nwatta A very easily grown plant, it prefers a moist soil and a position in full sun or partial shade[52, 238]. It can be very lush and vigorous when grown in a fertile soil[1], but in infertile soils it will flower and set seed whilst still very small. A very common garden weed, chickweed grows, flowers and sets seed all year round. The flowers open around 9 o'clock in the morning and remain open for about 12 hours[4]. They do not open in dull weather[4]. The leaves fold up of a night time, enfolding and protecting the tender buds of new shoots[4]. A food plant for the caterpillars of many butterfly species. Special Features: Edible, Not North American native, Invasive, Naturalizing, Suitable for cut flowers, Suitable for dried flowers, Extended bloom season in Zones 9A and above. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. A self-seeding annual [1-2]. A clumping mat former. Forming a dense prostrate carpet spreading indefinitely [1-2]. The root pattern is fibrous dividing into a large number of fine roots [1-2].

## 5.2.432 Dactylorhiza maculata

Spotted Orchid

4 tlin 8 cyuc 2 kcaok 0 tcan 2 dwat m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta Dactylorhiza maculata is a BULB growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, beetles. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

ckakta Edible Parts: RootEdible Uses: Root - cooked[2, 4, 46]. It is a source of 'salep', a fine white to yellowish-white powder that is obtained by drying the tuber and grinding it into a powder[2, 105, 177]. Salep is a starch-like substance with a sweetish taste and a faint somewhat unpleasant smell[4]. It is said to be very nutritious and is made into a

drink or can be added to cereals and used in making bread etc[100, 183]. One ounce of salep is said to be enough to sustain a person for a day[100, 115].

tcanta None known

dwatta Demulcent NutritiveSalep (see above for more details) is very nutritive and demulcent[4]. It has been used as a diet of special value for children and convalescents, being boiled with water, flavoured and prepared in the same way as arrowroot[4]. Rich in mucilage, it forms a soothing and demulcent jelly that is used in the treatment of irritations of the gastro-intestinal canal[4]. One part of salep to fifty parts of water is sufficient to make a jelly[4]. The tuber, from which salep is prepared, should be harvested as the plant dies down after flowering and setting seed[4].

propta Seed - surface sow, preferably as soon as it is ripe, in the greenhouse and do not allow the compost to dry out. The seed of this species is extremely simple, it has a minute embryo surrounded by a single layer of protective cells. It contains very little food reserves and depends upon a symbiotic relationship with a species of soil-dwelling fungus. The fungal hyphae invade the seed and enter the cells of the embryo. The orchid soon begins to digest the fungal tissue and this acts as a food supply for the plant until it is able to obtain nutrients from decaying material in the soil[200]. It is best to use some of the soil that is growing around established plants in order to introduce the fungus, or to sow the seed around a plant of the same species and allow the seedlings to grow on until they are large enough to move. Division of the tubers as the flowers fade[230]. This species produces a new tuber towards the end of its growing season. If this is removed from the plant as its flowers are fading, the shock to the plant can stimulate new tubers to be formed. The tuber should be treated as being dormant, whilst the remaining plant should be encouraged to continue in growth in order to give it time to produce new tubers[230]. Division can also be carried out when the plant has a fully developed rosette of leaves but before it comes into flower[230]. The entire new growth is removed from the old tuber from which it has arisen and is potted up, the cut being made towards the bottom of the stem but leaving one or two roots still attached to the old tuber. This can often be done without digging up the plant. The old tuber should develop one or two new growths, whilst the new rosette should continue in growth and flower normally[230].

nwatta Succeeds in most soils, but it prefers a moist loam and lots of leaf mould[42]. Requires a deep rich soil[1]. Grows well in full sun or partial shade[42], doing well in a woodland garden[230]. Orchids are, in general, shallow-rooting plants of well-drained low-fertility soils. Their symbiotic relationship with a fungus in the soil allows them to obtain sufficient nutrients and be able to compete successfully with other plants. They are very sensitive to the addition of fertilizers or fungicides since these can harm the symbiotic fungus and thus kill the orchid[230]. This symbiotic relationship makes them very difficult to cultivate, though they will sometimes appear uninvited in a garden and will then thrive. Transplanting can damage the relationship and plants might also thrive for a few years and then disappear, suggesting that they might be short-lived perennials[230]. Cultivated plants are very susceptible to the predation of slugs and snails[230]. Plants can succeed in a lawn in various parts of the country. The lawn should not be mown early in the year before or immediately after flowering[200]. Plant out bulbs whilst the plant is dormant, preferably in the autumn[200]. Bulbs can also be transplanted with a large ball of soil around the roots when they are in leaf, they are impatient of root disturbance[1].

