressing mulch. Very easy. Plant into their permanent positions in the autumn. Cuttings of half-ripe wood, June to August in a frame. Very easy.

nwatta Succeeds in most soils, including wet, ill-drained or intermittently flooded soils[1, 11], but prefers a damp, heavy soil in a sunny position[200]. Rarely thrives on chalk[200]. Hybridizes freely with other members of this genus[200]. Although the flowers are produced in catkins early in the year, they are pollinated by bees and other insects rather than by the wind[11]. Plants in this genus are notably susceptible to honey fungus[200]. Dioecious. Male and female plants must be grown if seed is required.

## 6.2.539 Lonicera gracilipes

5 tlin 9 cyuc 1 kcaak 0 tcan 1 dwat 1.8 m hkuc htut cyutli tcup hwicli hrasjlutnyk hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Lonicera gracilipes is a deciduous Shrub growing to 1.8 m (6ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw[105, 177, 179]. It should be eaten with caution because it is possibly cathartic and emetic[179]. The fruit is about 10mm in diameter[200].

tcanta None known dwatta Cathartic EmeticCathartic, emetic[179].

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed requires 2 months cold stratification[113] and should be sown as soon as possible in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm with or without a heel, July/August in a frame. Good percentage[78]. Cuttings of mature wood of the current season's growth, 15 - 20cm with or without a heel, November in a cold frame. Good percentage[78]. Layering in autumn[200].

nwatta Grows best in a good moist soil in a sunny position, it does not fruit so well in the shade[200].

## 6.2.540 Rhamnus leptophyllus

5 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 1.8 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyk hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Rhamnus leptophyllus is a deciduous Shrub growing to 1.8 m (6ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to June, and the seeds ripen from August to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Edible Uses: TeaA tea is made from the leaves[177].

tcanta None known dwatta None known

propta Seed - best sown in the autumn in a cold frame. Stored seed will require 1 - 2 months cold stratification at

It is hardy to UK zone 6. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: TeaRoot - chewed. This probably refers to its medicinal uses. A tea is made from the root.

tcanta None known dwatta Adaptogen Antianxiety Anticholesterolemic Appetizer Emetic Expectorant Hypoglycaemic Nerve Tonic-Ginseng has a history of herbal use going back over 5,000 years[238]. It is one of the most highly regarded of herbal medicines in the Orient, where it has gained an almost magical reputation for being able to promote health, general body vigour and also to prolong life[218]. The root is adaptogen, alterative, carminative, demulcent, emetic, expectorant, stimulant and tonic[165, 176, 178, 218]. It both stimulates and relaxes the nervous system, encourages the secretion of hormones, improves stamina, lowers blood sugar and cholesterol levels and increases resistance to disease[238]. It is used internally in the treatment of debility associated with old age or illness, lack of appetite, insomnia, stress, shock and chronic illness[238]. Ginseng is not normally prescribed for pregnant women, or for patients under the age of 40, or those with depression, acute anxiety or acute inflammatory disease[238]. It is normally only taken for a period of 3 weeks[238]. Excess can cause headaches, restlessness, raised blood pressure and other side effects, especially if it is taken with caffeine, alcohol, turpids and bitter or spicy foods[238]. The roots are harvested in the autumn, preferably from plants 6 - 7 years old, and can be used fresh or dried[238]. A dose of 10ug/ml of ginseng saponins has been shown to be significantly radio-protective when it is administered prior to gamma-irradiation[218]. The leaf is emetic and expectorant[218]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve Panax ginseng for lack of stamina (see [302] for critics of commission E).

propta Seed - sow in a shady position in a cold frame preferably as soon as it is ripe, otherwise as soon as the seed is obtained. It can be very slow and erratic to germinate. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a shady position in the greenhouse or frame for at least their first winter. Make sure the pots are deep enough to accommodate the plants. Plant out into their permanent positions in late summer. Division in spring.

nwatta Requires a moist humus rich soil in a shady position in a woodland[200]. Ginseng is widely cultivated and also collected from the wild in the Orient for its root which is commonly used as a medicine[178]. The root is prepared in a number of different ways, including by steaming it for 4 hours in wicker baskets over boiling water[200].

## 6.2.420 Arisaema jacquemontii

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 0.6 m hkuc pcmhmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprikliw hpa7tmwatli nyanhjen hjonli

drutta Arisaema jacquemontii is a PERENNIAL growing to 0.6 m (2ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to July. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Flies. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Root - cooked[177]. Used in the same ways as potatoes[272]. The tubers are 12 - 30mm in diameter[266]. The root must be thoroughly cooked or dried before use, see the notes above on toxicity. Leaves - dried[177]. The leaves are fermented before being eaten in Nepal[272]. Some caution is advised, see the notes above on toxicity.

tcanta None known

dwatta None known propta Seed - best sown as soon as it is ripe in a shady position in a cold frame[134]. Stored seed remains viable for at least a year and can be sown in spring in the greenhouse but it will probably require a period of cold stratification. Germination usually takes place in 1 - 6 months at 15°C[134]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least a couple of years until the corms are more than 20mm in diameter. Plant out into their permanent positions whilst they are dormant. Division of tubers when the plant dies down in late summer.

nwatta Prefers a cool moist peaty soil in the bog, woodland garden or a sheltered border in semi-shade[134, 200]. Prefers a loamy or peaty soil[1] and will tolerate a sunny position if the soil is moist but not water-logged and the position is not too exposed[1, 200]. This is probably the hardiest of the Himalayan species and should succeed outdoors in a suitable position in many parts of the country[90]. Only plant out full sized tubers and mulch them with organic matter in the winter[200]. Plants need protection from slugs[200]. Closely related to A. wardii. Most species in this genus are dioecious, but they are sometimes monoecious and can also change sex from year to year.

## 6.2.421 Dendranthema indicum

Chrysanthemum 5 tlin 9 cyuc 2 kcaak 0 tcan 3 dwat 0.6 m hkuc htut cyutli tcup hwicli hrasjlutnyk hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Dendranthema indicum is a PERENNIAL growing to 0.6 m (2ft) by 0.6 m (2ft in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves Oil SeedEdible Uses: Oil TeaThe flower heads are pickled in vinegar[46, 61, 177, 183]. Young leaves - cooked[105, 177, 183]. An aromatic tea is made from the leaves[183]. Seed[183]. No more details are given but it is very small and would be rather fiddly to use.

tcanta OilThe seed contains about 16% of a semi-drying oil, but no information is given as to its uses[240, 283]. The seed is rather small, commercial extraction is probably not viable[K].

dwatta Antiphlogistic Aperient Bitter Blood tonic Depurative Eczema Febrifuge Ophthalmic Stomachic VD VulneraryThe whole plant is antiphlogistic, blood tonic, depurative, febrifuge and vulnerary[147, 174, 178]. The plant is used in China to treat eye ailments[218]. In conjunction with black pepper it is used in the treatment of gonorrhoea[240]. The leaves are depurative[240]. They are used in China in the treatment of migraine[240]. The flowers are aperient, bitter, hypotensive, stomachic and vasodilator[176, 240]. They contain the glycoside chrysanthemin that yields glucose and cyanidin on hydrolysis, together with stachydrine and an essential oil[283]. They have an antibacterial action, inhibiting the growth of Staphylococcus, E. coli, streptococcus, C. diphtheriae, Bacillus dysenteriae[176]. The flowers are used in the treatment of furuncle, scrofula, deep-rooted boils, inflammation of the throat, eyes and cervix, eczema, itchiness of the skin and hypertension[176]. They have a rejuvenating effect when used over a long period of time[283]. An essential oil obtained from the plant contains chrysanthemone, this is active on the brain centre affected by Parkinson's disease[240].

propta Seed - sow spring to early summer in a greenhouse and only just cover the seed[200]. It usually germinates in 10 - 18 days at 15°C but if it does not germinate within 4 weeks then try chilling the seed for 3 weeks in the salad compartment of a fridge[164]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Succeeds in most well-drained fertile soils in a sunny position[1, 200]. Plants tolerate temperatures down to about -10°C and should succeed outdoors in most parts of Britain[260]. This species is closely related to *D. x grandiflorum* (the cultivated chrysanthemum) according to one report[58] whilst another says that it is a parent of the cultivated chrysanthemum[1]. It has been proposed (1999) to re-store this species to *Chrysanthemum* as *C. indicum* L. since the plant is so widely known under this name. When bruised, the foliage has a pungent refreshing fragrance that is somewhat lemon-like and reminiscent of chamomile[245].

### 6.2.422 Crocus serotinus

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 0.1 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta *Crocus serotinus* is a CORM growing to 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in leaf from November to May, in flower from November to December. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, butterflies. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Edible Uses: Colouring CondimentThe flowers are used as a saffron substitute in flavouring food and colouring it yellow[177, 183].

tcanta DyeThe yellow dye obtained from the stigmas yields a yellow dye, it is a saffron substitute[177].

dwatta None known

propta Seed - best sown as soon as it is ripe in a light sandy soil in pots in a cold frame[1]. The seed can also be sown in a cold frame in early spring[1]. Sow thinly because the seed usually germinates freely[1], within 1 - 6 months at 18°C[164]. Unless the seed has been sown too thickly, do not transplant the seedlings in their first year of growth, but give them regular liquid feeds to make sure they do not become deficient. Divide the small bulbs once the plants have died down, planting 2 - 3 bulbs per 8cm pot. Grow them on for another 2 years in a greenhouse or frame and plant them out into their permanent positions when dormant in late summer[K]. Plants take 3 - 4 years to flower from seed[200]. Division f the clumps after the leaves die down in spring[1, 200]. The bulbs can be planted out direct into their permanent positions.

nwatta Succeeds in most soils, conditions and positions[1]. Plants grow well in a peaty soil in a bulb frame and should succeed outdoors in a sandy peaty soil[90]. The subspecies *C. serotinus austriacus* can be naturalized in grass or beneath deep rooting trees on light well-drained soils[200]. Plants tend to move considerably from their original planting place because of their means of vegetative reproduction, it is therefore wise not to grow different species in close proximity[1]. Any planting out is best done in late spring or early summer[245]. Mice are very fond of the corms of this species[1]. Plants take 3 - 4 years to flower from seed[200]. The flowers are only open during the day time, closing at night[245].

### 6.2.423 Adenophora lamarkii

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 0.6 m hkuc htut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta *Adenophora lamarkii* is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 6. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Root - cooked. A sweet flavour[74].

tcanta None known

dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe[200]. The seed can also be sown in spring. Surface

sow 2 - 3 seeds per pot in the spring in order to avoid transplanting[133]. We have found that if transplanted when very small seedlings grow away without difficulty[K]. Germinates in 1 - 3 months at 10°C[133]. Plant out into their permanent positions whilst young. Basal cuttings in spring[K]. Division in spring - very difficult because the plant dislikes root disturbance[1].

nwatta Prefers a light rich slightly alkaline soil that is not too dry, and a warm sunny position[1, 200]. Intolerant of root disturbance[1]. The young growth is extremely attractive to slugs, they have been known to destroy even mature plants[K].

### 6.2.424 Eryngium campestre

Field Eryngo

5 tlin 9 cyuc 2 kcaak 0 tcan 2 dwat 0.6 m hkuc htut cyutli kyuctcup hwicli hyishrasjlut hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta *Eryngium campestre* is a PERENNIAL growing to 0.6 m (2ft) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: Leaves RootEdible Uses: Young shoots - cooked. An asparagus substitute[105, 177, 183]. Root - cooked. Used as a vegetable or candied and used as a sweetmeat[46, 183]. Easily digested[7, 61].

tcanta None known

dwatta Antispasmodic Aromatic Diaphoretic Diuretic Expectorant Galactofuge StimulantThe root is antispasmodic, aromatic, diaphoretic, diuretic, expectorant, galactofuge and stimulant[4, 7]. It should be harvested in the autumn from plants that are at least 2 years old[4]. The root promotes free expectoration and is very useful in the treatment of debility attendant on coughs of chronic standing in the advanced stages of pulmonary consumption[4]. Drunk freely it is used to treat whooping cough, diseases of the liver and kidneys and skin complaints[4, 238].

propta Seed - best sown as soon as it is ripe in early autumn on the surface of a well-drained compost in a cold frame[200]. The seed can also be sown in spring. It usually germinates in 5 - 90 days at 20°C. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in early spring or autumn. Take care since the plant resents root disturbance[200]. Root cuttings in autumn or winter[200].

nwatta Requires a well-drained soil and a sunny position[1]. Prefers a light sandy soil but tolerates most soil types including lime and poor gravels[200]. The plant has deep and wide-ranging roots, it can spread freely in the garden and become difficult to eradicate[4]. Plants should be put in their final position whilst small since they resent root disturbance[200]. The plant is often used in dried flower arrangements since it retains its colour for a long time[7].

### 6.2.425 Anacamptis pyramidalis

Pyramidal Orchid

5 tlin 9 cyuc 2 kcaak 0 tcan 1 dwat 0.3 m hkuc htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli prikwiisslip hpa7tmwatli xre7t hjonli

drutta *Anacamptis pyramidalis* is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from April to June, and the seeds ripen in July. The species is hermaphrodite (has both male and female organs) and is pollinated by Lepidoptera (Moths and Butterflies). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil.

(loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Edible Uses: TeaAn infusion of the leaves tastes like China tea[207].

tcanta None known

dwatta *TonicAn* infusion of the leaves is esteemed as a restorative tonic[207].

propta Seed - we have no information for this species but suggest sowing the seed as soon as it is ripe in a cold frame if possible. It is likely to require stratification before it germinates, so stored seed should be sown in a cold frame as early in the year as you receive it. Prick out the seedlings into individual pots when they are large enough to handle, and grow them on in a cold frame for their first winter. Plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, July/August in a light sandy soil a frame. Cuttings of mature wood of the current seasons growth, 15cm long, October/November in an outdoor frame[200]. Another report says that September is a good time to do this[11]. Division of suckers in early spring[200]. They can be planted out straight into their permanent positions.

nwatta Tolerates most soils[200], but prefers a good loamy soil, abundant moisture and full sunlight[11, 200]. This species is closely related to *S. salicifolia* and is often treated as no more than a variety of it[11]. Hybridizes freely with other members of this genus[11].

### 6.2.534 Peucedanum palustre

Marsh Hog's Fennel, Hogfennel

5 tlin 9 cyuc 1 kcaak 0 tcan 1 dwat 1.5 m hkuc hmimhtut cyutli tucphja7n hwicli hrasjlutnyik hpa7tli flatprikwisslip hpa7tmwatli fyifxre7t hjonli

drutta *Peucedanum palustre* is a BIENNIAL growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies), beetles. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta Edible Parts: Edible Uses: CondimentThe root can be used as a ginger substitute[2, 4, 17, 115, 183].

tcanta None known

dwatta Antispasmodic Epilepsy StimulantThe root is stimulant[4]. It is used in the treatment of epilepsy[4].

propta Seed - we have no information on this species but suggest sowing the seed in a cold frame as soon as it is ripe if this is possible otherwise in early spring. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer.

nwatta An easily grown plant, it succeeds in any moisture-retentive soil in a sunny position[200]. Suitable for group plantings in the wild garden[200].

### 6.2.535 Thalictrum aquilegifolium

5 tlin 9 cyuc 1 kcaak 0 tcan 1 dwat 1 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta *Thalictrum aquilegifolium* is a PERENNIAL growing to 1 m (3ft 3in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to July, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects, wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Root - raw or roasted[22, 46, 61]. Caution is advised, there is one report that suggests that the root is particularly poisonous[13]. Young leaves - cooked[105]. Caution is advised, they are possibly poisonous.

tcanta None known

dwatta CytostaticCytostatic[65].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame[K]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. The seed can also be sown in an outdoor seedbed in spring[111]. Plant them into their permanent positions the following spring. Division in spring as new growth commences or in the autumn[111]. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the summer or the following spring.

nwatta Succeeds in most fairly good soils in sun or semi-shade[1, 111]. Prefers a humid rich soil[111]. A very ornamental plant[1], it is hardy to about -25°C[187]. Grows well on a woodland edge[188]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54]. Members of this genus are rarely if ever troubled by browsing deer[233].

### 6.2.536 Aconitum heterophyllum

5 tlin 9 cyuc 1 kcaak 0 tcan 2 dwat 1.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikrip hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta *Aconitum heterophyllum* is a PERENNIAL growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from August to September, and the seeds ripen from September to October. The flowers are pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Leaves and root - cooked[177]. This report should be treated with great distrust due to the poisonous nature of the genus, but see the notes above on known hazards[K].

tcanta None known

dwatta Analgesic Antiinflammatory Antiperiodic Aphrodisiac Astringent Cholagogue Febrifuge TonicThe dried root is analgesic, anti-inflammatory, antiperiodic, aphrodisiac, astringent, cholagogue, febrifuge and tonic[4, 240]. It is used in India in the treatment of dyspepsia, diarrhoea and coughs[240, 243]. It is also used in Tibetan medicine, where it is said to have a bitter taste and a cooling potency[241]. It is used to treat poisoning from scorpion or snake bites, the fevers of contagious diseases and inflammation of the intestines[241]. The root is best harvested in the autumn as soon as the plant dies down and is dried for later use[4]. This is a very poisonous plant and should only be used with extreme caution and under the supervision of a qualified practitioner.

propta Seed - best sown as soon as it is ripe in a cold frame[111]. The seed can be stratified and sown in spring but will then be slow to germinate[133]. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for their first winter. Plant them out in late spring or early summer. Division - best done in spring but it can also be done in autumn[1, 111]. Another report says that division is best carried out in the autumn or late winter because the plants come into growth very early in the year[233].

nwatta Thrives in moist soils and in the light shade of trees[1]. Grows well in heavy clay soils. Prefers a moist soil in sun or semi-shade[200]. Prefers a calcareous soil. Grows well in open woodlands[1, 4]. The roots of this plant are extensively collected from the wild for medicinal use and the species is becoming much rarer in many areas of its range[272]. Members of this genus seem to be immune to the predations of rabbits and deer[233]. A greedy plant, inhibiting the growth of nearby species, especially legumes[54].

### 6.2.537 Euphorbia lathyris

Caper Spurge, Moleplant

5 tlin 9 cyuc 1 kcaak 3 tcan 2 dwat 1 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

August. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta Edible Parts: Root SeedEdible Uses: Root - cooked[172]. Seed[172]. No further details are given, but the seed is small and fiddly to use[K].

tcanta BeddingThe straw is used for bedding[61].  
dwatta None known

propta Seed - sow in situ in the spring in a moist soil in light shade. If seed is in short supply it can be sown in a cold frame and be planted out in the summer. The seed usually germinates in 2 - 6 weeks at 15°C[138]. Division in spring[200]. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the summer or following spring.

nwatta Easily grown in a damp to wet soil in full sun or shade[162, 200]. A very aggressive and invasive plant[162, 200]. Members of this genus are rarely if ever troubled by browsing deer[233].

### 6.2.530 *Kalimeris pinnatifida*

Japanese Aster

5 tlin 8 cyuc 1 kcak 0 tcan 0 dwat 1.5 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Kalimeris pinnatifida* is a PERENNIAL growing to 1.5 m (5ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves and young plants - cooked[1, 46, 61, 105, 177].

tcanta None known  
dwatta None known

propta Seed - sow spring in a greenhouse and only just cover. Keep the compost moist. The seed usually germinates in 2 - 3 weeks at 15°C[138]. Grow on in cool conditions, about 10°C[138]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring. This should be done at least every 3 years in order to maintain the vigour of the plant.

nwatta Landscape Uses:Border, Container, Massing, Specimen. Prefers a moist loamy soil[138] though it succeeds in most soils[1]. Cultivated as a vegetable in Japan[46].

### 6.2.531 *Lolium perenne*

Perennial Ryegrass, Italian ryegrass, Darnel, Lyme Grass, Terrell Grass, English Ryegrass, Strand Hk  
5 tlin 7 cyuc 1 kcak 0 tcan 1 dwat 1 m hkuc  
htut cyutli hgattcup hwicli hrasjlutnyik hpa7tli frusflatprikli-wissliphom hpa7tmwatli xre7t hjonli

drutta *Lolium perenne* is an evergreen Perennial growing to 1 m (3ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid, very alkaline and saline soils. It cannot grow in the shade. It prefers moist soil and can tolerate drought. It can tolerate atmospheric pollution.

kcakta Edible Parts: SeedEdible Uses: Seed - cooked. Used as a cereal[177]. The seed has a nutritional value similar to oats (*Avena sativa*) and contain gluten[269]. An emer-

gency food, it is only used when all else fails[177]. The seed is rather small and fiddly to use[K]. Yields of 1 tonne per hectare have been achieved, though around 500kg is a more common yield[269].

tcanta BiomassThe plant has the potential to be used as a source of biomass. Yields of up to 25 tonnes per hectare have been reported from Europe. In the absence of definitive yield information an average yield of 17.5 tonnes of dry matter per hectare per year and an energy content of 17.5 GJ per metric tonne are assumed[269].

dwatta Astrigent Cancer MalariaThe plant has occasionally been used in the treatment of cancer, diarrhoea, haemorrhages and malaria[269].

propta Seed - sow in situ in the spring. It is also possible to sow the seed in situ in the autumn in most parts of Britain. This will give larger plants and heavier yields.

nwatta Landscape Uses:Erosion control, Ground cover. Adapted to mild, humid temperate climates, this species grows best on rather heavy, rich, moist soils, but also does well on well-manured lighter soils with sufficient moisture[269]. It dislikes shade and requires a well-drained soil[200]. It prefers a pH in the range 6 - 7, though it can tolerate a range from 4.5 - 8.2[269]. Plants are moderately drought resistant, they tolerate atmospheric pollution and salt in the soil, and can also succeed when planted on mine-spoil[269]. They prefer an annual precipitation in the range of 21 - 176cm[269]. Many cultivars have been developed by selection of individual plants, clones and families for specific purposes, such as for lawns, pastures and hay[269]. A fast growing plant, it combines particularly well with white clover (*Trifolium repens*)[269]. Special Features: Not North American native, Naturalizing.

### 6.2.532 *Lonicera gracilipes glabra*

5 tlin 9 cyuc 1 kcak 0 tcan 1 dwat 1.8 m hkuc  
htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Lonicera gracilipes glabra* is a deciduous Shrub growing to 1.8 m (6ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw[105, 177, 179]. It should be eaten with caution because is possibly cathartic and emetic[179]. The fruit is about 10mm in diameter[200].

tcanta None known

dwatta Cathartic EmeticCathartic, emetic[179].

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed requires 2 months cold stratification[113] and should be sown as soon as possible in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm with or without a heel, July/August in a frame. Good percentage[78]. Cuttings of mature wood of the current season's growth, 15 - 20cm with or without a heel, November in a cold frame. Good percentage[78]. Layering in autumn[200].

nwatta Grows best in a good moist soil in a sunny position, it does not fruit so well in the shade[200].

### 6.2.533 *Spiraea alba*

White Meadowsweet

5 tlin 9 cyuc 1 kcak 0 tcan 1 dwat 1.5 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Spiraea alba* is a deciduous Shrub growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium

kcakta Edible Parts: RootEdible Uses: DrinkTuber - cooked[2, 4, 61]. It is a source of 'salep', a fine white to yellowish-white powder that is obtained by drying the tuber and grinding it into a powder[2, 105, 177]. Salep is a starch-like substance with a sweetish taste and a faint somewhat unpleasant smell[4]. It is said to be very nutritious and is made into a drink or can be added to cereals and used in making bread etc[5, 100, 183]. One ounce of salep is said to be enough to sustain a person for a day[100, 115].

tcanta None known

dwatta Demulcent NutritiveSalep (see above for more details) is very nutritive and demulcent[4]. It has been used as a diet of special value for children and convalescents, being boiled with water, flavoured and prepared in the same way as arrowroot[4]. Rich in mucilage, it forms a soothing and demulcent jelly that is used in the treatment of irritations of the gastro-intestinal canal[4]. One part of salep to fifty parts of water is sufficient to make a jelly[4]. The tuber, from which salep is prepared, should be harvested as the plant dies down after flowering and setting seed[4].

propta Seed - surface sow, preferably as soon as it is ripe, in the greenhouse and do not allow the compost to dry out. The seed of this species is extremely simple, it has a minute embryo surrounded by a single layer of protective cells. It contains very little food reserves and depends upon a symbiotic relationship with a species of soil-dwelling fungus. The fungal hyphae invade the seed and enter the cells of the embryo. The orchid soon begins to digest the fungal tissue and this acts as a food supply for the plant until it is able to obtain nutrients from decaying material in the soil[200]. It is best to use some of the soil that is growing around established plants in order to introduce the fungus, or to sow the seed around a plant of the same species and allow the seedlings to grow on until they are large enough to move. Division of the tubers as the flowers fade[230]. This species produces a new tuber towards the end of its growing season. If this is removed from the plant as its flowers are fading, the shock to the plant can stimulate new tubers to be formed. The tuber should be treated as being dormant, whilst the remaining plant should be encouraged to continue in growth in order to give it time to produce new tubers[230]. Division can also be carried out when the plant has a fully developed rosette of leaves but before it comes into flower[230]. The entire new growth is removed from the old tuber from which it has arisen and is potted up, the cut being made towards the bottom of the stem but leaving one or two roots still attached to the old tuber. This can often be done without digging up the plant. The old tuber should develop one or two new growths, whilst the new rosette should continue in growth and flower normally[230].

nwatta Requires a deep rich soil[1, 135]. Prefers a hot well-drained bank[42], growing well in a sunny dry border or on a scree[230]. Orchids are, in general, shallow-rooting plants of well-drained low-fertility soils. Their symbiotic relationship with a fungus in the soil allows them to obtain sufficient nutrients and be able to compete successfully with other plants. They are very sensitive to the addition of fertilizers or fungicides since these can harm the symbiotic fungus and thus kill the orchid[230]. Plants can be grown in lawns in calcareous soils, they should not be cut down until the leaves are dying down in the summer[230]. During the day the flowers have a pronounced aroma of vanilla in order to attract pollinating butterflies. In the evening, when damp with dew, the smell is more goat-like and this acts as a repellent to moths[245].

### 6.2.426 *Oxalis grandis*

Great Yellow Woodsorrel

5 tlin 7 cyuc 2 kcak 1 tcan 1 dwat 0.2 m hkuc  
pcimhmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta *Oxalis grandis* is a ANNUAL/PERENNIAL growing to 0.2 m (0ft 8in) by 0.2 m (0ft 8in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: Flowers LeavesEdible Uses: Leaves are tart [1-2]. Leaves - raw or cooked[2, 7, 12, 37]. A delicious lemony flavour, the leaves make a refreshing, thirst-quenching munch and are also added to salads, soups, sauces etc[183]. This leaf should be used in moderation[4, 5, 9, 76], see the notes above on toxicity. Flowers - raw. A decorative addition to salads[K]. The plant can be toxic and only small amounts should be eaten. Large quantities may cause trembling, cramps, and staggering as in grazing animals.

tcanta The juice of the leaves removes iron mould stains from linen[6, 66, 115]. Plants can be grown as a ground cover in woodland or under the shade of shrubs[208].

dwatta Some *Oxalis* species have medicinal properties but no information could be found for this species. For example *Oxalis acetosella*: The fresh or dried leaves are anodyne, antiscorbutic, astringent, diuretic, emmenagogue, expectorant, febrifuge, irritant and stomachic[4, 7, 9, 21]. A decoction is used in the treatment of fevers, both to quench the thirst and allay the fever[4]. Externally, the leaves are crushed and applied locally to dispel boils and abscesses, they also have an astringent affect on wounds[7]. When used internally, some caution is advised due to the oxalic acid content of the leaves[4], the plant is contra-indicated for people suffering from gastritis or a calculus condition[7].

propta Seed - best sown as soon as it is ripe in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in late spring or early summer. Division in spring. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Annual or perennial herb preferring shade to semi-shade and a mesic - moist to slightly dry soil. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2]. Bloom Color: Yellow. Bloom Time: May to Sep.

### 6.2.427 *Mentha satureioides*

Native Pennyroyal

5 tlin 9 cyuc 2 kcak 0 tcan 2 dwat 0.3 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprikli-wis hpa7tmwatli xre7t hjonli

drutta *Mentha satureioides* is a PERENNIAL growing to 0.3 m (1ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Condiment TeaLeaves - raw or cooked. Used as a flavouring in salads or cooked foods. A herb tea is made from the leaves.

tcanta Essential Repellent StrewingAn essential oil is obtained from the whole plant. It has a scent intermediate between pennyroyal and peppermint[238]. The plant is used as an insect repellent[154]. Rats and mice intensely dislike the smell of mint. The plant was therefore used in homes as a strewing herb and has also been spread in granaries to keep the rodents off the grain[244].

dwatta Abortifacient Alterative Antiseptic Antispasmodic Blood purifier Carminative Digestive Emmenagogue TonicThe leaves and flowering plant are alterative, antispasmodic, blood purifier, digestive, emmenagogue and tonic[152, 154, 238]. A tea made from the leaves has traditionally been used in the treatment of fevers, coughs, colds, headaches, digestive disorders, menstrual complaints and various minor ailments[152, 222, 238]. It can be used as a substitute for both pennyroyal (*Mentha pulegium*) and peppermint (*Mentha x piperita*)[238]. Like those species, it should not be prescribed for pregnant women since it can

procure an abortion[238]. The leaves are harvested as the plant comes into flower and can be dried for later use[238]. The essential oil in the leaves is antiseptic, though it is toxic in large doses[222] and can cause abortions[152, 154].

propta Seed - sow spring in a cold frame. Germination is usually fairly quick. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in the summer. Mentha species are very prone to hybridisation and so the seed cannot be relied on to breed true. Even without hybridisation, seedlings will not be uniform and so the content of medicinal oils etc will vary. When growing plants with a particular aroma it is best to propagate them by division[K]. Division can be easily carried out at almost any time of the year, though it is probably best done in the spring or autumn to allow the plant to establish more quickly. Virtually any part of the root is capable of growing into a new plant. Larger divisions can be planted out direct into their permanent positions. However, for maximum increase it is possible to divide the roots up into sections no more than 3cm long and pot these up in light shade in a cold frame. They will quickly become established and can be planted out in the summer.

nwatta Succeeds in most soils and situations so long as the soil is not too dry[1, 16, 200]. Prefers a slightly acid soil[16]. Grows well in heavy clay soils. A sunny position is best for production of essential oils, but it also succeeds in partial shade. Plants are hardy to about -15°c[238]. Most mints have fairly aggressive spreading roots and, unless you have the space to let them roam, they need to be restrained by some means such as planting them in containers that are buried in the soil[K]. Hybridizes freely with other members of this genus. The whole plant has a mint-like aroma. The flowers are very attractive to bees and butterflies[24]. A good companion plant for growing near cabbages and tomatoes, helping to keep them free of insect pests. Members of this genus are rarely if ever troubled by browsing deer[233].

## 6.2.428 Cardamine rotundifolia

American Water Cress, American bittercress
5 tin 9 cyuc 2 kcaak 0 tcan 0 dwat 0.3 m hkuc hmimhtut cyutli tucphja7nhs6s hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyfixre7t hjonli

drutta Cardamine rotundifolia is a PERENNIAL growing to 0.3 m (1ft) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from April to August, and the seeds ripen from May to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can grow in water.

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked[105. 161, 177]. A hot water-cress like flavour[2, K].

tcanta None known
dwatta None known

propta Seed - sow spring in a cold frame. Germination usually takes place within 1 - 3 weeks at 15°c[175]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in a greenhouse or cold frame for the first two years, planting them out when dormant in late summer. Division in early spring or after the plant dies down in the summer. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Succeeds in most soils so long as they are not dry[1]. Grows wild in shallow water[235]. Prefers a moist humus rich soil in shade or semi-shade[200]. A mat-forming stoloniferous species[200].

## 6.2.429 Centranthus ruber

Red Valerian, Fox’s Brush, Jupiter’s Beard
5 tin 8 cyuc 2 kcaak 1 tcan 1 dwat 0.9 m hkuc

htut cyutli hgatkyuctcup hwicli hyishrasjlutnyik hpa7tli flatpriklwisslip hpa7tmwatli xre7t hjonli

drutta Centranthus ruber is a PERENNIAL growing to 0.9 m (3ft) by 0.6 m (2ft in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to August, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

kcakta Edible Parts: Leaves RootEdible Uses: Young leaves - raw or cooked as greens[2, 5, 52, 115]. Exceedingly good, either in salads or cooked as a vegetable[4]. This differs from our own experience, whilst the leaves can be added to salads they are rather bitter and rather less than desirable[8, 183, K]. Root - cooked[4]. Used in soups[4].

tcanta MiscellanyThe seeds were used in ancient embalming[89, 148].

dwatta Miscellany NervineRed valerian is sometimes confused in herbals and folk tradition with the true valerian (Valeriana officinalis). Whilst true valerian has a very strong action on the nervous system, this species has no known medical properties[244, 268]. The plant is nervine[148]. This report possibly confuses this plant with the true valerian, Valeriana officinalis, which is a very effective nervine.

propta Seed - sow February to May in situ or as soon as it is ripe in situ and only just cover the seed. Germination is usually rapid. Division in spring. Cuttings, summer, in a cold frame.

nwatta Landscape Uses:Border, Ground cover, Massing, Rock garden, Seashore. Grows well in ordinary moist, well-drained garden soil and on dry walls[1, 111, 200]. Prefers a sunny position[111], though it also succeeds in semi-shade[219]. Thrives on chalk[200], poor soils[188] and in sandy soils[187]. Established plants are drought tolerant[190]. This species is hardy to about -15°c[187, 200]. Plants are generally long-lived and grow especially well in maritime areas, where they are a common feature of hedgerows and walls[219, K]. A very ornamental plant[1], it attracts moths and butterflies[30]. The flowers have an unpleasant smell like perspiration[245]. Special Features: Attracts birds, Attractive foliage, Not North American native, Naturalizing, Attracts butterflies, Suitable for cut flowers, Extended bloom season in Zones 9A and above, Fragrant flowers. The plant is heat tolerant in zones 8 through 5. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2].

## 6.2.430 Plantago lanceolata

Ribwort Plantain, Narrowleaf plantain

5 tin 9 cyuc 2 kcaak 3 tcan 3 dwat 0.5 m hkuc htut cyutli kyuctcup hwicli hyishrasjlutnyik hpa7tli flatpriklwisslip hpa7tmwatli fyfixre7t hjonli

drutta Plantago lanceolata is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from April to August, and the seeds ripen from June to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind, flies, beetles. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally

(has both male and female organs) and is pollinated by Bees, flies, beetles, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves and young plants - cooked[105, 116, 177].

tcanta None known
dwatta None known

propta Seed - surface sow in spring in a cold frame. Do not allow the compost to become dry. Pre-chilling the seed for two weeks can improve germination rates[134]. Germination usually takes place within 2 weeks at 20°c[134]. When large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring or autumn[200]. Very easy, larger divisions can be planted straight into their permanent positions whilst smaller clumps are best potted up and kept in a cold frame until they are growing away well.

nwatta We have very little information on this species and do not know if it will be hardy in Britain, though judging by its native range it should succeed outdoors in many parts of this country. The following notes are based on the general needs of the genus. Succeeds in most good garden soils[1], preferring one that is well-drained and moisture retentive[200]. Prefers a sunny position[200]. Most species in this genus seem to be immune to the predations of rabbits[233]. Hybridizes freely with other members of this genus[200].

## 6.2.526 Spiraea blumei

5 tin 9 cyuc 1 kcaak 0 tcan 0 dwat 1.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Spiraea blumei is a deciduous Shrub growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to June, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Edible Uses: TeaThe leaves are a tea substitute[177, 183].

tcanta None known
dwatta None known

propta Seed - we have no information for this species but suggest sowing the seed as soon as it is ripe in a cold frame if possible. It is likely to require stratification before it germinates, so stored seed should be sown in a cold frame as early in the year as you receive it. Prick out the seedlings into individual pots when they are large enough to handle, and grow them on in a cold frame for their first winter. Plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, July/August in a light sandy soil a frame. Cuttings of mature wood of the current seasons growth, 15cm long, October/November in an outdoor frame[200]. Another report says that September is a good time to do this[11]. Division of suckers in early spring[200]. They can be planted out straight into their permanent positions.

nwatta Tolerates most soils[200], but prefers a good loamy soil, abundant moisture and full sunlight[11, 200]. Hybridizes freely with other members of this genus[11]. A variable species, it is often confused in gardens with *S. trilobata*[11, 200].

## 6.2.527 Vaccinium virgatum

Rabbit-Eye Blueberry, Smallflower blueberry
5 tin 9 cyuc 1 kcaak 0 tcan 0 dwat 1 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta Vaccinium virgatum is a deciduous Shrub growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to June. The species is hermaphrodite (has both male and female organs)

and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105, 177]. The fruit is about 5mm in diameter[200].

tcanta None known
dwatta None known

propta Seed - sow late winter in a greenhouse in a lime-free potting mix and only just cover the seed[78]. Stored seed might require a period of up to 3 months cold stratification[113]. Another report says that it is best to sow the seed in a greenhouse as soon as it is ripe[200]. Once they are about 5cm tall, prick the seedlings out into individual pots and grow them on in a lightly shaded position in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 8cm with a heel, August in a frame[78]. Slow and difficult. Layering in late summer or early autumn[78]. Another report says that spring is the best time to layer[200]. Takes 18 months[78]. Division of suckers in spring or early autumn[113].

nwatta Requires a moist but freely-draining lime free soil, preferring one that is rich in peat or a light loamy soil with added leaf-mould[11, 200]. Prefers a very acid soil with a pH in the range of 4.5 to 6, plants soon become chlorotic when lime is present. Succeeds in full sun or light shade though it fruits better in a sunny position[200]. Requires shelter from strong winds[200]. Dislikes root disturbance, plants are best grown in pots until being planted out in their permanent positions[200]. This species is closely related to *V. corymbosum*[182] and to *V. amoenum*[1]. Plants in this genus are notably resistant to honey fungus[200].

## 6.2.528 Cuscuta japonica

Japanese Dodder

5 tin 9 cyuc 1 kcaak 0 tcan 2 dwat 1 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Cuscuta japonica is a ANNUAL CLIMBER growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from August to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young growth, boiled and seasoned[177].

tcanta None known

dwatta Aphrodisiac Demulcent Diaphoretic Enuresis Hepatic Ophthalmic TonicA sweet, pungent herb that acts mainly as a liver and kidney stimulant[238], the seed of Japanese dodder is aphrodisiac, demulcent, diaphoretic, enuresis, hepatic and tonic[147, 176, 178, 218, 238]. A decoction of the seed is used to treat a variety of complaints including diarrhoea, vaginal discharge, enuresis, backache, constipation and impotence[218]. The young shoots are used to treat sore eyes[218].

propta Seed - best sown as soon as it is ripe in the autumn, by lodging it among the stems of a host plant[238].

nwatta This is a parasitic species that is devoid of leaves, roots or chlorophyll and so is totally dependant upon its host[238]. It must be grown next to the host plant, which it penetrates with suckers in order to obtain nutriment[238]. Plants are hardy to at least -15°c[238]. A climbing plant, supporting itself by twining around other plants[238].

## 6.2.529 Carex riparia

Great Pond Sedge

5 tin 9 cyuc 1 kcaak 0 tcan 0 dwat 1.5 m hkuc hmimhtut cyutli tucphja7n hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Carex riparia is an evergreen Perennial growing to 1.5 m (5ft) by 2 m (6ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from May to June, and the seeds ripen from July to

drutta *Paeonia suffruticosa* is a deciduous Shrub growing to 2 m (6ft) by 3 m (9ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FlowersEdible Uses: Flowers - cooked[46, 61, 177]. The fallen flower petals are parboiled and sweetened for a teatime delicacy, or cooked in various dishes[183].

tcanta FuelThe stems are used as firewood[11]. The plant is quite slow growing so could not really be seen as a source of fuel[K].

dwatta Analgesic Antibacterial Antiinflammatory Antipyretic Antispasmodic Emmenagogue Sedative Styptic TonicThe root and root bark is analgesic, antibacterial, anti-inflammatory, antipyretic, antispasmodic, emmenagogue, sedative, styptic and tonic[46, 61, 174, 176, 178, 218, 279]. An extract of the plant has antibacterial activity, inhibiting the growth of *Staphylococcus*, *Bacillus dysenteriae*, *Typhoid bacillus*, *Paratyphoid bacillus*, *Proteus*, *Pseudomonas*, *E. coli*, *Haemophilus pertussis* and *Streptococcus*[176, 218]. The plant is used internally in the treatment of fevers, boils, menstrual disorders, nosebleeds, ulcers, irritability and gastrointestinal infections[238]. This remedy should only be used under the supervision of a qualified practitioner[238]. The herb acts as a synergist when used with liquorice (*Glycyrrhiza spp*)[218]. A tea made from the dried crushed petals of various penny species has been used as a cough remedy, and as a treatment for haemorrhoids and varicose veins[250].

propta Seed - best sown as soon as it is ripe in a cold frame[250]. When sown fresh, the seed produces a root about 6 weeks after sowing with shoots formed in the spring[200]. Stored seed is much slower, it should be sown as soon as possible in a cold frame but may take 18 months or more to germinate[200]. The roots are very sensitive to disturbance, so many growers allow the seedlings to remain in their pots for 2 growing seasons before potting them up. This allows a better root system to develop that is more resilient to disturbance[250]. If following this practice, make sure you sow the seed thinly, and give regular liquid feeds in the growing season to ensure the plants are well fed. We usually prick out the seedlings into individual pots as soon as they are large enough to handle, and then grow them on in a cold frame for at least two growing seasons before planting them out when they are in growth in the spring[K].

nwatta Landscape Uses:Border, Foundation, Seashore, Specimen. Requires a deep rich soil, preferably neutral or slightly alkaline[1], doing quite well in sun or light shade[1]. Prefers a limy soil and a sheltered position[200]. Plants are tolerant of a wide range of soil conditions, but will not survive if the soil becomes waterlogged or is too dry[250]. This species is lime tolerant[200]. Plants grown on sandy soils tend to produce more leaves and less flowers, whilst those growing on clay take longer to become established but produce better blooms[250]. Hardy to about -20°c[184], plants do better in the north of Britain than they do in the south and are generally best if given an open northerly aspect[11]. Plants come into growth early in the year and are then subject to damage by late frosts, they are therefore best sited in a position that is shaded from the early morning sun[11]. The branches are brittle and very subject to wind damage, especially when young[200]. There is some confusion over the name of this species, Chinese botanists believing that it was based on a cultivar. They do not recognise this name, instead raising to specific status two of its sub-species as *P. rockii* (Haw. and Lauener.) Hong, and *Li. and P. jishanensis* Hong, and *W.Z.Zhao* (syn *P. spontanea* (Rehder.) Hong, and *W.Z.Zhao.*)[214]. Most modern treatments no longer recognise this as a separate species, though some people use the name to house the large number of garden forms of tree peonies that have been developed over the centuries[250]. A very ornamental plant[1], there are many named varieties[182]. It grows best in areas with long hot summers[1] and requires an airy position because it is very subject to fungal attack[11]. Plants in this genus are notably susceptible to honey fungus[200]. The flowers of some forms of this species

are pleasantly scented[245]. Scented forms include 'Flora', 'Fragrans Maxima', 'Kimpai' and 'Kokuho'[245]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. A very greedy plant inhibiting the growth of nearby plants, especially legumes[54]. The plant does not really need much pruning apart from removing dead or diseased stems. It is, however, very tolerant of pruning and can be cut right back to ground level if it requires rejuvenation[200]. Strongly resents root disturbance, taking some time to recover after being divided[1]. Peony species are usually self-fertile, though they will also hybridise with other species if these flower nearby at the same time[250]. Plants take 4 - 5 years to flower from seed[200]. They generally breed true from seed[1]. Cultivated in China as a medicinal plant[214]. Special Features:Attractive foliage, Naturalizing, Suitable for cut flowers, Suitable for dried flowers, Fragrant flowers.

### 6.2.524 Viburnum phlebotrichum

5 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 2.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli dyatre7t hjonli

drutta *Viburnum phlebotrichum* is a deciduous Shrub growing to 2.5 m (8ft 2in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105, 177]. The ovoid fruit is about 9mm long and contains a single large seed[200].

tcanta None known

dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe. Germination can be slow, sometimes taking more than 18 months. If the seed is harvested 'green' (when it has fully developed but before it has fully ripened) and sown immediately in a cold frame, it should germinate in the spring[80]. Stored seed will require 2 months warm then 3 months cold stratification and can still take 18 months to germinate[113]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame or greenhouse. Plant out into their permanent positions in late spring or early summer of the following year. Cuttings of soft-wood, early summer in a frame[200]. Pot up into individual pots once they start to root and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, 5 - 8 cm long with a heel if possible, July/August in a frame[78, 113]. Plant them into individual pots as soon as they start to root. These cuttings can be difficult to overwinter, it is best to keep them in a greenhouse or cold frame until the following spring before planting them out[113]. Cuttings of mature wood, winter in a frame. They should root in early spring - pot them up when large enough to handle and plant them out in the summer if sufficient new growth is made, otherwise keep them in a cold frame for the next winter and then plant them out in the spring. Layering of current seasons growth in July/August. Takes 15 months[78].

nwatta An easily grown plant, it succeeds in most soils but is ill-adapted for poor soils and for dry situations[1]. It prefers a deep rich loamy soil in sun or semi-shade[11, 200]. Best if given shade from the early morning sun in spring[200]. Plants are self-incompatible and need to grow close to a genetically distinct plant in the same species in order to produce fruit and fertile seed[11, 200].

### 6.2.525 Aster yomena

5 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 1.5 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyfxre7t hjonli

drutta *Aster yomena* is a PERENNIAL growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from August to October, and the seeds ripen from August to October. The species is hermaphrodite

poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: Leaves SeedEdible Uses: Young leaves - raw or cooked[12, 46, 61]. They are rather bitter and very tedious to prepare, the fibrous strands are best removed prior to eating[9, 183]. The very young leaves are somewhat better and are less fibrous[K]. Seed - cooked. Used like sago[177, 183]. The seed can be ground into a powder and added to flours when making bread, cakes or whatever.

tcanta Dye Fibre StarchA good fibre is obtained from the leaves[4], it is said to be suitable for textiles[115]. A mucilage from the seed coats is used as a fabric stiffener[4]. It is obtained by macerating the seed in hot water[100, 115]. Gold and brown dyes are obtained from the whole plant[168]. Dynamic accumulator.

dwatta Antibacterial Antidote Astringent Demulcent Expectorant Haemostatic Laxative Ophthalmic PoulticeRibwort plantain is a safe and effective treatment for bleeding, it quickly staunches blood flow and encourages the repair of damaged tissue[254]. The leaves contain mucilage, tannin and silic acid[244]. An extract of them has antibacterial properties[240]. They have a bitter flavour and are astringent, demulcent, mildly expectorant, haemostatic and ophthalmic[9, 13, 21, 145, 165, 222, 244, 254]. Internally, they are used in the treatment of a wide range of complaints including diarrhoea, gastritis, peptic ulcers, irritable bowel syndrome, haemorrhage, haemorrhoids, cystitis, bronchitis, catarrh, sinusitis, asthma and hay fever[238, 254]. They are used externally in treating skin inflammations, malignant ulcers, cuts, stings etc[4]. The heated leaves are used as a wet dressing for wounds, swellings etc[213, 222]. The root is a remedy for the bite of rattlesnakes, it is used in equal portions with *Marrubium vulgare*[207]. The seeds are used in the treatment of parasitic worms[213]. Plantain seeds contain up to 30% mucilage which swells up in the gut, acting as a bulk laxative and soothing irritated membranes[238]. Sometimes the seed husks are used without the seeds[238]. A distilled water made from the plant makes an excellent eye lotion[7].

propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in early summer. A sowing can be made outdoors in situ in mid to late spring if you have enough seeds.

nwatta Succeeds in any moderately fertile soil in a sunny position[200]. Plants also succeed in very poor land[4]. An important food plant for the caterpillars of many species of butterflies[30]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is fibrous dividing into a large number of fine roots [2-1].

### 6.2.431 Epimedium sagittatum

Yin Yang Huo

5 tlin 9 cyuc 2 kcak 0 tcan 3 dwat 0.5 m hkuc hmim cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli dyatre7t hjonli

drutta *Epimedium sagittatum* is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers dry or moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young plant and young leaves - cooked[105]. Soaked and then boiled[177]. (This suggests that the leaves are bitter and need to be soaked in order to remove the bitterness.)

tcanta A good ground cover plant[200].

dwatta Antirheumatic Aphrodisiac Carminative Expectorant Infertility Kidney Ophthalmic Tonic VasodilatorThe whole plant is antirheumatic, aphrodisiac, carminative, expectorant, ophthalmic and vasodilator. Used as a kidney tonic, it also treats sterility and barrenness[147, 178, 238].

It is taken internally in the treatment of asthma, bronchitis, cold or numb extremities, arthritis, lumbago, impotence, involuntary and premature ejaculation, high blood pressure and absentmindedness[238]. It should be used with some caution since in excess it can cause vomiting, dizziness, thirst and nosebleeds[238]. The plant is harvested in the growing season and dried for later use[238].

propta Seed - best sown in a cold frame as soon as it is ripe in late summer[200, 280]. Sow stored seed as early as possible in the year in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in the cold frame or greenhouse for at least their first winter[K]. Plant them out in mid to late summer[K]. Division in July/August according to one report, in late spring according to another[200]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring. Cuttings in late summer[200].

nwatta Succeeds in any fertile humus-rich soil[200], preferring a moist but well-drained peaty loam[1, 280]. Grows best in the light dappled shade of a woodland[200, 280]. Plants can succeed in the dry shade of trees[233]. A shallow-rooting plant, the rhizomes creeping just below the soil and the finer roots occupying the top 30cm of the soil[280]. Although the plants are hardy to at least -15°c, the young growth in spring can be killed by frosts[238]. Grows well in the rock garden or wild garden[1]. Plants are self-sterile and so more than one clone is required for cross-fertilization in order for seed to be produced. Plants will often hybridise with other species growing nearby[280]. Cultivated as a medicinal plant in Japan[58]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233].

### 6.2.432 Rheum compactum

5 tlin 9 cyuc 2 kcak 0 tcan 0 dwat 0.5 m hkuc hmimhtut cyutli tcup hwicli jlutnyikfrip hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Rheum compactum* is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: StemEdible Uses: Leaf stem - cooked[2, 74]. A tart flavour, it can be used as a rhubarb substitute[105].

tcanta None known

dwatta None known

propta Seed - best sown in autumn in a shaded cold frame[200]. The seed can also be sown in spring in a cold frame. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse or cold frame for their first winter, planting them out in the spring. Division in early spring or autumn[1, 111]. Divide up the rootstock with a sharp spade or knife, making sure that there is at least one growth bud on each division. Larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Prefers a deep, fertile, moderately heavy, humus rich, moisture retentive, well-drained soil in sun or semi-shade[200]. Grows well in heavy clay soils. Hardy to about -20°c[200]. Plants in this genus seem to be immune to the predations of rabbits[233]. Hybridizes freely with other members of this genus[200].

### 6.2.433 Cirsium japonicum

No-Azami, Japanese thistle

5 tlin 9 cyuc 2 kcak 2 tcan 2 dwat 0.9 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyfxre7t hjonli

*drutta Cirsium japonicum* is a BIENNIAL/PERENNIAL growing to 0.9 m (3ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from August to September, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies), beetles. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

**kcakta Edible Parts:** Leaves **Oil Root**Edible Uses: Oil-Leaves - cooked[61, 105, 177]. Very palatable in the spring, they are used with the young roots[179].

**tcanta Oil**The seed of all species of thistles yields a good oil by expression[4]. No details of potential yields etc are given[K].

**dwatta Antiinflammatory Diuretic Haemostatic** SypticThe roots are anti-inflammatory, diuretic and haemostatic[61, 147, 176, 178]. A decoction of the dried roots is used in the treatment of boils and carbuncles, acute appendicitis, uterine bleeding, haematuria, nose bleeds, haematemesis and traumatic bleeding[147]. The leaf is haemostatic and diuretic[218]. The stem is haemostatic[218].

**propta Seed** - sow early spring or autumn in situ. Germination usually takes place within 2 - 8 weeks at 20°C[164]. Division in spring or autumn.

**nwatta** An easily grown plant, succeeding in any ordinary garden soil in a sunny position[200]. Cultivated for cut flowers in Japan[58]. There are some named forms selected for their ornamental value[200]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is fleshy. Thick or swollen - fibrous or tap root [2-1].

### 6.2.434 Ophrys holoserica

Late Spider Orchid

5 tlin 9 cyuc 2 kcaak 0 tcan 2 dwat 0.6 m hkuc hmimhtut cyutli kyucutcup hwicli hrasjlutnyik hpa7tli flat-prikliwis hpa7tmwatli xre7t hjonli

*drutta Ophrys holoserica* is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf from October to July, in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

**kcakta Edible Parts:** RootEdible Uses: Root - cooked. It is a source of 'salep', a fine white to yellowish-white powder that is obtained by drying the tuber and grinding it into a powder[200]. Salep is said to be very nutritious and is made into a drink or added to other cereals and used in bread etc[183]. One ounce of salep is said to be enough to sustain a person for a day[100, 115]. The salep can also be made into a drink[100].

**tcanta** None known

**dwatta Demulcent Nutritive**Salep (see above for more details) is very nutritive and demulcent[4]. It has been used as a diet of special value for children and convalescents, being boiled with water, flavoured and prepared in the same way as arrowroot[4]. Rich in mucilage, it forms a soothing and demulcent jelly that is used in the treatment of irritations of the gastro-intestinal canal[4]. One part of salep to fifty parts of water is sufficient to make a jelly[4]. The tuber, from which salep is prepared, should be harvested as the plant dies down after flowering and setting seed[4].