### 5.2.433 *Aralia mandschurica*

Manchurian Angelica Tree

4 tin 8 cyuc 2 kcaak 0 tcan 2 dwat m hkuc hmimhtut cyutli tcup hwicli hyishrasjlutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Aralia mandschurica* is a deciduous Shrub growing to 3.5 m (11ft 6in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid,

neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: LeavesEdible Uses: Young shoots - cooked. They can also be blanched and used in salads.

tcanta None known

dwatta Anodyne Carminative TonicAnodyne, carminative. The root, and especially the bark, stimulates the central nervous system[218]. The plant is said to restore the appetite, memory, vigour etc[218].

propta Seed - best sown as soon as ripe in a cold frame. Stored seed requires 3 - 5 months of cold stratification. Germination usually takes place within 1 - 4 months at 20°C[134]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in a greenhouse for at least their first winter. Once the plants are 25cm or more tall, they can be planted out into their permanent positions, late spring or early summer being the best time to do this. Root cuttings 8cm long, December in a cold frame[11, 78]. Store the roots upside down in sand and pot up in March/April. High percentage[78]. Division of suckers in late winter[11]. Very easy, the suckers can be planted out direct into their permanent positions if required.

nwatta Prefers a good deep loam and a position in semi-shade. Requires a sheltered position. Plants are hardier when grown on poorer soils. The young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. This plant is very closely related to *A. elata* and is included in that species by many botanists[58].

### 5.2.434 *Crataegus rivularis*

River Hawthorn

4 tin 8 cyuc 2 kcaak 0 tcan 2 dwat 4 m hkuc hmimhtut cyutli hgattcuphja7n hwicli hrasjlutnyikfrp hpa7tli flatprikliwslip hpa7tmwatli xre7t hjonli

drutta *Crataegus rivularis* is a deciduous Tree growing to 4 m (13ft 1in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in May, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Midges. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in highly clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcaakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[212]. The flesh is thin, dry and mealy[227]. The fruit can also be dried for later use or for making into pemmican[212]. The fruit is high in sugar but low in fats and protein[212]. The fruit is about 10mm in diameter[200]. There are up to five fairly large seeds in the centre of the fruit, these often stick together and so the effect is of eating a cherry-like fruit with a single seed[K].

tcanta Wood - heavy, hard, tough, close-grained. Useful for making tool handles, mallets and other small items[82].

dwatta Cardiotonic HypotensiveAlthough no specific mention has been seen for this species, the fruits and flowers of many hawthorns are well-known in herbal folk medicine as a heart tonic and modern research has borne out this use. The fruits and flowers have a hypotensive effect as well as acting as a direct and mild heart tonic[222]. They are especially indicated in the treatment of weak heart combined with high blood pressure[222]. Prolonged use is necessary for it to be efficacious[222]. It is normally used either as a tea or a tincture[222].

propta Seed - this is best sown as soon as it is ripe in the autumn in a cold frame, some of the seed will germinate in the spring, though most will probably take another year. Stored seed can be very slow and erratic to germinate, it should be warm stratified for 3 months at 15°C and then cold stratified for another 3 months at 4°C[164]. It may still take another 18 months to germinate[78]. Scarifying the seed before stratifying it might reduce this time[80]. Fermenting the seed for a few days in its own pulp may also speed up the germination process[K]. Another possibility is to harvest the seed 'green' (as soon as the embryo has fully developed but before the seedcoat hardens) and sow it immediately in a

soils. It cannot grow in the shade. It prefers moist or wet soil.

kcaakta Edible Parts: RootEdible Uses: DrinkRoot - cooked[2, 4, 46]. It is a source of 'salep', a fine white to yellowish-white powder that is obtained by drying the tuber and grinding it into a powder[2, 105, 177]. Salep is a starch-like substance with a sweetish taste and a faint somewhat unpleasant smell[4]. It is said to be very nutritious and is made into a drink or can be added to cereals and used in making bread etc[100, 183]. One ounce of salep is said to be enough to sustain a person for a day[100, 115].

tcanta None known

dwatta Antiflatulent Demulcent NutritiveSalep (see above for more details) is very nutritive and demulcent[4]. It has been used as a diet of special value for children and convalescents, being boiled with water, flavoured and prepared in the same way as arrowroot[4]. Rich in mucilage, it forms a soothing and demulcent jelly that is used in the treatment of irritations of the gastro-intestinal canal[4]. One part of salep to fifty parts of water is sufficient to make a jelly[4]. The tuber, from which salep is prepared, should be harvested as the plant dies down after flowering and setting seed[4].