**propta Seed** - surface sow, preferably as soon as it is ripe, in the greenhouse and do not allow the compost to dry out. The seed of this species is extremely simple, it has a minute embryo surrounded by a single layer of protective cells. It contains very little food reserves and depends upon a symbiotic relationship with a species of soil-dwelling fungus. The fungal hyphae invade the seed and enter the cells of the embryo. The orchid soon begins to digest the fungal tissue and this acts as a food supply for the plant until it is able to obtain nutrients from decaying material in the soil[200].

It is best to use some of the soil that is growing around established plants in order to introduce the fungus, or to sow the seed around a plant of the same species and allow the seedlings to grow on until they are large enough to move. This species only rarely forms new offsets and so division is seldom feasible, the following methods can be tried, however[230]. Division of the tubers as the flowers fade[230]. This species produces a new tuber towards the end of its growing season. If this is removed from the plant as its flowers are fading, the shock to the plant can stimulate new tubers to be formed. The tuber should be treated as being dormant, whilst the remaining plant should be encouraged to continue in growth in order to give it time to produce new tubers[230]. Division can also be carried out when the plant has a fully developed rosette of leaves but before it comes into flower[230]. The entire new growth is removed from the old tuber from which it has arisen and is potted up, the cut being made towards the bottom of the stem but leaving one or two roots still attached to the old tuber. This can often be done without digging up the plant. The old tuber should develop one or two new growths, whilst the new rosette should continue in growth and flower normally[230].

**nwatta** Plants can be grown in a lawn, but the lawn must not be cut until the plants have set seed[200]. Plants are best grown in a shady position[188]. Grows well in a sunny dry border or on a scree[230]. Orchids are, in general, shallow-rooting plants of well-drained low-fertility soils. Their symbiotic relationship with a fungus in the soil allows them to obtain sufficient nutrients and be able to compete successfully with other plants. They are very sensitive to the addition of fertilizers or fungicides since these can harm the symbiotic fungus and thus kill the orchid[230]. This symbiotic relationship makes them very difficult to cultivate, though they will sometimes appear uninvited in a garden and will then thrive. Transplanting can damage the relationship and plants might also thrive for a few years and then disappear, suggesting that they might be short-lived perennials[230]. A very rare species in Britain, where it is on the verge of extinction, it is rather more common in southern Europe[230]. The flowers resemble a female insect and also emit a scent similar to female pheromones, they are pollinated by a male insect of that species attempting to copulate with the flower[200]. Tubers should be planted out whilst they are dormant, this is probably best done in the autumn[200]. They should be planted at least 5cm below soil level[200].

### 6.2.435 Oxalis enneaphylla

Scurvy Grass

5 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 0.1 m hkuc htut cyutli kyucutcup hwicli hrasjut hpa7tli flatprikliwis hpa7tmwatli dyaxbre7t hjonli

*drutta Oxalis enneaphylla* is a PERENNIAL growing to 0.1 m (0ft 4in) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Lepidoptera (Moths and Butterflies). The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate strong winds but not maritime exposure.

**kcakta Edible Parts:** Flowers **Leaves** **Root**Edible Uses: Leaves - raw or cooked[2, 177]. Use in moderation, see notes at top of sheet. Flowers - raw or cooked[K]. Root[105]. No further details are given.

**tcanta** None known

**dwatta** None known

**propta Seed** - best sown as soon as ripe in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in late spring or early summer. Division in spring. Larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

**nwatta** Easily grown in a well-drained humus rich sandy soil in a warm dry sunny position[1, 200]. Requires a sheltered position[1]. A very ornamental plant, it does well in

hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

**kcakta Edible Parts:** **Fruit**Edible Uses: The fruit is almost certainly edible, but we do not know what its quality is[K].

**tcanta Hedge Hedge**The plant has viciously spiny leaves and makes a good boundary shrub[200].

**dwatta Antibacterial Antitumor Dysentery**Berberine, universally present in rhizomes of Berberis and Mahonia species, has marked antibacterial effects. Since it is not appreciably absorbed by the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not be used with Glycyrrhiza species (Licquorice) because this nullifies the effects of the berberine[218]. Berberine has also shown antitumour activity[218].

**propta Seed** - best sown as soon as it is ripe in a cold frame[78]. It usually germinates in the spring[K]. 'Green' seed (harvested when the embryo has fully developed but before the seed case has dried) should be sown as soon as it is harvested and germinates within 6 weeks[K]. Stored seed should be sown as soon as possible in late winter or spring. 3 weeks cold stratification will improve its germination, which should take place in 3 - 6 months at 10°C. Prick out the seedlings when they are large enough to handle and grow them on in a cold frame for at least their first winter. Plant them out in late spring or early summer. This species is a bi-generic hybrid and, if seed is produced, it is very unlikely to breed true. Wounded nodal semi-ripe cuttings in late summer or early autumn[200].

**nwatta** Succeeds in most soils in sun or shade[182, 200]. Prefers a fertile well-drained soil[188]. Plants only flower and fruit after a long warm growing season[200]. Plants are reputedly immune to rust[200].

### 6.2.520 Senecio nemorensis

5 tlin 9 cyuc 1 kcaak 0 tcan 1 dwat 2 m hkuc

hmimhtut cyutli tcup hwicli hyishrasjlutnyikfrip hpa7tli flat-prikliwis hpa7tmwatli xre7t hjonli

*drutta Senecio nemorensis* is a PERENNIAL growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**kcakta Edible Parts:** **Stem**Edible Uses: Young stems - pickled[177]. Some caution is advised, see the notes above on toxicity.

**tcanta** None known

**dwatta Hypoglycaemic Urinary**Urinary tract infections, gout, rheumatism and stone formation in the urinary tract. Lowers blood sugar. The herb is contraindicated in pregnancy and nursing and children under 12. Recommended only for external use. Do not apply to broken skin [301].

**propta Seed** - sow spring in a greenhouse and only just cover the seed. Make sure the compost does not dry out. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in early summer if they have grown sufficiently. Otherwise, grow them on in the greenhouse or cold frame for their first winter and plant them out the following year after the last expected frosts. Division in spring[200]. Root cuttings in early spring[200].

**nwatta** Succeeds in a sunny position in most well-drained moderately fertile soils[200]. The sub-species *S. nemorensis fuchsii*. (Gmel.)Celak. is the form used for food in Asia[177].

### 6.2.521 Weigela floribunda

Crimson weigela

5 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 2.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

*drutta Weigela floribunda* is a deciduous Shrub growing to 2.5 m (8ft 2in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to June. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. It can tolerate atmospheric pollution.

**kcakta Edible Parts:** **Leaves**Edible Uses: Young leaves - cooked[177]. A famine food, they are only used when all else fails.

**tcanta** None known

**dwatta** None known

**propta Seed** - we have no information for this species but suggest sowing the seed in a cold frame as soon as it is ripe if this is possible, otherwise in late winter or early spring. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant them out in late spring or early summer. Softwood basal cuttings, 10 - 12cm long, in a sandy soil in a cold frame in early summer[200]. Cuttings of half-ripe wood, 8 - 10 cm with a heel, July/August in a frame[200]. Cuttings of mature wood of the current seasons growth. 20 cm long, November in a sheltered outdoor nursery bed[200].

**nwatta** An easily grown plant, succeeding in most fertile soils[11, 200]. Prefers a moist well-drained soil in sun or partial shade[200]. Tolerates atmospheric pollution[200]. Plants are very hardy, tolerating temperatures down to about -23°C[200]. Plants are very floriferous and can exhaust themselves, literally flowering themselves to death. The flowers are borne in the leaf nodes of the previous years growth and any pruning is therefore best done as soon as the plant has finished flowering[182]. Closely related to *W. coraeensis*[11]. There are a number of named forms, selected for their ornamental value[200]. Plants in this genus are notably resistant to honey fungus[200].

### 6.2.522 Sorbus gracilis

5 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 2 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli frusflatprikliwis hpa7tmwatli xre7t hjonli

*drutta Sorbus gracilis* is a deciduous Shrub growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

**kcakta Edible Parts:** **Fruit**Edible Uses: Fruit - raw or cooked[105]. The fruit is up to 1cm across[200].

**tcanta** None known

**dwatta** None known

**propta Seed** - best sown as soon as it is ripe in a cold frame[78, 80]. If you have sufficient seed it can be sown in an outdoor seedbed[78, 80]. Stored seed germinates better if given 2 weeks warm then 14 - 16 weeks cold stratification[98], so sow it as early in the year as possible. Prick out the seedlings into individual pots when they are large enough to handle. Seedlings are very slow to put on top-growth for their first year or two[11], but they are busy building up a good root system. It is best to keep them in pots in a cold frame for their first winter and then plant them out into their permanent positions in late spring.

**nwatta** Succeeds in most reasonably good soils in an open sunny position[11]. Prefers an acid soil[121]. Tolerates light shade[188], though it fruits better in a sunny position[K]. Plants are susceptible to fireblight[188].

### 6.2.523 Paeonia suffruticosa

Moutan, Moutan peony, Tree Peony, Japanese Tree Peony

5 tlin 8 cyuc 1 kcaak 0 tcan 2 dwat 2 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprikliwissiip hpa7tmwatli fyifxre7t hjonli

wood of the current season's growth, preferably with a heel, October/November in a frame[78].

nwatta Prefers a warm moist loamy soil and light shade but it is by no means fastidious, succeeding in thin, dry and shallow soils but disliking waterlogged soils[11, 200]. Grows well in heavy clay soils. Plants can be pruned back quite severely, they resprouts well from the base[200]. Hybridizes freely with other members of this genus[1]. This species is closely related to *B. gyalacina*[11, 200].

## 6.2.516 *Callicarpa japonica*

Beautyberry, Japanese callicarpa, Japanese Beautyberry  
5 tlin 8 cyuc 1 kcaak 0 tcan 0 dwat 2 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwsh hpa7tmwatli xre7t hjonli

drutta *Callicarpa japonica* is a deciduous Shrub growing to 2 m (6ft 7in) at a medium rate. It is in flower in August, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Edible Uses: TeaThe leaves are a tea substitute[177, 183].

tcanta None known  
dwatta None known

propta Seed - sow February in a greenhouse[78]. Only just cover the seed[138]. Germination usually takes place within 1 - 3 months at 18°c[138]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter, planting them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood 10cm long, July/August in a frame. High percentage[78]. Cuttings of mature wood of the current season's growth with a heel[78] taken in early spring[200].

nwatta Landscape Uses:Border, Cascades, Container, Erosion control, Massing, Standard, Specimen. Requires a sunny position or light dappled shade[11, 200]. Prefers a highly fertile well-drained loamy soil[11, 200]. This species is only really hardy in the milder parts of Britain, requiring a warm sunny corner[11, 182], though some forms should prove to be hardier. A very ornamental[1] and polymorphic species[58]. Requires cross-pollination for good fruit production[182]. Plants in this genus are notably resistant to honey fungus[200]. Special Features: Fragrant foliage, Not North American native, Inconspicuous flowers or blooms.

## 6.2.517 *Rhododendron indicum*

Rhododendron

5 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 2 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta *Rhododendron indicum* is an evergreen Shrub growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower in June, and the seeds ripen in August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: Flowers LeavesEdible Uses: Flowers[105, 177, 183]. No further details are given but some caution is advised, see the notes above on toxicity. Leaves[105, 177, 183]. No further details are given but some caution is advised, see the notes above on toxicity. The galls on the leaves are also said to be edible[177]. The report does not say if the galls are eaten before or after the insect has left. Caution is advised, see notes above on toxicity.

tcanta Plants can be grown as ground cover when spaced about 1 metre apart each way[208].

dwatta None known

propta Seed - best sown in a greenhouse as soon as it is ripe in the autumn and given artificial light. Alternatively sow the seed in a lightly shaded part of the warm greenhouse in late winter or in a cold greenhouse in April. Surface-sow

the seed and do not allow the compost to become dry[200]. Pot up the seedlings when they are large enough to handle and grow on in a greenhouse for at least the first winter. Layering in late July. Takes 15 - 24 months[78]. Cuttings of half-ripe wood, August in a frame. Difficult[78].

nwatta Succeeds in a most humus-rich lime-free soils except those of a dry arid nature or those that are heavy or clayey[1]. Prefers a peaty or well-drained sandy loam[1]. Succeeds in sun or shade, the warmer the climate the more shade a plant requires[200]. A pH between 4.5 and 5.5 is ideal[1]. Plants do not succeed in all parts of Britain, they are hardy by the coast and succeed in warmer gardens inland[1]. Succeeds in a woodland though, because of its surface-rooting habit[200], it does not compete well with surface-rooting trees[1]. Plants need to be kept well weeded, they dislike other plants growing over or into their root system, in particular they grow badly with ground cover plants, herbaceous plants and heathers[200]. Plants form a root ball and are very tolerant of being transplanted, even when quite large, so long as the root ball is kept intact[200]. Plants in this genus are notably susceptible to honey fungus[200].

## 6.2.518 *Equisetum telmateia*

Giant Horsetail

5 tlin 9 cyuc 1 kcaak 3 tcan 1 dwat 2 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwsh hpa7tmwatli hjonli

drutta *Equisetum telmateia* is a PERENNIAL growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in March, and the seeds ripen in April. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: StemEdible Uses: Strobil (the fertile shoots in spring - raw or cooked[256]. The tough outer fibres are peeled off, or can be chewed and then discarded[256]. The vegetative shoots, produced from late spring onwards, were occasionally cleaned of their leaves, sheathing and branches and then eaten by native North American Indians, but only when very young and tightly compacted[256]. Root - cooked[257].

tcanta Basketry Fungicide Hair Liquid feed Polish SandpaperThe stems are very rich in silica[4]. They are used for scouring and polishing metal[1, 4, 46, 61, 99, 257] and as a fine sandpaper[54, 99, 257]. The stems are first bleached by repeated wetting and drying in the sun[74]. They can also be used as a polish for wooden floors and furniture[46, 178]. The infused stem is an effective fungicide against mildew, mint rust and blackspot on roses[14]. It also makes a good liquid feed[54]. Used as a hair rinse it can eliminate fleas, lice and mites[213]. The black roots have been used for imbrication on coiled baskets[257].

dwatta Astringent Diuretic PouliticeThe plant is astringent and diuretic[257]. A decoction has been used to treat 'stoppage of urine'[257]. A poultice of the rough leaves and stems is applied to cuts and sores[257].

propta Spores - best collected as soon as they are ripe in the spring and surface-sown immediately on a sterile compost. Keep moist and pot up as soon as the plants are large enough to handle. Very difficult[200]. Division. The plants usually spread very freely when well sited and should not really need any assistance.

nwatta Prefers a moist soil with a pH between 6.5 and 7.5[200]. Plants are hardy to about -30°c[200]. Plants have a deep and penetrating root system and can be invasive. If grown in the garden they are best kept in bounds by planting them in a large container which can be sunk into the ground[200].

## 6.2.519 *Mahoberberis aquisargentii*

5 tlin 9 cyuc 1 kcaak 0 tcan 2 dwat 2 m hkuc  
pcimhmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwsh hpa7tmwatli xre7t hjonli

drutta *Mahoberberis aquisargentii* is an evergreen Shrub growing to 2 m (6ft) by 2 m (6ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from January to March. The species is

the rock garden[1]. The flowers have a delicious almond-like perfume[245].

## 6.2.436 *Aster tripolium*

Sea Aster

5 tlin 9 cyuc 2 kcaak 0 tcan 1 dwat 0.9 m hkuc  
htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwshom hpa7tmwatli fyixre7t hjonli

drutta *Aster tripolium* is a PERENNIAL growing to 0.9 m (3ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles, Lepidoptera (Moths and Butterflyflies). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in saline soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves and stems - the somewhat fleshy leaves are used to make pickles or are cooked[2, 105, 177]. A sweet taste[179]. The stem contains about 8.4% ash, whilst the leaf is 9% ash - this is mainly sodium chloride[179].

tcanta None known  
dwatta OphthalmicOphthalmic[100].

propta Seed - surface sow in spring in a cold frame. Do not allow the compost to become dry. Pre-chilling the seed for two weeks can improve germination rates[134]. Germination usually takes place within 2 weeks at 20°c[134]. When large enough to handle, prick the seedlings out into individual pots and plant them out in the summer.

nwatta Succeeds in most good garden soils[1], preferring one that is well-drained and moisture retentive[200]. Prefers a sunny position[200]. This species tends to be a short-lived perennial[17]. Most species in this genus seem to be immune to the predations of rabbits[233]. Hybridizes freely with other members of this genus[200].

## 6.2.437 *Ophrys sphegodes*

Early Spider Orchid

5 tlin 9 cyuc 2 kcaak 0 tcan 2 dwat 0.5 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwssliip hpa7tmwatli xre7t hjonli

drutta *Ophrys sphegodes* is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Root - cooked. It is a source of 'salep', a fine white to yellowish-white powder that is obtained by drying the tuber and grinding it into a powder[200]. Salep is said to be very nutritious and is made into a drink or added to other cereals and used in bread etc[183]. One ounce of salep is said to be enough to sustain a person for a day[100, 115]. The salep can also be made into a drink[100].

tcanta None known

dwatta Demulcent NutritiveSalep (see above for more details) is very nutritive and demulcent[4]. It has been used as a diet of special value for children and convalescents, being boiled with water, flavoured and prepared in the same way as arrowroot[4]. Rich in mucilage, it forms a soothing and demulcent jelly that is used in the treatment of irritations of the gastro-intestinal canal[4]. One part of salep to fifty parts of water is sufficient to make a jelly[4]. The tuber, from which salep is prepared, should be harvested as the plant dies down after flowering and setting seed[4].

propta Seed - surface sow, preferably as soon as it is ripe, in the greenhouse and do not allow the compost to dry out. The seed of this species is extremely simple, it has a minute embryo surrounded by a single layer of protective cells. It contains very little food reserves and depends upon a symbiotic relationship with a species of soil-dwelling fungus. The fungal hyphae invade the seed and enter the cells of the

embryo. The orchid soon begins to digest the fungal tissue and this acts as a food supply for the plant until it is able to obtain nutrients from decaying material in the soil[200]. It is best to use some of the soil that is growing around established plants in order to introduce the fungus, or to sow the seed around a plant of the same species and allow the seedlings to grow on until they are large enough to move. This species only rarely forms new offsets and so division is seldom feasible, the following methods can be tried, however[230]. Division of the tubers as the flowers fade[230]. This species produces a new tuber towards the end of its growing season. If this is removed from the plant as its flowers are fading, the shock to the plant can stimulate new tubers to be formed. The tuber should be treated as being dormant, whilst the remaining plant should be encouraged to continue in growth in order to give it time to produce new tubers[230]. Division can also be carried out when the plant has a fully developed rosette of leaves but before it comes into flower[230]. The entire new growth is removed from the old tuber from which it has arisen and is potted up, the cut being made towards the bottom of the stem but leaving one or two roots still attached to the old tuber. This can often be done without digging up the plant. The old tuber should develop one or two new growths, whilst the new rosette should continue in growth and flower normally[230].

nwatta Plants can be grown in a lawn, but the lawn must not be cut until the plants have set seed[200]. Plants prefer a shady position[188]. Orchids are, in general, shallow-rooting plants of well-drained low-fertility soils. Their symbiotic relationship with a fungus in the soil allows them to obtain sufficient nutrients and be able to compete successfully with other plants. They are very sensitive to the addition of fertilizers or fungicides since these can harm the symbiotic fungus and thus kill the orchid[230]. This symbiotic relationship makes them very difficult to cultivate, though they will sometimes appear uninvited in a garden and will then thrive. Transplanting can damage the relationship and plants might also thrive for a few years and then disappear, suggesting that they might be short-lived perennials[230]. The flowers resemble a female insect and also emit a scent similar to female pheromones, they are pollinated by a male insect of that species attempting to copulate with the flower[200]. Plants are rather sparingly visited by bees, setting seed only if visited[17]. Tubers should be planted out whilst they are dormant, this is probably best done in the autumn[200]. They should be planted at least 5cm below soil level[200].

## 6.2.438 *Thymus praecox*

Mother of thyme, Creeping thyme, Woolly Thyme

5 tlin 8 cyuc 2 kcaak 0 tcan 2 dwat 0.1 m hkuc  
htut cyutli hgtakyuuctup hwicli hrasjlut hpa7tli flatprikliwsh hpa7tmwatli xre7t hjonli

drutta *Thymus praecox* is an evergreen Shrub growing to 0.1 m (0ft 4in) by 0.3 m (1ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Edible Uses: CondimentThe leaves are used as a food flavouring[177, 238]. If the leaves are to be dried, the plants should be harvested in early and late summer just before the flowers open and the leaves should be dried quickly[200].

tcanta Deodorant Disinfectant EssentialCan be used as a ground cover plant in a sunny position[188]. The essential oil obtained from the leaves is used in perfumery, as a mouth wash, medicinally etc[200].

dwatta Antiseptic Deodorant DisinfectantThe leaves, and especially the essential oil contained in them, are strongly antiseptic, deodorant and disinfectant[200, 238]. The plant can be used fresh at any time of the year, or it can be harvested as it comes into flower and either be distilled for the oil or dried for later use[238].

propta Seed - sow spring in a cold frame. Seed can also be sown in autumn in a greenhouse. Surface sow or barely cover the seed. Germination can be erratic. When they are

large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring or autumn[200]. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the summer or the following spring. Cuttings of young shoots, 5 - 8cm with a heel, May/June in a frame[200]. Cuttings of half-ripe wood, 5 - 8cm with a heel, July/August in a frame[200]. Layering.

**nwatta** Landscape Uses:Border, Container, Ground cover, Rock garden. Requires a light well-drained preferably calcareous soil in a sunny position[1, 200]. Succeeds in dry soils. Grows well between stepping stones on paths, tolerating light treading[183, 200]. Succeeds on walls. Thymes dislike wet conditions, especially in the winter. A layer of gravel on the soil around them will help protect the foliage from wet soils[238]. Plants are hardy to about -15°C[238]. The flowers are rich in nectar and are very attractive to honey bees[200]. This is a very difficult genus taxonomically, the species hybridize freely with each other and often intergrade into each other[1]. There are some named varieties selected for culinary and ornamental purposes[183, 200]. Special Features:Attractive foliage, Edible, Fragrant foliage.

### 6.2.439 Thuja plicata

Western Red Cedar, Giant Arborvitae, Giant Cedar, Incense Cedar, Western Red Cedar

5 tin 8 cyuc 1 kcaak 0 tcan 2 dwat 60 m hkuc hmimhtut cyutli tcuphja 7n hwicli hrasjlutnyikfrip hpa7tli flatprklwisslip hpa7tmwatli hjonli

drutta Thuja plicata is an evergreen Tree growing to 60 m (196ft) by 12 m (39ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from March to April, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil. The plant can tolerate maritime exposure.

**kcaak** Edible Parts: Inner barkEdible Uses: GumInner bark - fresh or dried[2, 105, 161]. The inner bark can be dried, ground into a powder and then used as a thickening in soups etc or mixed with cereals when making bread. A pitch obtained from the trunk has been used as a chewing gum[257].

**tcanta** Baby care Basketry Brush Dye Fibre Fuel Fungicide Gum Hair Hedge Hedge Insulation Paper Roofing Scourer Shelterbelt Stuffing Thatching Tinder Wick Wood-Tolerant of light trimming and of reasonable exposure, this species can be grown as a hedge or as part of a shelterbelt[75]. An infusion of the boughs can be used as a hair wash to treat dandruff and scalp germs[257]. The fibrous inner bark can be pounded until it is soft and then used as a sponge for scouring dishes etc, or can be used for making rough clothing, blankets, mats, ropes, sanitary towels, a padding in a baby's cradle, nappies etc. Waterproof hats, capes, trousers, skirts etc can be made from the inner bark[257]. It is also used in thatching and as a stuffing material for mattresses[46, 61, 82, 99, 118, 171, 226, 257]. Inner bark strips have been used as a roofing material[257]. The bark has also been used to make paint brushes[257]. The inner bark has been used to make a wick for oil lamps[257]. The inner bark has been used for making baskets[257]. The roots are used in basket making, making nets etc[99]. The roots have been used in coiled and imbricated baskets[257]. The roots have been peeled, split and used to make coiled watertight baskets that can be used for boiling water[257]. The roots are harvested in the spring or early autumn when it is easier to remove the bark. The outer strips of the roots are used to make the bottom of the basket, the centre core is used in the coils and the root bark, because of its toughness, is used to make the edges[257]. The fibrous bark is used for roofing and the sides of shelters. It is also used as an insulation[61,

99]. A fibre obtained from the bark is used in making paper. The fibre is about 3.8mm long (this refers to the heartwood fibre, the inner bark fibre is probably longer)[189]. Branches can be harvested at any time of the year, they are cut into usable pieces and pre-soaked in clear water prior to cooking. They are then cooked for six hours or more with lye. It is difficult to rinse it to clear water because it seems to be a dye material[189]. The fibre is then hand pounded with mallets, or put through a blender or a ball mill for six hours. It is difficult to hydrate properly. The resulting paper is a rich deep brown/red[189]. The slender pliable branches are used as a high quality rope[257]. They are gathered in spring, peeled and, if thick, are split into halves or quarters. They are then twisted and worked until soft and pliable and finally woven together to make the rope[99]. A green dye can be obtained from the leaves and twigs[257]. The inner bark can be used as a tinder[257]. Wood - aromatic, light, soft, straight-grained, not strong, very resistant to decay. This resistance to decay is probably due to the existence of powerful fungicides in the wood[226]. The wood from fallen trees remains sound for at least 100 years[226]. It is pale to dark red in colour[226]. The wood was widely utilized by many native North American Indian tribes who used it for making a wide range of items including canoes, houses, totem poles, bowls, spoons, ladles and tools[226, 257]. It is currently used in making greenhouses[1, 11, 82, 171]. The wood is not of such good quality when grown in mild humid areas[1]. It makes a good fuel, burning with very little smoke, though it burns quickly[99].

**dwatta** Abortifacient Analgesic Antidandruff Antirheumatic Astringent Emmenagogue Febrifuge Kidney Odontalgic Pectoral Poultice Skin Stomachic TB VDWestern red cedar was employed medicinally by a number of native North American Indian tribes, who used it to treat a wide range of complaints[257]. It is seldom, if ever, used in modern herbalism. An infusion of the leaves has been used in the treatment of stomach pains and diarrhoea[257]. A decoction of the leaves has been used in the treatment of colds[257]. A decoction of the powdered leaves has been used externally to treat various internal pains, including rheumatism[257]. The leaf buds have been chewed in the treatment of toothaches and sore lungs[257]. A decoction of the buds has been used as a gargle[257]. A decoction of the small branches has been used in the treatment of coughs, colds and tuberculosis[257]. A weak infusion has been drunk in the treatment of painful joints caused by rheumatism or arthritis[257]. A poultice of the crushed bough tips and oil has been applied to the back and chest in the treatment of bronchitis, rheumatism, stomach pains and swollen neck[257]. An infusion of the twigs has been used as a wash in the treatment of venereal disease sores[257]. A decoction of the boughs has been used as an antidandruff shampoo[257]. A decoction of the stem tips and the roots has been used in the treatment of colds[257]. An infusion of the bark and twigs has been used in the treatment of kidney complaints[257]. An infusion of the seeds and twigs has been used in the treatment of fevers[257]. The chewed bark, or a decoction of the bark, has been drunk to induce menstruation[257]. A moxa of the inner bark has been used as a counter-irritant for the skin[257]. A poultice of the inner bark has been applied to carbuncles[257]. The bark has been pounded until it is as soft as cotton and then used to rub the face[257]. The very soft bark has been used to bind wounds and cover dressings[257]. The shredded bark has been used to cauterize sores and swellings[257].

**propta** Seed - best sown when ripe in the autumn in a cold frame[113]. Stored seed germinates best if given a short cold stratification[113]. It can be sown in a cold frame in late winter. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. If growing large quantities of plants, the seed can be sown in an outdoor seed bed in mid spring[78]. Grow the plants on for two years and then plant them out into their permanent positions in late autumn or early spring. Cuttings of half-ripe wood, 5 - 8cm with a heel, July/August in a shaded frame. Forms roots by the end of September but it should be overwintered in a frame[78]. Cuttings of almost ripe wood, 5 - 10cm with a heel, September in a cold frame. Forms roots in the following summer. Plant out in autumn or spring[78].

**nwatta** Landscape Uses:Pest tolerant, Screen, Speci-

kcaak Edible Parts: LeavesEdible Uses: Young leaves - cooked[177]. Some caution is advised, see the notes above on toxicity.

**tcanta** None known

**dwatta** None known

**propta** Seed - best sown as soon as it is ripe in a cold frame[164, 200]. Sow stored seed as soon as it is obtained in a cold frame. Pre-soak the seed for 12 hours in warm water and remove as much of the tail and outer coat as possible[164]. A period of cold stratification is beneficial[164]. The seed germinates in 1 - 9 months or more at 20°C[164]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant out in late spring or early summer, after the last expected frosts. Internodal cuttings of soft to semi-ripe wood, late spring in sandy soil in a frame[200]. Layering of old stems in late winter or early spring[200]. Layering of current seasons growth in early summer[200].

**nwatta** Prefers a deep moist soil with its roots in the shade. Dislikes poorly-drained heavy clay soils, but grows well in clay if grit is added for drainage[11, 200]. Dislikes light sandy soils[11]. Does well on chalk. Succeeds in acid as well as alkaline soils[200]. A twining plant[182]. The leaf-stalks wrap themselves around twigs and branches for support. When a side of the stalk touches an object, the growth on that side slows down whilst the other side grows at its normal rate - this causes the leaf stalk to entwine the object it is touching[212]. Plants flower on the current season's new shoots. They can usually be left unpruned, though weak or dead shoots can be removed and main shoots can be cut back by up to two thirds of their length if they are outgrowing their allotted area[273]. When planting out, in order to avoid the disease 'clematis wilt', it is best to plant the rootball about 8cm deeper in the soil. This will also serve to build up a good root crown of growth buds[200]. Plants in this genus are notably resistant to honey fungus[200]. Plants seem to be immune to the predations of rabbits[233]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

### 6.2.513 Deutzia scabra

Fuzzy pride-of-rochester, Deutzia

5 tin 8 cyuc 1 kcaak 0 tcan 0 dwat 3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprklwisslip hpa7tmwatli xre7t hjonli

drutta Deutzia scabra is a deciduous Shrub growing to 3 m (9ft) by 2 m (6ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**kcaak** Edible Parts: LeavesEdible Uses: Young leaves - cooked. A famine food, it is only used when all else fails[105, 177].

**tcanta** Nails WoodWood - fine grained. Used for mosaic and wooden nails[46, 61].

**dwatta** None known

**propta** Seed - sown February in a greenhouse and only just cover the seed[78, 175]. Germination is usually good, taking 1 - 3 months at 18°C[78, 175]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts[78]. Cuttings of half-ripe wood, 10 - 12cm with a heel, end of June to July in a frame[11, 78]. Good to high percentage[78]. Cuttings of ripe wood, 20 - 25cm with a heel, either in an outdoor bed if it is sheltered enough, otherwise in a cold greenhouse[78].

**nwatta** Landscape Uses:Border, Foundation, Massing, Standard, Specimen. An easily grown plant, it tolerates most soils but prefers a moist well-drained fertile humus-rich soil with shade from the early morning sun when grown in areas with late frosts[11, 200]. Prefers a sunny sheltered position, it can be grown on a woodland edge[184]. Tolerates a limey soil[11]. Dormant plants are hardy to about -20°C[184]. The young growth, however, is subject to damage by late frosts and so a suitable position with shelter from early morning

spring sunshine is best. A very ornamental plant[1], it is the best and most reliable species in this genus for growing in Britain[11]. A number of cultivars have been developed for their ornamental value[182]. Flowers are produced on the previous seasons wood[182]. Flowering can be increased by thinning the old shoots after flowering[188]. A very polymorphic plant[58]. Plants in this genus are notably resistant to honey fungus[200]. Special Features: Not North American native, Blooms are very showy.

### 6.2.514 Senecio nemorensis fuchsii

5 tin 9 cyuc 1 kcaak 0 tcan 0 dwat 2 m hkuc hmimhtut cyutli tcup hwicli hyihshrasjlutnyikfrip hpa7tli flatprklwis hpa7tmwatli xre7t hjonli

drutta Senecio nemorensis fuchsii is a PERENNIAL growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**kcaak** Edible Parts: StemEdible Uses: Young stems - pickled[177]. Some caution is advised, see the notes above on toxicity.

**tcanta** None known

**dwatta** None known

**propta** Seed - sown spring in a greenhouse and only just cover the seed. Make sure the compost does not dry out. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in early summer if they have grown sufficiently. Otherwise, grow them on in the greenhouse or cold frame for their first winter and plant them out the following year after the last expected frosts. Division in spring[200]. Root cuttings in early spring[200].

**nwatta** Succeeds in a sunny position in most well-drained moderately fertile soils[200]. This sub-species is the form that is used for food in Asia[177].

### 6.2.515 Berberis sherriffii

5 tin 9 cyuc 1 kcaak 0 tcan 2 dwat 2 m hkuc hmimhtut cyutli kyuctup hwicli hyihshrasjlutnyikfrip hpa7tli flatprklwis hpa7tmwatli fyifxre7t hjonli

drutta Berberis sherriffii is a deciduous Shrub growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 6. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

**kcaak** Edible Parts: FruitEdible Uses: Fruit - raw or cooked.

**tcanta** DyeA yellow dye is obtained from the root.

**dwatta** Antibacterial Cancer DysenteryBerberine, universally present in rhizomes of Berberis species, has marked antibacterial effects. Since it is not appreciably absorbed by the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not be used with Glycyrrhiza species (Licquorice) because this nullifies the effects of the berberine[218]. Berberine has also shown antitumour activity[218].

**propta** Seed - best sown as soon as it is ripe in a cold frame, when it should germinate in late winter or early spring[78]. Seed from over-ripe fruit will take longer to germinate[78], whilst stored seed may require cold stratification and should be sown in a cold frame as early in the year as possible[80]. The seedlings are subject to damping off, so should be kept well ventilated[113]. When the seedlings are large enough to handle, prick them out into individual pots and grow them on in a cold frame. If growth is sufficient, it can be possible to plant them out into their permanent positions in the autumn, but generally it is best to leave them in the cold frame for the winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, July/August in a frame. Cuttings of mature

months cold stratification[113] and can be very slow to germinate[133]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in a cold frame or greenhouse for at least the first winter. Plant out in late spring or early summer. Cuttings of half-ripe wood, July/August in a frame[113, 200]. Cuttings of ripe wood of the current season's growth, 15 - 30cm long in a cold frame[238]. Root cuttings in late winter[200]. Division of suckers in the dormant season[200].

nwatta Succeeds in an open loamy soil[1], preferring a well-drained humus-rich soil in full sun[200]. Tolerates poor soils and atmospheric pollution[200]. Plants are hardy to at least -10 to -15°C if they are sheltered from cold winds[200]. This species is closely related to *E. sieboldianus*[200].

### 6.2.509 Viburnum corylifolium

5 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli dyatxre7t hjonli

drutta Viburnum corylifolium is a deciduous Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in June. The species is hermaphrodite (has both male and female organs) and is pollinated by insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105, 177]. The ovoid fruit is about 8mm long and contains a single large seed[200].

tcanta None known

dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe. Germination can be slow, sometimes taking more than 18 months. If the seed is harvested 'green' (when it has fully developed but before it has fully ripened) and sown immediately in a cold frame, it should germinate in the spring[80]. Stored seed will require 2 months warm then 3 months cold stratification and can still take 18 months to germinate[113]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame or greenhouse. Plant out into their permanent positions in late spring or early summer of the following year. Cuttings of soft-wood, early summer in a frame[200]. Pot up into individual pots once they start to root and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, 5 - 8 cm long with a heel if possible, July/August in a frame[78, 113]. Plant them into individual pots as soon as they start to root. These cuttings can be difficult to overwinter, it is best to keep them in a greenhouse or cold frame until the following spring before planting them out[113]. Cuttings of mature wood, winter in a frame. They should root in early spring - pot them up when large enough to handle and plant them out in the summer if sufficient new growth is made, otherwise keep them in a cold frame for the next winter and then plant them out in the spring. Layering of current seasons growth in July/August. Takes 15 months[78].

nwatta An easily grown plant, it succeeds in most soils but is ill-adapted for poor soils and for dry situations[1]. It dislikes chalky soils[1]. Prefers a deep rich loamy soil in sun or semi-shade[11, 200]. Best if given shade from the early morning sun in spring[200]. Plants are self-incompatible and need to grow close to a genetically distinct plant in the same species in order to produce fruit and fertile seed[11, 200].

### 6.2.510 Rubus coreanus

Korean Bramble

5 tlin 9 cyuc 1 kcaak 0 tcan 2 dwat 3 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Rubus coreanus is a deciduous Shrub growing to 3 m (9ft) by 3 m (9ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium

(loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105, 177]. Small with a poor flavour[11]. The dark red or purplish black fruit is 5–8 mm in diameter[266].

tcanta DyeA purple to dull blue dye is obtained from the fruit[168].

dwatta Aphrodisiac Astringent Ophthalmic Restorative Tonic UrinaryThe fruit is aphrodisiac, astringent, restorative and tonic[176, 218, 238]. It is taken internally in the treatment of complaints associated with disturbed liver and kidney functions, such as back pain, urinary dysfunction, premature greying, blurred vision, infertility, impotence and premature ejaculation[238, 279]. The fruit is harvested when fully ripe and can be used fresh or dried[238]. The juice of the bruised leaves or a decoction of the root are used in the treatment of ophthalmia[218]. The seed is astringent and tonic[218].

propta Seed - requires stratification and is best sown in early autumn in a cold frame. Stored seed requires one month stratification at about 3°C and is best sown as early as possible in the year. Prick out the seedlings when they are large enough to handle and grow on in a cold frame. Plant them out into their permanent positions in late spring of the following year. Division of the suckers in early spring or just before leaf-fall in the autumn[200].

nwatta Easily grown in a good well-drained loamy soil in sun or semi-shade[1, 11, 200]. Plants are rarely cultivated for their edible fruit in Japan[58]. This species is a raspberry with biennial stems, it produces a number of new stems each year from the perennial rootstock, these stems fruit in their second year and then die[200]. Plants in this genus are notably susceptible to honey fungus[200].

### 6.2.511 Grewia biloba parviflora

5 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 3 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Grewia biloba parviflora is a deciduous Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: FruitEdible Uses: Fruit. No more details. The fruit is about 10mm in diameter[200].

tcanta None known
dwatta None known

propta Seed - we have no information for this species but suggest sowing the seed in late winter in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Layering.

nwatta Succeeds in most soils[200]. One report says that this species is not very hardy in Britain, preferring hotter summers than are usually experienced here[11]. Another report, however, says that it is hardy to about -30°C[200].

### 6.2.512 Clematis pierotii

5 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 3 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Clematis pierotii is a deciduous Climber growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 6. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

men. Prefers a moist loamy soil[1, 81]. Dislikes dry soils[11]. Not suitable for light sandy soils because it is shallow rooting[75], but it succeeds on most other soil types, even on waterlogged soils and heavy clays[81, 200]. Succeeds in chalky soils[200]. Prefers some shelter from the wind according to some reports[1, 81] whilst others say that it is fairly wind resistant[11, 75]. Trees tolerate salt winds[75] but not severe maritime exposure[K]. The wood and foliage are highly aromatic[226]. The foliage has a strong fruity smell, like pear-drops or crushed apples[185]. A fast growing tree, it often puts out new growth of 1 metre a year and can average 60cm a year for the first 40 years. Increase in girth can also be rapid, 5cm a year for the first 60 years has been recorded[185]. Sometimes planted for forestry in Britain[17], it is at its best in the moister western half of the country[11, 185]. There are many named varieties selected for their ornamental value[188]. Tolerant of light trimming, so long as this is not back into old wood, plants also retain their lower branches unless these are shaded out by neighbouring plants[11]. The foliage turns bronze in cold weather[81]. Trees are notably susceptible to honey fungus[81, 200]. Special Features: North American native, Inconspicuous flowers or blooms.

### 6.2.440 Tsuga chinensis

Chinese Hemlock

5 tlin 9 cyuc 1 kcaak 0 tcan 2 dwat 45 m hkuc

pcimhmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli frusflatpriklwis hpa7tmwatli hjonli

drutta Tsuga chinensis is an evergreen Tree growing to 45 m (147ft 8in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in leaf all year, in flower in April, and the seeds ripen from October to November. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Inner barkEdible Uses: Tealnmner bark - raw or dried, ground into a powder and then used as a thickening in soups etc or mixed with cereals when making bread[2, 46, 161]. A herbal tea is made from the young shoot tips[2, 62, 95, 159, 183]. These tips are also an ingredient of 'spruce beer'[183].

tcanta Dye Hedge Hedge Resin Tannin WoodApart from the report about the use of the wood, all the other uses listed below are based on the uses that T. canadensis is put to and a note in [46] that this species has similar uses. Yields a resin similar to Abies balsamea, it is gathered by incisions in the trunk or by boiling the wood[46, 61, 64]. The bark contains 8 - 14% tannin[46, 171]. The inner bark is used according to one report[82]. A brown dye is obtained from the bark[21, 46]. A pitch (called hemlock pitch), is obtained by distillation of the young branches[46]. Tolerant of light trimming, plants can be grown as a hedge[81]. This species does not make a good hedge in Britain[200]. Wood - soft, durable. Used for shingles[82]. The timber is used for construction, aircraft, furniture, and in mines[266].

dwatta Astringent Diaphoretic DiureticThe bark is astringent, diaphoretic and diuretic[21]. A tea made from the inner bark or twigs is helpful in the treatment of kidney or bladder problems, and also makes a good enema for treating diarrhoea[21]. It can also be used as a gargle or mouthwash for mouth and throat problems or externally to wash sores and ulcers[21]. The powdered bark can be put into shoes for tender or sweaty feet or for foot odour[21].

propta Seed - it germinates better if given a short cold stratification[80, 113] and so is best sown in a cold frame in autumn to late winter. It can also be sown in early spring, though it might not germinate until after the next winter. If there is sufficient seed, an outdoor sowing can be made in spring[78]. Pot-grown seedlings are best potted up into individual pots once they are large enough to handle - grow them on in a cold frame and plant them out in early summer of the following year. Trees transplant well when they are up to 80cm tall, but they are best put in their final positions when they are about 30 - 45 cm or less tall, this is usually when they

are about 5 - 8 years old[200]. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200].

nwatta An easily grown plant, it thrives best when growing in a deep well-drained soil in the western parts of Britain where it appreciates the higher rainfall[11]. However, it succeeds in most soils and positions, being especially good on acidic sandy soils[81] but also tolerating some lime[11] so long as there is plenty of humus in the soil[208]. Plants are very shade tolerant when young, but need more sunlight as they grow older[81, 200]. Plants are thin and poor when grown in dry or exposed places[200]. A very slow growing tree in most of Britain but probably faster in the far west and in Ireland[185]. Plants require hot humid summers and do not usually thrive in Britain[200]. Plants are very liable to injury by late frosts[1], they are often shrubby in cultivation[200]. Plants in this genus are notably resistant to honey fungus[200].

### 6.2.441 Ulmus wallichiana

5 tlin 9 cyuc 1 kcaak 0 tcan 1 dwat 35 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Ulmus wallichiana is a deciduous Tree growing to 35 m (114ft 10in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked.

tcanta Dye Fibre String WoodA strong fibre is obtained from the inner bark. It is used for cordage, slow matches and sandals[146, 158]. The young shoots are used to make strong ropes[145]. A dye is obtained from the ashes of the burnt twigs[145]. The colour is not given. Wood - fairly hard, somewhat scented, fine grained, takes a good polish. Used for furniture[146, 158].

dwatta SkinSkin[145].

propta Seed - if sown in a cold frame as soon as it is ripe, it usually germinates within a few days[200]. Stored seed does not germinate so well and should be sown in early spring[200]. The seed can also be harvested 'green' (when it has fully developed but before it dries on the tree) and sown immediately in a cold frame. It should germinate very quickly and will produce a larger plant by the end of the growing season[80]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Plants should not be allowed to grow for more than two years in a nursery bed since they form a tap root and will then move badly. Layering of suckers or coppiced shoots[200].

nwatta Prefers a fertile soil in full sun[188], but is easily grown in any soil of at least moderate quality so long as it is well drained[1]. Susceptible to 'Dutch elm disease' according to one report[200], whilst another says that it might be resistant[11]. This disease that has destroyed the greater part of all the elm trees growing in Britain. The disease is spread by means of beetles. There is no effective cure (1992) for the problem, but most E. Asian, though not Himalayan, species are resistant (though not immune) to the disease so the potential exists to use these resistant species to develop new resistant hybrids with the native species[200]. The various species of this genus hybridize freely with each other and pollen is easily saved, so even those species with different flowering times can be hybridized[200].

### 6.2.442 Pterocarya rhoifolia

Japanese Wingnut

5 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 30 m hkuc

htut cyutli tcup hwicli jlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta *Pterocarya rhoifolia* is a deciduous Tree growing to 30 m (98ft 5in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in June, and the seeds ripen from October to December. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: Seed[105]. No more details are given but the seed is very small and would be very fiddly to use.

tcanta WoodWood - light, soft, not easily cracked. Used for clogs, chopsticks etc.

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame[80, 113]. Pre-soak stored seed for 24 hours in warm water[80] then cold stratify for 2 - 3 months[98, 113]. Prick out the seedlings into individual pots as soon as they are large enough to handle and grow them on in the greenhouse for their first winter. Plant them out in late spring or early summer of the following year[240]. Cuttings of half-ripe wood, July/August in a frame[113]. Cuttings of mature shoots, November in a frame. Only use vigorous shoots[113]. Layering. Division of suckers in the dormant season[188].

nwatta Prefers a sunny position in a rich strong loam with abundant moisture at the roots[11, 200]. Succeeds in areas that do not experience prolonged winter temperatures below about -12˚c[200], but young plants and the young shoots of older trees can be cut back by winter frosts[11]. The leaves are aromatic when bruised[245]. Plants in this genus are notably resistant to honey fungus[200].

### 6.2.443 Cedrus libani

Cedar Of Lebanon

5 tin 8 cyuc 1 ckak 0 tcan 1 dwat 30 m hkuc htut cyutli hgatkyuctcup hwicli hrasjlutnyik hpa7tli flatprikli-wisslip hpa7tmwatli hjonli

drutta *Cedrus libani* is an evergreen Tree growing to 30 m (98ft) by 15 m (49ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf all year, in flower from October to November, and the seeds ripen from October to December. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. It cannot tolerate atmospheric pollution.

kcakta Edible Parts: MannaEdible Uses: A manna is obtained from the tree[2, 105]. No more details were given in the report.

tcanta Essential Resin WoodAn oil similar to turpentine is obtained from the wood[46, 61]. An essential oil from the wood is used in perfumery[61]. Wood - moderately hard, durable. Used for construction[1, 46, 61]. The wood is extremely durable and retains its delightful fragrance for many years[245].

dwatta Antiseptic ExpectorantThe leaves and the wood are antiseptic and expectorant. They act to disinfect the respiratory tract[254].

propta Seed - collect the cones in winter and keep in a warm room until they open[1]. Sow immediately in a cold frame[78]. One report says that a short cold stratification of one month improves germination rates[113]. Keep the seed pot moist, but be careful because the young seedlings are very prone to damp off, keep them well ventilated[113]. Prick out the seedlings into individual pots when they are large enough to handle. Grow them on in a cold frame for their first winter and plant them out into their permanent positions in late spring or early summer. Give them some protection from winter cold for their first winter or two outdoors[K]. Cuttings of terminal shoots can be tried in a frame in November but they are very difficult[113].

nwatta Landscape Uses:Espalier, Pest tolerant, Specimen. Thrives on most soils, being very tolerant of chalk, dry sites and of drought when it is established[11, 81, 200]. Prefers a rich loam or a sandy clay in full sun[1]. Succeeds in

warm dry areas with less than 40cm of rain a year, but also in areas with cool summers and up to 200cm of rain[200]. Very intolerant of atmospheric pollution[11, 81]. Small trees less than 50cm tall establish much quicker and better than taller trees, those more than 2 metres tall are difficult to establish[200]. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200]. Fairly slow growing, trees rarely average more than 30cm increase in height per year[185]. Trees can be very long lived, to 300 years or more[185]. There are several named varieties selected for their ornamental value[188]. Small male cones are formed on the lower branches of trees, whilst the larger female cones are formed on higher branches[238]. These female cones persist on the tree for 2 - 3 years before breaking up[238]. Trees are notably susceptible to honey fungus[81, 200]. The trees have a broad canopy and tend to hold any falling snow. This can lead to branches being broken by the weight of snow[81]. Special Features: Not North American native, Inconspicuous flowers or blooms.

### 6.2.444 Ailanthus altissima

Tree Of Heaven

5 tin 8 cyuc 1 ckak 5 tcan 3 dwat 25 m hkuc hmimhtut cyutli hgatkyuctcuphja7n hwicli hyhshrasjlut hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

drutta *Ailanthus altissima* is a deciduous Tree growing to 25 m (82ft) by 15 m (49ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August, and the seeds ripen from September to November. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry moist or wet soil and can tolerate drought. The plant is not wind tolerant. It can tolerate atmospheric pollution.

kcakta Edible Parts: LeavesEdible Uses: Leaves - cooked[105]. Used as an emergency food in times of scarcity, they have an offensive odour[2, 177, 178]. Some caution is advised, see the notes above on toxicity.

tcanta Dye Hedge Hedge Herbicide Insecticide Repellent Soil reclamation Soil stabilization Tannin WoodA yellow dye is obtained from the leaves[7]. The leaves contain 12% tannin, quercetin, as well as isoquercetin, and the alkaloid linuthine[218, 269]. The leaves and wood are high in cellulose and are used in paper-making[7, 74]. The crushed leaves and flowers are insect-repellent[14]. The plant parts, when steeped in water, are said to yield an insecticidal solution[218, 269]. An aqueous extract of the leaves contains a substance that is toxic to other tree seedlings[240]. When plants are put into marshy areas they drain the soil and thereby remove mosquito breeding sites[254]. The plants have extensive root systems and sucker freely, they can be used in soil-stabilization programmes[149]. Since the plant is tolerant of soil pollution it can also be used in land reclamation schemes on old mine tips etc[200]. Plants can be grown as a tall hedge[14]. Wood - fairly hard, heavy, difficult to split, not durable, coarse grained. Though little used, except in poorer countries, the wood is suitable for cabinetry, cellulose manufacture, furniture, lumber, pulp, and woodwork. It is difficult to split but easy to work and polish. The wood is also used locally for charcoal and firewood[4, 46, 149, 178, 269]. Yields of 20 cubic metres per hectare is possible for this light wood[269].

dwatta Anthelmintic Antibacterial Anticonvulsant Antidiarrhoeal Antispasmodic Astringent Bitter Cardiac Deobstruent Diuretic Dysentery Emetic Emmenagogue Epilepsy Febrifuge Malaria RubefacientThe tree of heaven is not often used in Western herbal medicine, though it is more popular in the Orient. Various parts of the plant are used, though the bark is the part most commonly used - however, it contains a glycoside that has not been fully researched and so should be used with caution[7]. The root and stem bark are antispasmodic, astringent, bitter, cardiac depressant, diuretic, emetic, febrifuge, rubefacient and vermifuge[4, 61, 147, 176, 178, 218, 238]. The vermifuge properties do not act on round

tcanta WoodThe wood is hard and heavy, suitable for making furniture and other small articles[266].

dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe in the autumn. Stored seed will probably require stratification and should be sown as early in the year as possible[78]. Germination is usually good[78]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Basal cuttings in a frame[200]. Harvest the shoots with plenty of underground stem when they are about 8 - 10cm above the ground. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in a frame[11, 78]. They take about 2 months to root and should be overwintered in a greenhouse, planting out in late spring[78]. Fair to good percentage[78]. Cuttings of almost ripe side shoots, 7 - 12cm with a heel, October/November in a cold frame[78]. Lift the following autumn and plant in their permanent positions[78]. Layering in autumn. Partially sever the layer about 12 months later and lift in the following spring. High percentage[200].

nwatta Requires a well-drained fertile soil in a sheltered position in sun or light shade[1, 200]. Prefers a warm soil that is not too heavy or close[11]. Dislikes calcareous soils[11, 182, 200]. Plants are susceptible to fire-blight[200]. Plants in this genus are notably resistant to honey fungus[200].

### 6.2.506 Bryonia dioica

Red Bryony, Cretan bryony

5 tin 9 cyuc 1 ckak 0 tcan 2 dwat 3.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli priklwis hpa7tmwatli nyanhjen hjonli

drutta *Bryonia dioica* is a PERENNIAL CLIMBER growing to 3.5 m (11ft) by 3 m (9ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to June. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young shoots - must be cooked[2, 105]. They are eaten in spring. Caution is advised in the use of this plant, see the notes above regarding toxicity.

tcanta None known

dwatta Cathartic Cytotoxic Diaphoretic Expectorant Hydrogogue Irritant Pectoral Purgative VermifugeA powerful cathartic and purgative, bryony is used with great caution in present-day herbalism[254]. It is primarily prescribed for painful rheumatic conditions[254]. The root is cathartic, cytotoxic, diaphoretic, expectorant, hydrogogue, irritant, pectoral, purgative and vermifuge[4, 9, 19, 21, 46, 165]. It is used in small quantities internally in the treatment of various inflammatory conditions, bronchial complaints, asthma, intestinal ulcers, hypertension and arthritis[238]. Externally, it is applied as a rubefacient to muscular and joint pains and pleurisy[238]. The root, which can be 75cm long and 75mm thick[268], can be used fresh at any time of the year[7], it can also be harvested in the autumn and be dried for later use[4]. This plant should be used with great caution and only under the supervision of a qualified practitioner. See the notes above on toxicity. The whole herb has an antiviral effect[254].

propta Seed - best sown as soon as it is ripe in a cold frame. Sow stored seed in late winter in a cold frame. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter, planting them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in early spring.

nwatta A rapid grower, it is of easy cultivation succeeding in most soils that are well drained[1], avoiding acid soils

in the wild[17]. Prefers a sunny position[238]. A very deep-rooted climbing plant[7], attaching itself to other plants by means of tendrils[4]. The plant is not eaten by rabbits[17]. Plants can be easily encouraged by scattering ripe seed along the base of hedgerows[200]. Dioecious, male and female plants must be grown if seed is required[200].