propta Seed - surface sow, preferably as soon as it is ripe, in the greenhouse and do not allow the compost to dry out. The seed of this species is extremely simple, it has a minute embryo surrounded by a single layer of protective cells. It contains very little food reserves and depends upon a symbiotic relationship with a species of soil-dwelling fungus. The fungal hyphae invade the seed and enter the cells of the embryo. The orchid soon begins to digest the fungal tissue and this acts as a food supply for the plant until it is able to obtain nutrients from decaying material in the soil[200]. It is best to use some of the soil that is growing around established plants in order to introduce the fungus, or to sow the seed around a plant of the same species and allow the seedlings to grow on until they are large enough to move. Division of the tubers as the flowers fade[230]. This species produces a new tuber towards the end of its growing season. If this is removed from the plant as its flowers are fading, the shock to the plant can stimulate new tubers to be formed. The tuber should be treated as being dormant, whilst the remaining plant should be encouraged to continue in growth in order to give it time to produce new tubers[230]. Division can also be carried out when the plant has a fully developed rosette of leaves but before it comes into flower[230]. The entire new growth is removed from the old tuber from which it has arisen and is potted up, the cut being made towards the bottom of the stem but leaving one or two roots still attached to the old tuber. This can often be done without digging up the plant. The old tuber should develop one or two new growths, whilst the new rosette should continue in growth and flower normally[230].

nwatta Prefers a sunny position and a good limey loam soil[42]. Requires a deep rich soil[1]. Orchids are, in general, shallow-rooting plants of well-drained low-fertility soils. Their symbiotic relationship with a fungus in the soil allows them to obtain sufficient nutrients and be able to compete successfully with other plants. They are very sensitive to the addition of fertilizers or fungicides since these can harm the symbiotic fungus and thus kill the orchid[230]. This symbiotic relationship makes them very difficult to cultivate, though they will sometimes appear uninvited in a garden and will then thrive. Transplanting can damage the relationship and plants might also thrive for a few years and then disappear, suggesting that they might be short-lived perennials[230]. Plants can succeed in a lawn in various parts of the country. The lawn should not be mown early in the year before or immediately after flowering[200]. Plant out bulbs whilst the plant is dormant, preferably in the autumn[200]. Bulbs can also be transplanted with a large ball of soil around the roots when they are in leaf, they are impatient of root disturbance[1]. Plants seem to be immune to the predations of rabbits[233]. The flowers diffuse a powerful almond-like scent[245]. Cultivated plants are very susceptible to the predation of slugs and snails[230].

### 5.2.547 *Oenothera albicaulis*

Whitest Evening Primrose

4 tin 8 cyuc 2 kcaak 0 tcan 1 dwat 0.3 m hkuc

htut cyutli kyuctcup hwicli hyishrasjlut hpa7tli flatprikliw hpa7tmwatli fyifkre7t hjonli

drutta *Oenothera albicaulis* is a ANNUAL/BIENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in June. The species is hermaphrodite (has both male and female organs) and is pollinated by Lepidoptera (Moths and Butterflies), bees. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcaakta Edible Parts: Leaves Root Seed SeedpodEdible Uses: Fruit[105, 161]. Another report says that the plant has an edible seedpod[213]. The reports for edible fruit probably mean the seedpod[K]. Seed - cooked[257]. It can be used in soups or can be ground into a powder and then used as a gravy[257]. Root - cooked. Too small to be a staple food, but useful in an emergency, the roots taste best in late autumn, winter and early spring[213]. Leaves and young shoots - cooked[213].

tcanta None known

dwatta AntiphlogisticA poultice of the plant has been used to treat swellings[257]. A decoction of the root has been drunk and used as a lotion on muscle strains[257].

propta Seed - sow in situ from late spring to early summer or in the autumn[200].

nwatta Prefers a dryish well-drained sandy loam and full sun[1, 200]. Heavy clay soils may induce winter rots[200]. Succeeds in poor soils[200]. The flowers open in the evening, they are richly scented and are very attractive to moths.

### 5.2.548 *Prunella grandiflora*

4 tin 8 cyuc 2 kcaak 0 tcan 0 dwat 0.2 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwslip hpa7tmwatli xre7t hjonli

drutta *Prunella grandiflora* is an evergreen Perennial growing to 0.2 m (0ft 8in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in leaf all year, in flower from July to September, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked[46, 61, 105]. A mild flavour[K].

tcanta Can be used as a ground cover plant in a sunny position or light shade[188, 197]. It requires weeding for the first year or so[197]. They are best spaced about 45cm apart each way[208]. Plants have not been a reliable ground cover in Cornwall, often dying after flowering, though they usually self-sow[K].

dwatta None known

propta Seed - sow in mid spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. If you have sufficient seed then it can be sown outdoors in situ in mid to late spring. Division in spring or autumn. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Thrives in any damp soil in a shady position[1, 111] or in full sun[200]. Plants are hardy to about -25°C[187]. The sub-species *P. grandiflora pyrenaica* has larger flowers and is found wild on acid soils whilst the type species is usually found on alkaline soils[187]. Plants tend to be short-lived, often dying out after flowering heavily in the summer[208]. Fortunately, they will usually self-sow freely[K]. Most plants are hermaphrodite but sometimes male plants are found.

## 5.2.543 *Arabis caucasica*

Rock Cross, Wall Rockcross

4 tlin 9 cyuc 2 kcaak 3 tcan 0 dwat 0.2 m hkuc hmimhtut cyutli hgatkuyctcup hwicli hyishrasjlutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Arabis caucasica* is an evergreen Perennial growing to 0.2 m (0ft 8in) by 1 m (3ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in leaf all year, in flower from January to May, and the seeds ripen from April to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: LeavesEdible Uses: The leaves are used as a garnish in much the same way as watercress[183]. They are also sometimes used as a potherb[183].

tcanta A good ground cover plant for sunny positions[188, 197], forming a carpet[208].

dwatta None known

propta Seed - it is best to surface sow the seed as soon as it is ripe in a light position in a cold frame[134]. Seed can also be sown in spring. It usually germinates in 2 - 3 weeks at 21°c[134]. When large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division after flowering[111]. Very easy, the divisions can be planted out straight into their permanent positions if required. Cuttings in a shady border in summer[1].

nwatta Landscape Uses:Alpine garden, Border, Ground cover, Rock garden. Easily grown in ordinary well-drained soil[1]. Prefers a poor soil[187]. Succeeds in partial shade[134] though it tends to become straggly[197]. Established plants are very tolerant of drought and grow very well on a dry bank[190], they also succeed when grown in walls[219, K]. A very ornamental plant[1], it is hardy to about -15°c[187], but can be rather invasive[200]. There are some named varieties selected for their ornamental value[187]. A good butterfly and moth plant[30]. Bees are attracted to the flowers. Plants resent root disturbance and are best put in their final positions whilst still small[134]. This species is closely related to *A. alpina*[200]. Special Features: Attractive foliage. The plant is heat tolerant in zones 8 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2].

## 5.2.544 *Arisaema utile*

4 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat 0.5 m hkuc pcmhmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprikliw hpa7tmwatli nyanhjen hjonli

drutta *Arisaema utile* is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from May to June. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Flies. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves and flowering spathes - cooked as a potherb[272].

tcanta None known

dwatta None known

propta Seed - best sown as soon as it is ripe in a shady position in a cold frame[134]. Stored seed remains viable for at least a year and can be sown in spring in the greenhouse but it will probably require a period of cold stratification. Germination usually takes place in 1 - 6 months at 15°c[134]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least a couple of years until the corms are more than 20mm in diameter. Plant out into their permanent positions whilst they are dormant. Division of tubers when the plant dies down in late summer.

nwatta Prefers a cool peaty soil in the bog garden, woodland garden or a sheltered border in semi-shade[90, 134, 200]. Prefers a loamy or peaty soil and will tolerate a sunny position if the soil is moist but not water-logged and the position is not too hot or exposed[1, 200]. Tubers should be planted about 10cm deep[233]. Only plant out full sized tubers and mulch them with organic matter in the winter[200]. Plants need protection from slugs[200]. Closely related to *A. griffithii*[272]. Most species in this genus are dioecious, but they are sometimes monoecious and can also change sex from year to year.

## 5.2.545 *Potentilla recta*

Rough-Fruited Cinquefoil, Erect cinquefoil

4 tlin 8 cyuc 2 kcaak 0 tcan 1 dwat 0.6 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli fyifxre7t hjonli

drutta *Potentilla recta* is a PERENNIAL growing to 0.6 m (2ft) by 0.6 m (2ft in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[207]. The unripe fruit is almost as pleasant as the fully ripe fruit[207].

tcanta None known

dwatta AstringentThe whole plant is astringent[257]. A poultice of the pounded leaves and stems has been applied to open sores and wounds[257].

propta Seed - sow early spring or autumn in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring. Larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Easily grown in a well-drained loam, preferring a position in full sun but tolerating shade[1]. Prefers an acid soil[200]. Plants produce more foliage but flower less freely when grown in a rich soil[200]. Hardy to about -25°c[200]. There is at least one named variety selected for its ornamental value[200]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 5.2.546 *Orchis ustulata*

Dark-Winged Orchis

4 tlin 8 cyuc 2 kcaak 0 tcan 2 dwat 0.2 m hkuc htut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Orchis ustulata* is a BULB growing to 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline

cold frame. If timed well, it can germinate in the spring[80]. If you are only growing small quantities of plants, it is best to pot up the seedlings as soon as they are large enough to handle and grow them on in individual pots for their first year, planting them out in late spring into nursery beds or their final positions. When growing larger quantities, it might be best to sow them directly outdoors in a seedbed, but with protection from mice and other seed-eating creatures. Grow them on in the seedbed until large enough to plant out, but undercut the roots if they are to be left undisturbed for more than two years.