### 6.2.507 Spiraea henryi

5 tin 9 cyuc 1 ckak 0 tcan 0 dwat 3 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Spiraea henryi* is a deciduous Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Edible Uses: TeaA tea is made from the leaves[177].

tcanta None known

dwatta None known

propta Seed - we have no information for this species but suggest sowing the seed as soon as it is ripe in a cold frame if possible. It is likely to require stratification before it germinates, so stored seed should be sown in a cold frame as early in the year as you receive it. Prick out the seedlings into individual pots when they are large enough to handle, and grow them on in a cold frame for their first winter. Plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, July/August in a light sandy soil a frame. Cuttings of mature wood of the current seasons growth, 15cm long, October/November in an outdoor frame[200]. Another report says that September is a good time to do this[119]. Division of suckers in early spring[200]. They can be planted out straight into their permanent positions.

nwatta Tolerates most soils[200], but prefers a good loamy soil, abundant moisture and full sunlight[11, 200]. Hybridizes freely with other members of this genus[11]. A very ornamental plant[1], it is closely related to *S. wilsonii*. [182] and to *S. canescens*[11].

### 6.2.508 Eleutherococcus gracylistylus

Wu Jia Pi

5 tin 9 cyuc 1 ckak 0 tcan 3 dwat 3 m hkuc hmimhtut cyutli tcup hwicli hyhshrasjlutnyik hpa7tli flatprikli-wis hpa7tmwatli xre7t hjonli

drutta *Eleutherococcus gracylistylus* is a deciduous Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. It can tolerate atmospheric pollution.

kcakta Edible Parts: FlowersEdible Uses: Flowers[177]. No more details are given.

tcanta MiscellanyNone known

dwatta Antibacterial Antirheumatic Diuretic MiscellanyThe leafy shoots are tonic and are also believed to alleviate internal injuries by dispelling blood[218]. The root bark is antibacterial, antirheumatic and diuretic[176]. It is used in the treatment of arthritis, backache and a host of other ailments. A medicinal wine made from it is commonly on sale in China[218]. A decoction of the stem bark or the roots is used in the treatment of rheumatoid arthritis, aches and pains in the back and legs, open sores on the scrotum, beriberi and traumatic injuries[147]. The plant is aphrodisiac, nutritive and tonic[218].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame[200]. It can be slow to germinate. Stored seed requires 6 months warm followed by 3

kcakta Edible Parts: RootEdible Uses: Young root - boiled[74].

tcanta AdhesiveA glue is made from the roots[74].  
dwatta None known

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame[200]. Sow stored seed in a greenhouse as soon as it is obtained. Germination is slow and could take 1 - 12 months at 15°C. Prick out the seedlings into individual pots as soon as they are large enough to handle and grow on for their first winter in a greenhouse. Plant out into their permanent positions in late spring after the last expected frosts. Do not plant deeply in the soil, the crown of the plant should be slightly exposed[245]. Division after the plant dies down in late summer. Great care must be taken because the plants resent root disturbance[200]. Only divide the plants when it is really necessary, and no more frequently than once every 6 years, being careful not to break the brittle roots[245]. It is probably best to pot up the divisions and grow them on in the greenhouse until they are established.

nwatta Prefers a very well drained, very rich, light sandy loam in a warm sunny sheltered position[90, 200]. A covering of sharp sand helps the plant to survive wet winters. Plants can also be mulched overwinter with organic matter in the autumn in order to give them extra protection, but this mulch must be removed in the spring otherwise it might encourage the new growth to rot[200]. Some protection should be given to the young shoots in spring in areas subject to late frosts[200]. Keep plants dry in summer after they have flowered[90]. A very ornamental plant[1] and a good bee plant[74]. Plants resent root disturbance and so should be placed in their final positions as soon as possible[200]. Plants require some cold stratification in winter in order to flower well in the following summer[200]. Slugs are very attracted to this plant so some protection must be given.

### 6.2.503 Clematis serratifolia

5 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 3 m hkc  
hmimhtut cyuti tcup hwicli hrasjlutnyik hpa7tli flatprik-  
wisslip hpa7tmwatli xre7t hjonli

drutta Clematis serratifolia is a deciduous Climber growing to 3 m (9ft 10in). See above for USDA hardness. It is hardy to UK zone 6. It is in flower from August to October, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young shoots - cooked[105, 177]. Some caution is advised, see the notes above on toxicity.

tcanta None known  
dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame[164, 200]. Sow stored seed as soon as it is obtained in a cold frame. Pre-soak the seed for 12 hours in warm water and remove as much of the tail and outer coat as possible[164]. A period of cold stratification is beneficial[164]. The seed germinates in 1 - 9 months or more at 20°C[164]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant out in late spring or early summer, after the last expected frosts. Internodal cuttings of soft to semi-ripe wood, late spring in sandy soil in a frame[200]. Layering of old stems in late winter or early spring[200]. Layering of current seasons growth in early summer[200].

nwatta Prefers a deep moist soil with its roots in the shade[11, 200]. Dislikes poorly-drained heavy clay soils, but grows well in clay if grit is added for drainage[11, 200]. Dislikes light sandy soils[11]. Does well on chalk[1]. Succeeds in acid as well as alkaline soils[200]. A twining plant[182]. The leafstalks wrap themselves around twigs and branches for support. When a side of the stalk touches an object, the growth on that side slows down whilst the other side grows at its normal rate - this causes the leaf stalk to entwine the object it is touching[212]. Flowers are produced on the current season's growth, any pruning is best carried out in spring[219]. When planting out, in order to avoid the disease 'clematis wilt', it is best to plant the rootball about 8cm

deeper in the soil. This will also serve to build up a good root crown of growth buds[200]. Plants in this genus are notably resistant to honey fungus[200]. Plants seem to be immune to the predations of rabbits[233]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

### 6.2.504 Viburnum furcatum

5 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 3.5 m hkc  
hmim cyuti tcup hwicli hrasjlutnyik hpa7tli frusflatprik  
hpa7tmwatli dyatxre7t hjonli

drutta Viburnum furcatum is a deciduous Shrub growing to 3.5 m (11ft 6in). See above for USDA hardness. It is hardy to UK zone 6. It is in flower in May, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid and neutral soils and can grow in very acidic soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105, 177].

tcanta None known  
dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe. Germination can be slow, sometimes taking more than 18 months. If the seed is harvested 'green' (when it has fully developed but before it has fully ripened) and sown immediately in a cold frame, it should germinate in the spring[80]. Stored seed will require 2 months warm then 3 months cold stratification and can still take 18 months to germinate[113]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame or greenhouse. Plant out into their permanent positions in late spring or early summer of the following year. Cuttings of soft-wood, early summer in a frame[200]. Pot up into individual pots once they start to root and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, 5 - 8 cm long with a heel if possible, July/August in a frame[78, 113]. Plant them into individual pots as soon as they start to root. These cuttings can be difficult to overwinter; it is best to keep them in a greenhouse or cold frame until the following spring before planting them out[113]. Cuttings of mature wood, winter in a frame. They should root in early spring - pot them up when large enough to handle and plant them out in the summer if sufficient new growth is made, otherwise keep them in a cold frame for the next winter and then plant them out in the spring. Layering of current seasons growth in July/August. Takes 15 months[78].

nwatta An easily grown plant, it succeeds in most soils but is ill-adapted for poor soils and for dry situations[1]. It requires a lime-free soil, preferring a deep rich loamy soil in a shady position[1, 11]. Requires woodland conditions but without competition from other plants[11]. Best if given shade from the early morning sun in spring[200]. A very hardy plant, tolerating temperatures down to about -25°C[184]. Plants are self-incompatible and need to grow close to a genetically distinct plant in the same species in order to produce fruit and fertile seed[11, 200]. This species is closely related to *V. lantanoides*[11, 184].

### 6.2.505 Photinia parvifolia

5 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 3 m hkc  
hmimhtut cyuti tcup hwicli hrasjlutnyik hpa7tli flatprik  
hpa7tmwatli xre7t hjonli

drutta Photinia parvifolia is a deciduous Shrub growing to 3 m (9ft 10in). See above for USDA hardness. It is hardy to UK zone 6. It is in flower in May, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit. No more details are given[177]. The fruit is about 10mm in diameter[200].

worms or earthworms[269]. A nauseatingly bitter herb, it is used internally to treat malaria and fevers, it also slows the heart rate and relaxes spasms[238]. It needs to be used under the supervision of a qualified practitioner since the bark readily causes vomiting[238]. In China, the bark is a popular remedy for dysentery and other complaints of the bowels[4]. In one clinical trial, 81 out of 82 patients were cured of dysentery when they were given this herb[254]. A tincture of the root-bark has been used successfully in the treatment of cardiac palpitations, asthma and epilepsy[4]. Tree-of-heaven is a folk remedy for asthma, cancer, diarrhoea, dysentery, dysmenorrhoea, dysuria, ejaculation (premature), epilepsy, eruption, fever, gonorrhoea, haematochezia, leucorrhoea, malaria, metrorrhagia, sores, spasms, spermatorrhoea, stomachic, tumours of the breast (China), and wet dreams[269] The bark is harvested in the spring and dried for later use[7]. The leaves, bark of the trunk, and roots are put into a wash to treat parasitic ulcers, itch, and eruptions[269]. In Korea, the root bark is used in the treatment of coughs, gastric and intestinal upsets[269]. The stem bark is emmenagogue[218]. The leaves are anthelmintic, astringent and deobstruent[218]. The fruit is used in the treatment of bloody stools and dysentery[218, 269]. They have also been used to treat ophthalmic diseases[269]. Extracts from the plant are bactericidal[218]. The tree is used in homeopathic remedies for cancer[269]. A resin extracted from the roots and leaves is a revulsive or vesicant[269].

propta Seed - best sown outdoors as soon as it is ripe[78]. If you only have a small quantity of seed it will probably be better to sow it in a cold frame. The germination can be poor[80], averaging about 56%[98], though one kilo of seed will normally produce in the region of 6,500 usable plants[269]. The seed germinates best if given a short cold stratification of 8 weeks[80, 113]. The seed is not usually produced in Britain[80]. Prick out the seedlings into individual pots when they are large enough to handle, keep them in a cold frame for their first winter and plant them out in late spring[K]. Root cuttings in December[113]. Suckers, planted out in late winter.

nwatta Landscape Uses:Pest tolerant, Aggressive surface roots possible. A very tough and easily grown tree, succeeding under most conditions, the Tree of Heaven is resistant to most diseases and is also reported to be tolerant of alkalinity, drought, frost, heat, high pH, hydrogen fluoride, low pH, pollution, SO<sub>2</sub>, poor, dry or wet soils, heavily polluted soils and industrial pollution[200, 269]. The plant prefers a light moist soil and a sheltered position[1, 133]. Prefers a position in full sun or partial shade[238]. The tree is estimated to tolerate an annual precipitation of 30 to 250cm (tolerating a dry season up to 8 months), an annual average temperature of 10° to 20°C, and a pH of 5.5 to 8.0. Growing on the smallest of city plots and rubbish heaps, this species obviously can tolerate a wide array of soils, from acid to alkaline, sand to light clay, well-drained to swampy, poor to rich. It is said to do poorly on chalky soils or compact clay[269]. Plants are hardy to at least -15°C[200]. A very ornamental tree, it has a somewhat tropical appearance and is fast growing when young[1, 7, 14], though it is rather short-lived[229]. The trees send up suckers freely and soon form dense thickets[7, 200, 229]. The plant has become a noxious weed in parts of Australia and is rather weed-like in many other countries[238, 269]. The roots are rather aggressive and can cause damage to drainage systems[226]. The plants thrive even when growing in very polluted cities[11, 229] and so have been used as street trees and as shade-trees in parks[268], they do not do well in the north of Britain, however[98]. Male flowers are malodorous and have potentially allergenic pollen[80, 200]. The crushed leaves are also malodorous[226]. The large leaves have glandular teeth near their base and these release a pungent aroma when pressed[245]. The disagreeable odour of the plant may cause some people to feel sleepy[269]. This tree is occasionally cultivated for its wood[149]. This is brittle however, and branches are very liable to break off in the wind[200]. Trees coppice readily[200]. The leaves were once used as a food for silkworms[2], but were found to be unsuitable[7]. This species is notably resistant to honey fungus[88, 200]. Dioecious. Male and female plants must be grown if seed is required[269]. Special Features:Not North American native, Invasive, Attractive flowers or blooms.

### 6.2.445 Fraxinus angustifolia

Narrow-Leaved Ash

5 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 25 m hkc  
htut cyuti kyucup hwicli hrasjlutnyik hpa7tli flatprik-  
wisslip hpa7tmwatli xre7t hjonli

drutta Fraxinus angustifolia is a deciduous Tree growing to 25 m (82ft) by 12 m (39ft). See above for USDA hardness. It is hardy to UK zone 6 and is not frost tender. It is in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: Edible Uses: CondimentThe fruit is used as a condiment[177, 183].

tcanta None known  
dwatta None known

propta The seed is best harvested green - as soon as it is fully developed but before it has fully dried on the tree - and can then be sown immediately in a cold frame[80]. It usually germinates in the spring[80]. Stored seed requires a period of cold stratification and is best sown as soon as possible in a cold frame[200]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant them out into their permanent positions or a nursery bed in late spring or early summer of the following year. If you have sufficient seed then it is possible to sow it directly into an outdoor seedbed, preferably in the autumn. Grow the seedlings on in the seedbed for 2 years before transplanting either to their permanent positions or to nursery beds.

nwatta Prefers a deep loamy soil, even if it is on the heavy side[1, 200]. Most members of this genus are gross feeders and require a rich soil[200]. Plants succeed when growing in exposed positions[200] and also in alkaline soils[11]. They tolerate atmospheric pollution[200]. Quite cold-hardy when dormant, the young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. This species is closely related to *F. excelsior*[11]. A very ornamental tree[1], there are several named forms, selected for their ornamental value[200]. This species might be dioecious, in which case male and female plants must be grown if seed is required.

### 6.2.446 Zelkova serrata

Japanese Zelkova, Saw Leaf Zelkova

5 tlin 8 cyuc 1 kcaak 0 tcan 0 dwat 25 m hkc  
hmimhtut cyuti tcup hwicli hrasjlutnyik hpa7tli flatprik-  
lwis hpa7tmwatli hjonli

drutta Zelkova serrata is a deciduous Tree growing to 25 m (82ft) by 10 m (32ft) at a fast rate. See above for USDA hardness. It is hardy to UK zone 5 and is not frost tender. It is in flower from April to May, and the seeds ripen from September to November. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young leaves - cooked[105, 171].

tcanta WoodWood - tough, hard, beautifully grained. Used for tool handles, construction, furniture etc[46, 61, 151].

dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe. Stored seed requires stratification and should be sown as early in the year as possible[78, 200]. Germination rates are variable[78]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts.

nwatta Landscape Uses:Pest tolerant, Aggressive surface roots possible, Specimen, Street tree. An easily grown plant, it succeeds in almost any good soil, acid or alkaline, preferring a deep well-drained moist loam[11, 200]. Prefers a moderately sheltered position[11]. Relatively shade tolerant[200]. A fast growing tree[200]. Dormant plants are very cold-tolerant, but they are sometimes damaged by late spring frosts when they are young[11]. Plants are susceptible to Dutch Elm Disease, but the beetle that is the vector of this disease rarely feeds on *Zelkova* so infestation is rare[11, 200]. Plants in this genus are notably resistant to honey fungus[200]. Special Features:Not North American native, Inconspicuous flowers or blooms.

### 6.2.447 Sorbus japonica

5 tin 9 cyuc 1 kcaak 0 tcan 0 dwat 20 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Sorbus japonica* is a deciduous Tree growing to 20 m (65ft 7in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. The fruit is up to 13mm across[200] and is produced in bunches which makes harvesting easier[K].

tcanta None known  
dwatta None known  
propta Seed - best sown as soon as it is ripe in a cold frame[78, 80]. If you have sufficient seed it can be sown in an outdoor seedbed[78, 80]. Stored seed germinates better if given 2 weeks warm then 14 - 16 weeks cold stratification[98], so sow it as early in the year as possible. Prick out the seedlings into individual pots when they are large enough to handle. Seedlings are very slow to put on top-growth for their first year or two[11], but they are busy building up a good root system. It is best to keep them in pots in a cold frame for their first winter and then plant them out into their permanent positions in late spring.

nwatta Succeeds in most reasonably good soils in an open sunny position[11]. Tolerates light shade[188], though it fruits better in a sunny position[K]. Plants are susceptible to fireblight[188].

### 6.2.448 Carya aquatica

Water Hickory  
5 tin 9 cyuc 1 kcaak 0 tcan 0 dwat 20 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli fyif hjonli

drutta *Carya aquatica* is a deciduous Tree growing to 20 m (65ft 7in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf from June to October, in flower from April to May. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: Seed - raw or cooked. Astringent[177]. The seed is up to 35mm long, it is produced in clusters of 3 - 4 and has a thin shell, but the kernel is very bitter[11, 82, 229]. The seed ripens in late autumn and, when stored in its shell in a cool place, will keep for at least 6 months[K].

tcanta Fuel WoodWood - heavy and close grained but soft and brittle, which limits its use[229, 235]. It weighs 46lb per cubic foot and is used mainly in fencing and as a fuel, where it yields considerably more heat than most woods[229, 235].

dwatta None known  
propta Seed - requires a period of cold stratification. It is best sown in a cold frame as soon as it is ripe[78].

Stored seed should be kept moist (but not wet) prior to sowing and should be sown in a cold frame as soon as possible[78]. Where possible, sow 1 or 2 seeds only in each deep pot and thin to the best seedling. If you need to transplant the seedlings, then do this as soon as they are large enough to handle, once more using deep pots to accommodate the tap root. Put the plants into their permanent positions as soon as possible, preferably in their first summer, and give them some protection from the cold for at least the first winter[78, K]. Seed can also be sown in situ so long as protection is given from mice etc and the seed is given some protection from cold[200] (a plastic bottle with the top and bottom removed and a wire mesh top fitted to keep the mice out is ideal)

nwatta Prefers a deep moisture-retentive loam in a sunny sheltered position, requiring a good summer for best development[1, 63, 137, 200]. A slow growing tree[200], it does not begin bearing seed until more than 20 years old[229]. Most species in this genus have quite a wide range of distribution and, in order to find trees more suited to this country, seed from the most appropriate provenances should be sought[137]. Most trees growing in Britain at present tend to only produce good seed after hot summers[137]. *Carya aquatica* hybridizes with *C. illinoensis* (C. × *lecontei* Little) and is reported to hybridize with the tetraploid C. texana [C. × *ludoviciana* (Ashe) Little][270]. Plants are strongly tap-rooted and should be planted in their permanent positions as soon as possible[1, 137]. Sowing in situ would be the best method so long as the seed could be protected from mice[1, 200]. Trees are late coming into leaf (usually late May to June) and lose their leaves early in the autumn (usually in October)[137]. During this time they cast a heavy shade. These factors combine to make the trees eminently suitable for a mixed woodland planting with shrubs and other trees beneath them[137]. Plants in this genus are notably resistant to honey fungus[200]. Trees are self-fertile but larger crops of better quality seeds are produced if cross-pollination takes place[229].

### 6.2.449 Calocedrus decurrens

Incense Cedar, California Incense Cedar  
5 tin 8 cyuc 1 kcaak 0 tcan 1 dwat 15 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli hjonli

drutta *Calocedrus decurrens* is an evergreen Tree growing to 15 m (49ft) by 2 m (6ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower in May, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Edible Uses: CondimentThe dense leaflets have been used as a flavouring and protection when leaching acorns[257].

tcanta Basketry Broom Containers Miscellany WoodThe boughs and twigs have been used to make brooms[257]. The roots have been used as overlay twine warps and overlay twine weft bases in making baskets[257]. The bark has been made into baskets[257]. Wood - soft, light, close grained, very durable in the soil though it is often damaged by dry rot[82]. It has a powerful, incense-like fragrance[245] and is used for making shingles, lathes, fencing, pencils, construction etc[46, 61, 81, 171]. Mature trees are often infected by dry rot, so they are not considered to be a major timber species[229].

dwatta Miscellany StomachicA decoction of the leaves has been used to treat stomach troubles[257]. Steam from an infusion of the leaves has been inhaled in the treatment of colds[257].

propta Seed - sow early spring in a greenhouse[245]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in a greenhouse or cold frame for their first winter. Plant them out in late spring or early summer, after the last expected frosts and consider giving them some protection from the cold for their first winter outdoors. Cuttings of the current season's

order to produce fruit and fertile seed[11, 200]. Special Features:Attractive foliage, Not North American native, Blooms are very showy.

### 6.2.499 Vaccinium elliottii

Elliott's blueberry  
5 tin 9 cyuc 1 kcaak 0 tcan 0 dwat 4 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta *Vaccinium elliottii* is a deciduous Shrub growing to 4 m (13ft 1in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105, 177]. The fruit is about 8mm in diameter[200].  
tcanta None known  
dwatta None known  
propta Seed - sow late winter in a greenhouse in a lime-free potting mix and only just cover the seed[78]. Stored seed might require a period of up to 3 months cold stratification[113]. Another report says that it is best to sow the seed in a greenhouse as soon as it is ripe[200]. Once they are about 5cm tall, prick the seedlings out into individual pots and grow them on in a lightly shaded position in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 8cm with a heel, August in a frame[78]. Slow and difficult. Layering in late summer or early autumn[78]. Another report says that spring is the best time to layer[200]. Takes 18 months[78]. Division of suckers in spring or early autumn[113].

nwatta Requires a moist but freely-draining lime free soil, preferring one that is rich in peat or a light loamy soil with added leaf-mould[11, 200]. Prefers a very acid soil with a pH in the range of 4.5 to 6, plants soon become chlorotic when lime is present. Succeeds in full sun or light shade though it fruits better in a sunny position[200]. Requires shelter from strong winds[200]. Dislikes root disturbance, plants are best grown in pots until being planted out in their permanent positions[200]. Plants in this genus are notably resistant to honey fungus[200].

### 6.2.500 Euonymus sachalinensis

Euonymus  
5 tin 8 cyuc 1 kcaak 0 tcan 0 dwat 3.5 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Euonymus sachalinensis* is a deciduous Shrub growing to 3.5 m (11ft 6in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. The seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young leaves - boiled[105, 177]. Some caution is advised, see the notes above regarding possible toxicity.

tcanta WeavingThe white inner bark is used in making string shoes[151].

dwatta None known  
propta Seed - best sown as soon as it is ripe in a cold frame[121]. Stored seed requires 3 months cold stratification, so should be sown as early in the year as possible in a cold frame[113]. The seed can take 18 months to germinate. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 7cm long taken at a node or with a heel, July/August in a frame. Very easy[200].

nwatta Landscape Uses:Massing, Screen. Thriving in almost any soil, including chalk, it is particularly suited to dry shaded areas[200]. Prefers a well-drained loamy soil[11]. A plant in an open position at Cambridge Botanical Gardens was 2 metres tall and laden with fruit in September 1989[K]. This species is often confused with *E. planipes*[121]. Special Features:Not North American native, Inconspicuous flowers or blooms.

### 6.2.501 Cotoneaster franchetii

Orange cotoneaster  
5 tin 9 cyuc 1 kcaak 0 tcan 0 dwat 3 m hkuc pcmimimhtut cyutli kyuctcup hwicli hyishrasjlutnyikfrip hpa7tli flatprikliwsslip hpa7tmwatli xre7t hjonli

drutta *Cotoneaster franchetii* is an evergreen Shrub growing to 3 m (9ft) by 3 m (9ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower in May, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies, midges. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerate maritime exposure. It can tolerate atmospheric pollution.

kcakta The fruit has a mild flavour though it is very mealy and full of seeds[K].

tcanta Dye Hedge HedgeA rose-tan dye is obtained from the fruit[168]. The plant can be grown as an informal wind-break hedge in all but the most exposed situations[29, 75, 200]. Tolerates trimming[75].

dwatta None known  
propta Seed. Members of this genus hybridize freely so, if you require seed that breeds true, it is important to obtain it from a known wild source or from a controlled fertilization of garden plants. The seed is best sown as soon as it is ripe in the autumn in a cold frame, when it will usually germinate in the spring[11, 200]. Stored seed germinates faster if given 3 months warm stratification at 15°C and then 3 months cold stratification at 4°C[164]. The seed usually germinates within 1 - 18 months at 15°C but it can take 2 years[164]. Pot the seedlings up as soon as they are large enough to handle and plant them out into nursery beds or into their permanent positions when they are more than 10cm tall. Cuttings of half-ripe wood with a heel, July/August in a frame[11, 200].

nwatta An easily grown plant, it prefers a good soil but also does well in poor soils[1, 11, 200]. It thrives in lime and is also happy in peaty soils[1]. It succeeds in any soil that is not marshy or waterlogged[11, 200]. Succeeds in dry soils[188]. Grows well in heavy clay soils. Succeeds in full sun or semi-shade but does not fruit so freely in a shady position[11, 200]. Plants also succeed in deep shade[219]. Tolerates atmospheric pollution[200]. Fairly tolerant of maritime exposure[75, 200]. Plants are hardy to about -15°C[184]. Hybridizes freely with other members of this genus[200]. The flowers, when inhaled near to, have an unpleasant smell like decaying fish[245]. They are very attractive to bees whilst the fruit is a good winter food source for many species of birds[200]. Trees are notably susceptible to honey fungus[200].

### 6.2.502 Eremurus robustus

5 tin 9 cyuc 1 kcaak 0 tcan 0 dwat 3 m hkuc htut cyutli hgatkyuctcup hwicli hrasjlut hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Eremurus robustus* is a PERENNIAL growing to 3 m (9ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

## 6.2.496 Bryonia alba

White Bryony

5 tlin 9 cyuc 1 kcaok 0 tcan 2 dwat 4 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli prikrlwis hpa7tmwatli hjonli

drutta Bryonia alba is a PERENNIAL CLIMBER growing to 4 m (13ft 1in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to June. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: One report says that the young shoots are edible[2], though caution is advised[K]. See the notes above on toxicity. The starch of the root is a famine food for extending bread flour after removing the acrid element. The young shoots are eaten. Caution: It is probably very poisonous [1b].

tcanta None known

dwatta Antirheumatic Homeopathy UrinaryThe root is cathartic, hydrogogue, irritant, pectoral and purgative[4]. The root is harvested in the autumn and can be used either fresh or dried[4]. It should be used with great caution, see notes above on toxicity. The fresh root, gathered before the plant comes into flower, is made into a homeopathic remedy[232]. This is used in the treatment of a wide range of complaints[232]. It is said to be one of the best diuretics and an excellent remedy for gravel as well as all other obstructions and disorders of the urinary passage[4].

propta Seed - best sown as soon as it is ripe in a cold frame. Sow stored seed in late winter in a cold frame. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter, planting them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in early spring.

nwatta A rapid grower, it is of easy cultivation succeeding in most soils that are well drained[1], avoiding acid soils in the wild[17]. A climbing plant, attaching itself to other plants by means of tendrils[4]. Plants can be easily encouraged by scattering ripe seed at the base of hedgerows[200]. Plants in the north of their range are monoecious, but those growing in the south are dioecious[200]. Where necessary, male and female plants must be grown if seed is required.

## 6.2.497 Salix aegyptiaca

5 tlin 9 cyuc 1 kcaok 2 tcan 2 dwat 4 m hkuc htut cyutli tucphja7n hwicli hrasjlutnyikfrip hpa7tli flatprik hpa7tmwatli nyanhjen hjonli

drutta Salix aegyptiaca is a deciduous Shrub growing to 4 m (13ft) by 5 m (16ft). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from January to February. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers moist or wet soil.

kcakta Edible Parts: Flowers Inner bark LeavesEdible Uses: Drinkinner bark - raw or cooked. It can be dried, ground into a powder and added to cereal flours for use in making bread etc. A famine food, it is only used when all else fails[172]. Young shoots - cooked. They are not very palatable[172]. Male catkins - sugared[11, 177]. A perfumed drink is made from the catkins[11].

tcanta Dynamic accumulator.

dwatta Anodyne FebrifugeThe fresh bark of all members of this genus contains salicin[226], which probably decomposes into salicylic acid (closely related to aspirin) in the human body[213]. This is used as an anodyne and febrifuge[226].

propta Seed - must be surface sown as soon as it is ripe in late spring. It has a very short viability, perhaps as little as a few days. Cuttings of mature wood of the current

year's growth, November to February in a sheltered outdoor bed or planted straight into their permanent position and given a good weed-suppressing mulch. Very easy. Plant into their permanent positions in the autumn. Cuttings of half-ripe wood, June to August in a frame. Very easy.

nwatta Succeeds in most soils, including wet, ill-drained or intermittently flooded soils[1, 11], but prefers a damp, heavy soil in a sunny position[200]. Rarely thrives on chalk[200]. Closely related to *S. cinerea*[1]. Hybridizes freely with other members of this genus[200]. Although the flowers are produced in catkins early in the year, they are pollinated by bees and other insects rather than by the wind[11]. Plants in this genus are notably susceptible to honey fungus[200]. Dioecious. Male and female plants must be grown if seed is required.

## 6.2.498 Viburnum plicatum

Japanese Snowball, Japanese Snowball Viburnum, Doublefile Viburnum

5 tlin 8 cyuc 1 kcaok 0 tcan 0 dwat 4 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwis hpa7tmwatli dyakre7t hjonli

drutta Viburnum plicatum is a deciduous Shrub growing to 4 m (13ft) by 4 m (13ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from June to July, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Fruit LeavesEdible Uses: Fruit - raw or cooked. Young leaves - cooked[177]. Rather unpleasant[K].

tcanta None known

dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe. Germination can be slow, sometimes taking more than 18 months. If the seed is harvested 'green' (when it has fully developed but before it has fully ripened) and sown immediately in a cold frame, it should germinate in the spring[80]. Stored seed will require 2 months warm then 3 months cold stratification and can still take 18 months to germinate[113]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame or greenhouse. Plant out into their permanent positions in late spring or early summer of the following year. Cuttings of soft-wood, early summer in a frame[200]. Pot up into individual pots once they start to root and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, 5 - 8 cm long with a heel if possible, July/August in a frame[78, 113]. Plant them into individual pots as soon as they start to root. These cuttings can be difficult to overwinter, it is best to keep them in a greenhouse or cold frame until the following spring before planting them out[113]. Cuttings of mature wood, winter in a frame. They should root in early spring - pot them up when large enough to handle and plant them out in the summer if sufficient new growth is made, otherwise keep them in a cold frame for the next winter and then plant them out in the spring. Layering of current seasons growth in July/August. Takes 15 months[78].

nwatta Landscape Uses:Border, Massing, Screen, Specimen. An easily grown plant, it succeeds in most soils but is ill-adapted for poor soils and for dry situations[1]. It prefers a deep rich loamy soil in sun or semi-shade[11, 200]. Best if given shade from the early morning sun in spring[200]. A very hardy plant, tolerating temperatures down to about -25°C. Plants are surface-rooting and are very susceptible to damage by hoeing, drought or water-logging. A section of top growth will often die back if the roots are damaged, in severe cases this will lead to the death of the plant[202]. A very ornamental plant, there are many named varieties[182, 202]. The type species is actually a sterile garden form. The true wild species is often referred to as *V. plicatum tomentosum*. (Thunb.)Miq. Plants take about 5 years from planting out before they produce fruit[202]. Fruit production can be erratic[202]. Plants are self-incompatible and need to grow close to a genetically distinct plant in the same species in

growth, taken in mid autumn, in a light sandy soil in a cold frame[245].

nwatta Landscape Uses:Pest tolerant, Screen, Specimen. Succeeds in full sun in a moist well-drained soil that is neutral to acid, though it will also survive on dry alkaline soils[200]. Plants are shade tolerant when young[200]. It grows best in a position that is sheltered from strong winds[245]. Trees are slow growing but long-lived in the wild, with specimens up to 1000 years old recorded[229]. They grow slowly in Britain, but they are perfectly hardy[11]. Young trees can grow 60cm in a year but they seldom average more than 30cm[185]. Growth virtually stops once the tree reaches 25 metres tall[185]. All parts of the plant are strongly aromatic[188, 245]. This species is strongly resistant to honey fungus[81, 188]. The tree exhibits very different crown habits dependant upon the area in which it is being grown[185, 200]. At one time these different habits were considered to be different sub-species, but it is recognised now that it is only climatic forces that cause the differences. Special Features: North American native, Fragrant foliage, Inconspicuous flowers or blooms.

## 6.2.450 Thuja orientalis

Biota

5 tlin 9 cyuc 1 kcaok 0 tcan 3 dwat 15 m hkuc hmimhtut cyutli hgatkyuctcp hwicli hrasjlutnyik hpa7tli flatprikwsslip hpa7tmwatli hjonli

drutta Thuja orientalis is an evergreen Tree growing to 15 m (49ft) by 5 m (16ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought. It can tolerate atmospheric pollution.

kcakta Edible Parts: SeedEdible Uses: Seed - after removing the bitterness[105, 179]. No more details are given, but the bitterness in seeds is usually removed either by leaching them in water or by thoroughly cooking them[K].

tcanta Dye Hedge Hedge Parasiticide WoodTolerant of regular trimming, though not into old wood, it can be grown as a dense hedge[149]. A yellow dye is obtained from the young branches[4]. Wood - durable in the soil, moderately hard, close grained, rather coarse grained, light, soft, brittle. Used for construction, cabinet making, cooperage[4, 146, 149, 227].

dwatta Antiasthmatic Antibacterial Antipyretic Antitussive Aperient Astringent Diuretic Dysentery Emmenagogue Emollient Expectorant Haemostatic Lenitive Parasiticide Sedative Skin StomachicThis plant is commonly used in Chinese herbalism, where it is considered to be one of the 50 fundamental herbs[218]. Both the leaves and the seeds contain an essential oil consisting of borneol, bornyl acetate, thujone, camphor and sesquiterpenes[283]. The leaves also contain rhodoxanthin, amentoflavone, quercetin, myricetin, carotene, xanthophyll and ascorbic acid[283]. The leaves are antibacterial, antipyretic, antitussive, astringent, diuretic, emmenagogue, emollient, expectorant, febrifuge, haemostatic, refrigerant and stomachic[147, 176, 218, 238]. Their use is said to improve the growth of hair[147, 176, 238]. They are used internally in the treatment of coughs, haemorrhages, excessive menstruation, bronchitis, asthma, skin infections, mumps, bacterial dysentery, arthritic pain and premature baldness[238]. The leaves are harvested for use as required and can be used fresh or dried[238]. This remedy should not be prescribed to pregnant women[238]. The seed is aperient, lenitive and sedative[147, 176, 218]. It is used internally in the treatment of palpitations, insomnia, nervous disorders and constipation in the elderly[238]. The root bark is used in the treatment of burns and scalds[216]. The stems are used in the treatment of coughs, colds, dysentery, rheumatism and parasitic skin diseases[218].

propta Seed - best sown when ripe in the autumn in a cold frame. Stored seed germinates best if given a short cold stratification. It can then be sown in a cold frame in late winter. Plants make very little growth in their first year[78].

When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. If there is sufficient seed it is worthwhile trying a sowing in an outdoor seed bed in April[78]. Grow the plants on for at least two years before planting them out in the winter. Cuttings of half-ripe wood, 5 - 8cm with a heel, July/August in a shaded frame. Forms roots by the end of September but should be overwintered in a frame[78]. Cuttings of almost ripe wood, 5 - 10cm with a heel, September in a cold frame. Forms roots in the following summer. Plant out in autumn or spring[78].

nwatta Prefers a moist loamy soil[149]. Grows best on dry freely draining sites, often alkaline in reaction[200]. Does well over old building rubble[200]. Tolerant of dry dusty sites and of atmospheric pollution in towns[81]. Prefers a sunny sheltered position[238]. Easily transplanted[149]. There are many named varieties selected for their ornamental value. Produces seed freely in cultivation[200]. A slow growing tree, it does not really thrive in Britain[11], especially in the western part of the country[200]. The best specimens are to be found in towns or cities such as Oxford and very sharply drained soils in gardens[185]. Plants cannot regenerate from old wood. Pruning is not normally necessary for this species, any pruning that is carried out should be done with care[238]. Plants are susceptible to attacks by honey fungus[238]. Plants are monoecious, male catkins being produced at the tips of branches and female cones at the base[283].

## 6.2.451 Schizophragma hydrangeoid

Japanese Hydrangea Vine

5 tlin 8 cyuc 1 kcaok 0 tcan 0 dwat 12 m hkuc pcimhmhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikrlwis hpa7tmwatli xre7t hjonli

drutta Schizophragma hydrangeoides is a deciduous Climber growing to 12 m (39ft) by 12 m (39ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves - cooked[105, 177].

tcanta Plants can be allowed to sprawl and are then used as a ground cover for a shady position[188, 208].

dwatta None known

propta Seed - sow late winter to early spring in a greenhouse. Germination is usually fair to very good[78]. Prick out the seedlings into individual pots once they are large enough to handle and grow them on in light shade in the greenhouse for their first winter, planting them out in late spring or early summer. Layering in spring directly into pots. A fair to good percentage[78], though it can be difficult to find suitable low growth[202]. Cuttings of half-ripe wood, 4 - 5cm with a heel, July in a frame[1, 78]. Keep the cuttings moist[78].

nwatta Landscape Uses:Arbor. Requires a moist leafy soil and some shade at the roots. An easily grown plant[1], it prefers a good loamy soil and plenty of moisture[11]. Succeeds on most soil types, disliking only very alkaline soils[202]. Plants succeed in sun or shade[182], though they prefer full sun[202, 219]. In the hotter parts of Britain they prefer shade from the midday sun[219]. They succeed on north-facing walls[188, 219]. The fully dormant plant is hardy to about -20°C[182, 200]. Plants are slow to establish and slow-growing when young, though they speed up somewhat with age[202]. Plants do not normally require pruning, though any unwanted growth can be removed in the winter[219]. Plants have a similar growth habit to ivy (*Hedera helix*) climbing trees by means of aerial roots or growing along the woodland floor[1, 182]. Plants might need some help to become attached in their early years[182]. Some named varieties have been developed for their ornamental value[182]. Special Features:Not North American native, Attractive flowers or blooms.

## 6.2.452 Pterostyrax corymbosa

Epaulette Tree

5 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 12 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli frusflatprik hpa7tmwatli xre7t hjonli

drutta Pterostyrax corymbosa is a deciduous Tree growing to 12 m (39ft 4in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to July. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves - cooked. A famine food, it is only used when all else fails[179].

tcanta None known  
dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed requires 3 months cold stratification at 5°C[200]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse or cold frame for their first winter. Plant them out in the late spring or early summer of the following year. Cuttings of half-ripe wood, July/August in a frame[200]. Layering[200].

nwatta Requires a good loamy soil and a sunny position[1]. Requires a deep acid soil in sun or semi-shade[200]. A fast-growing tree[200]. Often confused with *P. hispida*[1]. Flowers are most abundantly produced on wood that was well-ripened the previous summer[200]. Plants in this genus are notably resistant to honey fungus[200].

## 6.2.453 Melittis melissophyllum

Bastard Balm

5 tlin 9 cyuc 1 kcaak 0 tcan 1 dwat m hkuc hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Melittis melissophyllum is a PERENNIAL growing to 0.3 m (1ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, moths. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: Edible Uses: TeaA coumarin scented (like new-mown hay) herb, it is occasionally used for making a 'Maiwein' or 'Maibowle' type of beverage[183].

tcanta None known

dwatta Astringent Blood purifier Diuretic Emmenagogue Sedative VulneraryAstringent, blood purifier, diuretic, emmenagogue, sedative, vulnerary[61].

propta Seed - best sown in a cold frame in the autumn[188]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring[200] or autumn[188]. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Succeeds in any good soil in partial shade[1, 187]. Prefers a rich loam[1]. Grows well in thickets, woodland edges and the garden border[1]. Plants are hardy to about -20°C[187]. The flowers have a pleasing sweet honey-like scent[245]. The leaves become sweetly fragrant as they dry[245], they retain their fragrance for a long time[200]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 6.2.454 Ligusticum mutellina

Mountain Lovage, Alpine lovage

5 tlin 9 cyuc 1 kcaak 0 tcan 1 dwat m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyixre7t hjonli

drutta Ligusticum mutellina is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 6. The species is hermaphrodite (has both male

and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: TeaLeaves. Used as a parsley substitute[46, 61, 177]. The dried leaves are a tea substitute[46, 61].

tcanta None known

dwatta StomachicStomachic[46, 61].

propta The seed is best sown as soon as it is ripe in a cold frame in the autumn. Stored seed should be sown as early in the year as possible in a greenhouse or cold frame[200]. Prick out the seedlings into individual pots when they are large enough to handle and plant them out into their permanent positions in the summer if they have grown large enough. Otherwise, keep them in a cold frame for the first winter and plant them out in early summer. Division in spring.

nwatta Succeeds in any well-drained soil in a sunny position[200].

## 6.2.455 Salix x mollissima hippophaeifolia

5 tlin 9 cyuc 1 kcaak 3 tcan 2 dwat m hkuc htut cyutli tcuphja7n hwicli hrasjlutnyikfrip hpa7tli flatprik hpa7tmwatli nyanhjen hjonli

drutta Salix x mollissima hippophaeifolia is a deciduous Shrub growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers moist or wet soil.

kcakta Edible Parts: Inner bark LeavesEdible Uses: Inner bark - raw or cooked. It can be dried, ground into a powder and then added to cereal flour for use in making bread etc. A very bitter flavour, it is a famine food that is only used when all else fails[172]. Young shoots - cooked. Not very palatable[172].

tcanta BasketryThe stems are very flexible and are used in basket making[131]. The plant is usually coppiced annually when grown for basket making, though it is possible to coppice it every two years if thick poles are required as uprights. Succeeds in wet, ill-drained or intermittently flooded soils[1, 11]. Dynamic accumulator.

dwatta Anodyne FebrifugeThe fresh bark of all members of this genus contains salicin[226], which probably decomposes into salicylic acid (closely related to aspirin) in the human body[213]. This is used as an anodyne and febrifuge[226].

propta Seed - must be surface sown as soon as it is ripe in late spring. It has a very short viability, perhaps as little as a few days. This is a hybrid species and it will not breed true from seed. Cuttings of mature wood of the current year's growth, November to February in a sheltered outdoor bed or planted straight into their permanent position and given a good weed-suppressing mulch. Very easy. Plant into their permanent positions in the autumn. Cuttings of half-ripe wood, June to August in a frame. Very easy.

nwatta Succeeds in most soils, including wet, ill-drained or intermittently flooded soils[1, 11], but prefers a damp, heavy soil in a sunny position[200]. Rarely thrives on chalk[200]. Hybridizes freely with other members of this genus[200]. Although the flowers are produced in catkins early in the year, they are pollinated by bees and other insects rather than by the wind[11]. Plants in this genus are notably susceptible to honey fungus[200]. Plants are rarely bisexual[200], but they are usually dioecious and then male and female plants must be grown if seed is required.

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwissip hpa7tmwatli xre7t hjonli

drutta Clematis flammula is a deciduous Climber growing to 4 m (13ft) by 4 m (13ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf from March to December, in flower from August to October, and the seeds ripen from October to January. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: LeavesEdible Uses: Young shoots - cooked[1, K5, 177]. Some caution is advised due to reports of toxicity[K].

tcanta Plants can be grown as ground cover, planted about 1.2 metres apart and allowed to scramble over the ground[208].

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame[164, 200]. Sow stored seed as soon as it is obtained in a cold frame. Pre-soak the seed for 12 hours in warm water and remove as much of the tail and outer coat as possible[164]. A period of cold stratification is beneficial[164]. The seed germinates in 1 - 9 months or more at 20°C[164]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant out in late spring or early summer, after the last expected frosts. Internodal cuttings of soft to semi-ripe wood, late spring in sandy soil in a frame[200]. Cuttings of half-ripe inter-nodal cuttings, June/July in a frame[202]. Layering of old stems in late winter or early spring[200]. Layering of current seasons growth in early summer[200].

nwatta Prefers a deep moist well-drained soil with its roots in the shade[182, 200]. Dislikes poorly-drained heavy clay soils, but grows well in clay if grit is added for drainage[11, 200]. Dislikes light sandy soils[11]. Does well on chalk[1]. Succeeds in acid as well as alkaline soils[200]. Thrives in exposed positions[182]. Plants are hardy to about -15°C[202]. A twining plant[182], it is fast growing[202]. The leafstalks wrap themselves around twigs and branches for support. When a side of the stalk touches an object, the growth on that side slows down whilst the other side grows at its normal rate - this causes the leaf stalk to entwine the object it is touching[212]. When planting out, in order to avoid the disease 'clematis wilt', it is best to plant the rootball about 8cm deeper in the soil. This will also serve to build up a good root crown of growth buds[200]. A very ornamental plant[1], the flowers are very fragrant[202]. They have a pronounced smell of meadowsweet, almost too powerful when inhaled close-up[245]. They are produced on the current season's growth and so any pruning of the plant is best carried out in the spring before new growth begins[219]. Plants rarely produce fertile seed in Britain[219]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54]. Plants seem to be immune to the predations of rabbits[233]. This species is notably resistant to honey fungus[88, 200].

## 6.2.494 Clematis patens

5 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 4 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Clematis patens is a deciduous Climber growing to 4 m (13ft 1in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to July, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young shoots - cooked[105, 177]. Some caution is advised, see the notes above on toxicity.

tcanta None known

Plant out in late spring or early summer, after the last expected frosts. Internodal cuttings of soft to semi-ripe wood, late spring in sandy soil in a frame[200]. Layering of old stems in late winter or early spring[200]. Layering of current seasons growth in early summer[200].

nwatta Prefers a deep moist soil with its roots in the shade[11, 200]. Dislikes poorly-drained heavy clay soils, but grows well in clay if grit is added for drainage[11, 200]. Dislikes light sandy soils[11]. Does well on chalk[1]. Succeeds in acid as well as alkaline soils[200]. When planting out, in order to avoid the disease 'clematis wilt', it is best to plant the rootball about 8cm deeper in the soil. This will also serve to build up a good root crown of growth buds[200]. A twining plant[182]. The leafstalks wrap themselves around twigs and branches for support. When a side of the stalk touches an object, the growth on that side slows down whilst the other side grows at its normal rate - this causes the leaf stalk to entwine the object it is touching[212]. Plants do not generally require pruning, any dead, unwanted or weak shoots are best removed in the winter or early spring[219]. Plants in this genus are notably resistant to honey fungus[200]. Plants seem to be immune to the predations of rabbits[233]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

## 6.2.495 Staphylea colchica

Bladdernut

5 tlin 9 cyuc 1 kcaak 0 tcan 1 dwat 4 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Staphylea colchica is a deciduous Shrub growing to 4 m (13ft) by 4 m (13ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to June, and the seeds ripen from September to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers OilEdible Uses: OilFlower buds[74]. No further details are given.

tcanta OilAn oil from the seed tastes like pistachio nuts but is purgative[74]. The report did not say if the oil had other uses.

dwatta PurgativePurgative[74].

propta Seed - this can be very slow to germinate, sometimes taking 18 months or more. It is best sown as soon as it is ripe in a cold frame[200], and some of it at least should then germinate in the spring. Stored seed should be sown as early in the year as possible and given cold stratification - it might not germinate until spring of the following year. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in the greenhouse for their first winter. Plant them out early the following summer. Cuttings of half-ripe wood, 5 - 8cm with a heel, July/August in a frame. Fair to good percentage[78]. Layering in July/August. Takes 15 months. Good percentage[78].

nwatta Tolerant of a wide range of soils so long as they are not too dry[182, 200], it prefers a rich loamy soil in full sun or semi-shade[1, 11, 200]. Prefers a neutral to acid soil but tolerates some alkalinity[202]. A very ornamental plant, it is hardy to about -20°C[184]. Fairly fast-growing when young, but slowing with age[202]. Flowers best in years that follow hot summers[200]. Plants in this genus are notably resistant to honey fungus[200].

winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood 10 - 15cm taken at a node, July/August in a frame. Plant out in autumn or spring. A very high percentage, they root within 3 weeks[78]. Cuttings of mature wood in a sheltered outdoor bed. Good percentage[78]. Layering in spring or summer. Plants often self-layer[K].

nwatta An easily grown plant, it succeeds in all soil types[202] but prefers a rich soil. Succeeds in limey soils. Grows well in heavy clay soils. It prefers a sunny position but succeeds in semi shade though it is apt to get leggy if grown in the shade of trees[182]. Succeeds against a north-facing wall[219]. Plants are hardy to about -25°c[184]. The flowers are produced quite early in the year and are frost-resistant[182]. Plants are medium to fast growing[202]. Flowers are produced on wood that is more than one year old[202]. Any pruning is best done after the plant has finished flowering[182]. A very ornamental plant, there are several named varieties[182]. This species is notably susceptible to honey fungus[200]. Special Features: Not North American native, Blooms are very showy. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is fleshy. Thick or swollen - fibrous or tap root [2-1].

### 6.2.491 Clematis chinensis

Wei Ling Xian

5 tlin 9 cyuc 1 kcaak 0 tcan 2 dwat 5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwsslip hpa7tmwatli xre7t hjonli

drutta Clematis chinensis is a deciduous Climber growing to 5 m (16ft) by 5 m (16ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from September to October, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young shoots - cooked[179]. They are said to be non-toxic in one report[179] but caution is still advised due to reports of toxicity in this genus[238]. It is quite probable that cooking destroys the acrimonious principle, though this is a plant that I have no desire to eat[K].

tcanta None known

dwatta Anodyne Antidote Antiperiodic Antirheumatic Antispasmodic Antitumor Cancer Carminative DiureticThe root is anodyne, antidote, antiperiodic, antispasmodic, carminative, diuretic and sedative[147, 176, 178, 218, 238]. A decoction is taken internally in the treatment of rheumatism and arthritis, tetanus and cold-type stomach-ache[147, 238]. The root is harvested in the autumn and dried for later use[238]. The whole plant is antirheumatic[147, 176, 178, 218]. The plant has a history of folk use in the treatment of cancer[147, 176, 178, 218]. The root contains anemonin, this has antibacterial, analgesic, sedative and antispasmodic actions. It also inhibits the heart and central nervous system and is rubefacient[176].

propta Seed - best sown as soon as it is ripe in a cold frame[164, 200]. Sow stored seed as soon as it is obtained in a cold frame. Pre-soak the seed for 12 hours in warm water and remove as much of the tail and outer coat as possible[164]. A period of cold stratification is beneficial[164]. The seed germinates in 1 - 9 months or more at 20°c[164]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for the first winter. Plant out in late spring or early summer, after the last expected frosts. Internodal cuttings of soft to semi-ripe wood, late spring in sandy soil in a frame[200]. Layering of old stems in late winter or early spring[200]. Layering of current seasons growth in early summer[200].

nwatta Prefers a deep moist soil with its roots in the shade and its shoots growing up to the light[164]. Dislikes poorly-drained heavy clay soils, but grows well in clay if grit is added for drainage[11, 200]. Dislikes light sandy soils[11].

Does well on chalk[11]. Succeeds in acid as well as alkaline soils[200]. When planting out, in order to avoid the disease 'clematis wilt', it is best to plant the rootball about 8cm deeper in the soil. This will also serve to build up a good root crown of growth buds[200]. A twining plant[182]. The leaf-stalks wrap themselves around twigs and branches for support. When a side of the stalk touches an object, the growth on that side slows down whilst the other side grows at its normal rate - this causes the leaf stalk to entwine the object it is touching[212]. Plants flower in the autumn on the current season's growth, any pruning is best carried out in the spring before new growth begins[219, 238]. The flowers are produced quite late in the season and can be damaged by late frosts, so plants generally do better in the milder western parts of the country[219]. Plants in this genus are notably resistant to honey fungus[200]. Plants seem to be immune to the predations of rabbits[233]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54]. The flowers are often damaged by winter cold[11].

### 6.2.492 Viburnum cylindricum

5 tlin 9 cyuc 1 kcaak 0 tcan 1 dwat 5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli dyatxre7t hjonli

drutta Viburnum cylindricum is an evergreen Shrub growing to 5 m (16ft 5in). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Oil OilEdible Uses: Oil OilAn edible oil is obtained from the seed[105, 146, 158, 179]. It is used for cooking[272].

tcanta Oil Oil WoodAn oil from the seed is used as a luminant[146]. Wood - hard, close grained[146, 158].

dwatta SkinThe oil from the seed is used to soothe itchy skin[272].

propta Seed - best sown in a cold frame as soon as it is ripe. Germination can be slow, sometimes taking more than 18 months. If the seed is harvested 'green' (when it has fully developed but before it has fully ripened) and sown immediately in a cold frame, it should germinate in the spring[80]. Stored seed will require 2 months warm then 3 months cold stratification and can still take 18 months to germinate[113]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame or greenhouse. Plant out into their permanent positions in late spring or early summer of the following year. Cuttings of soft-wood, early summer in a frame[200]. Pot up into individual pots once they start to root and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, 5 - 8 cm long with a heel if possible, July/August in a frame[78, 113]. Plant them into individual pots as soon as they start to root. These cuttings can be difficult to overwinter, it is best to keep them in a greenhouse or cold frame until the following spring before planting them out[113]. Cuttings of mature wood, winter in a frame. They should root in early spring - pot them up when large enough to handle and plant them out in the summer if sufficient new growth is made, otherwise keep them in a cold frame for the next winter and then plant them out in the spring. Layering of current seasons growth in July/August. Takes 15 months[78].

nwatta An easily grown plant, succeeding in most soils but ill-adapted for poor soils and dry situations[11]. Prefers a deep rich loamy soil in sun or semi-shade[11, 200]. Best if given shade from the early morning sun in spring[200]. Plants are self-incompatible and need to grow close to a genetically distinct plant in the same species in order to produce fruit and fertile seed[11, 200]. The flowers are sweetly scented[245].