nwatta A very easily grown plant, it prefers a well-drained moisture retentive loamy soil but is not at all fussy[11, 200]. Once established, it succeeds in excessively moist soils and also tolerates drought[200]. It grows well on a chalk soil and also in heavy clay soils[200]. A position in full sun is best when plants are being grown for their fruit, they also succeed in semi-shade though fruit yields and quality will be lower in such a position[11, 200]. Most members of this genus succeed in exposed positions, they also tolerate atmospheric pollution[200]. Hybridizes freely with other members of this genus[200]. There is some doubt over the correct name for this species. [200] suggests that it is a synonym for *C. douglasii* but also records it as a distinct species[K]. Seedling trees take from 5 - 8 years before they start bearing fruit, though grafted trees will often flower heavily in their third year[K]. The flowers have a foetid smell somewhat like decaying fish. This attracts midges which are the main means of fertilization. When freshly open, the flowers have more pleasant scent with balsamic undertones[245]. Seedlings should not be left in a seedbed for more than 2 years without being transplanted[11].

## 5.2.435 *Aronia arbutifolia*

Red Chokeberry

4 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Aronia arbutifolia* is a deciduous Shrub growing to 3 m (9ft) by 3 m (9ft). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower in May, and the seeds ripen from October to December. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105]. It can also be dried and used for making pemmican[161, 183]. Fruit quality is rather variable, some forms are rather pleasant when fully ripe, especially if they have experienced some frost[2]. The fruit is about 7mm in diameter[200], it can hang on the plant for several months[235].

tcanta None known

dwatta None known

propta Seed - best sown as soon as it is ripe in pots outdoors or in a cold frame[113]. Pre-soaked seed overnight and then cold stratify for 3 months at 2°c[113]. The seed germinates in 1 - 3 months at 15°c[134]. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for their first winter. Plant out in late spring. Cuttings of half-ripe wood, July/August in a frame[113]. Division of suckers in the dormant season[200]. Very easy, they can be planted straight out into their permanent positions. Layering[200].

nwatta Landscape Uses:Border, Erosion control, Foundation, Pest tolerant, Massing, Seashore, Specimen, Woodland garden. Prefers a moist peaty soil in full sun or partial shade[134]. Succeeds in most soils[1] but dislikes shallow chalk[200]. Tolerates atmospheric pollution[227]. Plants are hardy to about -25°c[184]. This genus is closely related to *Sorbus* species[200]. A suckering plant, it forms thickets in the wild[182]. Some named forms have been developed for their ornamental value[182]. Plants in this genus are notably resistant to honey fungus[200]. Special Features: Attracts birds, North American native, Wetlands plant, Attracts butterflies. The plant is heat tolerant in zones 8 through 4. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants

would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is multi-stemmed with multiple stems from the crown [1-2]. The root pattern is flat with shallow roots forming a plate near the soil surface [1-2]. The root pattern is suckering with new plants from underground runners away from the plant [1-2].

## 5.2.436 *Cornus sanguinea*

Dogwood, Bloodtwig dogwood

4 tlin 8 cyuc 2 kcaak 0 tcan 1 dwat 3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikrip hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Cornus sanguinea* is a deciduous Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to July, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Fruit Oil OilEdible Uses: Oil OilFruit - raw or cooked[105]. A bitter flavour, it can also have an emetic effect on the body[1, 7, 11]. It is not worthwhile[115]. The fruit is about 8mm in diameter[200]. An oil is obtained from the seed[2], it is edible when refined[75].

tcanta Basketry Charcoal Dye Fuel Hedge Hedge Oil Oil WoodThe seed contains 45% of a non-drying oil[74], it is used in soap making and lighting[7, 13, 100, 115, 177]. A non-drying oil is also obtained from the pericarp, it is used for lighting[74]. The pericarp contains 19 - 35% oil[74]. A greenish-blue dye is obtained from the fruit[13, 74]. The young stems are very flexible and are used in basketry[7, 13, 74, 100]. Wood - tough, hard. Used for small items such as tool handles, turnery etc[11, 61, 115]. A good quality charcoal is obtained from the wood[115], the wood also makes an excellent fuel[115].

dwatta Astringent Emetic FebrifugeThe bark is astringent and febrifuge[7]. It is used to treat fevers[254]. The leaves are sometimes used externally as an astringent[7]. The fruit is emetic[7].

propta Seed - best sown as soon as it is ripe in a cold frame or in an outdoors seedbed if there is sufficient seed[80, 113]. The seed must be separated from the fruit flesh since this contains germination inhibitors[80, 164]. Stored seed should be cold stratified for 3 - 4 months and sown as early as possible in the year[164]. Scarification may also help as may a period of warm stratification before the cold stratification[80, 164]. Germination, especially of struck seed, can be very slow, taking 18 months or more[164]. Prick out the seedlings of cold-frame sown seeds into individual pots as soon as they are large enough to handle and grow the plants on for their first winter in a greenhouse, planting out in the spring after the last expected frosts. Cuttings of half-ripe side shoots, July/August in a frame. Cuttings of mature wood of the current year's growth, taken with a heel if possible, autumn in a cold frame. High percentage[78]. Layering of new growth in June/July. Takes 9 months[78].