### 6.2.493 Clematis flammula

Fragrant Virgin's Bower, Fragrant clematis  
5 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 4 m hkuc

### 6.2.456 Aconitum violaceum

5 tlin 9 cyuc 1 kcaak 0 tcan 1 dwat m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprikliw hpa7tmwatli hjonli

drutta Aconitum violaceum is a PERENNIAL. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from August to October. The flowers are pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Root - cooked[177]. It is eaten as a pleasant tonic[240]. These reports should be treated with great distrust due to the poisonous nature of the genus[K].

tcanta None known

dwatta Antidote Antiinflammatory FebrifugeThe entire plant is used in Tibetan medicine, it is said to have a bitter taste and a cooling potency[241]. Antidote, anti-inflammatory and febrifuge, it is used in the treatment of snake and scorpion bites, contagious infections and inflammation of the intestines[241].

propta Seed - best sown as soon as it is ripe in a cold frame[111]. The seed can be stratified and sown in spring but will then be slow to germinate[133]. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for their first winter. Plant them out in late spring or early summer. Division - best done in spring but it can also be done in autumn[1, 111]. Another report says that division is best carried out in the autumn or late winter because the plants come into growth very early in the year[233].

nwatta We have very little information on this species and do not know if it will be hardy in Britain, though judging by the native range of the plant it should succeed outdoors in many parts of the country. It is a polymorphic species[51]. The following notes are based on the general needs of the genus. Thrives in most soils and in the light shade of trees[1]. Grows well in heavy clay soils. Prefers a moist soil in sun or semi-shade[200]. Prefers a calcareous soil. Grows well in open woodlands[1, 4]. Members of this genus seem to be immune to the predations of rabbits and deer[233]. A greedy plant, inhibiting the growth of nearby species, especially legumes[54].

### 6.2.457 Leucocrinum montanum

Sand Lily, Common starlily

5 tlin 9 cyuc 1 kcaak 0 tcan 1 dwat m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli lwisslip hpa7tmwatli xre7t hjonli

drutta Leucocrinum montanum is a PERENNIAL growing to 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to June. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Root[105, 161, 257]. No more details are given.

tcanta None known

dwatta PoulitceA poultice of the pulverized roots has been applied to sores and swellings[257].

propta Seed - we have no details for this species but suggest sowing the seed in a greenhouse as soon as it is ripe if possible otherwise in early spring. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts.

nwatta Requires a sunny position in a well-drained but moisture-retentive alkaline soil[200]. Tolerates temperatures down to about -20°c[200].

### 6.2.458 Daphniphyllum macropodium

5 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat m hkuc

pcimhmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli nyanhjen hjonli

drutta Daphniphyllum macropodium is an evergreen Shrub growing to 6 m (19ft) by 6 m (19ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower in May, and the seeds ripen from August to October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves - cooked. A 'New Year's green'[177]. (This quite possibly relates to the Chinese new year which begins in February)

tcanta WoodWood - soft, close and even grained, very handsome. Used for turnery, carving etc[146]. The wood of the roots is especially handsome, it is deep red in colour[158].

dwatta None known

propta Seed - sow spring in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of moderately ripened wood, 7 - 10cm with a heel or at a junction with old wood, July in individual pots in a frame. The cuttings are slow to root, give them brisk bottom heat[78]. Fair percentage[78]. Layering of current seasons growth, 12cm long in August/September. Takes 12 - 18 months. High percentage[78].

nwatta Succeeds in any good soil, tolerating lime but perhaps not suitable for very chalky soils[11]. A useful plant for moist shady positions[11]. Dislikes cold drying winds. A very ornamental plant[1], it is hardy to about -20°c[184]. Plants have withstood 30° of frost at Kew Gardens, but prefer shelter[11]. Very closely related to D. himalense and possibly no more than a sub-species of that species[11]. The flowers have a pungent aroma[182]. They are produced in racemes on the previous year's wood[11]. Dioecious, male and female plants must be grown if seed is required.

### 6.2.459 Chelidonium majus

Greater Celandine, Swallow Wort, Greater Celandine

5 tlin 8 cyuc 1 kcaak 0 tcan 3 dwat m hkuc pcimhmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli fyfexre7t hjonli

drutta Chelidonium majus is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.4 m (1ft 4in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from May to August, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves OilEdible Uses: OilLeaves - cooked in small quantities[177]. They contain small amounts of toxic alkaloids[179]. The leaves are boiled with clean earth, the mixture is left overnight and then thoroughly washed in several changes of water[179]. Very much a famine food, to be used when all else fails!![K].

tcanta OilPlants rapidly form a ground cover, but should only be used in wild places because of their invasive nature[200]. Seed contains 50 - 66% of a fatty oil[74]. No more details given.

dwatta Acid Alterative Anodyne Antispasmodic Cancer Cholagogue Diaphoretic Diuretic Hydrogogue Narcotic Ophthalmic Purgative Stomachic WartsGreater celandine has a long history of herbal use[4]. Traditionally it was employed as an ophthalmic to treat and clear the eyesight whilst in

modern herbal medicine it is used more as a mild sedative, antispasmodic and detoxifying herb, relaxing the muscles of the bronchial tubes, intestines and other organs[254]. The latex is much used externally to treat warts. Caution should be employed, especially when the plant is used internally however, because it contains toxic alkaloids[7, 21]. The leaves and the sap are acrid, alterative, anodyne, antispasmodic, caustic, cholagogue, diaphoretic, diuretic, hydrogogue, narcotic, purgative[4, 7, 9, 21, 46, 165, 238]. They are used in the treatment of bronchitis, whooping cough, asthma, jaundice, gallstones and gallbladder pains[254]. The plant is harvested in the spring as it comes into flower; it is best used fresh[7], but can also be dried for later use[9]. The roots can also be used, these are harvested in the autumn and dried for later use[9]. The plant has anticancer properties and is analgesic[4, 218]. It is an important component of a stomach ulcer drug[218]. The plant has an abundant acrid bright-orange sap that stains the skin strongly and is powerfully irritant[4]. It is used as an external treatment to get rid of warts, ringworm and corns[13, 187, 222, 244] and has also been used to remove films from the cornea of the eye[4]. The plant contains the alkaloid chelidonium, which is similar to the alkaloid papaverine found in poppies. This alkaloid has antispasmodic and sedative effects on the bile ducts and bronchi. However, results have been inconsistent, especially if the preparation is not fresh[244]. The plant also contains the alkaloid sparteine, which restores normal rhythm to feeble arrhythmic myocardia[207]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve Chelidonium majus for liver and gallbladder complaints (see [302] for critics of commission E).

propta Seed - sow in situ February to May or August to November. Germination usually takes place within 1 - 12 months[164, 200]. The plant self-sows freely and should not need much encouragement. Division in March[111]. The plant bleeds profusely so this method is not recommended[200].

nwatta Landscape Uses:Woodland garden. Succeeds in any soil other than boggy conditions[1, 111, 233]. Prefers a rich soil of a woodland nature[1, 31]. Shade tolerant[31]. Plants grow well on walls if they are given a semi-shaded position and a pocket of soil into which to root[219]. A short-lived perennial[187], but it self-sows freely and can easily become a weed[200]. It quickly colonizes waste ground and thin woodland areas[233]. Once established, the plant is very difficult to eradicate. Special Features: North American native, Naturalizing, Attractive flowers or blooms.

## 6.2.460 Aconitum multifidum

5 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat m hkuc hmimhtut cyutli tcup hwicli hrasjlutnykfrp hpa7tli flatprikkwis hpa7tmwatli hjonli

drutta Aconitum multifidum is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. The flowers are pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves[178]. No further details are given, apart from a claim that this species is not poisonous - a report that should be treated with extreme caution.

tcanta None known  
dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame[111]. The seed can be stratified and sown in spring but will then be slow to germinate[133]. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for their first winter. Plant them out in late spring or early summer. Division - best done in spring but it can also be done in autumn[1, 111]. Another report says that division is best carried out in the autumn or late winter because the plants come into growth very early in the year[233].

nwatta Thrives in most soils and in the light shade of trees[1]. Grows well in heavy clay soils. Prefers a moist soil in sun or semi-shade[200]. Prefers a calcareous soil. Grows well in open woodlands[1, 4]. Members of this genus seem to be immune to the predations of rabbits and deer[233]. A

greedy plant, inhibiting the growth of nearby species, especially legumes[54]. Considered to be a part of *A. napellus* by most botanists[1], it is probably *A. napellus vulgare*. (Rchb.)Rouy. and Foucaud[200]. We are keeping this record separate because the suggestion that this species is not poisonous[178] requires investigation.

## 6.2.461 Antirrhinum majus

Snapdragon, Garden snapdragon

5 tlin 10 cyuc 1 kcaak 2 tcan 1 dwat m hkuc hmimhtut cyutli kyuctup hwicli hyishrasjlutnykfrp hpa7tli flatprikkwis hpa7tmwatli fyfxkre7t hjonli

drutta Antirrhinum majus is a PERENNIAL growing to 1 m (3ft 3in) by 0.2 m (0ft 8in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from July to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: OilEdible Uses: OilAn oil that is little inferior to olive oil is said to be obtained from the seeds[4]. The report also says that the plant has been cultivated in Russia for this purpose[4]. The seeds are very small and I wonder about the authenticity of this report[K].

tcanta Dye OilA green dye is obtained from the flowers, it does not require a mordant[168]. Dark green and gold can also be obtained if a mordant is used[168].

dwatta Antiphlogistic Bitter Resolvent StimulantThe leaves and flowers are antiphlogistic, bitter, resolvent and stimulant[7, 115]. They have been employed in poultices on tumours and ulcers[4]. It is effective in the treatment of all kinds of inflammation and is also used on haemorrhoids[7]. The plant is harvested in the summer when in flower and is dried for later use[7].

propta Seed - surface sow March in a greenhouse. The seed usually germinates in 10 - 21 days at 18°C[134]. Cool nights assist germination[134]. When large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. The seed can also be sown in situ in July/August and will produce larger and more floriferous plants the following summer. Cuttings of half-ripe wood in September in a cold frame[200].

nwatta Landscape Uses:Border, Container, Foundation, Massing, Specimen, Woodland garden. Prefers a light well drained loam and a sunny position[1, 200]. Plants are tolerant of clay and lime soils, and also grow well on old walls[200]. Plants are often grown as an annual since they usually degenerate in their second year[1]. They often self sow when well-sited[K]. There are many named forms, selected for their ornamental value[200]. Special Features:Not North American native, Naturalizing, Attracts butterflies, Suitable for cut flowers, Suitable for dried flowers, Fragrant flowers.

## 6.2.462 Philadelphus microphyllus

Littleleaf Mock Orange

5 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat m hkuc hmimhtut cyutli kyuctup hwicli hyishrasjlutnykfrp hpa7tli flatprikkwisslip hpa7tmwatli xre7t hjonli

drutta Philadelphus microphyllus is a deciduous Shrub growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit[105, 161]. Formerly used as food[257]. No more details are given.

tcanta SoapThe leaves are rich in saponins, when crushed and mixed with water they produce a lather that is

## 6.2.488 Weigela coraeensis

5 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyk hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

drutta Weigela coraeensis is a deciduous Shrub growing to 5 m (16ft 5in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in June. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: LeavesEdible Uses: Young leaves-cooked[105]. A famine food, they are only used when all else fails[177].

tcanta None known  
dwatta None known

propta Seed - we have no information for this species but suggest sowing the seed in a cold frame as soon as it is ripe if this is possible, otherwise in late winter or early spring. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant them out in late spring or early summer. Softwood basal cuttings, 10 - 12cm long, in a sandy soil in a cold frame in early summer[200]. Cuttings of half-ripe wood, 8 - 10 cm with a heel, July/August in a frame[200]. Cuttings of mature wood of the current seasons growth. 20 cm long, November in a sheltered outdoor nursery bed[200].

nwatta An easily grown plant, succeeding in most fertile soils[11, 200]. Prefers a moist well-drained soil in sun or partial shade[200]. Tolerates atmospheric pollution[200]. Judging by the plants native range, it is likely to succeed in maritime exposure[K]. Plants are very floriferous and can exhaust themselves, literally flowering themselves to death. The flowers are borne in the leaf nodes of the previous years growth and any pruning is therefore best done as soon as the plant has finished flowering[182]. There are some named forms, selected for their ornamental value[200]. Plants in this genus are notably resistant to honey fungus[200].

## 6.2.489 Clematis terniflora

Sennin-So, Sweet autumn virginsbower, Sweet Autumn Clematis, Fall Clematis  
5 tlin 9 cyuc 1 kcaak 1 tcan 1 dwat 5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyk hpa7tli flatprikkwisslip hpa7tmwatli xre7t hjonli

drutta Clematis terniflora is a PERENNIAL CLIMBER growing to 5 m (16ft 5in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from September to October, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers LeavesEdible Uses: Young shoots - cooked[105, 177]. Parboiled, then eaten boiled or oil-roasted[183]. Some caution is advised, see the notes above on toxicity. The young buds (Does this refer to flower or leaf buds?) are parboiled then eaten boiled or oil-roasted, or they can be pickled in vinegar[183]. Flowers[105, 183]. No more details are given.

tcanta As an ornamental but can be invasive so plant with care. It's a vigorous climber.

dwatta Antidote Antiscrophulatic OphthalmicAntidote, antiscrofulatic, ophthalmic. Used in the treatment of corneal opacities[178].

propta Seed - best sown as soon as it is ripe in a cold frame[164, 200]. Sow stored seed as soon as it is obtained in a cold frame. Pre-soak the seed for 12 hours in warm water and remove as much of the tail and outer coat as possible[164]. A period of cold stratification is beneficial[164]. The seed germinates in 1 - 9 months or more at 20°C[164]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame

for their first winter. Plant out in late spring or early summer, after the last expected frosts. Internodal cuttings of soft to semi-ripe wood, late spring in sandy soil in a frame[200]. Layering of old stems in late winter or early spring[200]. Layering of current seasons growth in early summer[200].

nwatta Landscape Uses:Arbor, Ground cover, Specimen. Prefers a deep moist soil in a sunny position[200]. Dislikes poorly-drained heavy clay soils, but grows well in clay if grit is added for drainage[11, 200]. Dislikes light sandy soils[11]. Does well on chalk[11]. Succeeds in acid as well as alkaline soils[200]. This species has the potential to spread from cultivation in areas where it has been introduced and could become problematic[274]. When planting out, in order to avoid the disease 'clematis wilt', it is best to plant the rootball about 8cm deeper in the soil. This will also serve to build up a good root crown of growth buds[200]. Plants seem to be immune to the predations of rabbits[233]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54]. Special Features:Attractive foliage, Not North American native, All or parts of this plant are poisonous, Fragrant flowers, Attractive flowers or blooms.

## 6.2.490 Forsythia suspensa

Lian Qiao, Weeping forsythia

5 tlin 8 cyuc 1 kcaak 3 tcan 3 dwat 5 m hkuc pcimhmimhtut cyutli tcup hwicli hrasjlutnykfrp hpa7tli flatprikkwisslip hpa7tmwatli dyatxre7t hjonli

drutta Forsythia suspensa is a deciduous Shrub growing to 5 m (16ft) by 5 m (16ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from March to April. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: rutinYoung leaves - cooked[105, 177, 179]. Some caution is advised due to the presence of a glycoside[179]. The leaves are rich in rutin[218].

tcanta The sub-species *F. suspensa sieboldii* is a lax grower that roots freely where the branches touch the ground. It makes a very good tall ground cover when planted about 2.5 metres apart each way[208]. Landscape Uses: Border, Erosion control, Espalier, Massing, Screen.

dwatta Antidote Antiphlogistic Antitussive Cancer Diuretic Emmenagogue Febrifuge Laxative Tonic Urinary VermifugeLian Qiao has been used in Chinese herbalism for over 4,000 years and is considered to be one of the 50 fundamental herbs[218]. A bitter tasting pungent herb with an antiseptic effect, it is chiefly used to treat boils, carbuncles, mumps and infected neck glands[254]. The fruit is a bitter astringent herb that stimulates the heart, nervous system and gall bladder[238]. It contains vitamin P, which is used to strengthen capillaries[238]. The fruit is also antidote, antiphlogistic, antitussive, diuretic, emmenagogue, febrifuge, laxative and tonic[116, 147, 174, 176, 178, 218, 238]. It is used internally in the treatment of acute infectious diseases such as mumps, and also for tonsillitis, urinary tract infections allergic rashes etc[238]. The fruit is harvested when fully ripe and is dried for use in decoctions[238]. The plant has a similar action to *Lonicera japonica* and is usually used in combination with that species to achieve a stronger action[176]. The flowers have a broad-spectrum antibacterial action, inhibiting the growth of *Staphylococcus aureus*, *Shigella dysenteriae*, haemolytic streptococcus, *Pneumococcus*, *Bacillus typhi*, *Mycobacterium tuberculosis* etc[176]. The plant is vermifuge, though the part used is not stated[116, 147, 174, 178]. The leaves are febrifuge and are also poulticed onto ulcerated glands and haemorrhoids[218]. A decoction of the leaves and twigs is used in the treatment of breast cancer[61]. The root is used in the treatment of cancer, colds, fever and jaundice[182].

propta Seed - sow spring in a cold frame. The seed usually germinates within 2 months[K]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first

drutta *Acer acuminatum* is a deciduous Tree growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from April to May. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). . The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Edible Uses: TeaThe leaves are used as a tea substitute[183].

tcanta Preservative WoodThe leaves are packed around apples, rootcrops etc to help preserve them[18, 20]. Wood - compact, moderately hard. It is seldom used[158].

dwatta None known  
propta Seed - best sown as soon as it is ripe in a cold frame, it usually germinates in the following spring. Pre-soak stored seed for 24 hours and then stratify for 2 - 4 months at 1 - 8°C. It can be slow to germinate. The seed can be harvested 'green' (when it has fully developed but before it has dried and produced any germination inhibitors) and sown immediately. It should germinate in late winter. If the seed is harvested too soon it will produce very weak plants or no plants at all[80, 113]. When large enough to handle, prick the seedlings out into individual pots and grow them on until they are 20cm or more tall before planting them out in their permanent positions. Layering, which takes about 12 months, is successful with most species in this genus. Cuttings of young shoots in June or July. The cuttings should have 2 - 3 pairs of leaves, plus one pair of buds at the base. Remove a very thin slice of bark at the base of the cutting, rooting is improved if a rooting hormone is used. The rooted cuttings must show new growth during the summer before being potted up otherwise they are unlikely to survive the winter. Good results are usually obtained.

nwatta Of easy cultivation, it prefers a good moist well-drained soil[1, 11] in a sunny position but tolerates some shade[11, 200]. Grows well in heavy clay soils. Chlorosis can sometimes develop as a result of iron deficiency when the plants are grown in alkaline soils, but in general maples are not fussy as to soil pH. This species is often confused with *A. papilio*[11]. Most maples are bad companion plants, inhibiting the growth of nearby plants[18, 20]. Dioecious. Male and female plants must be grown if seed is required.

## 6.2.486 Weigela decora

5 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 5 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Weigela decora* is a deciduous Shrub growing to 5 m (16ft 5in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to June. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. It can tolerate atmospheric pollution.

kcakta Edible Parts: LeavesEdible Uses: Young leaves - cooked[105]. They can be boiled with rice or millet[177].

tcanta None known  
dwatta None known

propta Seed - we have no information for this species but suggest sowing the seed in a cold frame as soon as it is ripe if this is possible, otherwise in late winter or early spring. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant them out in late spring or early summer. Softwood basal cuttings, 10 - 12cm long, in a sandy soil in a cold frame in early summer[200]. Cuttings of half-ripe wood, 8 - 10 cm with a heel, July/August in a frame[200]. Cuttings of mature wood of the current seasons growth. 20 cm long, November in a sheltered outdoor nursery bed[200].

nwatta An easily grown plant, succeeding in most fertile soils[11, 200]. Prefers a moist well-drained soil in sun or partial shade[200]. Tolerates atmospheric pollution[200]. Plants are very floriferous and can exhaust themselves, literally flowering themselves to death. The flowers are borne

in the leaf nodes of the previous years growth and any pruning is therefore best done as soon as the plant has finished flowering[182]. Plants in this genus are notably resistant to honey fungus[200].

## 6.2.487 Cotinus coggygia

Smoke Tree, European smoketree, Venetian Sumac, Wig Tree, Smoke Tree  
5 tlin 8 cyuc 1 kcak 0 tcan 1 dwat 5 m hkuc  
hmimhtut cyutli hgatkycutcup hwicli hyishrasjlitnyik hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

drutta *Cotinus coggygia* is a deciduous Shrub growing to 5 m (16ft) by 5 m (16ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from June to July, and the seeds ripen from September to October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). . The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: LeavesEdible Uses: Leaves[2, 179]. They are possibly edible[105, 177]. Some caution is advised. A volatile oil in the leaves contains pinene and camphene[179]. One report suggests that the essential oil contained in the flowers and leaves has a mango-like odour[158]. We have tried these leaves and really would not recommend them to anyone[K].

tcanta Basketry Dye Essential Tannin WoodAn essential oil is obtained from the leaves and flowers[105]. It has a mango-like smell[158]. Is it edible[K]? A yellow to orange dye is obtained from the root and stem[1, 4, 11, 14, 57]. It is somewhat fugitive though[4]. The leaves and bark are a good source of tannins[46, 61, 158]. Wood - ornamental. Used for cabinet making, picture frames[158]. The twigs are used in basketry[158].

dwatta Cholagogoue Febrifuge OphthalmicThe wood is used as a cholagogoue, febrifuge and for eye ailments[218].

propta Seed - best sown as soon as it is ripe in a cold frame[78, 113, 200]. It should germinate in the spring. Slightly immature or 'green' seed, harvested when it has fully developed but before it dries on the plant, gives the best results[113]. Warm stratify stored seed for 2 - 3 months at 15°C, then cold stratify for 2 - 3 months[164]. Germination can be very slow, often taking 12 months or more at 15°C[164]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the cold frame for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. The seed has a long viability and should store for several years[113]. Cuttings of half-ripe wood, July/August in a frame[113]. Trench layering in spring[200].

nwatta Industrial Crop: Dye Industrial Crop: Tannin Management: Coppice Wild CropLandscape Uses:Border, Container, Massing, Pollard, Screen, Standard, Specimen. Tolerates most soils[202]. Prefers a well-drained dry or moist soil in a sunny position[108, 200], doing better in a soil that is not very rich[11, 49]. Prefers a fertile but not over-rich soil[188]. Tolerates light shade[188]. Established plants are drought tolerant. Plants are hardy to about -20°C[184], though die-back often occurs at the tips of shoots during the winter[202]. Plants are slow to establish but are then quite fast growing when young though they slow down with age[202]. Hybridizes with *C. obovatus*[182]. A number of cultivars have been developed for their ornamental value[182, 200]. The purple-leaved cultivars are susceptible to mildew[202]. Plants flower on wood that is at least 3 years old[202]. Any pruning is best done in the spring[202]. Branches sometimes wilt, especially after hard pruning, and these should be removed[182]. This species is notably resistant to honey fungus[88, 200]. Dioecious. Male and female plants must be grown if seed is required. Special Features: Not North American native, Attractive flowers or blooms.

an effective cleaner, used on the body, clothes etc[169]. You can wash your hands by merely picking a couple of leaves or a bunch of blossom, wetting your hands and then rubbing the plant material vigorously as if it was a bar of soap[K]. This soap is a very gentle cleaner that does not remove the body's natural oils, but does remove dirt. It is not very effective against oil[K].

dwatta None known  
propta Seed - best if given 1 months cold stratification[113]. Sow February in a light position in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm long side-shoots, July/August in a shaded frame. Plant out in spring. High percentage[78]. Cuttings of mature wood of the current year's growth, 15 - 25cm with a heel, December in a sheltered bed outdoors. Fair to good percentage[78]. Layering in summer. Very easy.

nwatta Easily grown in any moderately fertile preferably dry soil[184], succeeding in thin soils over chalk and tolerating poor soils[200]. Grows well in heavy clay soils. Succeeds in semi-shade but prefers a position in full sun where it will flower more freely[182, 200]. Hardy to about -20°C[184]. Plants grow best in the east and south-east of Britain, they are shy to flower in gardens with cool summers[11]. Plants are very tolerant of pruning, one third of the stems can be cut down to the ground each year in order to promote fresh growth and heavier flowering[202]. A very ornamental plant[1] with aromatic flowers smelling of pineapples[182].

## 6.2.463 Pyrus serrulata

5 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 10 m hkuc  
hmimhtut cyutli hgattcup hwicli hrasjlutnyikfrip hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Pyrus serrulata* is a deciduous Tree growing to 10 m (32ft 10in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in May, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil and can tolerate drought. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[177]. The fruit is about 1.5cm in diameter[200].

tcanta None known  
dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe in the autumn, it will then usually germinate in mid to late winter. Stored seed requires 8 - 10 weeks cold stratification at 1°C and should be sown as early in the year as possible[200]. Temperatures over 15 - 20°C induce a secondary dormancy in the seed[200]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in a cold frame or greenhouse for their first year. Plant them out in late spring or early summer of the following year.

nwatta Prefers a good well-drained loam in full sun[200]. Grows well in heavy clay soils. Tolerates light shade but does not fruit so well in such a position. Tolerates atmospheric pollution, excessive moisture and a range of soil types if they are moderately fertile[200]. Established plants are drought tolerant[200]. Plants are hardy to at least -15°C[200]. A very ornamental tree. This species is closely related to *P. serotina*, differing mainly in having smaller fruit[109].

## 6.2.464 Picrasma quassioides

Nigaki  
5 tlin 9 cyuc 1 kcak 0 tcan 2 dwat 10 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Picrasma quassioides* is a deciduous Tree growing to 10 m (32ft) by 7 m (23ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in May, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Condition TeaFruit[105, 177]. Small and red[183]. The fruit is a berry about 7mm in diameter[200]. Young buds (the report does not say if they are flower or leaf buds) are used to make a tea[177, 179, 183]. A bitter substance called quassin' is extracted from (the bark of?) the tree and can be used as a hop substitute in brewing beer[183].

tcanta Insecticide Parasiticide WoodThe bark is used as an insecticide[46, 61]. Another report says that it is the wood that is used[240]. It is a substitute for the insecticide quassia, which is obtained from the wood of a tropical tree[240]. Quassia is a relatively safe organic insecticide that breaks down quickly and is of low toxicity to mammals. It has been used as a parasiticide to get rid of lice, fleas etc. Wood - hard, fine and close grained. Used for mosaic, utensils etc[46, 61, 158].

dwatta Anthelmintic Antiviral Bitter Febrifuge Hypotensive Parasiticide Stomachic TonicThe wood contains a number of medicinal compounds and has been shown to be anthelmintic, antiameobal, antiviral, bitter, hypotensive and stomachic[279]. It increases the flow of gastric juices[279]. It is used in Korea in the treatment of digestive problems, especially chronic dyspepsia[279]. A decoction of the stem bark is bitter, febrifuge and tonic[46, 61, 146, 158, 174, 218, 240, 272]. The leaves have been used to treat itchy skins[240, 272]. (Probably acting by killing body parasites[K].

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed requires 3 months cold stratification[113] and should be sown as early in the year as possible. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame[200]. Root cuttings 4cm long in December. Plant them out horizontally in pots in a greenhouse[78].

nwatta Requires a fertile humus-rich moisture-retentive loam in a sunny position[200]. Plants also succeed when growing in semi-shade[188]. According to [200] this plant is only hardy to zone 10 (not tolerating frosts) but there are healthy trees in many parts of Britain including one 8.5 metres tall at Kew in 1981, one 8 metres tall seen growing in light woodland shade at Cambridge Botanical Gardens where it was bearing fruit in the autumn of 1996 and one 9 metres tall at Westonbirt in 1980[11, K].

## 6.2.465 Catalpa ovata

Chinese Catalpa  
5 tlin 9 cyuc 1 kcak 0 tcan 1 dwat 10 m hkuc  
htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Catalpa ovata* is a deciduous Tree growing to 10 m (32ft 10in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from July to August, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil. It can tolerate atmospheric pollution.

kcakta Edible Parts: Flowers SeedpodEdible Uses: Flowers and young pods - cooked[183]. They are boiled and washed[179]. (possibly in that order so as to remove any bitterness[K])

tcanta None known  
dwatta DiureticThe stems are diuretic (strongly)[174, 218].

propta Seed - best sown outdoors, or in a cold frame, as soon as it is ripe[200]. Stratify stored seed for 3 weeks at

1°C and sow in spring[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Softwood cuttings, 10cm long, in a frame. They should be taken in late spring to early summer before the leaves are fully developed[200]. Root cuttings in winter[200].

nwatta Landscape Uses:Specimen. Prefers a good moist loamy soil and a sunny position that is not exposed[1, 11]. Tolerates heavy clay soils. Very resistant to atmospheric pollution[188]. Plants are hardy to about -15°C, probably more in continental climates[200], they grow best in areas with hot summers[188]. Protect plants from late frosts when they are young[200]. Transplants easily[200]. The flowers are very fragrant[245]. The bruised foliage has an aromatic fragrance[245]. The flowers are considered to be one of the best bee plants in Japan[245]. Plants in this genus are notably resistant to honey fungus[200]. Special Features:Not North American native, Attractive flowers or blooms.

## 6.2.466 Gentiana macrophylla

Qin Jiao  
5 tlin 9 cyuc 1 kcaak 0 tcan 3 dwat m hkuc  
hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Gentiana macrophylla is a PERENNIAL growing to 0.6 m (2ft) by 0.6 m (2ft in). See above for USDA hardness. It is hardy to UK zone 6. It is in flower from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bumblebees, butterflies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves - cooked[177]. An emergency food, used when all else fails.

tcanta None known  
dwatta Analgesic Antiinflammatory Antipyretic Antirheumatic HypotensiveQin Jiao has been used in Chinese herbalism for over 2,000 years and, like other members of this genus, the roots contain some of the most bitter compounds known and make an excellent tonic for the whole digestive system, working especially on the stomach, liver and gall bladder[238, 254]. The root is analgesic, anti-inflammatory, antipyretic, antirheumatic, diuretic, febrifuge, hypoglycaemic and hypotensive[176, 218, 238]. The root is used internally in the treatment of digestive problems, arthritis, allergic inflammations, low-grade fever in chronic diseases, jaundice and hepatitis[176, 218, 238, 254]. The root is harvested in the autumn and dried for later use.

propta Seed - best sown as soon as it is ripe in a light position in a cold frame[200]. It can also be sown in late winter or early spring but the seed germinates best if given a period of cold stratification and quickly loses viability when stored, with older seed germinating slowly and erratically[200, 239]. It is advantageous to keep the seed at about 10°C for a few days after sowing, to enable the seed to imbibe moisture[239]. Following this with a period of at least 5 - 6 weeks with temperatures falling to between 0 and -5°C will usually produce reasonable germination[239]. It is best to use clay pots, since plastic ones do not drain so freely and the moister conditions encourage the growth of moss, which will prevent germination of the seed[239]. The seed should be surface-sown, or only covered with a very light dressing of compost. The seed requires dark for germination, so the pots should be covered with something like newspaper or be kept in the dark[239]. Pot up the seedlings into individual pots as soon as they are large enough to handle and grow on in light shade in the greenhouse for at least their first winter. The seedlings grow on very slowly, taking 2 - 7 years to reach flowering size[239]. When the plants are of sufficient size, place them out into their permanent positions in late spring or early summer. Division in March[111]. Most members of this genus have either a single tap-root, or a compact root system united in a single root head, and are thus unsuitable for division[239]. Cuttings of basal shoots in late spring[238].

nwatta In general, gentians require a moist well-drained soil in a sheltered position, a certain minimum of atmospheric

humidity, high light intensity but a site where temperatures are not too high[239]. They are therefore more difficult to grow in areas with hot summers and in such a region they appreciate some protection from the strongest sunlight[200, 239]. Most species will grow well in the rock garden[200]. This species requires a moist well-drained neutral to acid soil in a sheltered position[200, 238]. It prefers full sun but succeeds in partial shade[111]. Plants are hardy to at least -15°C[238]. A moisture loving plant, preferring to grow with full exposure to the sun but with plenty of underground moisture in the summer, it grows better in the north and west of Britain[1]. Plants are intolerant of root disturbance[200].

## 6.2.467 Phalaris minor

Small Canary Grass, Littleseed canarygrass  
5 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat m hkuc  
htut cyutli tcuphja7n hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Phalaris minor is a ANNUAL growing to 1.2 m (4ft) by 0.5 m (1ft 8in). See above for USDA hardness. It is hardy to UK zone 6. It is in leaf from May to October, in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist or wet soil.

kcakta Seed - cooked[257]. The seed can be ground into a flour and used in making bread, cakes etc. It is rather small and fiddly to utilize.

tcanta None known  
dwatta None known  
propta Seed - sow spring in situ[162].  
nwatta An easily grown plant, succeeding in an ordinary garden soil[1]. It is tolerant of most conditions, dry or wet[200].

## 6.2.468 Asclepias mexicana

5 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat m hkuc  
hmimhtut cyutli kyuctcup hwicli hras hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Asclepias mexicana is a PERENNIAL growing to 0.8 m (2ft 7in). See above for USDA hardness. It is hardy to UK zone 6. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects, Lepidoptera (Moths and Butterflies). Suitable for: light (sandy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: FlowersEdible Uses: Young blossoms - cooked[161, 177]. Some caution is advised, see the notes on toxicity at the top of the page.

tcanta LatexRubber can be made from latex contained in the leaves and the stems[112].

dwatta None known  
propta Seed - best sown in a greenhouse as soon as it is ripe in the autumn or in late winter[134, 169]. We have also had good results from sowing the seed in the greenhouse in early spring[K], though stored seed might need 2 - 3 weeks cold stratification[134]. Germination usually takes place in 1 - 3 months at 18°C[134]. As soon as the seedlings are large enough to handle, prick them out into individual pots and grow them on in the greenhouse for their first winter. Plant out when they are in active growth in late spring or early summer and give them some protection from slugs until they are growing away strongly. Division in spring. With great care since the plant resents root disturbance. Pot the divisions up and place them in a lightly shaded position in the greenhouse until they are growing away strongly, then plant them out in the summer, giving them some protection from slugs until they are established.. Basal cuttings in late spring. Use shoots about 10cm long with as much of their white underground stem as possible. Pot them up individually and place them in a lightly shaded position in a greenhouse until they are rooting and growing actively. If the plants grow sufficiently, they can be put into their permanent positions in the summer, otherwise keep them in the greenhouse until the

from the inner bark or twigs is helpful in the treatment of influenza, colds, kidney or bladder problems, and also makes a good enema for treating diarrhoea[21, 257]. It can also be used as a gargle or mouthwash for mouth and throat problems or externally to wash sores and ulcers[21]. The powdered bark can be put into shoes for tender or sweaty feet or for foot odour[21]. A poultice of the chewed leaves has been used to treat burns[257]. The warm gum obtained from the trunks has been used as a dressing on cuts[257].

propta Seed - it germinates better if given a short cold stratification[80, 113] and so is best sown in a cold frame in autumn to late winter. It can also be sown in early spring, though it might not germinate until after the next winter. If there is sufficient seed, an outdoor sowing can be made in spring[78]. Pot-grown seedlings are best potted up into individual pots once they are large enough to handle - grow them on in a cold frame and plant them out in early summer of the following year. Trees transplant well when they are up to 80cm tall, but they are best put in their final positions when they are about 30 - 45 cm or less tall, this is usually when they are about 5 - 8 years old[200]. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200].

nwatta Landscape Uses:Hedge, Aggressive surface roots possible, Screen, Specimen, Woodland garden. An easily grown plant, it thrives best when growing in a deep well-drained soil in the western parts of Britain where it appreciates the higher rainfall[11]. However, it succeeds in most soils and positions, being especially good on acidic sandy soils[81]. Plants are very shade tolerant when young, but need more sunlight as they grow older[81, 200]. Plants are thin and poor when grown in dry or exposed places[200]. Dislikes atmospheric pollution[82]. A very ornamental plant[11], it is slow growing for the first few years, averaging 30cm a year, but older trees, especially in Scottish lowland sites in areas with cool moist summers, are growing rapidly[185]. Trees live 400 - 500 years in the wild[229]. They commence bearing seeds when about 20 - 30 years old, years of high production alternating with years of low production[229]. Plants in this genus are notably resistant to honey fungus[200]. Special Features:North American native, Inconspicuous flowers or blooms.

## 6.2.482 Euptelea pleiosperma

5 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 9 m hkuc  
hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Euptelea pleiosperma is a deciduous Tree growing to 9 m (29ft 6in). See above for USDA hardness. It is hardy to UK zone 6. It is in flower in May, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves - cooked. A famine food, used when all else fails[179].

tcanta None known  
dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Layering.

nwatta Prefers an open moderately rich free soil[1] and full sun[200]. Grows well in an open situation in a woodland garden or shrub border[200].

## 6.2.483 Lonicera affinis

5 tlin 9 cyuc 1 kcaak 0 tcan 1 dwat 7 m hkuc  
hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Lonicera affinis is an evergreen Climber growing to 7 m (23ft). See above for USDA hardness. It is hardy to UK zone 6. It is in flower from May to July. The species is hermaphrodite (has both male and female organs) and is

pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers FruitEdible Uses: Fruit[177]. No more details are given. The fruit is about 7mm in diameter[200]. Flowers. Used as a flavouring in drinks[177].

tcanta None known  
dwatta SkinA tea made from the flowers and leaves is used to treat rashes and boils[218].

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed requires 2 months cold stratification[113] and should be sown as soon as possible in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm with or without a heel, July/August in a frame. Good percentage[78]. Cuttings of mature wood of the current season's growth, 15 - 20cm with or without a heel, November in a cold frame. Good percentage[78]. Layering in autumn[200].

nwatta Prefers a good moist soil with its roots in the shade and its top growing into the light[200]. A climbing plant, supporting itself by twining around other plants[219].

## 6.2.484 Cornus occidentalis

Western Dogwood  
5 tlin 9 cyuc 1 kcaak 0 tcan 1 dwat 6 m hkuc  
hmimhtut cyutli tcup hwicli hrasljutnyikrip hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Cornus occidentalis is a deciduous Shrub growing to 6 m (19ft 8in). See above for USDA hardness. It is hardy to UK zone 6. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105, 177]. They were often eaten by native North Americans, but they are bitter and acid[161, 257].

tcanta None known  
dwatta OphthalmicThe bitter-tasting bark is astringent, ophthalmic and tonic[118, 257]. An infusion has been used as a wash for sore eyes[257].

propta Seed - best sown as soon as it is ripe in a cold frame or in an outdoors seedbed if there is sufficient seed[80, 113]. The seed must be separated from the fruit flesh since this contains germination inhibitors[80, 164]. Stored seed should be cold stratified for 3 - 4 months and sown as early as possible in the year[164]. Scarification may also help as may a period of warm stratification before the cold stratification[80, 164]. Germination, especially of stored seed, can be very slow, taking 18 months or more[164]. Prick out the seedlings of cold-frame sown seeds into individual pots as soon as they are large enough to handle and grow the plants on for their first winter in a greenhouse, planting out in the spring after the last expected frosts. Cuttings of half-ripe side shoots, July/August in a frame. Cuttings of mature wood of the current year's growth, taken with a heel if possible, autumn in a cold frame. High percentage[78]. Layering of new growth in June/July. Takes 9 months[78].

nwatta An easily grown plant, it succeeds in any soil of good or moderate fertility[1], ranging from acid to shallow chalk[200]. Grows well in heavy clay soils. Succeeds in poorly drained soils[200]. Succeeds in full sun or light shade[188]. Allied to *C. stolonifera* and considered to be part of that species by some botanists[11, 60, 200]. Plants in this genus are notably resistant to honey fungus[200].

## 6.2.485 Acer acuminatum

5 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 6 m hkuc  
hmimhtut cyutli tcup hwicli hrasljutnyikrip hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

half-ripe wood, July/August in a frame. Cuttings of mature wood of the current season's growth, preferably with a heel, October/November in a frame[78].

nwatta Prefers a warm moist loamy soil and light shade but is by no means fastidious, succeeding in thin, dry and shallow soils. Grows well in heavy clay soils. Plants are hardy to about -25°c[184]. Plants can be pruned back quite severely, they resprout well from the base[200]. This species is closely related to *B. poirietii*. *C.K.Schn.*, differing in its broader leaves and dark red fruits[200]. The range of this plant is often mistakenly given as the Caucasus, this is based on a misidentification[200]. Hybridizes freely with other members of this genus[1].

### 6.2.479 Sambucus microbotrys

Red Elder

5 tlin 9 cyuc 1 kcak 0 tcan 0 dwat m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Sambucus microbotrys is a deciduous Shrub growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 6. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: Flowers FruitEdible Uses: Flowers - raw or cooked. Fruit - raw or cooked[177, 257]. The fruit is about 4mm in diameter and is borne in large clusters[200]. Some caution is advised, see the notes above on toxicity.

tcanta None known
dwatta None known

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame, when it should germinate in early spring. Stored seed can be sown in the spring in a cold frame but will probably germinate better if it is given 2 months warm followed by 2 months cold stratification first[78, 98, 113]. Prick out the seedlings into individual pots when they are large enough to handle. If good growth is made, the young plants can be placed in their permanent positions during the early summer. Otherwise, either put them in a sheltered nursery bed, or keep them in their pots in a sheltered position and plant them out in spring of the following year. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in a frame[78]. Cuttings of mature wood of the current season's growth, 15 - 20cm with a heel, late autumn in a frame or a sheltered outdoor bed[78].

nwatta Tolerates most soils, including chalk[200], but prefers a moist loamy soil[11, 200]. Grows well in heavy clay soils. Tolerates some shade but is best in a sunny position[1]. Tolerates atmospheric pollution and coastal situations[200]. Plants in this genus are notably resistant to honey fungus[200].

### 6.2.480 Magnolia denudata

Lily Tree, Yulan Magnolia

5 tlin 9 cyuc 1 kcak 0 tcan 2 dwat 10 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikl hpa7tmwatli xre7t hjonli

drutta Magnolia denudata is a deciduous Tree growing to 10 m (32ft) by 10 m (32ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from March to May, and the seeds ripen from September to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Beetles. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. It can tolerate atmospheric pollution.

kcakta Edible Parts: Edible Uses: CondimentThe flowers, after the calyx has been removed, are pickled and used for flavouring rice[183].

tcanta None known

dwatta Anodyne Antifungal Astringent Carminative Cytotoxic Diaphoretic Hypotensive Sedative Tonic Uterine tonicTonic[177]. The flower buds and the seeds are carminative and diaphoretic[218]. The flower buds are antifungal, astringent, cytotoxic, hypotensive and a uterie stimulant[279]. They are used in Korea in the treatment of headaches, nasal obstruction and sinusitis[279]. They are picked in early spring, dried and then used in Chinese medicine to clear the nasal passages[177]. The plant is anodyne and sedative[218].

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed must be kept cold over the winter and should be sown in late winter in a cold frame[200]. The seed usually germinates in the spring but it can take 18 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in a cold frame or greenhouse for at least their first winter. They can be planted out into their permanent positions when they are more than 15cm tall, though should be well mulched and given some protection from winter cold for their first winter or two outdoors. Layering in early spring[200].

nwatta Landscape Uses:Border, Espalier, Firewood, Pest tolerant, Specimen. Best grown in a warm position in a moderately rich free soil of an open texture[1]. Succeeds in an acid or neutral peaty soil in sun or part shade[184]. Tolerates alkaline soils so long as they are deep and rich in humus[188]. The branches are brittle so a sheltered position is required[200]. Very tolerant of atmospheric pollution[200]. A very ornamental tree[1], it is hardy to about -20°c when dormant[184] but plants can be excited into early growth by mild winters and the flowers are then liable to be killed by frost[11]. The flowers, which begin to be produced when the plant is quite young, are deliciously scented[245]. The fleshy roots are easily damaged and any transplanting is best done during a spell of mild moist weather in late spring[182]. Special Features: Not North American native, Fragrant flowers, Blooms are very showy.

### 6.2.481 Tsuga mertensiana

Mountain Hemlock

5 tlin 7 cyuc 1 kcak 0 tcan 2 dwat m hkuc pcmimhmhtut cyutli tcup hwicli hrasjlutnyik hpa7tli frusflatpriklwis hpa7tmwatli hjonli

drutta Tsuga mertensiana is an evergreen Tree growing to 45 m (147ft) by 10 m (32ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in leaf all year, in flower in April, and the seeds ripen from October to November. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil. It cannot tolerate atmospheric pollution.

kcakta Edible Parts: Inner barkEdible Uses: Tealner bark - raw or dried, ground into a powder and then used as a thickening in soups etc or mixed with cereals when making bread[161]. It is best used in the spring[172]. An emergency food, it is only used when all else fails[183]. A herbal tea is made from the young leaves and shoot tips[172, 183].

tcanta Dye Hedge Hedge Incense Pot-pourri Resin Tannin WoodThe slightly unripe cones are used in pot-pourri. They retain an attractive scent for several years[200]. Yields a resin similar to *Abies balsamea*, it is gathered by incisions in the trunk or by boiling the wood[46, 61, 64]. The bark contains 8 - 14% tannin[46, 171]. The inner bark is used according to one report[82]. A brown dye is obtained from the bark[21, 46]. The boughs are steamed or rubbed on furniture and used as a room deodorant and disinfectant[257]. A pitch (called hemlock pitch), is obtained by distillation of the young branches[46]. Tolerant of light trimming, plants can be grown as a tall hedge[29, 81]. Wood - strong[171]. Used for heavy construction[171]. Close-grained, light, soft and weak according to other reports, which go on to say that it is occasionally manufactured into lumber when other wood is not available[82, 229].

dwatta Astringent Diaphoretic Diuretic PouliticeThe bark is astringent, diaphoretic and diuretic[21]. A tea made

following spring and when they are in active growth plant them out into their permanent positions. Give them some protection from slugs until they are established.

nwatta Prefers a well-drained light rich or peaty soil in a sunny position[1, 200]. Succeeds in poor soils. There is some confusion over nomenclature. *A. mexicana*. Rydb. is a synonym of *A. fascicularis* and the reports on the uses of this plant did not specify the authors name[60]. We have assumed that the uses refer to *A. mexicana*. Cav. There is also some confusion over the hardness of this plant with one report saying that it needs greenhouse protection in Britain[1] whilst another says that it is hardy to zone 6, or about -20°c[200]. Many members of this genus seem to be particularly prone to damage by slugs. The young growth in spring is especially vulnerable, but older growth is also attacked and even well-established plants have been destroyed in wet years[K]. Plants resent root disturbance and are best planted into their final positions whilst small[134]. The flower of many members of this genus can trap insects between its anther cells, the struggles of the insect in escaping ensure the pollination of the plant[207].

### 6.2.469 Eremurus aucherianus

5 tlin 9 cyuc 1 kcak 0 tcan 0 dwat m hkuc htut cyutli hgatkuyctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Eremurus aucherianus is a PERENNIAL. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: LeavesEdible Uses: Leaves - cooked[46, 61, 177].

tcanta AdhesiveA glue is made from the mucilage contained in the root and is used with leather and in book-binding[46, 61].

dwatta None known

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame[200]. Sow stored seed in a greenhouse as soon as it is obtained. Germination is slow and could take 1 - 12 months at 15°c. Prick out the seedlings into individual pots as soon as they are large enough to handle and grow on for their first winter in a greenhouse. Plant out into their permanent positions in late spring after the last expected frosts. Do not plant deeply in the soil, the crown of the plant should be slightly exposed[245]. Division after the plant dies down in late summer. Great care must be taken because the plants resent root disturbance[200]. Only divide the plants when it is really necessary, and no more frequently than once every 6 years, being careful not to break the brittle roots[245]. It is probably best to pot up the divisions and grow them on in the greenhouse until they are established.

nwatta Prefers a very well drained, very rich, light sandy loam in a warm sunny sheltered position[90, 200]. A covering of sharp sand helps the plant to survive wet winters. Plants can also be mulched overwinter with organic matter in the autumn in order to give them extra protection, but this mulch must be removed in the spring otherwise it might encourage the new growth to rot[200]. Some protection should be given to the young shoots in spring in areas subject to late frosts[200]. Keep plants dry in summer after they have flowered[90]. Plants resent root disturbance and so should be placed in their final positions as soon as possible[200]. Plants require some cold stratification in winter in order to flower well in the following summer[200]. Slugs are very attracted to this plant so some protection must be given.

### 6.2.470 Matricaria matricarioides

Pineapple Weed

5 tlin 9 cyuc 1 kcak 0 tcan 2 dwat m hkuc htut cyutli kyuctup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta *Matricaria matricarioides* is a ANNUAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from June

to July, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: FlowersEdible Uses: TeaFlower heads - raw or cooked[172]. A tasty nibble[172]. The dried flowers are used to make herb teas[172]. They are pineapple scented when steeped in hot water[183].

tcanta RepellentThe plant repels insects[172]. The dried flowers are used as an insect repellent[213].

dwatta Antispasmodic Carminative Galactogogue Sedative Skin VermifugeThe flowering plant is antispasmodic, carminative, galactogogue, sedative, skin and vermifuge[9, 172, 222]. This plant is rarely used medicinally, though it is sometimes employed as a domestic remedy in the treatment of intestinal worms and also as a sedative[9]. The plant is harvested when in flower in the summer and is dried for later use[9]. Some caution is advised since some individuals are allergic to this plant[222].

propta Seed - sow spring or late summer in situ. Germination should take place within 3 weeks.

nwatta Succeeds in any well-drained soil in a sunny position[200]. The bruised or sun-warmed leaves emit the appealing odour of ripe apples[245].

### 6.2.471 Sorbus commixta

5 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 10 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Sorbus commixta is a deciduous Tree growing to 10 m (32ft) by 6 m (19ft). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in May, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: Fruit LeavesEdible Uses: Fruit - raw or cooked[105]. About 7.5mm across[200], it is produced in fairly large bunches making harvesting easy[K]. Leaves - cooked. A famine food when all else fails[177]. The leaves may contain cyanogens so caution is advised.

tcanta None known
dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame[78, 80]. If you have sufficient seed it can be sown in an outdoor seedbed[78, 80]. Stored seed germinates better if given 2 weeks warm then 14 - 16 weeks cold stratification[98], so sow it as early in the year as possible. Prick out the seedlings into individual pots when they are large enough to handle. Seedlings are very slow to put on top-growth for their first year or two[11], but they are busy building up a good root system. It is best to keep them in pots in a cold frame for their first winter and then plant them out into their permanent positions in late spring.

nwatta Succeeds in most reasonably good soils in an open sunny position[11]. Dislikes dry soils[188]. Tolerates light shade[188], though it fruits better in a sunny position[K]. Plants are susceptible to fireblight[188]. This species is suitable for street planting[200].

### 6.2.472 Phellodendron lavallei

Lavalle corktree

5 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 10 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Phellodendron lavallei is a deciduous Tree growing to 10 m (32ft 10in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from June to July. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown

if seed is required). . The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Fruit OilEdible Uses: OilFruit[105, 177]. This use refers to the closely related *P. amurense*, it almost certainly applies to this tree as well[K]. The fruit is about 1cm in diameter and has a strong scent of turpentine, it is produced copiously in Britain[200].

tcanta Cork Dye Insecticide Oil WoodThe bark is thick and corky[200]. Can this be used as a source of cork[K]? The following uses are for the closely related *P. amurense*. They almost certainly also apply to this tree. A yellow dye is obtained from the inner bark[178]. An oil obtained from the seed has insecticidal properties similar to pyrethrum[57]. Wood - heavy, hard, strong, close grained. Used for furniture[74].

dwatta None known

propta Seed - best sown in the autumn in a cold frame[200]. Stored seed requires 2 months cold stratification, sow in late winter in a cold frame[78, 113]. Germination is usually good. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the cold frame for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in a frame. Pot up in autumn and over winter in a cold frame. Fair to good percentage[78]. Root cuttings - obtain in December and store in leafmold in a warm place for 3 weeks. Cut into 4cm lengths and plant horizontally in pots. Grow on in a warm greenhouse. Good percentage[78].

nwatta Prefers a moisture retentive well-drained deep rich loam in an open position in full sun[11, 200]. Grows best in areas with long hot summers[200]. Plants are gross feeders and require a rich soil if they are to perform well[11]. Dormant plants are hardy to at least -20°C, but the young growth is liable to damage from late spring frosts[11, 200]. This species is occasionally cultivated for timber in S.E. Europe[50]. Dioecious. Male and female plants must be grown if seed is required. The fruit is produced copiously on trees in Britain[200].

### 6.2.473 *Eriogonum microthecum*

Slender Buckwheat, Alpine slender buckwheat, San Bernardino buckwheat, Johnston's buckwheat, Panama 5 tin 9 cyuc 1 kcaak 0 tcan 1 dwat m hkuc htut cyutli kyuctcup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Eriogonum microthecum* is an evergreen Shrub growing to 0.3 m (1ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from July to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Edible Uses: TeaA tea is made from the plant[257].

tcanta None known

dwatta Diuretic Poulitce TBA decoction of the roots or tops has been used in the treatment of coughs caused by TB[61, 257]. A decoction of the stems and leaves has been used to treat bladder problems[257]. It has also been used externally in hot compresses or as a wash for lameness and rheumatism[257].

propta Seed - best sown as soon as it is ripe in the autumn in a sandy compost in a greenhouse. Sow stored seed in early spring in a warm greenhouse[1]. As soon as they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant out in late spring or early summer, after the last expected frosts. Division in early spring[1]. This has to be done with care because the plant resents root disturbance[200]. Try to obtain divisions from around the edges of the plants without digging up the whole clump. Tease the divisions out with as much root on them as possible and pot

them up. Grow them on in light shade in the greenhouse until they are rooting well and plant them out in the summer. Cuttings of greenwood with a heel in the summer[200].

nwatta Requires a loose lean gritty well-drained soil in a very sunny position[200]. Succeeds in dry soils. Tolerates exposed positions[200]. Requires some protection from winter wet[1]. A very variable plant, it has been divided into a number of varieties[270]. Established plants resent root disturbance[200].

### 6.2.474 *Chimonobambusa marmorea*

Kan-Chiku

5 tin 9 cyuc 1 kcaak 0 tcan 0 dwat m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Chimonobambusa marmorea* is an evergreen Bamboo growing to 1.5 m (5ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Seed StemEdible Uses: Young shoots - cooked[177]. Seed - used as a cereal[177]. The seed is neither regularly nor abundantly produced.

tcanta Hedge HedgeThe plant is useful for low screens, clumps and hedges[195, 200].

dwatta None known

propta Seed - surface sow as soon as it is ripe in a greenhouse at about 20°C. Do not allow the compost to dry out. Germination usually takes place fairly quickly so long as the seed is of good quality, though it can take 3 - 6 months. Grow on in a lightly shaded place in the greenhouse until large enough to plant out. Seed is rarely available. Division in spring as new growth commences. Take divisions with at least three canes in the clump, trying to cause as little root disturbance to the main plant as possible. Grow them on in light shade in a greenhouse in pots of a high fertility sandy medium. Mist the foliage regularly until plants are established. Plant them out into their permanent positions when a good root system has developed, which can take a year or more[200]. Basal cane cuttings.

nwatta Prefers a good loamy soil[1]. Succeeds in most soils so long as they do not dry out[200]. Dislikes drought[1]. Prefers a position sheltered from cold north and east winds[1]. Plants are liable to injury by winter cold[11]. They are hardy to about -20°C according to another report[200]. This species is notably resistant to honey fungus[200]. Plants only flower at intervals of many years. When they do come into flower most of the plants energies are directed into producing seed and consequently the plant is severely weakened. They sometimes die after flowering, but if left alone they will usually recover though they will look very poorly for a few years. If fed with artificial NPK fertilizers at this time the plants are more likely to die[122]. A few stems on each plant usually produce flowers in most years without noticeable harm to the plant[11]. Plants spread rapidly by means of underground suckers and are apt to be invasive, especially when they are well established[11, 200]. New canes are produced from late April.

### 6.2.475 *Filipendula multijuga*

5 tin 9 cyuc 1 kcaak 0 tcan 0 dwat m hkuc hmimhtut cyutli tucphja7n hwicli hrasjlutnyikrip hpa7tli prikliwis hpa7tmwatli fyixre7t hjonli

drutta *Filipendula multijuga* is a PERENNIAL growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta Edible Parts: LeavesEdible Uses: Young shoot tips - cooked[116].

tcanta None known

dwatta None known

propta Seed - best sown in the autumn in a cold frame[1].

The seed can also be sown in a cold frame in spring, germinating best at a temperature of 10 - 13°C[200]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer if they have grown enough. If not, keep them in a cold frame for the winter and plant them out in late spring. Division in autumn or winter[200]. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Requires a humus-rich moist soil in semi-shade[200]. Succeeds in full sun only if the soil is reliably moist throughout the growing season[200]. Dislikes dry or acid soils. Does well in marshy soils. Grows well in heavy clay soils. A very ornamental plant[116]. The flowers are very attractive to bees. Members of this genus are rarely if ever troubled by browsing deer[233].

### 6.2.476 *Ephedra major*

Ma Huang

5 tin 9 cyuc 1 kcaak 0 tcan 4 dwat m hkuc htut cyutli hgatkuyctcup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

drutta *Ephedra major* is an evergreen Shrub growing to 2 m (6ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). . The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Fruit - raw.

tcanta None known

dwatta Antiasmatic Antidote Cardiac Diaphoretic Diuretic Febrifuge Nervine Pectoral Tonic Vasoconstrictor VasodilatorMembers of this genus contain various medicinally active alkaloids (but notably ephedrine) and they are widely used in preparations for the treatment of asthma and catarrh[238]. This species is the richest source of ephedrine in India, the stems containing over 2.5% total alkaloids, of which about 75% is ephedrine[240]. The whole plant can be used at much lower concentrations than the isolated constituents - unlike using the isolated ephedrine, using the whole plant rarely gives rise to side-effects[254]. The plant also has antiviral effects, particularly against influenza[238]. The stems are a pungent, bitter, warm herb that dilates the bronchial vessels whilst stimulating the heart and central nervous system[238]. The stems are also diaphoretic, diuretic, febrifuge, hypertensive, nervine, pectoral, tonic, vasoconstrictor and vasodilator[165, 176, 238]. They are used internally in the treatment of asthma, hay fever and allergic complaints[238]. They are also combined with a number of other herbs and used in treating a wide range of complaints[238]. This herb should be used with great caution, preferably under the supervision of a qualified practitioner[238]. It should not be prescribed to patients who are taking monoamine oxidase inhibitors, or suffering from high blood pressure, hyperthyroidism or glaucoma[238]. Ephedrine is seen as a performance-boosting herb and, as such, is a forbidden substance in many sporting events such as athletics[K]. The stems can be harvested at any time of the year and are dried for later use[238].

propta Seed - best sown as soon as it is ripe in the autumn in a greenhouse[200]. It can also be sown in spring in a greenhouse in a sandy compost[K]. Prick out the seedlings into individual pots as soon as they are large enough to handle and grow them on for at least their first winter in a greenhouse. Plant out in the spring or early summer after the last expected frosts and give some protection in their first winter[K]. Division in spring or autumn[238]. Layering.

nwatta Requires a well-drained loamy soil and a sunny position[11]. Established plants are drought resistant and

are also lime tolerant[200]. Dioecious, male and female plants must be grown if fruit and seed are required.

### 6.2.477 *Tulipa montana*

5 tin 9 cyuc 1 kcaak 0 tcan 0 dwat m hkuc

htut cyutli tcup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Tulipa montana* is a BULB growing to 0.1 m (0ft 4in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from April to June, and the seeds ripen in June. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Bulb - cooked. It can be dried, ground into a powder and then mixed with cereals when making bread etc[22, 46, 61, 74].

tcanta None known

dwatta None known

propta Seed - best sown in a shady part of the cold frame as soon as it is ripe in early summer[1], or in the early autumn[200]. A spring sowing of stored seed in the greenhouse also succeeds[K]. Sow the seed thinly so that the seedlings can be grown on without disturbance for their first growing season - apply liquid feeds to the pot if necessary. Divide the bulbs once the plants have become dormant, putting 3 - 4 bulbs in each pot. Grow the on in the greenhouse for at least the next year, planting them out when dormant. Division of offsets in July. Larger bulbs can be planted out straight into their permanent positions, or can be stored in a cool place and then be planted out in late autumn. It is best to pot up smaller bulbs and grow them on in a cold frame for a year before planting them out when they are dormant in late summer to the middle of autumn.

nwatta Requires a very well-drained sandy soil in a sunny position[42]. Bulbs can be harvested after the plants have died down in July, stored in a cool dry place and then replanted in October[1]. This species is closely related to *T. linifolia* and *T. maximowiczii*[90].

### 6.2.478 *Berberis chinensis*

5 tin 9 cyuc 1 kcaak 0 tcan 2 dwat m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikrip hpa7tli flatprikliwis hpa7tmwatli fyixre7t hjonli

drutta *Berberis chinensis* is a deciduous Shrub. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[177].

tcanta A yellow dye is obtained from the root.

dwatta Antibacterial Cancer DysenteryBerberine, universally present in rhizomes of *Berberis* species, has marked antibacterial effects. Since it is not appreciably absorbed by the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not be used with Glycyrrhiza species (Licorice) because this nullifies the effects of the berberine[218]. Berberine has also shown antitumour activity[218].

propta Seed - best sown as soon as it is ripe in a cold frame, when it should germinate in late winter or early spring[78]. Seed from over-ripe fruit will take longer to germinate[78], whilst stored seed may require cold stratification and should be sown in a cold frame as early in the year as possible[80]. The seedlings are subject to damping off, so should be kept well ventilated[113]. When the seedlings are large enough to handle, prick them out into individual pots and grow them on in a cold frame. If growth is sufficient, it can be possible to plant them out into their permanent positions in the autumn, but generally it is best to leave them in the cold frame for the winter and plant them out in late spring or early summer of the following year. Cuttings of

by 12 weeks cold stratification can help[98]. The seed usually (eventually) germinates quite well[78]. Prick out the seedlings into individual pot as soon as they are large enough to handle and plant out when they are at least 15cm tall. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in a frame. Rather slow, but you usually get a good percentage rooting[78]. June is the best time to take cuttings[202]. Cuttings of mature wood of the current year's growth, 10 - 12cm with a heel, November in a frame. Leave for 12 months. Fair to good percentage[78]. Layering in September/October. Takes 12 months[78].

nwatta Succeeds in most soils that are well-drained[11, 200]. Prefers a soil that is only moderately fertile, succeeding in poor soils and in dry soils[11, 200]. Established plants are drought resistant. Tolerates shade and can be grown under other trees[K]. This species is notably resistant to honey fungus[88, 200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. An excellent companion plant, when grown in orchards it can increase yields from the fruit trees by up to 10%. Fruiting as it does in April and May, this plant has excellent potential as a fruit crop, it should be fairly easy to selectively breed for improved fruit size and flavour[K]. The small flowers have a strong, pleasant scent that pervades the garden on calm days[K].

## 7.1.6 Alnus rubra

Red Alder, Oregon Alder

tfo2n 6 tlin 8 cyuc 2 kcaak 4 tcan 2 dwat 20 m hkuc hmimhtut cyutli tucphja7n hwicli hylisjnutnyikfrip hpa7tli flat-prikliwis hpa7tmwatli hjonli

drutta Alnus rubra is a deciduous Tree growing to 20 m (65ft 7in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in March, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. It can fix Nitrogen. Suitable for: medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: Flowers Inner bark SapEdible Uses: Catkins - raw or cooked. They are rich in protein but have a bitter flavour and are not very palatable[172]. Inner bark - cooked, it must be dried since it is emetic when fresh[105, 161, 177]. No more details are given but inner bark is often dried, ground into a powder and then used as a thickening in soups etc or mixed with cereals when making bread[K]. Sap - raw[118]. Harvested in late winter, the flow is best on a warm, sunny day that follows a cold frosty night. A sweet flavour, it was often used to sweeten other foods[257]. Buds[105, 177]. No further information is given, does this refer to the flower buds or leaf buds?[K]

tcanta Charcoal Dye Fodder Fuel Hedge Pioneer Shelterbelt Soil stabilization Tannin WoodA fast-growing and very wind resistant tree, it is an excellent plant for providing rapidly produced shelterbelts[K]. The trees extensive root system also makes it suitable for controlling erosion along the banks of rivers[226]. This is an excellent pioneer species for re-establishing woodlands on disused farmland, difficult sites etc[226]. Its fast rate of growth means that it quickly provides sheltered conditions to allow more permanent woodland trees to become established. In addition, bacteria on the roots fix atmospheric nitrogen - whilst this enables the tree to grow well in quite poor soils it also makes some of this nitrogen available to other plants growing nearby. Alder trees also have a heavy leaf canopy and when the leaves fall in the autumn they help to build up the humus content of the soil. Alder seedlings do not compete well in shady woodland conditions and so this species gradually dies out as the other trees become established[K]. Tannin is obtained from the bark and the strobils[82]. Both the roots and the young shoots have been used in making baskets[257]. A red to brown dye is obtained from the bark[61, 118, 257]. Wood - soft, brittle, not strong, light, close and straight-grained, very durable in water[82]. An important

lumber tree, it makes a good imitation mahogany[60, 103] and is used for cheap furniture etc[46, 61, 82, 171, 229]. A good fuel, it does not spark so can be used in the open[60, 118, 172], it also makes a high grade charcoal[103].

dwatta Anodyne Appetizer Astringent Cathartic Cytostatic Eczema Febrifuge Skin Stomachic TB TonicRed alder was widely employed medicinally by native North American Indians who mainly used the bark to treat a wide range of complaints[257]. The plant is little used in modern herbalism[K]. The bark is appetizer, astringent, cathartic, cytostatic, emetic, stomachic and tonic[61, 172, 257]. The bark contains salicin[226], which probably decomposes into salicylic acid (closely related to aspirin) in the human body[213]. This is used as an anodyne and febrifuge[226]. An infusion of the bark has been used in the treatment of many complaints such as headaches, rheumatic pains, internal injuries and diarrhoea[226, 257]. Externally, a poultice of the bark has been applied to eczema, sores and aches[257]. The sap is applied externally to cuts[257]. The catkins and young cones are astringent and have been chewed in the treatment of diarrhoea[257].

propta Seed - best sown in a cold frame as soon as it is ripe and only just covered[200]. Spring sown seed should also germinate successfully so long as it is not covered[200, K]. The seed should germinate in the spring as the weather warms up. When large enough to handle, prick the seedlings out into individual pots. If growth is sufficient, it is possible to plant them out into their permanent positions in the summer, otherwise keep them in pots outdoors and plant them out in the spring. If you have sufficient quantity of seed, it can be sown thinly in an outdoor seed bed in the spring[78]. The seedlings can either be planted out into their permanent positions in the autumn/winter, or they can be allowed to grow on in the seed bed for a further season before planting them. Cuttings of mature wood, taken as soon as the leaves fall in autumn, outdoors in sandy soil.

nwatta Agroforestry Services: Alley crop Agroforestry Services: Nitrogen Fodder: Bank Management: Coppice Management: Standard Regional CropLandscape Uses:Border, Erosion control, Woodland garden. Prefers a heavy soil and a damp situation[1, 11]. Grows well in heavy clay soils[11]. Tolerates very infertile sites[200]. A very wind resistant tree with excellent establishment in severely exposed sites, it tolerates severe maritime exposure[75, K]. The red alder is a very fast growing tree, even when planted in severe exposure[75, 229, K], but it is short-lived, dying when 60 - 80 years old[229]. Trees that are 5 years old from seed have reached 6 metres in height on a very exposed site in Cornwall, they are showing no signs of wind-shaping[K]. This is an important pioneer tree, quickly invading logged or burnt over sites, and providing ideal conditions for other trees to become established[229, K]. A very ornamental tree[1]. This species has a symbiotic relationship with certain soil micro-organisms, these form nodules on the roots of the plants and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. Red alder has been estimated to fix as much as 300 kg of nitrogen per hectare[269]. Special Features: Attracts birds, North American native, Inconspicuous flowers or blooms. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

## 7.1.7 Albizia julibrissin

Mimosa, Silktree, Mimosa Tree,

tfo2n 6 tlin 9 cyuc 2 kcaak 2 tcan 2 dwat 12 m hkuc htut cyutli hgatkuyctup hwicli hylisjrasjnutnyik hpa7tli flat-prikliwsihpsom hpa7tmwatli xre7t hjonli

drutta Albizia julibrissin is a deciduous Tree growing to 12 m (39ft) by 10 m (32ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from July to August, and the seeds ripen from September to November. The species is hermaphrodite (has both male and female organs). It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor

## 6.2.567 Centaurea iberica

Iberian Star Thistle, Iberian knapweed

5 tlin 9 cyuc 1 kcaak 0 tcan 2 dwat 0.9 m hkuc htut cyutli hgatkuyctup hwicli hylisjrasjnutnyik hpa7tli flat-prikliwis hpa7tmwatli fyfjxre7t hjonli

drutta Centaurea iberica is a BIENNIAL growing to 0.9 m (3ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: LeavesEdible Uses: Edible cooked[145, 177]. The part used is not specified.

tcanta None known

dwatta Antioxidant and antimicrobial activity. Antibacterial and antifungal. Used in Turkish folk medicine to alleviate the pain and inflammatory symptoms in rheumatoid arthritis, high fever, headache, and for healing of wounds. In its native range, various uses in folk medicine are proving to have a scientific basis [1d].

propta Seed - sow April in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer.

nwatta Succeeds in ordinary garden soil[1, 200]. Prefers a well-drained fertile soil and a sunny position[200]. Tolerates dry, low fertility and alkaline soils[200]. This species is closely related to *C. calcitrapa*. Members of this genus are rarely if ever troubled by browsing deer[233].

## 6.2.568 Cynoglossum officinale

Hound's Tongue, Gypsiflower

5 tlin 9 cyuc 1 kcaak 2 tcan 2 dwat 0.8 m hkuc htut cyutli tcup hwicli hylisjrasjnut hpa7tli prikliwis hpa7tmwatli fyfjxre7t hjonli

drutta Cynoglossum officinale is a BIENNIAL/PERENNIAL growing to 0.8 m (2ft 7in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: LeavesEdible Uses: Young leaves - raw or cooked[46, 61, 105, 177, 183]. A disagreeable odour and taste[212]. Caution is advised, see the notes above on toxicity.

tcanta Leaves of *C. officinale* have been used as a mole repellent in gardens and for protection of stored vegetables and fruits from rodents [1d].

dwatta Analgesic Antidiarrhoeal Antihæmorrhoidal Antispasmodic Astringent Cancer Digestive Emollient NarcoticHound's tongue has a long history of use as a medicinal herb, though it is rarely used in modern herbalism[7, 268]. The leaves contain allantoin, a highly effective agent that speeds up the healing process in the body[238, K]. Caution should be applied, however, since narcotic effects result from large doses taken internally[7] and the plant is potentially carcinogenic[222] (though it has also been used in the treatment of cancer[218]). The leaves and roots are analgesic, antihæmorrhoidal, antispasmodic, astringent, digestive, emollient and slightly narcotic[4, 7, 9, 21, 46, 222]. The plant contains the alkaloids cynoglossine and consolidin, which are used medicinally to relieve pain[212]. They depress the central nervous system and are also potentially carcinogenic[222]. The plant has been used internally in the treatment of coughs and diarrhoea, though it is now mainly used externally as a poultice on piles, wounds, minor injuries, bites and ulcers[222, 238]. The root is harvested at the end of spring of the plants second year[7]. Another report says that it is best harvested in the autumn and dried for later

use[238]. The leaves and flowering shoots are harvested as the plant comes into flower and are dried for later use[238]. The plant has a wide antitumour reputation for cancers of various types[218]. A homeopathic remedy is made from the roots[7]. It is very effective in the treatment of insomnia[7].

propta Seed - sow in situ in early summer. The seed can be sown in spring or autumn, a period of cold stratification improves germination.

nwatta Prefers sandy, gravelly and basic soils[17]. Grows well in an ordinary well-drained soil[1]. Succeeds in full sun or partial shade[238]. The flowers are an absolute magnet for bees[K]. The plant smells of mice[17].

## 6.2.569 Dodæcætheon hendersonii

Sailor-Caps, Mosquito bills

5 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 0.3 m hkuc pimchmim cyutli tcup hwicli hrasjnutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Dodæcætheon hendersonii is a PERENNIAL growing to 0.3 m (1ft) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in leaf from March to July, in flower from April to June, and the seeds ripen from June to July. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Root - cooked[22, 46, 61, 105]. Roasted in ashes[161, 257]. It is a bulbil[60]. Leaves - cooked[46, 61, 105]. Roasted in ashes[161, 257].

tcanta None known

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame[175, 200]. A short period of cold stratification may improve the germination of stored seed which should be sown in spring in a cold frame. The seed usually germinates in 1 - 12 months at 15°C[175]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in March or September. Autumn is best[1]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Prefers a moist, rich, well-drained soil and some shade[1, 175]. Prefers woodland conditions or a cool moist shady border[111, 200]. Plants prefer a dry period when dormant in the summer[188].

## 6.2.570 Corydalis solida

Fumewort, Spring fumewort

5 tlin 9 cyuc 1 kcaak 0 tcan 3 dwat 0.2 m hkuc hmim cyutli tcup hwicli hrasjnut hpa7tli flatprikliwis hpa7tmwatli fyfjxre7t hjonli

drutta Corydalis solida is a PERENNIAL growing to 0.2 m (0ft 8in) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in leaf from March to July, in flower from April to May, and the seeds ripen from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Root - boiled[46, 61, 105, 115]. Rich in starch[2]. Some caution is advised, there is a report that the plant is toxic.

tcanta None known

dwatta Anodyne Antibacterial Antispasmodic Hallucinogenic Nerve SedativeFumewort has been used as a painkiller in Chinese medicine for over 1,000 years[238]. The tuber is anodyne, antibacterial, antispasmodic, hallucinogenic, nerve and sedative[9, 13, 238]. It is used internally as a sedative for insomnia and as a stimulant and

painkiller, especially in painful menstruation, traumatic injury and lumbago[238]. It is also used for lowering the blood pressure[9, 13]. Research suggests that it also has an action in the thyroid and adrenal cortex[238]. The tuber should not be prescribed for pregnant women[238]. The tubers are harvested when the plant is dormant and are dried for later use[238].

propta Seed - best sown as soon as it is ripe, the seed rapidly loses viability if it is allowed to become dry[129]. Surface sow and keep moist, it usually germinates in 1 - 3 months at 15°c[164]. Germinates in spring according to another report[129]. Two months warm, then a cold stratification improves the germination of stored seed[134, 164]. Sow the seed thinly so that the seedlings can be allowed to grow undisturbed in the pot for their first year. Apply liquid feed at intervals during their growing season to ensure they are well fed. The seedlings only produce one leaf in their first year of growth[175] and are very prone to damping off[129]. Divide the seedlings into individual pots once they have become dormant and grow them on in a partially shaded area of a greenhouse for at least another year. Plant them out into their permanent positions when they are dormant. Division after flowering.

nwatta Prefers a moist, well-drained rather light soil, thriving in semi-shade. Grows well in a woodland garden or peat bed. Increases well when grown in a bulb frame, but less freely when grown in the garden[90]. A very ornamental[1] and easily grown plant[129]. There are some named varieties[90]. Plants seem to be immune to the predations of rabbits[233].

## 6.2.571 Polygala tenuifolia

Yuan Zhi

5 tlin 9 cyuc 1 kcaak 0 tcan 3 dwat 0.2 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Polygala tenuifolia is a PERENNIAL growing to 0.2 m (0ft 8in) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 6. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Young leaves - cooked[105, 177, 179]. Root - cooked[105, 177]. The core is removed and the root is boiled in several changes of water[179].

tcanta None known

dwatta Cardiotonic Expectorant Haemolytic Kidney Sedative TonicYuan Zhi contains triterpenoid saponins, these promote the clearing of phlegm from the bronchial tubes. The plant is used mainly as an expectorant and stimulant to treat bronchial asthma, chronic bronchitis and whooping cough[254]. The root is antibacterial, cardiotonic, cerebrotonic, expectorant, haemolytic, hypertensive, sedative and tonic[116, 147, 176, 218]. It acts mainly as a tonic for the heart and kidney energies[238]. It is taken internally in the treatment of coughs with profuse phlegm, bronchitis, insomnia, palpitations, poor memory, anxiety, depression and nervous tension[238]. Externally it is used to treat boils and carbuncles[147, 238]. The root is harvested in the autumn and dried for later use[238]. The leaves are used as a tonic for the kidneys[218].

propta Seed - sow spring or autumn in a cold frame[214]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division. Cuttings of young shoots in a frame in late spring[1].

nwatta Prefers a moderately fertile moisture-retentive well-drained soil, succeeding in full sun if the soil remains moist throughout the growing season, otherwise it is best in semi-shade[200, 238]. Dislikes shade according to another report. Plants are hardy to at least -15°c[238].

## 6.2.572 Sedum divergens

Pacific Stonecrop

5 tlin 9 cyuc 1 kcaak 0 tcan 1 dwat 0.2 m hkuc

htut cyutli hgatkyuctup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Sedum divergens is an evergreen Perennial growing to 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked[172, 177]. The leaves are very small and round, looking rather like a small green berry[256]. They have a crisp texture and were valued as a food by some North American Indian tribes who would eat them raw[256].

tcanta None known

dwatta Antihæmorrhoidal LaxativeThe plant has been used in the treatment of piles and has been given to children as a laxative[257].

propta Seed - surface sow in spring in well-drained soil in a sunny position in a greenhouse. Do not allow the soil to dry out. Prick out the seedlings into individual pots when they are large enough to handle. If sufficient growth is made, it is possible to plant them out during the summer, otherwise keep them in a cold-frame or greenhouse for their first winter and plant them out in early summer of the following year[K]. Division is very easy and can be carried out at almost any time in the growing season, though is probably best done in spring or early summer. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Succeeds in most soils[188] but prefers a fertile well-drained soil and requires a sunny position[200]. Established plants are drought tolerant[200]. All members of this genus are said to have edible leaves, though those species, such as this one, that have yellow flowers can cause stomach upsets if they are eaten in quantity[62, 85]. Plants in this genus seem to be immune to the predations of rabbits[233].

## 6.2.573 Monarda punctata

Horse Mint, Spotted beebalm

5 tlin 9 cyuc 1 kcaak 0 tcan 3 dwat 0.8 m hkuc

hmimhtut cyutli kyuctup hwicli hrasjlutnyikfrp hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Monarda punctata is a ANNUAL/PERENNIAL growing to 0.8 m (2ft 7in) by 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Edible Uses: Condi- ment TeaLeaves - raw or cooked. A strong aromatic taste, they are used as a flavouring in salads and cooked foods, and also as an aromatic tea[183].

tcanta Essential IncenseThe plant has a pleasing aroma and has been hung in the house as an incense[257].

dwatta Antiseptic Carminative Diaphoretic Diuretic Emenagogue Rubefacient Stimulant Stomachic VesicantHorse mint was traditionally taken by several native North American Indian tribes to treat nausea and vomiting, and to encourage perspiration during colds. It was also applied externally as a poultice to treat swellings and rheumatic pains[254]. Nowadays it is used primarily to treat digestive and upper respiratory tract problems[254]. The leaves are carminative, diaphoretic, diuretic, emmenagogue, rubefacient, stimulant, stomachic and vesicant[4, 61, 238]. An infusion of the leaves is used in the treatment of flatulence, nausea, indigestion,

germinate, often taking more than 18 months. A warm stratification for 4 weeks followed by 12 weeks cold stratification can help[98]. The seed usually (eventually) germinates quite well[78]. Prick out the seedlings into individual pot as soon as they are large enough to handle and plant out when they are at least 15cm tall. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in a frame. Good percentage[78]. It is best to take the cuttings in June[202]. Cuttings of mature wood of the current year's growth, 10 - 12cm with a heel, November in a frame. Leave for 12 months. Fair to good percentage[78]. Layering in September/October. Takes 12 months[78].

nwatta Landscape Uses:Cascades, Erosion control, Hedge, Screen, Seashore. Succeeds in most soils that are well-drained[11, 200]. Dislikes very alkaline soils[202]. Prefers a soil that is only moderately fertile, succeeding in poor soils and in dry soils[11, 200]. Grows well in heavy clay soils. Very drought and shade resistant[200]. Tolerates maritime exposure[75]. Plants are hardy to about -15°c[200]. The foliage can be damaged in severe wind-chill conditions[202]. This is a potentially valuable fruit crop, fruiting as it does in April and May[K]. There are a number of named varieties[200, 202] and so there is plenty of scope for improving size and quality of fruit by selective breeding. Most cultivars are variegated and therefore slower-growing than the species[K]. This species is notably resistant to honey fungus[88, 200]. The small flowers have a sweet but pungent aroma. They pervade the garden for some distance on sunny days[245]. Closely related to *E. glabra*[11]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. An excellent companion plant, when grown in orchards it can increase yields from the fruit trees by up to 10%. Special Features:Not North American native, Naturalizing, Fragrant flowers, Inconspicuous flowers or blooms. The plant is heat tolerant in zones 9 through 7. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.)

## 7.1.4 Cercis siliquastrum

Judas Tree, Redbud

tfo2n 6 tlin 9 cyuc 4 kcaak 4 tcan 0 dwat 12 m hkuc

hmimhtut cyutli hgatkyuctup hwicli hyhshrasjlutnyik hpa7tli flatprikliwsslip hpa7tmwatli xre7t hjonli

drutta Cercis siliquastrum is a deciduous Tree growing to 12 m (39ft) by 10 m (32ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in May, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It can fix Ni- trogen. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Flowers SeedpodEdible Uses: Flowers - raw[2, 89, 105]. A sweetish-acid taste, they are a nice addition to the salad bowl[11, 183, K]. The flower buds are pickled and used as a condiment[183]. Seedpods - raw[2].

tcanta WoodWood - very hard, beautifully grained, takes a very fine polish. Used for veneers[89, 200].

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame[200]. Pre-soak stored seed for 24 hours in warm water then cold stratify for 3 months[113]. Sow spring in the greenhouse[78]. As soon as they are large enough to handle, prick the seedlings out into individual pots and grow them on in a greenhouse for their first winter. Plant them out into

their permanent positions in late spring or early summer, after the last expected frosts. Plants resent root disturbance and are best planted out in their permanent positions as soon as possible[11]. Cuttings of half-ripe wood, July/August in a frame[200].

nwatta Landscape Uses:Specimen. Succeeds in most soils and pH types, but dislikes growing in wet soils, especially when these are of clay[200]. Prefers a deep sandy loam and a very sunny position[11, 182]. Thrives on chalk[11, 98] and in dry sandy soils[98]. Probably does best on a poorish soil[49]. Succeeds in light shade[200]. Dislikes drought[200]. Dormant plants are hardy to about -15°c[202]. The young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. Plants do not generally thrive at Kew, they prefer a hotter, continental climate in order to fully ripen their wood[11]. One report says that plants require cool greenhouse treatment in Britain[1], though several good specimens have been seen outdoors in this country[K]. The tree often does not flower freely in Britain, especially if the previous summer was cool. Plants are susceptible to coral spot fungus, especially when growing in areas with cool summers where the wood is not fully ripened[11]. Plants in this genus are notably resistant to honey fungus[200]. Resents root disturbance, plants should be planted into their permanent positions as soon as possible, preferably in May, and should be kept well watered until established[11]. Any pruning is best carried out in the winter[202]. A very ornamental plant[1], flowering well in Cornwall[59]. It flowers better when growing in a continental climate[200]. The flowers are produced on the branches of the previous or earlier years, and also on the trunk of the plant[82]. A good bee plant[108]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. Special Features:Not North American native, Blooms are very showy.

## 7.1.5 Elaeagnus x reflexa

tfo2n 6 tlin 9 cyuc 3 kcaak 4 tcan 2 dwat 4.5 m hkuc

pcimhmimhtut cyutli hgatkyuctup hwicli hyhshrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Elaeagnus x reflexa is an evergreen Shrub growing to 4.5 m (14ft 9in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower from October to December, and the seeds ripen from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

kcakta Edible Parts: Fruit SeedEdible Uses: Fruit - raw or cooked[K]. The fruit must be fully ripe before it can be enjoyed raw, if even slightly under-ripe it will be quite astringent[K]. The fruit contains a single large seed[K]. Seed - raw or cooked. It can be eaten with the fruit though the seed case is rather fibrous[K].

tcanta Hedge HedgeCan be grown as a hedge in exposed positions, tolerating maritime exposure[11]. It can also be planted in windy gaps under trees in shelterbelts and will in time fill in the gaps and climb into the trees[11, 29].

dwatta CancerThe fruit of many members of this genus is a very rich source of vitamins and minerals, especially in vitamins A, C and E, flavanoids and other bio-active compounds. It is also a fairly good source of essential fatty acids, which is fairly unusual for a fruit. It is being investigated as a food that is capable of reducing the incidence of cancer and also as a means of halting or reversing the growth of cancers[214].

propta Seed - this is a hybrid and it will not breed true from seed. If this is not a problem, then the seed is best sown as soon as it is ripe in a cold frame[78]. It should germinate freely within 4 weeks, though it may take 18 months[K]. Stored seed can be very slow to germinate, often taking more than 18 months. A warm stratification for 4 weeks followed

in winter, store them in a cool fairly dry but frost-free place over the winter and then plant them out in the spring. The tubers lose moisture rapidly once they have been harvested, so make sure that you store them in a damp medium such as leafmold.

dwatta We have very little information on this species and do not know if it will be hardy in Britain, though judging by its native range it should succeed outdoors in many parts of this country. The following notes are based on the general needs of the genus. Prefers a light rich soil and a sunny position[1, 27]. Another report says that it prefers light dappled shade[200]. Tolerates acid soils[160]. A climbing plant, supporting itself by twining around the thin branches of shrubs[235]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. Growth habit is a single or multiple shooting vine from a crown [1-2]. Herbaceous. The root pattern is tuberous with swollen potato-like roots [1-2].

### 7.1.2 Elaeagnus macrophylla

Broad-leaved Oleaster

tfo2n 6 tlin 9 cyuc 5 kcak 3 tcan 2 dwat m hkuc pcmihmhmtut cyutli hgatkyuctcup hwicli hyishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Elaeagnus macrophylla is an evergreen Shrub growing to 3 m (9ft) by 3 m (9ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower from October to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

kckahta Edible Parts: Fruit SeedEdible Uses: Fruit - raw or cooked[105, 177]. A very acceptable rich flavour when fully ripe, though it is somewhat astringent before then[K]. A potentially very valuable crop, ripening as it does in April and May[K]. We are not sure how reliable a crop it is though, some plants bear very heavy crops whilst others rarely bear fruit[K]. The fruit is up to 30mm long and contains a single large seed[K]. Seed - raw or cooked. A mild flavour, that has a hint of peanut, it can be eaten in quantity[K]. It can be eaten together with the fruit though the seed case is rather fibrous[K].

tcanta Hedge HedgePlants can be grown as a hedge in exposed positions, they are very tolerant of maritime exposure[75, 200]. Reasonably fast-growing and providing a dense cover, it gives a very good protection from the wind[K]. Plants are very tolerant of regular trimming, they can also be cut back almost to the ground and will resprout from the base[K].

dwatta CancerThe fruit of many members of this genus is a very rich source of vitamins and minerals, especially vitamins A, C and E, flavanoids and other bio-active compounds. It is also a fairly good source of essential fatty acids, which is fairly unusual for a fruit. It is being investigated as a food that is capable of reducing the incidence of cancer and also as a means of halting or reversing the growth of cancers[214].

propta Seed - best sown as soon as it is ripe in a cold frame[78]. It should germinate freely within 4 weeks, though it may take 18 months[K]. Stored seed can be very slow to germinate, often taking more than 18 months. A warm stratification for 4 weeks followed by 12 weeks cold stratification can help[98]. The seed usually (eventually) germinates quite well[78]. Prick out the seedlings into individual pot as soon as they are large enough to handle and plant out when they are at least 15cm tall. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in a frame. Good percentage[78]. It is best to take the cuttings in June[202]. Cuttings of mature wood of the current year's growth, 10 - 12cm with a heel,

November in a frame. Leave for 12 months. Fair to good percentage[78]. Layering in September/October. Takes 12 months[78].

nwatta Succeeds in most soils that are well-drained[11, 200]. Prefers a soil that is only moderately fertile, succeeding in poor soils and in dry soils[11, 200]. Succeeds in sun or shade[11, 200]. Plants are very tolerant of maritime exposure[75]. This species is hardy to about -15°c[184], succeeding in the warmer counties of Britain. This is a plant with a very big potential as a commercial fruit crop. The fruit ripens outdoors in Britain in April, a season where traditionally there is no fresh fruit available. The fruit is of a reasonable size, has a very nice flavour when fully ripe and also has a fairly large edible seed[K]. Some research needs to be carried out in order to find the conditions that are necessary to ensure good crops - some plants fruit very heavily whilst others have very light or no crops[K]. This is the second of the evergreen Elaeagnus species to ripen in the spring, about a week or 10 days later than *E. cordifolia*[K]. This species is notably resistant to honey fungus[88, 200]. Plants can succumb to wind-rock in very wet seasons[75]. Plants are sometimes damaged by voles[75]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. An excellent companion plant, when grown in orchards it can increase yields from the fruit trees by up to 10%. Allied to *E. pungens* and *E. glabra*[11]. The flowers are very aromatic[184], their aroma pervading the garden on calm days[K].

### 7.1.3 Elaeagnus pungens

Elaeagnus, Thorny olive, Thorny Elaeagnus, Oleaster, Silverberry, Silverthorn, Pungent Elaeagnus
tfo2n 6 tlin 10 cyuc 5 kcak 3 tcan 2 dwat 4 m hkuc pcmihmhmtut cyutli hgatkyuctcup hwicli hyishrasjlutnyik frip hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Elaeagnus pungens is an evergreen Shrub growing to 4 m (13ft) by 4 m (13ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower from November to February, and the seeds ripen from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

kckahta Edible Parts: Fruit SeedEdible Uses: Fruit - raw or cooked[105, 177]. About the size of a large blackcurrant, though the seed is also quite large[K]. A nice sub-acid flavour when fully ripe but astringent if eaten before then[K]. Can be made into preserves, drinks etc[183]. The oval fruit is about 15mm long[200]. Seed - raw or cooked. It can be eaten with the fruit though the seed case is rather fibrous[K]. A taste vaguely reminiscent of peanuts[K]. The seed contains 42.2% protein and 23.1% fat on a zero moisture basis[218].

tcanta Hedge HedgePlants can be grown as a hedge in exposed positions, tolerating maritime exposure[75]. Succeeds when planted under trees that have become bare at the base, in time it will scramble up into the tree and fill out the bottom[75].

dwatta Antiasthmatic Antitussive Astringent CancerThe fruit of many members of this genus is a very rich source of vitamins and minerals, especially in vitamins A, C and E, flavanoids and other bio-active compounds. It is also a fairly good source of essential fatty acids, which is fairly unusual for a fruit. It is being investigated as a food that is capable of reducing the incidence of cancer and also as a means of halting or reversing the growth of cancers[214]. The leaves and the stems are concocted and used in the treatment of asthma, cough, diarrhoea, haemorrhoids etc[147, 218]. The seed is used to treat watery diarrhoea[218]. The root is astringent and is applied to sores, itchy skin etc[147, 218].

propta Seed - best sown as soon as it is ripe in a cold frame[78]. It should germinate freely within 4 weeks, though it may take 18 months[K]. Stored seed can be very slow to

catarrh in the upper respiratory tract, and to induce sweating and promote urination[4, 254]. The herb is principally used externally as a rubefacient, applied as a poultice it helps to lessen the pain of arthritic joints by increasing the flow of blood in the area and thereby hastening the flushing out of toxins[4, 254]. The leaves can be harvested before the plant flowers, or they can be harvested with the flowering stems. They can be used fresh or dried[238]. The plant is a rich source of the medicinal essential oil 'thymol', which is anti-septic[4, 213, 222]. The plant has been commercially cultivated for its essential oil, though this is now produced synthetically[222]. Thymol is also an effective hookworm remedy, but must be ingested in such large quantities that it can prove fatal to the patient[213].

propta Seed - sow mid to late spring in a cold frame. Germination usually takes place within 10 - 40 days at 20°c. When large enough to handle, prick the seedlings out into individual pots and plant them out into their permanent positions in early summer. The seed can also be sown in situ in late summer in areas where the winters are not too severe and will produce larger plants. Cuttings of soft basal shoots in spring. Harvest the shoots with plenty of underground stem when they are about 8 - 10cm above the ground. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer. Division in spring or autumn. Large divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Easily grown in ordinary garden soil so long as it is not too dry[1, 200]. Requires a moist soil and a sunny position[200]. This species prefers a light dry alkaline soil[238]. Plants are hardy to about -10°c[260] and should succeed outdoors in most parts of Britain. A polymorphic species[200]. A good bee plant[200]. Subject to mildew in dry summers[200].

### 6.2.574 Artemisia schmidtiana

Sagebrush, Silvermound, Wormwood, Mugwort

5 tlin 8 cyuc 1 kcak 0 tcan 0 dwat 0.3 m hkuc htut cyutli hgatkyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Artemisia schmidtiana is a PERENNIAL growing to 0.3 m (1ft) by 0.6 m (2ft in) at a medium rate. It is in flower from August to November, and the seeds ripen from September to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kckahta Edible Parts: StemEdible Uses: Stems - cooked[177].

tcanta None known
dwatta None known
propta Seed - surface sow from late winter to early summer in a greenhouse, making sure that the compost does not dry out[200]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant out in late spring or early summer. Division in spring or autumn[200]. Basal cuttings in late spring. Harvest the young shoots when about10 - 15cm long, pot up in a lightly shaded position in a greenhouse or cold frame and plant them out when well rooted. Very easy.

nwatta Landscape Uses:Border, Ground cover, Specimen. Requires a well-drained sandy soil in full sun[187]. Established plants are drought tolerant[190]. Plants are longer lived, more hardy and more aromatic when they are grown in a poor dry soil[245]. Plants are hardy to about -20°c[187]. Members of this genus are rarely if ever troubled by browsing deer[233]. Special Features: Attractive foliage, Fragrant foliage, Inconspicuous flowers or blooms.

### 6.2.575 Acaenia anserinifolia

Pirri-Pirri Bur

5 tlin 9 cyuc 1 kcak 0 tcan 1 dwat 0.1 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Acaenia anserinifolia is an evergreen Perennial growing to 0.1 m (0ft 4in) by 1 m (3ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in leaf all year, in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure.

kckahta Edible Parts: LeavesEdible Uses: TeaThe leaves are used as a substitute for tea[2, 144, 173, 183].

tcanta A good ground-cover plant, tolerating some treading[200]. A carpeting plant, rooting as it spreads[208]. dwatta Antiphlogistic Diuretic VulneraryThe leaves are antiphlogistic, carminative, diuretic and vulnerary[61].

propta Seed - sow March in a greenhouse. Germination, which can be very poor, usually takes place within 1 - 3 months at 10°c[133]. When the seedlings are large enough to handle, prick them out into individual pots, planting them out in the summer. Division in April or October. Very easy, the plants can be divided at any time of the year if required, though it will need to be done in a greenhouse during the winter months. Cuttings - August in a cold frame.

nwatta An easily grown plant, it succeeds in ordinary well-drained soil in sun or semi-shade[133, 200]. Requires a warm position[208]. Adaptable to poorly-drained soils in Australia[157]. A very invasive plant, spreading freely by its procumbent rooting stems[K]. It is low-growing, however, and so can be grown as a ground cover amongst taller plants[K].

### 6.2.576 Centaurea solstitialis

St. Barnaby's Thistle, Yellow star-thistle

5 tlin 9 cyuc 1 kcak 0 tcan 1 dwat 0.6 m hkuc htut cyutli hgatkyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwisslip hpa7tmwatli fyfixre7t hjonli

drutta Centaurea solstitialis is a ANNUAL/BIENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to September, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kckahta Edible Parts: LeavesEdible Uses: The plant is eaten as a vegetable[100]. The part used is not specified.

tcanta None known
dwatta LithontripicThe powdered seed is used as a remedy for stone[4]. The powdered root is said to be a cure for fistula and gravel[4].

propta Seed - sow April in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out into their permanent positions in the summer. If you have sufficient seed it can be sown in situ in the spring, and an autumn swing in situ might also be worth trying.

nwatta Succeeds in ordinary garden soil[1, 200]. Prefers a well-drained fertile soil and a sunny position[200]. Tolerates dry, low fertility and alkaline soils[200]. A good bee and butterfly plant the flowers are rich in nectar[171]. Members of this genus are rarely if ever troubled by browsing deer[233].

### 6.2.577 Gagea lutea

Yellow Star Of Bethlehem

5 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 0.2 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Gagea lutea is a BULB growing to 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 6. It is

in flower from March to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**kcakta** Edible Parts: Leaves Root**Edible Uses:** Bulb - raw or cooked[4, 105, 177]. A famine food, it is only used in times of scarcity[4]. Young leaves - cooked.

tcanta None known
dwatta None known

propta Seed - sow spring in a greenhouse[200]. Sow the seed thinly so that there is no need to transplant them, and grow the seedlings on in the same pot in the greenhouse for their first year or two. Give an occasional liquid feed to ensure they do not become nutrient deficient. Pot up the small bulbs when the plants are dormant, placing 2 - 3 bulbs in each pot. Grow them on for another year or two in the greenhouse before planting them out when they are dormant. Division. We have no details of when is the best time to divide the bulbs but suggest doing it after the leaves die down in the summer.

nwatta Requires a moist soil, preferring one on the alkaline side of neutral, and succeeding in sun or shade. The dormant bulbs are fairly hardy and will withstand soil temperatures down to at least -10<sup>o</sup>c[214].

### 6.2.578 Euphrasia officinalis

Eyebright

5 tlin 9 cyuc 1 kcaak 0 tcan 3 dwat 0.2 m hkuc
hmmihmtt cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikli-wisslip hpa7tmwatli fyifxre7t hjonli

drutta Euphrasia officinalis is a ANNUAL growing to 0.2 m (0ft 8in) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**kcakta** Edible Parts: Leaves**Edible Uses:** Leaves - raw[7]. They are occasionally used in salads for their slightly bitter flavour[7].

tcanta None known

dwatta Antiinflammatory Astringent Digestive Homeopathy Ophthalmic Tonic**Eyebright** has a long history of herbal use in the treatment of eye problems and is still in current herbal use[4]. It is important that only the correct forms of eyebright, with glandular hairs on the calyx, are used, since other forms do not possess medicinal virtues[268]. Eyebright tightens the mucous membranes of the eye and appears to relieve the inflammation of conjunctivitis and blepharitis[254]. Its ability to counter catarrh means that it is often used for infectious and allergic conditions affecting the eyes, middle ear, sinuses and nasal passages[254]. The whole plant is anti-inflammatory, astringent, digestive, ophthalmic and slightly tonic[4, 7, 9, 14, 165, 220]. It is taken internally in the treatment of catarrh, sinusitis, hay fever, upper respiratory tract infections etc[238]. As an ophthalmic, an infusion of the plant can be taken internally or used as an eye wash. Alternatively, the diluted juice can be dropped into the eyes[232]. Some caution should be exercised, experimentally it can induce side effects including dim vision[222]. The plant's astringency makes it inappropriate for treating dry or stuffy congestion[254]. The plant can be used externally as a poultice to aid the healing of wounds[268]. Eyebright should be harvested when in flower and can be dried for later use[238]. The dried herb is a ingredient of herbal smoking mixtures, used in the treatment of chronic bronchial coughs[4]. A homeopathic remedy is made from the expressed juice of the plant[232]. It is used particularly in the treatment of eye inflammations and colds[7, 232].

propta Sow the seed outdoors in situ in early spring amongst grass in a moist but not marshy soil[1].

nwatta Succeeds in most soils, preferring chalk or limestone[200]. Eyebright is a semi-parasitic plant, growing on the roots of various species of grass[4] and also on Trifolium pratense and Plantago species[238]. The grass does not seem to suffer unduly from this parasitism since eyebright

is an annual and its cells do not penetrate very deeply into the grass[4]. There is some doubt over the validity of the name of this species, some botanists now call it Euphrasia rostkoviana. Eyebright is a variable aggregate species, some botanists divide it into a number of different species[1, 50]. Only those forms of eyebright which have glandular hairs on the calyx possess medicinal qualities[268]. It hybridizes freely with other members of this genus[200].

### 6.2.579 Lithospermum officinale

Gromwell, European stoneseed

5 tlin 9 cyuc 1 kcaak 0 tcan 2 dwat 0.8 m hkuc
hmmihmtt cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Lithospermum officinale is a PERENNIAL growing to 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to July, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**kcakta** Edible Parts: Edible Uses: TeaThe leaves are used as a tea substitute[46, 61, 183].

tcanta DyeA purple dye is obtained from the roots. It is best harvested in the spring[178].

dwatta Contraceptive Depurative Diuretic Lithontripic Oxytotic SedativeThe mature seeds are diuretic, lithontripic and oxytotic[9, 240]. They are ground into a powder and used in the treatment of bladder stones, arthritis and febrile conditions[9]. An infusion of the leaves is used as a sedative[240]. The root is depurative[240]. A syrup made from a decoction of the root and stems is used in the treatment of eruptive diseases such as smallpox, measles and itch[240]. All parts of the plant contain a substance that inhibits the secretion of the pituitary gonadotrophic hormone[240]. Extracts of the herb possess contraceptive properties[240].

propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings. Division.

nwatta Prefers a moderately fertile well-drained soil[200].

### 6.2.580 Sedum stenopetalum

Wormleaf Stonecrop

5 tlin 9 cyuc 1 kcaak 0 tcan 1 dwat 0.2 m hkuc
htut cyutli hgatyuctcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Sedum stenopetalum is an evergreen Perennial growing to 0.2 m (0ft 8in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from June to July, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

**kcakta** Edible Parts: Leaves**Edible Uses:** Leaves - raw or cooked. Best used when young[85].

tcanta None known

dwatta VDAan infusion of the whole plant has been used in the treatment of venereal diseases[257].

propta Seed - surface sow in spring in well-drained soil in a sunny position in a greenhouse. Do not allow the soil to dry out. Prick out the seedlings into individual pots when they are large enough to handle. If sufficient growth is made, it is possible to plant them out during the summer, otherwise keep them in a cold-frame or greenhouse for their first winter and plant them out in early summer of the following year[K]. Division is very easy and can be carried out at almost any time in the growing season, though is probably best done in

propta Spores - best sown as soon as they are ripe on the surface of a humus-rich sterilized soil. Keep the compost moist, preferably by putting a plastic bag over the pot. Germinates in spring[1]. Spring sown spores germinate in 1 - 3 months at 15<sup>o</sup>c[134]. Pot on small clumps of plantlets as soon as they are large enough to handle and grow them on in light shade in a cold frame or greenhouse. Keep them humid until they are well established. When they are at least 15cm tall, plant them out into their permanent positions in late spring or early summer.

nwatta Requires a partly shaded site with preferably less than 3 hours sunshine daily[200]. Plants can be grown in old brick walls[219]. Members of this genus are rarely if ever troubled by browsing deer[233].

### 6.2.743 Geranium sibiricum

Siberian geranium

5 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 0.2 m hkuc
htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Geranium sibiricum is a PERENNIAL growing to 0.2 m (0ft 8in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta None known

tcanta None known

dwatta Astringent Diuretic VulneraryThe plant is used as an astringent, diuretic and vulnerary[240].

propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring or autumn. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Succeeds in only moderately fertile retentive soil in a sunny position[200]. Tolerates a wide range of soil types[200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233].

### 6.2.744 Morina longifolia

Whorlflower

5 tlin 9 cyuc 0 kcaak 0 tcan 2 dwat 0.6 m hkuc
hmmihmtt cyutli tcup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Morina longifolia is an evergreen Perennial growing to 0.6 m (2ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Moths. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta Essential IncenseThe plant is used as an incense[145, 240, 272]. The roots yield 0.34% essential oil[240].

dwatta Digestive Emetic StomachicThe stem, leaves and flowers are used in Tibetan medicine, they are said to have a sweet and astringent taste with a heating potency[241]. They are digestive, emetic and stomachic, and are used in the treatment of stomach disorders such as indigestion giving rise to vomiting and nausea[241].

propta Seed - best sown as soon as it is ripe in individual pots to minimize disturbance to the tap root. Overwinter in a well ventilated cold frame[200]. Sow stored seed in early spring in a cold frame[111]. Plant out into their permanent positions in the summer when the plants are at least 15cm tall. Division in spring is possible but very difficult. Divided plants are often extremely slow to re-establish[200]. It is best carried out immediately after the plant flowers[188]. Root cuttings in individual pots in November. Plants are quick to

produce foliage but slow to form roots. They are best left in pots for 12 months before planting out[175].

nwatta Requires a fertile, humus-rich, moisture retentive but well-drained sandy or gritty soil in a sunny position[1, 111, 200]. It grows best with a little shade and shelter from high winds[1]. Prefers a slightly acid soil[175]. A very ornamental plant[1], the leaves are spicily aromatic[187]. A fairly easy plant to grow, though it tends to be short-lived[187]. It is hardy to about -17<sup>o</sup>c when growing in a perfectly drained soil[187, 200]. It grows best in the western side of Britain, sometimes succumbing to cold in the south-east of the country[233]. Requires protection from slugs[K]. The flowers open in the evening and are pollinated by moths. If pollination does not take place by morning then the top of the pistil curves over and effects self-pollination[211]. Resents root disturbance[200].

### 6.2.745 Senecio viscosus

Sticky Groundsel, Sticky ragwort

5 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 0.4 m hkuc
htut cyutli kyuctup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Senecio viscosus is a ANNUAL growing to 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to September, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcakta None known

tcanta None known

dwatta Carminative EmeticThe leaves are carminative and emetic[4].

propta Seed - sow spring in situ.

nwatta See the plants native habitat for ideas on its cultivation needs. The plant has an unpleasant odour[4].

# 7 6 tlin

## 7.1 bwon

### 7.1.1 Apios priceana

Traveler's delight

tfo2n 6 tlin 9 cyuc 5 kcaak 3 tcan 0 dwat 3 m hkuc
hmmihmtt cyutli tcup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Apios priceana is a PERENNIAL growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**kcakta** Edible Parts: Root**Edible Uses:** Tuber - raw or cooked[62]. It has a delicious flavour somewhat like sweet potatoes when roasted. The tuber can also be dried and ground into a powder. The tuber is solitary, unlike other members of this genus that produce strings of tubers[62]. The tuber can be 15cm thick and somewhat longer[235].

tcanta Nitrogen fixer.

dwatta None known

propta Seed - pre-soak for 3 hours in tepid water and sow February/March in a cold frame. The seed usually germinates in 1 - 3 months at 15<sup>o</sup>c[134]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for their first winter, planting them out in late spring or early summer. Division can be carried out at almost any time of the year, though spring is probably the best time. Simply dig up the roots, harvest the tubers and replant them where you want the plants to grow. It is also possible to harvest the tuber

dwatta Cardiac Stomachic Women's complaintsA tea made from the plant is used in the treatment of painful or irregular menstruation, diarrhoea, bronchitis, heart diseases, sore throats and stomach aches[222, 257]. Externally, it is used as a lotion on backaches, hand sores etc and as a gargle for sore throats[257]. Caution is advised in the use of this plant, see the note above on toxicity.

propta Seed - surface sow in situ in the spring[222].

nwatta Prefers a moist, well-drained rather light soil, thriving in semi-shade[1]. Grows well in a woodland garden or peat bed. Plants seem to be immune to the predations of rabbits[233].