nwatta An easily grown plant, it succeeds in any soil of good or moderate fertility[1], ranging from acid to shallow chalk[200]. Grows well in heavy clay soils. Plants are relatively shade tolerant, though they are not happy when growing in dense shade[186]. They grow badly when exposed to strong cold winds[186]. Plants are hardy to about -25°c[184]. The flowers have a rather unpleasant smell to most people, though they are attractive to insects[186]. Plants have a suckering habit and can quickly form dense thickets[186]. They can be coppiced regularly and will throw

up long straight stems after being cut back[186]. Plants in this genus are notably resistant to honey fungus[200].

### 5.2.437 Quercus undulata

Wavyleaf Oak  
4 tlin 8 cyuc 2 kcak 0 tcan 2 dwat 3 m hkuc  
hmimhtut cyutli tcup hwicli jlutnyik hpa7tli flatprikwiss hpa7tmwatli hjonli

drutta Quercus undulata is a deciduous Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: SeedEdible Uses: CoffeeSeed - raw or cooked[61, 105, 161, 257]. Up to 2cm long[200]. It can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread. The seed contains bitter tannins, these can be leached out by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute[257].

tcanta Fuel Repellent Tannin WoodA mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth[20]. Oak galls are excrecences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4]. Tannin is obtained from the bark[46, 61]. Wood. Used mainly as a fuel[46, 61].

dwatta Analgesic Astringent DysenteryA decoction of the root bark has been used to treat internal pains[257]. Any galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4].

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Young plants tolerate reasonable levels of side shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. Prefers warmer summers than are usually experienced in Britain, trees often grow poorly in this country and fail to properly ripen their wood resulting in frost damage overwinter[200]. The seed ripens in its first year[200]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. Hybridizes freely with other members of the genus[200]. Plants in this genus are notably resistant to honey fungus[200].

### 5.2.438 Crataegus uniflora

Dwarf hawthorn  
4 tlin 8 cyuc 2 kcak 0 tcan 2 dwat 3 m hkuc  
hmimhtut cyutli hgattcuphja7n hwicli hrasjlutnyikfrip hpa7tli flatprikwisslip hpa7tmwatli xre7t hjonli

drutta Crataegus uniflora is a deciduous Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in May, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Midges. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[161, 177]. The fruit is about 10mm in diameter and is borne in small clusters[200]. The fruit is usually borne singly, or in groups of up to 3 fruits[235]. It can be up to 16mm in diameter and has a firm flesh[235]. There are up to five fairly large seeds in the centre of the fruit, these often stick together and so the effect is of eating a cherry-like fruit with a single seed[K].

tcanta Wood - heavy, hard, tough, close-grained. Useful for making tool handles, mallets and other small items[82].

dwatta Cardiotonic HypotensiveAlthough no specific mention has been seen for this species, the fruits and flowers of many hawthorns are well-known in herbal folk medicine as a heart tonic and modern research has borne out this use. The fruits and flowers have a hypotensive effect as well as acting as a direct and mild heart tonic[222]. They are especially indicated in the treatment of weak heart combined with high blood pressure[222]. Prolonged use is necessary for it to be efficacious[222]. It is normally used either as a tea or a tincture[222].

propta Seed - this is best sown as soon as it is ripe in the autumn in a cold frame, some of the seed will germinate in the spring, though most will probably take another year. Stored seed can be very slow and erratic to germinate, it should be warm stratified for 3 months at 15°C and then cold stratified for another 3 months at 4°C[164]. It may still take another 18 months to germinate[78]. Scarifying the seed before stratifying it might reduce this time[80]. Fermenting the seed for a few days in its own pulp may also speed up the germination process[K]. Another possibility is to harvest the seed 'green' (as soon as the embryo has fully developed but before the seedcoat hardens) and sow it immediately in a cold frame. If timed well, it can germinate in the spring[80]. If you are only growing small quantities of plants, it is best to pot up the seedlings as soon as they are large enough to handle and grow them on in individual pots for their first year, planting them out in late spring into nursery beds or their final positions. When growing larger quantities, it might be best to sow them directly outdoors in a seedbed, but with protection from mice and other seed-eating creatures. Grow them on in the seedbed until large enough to plant out, but undercut the roots if they are to be left undisturbed for more than two years.