## 6.2.739 *Gentiana tubiflora*

5 tlin 9 cyuc 0 kcaak 0 tcan 2 dwat 0.1 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik  
hpa7tmwatli xre7t hjonli

drutta *Gentiana tubiflora* is a PERENNIAL growing to 0.1 m (0ft 4in) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bumblebees, butterflies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta None known

dwatta Antidote Antiinflammatory FebrifugeThe entire plant is used in Tibetan medicine, it is said to have a bitter taste and a cooling potency[241]. Antidote, anti-inflammatory and febrifuge, it is used in the treatment of headaches and redness of the eyes, inflammation of the throat and inflammation of the gall bladder giving rise to yellowish skin[241].

propta Seed - best sown as soon as it is ripe in a light position in a cold frame[200]. It can also be sown in late winter or early spring but the seed germinates best if given a period of cold stratification and quickly loses viability when stored, with older seed germinating slowly and erratically[200, 239]. It is advantageous to keep the seed at about 10°C for a few days after sowing, to enable the seed to imbibe moisture[239]. Following this with a period of at least 5 - 6 weeks with temperatures falling to between 0 and -5°C will usually produce reasonable germination[239]. It is best to use clay pots, since plastic ones do not drain so freely and the moister conditions encourage the growth of moss, which will prevent germination of the seed[239]. The seed should be surface-sown, or only covered with a very light dressing of compost. The seed requires dark for germination, so the pots should be covered with something like newspaper or be kept in the dark[239]. Pot up the seedlings into individual pots as soon as they are large enough to handle and grow on in light shade in the greenhouse for at least their first winter. The seedlings grow on very slowly, taking 2 - 7 years to reach flowering size[239]. When the plants are of sufficient size, place them out into their permanent positions in late spring or early summer. Division in March[111]. Most members of this genus have either a single tap-root, or a compact root system united in a single root head, and are thus unsuitable for division[239]. Cuttings of basal shoots in late spring[238].

nwatta In general, gentians require a moist well-drained soil in a sheltered position, a certain minimum of atmospheric humidity, high light intensity but a site where temperatures are not too high[239]. They are therefore more difficult to grow in areas with hot summers and in such a region they appreciate some protection from the strongest sunlight[200, 239]. Most species will grow well in the rock garden[200].

## 6.2.740 *Semiaquilegia adoxoides*

Tian Kui

5 tlin 9 cyuc 0 kcaak 0 tcan 2 dwat 0.3 m hkuc

drutta *Semiaquilegia adoxoides* is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in May. The species is hermaphrodite (has both male and female organs). Suitable

for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta None known

dwatta Depurative Diuretic Febrifuge Skin UrinaryThe root is specifically recommended in the treatment of dry scabby skin and urinary disorders[218]. The tubers are depurative, diuretic and febrifuge[218].

propta Seed - best sown as soon as it is ripe in a cold frame. It can be slow to germinate[200]. Stored seed can be sown in late winter in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring[200].

nwatta Succeeds in ordinary garden soil, preferring a moist but not wet soil and a sunny position[1]. Intolerant of heavy clay[200]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

## 6.2.741 *Adonis aestivalis*

Pheasant's Eye, Summer pheasant's eye

5 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 0.3 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik  
hpa7tmwatli fyfxre7t hjonli

drutta *Adonis aestivalis* is a ANNUAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in June, and the seeds ripen in July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta None known

dwatta Cardiotonic Diuretic Laxative LithotropicThe plant is a cardiotonic, diuretic and stimulant[13, 46, 61]. Some caution is advised in the use of this remedy, see the notes above on toxicity. The flowers are considered to be diuretic, laxative and lithotropic[240].

propta Seed - best sown in situ as soon as it is ripe in the autumn[1], though it can also be sown in situ in the spring[134].

nwatta Grows well in ordinary garden soil[1]. Prefers a moist well-drained soil in sun or semi-shade[200]. A greedy plant inhibiting the growth of nearby plants, especially legumes[54]. Very closely related to *A. annua*[200].

## 6.2.742 *Asplenium adiantum*

Black Spleenwort

5 tlin 9 cyuc 0 kcaak 0 tcan 2 dwat 0.5 m hkuc  
pcimhmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik  
hpa7tmwatli hjonli

drutta *Asplenium adiantum-nigrum* is an evergreen Fern growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, and the seeds ripen from June to October. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta None known

tcanta HairA decoction of the herb is a good hair wash[17].

dwatta Bitter Contraceptive Diuretic Emmenagogue Expecto- rant Laxative Ophthalmic PectoralThe plant is bitter, diuretic, laxative and ophthalmic[240]. It is taken internally to treat diseases of the spleen, jaundice and ophthalmia[240]. It is said to produce sterility in women[240]. A decoction or syrup made from the fronds is emmenagogue, expecto- rant and pectoral[240]. It is used to relieve troublesome coughs[4].

spring or early summer. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer. Bulbils harvested in late summer and planted out immediately.

nwatta Succeeds in most soils[188] but prefers a fertile well-drained soil in a sunny position[200]. Established plants are very drought tolerant[200], they grow well in dry soils and can be grown on a wall[200]. Plants are viviparous, producing bulbils in their leaf axils at flowering time[83, 200]. All members of this genus are said to have edible leaves, though those species, such as this one, that have yellow flowers can cause stomach upsets if they are eaten in quantity[62, 85]. Plants in this genus seem to be immune to the predations of rabbits[233].

## 6.2.581 *Urospermum dalechampii*

5 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 0.5 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik  
hpa7tmwatli xre7t hjonli

drutta *Urospermum dalechampii* is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 6. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw. They can be used in salads but are very bitter[217].

tcanta None known

dwatta None known

propta Seed - we have no information for this species but suggest sowing the seed in situ either as soon as it is ripe in late summer or in the spring. Division.

nwatta Succeeds in any fertile soil in a very sunny position[233]. A very ornamental plant[233].

## 6.2.582 *Pinellia ternata*

Ban Xia, Crowdipper

5 tlin 9 cyuc 1 kcaak 0 tcan 3 dwat 0.2 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik  
hpa7tmwatli xre7t hjonli

drutta *Pinellia ternata* is a CORM growing to 0.2 m (0ft 8in) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Root[177]. The tuber is about 12mm in diameter[266]. No more details of edibility are given in these reports but caution is advised since the fresh root is toxic[238]. The toxins can be destroyed by thoroughly drying, or very well cooking the root[K].

tcanta None known

dwatta Antiemetic Antiplogistic Cancer Expecto- rant Febrifuge Sialagogue StypticThe root of ban xia is antiemetic, antiplogistic, expecto- rant, febrifuge, siala- gogue and styptic. It also strengthens the spleen[147, 174, 176, 178, 279]. Modern research has shown that this remedy is very effective in controlling nausea and vomiting[238]. It is also an ingredient of a Chinese prescription for removing gallstones without surgery, a process that usually causes severe nausea[238]. The root is also used internally in the treatment of coughs with thin watery phlegm and gastritis[238]. The fresh root is extremely acid and contains toxins, these are neutralized upon drying or by soaking in tea or vinegar[238]. The root is harvested in the summer and dried for later use, it should not be used fresh[174, 238]. Extracts of the plant have been shown to have analgesic, antiemetic, anticancer and sedative activity[218].

propta Seed - we have no information but suggest sowing the seed in a cold frame as soon as it is ripe if this is possible otherwise in early spring. When they are large enough to handle, prick the seedlings out into individual pots and grow

them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division of offsets as new growth begins in spring[238]. Bulbils from the leaf axils can be potted up in late summer and be planted out in late spring[238].

nwatta An easily grown when given a rich soil, it requires plenty of water in the growing season[1]. Succeeds in full sun or partial shade[188]. This species is cultivated as a medicinal plant in China[178]. Plants produce bulbils in their leaf axils and when growing in suitable conditions can become invasive[188, 238]. The plants can be naturalized in woodland[1].

## 6.2.583 *Gaultheria insana*

5 tlin 9 cyuc 1 kcaak 0 tcan 1 dwat 0.5 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli frusflatprik  
hpa7tmwatli xre7t hjonli

drutta *Gaultheria insana* is an evergreen Shrub growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from April to June. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Most members of this genus have more or less edible fruits, but it is unwise to eat the fruits of this species. See below under medical uses for more information.

tcanta None known

dwatta The fruits cause intoxication when consumed[192]. The person becomes confused, often suffers delirium and, if the fruit is taken in excess, a permanent mental condition that mimics insanity can be caused[192].

propta The seed requires a period of cold stratification. Pre-chill for 4 - 10 weeks and then surface sow in a lime-free compost in a shady part of the greenhouse and keep the compost moist[78]. The seed usually germinates well, usually within 1 - 2 months at 20°C, but the seedlings are liable to damp off. It is important to water them with care and to ensure that they get plenty of ventilation. Watering them with a garlic infusion can also help to prevent damping off[K]. Prick out the seedlings into individual pots when they are about 25mm tall and grow them on in light shade in the greenhouse for at least their first winter[K]. Plant them out in late spring or early summer. The seedlings are susceptible to spring frosts so might need some protection for their first few years outdoors. The leaves remain very small for the first few years[11]. Cuttings of half-ripe wood 3 - 6cm long, July/August in a frame in a shady position. They form roots in late summer or spring[78]. A good percentage usually take. Division in spring just before new growth begins[200]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring. Layering.

nwatta Prefers a cool moist but not boggy humus rich soil in shade or semi-shade[11, 200]. A peat and moisture loving species, it requires a lime-free soil[11, 200]. Prefers full sun but tolerates light shade[11, 200]. This species is slightly tender in Britain and does not succeed in the colder parts of the country[11]. Plants in this genus are notably resistant to honey fungus[200].

## 6.2.584 *Hypericum erectum*

5 tlin 9 cyuc 1 kcaak 0 tcan 1 dwat 0.6 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik  
hpa7tmwatli fyfxre7t hjonli

drutta *Hypericum erectum* is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves and stems[105, 177]. No more details.

tcanta None known  
dwatta Astringent GalactogogueThe leaves and flowering tops are galactogogue[218]. The stems are rich in tannin and are used in the treatment of arthritis, lumbago, neuralgia and rheumatism[218].

propta Seed - sow spring in a greenhouse and only just cover the seed. Germination usually takes place within 1 - 3 months at 10°c. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Easily grown in any reasonably good well-drained but moisture retentive soil[1]. Succeeds in sun or semi-shade but flowers better in a sunny position[200]. One report says that the plant is vigorous but not quite hardy in Britain[1]. This seems to be a mistake, other reports say that it is hardy to zone 6, tolerating winter temperatures down to -15°c or lower[200].

## 6.2.585 Iris ensata

Japanese Water Iris

5 tlin 8 cyuc 1 kcak 0 tcan 1 dwat 0.6 m hkuc  
htut cyutli tcuphja7n hwicli hrasjlut hpa7tli flatprik hpa7tmwatli fyifxre7t hjonli

drutta Iris ensata is a PERENNIAL growing to 0.6 m (2ft) by 1 m (3ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from May to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers moist or wet soil.

kcakta Edible Parts: RootEdible Uses: Root - the source of an edible starch[2, 105, 177]. Some caution is advised, see the notes above on toxicity.

tcanta Basketry Broom Fibre ThatchingA fibre is obtained from the leaves, a substitute for hemp[42]. It is used for rope and coarse cloth[74]. Also used in thatching and basket making[123]. The root is long and fibrous, it is used for making brooms, brushes etc[178].

dwatta Alternative Anthelmintic Antidote Appetizer Depurative Diuretic Hepatic VermifugeThe root is alterative, anthelmintic, antidote, appetizer, depurative, diuretic, hepatic and vermifuge[61, 178, 218]. It is used with other herbs in the treatment of venereal affections, liver complaints and dropsy[240].

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed should be sown as early in the year as possible in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse or cold frame for their first year. Plant out into their permanent positions in late spring or early summer. Division in March or October. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Landscape Uses:Border, Container, Massing, Specimen, Woodland garden. Prefers a light well-drained soil and a sunny position[42]. Prefers partial shade[188]. Likes plenty of moisture and a rich loamy slightly acid soil[79, 200]. Requires a lime-free soil[233]. Some cultivars, in particular the 'Higo' strain, tolerate a pH up to 7.4[200]. Plants can be grown in containers in pond margins but are then best kept in drier conditions over winter[200]. This species is hardy to about -20°c[187]. Cultivated for its root in Japan[2]. (for the starch). There are many named varieties, selected for their ornamental value[187, 200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. Special Features: Attractive foliage, North American native, All or parts of this plant are poisonous, Wetlands plant, Suitable for cut flowers.

## 6.2.586 Matricaria recutita

German Camomile

5 tlin 9 cyuc 1 kcak 4 tcan 5 dwat 0.5 m hkuc  
htut cyutli kyuctcup hwicli hyishrasjlutnyik hpa7tli flatprikwishsom hpa7tmwatli xre7t hjonli

drutta Matricaria recutita is a ANNUAL growing to 0.5 m (1ft 8in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from June to July, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in saline soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Edible Uses: Condiment TeaThe young sprigs are used as a seasoning[15]. The dried flowers are used to make herb teas[21, 37]. It is aromatic but with a very bitter flavour[4].

tcanta Dye Essential Hair Liquid feed Repellent StrewingAn infusion of the flowers is used as a hair shampoo, especially for fair hair[14, 20, 168]. It is also used as a liquid feed and general plant tonic, effective against a number of plant diseases[14, 18, 20]. The flowers are also an ingredient of 'Quick Return' herbal compost activator[32]. The whole plant was formerly used as a strewing herb[4, 168]. The whole plant is insect repellent[14, 20]. An essential oil from the whole plant is used as a flavouring and in perfumery[46]. Yellow to gold dyes are obtained from the flowers[168].

dwatta Anodyne Antiinflammatory Antiseptic Antispasmodic Carminative Cholagogue Diaphoretic Homeopathy Nervine Stomachic Tonic VasodilatorGerman camomile is a well known herbal remedy and is much used in the West. In particular it is an excellent herb for treating various digestive disorders, nervous tension and irritability and is also used externally to treat skin problems[254]. An infusion of the flowers is taken internally as an anodyne, anti-inflammatory, antiseptic, antispasmodic, carminative, cholagogue, diaphoretic, emmenagogue, febrifuge, sedative, stomachic, tonic and vasodilator[7, 218, 238]. An infusion is particularly useful as a stomachic, nervine and sedative for young children, especially when they are teething[238]. It is also used in the treatment of irritable bowel syndrome, Crohn's disease, peptic ulcers and hiatus hernia[254]. In large doses, or when taken regularly for several times each day, the tea can be emetic[218] and can also cause the symptoms it is intended to cure[232]. The flowers are also used externally to treat wounds, sunburn, burns, haemorrhoids, mastitis and leg ulcers[238]. The flowers are harvested when fully open and are dried for later use[254]. The flowers contain various volatile oils including proazulenes[254]. Upon steam distillation these proazulenes produce chamazulene, this is remarkably anti-allergenic and is useful in the treatment of asthma and hay fever[254]. The flowers are sometimes added to cosmetics as an anti-allergenic agent[238]. The whole plant, harvested when in flower, is used to make a homeopathic remedy[232]. It is especially suited to teething children and those who have been in a highly emotional state over a long period of time[232]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve Camomile for coughs and bronchitis, fevers and colds, inflammations of the skin, inflammation of the mouth and pharynx, tendency to infection - improve immunity, wounds and burns (see [302] for critics of commission E).

propta Seed - sow spring or autumn in situ[238]. Germination should take place within 3 weeks.

nwatta An easily grown plant, it succeeds in any well-drained soil in a sunny position[200]. It prefers neutral to slightly acid conditions and succeeds in poor soils[238]. It usually self-sows freely when well-sited[K]. Chamomile has a long history as a gentle and effective folk medicine for a wide variety of disorders, being especially effective and safe for children[K]. There is some confusion between this plant and Chamaemelum nobile as to which is the genuine camomile. This species is said to be more bitter and inferior to Chamaemelum nobile in some reports[200] and to be more active medicinally in other reports[9, 238]. Both have similar properties and can probably be used interchangeably[K]. The whole plant has a pungent aroma[245].

A poultice of the warmed root has been applied to treat the pain of toothache[257]. An infusion of the crushed seed has been drunk and used externally in the treatment of stomach or bowel cramps[257].

propta Seed - sow spring in an outdoor seedbed. Germination usually takes place within 3 weeks. Plant the seedlings into their permanent positions when they are large enough to handle. If seed is in short supply, it can be sown in spring in pots in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in early summer.

nwatta Requires a well-drained soil and a sunny position[200]. Dislikes acid soils[200]. Tolerates poor soils[200]. Grows well on a sunny wall and is indeed longer lived in such a position[166]. A polymorphic species[155], it is possibly a form of *E. asperum*[1].

## 6.2.735 Linum strictum

5 tlin 9 cyuc 0 kcak 0 tcan 1 dwat 0.4 m hkuc

htut cyutli kyuctcup hwicli hyishrasjlut hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

drutta Linum strictum is a ANNUAL growing to 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 6. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta None known  
tcanta None known  
dwatta EmollientThe seeds are used as an emollient[240].

propta Seed - sow early spring in situ.

nwatta Prefers a light well-drained moderately fertile humus-rich soil in a sunny sheltered position[200].

## 6.2.736 Galax urceolata

Beetleweed, Wandflower

5 tlin 8 cyuc 0 kcak 2 tcan 1 dwat 0.2 m hkuc  
pcimhmim cyutli kyuctcup hwicli hrasjlutnyik hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta Galax urceolata is an evergreen Perennial growing to 0.2 m (0ft 8in) by 0.3 m (1ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf all year, in flower from June to July. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers dry or moist soil.

kcakta None known  
tcanta An attractive ground cover, the leaves turn bronze-red in winter[200]. Plants should be spaced about 25cm apart each way[208].

dwatta Kidney VulneraryThe plant is used for healing all kinds of wounds and cuts[207]. An infusion of the root is used to treat kidney problems[257].

propta Seed - sow early spring or autumn in a shaded cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a shady position in a greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division with care in early spring[200].

nwatta Landscape Uses:Border, Container, Ground cover, Rock garden, Specimen, Woodland garden. Requires a moist humus-rich lime-free soil with part day shade[200]. Succeeds in full shade[208]. Plants can succeed in the dry shade of trees[233]. Succeeds in the woodland garden, large rock gardens or as an edging for shady paths[200]. Plants like an annual mulch of pine needles or other acid organic matter each spring[200]. Special Features:Attractive foliage, Naturalizing, Suitable for cut flowers. The plant is heat tolerant in zones 8 through 5. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of

"heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. An evergreen. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2]. The root pattern is fibrous dividing into a large number of fine roots [1-2]. The root pattern is stoloniferous rooting from creeping stems above the ground [1-2].

## 6.2.737 Geranium robertianum

Herb Robert, Robert geranium

5 tlin 9 cyuc 0 kcak 2 tcan 2 dwat 0.4 m hkuc  
hmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatprikkwis hpa7tmwatli fyifxre7t hjonli

drutta Geranium robertianum is a ANNUAL/BIENNIAL growing to 0.4 m (1ft 4in) by 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from June to October, and the seeds ripen from July to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insect. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta None known  
tcanta Dye RepellentFreshly picked leaves are rubbed on the body to repel mosquitoes[53]. They impart their own peculiar odour. A brown dye is obtained from the whole plant[168].

dwatta Antidiarrhoeal Antirheumatic Astringent Diuretic Homeopathy VulneraryHerb Robert is little used in modern herbalism, but is occasionally employed as an astringent to halt bleeding, treat diarrhoea etc in much the same way as *G. maculatum*[254]. The leaves are antirheumatic, astringent, mildly diuretic and vulnerary[7, 9, 21, 222, 238]. Modern research has shown that the leaves can lower blood sugar levels and so it can be useful in the treatment of diabetes[244]. An infusion of the leaves is used in the treatment of bleeding, stomach ailments, kidney infections, jaundice etc[222]. Externally, a wash or poultice is applied to swollen and painful breasts[222], rheumatic joints[7], bruises, bleeding etc[9]. It is best to use the entire plant, including the roots[9]. The plant can be harvested at any time from late spring to early autumn and is usually used fresh[9, 238]. A homeopathic remedy is made from the plant[9]. Details of uses are not given in this report[K].

propta Seed - sow spring in situ.

nwatta Succeeds in any moderately fertile retentive soil in a sunny position[200]. Tolerates a wide range of soil types[200], succeeding in dry soils[238]. Grows well on woodland edges[24]. The whole plant has an unpleasant aroma[244]. The foxy smell is particularly pronounced after rain[245]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233].

## 6.2.738 Corydalis aurea

Scrambled Eggs

5 tlin 9 cyuc 0 kcak 0 tcan 2 dwat 0.5 m hkuc  
hmim cyutli tcup hwicli hrasjlut hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

drutta Corydalis aurea is a ANNUAL/BIENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta None known  
tcanta None known

be put in their final position whilst small since they resent root disturbance[200]. A very ornamental plant[1], there are some named varieties[233]. A good bee plant. Special Features:Not North American native, Naturalizing, Suitable for cut flowers, Suitable for dried flowers, Extended bloom season in Zones 9A and above, Attractive flowers or blooms.

## 6.2.732 Gentiana andrewsii

Closed Bottle Gentian, Dakota gentian  
5 tlin 9 cyuc 0 kcaak 0 tcan 3 dwat 0.6 m hkuc  
hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Gentiana andrewsii is a PERENNIAL growing to 0.6 m (2ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bumblebees, butterflies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known  
tcanta None known  
dwatta Antidote Appetizer Bitter Digestive Ophthalmic Poultice Stomachic TonicThe root is said to be an antidote to snakebites[61, 254]. An infusion of the roots has been used as a wash and also taken internally in the treatment of pain and headaches[257]. An infusion of the roots has been used as drops for sore eyes[257]. This N. American species has medicinal properties practically identical with the European gentians[4]. The following notes are based on the general uses of *G. lutea* which is the most commonly used species in the West[K]. Gentian root has a long history of use as a herbal bitter in the treatment of digestive disorders and is an ingredient of many proprietary medicines. It contains some of the most bitter compounds known and is used as a scientific basis for measuring bitterness[238]. It is especially useful in states of exhaustion from chronic disease and in all cases of debility, weakness of the digestive system and lack of appetite[4]. It is one of the best strengtheners of the human system, stimulating the liver, gall bladder and digestive system[238], and is an excellent tonic to combine with a purgative in order to prevent its debilitating effects[4]. The root is antelmintic, anti-inflammatory, antiseptic, bitter tonic, cholagogue, emmenagogue, febrifuge, refrigerant, stomachic[4, 7, 9, 14, 21, 165, 238]. It is taken internally in the treatment of liver complaints, indigestion, gastric infections and anorexia[238]. It should not be prescribed for patients with gastric or duodenal ulcers[238]. The root is harvested in the autumn and dried for later use[4]. It is quite likely that the roots of plants that have not flowered are the richest in medicinal properties[4].

propta Seed - best sown in early January in a light position in a cold frame[239]. It can also be sown in late winter or early spring but the seed germinates best if given a period of cold stratification and quickly loses viability when stored, with older seed germinating slowly and erratically[200, 239]. It is advantageous to keep the seed at about 10°C for a few days after sowing, to enable the seed to imbibe moisture[239]. Following this with a period of at least 5 - 6 weeks with temperatures falling to between 0 and -5°C will usually produce reasonable germination[239]. It is best to use clay pots, since plastic ones do not drain so freely and the moister conditions encourage the growth of moss, which will prevent germination of the seed[239]. The seed should be surface-sown, or only covered with a very light dressing of compost. The seed requires dark for germination, so the pots should be covered with something like newspaper or be kept in the dark[239]. Pot up the seedlings into individual pots as soon as they are large enough to handle and grow on in light shade in the greenhouse for at least their first winter. The seedlings grow on very slowly, taking 2 - 7 years to reach flowering size[239]. When the plants are of sufficient size, place them out into their permanent positions in late spring or early summer. Division in March[111]. Most members of this genus have either a single tap-root, or a compact root system united in a single root head, and are thus unsuitable for division[239]. Cuttings of basal shoots in late spring[238].

nwatta In general, gentians require a moist well-drained soil in a sheltered position, a certain minimum of atmospheric

humidity, high light intensity but a site where temperatures are not too high[239]. They are therefore more difficult to grow in areas with hot summers and in such a region they appreciate some protection from the strongest sunlight[200, 239]. Most species will grow well in the rock garden[200]. This species is fairly easy to grow, succeeding in most humus-rich soils[239]. It tolerates more shade (but not full shade) than most members of the genus, growing well in a woodland garden[200, 239]. Plants are intolerant of root disturbance[200]. A moisture loving plant, preferring to grow with full exposure to the sun but with plenty of underground moisture in the summer, it grows better in the north and west of Britain[1].

## 6.2.733 Potentilla hippiana

Woolly Cinquefoil  
5 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 0.6 m hkuc  
hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwish-som hpa7tmwatli fyfibre7t hjonli

drutta Potentilla hippiana is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in saline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known  
tcanta None known  
dwatta Oxytoxic Poultice SalveThe whole plant is oxytoxic, poultice and salve[155]. An infusion of the plant has been used to expedite childbirth[257]. The plant has been used as a lotion on burns and a poultice of the fresh leaves applied to injury[257]. The plant is dried, powdered and applied to sores[257].

propta Seed - sow early spring or autumn in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring. Larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Easily grown in a well-drained loam, preferring a position in full sun but tolerating shade[1]. Prefers an alkaline soil but tolerates a slightly acid soil[200]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 6.2.734 Erysimum capitatum

Coastal Wallflower, Sanddune wallflower, Contra Costa wallflower, San Luis Obispo wallflower, Pursh'  
5 tlin 9 cyuc 0 kcaak 0 tcan 2 dwat 0.6 m hkuc  
htut cyutli kyuctcup hwicli hyishrasljutnyik hpa7tli priklwis hpa7tmwatli xre7t hjonli

drutta Erysimum capitatum is a BIENNIAL/PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta None known  
tcanta None known  
dwatta Antirheumatic Odontalgic Poultice SkinA preventative against sun burn, the plant was ground up then mixed with water and applied to the skin[213]. It relieves the pain caused by overexposure to heat[155]. A poultice of the whole pounded plant has been applied to open fresh wounds and rheumatic joints[257]. An infusion of the whole plant has been used as a wash on aching muscles[257]. The crushed leaves have been sniffed as a treatment for headaches[257].

## 6.2.587 Anemone flaccida

5 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 0.1 m hkuc  
pcimhmm cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli fyfibre7t hjonli

drutta Anemone flaccida is a PERENNIAL growing to 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves and stems - cooked[46, 61, 177]. Some caution is advised, see the notes above on toxicity.

tcanta None known  
dwatta None known  
propta Seed - best sown in a cold frame as soon as it is ripe in the summer[1]. Surface sow or only just cover the seed and keep the soil moist. Sow stored seed as soon as possible in late winter or early spring. The seed usually germinates in 1 - 6 months at 15°C[133]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least their first year. When the plants are large enough, plant them out in the spring. Division in late summer after the plant dies down.

nwatta Succeeds in ordinary garden soil but prefers a woodland soil[1]. Prefers a moist peaty soil in some shade[187]. Plants succeed in maritime gardens[233]. Hardy to at least -20°C[187]. Plants seem to be immune to the predations of rabbits[233]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54]. A good woodland plant[1, 187].

## 6.2.588 Vaccinium tenellum

Small-Cluster Blueberry  
5 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 0.3 m hkuc  
hmimhtut cyutli tcup hwicli hrasljut hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta Vaccinium tenellum is a deciduous Shrub growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 6. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[177]. A poor taste and texture[200]. The fruit is about 6 - 8mm in diameter[200].

tcanta None known  
dwatta None known  
propta Seed - sow late winter in a greenhouse in a lime-free potting mix and only just cover the seed[78]. Stored seed might require a period of up to 3 months cold stratification[113]. Another report says that it is best to sow the seed in a greenhouse as soon as it is ripe[200]. Once they are about 5cm tall, prick the seedlings out into individual pots and grow them on in a lightly shaded position in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 8cm with a heel, August in a frame[78]. Slow and difficult. Layering in late summer or early autumn[78]. Another report says that spring is the best time to layer[200]. Takes 18 months[78]. Division of suckers in spring or early autumn[113].

nwatta Requires a moist but freely-draining lime free soil, preferring one that is rich in peat or a light loamy soil with added leaf-mould[11, 200]. Prefers a very acid soil with a pH in the range of 4.5 to 6, plants soon become chlorotic when lime is present. Succeeds in full sun or light shade though it fruits better in a sunny position[200]. Requires shelter from strong winds[200]. Dislikes root disturbance, plants are best grown in pots until being planted out in their permanent positions[200]. Plants in this genus are notably resistant to honey fungus[200].

## 6.2.589 Ranunculus kochii

5 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 0.1 m hkuc  
htut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Ranunculus kochii is a PERENNIAL growing to 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from April to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Flowers StemEdible Uses: Young stems[177]. No more details are given. Petals[177]. No more details are given. Caution is advised for both these uses, see the notes above on toxicity.

tcanta None known  
dwatta None known  
propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring.

nwatta Prefers a moist loamy soil[1]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

## 6.2.590 Carex hirta

Hammer sedge  
5 tlin 9 cyuc 1 kcaak 0 tcan 1 dwat 0.5 m hkuc  
hmimhtut cyutli tucpja7n hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta Carex hirta is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to June, and the seeds ripen from June to July. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta Edible Parts: Root SeedEdible Uses: Root - cooked[172]. Seed[172]. No further details are given, but the seed is small and fiddly to use[K].

tcanta BeddingThe leaves are used for bedding[61].  
dwatta DiureticDiuretic[61].  
propta Seed - sow in situ in the spring in a moist soil in light shade. If seed is in short supply it can be sown in a cold frame and be planted out in the summer. The seed usually germinates in 2 - 6 weeks at 15°C[138]. Division in spring[200]. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the summer or following spring.

nwatta Easily grown in a damp to wet soil in full sun or shade[162, 200]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 6.2.591 Sedum oreganum

Oregon stonecrop  
5 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 0.2 m hkuc  
htut cyutli hgatkyuctcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli fyfibre7t hjonli

drutta Sedum oreganum is an evergreen Perennial growing to 0.2 m (0ft 8in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: LeavesEdible Uses: Leaves and young shoots - raw or cooked[60, 177, 256].

tcanta Plants can be grown as a ground cover when planted about 25cm apart each way[208].

dwatta None known  
propta Seed - surface sow in spring in well-drained soil in a sunny position in a greenhouse. Do not allow the soil to dry out. Prick out the seedlings into individual pots when they are large enough to handle. If sufficient growth is made, it is possible to plant them out during the summer, otherwise keep them in a cold-frame or greenhouse for their first winter and plant them out in early summer of the following year[K]. Division is very easy and can be carried out at almost any time in the growing season, though is probably best done in spring or early summer. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Succeeds in most soils[188] but prefers a fertile well-drained soil in a sunny position[200]. Established plants are drought tolerant[200]. Can be grown on a wall[200]. All members of this genus are said to have edible leaves, though those species, such as this one, that have yellow flowers can cause stomach upsets if they are eaten in quantity[62, 85]. Plants in this genus seem to be immune to the predations of rabbits[233].

## 6.2.592 Polygala vulgaris

Milkwort, Common milkwort  
5 tlin 9 cyuc 1 kcaak 0 tcan 2 dwat 0.4 m hkuc  
hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Polygala vulgaris is a PERENNIAL growing to 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Edible Uses: TeaThe leaves are used as a tea substitute[177]. They are used to adulterate green China tea[2].

tcanta None known  
dwatta Diaphoretic Diuretic Expectorant StimulantThe bitter-tasting milkwort has a reputation for increasing milk flow in nursing mothers, but this belief is in fact unfounded[254]. Whilst little used in modern herbalism, the root and aerial parts of the plant contain triterpenoid saponins which promote the clearing of phlegm from the bronchial tubes and so is a valuable herb for the treatment of respiratory problems such as chronic bronchitis, bronchial asthma and convulsive coughs such as whooping cough[254]. The plant is also thought to have sweat-inducing and diuretic properties[254].

propta Seed - sow spring or autumn in a cold frame[214]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division. Cuttings of young shoots in a frame in late spring[1].

nwatta Prefers a moderately fertile moisture-retentive well-drained soil, succeeding in full sun if the soil remains moist throughout the growing season, otherwise it is best in semi-shade[200]. Dislikes shade according to another report. A very polymorphic species[200].

## 6.2.593 Iris germanica florentina

Orris, Orris-root  
5 tlin 10 cyuc 1 kcaak 0 tcan 3 dwat 0.9 m hkuc  
hmimhtut cyutli tcup hwicli hrasljut hpa7tli flatprikliw hpa7tmwatli fyfxxre7t hjonli

drutta Iris germanica florentina is a PERENNIAL growing to 0.9 m (3ft) by 0.6 m (2ft in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in May, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy)

soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Edible Uses: CondimentThe root can be dried, ground into a powder and used as a food flavouring[105]. The root may take several years of drying to develop its full fragrance[168].

tcanta Beads Cosmetic Dye Essential IncenseThe root is a source of Orris powder which has the scent of violets[238]. It is obtained by grinding up the dried root[4, 7, 46]. It is much used as a fixative in perfumery and pot-pourri, as an ingredient of toothpastes, breath fresheners etc and as a food flavouring. The root can take several years of drying to fully develop its violet-like fragrance, when fresh it has an acrid flavour and almost no smell[4, 168]. An essential oil is obtained from the fresh root, this has the same uses as the root[57, 61]. The root has been burnt in open fires in order to sweeten the smell of a room[245]. The juice of the root is sometimes used as a cosmetic and also for the removal of freckles from the skin[4]. A black dye is obtained from the root[168]. A blue dye is obtained from the flowers[168]. The seeds are used as rosary beads[61]. Plants can be grown for ground cover, the dense mat of roots excluding all weeds[208].

dwatta Diuretic Purgative StomachicThe dried root is diuretic, expectorant and stomachic[21, 238]. It is taken internally in the treatment of coughs, catarrh and diarrhoea[238]. Externally it is applied to deep wounds[238]. The root is harvested in late summer and early autumn and dried for later use[238]. The juice of the fresh root is a strong purge of great efficiency in the treatment of dropsy[4].

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed should be sown as early in the year as possible in a cold frame. A sterile plant, it does not produce seed[233]. Division, best done after flowering though it is usually successful at most times of the year. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Landscape Uses:Border, Massing, Specimen. Prefers a sunny position in a well-drained soil that contains some lime[1, 79]. Grows well in dry soils in light deciduous shade[187]. Succeeds in full sun or partial shade[79]. Prefers a pH in the range 6 to 7.5 or higher[200]. The plant is sometimes cultivated for the essential oil in its root[9, 46]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. Special Features: Attracts birds, Not North American native, Naturalizing, All or parts of this plant are poisonous, Attracts butterflies, Suitable for cut flowers, Fragrant flowers.

## 6.2.594 Senecio vulgaris

Groundsel  
5 tlin 9 cyuc 1 kcaak 3 tcan 2 dwat 0.3 m hkuc  
htut cyutli kyuctcup hwicli hyishrasljutnyikfrip hpa7tli flatprikliw hpa7tmwatli fyfxxre7t hjonli

drutta Senecio vulgaris is a ANNUAL growing to 0.3 m (1ft) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower all year, and the seeds ripen all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: LeavesEdible Uses: Leaves - cooked or raw[7, 105]. The young leaves have been used in many areas as a salad, though this is very inadvisable, see the notes on toxicity at the top of the page[7].

tcanta A good food plant for the caterpillars of many butterfly and moth species, and is one of only two species that provide food for cinnabar moth caterpillars. Dynamic accumulator.

dwatta Anthelmintic Anticonvulsant Antiscorbutic Diaphoretic Diuretic Emmenagogue Homeopathy Poultice

treatment of nose bleeds and haemorrhoids and is used externally to treat Trichomonas vaginitis[176]. The fresh herb is a cardiac and nervous sedative, producing a hypnotic state with a diminution of the senses followed by a paralysing action[218]. A constituent similar to digitalis can be extracted from the whole herb with the roots removed[176]. This is cardiotonic[176].

propta Seed - best sown as soon as it is ripe in early summer in a cold frame. The seed usually germinates in about 2 - 3 weeks. Sow stored seed in late winter in a cold frame. Germination takes about 1 - 6 months at 15°C. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in the spring. Root cuttings, 4cm long taken in early winter, potted up in a mixture of peat and sand[175]. They can also be taken in July/August, planted vertically in pots in a greenhouse or frame.

nwatta Requires a well-drained humus-rich gritty soil and a sunny position[200]. Tolerant of alkaline soils[200]. This species is closely related to *P. cernua*[200]. Large plants have a deep woody rootstock and transplant badly[200]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

## 6.2.729 Inula royleana

5 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 0.6 m hkuc  
htut cyutli tcup hwicli hrasljutnyikfrip hpa7tli flatprikliw hpa7tmwatli fyfxxre7t hjonli

drutta Inula royleana is a PERENNIAL growing to 0.6 m (2ft) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from August to October, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta None known  
tcanta Disinfectant Insecticide ParasiticideUsed as a parasiticide[145]. The plant is insecticidal[240].

dwatta Disinfectant ParasiticideThe plant is disinfectant[240]. It is also considered to be poisonous[240]. The root has been used to adulterate the roots of *Saussurea lappa*[240]. It contains 3% of an alkaloid that produces a fall in blood pressure and stimulates tone and peristaltic movements in the intestines[240].

propta Seed - sow spring or autumn in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring or autumn[111].

nwatta Succeeds in a sunny position in ordinary garden soil[1]. Requires a moist well-drained soil in sun or partial shade[187]. Grows well in heavy clay soils. This species is hardy to about -20°C[187]. Plants take some years to become fully established[233].

## 6.2.730 Aristolochia clematitis

Birthwort  
5 tlin 9 cyuc 0 kcaak 0 tcan 2 dwat 0.7 m hkuc  
hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Aristolochia clematitis is a PERENNIAL growing to 0.7 m (2ft 4in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf from May to November, in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known  
tcanta None known  
dwatta Abortifacient Antinflammatory Antispasmodic Diaphoretic Eczema Emmenagogue Febrifuge Oxytoxic StimulantBirthwort has a very long history of medicinal use,

though it has been little researched scientifically and is little used by present-day herbalists[254, 268]. It is an aromatic tonic herb that stimulates the uterus, reduces inflammation, controls bacterial infections and promotes healing[238]. The juice from the stems was used to induce childbirth[268]. The plant contains aristolochic acid which, whilst stimulating white blood cell activity and speeding the healing of wounds, is also carcinogenic and damaging to the kidneys[254]. The flowering herb, with or without the root, is abortifacient, anti-inflammatory, antispasmodic, diaphoretic, emmenagogue, febrifuge, oxytoxic and stimulant[7, 9, 21, 100, 200]. Another report says that the root is used on its own[238] whilst a third says that either the fresh flowering herb or the dried rootstock can be used[268]. The plant should not be used internally without experienced supervision, externally it is used in the treatment of slow-healing cuts, eczema, infected toe and finger nails etc[9]. Use with caution, internal consumption can cause damage to the kidneys and uterine bleeding[7, 9, 21]. It should not be used by pregnant women[238].

propta Seed - best sown in a greenhouse as soon as it is ripe in the autumn. Pre-soak stored seed for 48 hours in hand-hot water and surface sow in a greenhouse[134]. Germination usually takes place within 1 - 3 months at 20°C[134]. Stored seed germinates better if it is given 3 months cold stratification at 5°C[200]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant out in late spring or early summer after the last expected frosts. Division in autumn[200]. Root cuttings in winter[200].

nwatta Prefers a well-drained loamy soil, rich in organic matter, in sun or semi-shade[1, 134]. Succeeds in ordinary garden soil[134]. The plant has an invasive root system[233]. Most species in this genus have malodorous flowers, often smelling like decaying flesh[245], that are pollinated by flies[200]. The insects that pollinate this plant become trapped in the hairy throat of the flower[233]. Birthwort was formerly cultivated as a medicinal plant in most of Europe[50].

## 6.2.731 Eryngium planum

Plains eryngo, Blue Cap, Eringoe, Eryngo, Flat Sea Holly  
5 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 0.7 m hkuc  
htut cyutli hgatkyuctcup hwicli hyishrasljutnyik hpa7tli flatprikliw hpa7tmwatli fyfxxre7t hjonli

drutta Eryngium planum is a PERENNIAL growing to 0.7 m (2ft 4in) by 0.4 m (1ft 4in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure.

kcakta None known  
tcanta None known  
dwatta DiureticThe plant is diuretic[61]. It is used in the treatment of whooping cough[238].

propta Seed - best sown as soon as it is ripe in early autumn on the surface of a well-drained compost in a cold frame[200]. The seed can also be sown in spring. It usually germinates in 5 - 90 days at 20°C. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in early spring or autumn. Take care since the plant resents root disturbance[200]. Root cuttings in autumn or winter[200].

nwatta Landscape Uses:Border, Rock garden, Seashore, Specimen. Requires a well-drained soil and a sunny position[1]. Prefers a light sandy soil but tolerates most soil types including lime and poor gravels[200]. When grown in soils that are too rich the stems will need staking before they flop[187]. Established plants are drought tolerant[190]. Plants are hardy to about -25°C[187]. Plants should

but well-drained soil enriched with leafmold[200]. Dislikes wet soils[200]. Requires shade from the midday sun[1]. Plants prefer a sheltered position in light shade, also succeeding in full sun in humus-rich soils[230]. Plants are hardy in favoured localities in Britain but they usually require greenhouse protection in this country[1]. Plants have grown well at Kew Botanical gardens, where they have formed large colonies[230]. Apply a good organic mulch in the late autumn or lift the bulbs and store them dry in a frost free place[200]. Plant out in spring and only just cover the bulb[200]. This species is cultivated in China as a medicinal plant[238]. Grows well with ferns in a woodland setting[200]. Orchids are, in general, shallow-rooting plants of well-drained low-fertility soils. Their symbiotic relationship with a fungus in the soil allows them to obtain sufficient nutrients and be able to compete successfully with other plants. They are very sensitive to the addition of fertilizers or fungicides since these can harm the symbiotic fungus and thus kill the orchid[230]. Plant the tubers no more than 5cm deep in the soil[233]. Special Features:Not North American native.

## 6.2.726 Corydalis cava

5 tlin 9 cyuc 0 kcaak 0 tcan 3 dwat 0.2 m hkuc hmim cyutli tcup hwicli hrasjlut hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta Corydalis cava is a PERENNIAL growing to 0.2 m (0ft 8in) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf from March to June, in flower from February to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta None known  
tcanta None known

dwatta Analgesic Antianxiety Antidepressant Antisepic Antispasmodic Antitussive Cancer Cardiotonic Hallucinogenic Hypotensive SedativeThe tuber is antispasmodic, hallucinogenic and also slows the pulse[9]. It is harvested in the spring before the plant comes into flower and dried for later use[9]. The plant should only be used under the guidance of a trained herbalist, it is used in the treatment of Parkinson's disease and other neurological disorders[9]. One report says that the plant is cultivated for its medicinal uses in Sweden, but gives no more details[175]. The following reports are for *C. yanhusuo* which, according to one authority, is the correct name for this species[218]. It is treated as a separate species here[K]. The tuber is analgesic, antiseptic, antispasmodic and sedative[176]. The root has traditionally been used to lower pain and strengthen the circulation[218]. It also has sedative properties and is used in the treatment of a wide range of ailments[218]. Various extracts from the plant have shown antitussive, cardiotonic, hypotensive and anticancer activity[218].

propta Seed - best sown as soon as it is ripe, the seed rapidly loses viability if it is allowed to become dry[129]. Surface sow and keep moist, it usually germinates in 1 - 3 months at 15°C[164]. Germinates in spring according to another report[129]. Two months warm, then a cold stratification improves the germination of stored seed[134, 164]. Sow the seed thinly so that the seedlings can be allowed to grow undisturbed in the pot for their first year. Apply liquid feed at intervals during their growing season to ensure they are well fed. The seedlings only produce one leaf in their first year of growth[175] and are very prone to damping off[129]. Divide the seedlings into individual pots once they have become dormant and grow them on in a partially shaded area of a greenhouse for at least another year. Plant them out into their permanent positions when they are dormant. Division after flowering.

nwatta Prefers a moist, well-drained rather light soil, thriving in semi-shade[1]. Grows well in a woodland garden or peat bed. There is at least one named variety, selected for its ornamental value[200]. There is some possible confusion over the name of this species. 'Flora Europaea' says that it is a synonym of *C. bulbosa*[50] but the RHS 'Dictionary of Gardening' gives *C. bulbosa* as a synonym of this species[200]. In another report this species is said to be no more than a synonym for *C. yanhusuo*[218]. Closely related to *C. solida*[200],

differing mainly in its solid tubers, rather than hollow as in *C. solida*[238]. Plants seem to be immune to the predations of rabbits[233].

## 6.2.727 Dicentra cucullaria

Dutchman's Breeches

5 tlin 9 cyuc 0 kcaak 0 tcan 2 dwat 0.1 m hkuc pcmhmmim cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta *Dicentra cucullaria* is a PERENNIAL growing to 0.1 m (0ft 4in) by 0.3 m (1ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid and neutral soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta None known  
tcanta None known

dwatta Alterative Diaphoretic Diuretic Poulitice Tonic VDAalterative, tonic[46, 61]. The dried tubers were used as a tonic and were recommended in the treatment of VD[213]. A tea made from the roots is diaphoretic and diuretic[222]. A poultice made from the leaves has been used in the treatment of skin ailments and as a muscle rub to make them more limber[222]. The plant contains an alkaloid that depresses the central nervous system - it is used in the treatment of paralysis and tremors[222].

propta Seed - best sown as soon as it is ripe in a cold frame[134]. Stored seed should be sown in March[175]. Germination usually takes place within 1 - 6 months at 15°C[175]. Two weeks warm stratification at 18°C followed by six weeks at 2°C can shorten up the germination time[134]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in early spring[200]. Best done when the plant is dormant in late winter[188]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring. Root cuttings 7 - 10cm long in sandy soil in a cold frame[200].

nwatta Landscape Uses:Alpine garden, Seashore, Woodland garden. Easily grown in a rich light soil[1], preferably neutral to slightly acid[200]. Prefers light shade and a sheltered position[175] but also succeeds in heavier shade[200]. Plants are hardy to at least -20°C[187]. The seed is difficult to harvest, it ripens and falls from the plant very quickly[134]. The plant becomes dormant in the summer[188]. After fruit set, the bulblets of *Dicentra cucullaria* remain dormant until the autumn, when stored starch is converted to sugar. At this time also, flower buds and leaf primordia are produced below ground; these then remain dormant until spring[270]. This species is closely related to *D. canadensis*[270]. Members of this genus are rarely if ever troubled by browsing deer[233]. Special Features: Attractive foliage, North American native.

## 6.2.728 Pulsatilla dahurica

5 tlin 9 cyuc 0 kcaak 0 tcan 3 dwat 0.3 m hkuc htut cyutli tcup hwicli hrasjlut hpa7tli flatprikwisslip hpa7tmwatli xre7t hjonli

drutta *Pulsatilla dahurica* is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers moist soil.

kcakta None known  
tcanta None known

dwatta Analgesic Antiinflammatory Antispasmodic Cardiotonic Dysentery Hypnotic SedativeThe root is anodyne, anti-inflammatory, antispasmodic, astringent and sedative[174, 176, 218]. The root is an effective cure for bacterial and amoebic dysentery[176, 218]. It is also used in the

PurgativeGroundsel has a long history of herbal use and, although not an official plant, it is still often used by herbalists[4]. The whole herb is anthelmintic, antiscorbutic, diaphoretic, diuretic, emmenagogue and purgative[4, 9, 21, 54]. It is often used as a poultice and is said to be useful in treating sickness of the stomach, whilst a weak infusion is used as a simple and easy purgative[4]. The plant can be harvested in May and dried for later use, or the fresh juice can be extracted and used as required[4]. Use with caution[21]. This plant should not be used by pregnant women[7], see also the notes above on toxicity. A homeopathic remedy is made from the plant[9]. It is used in the treatment of menstrual disorders and nose bleeds[9].

propta Seed - it doesn't need any encouragement from us.

nwatta A common weed of cultivated land, it does not require cultivation. Groundsel is a good food plant for the caterpillars of many butterfly and moth species, and is one of only two species that provide food for cinnabar moth caterpillars. One report states that this plant was formerly cultivated as a food crop for livestock[54]! Since the plant is a cumulative toxin this use is most questionable.

## 6.2.595 Rhodiola tibetica

5 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 0.3 m hkuc htut cyutli hgatkyuctcup hwicli hrasjlutnyik hpa7tli flatprikwis hpa7tmwatli nyanhjen hjonli

drutta *Rhodiola tibetica* is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August, and the seeds ripen from August to September. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked[105].

tcanta None known  
dwatta None known

propta Seed - surface sow spring in well-drained soil in a sunny position in a greenhouse. Do not allow the soil to dry out. Prick out the seedlings into individual pots when they are large enough to handle, and grow them on in the greenhouse for their first winter. Plant out in early summer of the following year. Division in spring or early summer. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Prefers a fertile well-drained soil in a sunny position[200]. Established plants are drought tolerant[200]. This species is closely related to *R. quadrifida*[1]. The flowers of this species are dark purple[1]. All members of this genus are said to have edible leaves, though those species that have yellow flowers can cause stomach upsets if they are eaten in quantity[62, 85]. Dioecious, male and female plants must be grown if seed is required.

## 6.2.596 Scabiosa columbaria

Pigeon's Scabious, Dove pincushions, Pincushion Flower

5 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 0.8 m hkuc htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatprikwisslip hpa7tmwatli xre7t hjonli

drutta *Scabiosa columbaria* is a PERENNIAL growing to 0.8 m (2ft 7in) by 0.8 m (2ft 7in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to September, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay)

soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves[177]. No more details are given.

tcanta None known  
dwatta None known

propta Seed - sow spring in a cold frame. The seedlings are subject to damping off[1] so water with care and make sure to give adequate ventilation. Prick out the seedlings into individual pots once they are large enough to handle and plant them out into their permanent positions in the summer. Division in spring. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Landscape Uses:Border. Prefers a neutral or alkaline soil and a sunny position[200]. Succeeds in ordinary garden soil[1]. Grows well in a dry sunny meadow[200]. The flowers are a good nectar source for bees and lepidoptera, the plant is also a good food source for the caterpillars of many butterfly species[200]. This species name is sometimes treated as the group name for an aggregate of species[200]. Members of this genus are rarely if ever troubled by browsing deer[233]. Special Features: Attractive foliage, Not North American native, Naturalizing, Attracts butterflies, Suitable for cut flowers, Extended bloom season in Zones 9A and above, Attractive flowers or blooms.

## 6.2.597 Sedum arboroseum

Garden Stonecrop

5 tlin 9 cyuc 1 kcaak 0 tcan 2 dwat 0.5 m hkuc hmimhtut cyutli hgatkyuctcup hwicli hrasjlutnyik hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta *Sedum arboroseum* is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from September to October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: LeavesEdible Uses: Young plant - cooked. A famine food, it is only used when all else fails[177].

tcanta None known  
dwatta Poulitice Women's complaintsThe leaves are used

in the treatment of fevers, inflammations and wounds[218]. The leaf juice is applied to burns and eruptions[218]. The flowers are used in the treatment of vaginal fluxes, nervous afflictions of children, corneal opacity and prolapse of the genitals following labour[218]. The whole plant is crushed and used as a poultice on inflammations etc[218].

propta Seed - surface sow in spring in well-drained soil in a sunny position in a greenhouse. Do not allow the soil to dry out. Prick out the seedlings into individual pots when they are large enough to handle. If sufficient growth is made, it is possible to plant them out during the summer, otherwise keep them in a cold-frame or greenhouse for their first winter and plant them out in early summer of the following year[K]. Division is very easy and can be carried out at almost any time in the growing season, though is probably best done in spring or early summer. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Succeeds in most soils[188] but prefers a fertile well-drained soil, succeeding in dry soils but preferring one that does not dry out completely[200]. Established plants are very drought tolerant[200]. Plants can be grown on walls[200]. Requires a sunny position[188]. Hardy to at least -15°C[200]. All members of this genus are said to have edible leaves, though those species that have yellow flowers can cause stomach upsets if they are eaten in quantity[62, 85]. Plants in this genus seem to be immune to the predations of rabbits[233].

## 6.2.598 Bupleurum rotundifolium

Hare's Ear

5 tin 9 cyuc 1 kcaok 0 tcan 0 dwat 0.4 m hkuc htut cyutli kyucup hwicli hrasjlut hpa7tli flatprikkwis hpa7tmwatli fyifxre7t hjonli

drutta Bupleurum rotundifolium is a ANNUAL growing to 0.4 m (1ft 4in) by 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to July, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked[177]. Added to salads or used as a pot-herb[2]. The leaves are also used as a spice[105, 183].

tcanta None known dwatta None known propta Seed - sow spring in situ. nwatta Requires a well-drained soil and a sunny position[200].

## 6.2.599 Drosera rotundifolia

Sundew, Roundleaf sundew

5 tin 9 cyuc 1 kcaok 0 tcan 3 dwat 0.1 m hkuc htut cyutli tcuphja7n hwicli hyishrasjlut hpa7tli frusflatprikkwis hpa7tmwatli fyifxre7t hjonli

drutta Drosera rotundifolia is an evergreen Perennial growing to 0.1 m (0ft 4in) by 0.1 m (0ft 4in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from July to August. The species is hermaphrodite (has both male and female organs). The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It cannot grow in the shade. It prefers moist or wet soil.

kcakta Edible Parts: Edible Uses: Curdling agentThe juice of the plant is used to curdle plant milks[177, 183]. You heat the milk and the leaves together in order to make the milk curdle[7].

tcanta FungicideSubstances in the plant are used to curb the growth of bacteria[13].

dwatta Antibacterial Antibiotic Antispasmodic Demulcent Expectorant Homeopathy Hypoglycaemic WartsThe sundew has a long history of herbal use, having been popular for its fortifying and aphrodisiac effects[238]. It relaxes the muscles of the respiratory tract, easing breathing and relieving wheezing and so is of great value in the treatment of various chest complaints[254]. The plant has become quite rare and so it should not be harvested from the wild[254]. The flowering plant is antibacterial, antibiotic, antispasmodic, antitussive, demulcent, expectorant and hypoglycaemic[4, 7, 9, 13, 21, 46, 165, 172, 222, 238]. The plant is used with advantage in the treatment of whooping cough, exerting a peculiar action on the respiratory organs[4]. It is also used in the treatment of incipient phthisis, chronic bronchitis and asthma[4]. Externally, it has been used to treat corns, warts and bunions[257].The plant is harvested in the summer and can be dried for later use[7]. Use with caution[21]. Internal use of this herb causes a harmless colouring of the urine[9]. An extract of the plant contains plumbagin, which is antibiotic against a wide range of pathogens[222, 238]. Because of their protein digesting enzymes, the leaf juice has been used in the treatment of warts and corns[4, 222]. The entire fresh plant, harvested when it is starting to flower, is used to make a homeopathic remedy[232]. It is used mainly in the treatment of coughs[232] and is specific for whooping cough[7].

propta Seed - best sown thinly as soon as it is ripe into pots of a free-draining soil with some charcoal added and with a layer of finely chopped sphagnum moss on top[175]. Surface sow and keep the compost moist. The seed usually germinates in 1 - 2 months at 20°c[175]. Grow the plants on in the pots for their first growing season, making sure that the soil does not become dry. Divide the plants in the autumn, grow them on in the greenhouse for the winter and plant them out into their permanent positions in late spring.

nwatta Prefers a sandy peaty soil, succeeding in poor soils and bogs[1, 200]. Requires a sunny position[238]. An insectivorous plant, it can survive in nitrogen poor soils because it gets the nutrients it needs from insects[1, 7, 9, 200]. The upper surfaces of leaves are covered with hairs that secrete a sweet sticky substance[7].This attracts insects, which become smeared with it and unable to escape - the plant then exudes a digestive fluid that enables it to absorb most of the insect into its system[7].

## 6.2.600 Carlina vulgaris

Carlina Thistle

5 tin 9 cyuc 1 kcaok 0 tcan 1 dwat 0.5 m hkuc htut cyutli kyucup hwicli hyishrasjlutnyik hpa7tli flatprikkwisslip hpa7tmwatli fyifxre7t hjonli

drutta Carlina vulgaris is a BIENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: FlowersEdible Uses: Flowering head - cooked. Used as a globe artichoke substitute[2, 105, 177, 183], though they are considerably smaller and even more fiddly[K].

tcanta Weather forecastingThe flower heads expand in dry weather and close in moist weather. The dried flowers will continue to do this for a long time and they thus form a basic hygrometer for use in weather forecasting[4].

dwatta Diaphoretic PurgativeThe roots and leaves are diaphoretic and purgative[4].

propta Seed - surface sow in a cold frame in the spring. The seed usually germinates in 4 - 8 weeks at 15°c[138]. As soon as they are large enough to handle, prick the seedlings out into individual pots and plant them out into their permanent positions in the summer.

nwatta Succeeds in a sunny position in ordinary garden soil[1]. Prefers an alkaline soil[138]. Prefers a poor soil[4, 200]. Plants are hardy to about -15°c[200]. The presence of this species in a meadow usually indicates a poor sandy soil[4]. This species resents root disturbance, it should be planted into its final position as soon as possible[138].

## 6.2.601 Ligusticum porteri

Porter's Licorice Root

5 tin 9 cyuc 1 kcaok 0 tcan 3 dwat 0.9 m hkuc htut cyutli kyucup hwicli hrasjlutnyik hpa7tli flatprikkwis hpa7tmwatli fyifxre7t hjonli

drutta Ligusticum porteri is a PERENNIAL growing to 0.9 m (3ft) by 0.6 m (2ft in). See above for USDA hardiness. It is hardy to UK zone 6. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Edible Uses: CondimentThe leaves are used as a flavouring, a celery substitute[155].

tcanta None known

dwatta Antirheumatic Antispasmodic Diaphoretic Diuretic Expectorant Febrifuge Kidney Stomachic TB Uterine tonicThe roots, seed and essential oil (obtained from the roots and the seed) of this plant are a bitter, camphoraceous warming herb that stimulates the circulation, kidneys and uterus[238]. They are also antirheumatic, antispasmodic, diaphoretic, digestive, expectorant, febrifuge and stomachic[155, 172, 238]. They are used internally in the treatment of eruptive fevers, bronchial infections, digestive complaints, toothache, painful menstruation and retained placenta[238]. They have also been used to treat TB. and

well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta IncenseThe root extract is used as an incense[145]. The plant is used for incense[272].

dwatta Poultice StomachicA decoction of the root is cordial[240]. It is given in the treatment of colic and puerperal fever[240]. The juice of the roots is used in the treatment of fevers[272]. The bruised root is applied as a poultice to eruptions[240].

propta Seed - we have no information on this species but suggest sowing the seed in a cold frame as soon as it is obtained. Only just cover the seed. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring[200].

nwatta Succeeds in any ordinary soil in a sunny position[200].

## 6.2.723 Pachysandra procumbens

Allegheny spurge

5 tin 8 cyuc 0 kcaok 3 tcan 0 dwat 0.3 m hkuc pcmhmim cyutli tcup hwicli hrasjlutnyik hpa7tli frusflatprik hpa7tmwatli hjonli

drutta Pachysandra procumbens is a PERENNIAL growing to 0.3 m (1ft) by 0.6 m (2ft in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta None Known

tcanta A low to medium density groundcover for shady areas especially with acid soils. Good for woodland gardening.

dwatta None known

propta Propagate by root division in August or September. By softwood cuttings in spring, or by layering.

nwatta An evergreen subshrub making a good groundcover. Leaves are typically deciduous in USDA Zones 5 and 6 but semi-evergreen to evergreen in Zones 7 to 9. Performs well in a variety of soils from moist to dry and a range of soil pH as long as it is growing in partial to full shade. Spreads indefinitely by rhizomes to form a dense carpet of matte blue-green leaves. Prefers well-draining, organic-rich soil that is mildly acidic 5.5-6.5 pH. Drought resistant over time. Flowers are fragrant white (staminate) showing in early spring. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2]. Flower: Showy, Fragrant

## 6.2.724 Iris sanguinea

Blood iris

5 tin 9 cyuc 0 kcaok 0 tcan 1 dwat 0.8 m hkuc hmimhtut cyutli tcuphja7n hwicli hrasjlutnyikfrp hpa7tli flatprikkwis hpa7tmwatli fyifxre7t hjonli

drutta Iris sanguinea is a PERENNIAL growing to 0.8 m (2ft 7in) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in June, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta None known

tcanta InsecticideAn insecticide is obtained from the plant[218]. (from the root?)

dwatta ExpectorantExpectorant[218].

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed should be sown as early in the year as possible in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse or cold frame for their first year. Plant out into their permanent positions in late spring or early summer. Division, best done in August/September after flowering but can also be done in April. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta An easily grown plant, it prefers a humus-rich soil[79, 200], succeeding in a moist border or by water[42, 79]. Grows well in heavy clay soils. Plants are very cold tolerant, but they can be damaged when dormant if the soil is too moist[79]. A very ornamental plant, there are some named varieties[200]. Plant the bulbs out very shallowly[79]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233].

## 6.2.725 Bletilla striata

Hyacinth Orchid, Urn orchid, Hyacinth Bletilla, Hardy Orchid, Chinese Ground Orchid

5 tin 8 cyuc 0 kcaok 0 tcan 3 dwat 0.4 m hkuc hmim cyutli tcup hwicli jlut hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

drutta Bletilla striata is a BULB growing to 0.4 m (1ft 4in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: Edible Uses: GumNone known tcanta Gum Ink SizeThe bulb is mucilaginous, it is used as a size to impart a glossiness to ink and also to make an invisible ink (seen by wetting the paper and holding it up to the light)[178].

dwatta Antibacterial Antiinflammatory Antiphlogistic Demulcent Pectoral Skin Styptic VulneraryThe hyacinth orchid is an important wound herb in China, where it has been used medicinally for over 1,500 years[238]. The root (actually a pseudobulb) is antibacterial, anti-inflammatory, antiphlogistic, demulcent, pectoral, skin, styptic and vulnerary[147, 176, 178]. It is taken internally in the treatment of haemorrhages of the stomach or lungs, uterine bleeding and nose bleeds[238]. It is particularly effective against the endotoxin produced by *Haemophilus pertusis* in whooping cough[176]. Externally, it is mixed with sesame oil and applied as a poultice to burns, cuts, abscesses and sores[238]. The pseudobulbs are harvested when the plant is dormant and are dried for use in decoctions and powders[238].

propta Seed - surface sow, preferably as soon as it is ripe, in the greenhouse and do not allow the compost to dry out. The seed of this species is extremely simple, it has a minute embryo surrounded by a single layer of protective cells. It contains very little food reserves and depends upon a symbiotic relationship with a species of soil-dwelling fungus. The fungal hyphae invade the seed and enter the cells of the embryo. The orchid soon begins to digest the fungal tissue and this acts as a food supply for the plant until it is able to obtain nutrients from decaying material in the soil[200]. It is best to use some of the soil that is growing around established plants in order to introduce the fungus, or to sow the seed around a plant of the same species and allow the seedlings to grow on until they are large enough to move. Division in autumn. Make sure that you keep plenty of soil with each plant. It is also said to be possible to transplant orchids after they have flowered but whilst they are still in leaf. Division is best carried out in the spring[230]. Each division should have a leading point and two, or preferably three, pseudobulbs/joints of the rhizome[230]. More propagating material can be obtained by cutting halfway through the rhizome during the previous growing season at the point where you wish to divide[230]. This will stimulate the production of growth buds at the point of division[230].

nwatta Landscape Uses:Border, Container, Rock garden, Specimen, Woodland garden. Requires a friable, damp

## 6.2.719 Polygala amara

Bitter Milkwort

5 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 0.2 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikli-wisslip hpa7tmwatli xre7t hjonli

drutta Polygala amara is a PERENNIAL growing to 0.2 m (0ft 8in). See above for USDA hardness. It is hardy to UK zone 6. It is in flower from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known  
tcanta None known  
dwatta Bitter Diaphoretic Diuretic Emollient Expecto-rant GalactagogueThe herb is bitter, diaphoretic, diuretic, emollient, mildly expectorant, galactagogue[9, 21]. An infusion is used to treat stomach upsets, bladder and kidney dis-orders etc[9]. The plant is harvested as it comes into flower and dried for later use[9].

propta Seed - sow spring or autumn in a cold frame[214]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division. Cuttings of young shoots in a frame in late spring[1].

nwatta Prefers a moderately fertile moisture-retentive well-drained soil, succeeding in full sun if the soil remains moist throughout the growing season, otherwise it is best in semi-shade[200]. Dislikes shade according to another report.

## 6.2.720 Paris quadrifolia

Herb Paris

5 tlin 9 cyuc 0 kcaak 0 tcan 2 dwat 0.3 m hkuc pcmihmim cyutli tcup hwicli hrasjlut hpa7tli flatprikli-wisslip hpa7tmwatli fyifxre7t hjonli

drutta Paris quadrifolia is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardness. It is hardy to UK zone 6. It is in flower from May to August. The species is hermaphrodite (has both male and female organs) and is pol-linated by Flies, midges. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta None known  
tcanta DyeA red dye is obtained from the berries[13]. A yellow dye is obtained from the leaves[137].

dwatta Antianxiety Antidote Antirheumatic Aphrodisiac Detergent Homeopathy Narcotic OphthalmicThe entire plant, harvested just as it is coming into flower, is anti-rheumatic and detergent[13, 61, 178]. In large doses the herb is narcotic, producing nausea, vomiting, vertigo etc[4]. It should be used with great caution, overdoses have proved fatal to children[4]. In small doses it is of benefit in the treatment of bronchitis, spasmodic coughs, rheumatism, colic etc[4]. The plant is also used in the treatment of headaches and neuralgia[61, 178]. The seeds and the berries have something of the nature of opium, they have been used as an aphrodisiac[4]. A tincture of the fresh plant is useful as an antidote to poisoning by mercurial sublimate and arsenic[4]. A cooling ointment made from the seeds and juice of the leaves is applied externally to wounds, tumours and in-flammations[4]. The juice of the berries is used to treat eye inflammations[4]. A homeopathic remedy is made from the plant[4].

propta Seed - best sown as soon as it is ripe in late summer in a cold frame. Sow stored seed in a cold frame as soon as it is received. The seed is very slow to germinate. It produces a primary root about 7 months after sowing, this pulls the seed deeper into the soil. Leaves are produced about 4 months later[137]. Sow the seed thinly so that it does not need to be thinned and grow the young plants on undisturbed in a shady part of the greenhouse for their first two years of growth. Give an occasional liquid feed in the growing season

to ensure the plants do not become nutrient deficient. At the end of the second year's growth prick out the young plants into individual pots and grow them on for another year or two in a shady part of the greenhouse before planting them out in the spring. Division.

nwatta Easily grown in a humus-rich soil in woodland conditions[200]. Prefers a light sandy loam[42, 90]. Plants are hardy to about -15°C[200]. The presence of this plant in a truly wild state in Britain is an indicator of ancient wood-land[200]. Plants are very slow to flower from seed[137]. The flowers are very long-lived[200]. The flowers emit a strong unpleasant smell rather like decaying meat[245].

## 6.2.721 Pulsatilla chinensis

Bai Tou Weng

5 tlin 9 cyuc 0 kcaak 0 tcan 3 dwat 0.3 m hkuc htut cyutli tcup hwicli hrasjlut hpa7tli flatprikli-wisslip hpa7tmwatli xre7t hjonli

drutta Pulsatilla chinensis is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardness. It is hardy to UK zone 6. It is in flower from March to May, and the seeds ripen from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suit-able for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers moist soil.

kcakta None known  
tcanta None known  
dwatta Analgesic Antiinflammatory Antispasmodic Car-diotoxic Dysentery Hypnotic Malaria SedativeBai Tou Weng is thought to clear toxicity and to lower fever. It is most commonly taken as a decoction to counter infection within the gastro-intestinal tract[254]. The root is anodyne, anti-inflammatory, antispasmodic, astringent and sedative[174, 176, 218]. The root is an effective cure for bacterial and amoebic dysentery[176, 218]. It is also used in the treatment of malaria, nose bleeds and haemorrhoids and is used exter-nally to treat Trichomonas vaginitis[176, 254]. The root is harvested in the autumn or before the plant comes into flower in the spring, it can be dried for later use[254]. The root con-tains the lactone protoanemonin which has an irritant and antibacterial action. Protoanemonin is destroyed when the root is dried[254]. The fresh herb is a cardiac and nervous sedative, producing a hypnotic state with a diminution of the senses followed by a paralysing action[218]. A constituent similar to digitalis can be extracted from the whole herb with the roots removed[176]. This is cardiotoxic[176].

propta Seed - best sown as soon as it is ripe in early sum-mer in a cold frame. The seed usually germinates in about 2 - 3 weeks. Sow stored seed in late winter in a cold frame. Germination takes about 1 - 6 months at 15°C. When they are large enough to handle, prick the seedlings out into indi-vidual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent posi-tions in the spring. Root cuttings, 4cm long taken in early winter, potted up in a mixture of peat and sand[175]. They can also be taken in July/August, planted vertically in pots in a greenhouse or frame.

nwatta Requires a well-drained humus-rich gritty soil and a sunny position[200]. Tolerates alkaline soils[200]. Plants are hardy to about -20°C[187]. They are said to be difficult to grow in Britain, requiring a dry winter and spring followed by a warm humid summer[187]. Large plants have a deep woody rootstock and transplant badly[200]. A greedy plant, inhibiting the growth of nearby plants, espe-cially legumes[54].

## 6.2.722 Jurinea dolomiaea

5 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 0.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikli-wis hpa7tmwatli xre7t hjonli

drutta Jurinea dolomiaea is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardness. It is hardy to UK zone 6. It is in flower from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers

headaches[155, 172]. An infusion of the roots is used exteri-ally to treat body aches[257]. The root is harvested in the autumn and can be used fresh or dried[238].

propta The seed is best sown as soon as it is ripe in a cold frame in the autumn. Stored seed should be sown as early in the year as possible in a greenhouse or cold frame[200]. Prick out the seedlings into individual pots when they are large enough to handle and plant them out into their perma-nent positions in the summer if they have grown large enough. Otherwise, keep them in a cold frame for the first winter and plant them out in early summer. Division in spring.

nwatta Succeeds in any well-drained soil in a sunny posi-tion[200]. Succeeds in dry soils[238]. Plants are hardy to at least -15°C[238].

## 6.2.602 Stachys officinalis

Wood Betony, Common hedgenettle, Betony, Woundwort

5 tlin 10 cyuc 1 kcaak 2 tcan 2 dwat 0.6 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikriph hpa7tli flatprikli-wis hpa7tmwatli xre7t hjonli

drutta Stachys officinalis is a PERENNIAL growing to 0.6 m (2ft) by 0.5 m (1ft 8in) at a fast rate. See above for USDA hardness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to September, and the seeds ripen from July to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Edible Uses: TeaThe leaves and flowering tops make a good tea substitute. Refreshing and aromatic[21, 100, 183], it has all the good qualities of tea without the negative ones[4].

tcanta DyeA fine yellow dye is obtained from the leaves[4].

dwatta Anthelmintic Antiseptic Astringent Carminative Cathartic Cholagogue Digestive Diuretic Emetic Emmena-gogue Expectorant Homeopathy Nervine Sedative Sternu-atory Tonic VulneryWood betony was at one time com-monly used as a medicinal plant in the treatment of a wide range of disorders, especially as a nervine and tonic for treating maladies of the head and as an external applica-tion to wounds[4, 7, 238]. It also stimulates the digestive sys-tem and the liver, having an overall tonic effect upon the body[254]. Wood betony is much less used nowadays, and more often forms part of a mixture of herbs[4]. The whole plant is collected when in flower in the summer and can be dried for later use[4, 254]. It is anthelmintic, antiseptic, astringent, carminative, mildly cathartic, cholagogue, di-gestive, diuretic, mildly emetic, emmenagogue, expectorant, nervine, sedative, sternutatory, tonic and vulnerary[4, 9, 14, 21, 165, 218]. It is taken in the treatment of 'frayed nerves', pre-menstrual complaints, poor memory and tension[254]. It can be taken in combination with herbs such as com-frey, Symphytum officinale, and lime flowers, Tilia species, to treat sinus headaches and congestion[254]. Wood betony can be taken on its own, or with yarrow, Achillea millefolium, to staunch nosebleeds[254]. A pinch of the powdered herb will provoke violent sneezing and it has been used as part of a herbal snuff mixture in the treatment of headaches[4]. A homeopathic remedy is made from the fresh plant[9]. It is used in the treatment of asthma and excessive perspira-tion[9].

propta Seed - sow spring in a cold frame. Prick out the seedlings into individual pots once they are large enough to handle and plant them out in the summer. Division in spring. Very easy, the plant can be successfully divided at almost any time of the year. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Landscape Uses:Border, Ground cover, Specimen. Prefers a light moist neutral to acid soil in sun or light shade[7, 17, 238]. A characteristic plant of healthy roadside banks on heavy soils[187]. Hardy to at least -25°C[187]. At one time bugle was often cultivated for its medicinal virtues,

though it is now little used[4]. There are some named vari-eties selected for their ornamental value[188]. An excellent bee plant[24]. Special Features:Attractive foliage, Fragrant foliage, Not North American native, Invasive, Naturalizing, Suitable for cut flowers, Suitable for dried flowers. In gar-den design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements includ-ing nutrients and water. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [2-1].

## 6.2.603 Lychnis fulgens

Brilliant campion

5 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 0.6 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikli-wis hpa7tmwatli xre7t hjonli

drutta Lychnis fulgens is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardness. It is hardy to UK zone 6. It is in flower from June to August, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly al-kaaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young plant - cooked[177].

tcanta SoapAlthough no specific mention has been seen for this species, the root of several members of this genus contains saponins, a soap substitute used for wash-ing clothes, hair etc[K]. It is extracted by boiling the roots in water[20]. Do not overboil the roots because this will break down the saponins[K].

dwatta None known  
propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individ-ual pots and plant them out in the summer. The seed can also be sown in situ in spring or early autumn though this requires more seed. Division in spring or autumn[200]. Very easy, larger clumps can be replanted direct into their perma-nent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta An easily grown plant, succeeding in a good gar-den soil and a warm sheltered position[1].

## 6.2.604 Achillea sibirica

Siberian Yarrow

5 tlin 9 cyuc 1 kcaak 0 tcan 1 dwat 0.5 m hkuc htut cyutli kyuctcup hwicli hyhshrasjlutnyik hpa7tli flatprikli-wis hpa7tmwatli xre7t hjonli

drutta Achillea sibirica is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.5 m (1ft 8in). See above for USDA hardi-ness. It is hardy to UK zone 6 and is not frost tender. It is in flower from July to September, and the seeds ripen from Au-gust to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suit-able for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly al-kaaline) soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: LeavesEdible Uses: Young shoots and leaves - cooked[177].

tcanta None known  
dwatta Antibacterial Antiinflammatory Carminative Di-aphoretic Emmenagogue Odontalgic Stomachic TonicThe whole plant is antibacterial, anti-inflammatory, antibacterial, carminative, diaphoretic, emmenagogue, odontalgic, stom-achic and tonic[147, 172, 218]. A decoction is used in the treatment of abscesses, abdominal cramps, amenorrhoea, bleeding, falls, snakebite and stomach ulcers[147, 218]. A poultice of the chewed root can be applied to gum sores[257].

propta Seed - sow spring or early autumn in a cold frame[133]. The seed usually germinates in 1 - 3 months[133]. When large enough to handle, prick the seedlings out into individual pots and plant them out in the

summer. Division in spring or autumn. Very easy, the divisions can be planted direct into their permanent positions. Basal cuttings of new shoots in spring. Very easy, collect the shoots when they are about 10cm tall, potting them up individually in pots and keeping them in a warm but lightly shaded position. They should root within 3 weeks and will be ready to plant out in the summer.

nwatta Succeeds in most soils but prefers a well-drained soil in a sunny position[1, 200]. Plants succeed in maritime gardens[233]. They live longer when growing in a poor soil[200]. A very ornamental plant[200]. Polymorphic. Hybridizes freely with other members of this genus[200].

### 6.2.605 Sedum lanceolatum

Spearleaf Stonecrop, Subalpine stonecrop
5 tlin 9 cyuc 1 kcaak 0 tcan 1 dwat 0.2 m hkuc htut cyutli hgatkyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Sedum lanceolatum is an evergreen Perennial growing to 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerates strong winds but not maritime exposure.

kcaakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked[60].

tcanta None known
dwatta Birthing aid LaxativeThe plant is laxative[257]. An infusion of the stems, leaves and flowers has been taken to clean out the womb after childbirth[257].

propta Seed - surface sow in spring in well-drained soil in a sunny position in a greenhouse. Do not allow the soil to dry out. Prick out the seedlings into individual pots when they are large enough to handle. If sufficient growth is made, it is possible to plant them out during the summer, otherwise keep them in a cold-frame or greenhouse for their first winter and plant them out in early summer of the following year[K]. Division is very easy and can be carried out at almost any time in the growing season, though is probably best done in spring or early summer. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Succeeds in most soils[188] but prefers a fertile well-drained soil in a sunny position[200]. Established plants are drought tolerant[190, 200]. Succeeds when grown on a wall[200]. Hardy to at least -15°C[200]. A very polymorphic species[60], it is closely related to *S. stenopetalum*, but this species is not creeping[200]. All members of this genus are said to have edible leaves, though those species, such as this one, that have yellow flowers can cause stomach upsets if they are eaten in quantity[62, 85]. Plants in this genus seem to be immune to the predations of rabbits[233].

### 6.2.606 Athamantha cretensis

Candy Carrot
5 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 0.6 m hkuc htut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Athamantha cretensis is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcaakta Edible Parts: Edible Uses: CondimentThe seed is used as a flavouring[177, 183]. An agreeable liquor is made from it[2].

tcanta None known
dwatta None known
propta Seed - sow spring in a cold frame[1]. Germination usually takes place within 3 - 6 weeks at 13°C[134]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. The seed can also be sown in situ as soon as the soil is workable in the spring[134]. Division in spring, with care[200].

nwatta Succeeds in most soils[1]. Prefers a well-drained soil in full sun[200]. The long tap root is susceptible to rot in wet winters[200].

#### 6.2.607 Iris tectorum

Roof Iris, Wall iris, Japanese Roof, White Roof Iris
5 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 0.3 m hkuc hmimhtut cyutli hgatkyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Iris tectorum is an evergreen Perennial growing to 0.3 m (1ft) by 0.5 m (1ft 8in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcaakta Edible Parts: RootEdible Uses: Root - an edible starch is said to be extracted from it[2, 105, 177]. Some caution is advised since there are reports that the plant might be poisonous. Perhaps the extracted starch is edible.

tcanta None known
dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed should be sown as early in the year as possible in a cold frame. Stored seed does not require cold conditions in order to stimulate germination. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse or cold frame for their first year. Plant out into their permanent positions in late spring or early summer. Division, best done in July/August after flowering. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Landscape Uses:Border, Container, Massing, Seashore. Prefers a well-drained loam rich in leafmold with plenty of moisture in summer and an open sunny position[1, 42, 79, 200]. Requires a really well-drained soil that is dry rather than damp, and a hot sunny position[233]. Prefers a lime-free soil but succeeds in most good soils and in partial shade[79]. Succeeds in dry soils and, once established, is drought tolerant[190]. Cultivated for its edible root in Japan[2]. There are some named varieties, selected for their ornamental value[233]. In China the plants are grown on the roofs of houses[190]. Plants do not flower so freely in cultivation in Britain. In their native habitat they experience cold dry winters and warm wet summers[187]. It is best to lift the plants in October, store them in sand in a cool frost free place over winter and replant in March[1]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. Special Features: All or parts of this plant are poisonous, Attractive flowers or blooms.

### 6.2.608 Corydalis ambigua

5 tlin 9 cyuc 1 kcaak 0 tcan 3 dwat 0.2 m hkuc hmim cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Corydalis ambigua is a PERENNIAL growing to 0.2 m (0ft 8in) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in leaf from March to June, and the seeds ripen from May to June. The species is hermaphrodite (has both male and

dwatta Anthelmintic Laxative StimulantThe leaves are antirheumatic, laxative and stimulant[7]. The plant is a mild laxative, but it also has a beneficial effect on the stomach and is therefore preferable to many other laxatives[7].

propta Seed - best sown in a cold frame as soon as it is ripe[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division. Cuttings of semi-ripe wood, June/July in a cold frame[200].

nwatta Requires a gritty well-drained circumneutral or slightly alkaline soil in full sun[200]. Grows well in a dry sunny position in the rock garden[200].

### 6.2.716 Filipendula vestita

5 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 0.8 m hkuc hmimhtut cyutli tcuphja7n hwicli hrasjlutnyikfrip hpa7tli priklwis hpa7tmwatli fyifxre7t hjonli

drutta Filipendula vestita is a PERENNIAL growing to 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to August, and the seeds ripen from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcaakta None known
tcanta MiscellanyNone known

dwatta MiscellanyOne report says that the plant has medicinal properties but gives no details[145].

propta Seed - best sown in the autumn in a cold frame[1]. The seed can also be sown in a cold frame in spring, germinating best at a temperature of 10 - 13°C[200]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer if they have grown enough. If not, keep them in a cold frame for the winter and plant them out in late spring. Division in autumn or winter[200]. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Requires a humus-rich moist soil in semi-shade[200]. Succeeds in full sun only if the soil is reliably moist throughout the growing season[200]. Dislikes dry or acid soils. Does well in marshy soils. Grows well in heavy clay soils. Members of this genus are rarely if ever troubled by browsing deer[233].

### 6.2.717 Senecio sylvaticus

Mountain Groundsel, Woodland ragwort
5 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 0.6 m hkuc htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli fyifxre7t hjonli

drutta Senecio sylvaticus is a ANNUAL growing to 0.6 m (2ft) by 0.6 m (2ft in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcaakta None known
tcanta None known

dwatta Antiscorbatic DetergentThe plant is detergent and antiscorbatic[4].

propta Seed - sow spring in situ.

nwatta See the plants native habitat for ideas on its cultivation needs. The plant has an unpleasant odour[4].

### 6.2.718 Arnica montana

Arnica, Mountain arnica
5 tlin 9 cyuc 0 kcaak 0 tcan 3 dwat m hkuc hmimhtut cyutli tcup hwicli hyishrasjlutnyik hpa7tli frusflat-priklwis hpa7tmwatli fyifxre7t hjonli

drutta Arnica montana is a PERENNIAL growing to 0.3 m (1ft) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta None known

tcanta None known

dwatta Antiechymotic Antiphlogistic Antirheumatic Epilepsy Nervine Sternutatory VulneraryArnica has a long history of herbal use, especially as an external treatment for bruises and sprains[232, 238] - it is an ingredient of a number of proprietary preparations[238]. Internally, it has been used in the treatment of heart complaints and as a booster for the immune system[238]. Arnica increases local blood supply and accelerates healing, it is anti-inflammatory and increases the rate of absorption of internal bleeding[254]. Generally the plant is nowadays only recommended for internal use as a homeopathic medicine, principally for treating shock, injury and pain[254]. If used as a decoction or tincture it stimulates the circulation and is valuable in the treatment of angina and a weak or failing heart, but it can be toxic even at quite low doses and so is rarely used this way[254]. The flowers are the part most commonly used[4, 232], they are harvested when fully open and dried - the receptacles are sometimes removed since these are liable to be attacked by insects[4]. The root is also used, it is harvested after the leaves have died down in the autumn and dried for later use[4]. The whole plant is antiechymotic, antiphlogistic, nervine, sternutatory, vulnerary[4, 7, 9, 46, 165]. Although a very valuable remedy, it should be used with caution. It has been known to cause contact dermatitis when used externally and collapse when taken internally[238]. Only take it internally under the supervision of a qualified practitioner: The freshly crushed flowers cause sneezing if inhaled[232]. The leaves have also been smoked as a tobacco[232], though it is unclear whether this was for medicinal reasons The whole plant, harvested when in flower, is used in homeopathic remedies[232]. It is especially useful in the treatment of traumatic injuries, sores and bruises[232]. The homeopathic dose has also been used effectively in the treatment of epilepsy and seasickness, and it might be of use as a hair growth stimulant[268]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve Arnica montana for fever and colds, inflammation of the skin, cough/bronchitis, inflammation of the mouth and pharynx, rheumatism, common cold, blunt injuries, tendency to infection (see [302] for critics of commission E). The essential oil has to be diluted before being used externally [301].

propta Seed - best sown as soon as it is ripe in pots outdoors. Sow stored seed in early spring in a cold frame[4]. A period of cold stratification is helpful[238]. The fresh seed can germinate in 3 - 4 weeks at 13°C according to one report[134], though it can be slow, difficult and erratic and take 2 years to germinate[268]. Prick out the seedlings into individual pots when they are large enough to handle and plant them out into their permanent positions in the following spring. Division in spring.

nwatta Prefers a moist, well-drained humus rich soil, preferably lime-free[200]. One report says that it is often found in calcareous soils in the wild[7]. Tolerates a pH in the range 5.8 to 7.6. Prefers a mixture of sand, loam and peat[1]. Prefers a position in full sun[1, 134]. Succeeds in light woodland[14] and in a rock garden or border[1, 14]. Plants are hardy to about -25°C[187]. This species is declining in the wild, probably because of over-collection as a medicinal herb. It may become extinct in part of its range[200].

the powder retain their insecticidal properties almost indefinitely[238]. The growing plant can be used as an insect repellent in the garden[14, 18, 20]. Effective against mosquitoes and ants[201].

dwatta VermifugeDalmatian pellitory is not used medicinally, though research has shown that the flowers possess weak antibiotic activity[268]. The flowers are the main source of the insecticide pyrethrum, which is toxic to insects but not to mammals. It has sometimes been used as a vermifuge in China[147].

propta Seed - sow spring in a greenhouse. Only just cover the seed and do not allow the pot to dry out. Prick out the seedlings into individual pots once they are large enough to handle and grow them on in the greenhouse for their first winter. Plant out in late spring or early summer. Division in spring. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the summer or the following spring.

nwatta Industrial Crop: Pesticide Management: Hay Minor Global CropSucceeds in an ordinary garden soil[1]. Prefers a rich soil with plenty of humus[147]. Prefers a pebbly, calcareous dry soil in a sunny position[4]. When grown in moist climates the plants often die after flowering[4].Tolerates a pH in the range 5.2 to 7.5. Pyrethrum is widely cultivated as a source of an insecticide[57, 61], the growing plant is also said to repel insects from plants growing nearby[14, 18, 20].

### 6.2.712 Pinellia pedatisecta

Hu Zhang

5 tlin 9 cyuc 0 kcaak 0 tcan 2 dwat 0.2 m hkuc hmimhmtt cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

drutta Pinellia pedatisecta is a CORM growing to 0.2 m (0ft 8in) by 0.2 m (0ft 8in). See above for USDA hardness. It is hardy to UK zone 6. It is in flower from July to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta None known

dwatta Antiemetic Antiphlogistic Cancer Expectorant Febrifuge Sialagogue Styptic UrinaryThe poisonous tubers are used as a medicine for the treatment of enlargement of the lymph node and urinary tract infections[266]. The following notes for *P. ternata* almost certainly also apply to this species[218]. The root is antiemetic, antiphlogistic, expectorant, febrifuge, sialagogue, styptic. Strengthens the spleen[147, 174, 176, 178]. Modern research has shown that this remedy is very effective in controlling nausea and vomiting[238]. It is also an ingredient of a Chinese prescription for removing gallstones without surgery, a process that usually causes severe nausea[238]. The root is also used internally in the treatment of coughs with thin watery phlegm and gastritis[238]. The fresh root is extremely acrid and contains toxins, these are neutralized upon drying or by soaking in tea or vinegar[238]. The root is harvested in the summer and dried for later use, it should not be used fresh[174, 238]. Extracts of the plant have been shown to have analgesic, antiemetic, anticancer and sedative activity[218].

propta Seed - we have no information but suggest sowing the seed in a cold frame as soon as it is ripe if this is possible otherwise in early spring. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division as new growth begins in spring. Bulbils from the leaf axils.

nwatta Easily grown in a rich soil, it requires plenty of water in the growing season[1]. Succeeds in full sun or partial shade[188]. Plants can be naturalized in woodland[1]. Plants produce bulbils in their leaf axils[188].

### 6.2.713 Primula reticulata

5 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 0.4 m hkuc hmimhmtt cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

drutta Primula reticulata is a PERENNIAL growing to 0.4 m (1ft 4in). See above for USDA hardness. It is hardy to UK zone 6. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta None known

dwatta AnodyneThe herb is used externally as an anodyne[240].

propta Seed - best sown as soon as it is ripe in a cold frame[133]. Sow stored seed in early spring in a cold frame[1]. Germination is inhibited by temperatures above 20°c[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in autumn. This is best done every other year[200].

nwatta Prefers a deep moist humus-rich soil, succeeding in full sun if the soil is reliably moist throughout the growing season, otherwise it requires some shade[1, 200]. Grows well in heavy clay soils. Succeeds along the sides of streams and in woodland gardens[200]. Plants self-sow when in suitable conditions[200].

### 6.2.714 Ajuga chamaepitys

Ground Pine, Yellow bugle

5 tlin 9 cyuc 0 kcaak 0 tcan 2 dwat 0.2 m hkuc hmimhmtt cyutli kyuctcup hwicli hyhishrasjlutnyik hpa7tli flatprikkwisslip hpa7tmwatli xre7t hjonli

drutta Ajuga chamaepitys is a ANNUAL growing to 0.2 m (0ft 8in) by 0.2 m (0ft 8in). See above for USDA hardness. It is hardy to UK zone 6. It is in flower from May to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta None known

tcanta None known

dwatta Antirheumatic Diuretic Emmenagogue Stimulant Urinary Women's complaintsThe leaves are diuretic, stimulant and emmenagogue[4]. The plant acts mainly on the urinary system and uterus[238]. It once had a high reputation in the treatment of rheumatism, dropsy, jaundice etc and has also proved of worth when used in conjunction with other herbs in the treatment of women's complaints[4]. The leaves are harvested in the summer and can be dried for later use[238].

propta Seed - sow spring in situ. Germination can be erratic[238].

nwatta Thrives in a poor dry soil in full sun[238]. Prefers a humus-rich moisture-retentive soil[200]. Plants are usually annual, but are sometimes short-lived perennials[200]. The whole plant smells of pine trees when crushed[17, 238].

### 6.2.715 Globularia vulgaris

5 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 0.2 m hkuc htut cyutli kyuctcup hwicli hrasjlut hpa7tli priklkwis hpa7tmwatli xre7t hjonli

drutta Globularia vulgaris is an evergreen Perennial growing to 0.2 m (0ft 8in). See above for USDA hardness. It is hardy to UK zone 6. It is in leaf all year, in flower from July to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Root - cooked[46, 61, 105, 177].

tcanta None known

dwatta Alterative Analgesic Antiperiodic Antispasmodic Astringent Contraceptive Deobstruent Diuretic Emmenagogue Sedative TonicAlterative, antiperiodic, astringent, deobstruent, diuretic, emmenagogue, sedative, tonic[178]. The root is analgesic, antispasmodic and sedative[218]. The tuber has a history of over a thousand years use in mitigating pain[218]. This species was ranked 10th in a test of 250 potential antifertility drugs[218].

propta Seed - best sown as soon as it is ripe, the seed rapidly loses viability if it is allowed to become dry[129]. Surface sow and keep moist, it usually germinates in 1 - 3 months at 15°c[164]. Germinates in spring according to another report[129]. Two months warm, then a cold stratification improves the germination of stored seed[134, 164]. Sow the seed thinly so that the seedlings can be allowed to grow undisturbed in the pot for their first year. Apply liquid feed at intervals during their growing season to ensure they are well fed. The seedlings only produce one leaf in their first year of growth[175] and are very prone to damping off[129]. Divide the seedlings into individual pots once they have become dormant and grow them on in a partially shaded area of a greenhouse for at least another year. Plant them out into their permanent positions when they are dormant. Division in spring after flowering. Once the plants are dying down, dig up the clump and divide the tubers, planting them out straight into their permanent positions if required.

nwatta Prefers a moist, well-drained rather light soil, thriving in semi-shade[1]. Grows well in a woodland garden or peat bed[129]. This species is very closely related to and probably part of *C. fumarifolia*[175]. It is probably not really worthy of specific status and is best treated as a cultivar, *C. 'Ambigua* [200]. Plants seem to be immune to the predations of rabbits[233].

### 6.2.609 Anemone nikoensis

5 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 0.3 m hkuc pcmhmimhmtt cyutli hgatkyuctcup hwicli hrasjlutnyik hpa7tli flatprikkwisslip hpa7tmwatli xre7t hjonli

drutta Anemone nikoensis is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardness. It is hardy to UK zone 6. It is in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: LeavesEdible Uses: Leaves - cooked[177]. Some caution is advised, see the notes above on toxicity.

tcanta None known

dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe in the summer[1]. Surface sow or only just cover the seed and keep the soil moist. Sow stored seed as soon as possible in late winter or early spring. The seed usually germinates in 1 - 6 months at 15°c[133]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least their first year. When the plants are large enough, plant them out in the spring. Division in late summer after the plant dies down.

nwatta Succeeds in ordinary garden soil but prefers a moist well-drained humus-rich soil[1, 200]. Tolerates dry summer conditions[200]. This species is closely related to *A. nemerosa*[200]. Plants seem to be immune to the predations of rabbits[233]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

### 6.2.610 Mitchella undulata

5 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 0.1 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli frusflatprik hpa7tmwatli xre7t hjonli

drutta Mitchella undulata is an evergreen Perennial growing to 0.1 m (0ft 4in) by 0.5 m (1ft 8in). See above for USDA hardness. It is hardy to UK zone 6. It is in leaf all year, in flower from June to July. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit. Not very well-flavoured[200].

tcanta Can be used as a ground cover plant in a shady position[188]. Especially good on a peat terrace or in a woodland[200]. Plants form a spreading carpet, rooting along the stems, and are best spaced about 30cm apart each way[208].

dwatta None known

propta Seed - it germinates better if given 3 months cold stratification and so it is best sown as soon as it is ripe in the autumn[113]. Sow stored seed as early in the year as possible. Make sure that all the fruit pulp is removed from the seed because it contains germination inhibitors[113]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division of naturally layered stems in the spring[200]. Cuttings.

nwatta Requires a moist but well-drained lime-free soil and some shade[11]. Prefers a peaty soil[1, 200], succeeding in neutral to acid soils[200].

### 6.2.611 Limonium tetragonum

5 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 0.5 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

drutta Limonium tetragonum is a BIENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardness. It is hardy to UK zone 6. It is in flower in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young leaves - cooked[105, 177].

tcanta None known

dwatta None known

propta Seed - sow spring in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer.

nwatta Requires a well drained soil and a sunny position[200].

### 6.2.612 Patrinia scabiosifolia

Eastern Valerian, Scabious Patrinia

5 tlin 8 cyuc 1 kcaak 0 tcan 3 dwat 0.6 m hkuc htut cyutli tcup hwicli hrasjlut hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

drutta Patrinia scabiosifolia is a PERENNIAL growing to 0.6 m (2ft) at a fast rate. It is in flower in August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young leaves, stem tips and flower buds - cooked and used as a potherb, added to soups or dried for later use[105, 177, 183].

tcanta ParasiticideNone known

dwatta Antibacterial Anticoagulant Antidote Antiphlogistic Antispasmodic Depurative Diuretic Febrifuge Haemostatic Hepatic Parasiticide ResolventThe root is antibacterial, anticoagulant, antiphlogistic, antispasmodic, depurative, diuretic, febrifuge haemostatic and resolvent[147, 174,

178, 218, 279]. It contains several medically active compounds, including triterpenic glycosides and has been shown to stimulate the liver into producing drug-metabolizing enzymes[279]. The root is used in Korea in the treatment of the initial stages of appendicitis, perityphlitis and neuralgia[279]. It is also used in the treatment of parasitic skin diseases and as an antidote to poison[218]. The entire plant is antibacterial, anti-inflammatory and hepatic[176]. It is used traditionally as a sedative[218] and also in the treatment of carbuncles, acute appendicitis, intestinal abscess, postpartum pain, dysmenorrhoea and endometriosis[176]. It stimulates the circulation, treats abscesses, promotes regeneration of liver cells[147, 174, 176, 178]. Large doses can cause a decrease of white blood cells, nausea and dizziness[176]. The crushed leaves are applied to abscesses and boils[147, 218].

propta Seed - sow in situ in April[111]. If you only have a small quantity of seed it is probably better to sow it in a pot in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in early summer. Division in spring or autumn.

nwatta Landscape Uses:Border, Massing, Rock garden. Easily grown in any light rich soil in a sunny position[1, 111]. Special Features:Not North American native, Suitable for cut flowers.

### 6.2.613 Centaurea jacea

Brown Knapweed

5 tlin 9 cyuc 1 kcaak 0 tcan 1 dwat 0.6 m hkuc htut cyutli hgatkuyctcup hwicli hyishrasjlutnyik hpa7tli flat-prikwisslip hpa7tmwatli fyfkr7t hjonli

drutta Centaurea jacea is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from August to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcaakta The young leaves are cooked as a vegetable [1b]. tcanta None known

dwatta Bitter Diuretic Ophthalmic Stomachic TonicThe root is bitter tonic, diuretic and stomachic[7]. An excellent bitter for treating difficult digestive systems, it is still used in rural areas as a digestive and also to reduce the temperature of feverish children[7]. A distilled water made from the leaves is used as an eye lotion in the treatment of conjunctivitis[7].

propta Seed - sow April in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out into their permanent positions in the summer. Division in autumn. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the summer or following spring. This should be done at least once every three years in order to maintain the vigour of the plant. Basal cuttings in spring. Harvest the shoots when they are about 10 - 15cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Succeeds in ordinary garden soil[1, 200]. Prefers a well-drained fertile soil and a sunny position[200]. Tolerates dry, low fertility and alkaline soils[200]. Plants are suitable for the wild garden and for naturalising[200]. This species is hardy to at least -15°C[200]. Members of this genus are rarely if ever troubled by browsing deer[233].

### 6.2.614 Sisymbrium officinale

Hedge Mustard

5 tlin 9 cyuc 1 kcaak 0 tcan 2 dwat 0.6 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwisslip hpa7tmwatli fyfkr7t hjonli

drutta Sisymbrium officinale is a ANNUAL growing to 0.6 m (2ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from June to July, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs). The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Leaves SeedEdible Uses: CondimentYoung shoots - raw or cooked[2, 9, 85]. A bitter cabbage-like flavour, they are used as a flavouring in salads or cooked as a potherb[183, K]. Seed - raw or cooked[257]. It can be ground into a powder and used as a gruel or as a mustard-like flavouring in soups etc[85, 183].

tcanta Soil conditionerAlkaline secretions from the growing roots help to sweeten an acid soil[18].

dwatta Antiaphonic Diuretic Expectorant Laxative StomachicThe whole plant is said to be antiaphonic, diuretic, expectorant, laxative and stomachic[4, 7, 21, 46]. This plant was at one time known as the 'singer's plant' because of its use in treating loss of the voice[7]. A strong infusion of the whole plant has been used in the treatment of throat complaints[4, 238]. Excessive doses can affect the heart[238]. The dried plant is almost inactive, so it should only be used when freshly harvested[7].

propta Seed - sow spring or autumn in situ[238]. nwatta An easily grown plant, it succeeds in most soils but prefers a moist to dry acid to alkaline soil in full sun or light shade[238]. Plants are hardy to at least -15°C[238]. Hedge mustard grows well near oats but it inhibits the growth of turnips[18]. The plant has a peculiar aptitude for collecting and retaining dust[4]. This means that when growing near roads or other polluted places the leaves are seldom edible[K]. A food plant for the caterpillars of several butterfly and moth species[30].

### 6.2.615 Abies procera

Noble Fir

5 tlin 6 cyuc 0 kcaak 0 tcan 1 dwat 60 m hkuc pcmhmimhtut cyutli tcup hwicli hyishrasjlutnyikfrip hpa7tli flatprik hpa7tmwatli hjonli

drutta Abies procera is an evergreen Tree growing to 60 m (196ft) by 5 m (16ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf all year, and the seeds ripen in September. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid and neutral soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure.

kcaakta None known tcanta WoodWood - light, hard, strong, close grained, works easily. Used for lumber, interior work, pulp etc[46, 61, 82, 229].

dwatta PectoralA decoction of the leaves has been used as a cough medicine[257].

propta Seed - sow early February in a greenhouse or outdoors in March[78]. Germination is often poor, usually taking about 6 - 8 weeks[78]. Stratification is said to produce a more even germination so it is probably best to sow the seed in a cold frame as soon as it is ripe in the autumn[80, 113]. The seed remains viable for up to 5 years if it is well stored[113]. When large enough to handle, prick the seedlings out into individual pots and grow them on for at least their first winter in pots. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Alternatively, if you have sufficient seed, it is possible to sow in an outdoor seedbed. One report says that it is best to grow the seedlings on in the shade at a density of about 550 plants per square metre[78] whilst another report says that they are best grown on in a sunny position[80].

nwatta Landscape Uses:Screen. Prefers a good moist but not water-logged soil[1]. Succeeds in cold exposed positions and in poor mountain peats[11]. Succeeds in poor thin soils so long as sufficient moisture is present[229].

### 6.2.708 Glandularia canadensis

Rose Verbena

5 tlin 9 cyuc 0 kcaak 3 tcan 0 dwat 0.3 m hkuc hmimhtut cyutli hgatkuyctcup hwicli hyishrasjlutnyik hpa7tli frusflatprik hpa7tmwatli hjonli

drutta Glandularia canadensis is a PERENNIAL growing to 0.3 m (1ft) by 0.4 m (1ft 4in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils and can grow in very acidic soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcaakta None known tcanta A medium density groundcover. Nectary: provides nectar or pollen for beneficial insects [1-2]. Garden Uses include rock gardens or border fronts. Spreads to form an attractive ground cover with a long and floriferous summer bloom. Edging. Containers. Hanging baskets [368-1]. Both the flowers and foliage are fragrant. Landscape restoration.

dwatta None known propta Root Division , Seeds , Softwood Cuttings. Seed sown in spring or fall, cuttings, and root division are methods of propagation.

nwatta An herbaceous creeping annual or perennial plant. Prefers full to partial sun and mesic (requiring a moderate amount of moisture) to dry conditions. The soil can contain rocky material, gravel, sand, loam, or clay-loam. Avoid wet, poorly drained soils. Bloom Time: May to August. Bloom Description: Rose-pink to rose-purple. Flower: Showy. Purple flowers in the spring, which can persist until fall. Tolerate: Drought, Dry Soil, Shallow-Rocky Soil. May be grown as an annual throughout the normal range for the species, and in particular in the northern parts of USDA Zone 5 where it is not reliably winter hardy and appreciates some winter protection [1-6]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2].

### 6.2.709 Dryopteris oreades

Mountain Male Fern

5 tlin 9 cyuc 0 kcaak 0 tcan 4 dwat 0.6 m hkuc hmim cyutli hgatkuyctcup hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli hjonli

drutta Dryopteris oreades is a FERN growing to 0.6 m (2ft) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 6. The seeds ripen from July to September. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland). It prefers moist soil and can tolerate drought.

kcaakta None known tcanta None known

dwatta AnthelminticThe root contains 'filicin', a substance that paralyses tapeworms and other internal parasites and has been used as a worm expellent[4, 172, 238]. It is one of the most effective treatments known for tapeworms - its use should be immediately followed by a non-oily purgative such as magnesium sulphate in order to expel the worms from the body[238]. An oily purge, such as castor oil, increases the absorption of the fern root and can be dangerous[238]. The root is harvested in the autumn and can be dried for later use, it should not be stored for longer than 12 months[238]. This remedy should be used with caution and only under the supervision of a qualified practitioner[238]. The root is toxic and the dosage is critical[238]. See also the notes above on toxicity. The root is also used in the treatment of dandruff[4, 172].

propta Spores - can be sown at any time of the year in a greenhouse. Surface sow on a sterilised compost and keep moist, possibly by placing the pot in a plastic bag. Germinates in 1 - 3 months at 20°C. Pot up small clumps of the plants when they are large enough to handle and grow on in a shady part of the greenhouse until large enough to plant

out. Division in spring. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta An easily grown plant[233], it prefers an acid to neutral soil, succeeding in ordinary fertile soil in a shady position[175, 200]. Prefers a moist soil[188], but is drought tolerant when well established[200]. Members of this genus are rarely if ever troubled by browsing deer[233].

### 6.2.710 Lysimachia nemorum

Yellow Pimpernel

5 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 0.5 m hkuc hmimhtut cyutli tcuphja7n hwicli hrasjlutnyikfrip hpa7tli flat-prikwisslip hpa7tmwatli fyfkr7t hjonli

drutta Lysimachia nemorum is an evergreen Perennial growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcaakta None known tcanta None known dwatta Astringent An astringent herb, yellow pimpernel is used as a wound herb to staunch bleeding[254].

propta Seed - sow spring or autumn in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring or autumn[200]. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring. Basal cuttings, March to April in a cold frame. Harvest the shoots with plenty of underground stem when they are about 8 - 10cm above the ground. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta An easily grown plant, succeeding in a moist or wet loamy soil in sun or partial shade[200]. Hardy to at least -25°C[187]. Most species in this genus seem to be immune to the predations of rabbits[233].

### 6.2.711 Tanacetum cinerariifolium

Dalmation Pellitory, Pyrethrum

5 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 0.5 m hkuc htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatprikwisslip hpa7tmwatli fyfkr7t hjonli

drutta Tanacetum cinerariifolium is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from July to September, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcaakta None known tcanta Insecticide RepellentThe dried flower buds are the source of the insecticide 'Pyrethrum'[1, 4, 14, 18, 46, 57, 61]. The pyrethrins are produced in the yellow disc florets[169]. The highest pyrethrin content is from the flowers when they are in full bloom (1.22%) and lowest in the preceding period (0.71%)[240]. This insecticide also kills many beneficial insects, though it is relatively harmless to mammals[4]. Another report says that it is non-toxic to mammals[238]. It is best used in the evening so that it will have lost much of its virulence by the morning[201]. Steep two handfuls of the dried powdered flowers in one litre of hot water for an hour. This mixture can be either pureed or strained and then used as a spray[201]. Once dried, the flowers or

hmimhtut cyutli kyucutcup hwicli hrasjlutnyik hpa7tli flat-prikliwsslip hpa7tmwatli xre7t hjonli

drutta *Aristolochia macrophylla* is a CLIMBER growing to 7 m (23ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to August, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta None known

tcanta None known

dwatta Antiseptic AntitumorThe plant contains the antiseptic and antitumor compound aristolochic acid[222]. A decoction of the root has been used externally to treat 'swelling of feet and legs'[257]. A compound infusion of stalk chips has been used in the treatment of 'yellowish urine'[257].

propta Seed - best sown in a greenhouse as soon as it is ripe in the autumn. Pre-soak stored seed for 48 hours in hand-hot water and surface sow in a greenhouse[134]. Germination usually takes place within 1 - 3 months at 20°C[134]. Stored seed germinates better if it is given 3 months cold stratification at 5°C[200]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant out in late spring or early summer after the last expected frosts. Division in autumn[200]. Root cuttings in winter[200].

nwatta Landscape Uses:Arbor, Screen. Prefers a well-drained loamy soil, rich in organic matter, in sun or semi-shade[1, 200], but succeeds in ordinary garden soil[134]. Plants are hardy to at least -10°C[200]. A fast-growing climbing plant, attaching itself by means of twining around other plants, it has been recommended for covering pergolas[200]. Most species in this genus have malodorous flowers that are pollinated by flies[200]. Special Features:Attracts birds, Attractive foliage, North American native, All or parts of this plant are poisonous, Attracts butterflies, Attractive flowers or blooms.