nwatta A very easily grown plant, it prefers a well-drained moisture retentive loamy soil but is not at all fussy[11, 200]. Once established, it succeeds in excessively moist soils and also tolerates drought[200]. It grows well on a chalk soil and also in heavy clay soils[200]. A position in full sun is best when plants are being grown for their fruit, they also succeed in semi-shade though fruit yields and quality will be lower in such a position[11, 200]. Most members of this genus succeed in exposed positions, they also tolerate atmospheric pollution[200]. This species is often confused with *C. tomentosa*. L.[235]. It hybridizes freely with other members of the genus[200]. Seedling trees take from 5 - 8 years before they start bearing fruit, though grafted trees will often flower heavily in their third year[K]. The flowers have a foetid smell somewhat like decaying fish. This attracts midges which are the main means of fertilization. When freshly open, the flowers have more pleasant scent with balsamic undertones[245]. Seedlings should not be left in a seedbed for more than 2 years without being transplanted[11].

### 5.2.439 Angelica atropurpurea

Purplestem Angelica  
4 tlin 8 cyuc 2 kcak 0 tcan 2 dwat 3 m hkuc

### 5.2.541 Hemerocallis forrestii

4 tlin 8 cyuc 2 kcak 0 tcan 1 dwat 0.4 m hkuc  
hmimhtut cyutli kyuctup hwicli hrasjlutnyikfrip hpa7tli flatprikwiss hpa7tmwatli xre7t hjonli

drutta Hemerocallis forrestii is an evergreen Perennial growing to 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in leaf all year. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Leaves and young shoots - cooked. They must be consumed when very young or else they become fibrous[K]. Flowers and flower buds - raw or cooked. Root - raw or cooked. The roots are swollen and conspicuously enlarged at each end[200]. The roots are slightly fleshy, with a large, globose, swollen, tuberous part near the tip[266].

tcanta WeavingThe tough dried foliage is plaited into cord and used for making footwear[205].

dwatta Antidote DiureticThe juice of the roots is an effective antidote in cases of arsenic poisoning[205]. A tea made from the boiled roots is used as a diuretic[205].

propta Seed - sow in the middle of spring in a greenhouse. Germination is usually fairly rapid and good. Prick out the seedlings into individual pots when they are large enough to handle. Grow the plants on for their first winter in a greenhouse and plant out in late spring[K]. Division in spring or after flowering in late summer or autumn[200]. Division is very quick and easy, succeeding at almost any time of the year[K]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Succeeds in most soils[1], including dry ones, preferring a rich moist soil[205]. Grows well in heavy clay soils. Succeeding in sun or shade, it produces more flowers in a sunny position though these flowers can be shorter-lived in very sunny positions[205]. Succeeds in short grass if the soil is moist[1]. Prefers a pH between 6 and 7[200]. Some reports say that this species is not hardy in Britain[205], whilst another says that it is hardy to zone 5 (tolerating quite heavy frosts[200]). There is a plant at Kew Botanical Gardens that bears this name and appears to be fully hardy, growing near the base of a west-facing brick wall[K]. It is possible that the plant is actually a hybrid *H. forrestii* x *H. middendorffii*[205]. Hybridizes freely with other members of this genus[200]. Individual flowers are very short-lived, usually withering within 24 hours of opening. The plants produce a succession of blooms over a period of a month or more[205]. Plants take a year or two to become established after being moved[1]. Plants seem to be immune to the predations of rabbits[233]. The plants are very susceptible to slug and snail damage, the young growth in spring is especially at risk[200].

### 5.2.542 Calluna vulgaris

Heather, Scotch Heather

4 tlin 7 cyuc 2 kcak 5 tcan 2 dwat 0.6 m hkuc  
hmimhtut cyutli kyuctup hwicli hyishrasjlut hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta Calluna vulgaris is an evergreen Shrub growing to 0.6 m (2ft) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 4. It is in leaf all year, in flower from July to October, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies), wind. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils and can grow on nutritionally poor soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: Edible Uses: Condiment TeaA tea is made from the flowering stems[177, 183]. A kind of mead was once brewed from the flowers and the young shoots have been used instead of hops to flavour beer[7, 183].

tcanta Basketry Besom Dye Fuel Hedge Hedge Insulation Musical Tannin ThatchingThe branches have many uses, including in thatching, as a bedding or a stuffing for mattresses, for insulation, basketry, rope making and for making brooms[6, 7, 11, 46, 61, 66, 100, 254]. The dried branches are a good fuel[6, 66]. The rootstock can be made into musical pipes[254]. A yellow dye is obtained from the plant[7, 46, 61]. The bark is a source of tannin[46]. Heather can be grown as a low hedge and is quite useful as an edging to beds. It is fairly amenable to trimming[29]. A useful ground cover plant for covering dry banks[188, 197]. The cultivar 'White Lawn' has been recommended[188]. All except the very dwarf cultivars will need trimming each spring in order to keep them compact[208].