## 6.2.705 *Cyrtomium fortunei*

Asian netvein hollyfern

5 tlin 9 cyuc 0 kcak 0 tcan 2 dwat 0.5 m hkuc

pcimhmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta *Cyrtomium fortunei* is an evergreen Fern growing to 0.5 m (1ft 8in) by 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta None known

dwatta Analgesic Anthelmintic Antibacterial Anticoagulant Antiviral Depurative Febrifuge HaemostaticThe rhizome is analgesic, anthelmintic, antibacterial, anticoagulant, antiviral, depurative, febrifuge and haemostatic[147, 176, 218]. A decoction is used in the treatment of hookworm, tapeworm, ascariasis, filariasis, acute infectious hepatitis and various bleeding ailments[147]. The decoction is also used as a preventative for influenza and measles[147].

propta Spores - best sown as soon as ripe on the surface of a humus-rich sterilized soil. Keep the compost moist, preferably by putting a plastic bag over the pot. Germinates in 1 - 3 months at 20°C[164]. Pot on small clumps of plantlets as soon as they are large enough to handle and keep humid until they are well established. Do not plant outside until the ferns are at least 2 years old and then only in a very well sheltered position. Division in spring or summer[188].

nwatta Requires a moderately loose soil, do not firm the soil any more than is necessary[1]. Tolerates a little direct sun but it grows better in the shade[200]. Grows well in a woodland garden[166]. Prefers a pH between 6 and 7 but this is not critical[200]. Dislikes too much winter moisture[1]. A very ornamental and hardy plant[1], tolerating temperatures down to about -30°C[200]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 6.2.706 *Carex morrowii*

Iwashiba, Japanese Sedge

5 tlin 9 cyuc 0 kcak 4 tcan 0 dwat m hkuc

pcimhmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flat-prikliwis hpa7tmwatli hjonli

drutta *Carex morrowii* is an evergreen Perennial growing to 0.6 m (2ft) by 0.6 m (2ft in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None Known

tcanta Carbon Farming Solutions - Industrial Crop: biomass (Crops grown for non-food uses. Industrial crops provide resources in three main categories: materials, chemicals, and energy. Traditional materials include lumber and thatch, paper and cardboard, and textiles) [1-1]. *Carex* species are popular in horticulture especially for shady positions. No information was found for *Carex morrowii* but some *Carex* native species are used in wildland habitat restoration projects, natural landscaping, and in sustainable landscaping as drought-tolerant grass replacements for lawns and garden meadows. Grows well in the shade of trees. *Carex morrowii* is typically grown for its attractive shape and foliage. Effective accent for smaller gardens. Can be grown in pots.

dwatta None Known

propta Propagation is by seed or division in spring.

nwatta Industrial Crop: Biomass Management: Hay Regional CropClimate: boreal to warm temperate. Humidity: aquatic. Best grown in moist, fertile, medium to wet soils in part shade to full shade. Soils should not be allowed to dry out. In full sun and hot sites foliage tends to bleach to an unattractive yellow. Tolerates: Deer, Heavy Shade, Erosion, Wet Soil. Carbon Farming Solutions - Cultivation: regional crop. Management: hay (Describes the non-destructive management systems that are used in cultivation) [1-1]. .

## 6.2.707 *Carex hachijoensis*

Japanese sedge

5 tlin 9 cyuc 0 kcak 3 tcan 0 dwat 0.3 m hkuc

pcimhmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta *Carex hachijoensis* is an evergreen Perennial growing to 0.3 m (1ft) by 0.3 m (1ft in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. The flowers are pollinated by Wind, Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta None known

tcanta ContainersA good evergreen ground cover supplying winter interest. Can be used on slope or Banks. Good in containers. Variegated forms available for foliage interest including *Carex hachijoensis* Evergold. Can make a good edging plant. Deer resistant and shade tolerant.

dwatta None Known

propta Propagate by plant division in spring or seeding in the fall.

nwatta Best grown in moist, fertile, medium to wet soils in part shade to full shade. Soils should not be allowed to dry out. In full sun and hot sites foliage tends to bleach to an unattractive yellow. Tolerates: Deer, Heavy Shade, Erosion, Wet Soil. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is clumping, giving the plant a 'clumping' habit. The predictable growth behaviour makes it easier to maintain without having to apply containment methods[2-1].

Grows well in heavy clay soils. Plants are very shade tolerant, especially when young, but they grow more slowly in dense shade[81]. Intolerant of atmospheric pollution[1]. Prefers slightly acid conditions with a pH down to about 5[200]. Grows well on a north-facing slope[200]. A long-lived tree in the wild, with specimens more than 600 years old recorded[229]. It is a very ornamental tree[1], but is very susceptible to damage by aphids in some areas of the country[1, 11]. Planted for timber in W. and N. Europe[50], in Britain it grows best in wetter parts of the country such as the Perthshire valleys of Scotland[11]. Trees do not grow well in the drier areas of Britain[81]. In a suitable site it can make new growth of 1 metre a year until it is 25 metres tall when growth slows[185]. Exposure seems to severely limit growth in height in southern and eastern regions but less so in areas of high rainfall such as N. Wales and Argyll[185]. New growth takes place from early June to August[185]. Trees should be planted into their permanent positions when they are quite small, between 30 and 90cm in height. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200]. Trees are sometimes used as 'Christmas trees'[200]. Plants are strongly outbreeding, self-fertilized seed usually grows poorly[200]. They hybridize freely with other members of this genus[200]. Special Features:Attractive foliage, North American native, There are no flowers or blooms.

## 6.2.616 *Pseudolarix amabilis*

Golden Larch, Chinese golden-larch

5 tlin 7 cyuc 0 kcak 0 tcan 2 dwat 40 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli frusflat hpa7tmwatli hjonli

drutta *Pseudolarix amabilis* is a deciduous Tree growing to 40 m (131ft 3in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta Miscellany WoodThe wood is used for furniture, boat building, and bridges[266].

dwatta MiscellanyThis plant is commonly used in Chinese herbalism, where it is considered to be one of the 50 fundamental herbs[218]. The stem bark is used in the treatment of ringworm[218]. The bark shows fungicidal activity against the parasitic Epidermophyton and Trichophyton fungi that cause ringworm[218].

propta Seed - sow late winter in a cold greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts.

nwatta Landscape Uses:Border, Pest tolerant, Specimen. Best grown in a warm sheltered site on a deep fertile soil with a pH between 5 and 6 and an annual rainfall of around 1000mm[200]. Plants dislike dry winds and soils that dry out readily[200]. Slow-growing[11]. A difficult tree to grow well in cool temperate regions, if planted out when small it is easily scorched and can be killed by temperatures of -5°C[200]. In Britain good trees are only found in the southern part of the country[200]. Plants prefer a continental climate with hot summers - they are then much hardier and tolerate cold winters[200]. Best planted out when 30 - 80cm tall, it needs to be kept weed free until established and might require winter protection for its first few years[200]. There are several named forms, selected for their ornamental value[200]. Special Features:Not North American native, Inconspicuous flowers or blooms.

## 6.2.617 *Carpinus betulus*

Hornbeam, European hornbeam, Common Hornbeam, European Hornbeam

5 tlin 7 cyuc 0 kcak 0 tcan 2 dwat 25 m hkuc

pcimhmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flat-prikliwsslip hpa7tmwatli hjonli

drutta *Carpinus betulus* is a deciduous Tree growing to 25 m (82ft) by 20 m (65ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from April to May, and the seeds ripen in November. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta Dye Fuel Hedge Hedge WoodPlants can be grown as a medium to tall hedge, they retain their dead leaves throughout the winter if clipped at least once a year in late summer[11, 29, 186]. They should not be clipped in spring since they will bleed profusely[200]. A yellow dye is obtained from the bark[115]. Wood - heavy, close grained, hard, very tough, very durable, not very durable according to another report. Used for flooring, cogs, tools, piano mechanisms etc[1, 11, 13, 46, 115]. A good fuel[6].

dwatta Bach Haemostatic OphthalmicThe leaves are haemostatic[7]. They are used in external compresses to stop bleeding and heal wounds[7]. A distilled water made from the leaves is an effective eye lotion[7]. The leaves are harvested in August and dried for later use[7]. The plant is used in Bach flower remedies - the keywords for prescribing it are 'Tiredness', 'Weariness' and 'Mental and physical exhaustion'[209].

propta Seed - best sown in an outdoors seedbed as soon as it is ripe[78]. Germination is usually good, though it may take 18 months[80]. If collected whilst still 'green' (after the seed is ripe but before it has dried fully on the plant) and sown immediately it should germinate in the following spring[80]. Grow the plants on for two years in the seedbed and then plant them out into their permanent positions in the winter. The average seed viability is around 65%[98]. Pre-treat stored seed with 4 weeks warm and 12 weeks cold stratification and sow in a cold frame[98]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame until they are at least 15cm tall before planting them into their permanent positions.

nwatta Landscape Uses:Espalier, Pest tolerant, Hedge, Superior hedge, Specimen, Street tree. Thrives in any good loam, including chalk[1, 11], it does not demand much light[186]. Prefers a deep open loam[1] and does well on damp clays[186]. Succeeds in all but the most acid soils[186]. Dormant trees are very cold tolerant, the young growth is not usually damaged by late spring frosts[186]. The trees cast a deep shade[98, 186]. A very ornamental plant[1]. Trees are shallow-rooted[7]. The hornbeam has 28 species of associated insects[24]. Trees take 10 - 20 years from seed before they produce seed[98] and about 100 years to reach maturity[186]. At one time this tree was commonly pollarded or coppiced for its wood and for fuel[11, 13, 186]. Special Features: Not North American native, Inconspicuous flowers or blooms.

## 6.2.618 *Chamaecyparis lawsoniana*

Lawson Cypress, Port orford cedar, Oregon Cedar, Port Orford Cedar, Lawson's Cypress

5 tlin 7 cyuc 0 kcak 0 tcan 1 dwat 25 m hkuc

hmimhtut cyutli hgatyuctcup hwicli hrasjlutnyikfrip hpa7tli flatprikliwsslip hpa7tmwatli hjonli

drutta *Chamaecyparis lawsoniana* is an evergreen Tree growing to 25 m (82ft) by 4 m (13ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from March to April, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland)

or no shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta None known

tcanta Broom Hedge Resin WoodPlants can be grown as a tall hedge[29, 75, 200] They are very tolerant of clipping so long as this does not extend into the brown barked wood since trees cannot regenerate from this[200]. Any trimming should be done in the summer[200]. Certain dwarf forms can be used for ground cover, the cultivars 'Knowefieldensis', 'Nidiformis' and 'Tamariscifolia' have been recommended[208]. The branches have been used to make brooms[257]. Wood - very close-grained, hard, strong, durable, easily worked, light, abounding in fragrant resin, acid resistant. One of the world's finest timbers, it is widely used for flooring, fencing, making boats etc[46, 61, 82, 171]. It is now in short supply due to over-harvesting without replanting[200].

dwatta DiureticThe resin is a powerful diuretic[46, 61, 82].

propta Seed - sow March/April in a seedbed outdoors[78]. The seed is best sown in pots in a frame[K]. Seed can take 18 months to germinate. One month warm then one month cold stratification has produced good results[113]. When large enough to handle, prick the seedlings out into individual pots and grow them in a cold frame for their first winter, planting them out in late spring after the last expected frosts. Cuttings in late summer or autumn in sandy soil in a cold frame[1, 11, 200]. Difficult, it may be best done in late winter to early spring[113].

nwatta Landscape Uses:Hedge, Screen, Specimen. Succeeds in most soils and situations, but prefers a moist deep loamy soil and a sheltered position[1, 11]. Grows well in heavy clay soils. Survives on dry alkaline soils[200]. Growth of trees is hardly affected by a lack of phosphate in the soil. Plants are moderately shade tolerant, especially when young[81, 200]. Plants are tolerant of atmospheric pollution according to one report[200], whilst another says that they do not do well in a polluted atmosphere[1]. A fairly wild tolerant plant, but it does not like severe maritime exposure[75]. Plants are susceptible to wind burn and recover variably[75]. This species is hardy to about -25°C[200]. A fairly long-lived tree in the wild with specimens 500 - 600 years old[229]. It is a very valuable timber tree in N. America and it is sometimes cultivated as a forestry tree in Britain, where it occasionally self-sows[1, 11]. It establishes well and grows quickly. New shoots can make 1 metre in a year but trees rarely maintain that rate and 30cm is nearer the average[185]. New growth starts very slowly in April, speeds up in June and ceases in September[185]. A very uniform species in the wild[200], in cultivation it is polymorphic and there are many named varieties[1, 185, 200]. The crushed foliage has a pungent smell[245]. Favoured by many birds for roosting, providing high cover and especially for nesting, large specimens of this tree help to attract songbirds to the garden[200]. Trees are notably susceptible to honey fungus[200]. Special Features: Attractive foliage, North American native, Inconspicuous flowers or blooms.

### 6.2.619 Fraxinus chinensis rhynchophylla

Hua Qu Liu

5 tin 9 cyuc 0 kcaak 0 tcan 2 dwat 25 m hkuc htut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Fraxinus chinensis rhynchophylla is a deciduous Tree growing to 25 m (82ft 0in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in June. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta None known

tcanta Weather protection WoodThe plant (extract?) is said to be used as a barrier to protect the skin from ultraviolet light[176]. The wood is used for cabinet making[266].

dwatta Analgesic Antiinflammatory Antitussive Astringent Diuretic Dysentery Expectorant StomachicThe bark is analgesic, anti-inflammatory, antitussive, astringent, diuretic, expectorant and stomachic[176, 218, 238]. It controls bacterial infections and coughs[238]. It is used in the treatment of apoplexy, liver diseases, diarrhoea, dysentery, eye diseases such as cataracts, cough and asthma[176, 279]. The bark contains aesculin, this has anti-inflammatory, anticoagulant and analgesic actions[176]. The bark also contains fraxetin. This has an inhibitory effect on the central nervous system, is a stronger and safer anodyne than aspirin and has some antibacterial activity[176].

propta The seed is best harvested green - as soon as it is fully developed but before it has fully dried on the tree - and can then be sown immediately in a cold frame[80]. It usually germinates in the spring[80]. Stored seed requires a period of cold stratification and is best sown as soon as possible in a cold frame[200]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant them out into their permanent positions or a nursery bed in late spring or early summer of the following year. If you have sufficient seed then it is possible to sow it directly into an outdoor seedbed, preferably in the autumn. Grow the seedlings on in the seedbed for 2 years before transplanting either to their permanent positions or to nursery beds.

nwatta Prefers a deep loamy soil, even if it is on the heavy side[1, 200]. Most members of this genus are gross feeders and require a rich soil[11, 200]. Plants succeed when growing in exposed positions[200] and also in alkaline soils[11]. They tolerate atmospheric pollution[200]. This sub-species grows well in Britain and is much more common in cultivation than *F. chinensis*[11, 200]. This species might be dioecious, in which case male and female plants must be grown if seed is required.

### 6.2.620 Cedrus atlantica

Atlas Deodar, Atlantic cedar

5 tin 9 cyuc 0 kcaak 3 tcan 2 dwat 25 m hkuc htut cyutli hgatkyuctup hwicli hrasljutnyik hpa7tli flatprikliw hpa7tmwatli hjonli

drutta Cedrus atlantica is an evergreen Tree growing to 25 m (82ft) by 10 m (32ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower in September, and the seeds ripen from October to December. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta None known

tcanta Essential Hedge Hedge Repellent WoodAn essential oil obtained from the distilled branches is used in perfumery, notably in jasmine-scented soaps[238]. The essential oil also repels insects[238]. Plants can be grown as a tall hedge[29]. Wood - fragrant and durable[238]. It is prized for joinery and veneer and is also used in construction[61, 238]. It is also used for making insect-repellent articles for storing textiles[238].

dwatta Antidandruff Antifungal Antiseptic Nervine Pectoral SkinAn essential oil obtained from the distilled branches is a good antiseptic and fungicide that stimulates the circulatory and respiratory systems and also calms the nerves[238]. The oil is also astringent, diuretic, expectorant and sedative[254]. Diluted with a carrier oil such as almond, and massaged into the skin it is used in the treatment of skin diseases, ulcers, chest infections, catarrh, cystitis and dandruff[4, 238, 254]. It is used as an inhaler for treating bronchitis, tuberculosis and nervous tension[4, 238]. An infusion of the branches can also be used[238].

propta Seed - collect the cones in winter and keep in a warm room until they open[1]. Sow immediately in a cold frame[78]. One report says that a short cold stratification of one month improves germination rates[113]. Keep the seed pot moist, but be careful because the young seedlings are

drutta Clematis douglasii is a deciduous Perennial growing to 0.6 m (2ft) by 0.6 m (2ft in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to June, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta Insulation Miscellany TinderThe seed floss makes an excellent tinder for starting fires, a spark from a flint will quickly ignite it[212]. The seed floss can be used as an insulation in shoes etc[212].

dwatta MiscellanyA decoction of the leaves has been used to treat headaches[257]. The root has been used in the treatment of congested nose pain[257].

propta Seed - best sown as soon as it is ripe in a cold frame[164, 200]. Sow stored seed as soon as it is obtained in a cold frame. Pre-soak the seed for 12 hours in warm water and remove as much of the tail and outer coat as possible[164]. A period of cold stratification is beneficial[164]. The seed germinates in 1 - 9 months or more at 20°C[164]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for the first winter. Plant out in late spring or early summer, after the last expected frosts. Internodal cuttings of soft to semi-ripe wood, late spring in sandy soil in a frame[200]. Layering of old stems in late winter or early spring[200]. Layering of current seasons growth in early summer[200].

nwatta Succeeds in any fertile well-drained soil in a sunny position[233]. Prefers a deep moist soil with its roots in the shade[11, 200]. Dislikes poorly-drained heavy clay soils, but grows well in clay if grit is added for drainage[11, 200]. Dislikes light sandy soils[11]. Does well on chalk[1, 233]. Succeeds in acid as well as alkaline soils[200]. When planting out, in order to avoid the disease 'clematis wilt', it is best to plant the rootball about 8cm deeper in the soil. This will also serve to build up a good root crown of growth buds[200]. Plants seem to be immune to the predations of rabbits[233]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

### 6.2.701 Goodyera repens

Creeping Lady's Tresses, Lesser rattlesnake plantain

5 tin 9 cyuc 0 kcaak 0 tcan 2 dwat 0.3 m hkuc hmimhtut cyutli kyuctup hwicli hrasljut hpa7tli flatprikliw hpa7tmwatli dyatxe7t hjonli

drutta Goodyera repens is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Humble bees. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta None known

tcanta None known

dwatta A cold infusion of the leaves has been used to improve the appetite and also in the treatment of colds and kidney problems[257]. A poultice of the wilted leaves has been used to 'draw out burns'[257]. The infusion can be held in the mouth as a treatment for toothache[257]. The root and the leaves have been used in the treatment of bladder problems[257]. The roots and the leaves have been used in the treatment of stomach problems and female disorders[257]. A poultice of the chewed leaves, and the swallowed juice, has been used in the treatment of snake bites[257]. The plant ooze has been used as drops to treat sore eyes[257].

propta Seed - surface sow, preferably as soon as it is ripe, in the greenhouse and do not allow the compost to dry out. The seed of this species is extremely simple, it has a minute embryo surrounded by a single layer of protective cells. It contains very little food reserves and depends upon a symbiotic relationship with a species of soil-dwelling fungus. The fungal hyphae invade the seed and enter the cells of the embryo. The orchid soon begins to digest the fungal tissue and this acts as a food supply for the plant until it is able

to obtain nutrients from decaying material in the soil[200]. It is best to use some of the soil that is growing around established plants in order to introduce the fungus, or to sow the seed around a plant of the same species and allow the seedlings to grow on until they are large enough to move.

nwatta Requires a somewhat shady site and a well-drained compost of peat, leafmold and sand[1]. Does well in the woodland garden[42, 230]. Orchids are, in general, shallow-rooting plants of well-drained low-fertility soils. Their symbiotic relationship with a fungus in the soil allows them to obtain sufficient nutrients and be able to compete successfully with other plants. They are very sensitive to the addition of fertilizers or fungicides since these can harm the symbiotic fungus and thus kill the orchid[230].

### 6.2.702 Erysimum repandum

Bushy Wallflower, Spreading wallflower  
5 tin 9 cyuc 0 kcaak 0 tcan 1 dwat 0.6 m hkuc htut cyutli kyuctup hwicli hyhisrasljutnyik hpa7tli prikliw hpa7tmwatli xre7t hjonli

drutta Erysimum repandum is a ANNUAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to June. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta None known

tcanta None known

dwatta Antiscorbatic FebrifugeThe plant is used in Spain as an antiscorbatic[240]. The seeds are used in the treatment of fevers[240].

propta Seed - sow spring in situ[200]. Germination should take place within 3 weeks. The flowering season can be extended by making a succession of sowings from spring to early summer[200]. An autumn sowing should overwinter in many parts of the country and would provide flowering plants in the spring.

nwatta Requires a position in full sun in a well-drained approximately neutral soil[200]. Acid soils should be given some lime[200]. Plants are generally tolerant of poor soils[200].

### 6.2.703 Pinellia tripartita

5 tin 9 cyuc 0 kcaak 0 tcan 1 dwat 0.5 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Pinellia tripartita is a CORM growing to 0.5 m (1ft 8in) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta None known

dwatta Antiemetic Antitussive Cardiotonic Diuretic ExpectorantThe root is antiemetic, antitussive, cardiotonic, diuretic, expectorant[218].

propta Seed - we have no information but suggest sowing the seed in a cold frame as soon as it is ripe if this is possible otherwise in early spring. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division as new growth begins in spring. Bulbils from the leaf axils.

nwatta Easily grown in a rich soil, it requires plenty of water in the growing season[1]. Succeeds in full sun or partial shade[188]. Plants can be naturalized in woodland[1]. Plants produce bulbils in their leaf axils[188].

### 6.2.704 Aristolochia macrophylla

Pipevine, Dutchman's Pipe

5 tin 8 cyuc 0 kcaak 0 tcan 1 dwat m hkuc

considered to be useful in the treatment of coughs and rickets in children[4]. It was at one time used as a herbal remedy for rickets[219] and its tannin content renders it suitable for stopping bleeding from small wounds[7]. The fronds are harvested in late spring and dried for later use[7].

propta Spores - best sown as soon as they are ripe on the surface of a humus-rich sterilized soil. Keep the compost moist, preferably by putting a plastic bag over the pot. Germinates in spring[1]. Spring sown spores germinate in 1 - 3 months at 15°c[134]. Pot on small clumps of plantlets into individual pots as soon as they are large enough to handle and grow them on in light shade in a cold frame or greenhouse. Keep the plants humid until they are well established. Once the plants are 15cm or more tall, plant them out into their permanent positions in the spring. Division in spring.

nwatta Requires a well-drained position and lots of old mortar rubble in the soil[1]. Requires a humid atmosphere and some shade[28, 31]. A good plant for growing on a shady part of an old dry-stone or brick wall[K], also succeeding in full sun[219]. A very ornamental fern[1], it is very tough but slow to establish[219]. Members of this genus are rarely if ever troubled by browsing deer[233].

### 6.2.697 Senecio erucifolius

Hoary Groundsel, Hoary ragwort

5 tlin 9 cyuc 0 kcaak 0 tcan 2 dwat 0.6 m hkuc htuc cyutli kyuctcup hwicli hrasljutnyik frip hpa7tli flatprikliwisslip hpa7tmwatli fyifxre7t hjonli

drutta Senecio erucifolius is a PERENNIAL growing to 0.6 m (2ft) by 0.6 m (2ft in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcakta None known

tcanta None known

dwatta Anthelmintic Antiscorbutic Diaphoretic Diuretic Emmenagogue Poultrice PurgativeThe plant is used in plasters, ointments and poultices[4]. This species is related to groundsel, *S. vulgaris*, and is said to have similar properties[4]. These are:- The whole herb is anthelmintic, antiscorbutic, diaphoretic, diuretic, emmenagogue and purgative[4, 9, 21, 54]. It is often used as a poultice and is said to be useful in treating sickness of the stomach, whilst a weak infusion is used as a simple and easy purgative[4]. The plant can be harvested in May and dried for later use, or the fresh juice can be extracted and used as required[4]. Use with caution[21], see notes above on toxicity.

propta Seed - sow spring in situ. Division in spring.

nwatta We have very little information on the cultivation needs of this plant but, judging by its native habitats, it is likely to require a sunny position and to succeed in most moderate to heavy soils, including those of an alkaline nature[K].

### 6.2.698 Helianthemum nummularium

Common Rockrose, Sun Rose, Rock Rose

5 tlin 8 cyuc 0 kcaak 0 tcan 1 dwat 0.5 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Helianthemum nummularium is an evergreen Shrub growing to 0.5 m (1ft 8in) by 1 m (3ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf all year, in flower from June to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta A prostrate growing plant, it can be used as a ground cover[11].

dwatta BachThe plant is used in Bach flower remedies - the keywords for prescribing it are 'Terror', 'Panic' and 'Extreme fright'[209]. It is also one of the five ingredients in the 'Rescue remedy'[209].

propta Seed - sow spring in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 6 - 8cm with a heel, late summer in a sandy soil in a frame[200].

nwatta Landscape Uses:Alpine garden, Border, Ground cover, Rock garden, Specimen. Requires an open sunny position in a light well-drained soil with a pH between 5.5 and 8[200]. Plants are hardy to at least -10°c[200]. A vigorous plant suitable for the rock garden, crevices in walls or gravel beds[200]. Plants are short-lived, though, soon becoming leggy or sparse, and require fairly frequent replacement[200]. The flowers only open in bright sunshine[200]. Plants resent root disturbance and should be placed in their permanent positions as soon as possible[200]. A polymorphic species[11], there are some named forms that have been selected for their ornamental value[200]. Plants are generally pest and disease-free[200]. Plants in this genus are notably resistant to honey fungus[200]. Special Features:Attractive foliage, Not North American native, Attracts butterflies.

### 6.2.699 Lithospermum erythrorhizon

Lithospermum

5 tlin 9 cyuc 0 kcaak 0 tcan 3 dwat 0.7 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Lithospermum erythrorhizon is a PERENNIAL growing to 0.7 m (2ft 4in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to September, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta DyeA purple dye is obtained from the root[46, 61, 218]. It is harvested in the spring[178]. It is much liked but the colour is fugitive and production costs high[174].

dwatta Antitumor Contraceptive Depurative Eczema Febrifuge SalveAll parts of the plant are antitumor, cardiotoxic, contraceptive, depurative and febrifuge[147, 174, 176, 218, 238]. It is used internally in the treatment of irritant skin conditions, measles, chicken pox, boils, carbuncles, hepatitis and skin cancer[238]. Externally it is used to treat nappy rash, burns, cuts, wounds, abscesses, eczema and haemorrhoids[147, 174, 176, 218, 238]. The plant is an ingredient of commercial skin care creams[238]. The plants are harvested when in flower; the roots in the autumn[238]. They are dried for later use[238].

propta Seed - sow spring or autumn in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings. Division in the autumn[238].

nwatta Requires a warm sunny position in a moderately fertile well-drained soil[1, 200]. Prefers a neutral to alkaline soil and also succeeds in partial shade[238]. Plants are hardy to at least -15°c[238]. This species is cultivated in Japan[46] (as a dye plant?).

### 6.2.700 Clematis douglasii

Hairy Clematis

5 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 0.6 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

very prone to damp off, keep them well ventilated[113]. Prick out the seedlings into individual pots when they are large enough to handle. Grow them on in a cold frame for their first winter and plant them out into their permanent positions in late spring or early summer. Give them some protection from winter cold for their first winter or two outdoors[K]. Cuttings of terminal shoots can be tried in a frame in November but they are very difficult[113].

nwatta Thrives on most soils, being very tolerant of chalk, dry sites and of drought when it is established[11, 81, 200]. Prefers a rich loam or a sandy clay in full sun[1]. This species is more tolerant of atmospheric pollution than other members of the genus[11]. Succeeds in warm dry areas with less than 40cm of rain a year, but also in areas with cool summers and up to 200cm of rain[200]. Small trees less than 50cm tall establish much quicker and better than taller trees, those more than 2 metres tall are difficult to establish[200]. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200]. Trees grow fairly rapidly, with height gains of 60cm in a year recorded[185]. This species is cultivated for its timber in some parts of S. Europe[50]. Small male cones are formed on the lower branches of trees, whilst the larger female cones are formed on higher branches[238]. These female cones persist on the tree for 2 - 3 years before breaking up[238]. Trees are notably susceptible to honey fungus[200]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is fleshy. Thick or swollen - fibrous or tap root [2-1].

### 6.2.621 Betula utilis

Indian Paper Birch, Whitebarked Himalayan Birch, Jacquemontii Birch

5 tlin 6 cyuc 0 kcaak 3 tcan 2 dwat 2 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik frip hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta Betula utilis is a deciduous Tree growing to 20 m (65ft 7in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in flower in April, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta None known

tcanta Incense Paper Waterproofing WoodA paper is made from the inner bark[46, 51, 61]. The outer bark can be carefully peeled off the tree (this does not harm the tree) and used as a paper[158]. The outer bark can also be used as a waterproofing and for roofing houses[51, 146, 272]. The bark is sometimes used as an incense[272]. Wood - tough, even grained, moderately hard, elastic. Used for construction[51, 146, 158, 272].

dwatta Antiseborrheic Antiseptic Carminative UrinaryAn infusion of the bark is antiseptic and carminative[240, 243, 272]. It has been used in the treatment of hysteria and jaundice[240, 243, 272]. It is applied as drops to the ears to relieve earache[272]. A paste made from the bark is used as a poultice on cuts, wounds and burns[272]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve Betula species for infections of the urinary tract, kidney and bladder stones, rheumatism (see [302] for critics of commission E).

propta Seed - best sown as soon as it is ripe in a light position in a cold frame[78, 80, 113, 134]. Only just cover the seed and place the pot in a sunny position[78, 80, 134]. Spring sown seed should be surface sown in a sunny position in a cold frame[113, 134]. If the germination is poor, raising the temperature by covering the seed with glass can help[134]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. If you have sufficient seed, it can be

sown in an outdoor seedbed, either as soon as it is ripe or in the early spring - do not cover the spring sown seed. Grow the plants on in the seedbed for 2 years before planting them out into their permanent positions in the winter[78, 80, 113, 134].

nwatta Landscape Uses:Specimen. Succeeds in a well-drained loamy soil in a sheltered position[11, 200]. Grows well in heavy clay soils. Dislikes wet soils[200]. Shade tolerant[200]. Plants are showing good wind-resistance on our Cornish trial ground[K]. Hybridizes freely with other members of this genus[50]. A good plant to grow near the compost heap, aiding the fermentation process[200]. Trees are notably susceptible to honey fungus[200]. Special Features: Not North American native, Inconspicuous flowers or blooms.

### 6.2.622 Cryptomeria japonica

Japanese Cedar, Sugi

5 tlin 8 cyuc 0 kcaak 0 tcan 1 dwat 20 m hkuc htuc cyutli tcup hwicli hrasljutnyik hpa7tli frusflatprikliwis hpa7tmwatli hjonli

drutta Cryptomeria japonica is an evergreen Tree growing to 20 m (65ft) by 8 m (26ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from February to March, and the seeds ripen from October to March. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta None known

tcanta Incense Shelterbelt WoodThe leaves are very aromatic and are used as incense sticks[46, 61, 272]. A fairly wind-tolerant tree, it can be used in shelterbelt plantings[200]. Wood - light, fragrant, fine grained[46, 61]. The wood is strongly rot resistant, easily worked, and is used for buildings, bridges, ships, lamp posts, furniture, utensils, and paper manufacture[1, 46, 61, 266]. The wood can be used as a substitute for Deal[146]. Old wood that has been buried in the soil turns a dark green and is then much esteemed[46, 61].

dwatta Depurative VDAAn oil and/or a resin from the plant is depurative and also used in the treatment of gonorrhoea[218].

propta Seed - sow early spring in a cold frame. The seed germinates better if given a short cold stratification for 2 - 3 weeks at 4°c and is then placed in a warm position[164]. Germination usually takes place within 3 - 9 weeks at 15°c[164]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. An alternative is to plant out the young trees into an outdoor nursery bed when they are about 8cm tall and grow them on for a couple of years before planting them into their permanent positions in late autumn or early spring[164]. Cuttings in the autumn in a sandy soil in a cold frame.

nwatta Landscape Uses:Screen, Specimen, Street tree. Prefers a deep rich moist alluvial soil and a sheltered position in full sun[1, 11, 164]. Tolerates very acid to somewhat alkaline soils, but becomes chlorotic on shallow soils over chalk[200]. Plants are fairly wind-tolerant[200]. A very ornamental tree[1], it has been widely cultivated as a forestry tree for several centuries in Japan and there are many strains each adapted to the various local conditions[11]. Many forms, almost all of them dwarf, have also been selected for their ornamental value[185, 200]. A fast-growing tree on deep, well-drained soils in montane areas with a warm, moist climate, but intolerant of poor soils and cold, drier climates[266]. Occasionally planted for timber in Europe[50], trees do not generally do as well as could be expected in Britain, the best specimens are to be found in the west, especially in the south-west[11]. Trees can grow quite fast in the western part of the country with annual increases of 1 metre or more[185]. New growth takes place from early June to August[185]. Growth decreases rapidly with age, virtually ceasing when the tree reaches 25 metres[185]. This species is no-

tably resistant to honey fungus[200]. Unlike most conifers, this species can be coppiced[81]. Special Features: Attractive foliage, Not North American native, Inconspicuous flowers or blooms.

## 6.2.623 Fraxinus latifolia

Oregon Ash

5 tlin 9 cyuc 0 kcak 0 tcan 1 dwat 20 m hkuc htut cyutli tcup hwicli hrasjlutnykrip hpa7tli flatprikliw hpa7tmwatli nyanhjen hjonli

drutta Fraxinus latifolia is a deciduous Tree growing to 20 m (65ft 7in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in April, and the seeds ripen in October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerate maritime exposure. It can tolerate atmospheric pollution.

kcakta None known

tcanta Shelterbelt WoodA fairly wind resistant tree, it can be grown as part of a shelterbelt planting[200]. Wood - hard, brittle, light, coarse grained. A valuable timber tree, it is largely used for making furniture, the interiors of buildings, cooperage etc, and as a fuel[46, 61, 82, 171].

dwatta Anthelmintic Febrifuge VulneraryThe pulverised fresh roots were used by some native North American Indian tribes to treat serious wounds[213, 257]. A cold infusion of the twigs has been used to treat fevers[257]. The bark is anthelmintic[257].

propta The seed is best harvested green - as soon as it is fully developed but before it has fully dried on the tree - and can then be sown immediately in a cold frame[80]. It usually germinates in the spring[80]. Stored seed requires a period of cold stratification and is best sown as soon as possible in a cold frame[200]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant them out into their permanent positions or a nursery bed in late spring or early summer of the following year. If you have sufficient seed then it is possible to sow it directly into an outdoor seedbed, preferably in the autumn. Grow the seedlings on in the seedbed for 2 years before transplanting either to their permanent positions or to nursery beds.

nwatta Prefers a deep loamy soil, even if it is on the heavy side[1, 200]. Most members of this genus are grass feeders and require a rich soil[11, 200]. Plants succeed when growing in exposed positions[200] and also in alkaline soils[11]. They tolerate atmospheric pollution[200]. A fast growing tree for its first 75 years in the wild, it then grows slowly reaching a maximum age of 250 years[229]. This species is closely related to *F. pennsylvanica*[200]. Dioecious. Male and female plants must be grown if seed is required.

## 6.2.624 Catalpa bignonioides

Indian Bean Tree, Southern catalpa

5 tlin 9 cyuc 0 kcak 0 tcan 2 dwat 15 m hkuc htut cyutli tcup hwicli hrasjlutnykrip hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Catalpa bignonioides is a deciduous Tree growing to 15 m (49ft) by 12 m (39ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to July, and the seeds ripen from October to December. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil. It can tolerate atmospheric pollution.

kcakta None known

tcanta WoodA fast-growing tree with an extensive root system, it has been planted on land that is subject to landslips or erosion in order to stabilize the soil[7]. Wood - coarse and

straight-grained, soft, not strong, moderately high in shock resistance, very durable in the soil. It weighs about 28lb per cubic foot. It is highly valued for posts and fencing rails, and is also used for interior finishes, cabinet work etc[46, 61, 82, 227].

dwatta Antidote Antiseptic Cardiac Laxative Malaria Ophthalmic Sedative VermifugeA tea made from the bark has been used as an antiseptic, antidote to snake bites, laxative, sedative and vermifuge[222]. As well as having a sedative effect, the plant also has a mild narcotic action, though it never causes a dazed condition[7]. It has therefore been used with advantage in preparations with other herbs for the treatment of whooping cough in children, it is also used to treat asthma and spasmodic coughs in children[7, 254]. The bark has been used as a substitute for quinine in treating malaria[254]. The leaves are used as a poultice on wounds and abrasions[222]. A tea made from the seeds is used in the treatment of asthma and bronchitis and is applied externally to wounds[222]. The pods are sedative and are thought to have cardioactive properties[222]. Distilled water made from the pods, mixed with eyebright (*Euphrasia officinalis*) and rue (*Ruta graveolens*) is a valuable eye lotion in the treatment of trachoma and conjunctivitis[7].

propta Seed - best sown outdoors, or in a cold frame, as soon as it is ripe[200]. Stratify stored seed for 3 weeks at 1°C and sow in spring[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Softwood cuttings, 10cm long, in a frame. They should be taken in late spring to early summer before the leaves are fully developed[200]. Root cuttings in winter[200].

nwatta Landscape Uses:Specimen, Street tree. Prefers a good moist loamy soil and a sunny position that is not exposed[1, 11]. Tolerates heavy clay soils[200]. Very resistant to atmospheric pollution[188]. Plants become chlorotic on shallow alkaline soils[202]. Plants are hardy to about -15°C, probably more in continental climates[200], they grow best in areas with hot summers[188]. Protect plants from late frosts when they are young[200]. A very ornamental plant[1], it is fast-growing in the wild where it often flowers when only 6 - 8 years old[229]. The sweetly-scented flowers are borne in forked panicles at the end of branches[245]. There are some named varieties selected for their ornamental value[188, 200, 202]. The trees transplant easily[200]. The crushed foliage has an unpleasant smell[202]. Another report says that the leaves are attractively scented when bruised[245]. Plants in this genus are notably resistant to honey fungus[200]. Special Features:North American native, Naturalizing, All or parts of this plant are poisonous, Blooms are very showy.

## 6.2.625 Hedera helix

Ivy, English ivy, Algerian ivy, Baltic Ivy, Common Ivy

5 tlin 11 cyuc 0 kcak 4 tcan 3 dwat 15 m hkuc pcmhmmhtut cyutli hgattcuphja7n hwicli hyishrasjlutnykrip hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Hedera helix is an evergreen Climber growing to 15 m (49ft) by 5 m (16ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in leaf all year, in flower from October to November, and the seeds ripen from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist or wet soil and can tolerate drought. It can tolerate atmospheric pollution.

kcakta Although they are almost certainly not edible, there is a report that the seeds contain 16.2% protein and 35.1% fat[218].

tcanta Dye Hair Hedge Hedge Parasiticide Pollution Soap WoodA yellow and a brown dye are obtained from the twigs[46, 61]. A decoction of the leaves is used to restore black fabrics[7, 46, 53] and also as a hair rinse to darken

propta Seed - sow May/June in a cold frame. The seed usually germinates in 2 - 3 weeks. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer or autumn[1]. The seed can also be sown thinly in an outdoor seedbed in late spring, the young plants being planted out in late spring or the autumn[1]. Cuttings of half-ripe shoots, July in a frame[1]. Division in September[1]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Landscape Uses:Border, Container, Ground cover, Massing, Rock garden. Prefers a rich well-drained loamy neutral to alkaline soil in a sunny position[1, 238], but succeeds in most soils including dry ones[1]. A very ornamental plant[1], it is usually biennial in habit, but can be a short-lived perennial. There are many cultivars that are widely grown in gardens. Since these flower freely in their first year and then degenerate, they are usually treated as annuals[200]. A very variable species in the wild, it has often been subdivided into up to eight different varieties[266]. Special Features:Attractive foliage, Naturalizing, Suitable for cut flowers, Fragrant flowers, Attractive flowers or blooms.

## 6.2.694 Magnolia macrophylla

Bigleaf Magnolia

5 tlin 8 cyuc 0 kcak 0 tcan 1 dwat m hkuc hmimhtut cyutli tcup hwicli hrasjlutnykrip hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Magnolia macrophylla is a deciduous Tree growing to 10 m (32ft) by 10 m (32ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in June. The species is hermaphrodite (has both male and female organs) and is pollinated by Beetles. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant is not wind tolerant. It can tolerate atmospheric pollution.

kcakta None known

tcanta WoodWood - soft, light, not strong, close-grained. Used for flooring, cabinet making etc[61]. The wood is hard but weak according to another reports, which say that it is not used commercially[82, 229]. The wood weighs 33lb per cubic foot[235].

dwatta Odontalgic StomachicAn infusion of the bark has been used in the treatment of stomach aches or cramps[257]. A hot infusion of the bark has been snuffed for treating sinus problems and has been held in the mouth for treating toothache[257].

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed must be kept cold over the winter and should be sown in late winter in a cold frame[200]. The seed usually germinates in the spring but it can take 18 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in a cold frame or greenhouse for at least their first winter. They can be planted out into their permanent positions when they are more than 15cm tall, though should be well mulched and given some protection from winter cold for their first winter or two outdoors. Layering in early spring[200].

nwatta Landscape Uses:Firewood, Pest tolerant, Specimen. Best grown in a warm position in a moderately rich free soil of an open texture[1]. Dislikes limey soils[11]. Prefers a neutral to acid soil but tolerates alkaline soils so long as they are deep and rich in humus[188]. The branches are brittle and the leaves very large, so a sheltered position is required[200, 229]. Very tolerant of atmospheric pollution[200]. Dormant mature plants are hardy to about -20°C[200] but the plants are apt to be damaged by late frosts when they are young[1]. Trees are slow-growing in the wild[229] and do not commence flowering until they are mature[245]. The leaves are very large and can be up to 80cm long by 25cm wide[229]. The flowers are sweetly scented[229, 245]. The fleshy roots are easily damaged and any transplanting is best done during a spell of mild moist weather in late spring[182]. Special Features: Attractive foliage, North American native, Fragrant flowers, Blooms are very showy.

## 6.2.695 Helleborus viridis

Green Hellebore

5 tlin 9 cyuc 0 kcak 0 tcan 2 dwat 0.3 m hkuc hmim cyutli tcup hwicli hrasjlutnykrip hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Helleborus viridis is a PERENNIAL growing to 0.3 m (1ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from February to April, and the seeds ripen from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta None known

tcanta ParasiticideA decoction of the roots is used as a parasiticide against body lice, fleas etc[76, 213]. This use is somewhat dangerous, see the notes above on toxicity. Plants are suitable for ground cover when spaced about 45cm apart each way[208].

dwatta Anthelmintic Antiemetic Cardiac Cathartic Diuretic Emetic Emmenagogue Hypotensive Irritant Narcotic Parasiticide PurgativeThe root is anthelmintic, cardiac, cathartic, diuretic, emetic, emmenagogue, irritant, violently narcotic and a drastic purgative[4, 9, 21, 46]. The dried root is used, it contains the alkaloids nervine, pseudo-nervine and veratridine[213]. It is best to harvest the root in the autumn[213]. The plant is useful for reducing blood pressure in various conditions of hypertension[213].

propta Seed - best sown as soon as it is ripe in a cold frame[1, 134]. Sow stored seed as early in the year as possible[1], it usually germinates in the autumn to spring. Seed can take 18 months to germinate. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a lightly shaded position in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. This species produces flowering plants in 2 - 3 years from seed[200]. Division after flowering or in autumn. Take care since the plant resents disturbance[111, 200].

nwatta Cultivation of this plant is not always easy, it prefers a rich limy soil in partial shade[187]. One report says that the plant requires an alkaline soil[17]. Succeeds in any good garden soil[1], preferring a moist well-drained rich loam in a sheltered position in partial shade[1, 4, 31, 111]. Succeeds when grown in the shade of a north-facing wall[233]. Does not object to lime[1]. Grows well in heavy clay soils[200]. Dislikes drought. Slugs are very fond of this plant and it will probably require some protection from them[187]. The various species in this genus hybridize freely[95]. Plants resent root disturbance and should be placed in their permanent positions whilst still small[200]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

## 6.2.696 Asplenium ruta

Wall Rue, Lance asplenium

5 tlin 9 cyuc 0 kcak 0 tcan 2 dwat 0.1 m hkuc hmim cyutli tcup hwicli hrasjlut hpa7tli lwisslip hpa7tmwatli hjonli

drutta Asplenium ruta-muraria is an evergreen Fern growing to 0.1 m (0ft 4in) by 0.2 m (0ft 8in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, and the seeds ripen from July to October. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta None known

tcanta None known

dwatta Astringent Deobstruent Emmenagogue Expecto-rant OphthalmicThe fronds are astringent, deobstruent, emmenagogue, expectorant and ophthalmic[4, 7, 240]. A distilled water made from the fronds has proved of benefit in the treatment of many eye complaints[7]. The plant is also

that have not flowered are the richest in medicinal properties[4].

propta Seed - best sown as soon as it is ripe in a light position in a cold frame[200]. It can also be sown in late winter or early spring but the seed germinates best if given a period of cold stratification and quickly loses viability when stored, with older seed germinating slowly and erratically[200, 239]. It is advantageous to keep the seed at about 10°c for a few days after sowing, to enable the seed to imbibe moisture[239]. Following this with a period of at least 5 - 6 weeks with temperatures falling to between 0 and -5°c will usually produce reasonable germination[239]. It is best to use clay pots, since plastic ones do not drain so freely and the moister conditions encourage the growth of moss, which will prevent germination of the seed[239]. The seed should be surface-sown, or only covered with a very light dressing of compost. The seed requires dark for germination, so the pots should be covered with something like newspaper or be kept in the dark[239]. Pot up the seedlings into individual pots as soon as they are large enough to handle and grow on in light shade in the greenhouse for at least their first winter. The seedlings grow on very slowly, taking 2 - 7 years to reach flowering size[239]. When the plants are of sufficient size, place them out into their permanent positions in late spring or early summer. Division in March[111]. Most members of this genus have either a single tap-root, or a compact root system united in a single root head, and are thus unsuitable for division[239]. Cuttings of basal shoots in late spring[238].

nwatta In general, gentians require a moist well-drained soil in a sheltered position, a certain minimum of atmospheric humidity, high light intensity but a site where temperatures are not too high[239]. They are therefore more difficult to grow in areas with hot summers and in such a region they appreciate some protection from the strongest sunlight[200, 239]. Most species will grow well in the rock garden[200]. This species requires a fairly dry site with good drainage[239]. Plants are intolerant of root disturbance[200]. A moisture loving plant, preferring to grow with full exposure to the sun but with plenty of underground moisture in the summer, it grows better in the north and west of Britain[1]. This species is closely related to *G. affinis*[239].

### 6.2.691 *Ajuga australis*

Australian Bugle

5 tin 9 cyuc 0 kcak 3 tcan 1 dwat 0.2 m hkuc htuc cyutli kyuctcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Ajuga australis* is an evergreen Perennial growing to 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta None known

tcakta Plants can be used for ground cover[200].

dwatta *Salve*The leaves are used as a salve for wounds[238] and also in the treatment of boils and sores[152, 238].

propta Seed - sow spring or autumn in the open border[1]. Division in spring.

nwatta Prefers a humus-rich, moisture retentive soil and a sunny position[200]. Easily grown in the rock garden[1], it spreads rapidly by root suckers[157].

### 6.2.692 *Jeffersonia diphylla*

Twinleaf, Rheumatism Root

5 tin 8 cyuc 0 kcak 0 tcan 2 dwat 0.2 m hkuc pcmihmmi cyutli tcup hwicli hrasljut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Jeffersonia diphylla* is a PERENNIAL growing to 0.2 m (0ft 8in) by 0.2 m (0ft 8in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in May. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full

shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta None known

tcanta None known

dwatta Antispasmodic Cancer Diuretic Emetic Expecto-rant Poulrice Tonic UrinaryThe whole plant is antispasmodic, diuretic, emetic, expectorant and tonic[21, 46, 218, 222]. An infusion is used in the treatment of diarrhoea, dropsy, gravel and urinary problems[257]. The root is emetic in large doses and expectorant in smaller doses[207]. The root contains berberine, which has been shown to have anti-tumour activity[218]. A poultice of the plant is applied to sores, ulcers and inflamed parts[257].

propta Seed - best sown as soon as it is ripe in a cold frame[200]. Sow stored seed as soon as possible in late winter or the spring. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in early spring[200].

nwatta Landscape Uses:Rock garden, Woodland garden. Prefers a light sandy, peaty or humus-rich woodland soil and a rather shady situation[1, 130, 280]. Suitable for a choice position in a cool leafy soil[187]. Plants are hardy to at least -20°c[187]. A slow-growing plant[188]. Plants have an extensive root system and resent disturbance[188]. They should be pot-grown and planted into their permanent positions as soon as possible. Special Features:North American native, Attractive flowers or blooms. The plant is heat tolerant in zones 7 through 5. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is fibrous dividing into a large number of fine roots [1-2].

### 6.2.693 *Dianthus chinensis*

drutta *Dianthus chinensis* is a PERENNIAL growing to 0.7 m (2ft 4in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

dwatta Anthelmintic Antibacterial Antiphlogistic Diaphoretic Diuretic Emmenagogue Febrifuge Haemostatic Ophthalmic Tonic UrinaryThe Chinese pink has been used for over 2,000 years in Chinese herbal medicine[238]. The whole plant is a bitter tonic herb that stimulates the digestive and urinary systems and also the bowels[238]. It is also anthelmintic, antibacterial, antiphlogistic, diaphoretic, diuretic, emmenagogue, febrifuge and haemostatic[218, 238, 279]. It is used internally in the treatment of acute urinary tract infections (especially cystitis), urinary stones, constipation and failure to menstruate[238]. It is used externally to treat skin inflammations and swellings[238]. The old leaves are crushed and used for clearing the eyesight[218]. The plants are harvested just before the flowers open and are dried for later use[238].

the hair[7, 53]. If the leaves are boiled with soda they are a soap substitute for washing clothes etc[61]. An excellent ground cover for shady places, succeeding even in the dense shade of trees[197, 208]. A very effective weed suppresser[190]. The cultivars 'Hibernica', 'Lutzi' and 'Neilsonii' have been especially mentioned[190]. Plants can be grown along fences to form a hedge. The variety 'Digitata' is very useful for this[200]. Plants have been grown indoors in pots in order to help remove toxins from the atmosphere. It is especially good at removing chemical vapours, especially formaldehyde[259]. The plants will probably benefit from being placed outdoors during the summer[259]. The wood is very hard and can be used as a substitute for *Buxus sempervirens* (Box), used in engraving etc[46, 61]. Another report says that the wood is very soft and porous and is seldom used except as a strop for sharpening knives[4].

dwatta Antibacterial Antirheumatic Antiseptic Antispasmodic Astringent Cathartic Diaphoretic Emetic Emmenagogue Parasitice Skin Stimulant Vasoconstrictor Vasodilator VermifugeIvy is a bitter aromatic herb with a nauseating taste[238]. It is often used in folk herbal remedies[218], especially in the treatment of rheumatism and as an external application to skin eruptions, swollen tissue, painful joints, burns and suppurating cuts[9, 238]. Recent research has shown that the leaves contain the compound 'emetine', which is an amoebicidal alkaloid, and also triterpene saponins, which are effective against liver flukes, molluscs, internal parasites and fungal infections[238]. The leaves are antibacterial, antirheumatic, antiseptic, antispasmodic, astringent, cathartic, diaphoretic, emetic, emmenagogue, stimulant, sudorific, vasoconstrictor, vasodilator and vermifuge[7, 218, 238]. The plant is used internally in the treatment of gout, rheumatic pain, whooping cough, bronchitis and as a parasiticide[238]. Some caution is advised if it is being used internally since the plant is mildly toxic[7]. Excessive doses destroy red blood cells and cause irritability, diarrhoea and vomiting[238]. This plant should only be used under the supervision of a qualified practitioner[238]. An infusion of the twigs in oil is recommended for the treatment of sunburn[4]. The leaves are harvested in spring and early summer, they are used fresh and can also be dried[9]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve *Hedera helix* for cough, bronchitis (see [302] for critics of commission E).

propta Seed - remove the flesh, which inhibits germination, and sow the seed in spring in a cold frame[113]. Four weeks cold stratification will improve germination[113]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the cold frame for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a shady position in a frame. Good percentage[78]. Cuttings of mature wood, 12cm long, November in a cold frame[78]. Layering. Plants often do this naturally.