dwatta Antianxiety Antirheumatic Antiseptic Bach Cholagogue Depurative Diaphoretic Diuretic Expectorant Sedative Urinary VasoconstrictorHeather has a long history of medicinal use in folk medicine. In particular it is a good urinary antiseptic and diuretic, disinfecting the urinary tract and mildly increasing urine production[254]. The flowering shoots are antiseptic, astringent, cholagogue, depurative, diaphoretic, diuretic, expectorant, mildly sedative and vasoconstrictor[7, 8, 9, 21, 165, 238]. The plant is often macerated and made into a liniment for treating rheumatism and arthritis, whilst a hot poultice is a traditional remedy for chilblains[7, 254]. An infusion of the flowering shoots is used in the treatment of coughs, colds, bladder and kidney disorders, cystitis etc[9, 238, 254]. A cleansing and detoxifying plant, it has been used in the treatment of rheumatism, arthritis and gout[254]. The flowering stems are harvested in the autumn and dried for later use[7]. The plant is used in Bach flower remedies - the keywords for prescribing it are 'Self-centredness' and 'Self-concern'[209]. A homeopathic remedy is made from the fresh branches[9]. It is used in the treatment of rheumatism, arthritis and insomnia[9].

propta Seed - sow as soon as it is ripe or in February in a shaded part of the greenhouse[78, 113]. Surface sow or only just cover the seed[113, 138]. Cold stratification for 4 - 20 weeks aids germination[138]. The seed usually germinates in 1 - 2 months at 20°C. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter, planting them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood 4 - 5cm with a heel, July/August in a frame. Good percentage[78]. Cuttings of mature wood of the current season's growth, 5 - 7cm with a heel, October/November in a frame. Good percentage[78]. Layering in autumn[78]. Division in spring. Dig up the plant 12 months prior to division and re-plant it 15 - 30cm deeper in the soil in order to encourage rooting along the stems. When ready to take the divisions, it is just a matter of digging up the plant and cutting off sections of stem with roots on them. These are best potted up and kept in a cold frame or greenhouse until they are well rooted before planting them out in the summer or following spring.

nwatta Landscape Uses:Alpine garden, Border, Foundation, Ground cover, Massing, Rock garden, Specimen. Requires a light acid soil and a sunny position[138, 182]. Prefers a sunny position but tolerates light shade[186]. Only succeeds if the pH is below 6.5[186]. Prefers a poor peaty soil[11]. Plants are tolerant of fairly dry soils but they dislike prolonged drought[186]. They tolerate wet conditions in the winter[238]. Plants regenerate well from the base after a fire if the heat was not too great, if the fire was slow and intense then new seedlings will quickly become established[186]. Commonly grown in the ornamental garden, there are many named varieties[200, 238]. The flowers are rich in nectar and are very attractive to bees, butterflies and moths[7, 11, 30]. This plant is also an important food source for the caterpillars of many lepidoptera[30]. Special Features:Attractive foliage, Not North American native, Suitable for cut flowers, Suitable for dried flowers, Attractive flowers or blooms. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

is not frost tender. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: CondimentYoung leaves - cooked[177]. The radical leaves are said to be slightly toxic so only the top leaves should be used. Old leaves are powdered and used as a flavouring. Root - cooked[177]. Eaten in soups as a tonic vegetable[238]. It is also peeled and pickled or preserved in sugar[218]. A nutritional analysis is available[218].

tcanta None known

dwatta Anthelmintic Anticholesterolemic Antiphlogistic Antitussive Astringent Expectorant Haemolytic Hypoglycaemic Sedative Stomachic TonicThis species has a history of herbal use in China going back over 2,000 years and modern clinical tests have demonstrated its efficacy[218, 238]. It is widely used there in patent remedies and is also made into cough tablets[238]. The root contains saponins and is anthelmintic, antiasthmatic, anticholesterolemic, antiphlogistic, antitussive, astringent, carminative, expectorant, haemolytic, hypoglycaemic, sedative, stomachic, tonic and vermifuge. It lowers blood sugar and cholesterol levels in the liver and inhibits the release of histamine[116, 147, 174, 176, 178, 218, 238, 279]. It is used internally in the treatment of coughs with profuse phlegm, colds, bronchitis, pleurisy, pulmonary abscesses and throat infections[176, 238]. It is also used to treat hypertension and diabetes in Korea[279]. The root of plants 2 - 3 years old are harvested in the spring or autumn, peeled and used fresh or dried[238].

propta Seed - sow spring in a cold frame[111]. Free and quick germination[K]. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in the winter when the plants are dormant[238, K]. Basal cuttings of non-flowering shoots in spring, preferably with a piece of root attached[188]. Harvest the shoots with plenty of underground stem when they are about 8 - 10cm above the ground. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Landscape Uses:Border, Container, Rock garden, Specimen. An easily grown plant, it succeeds in any good well-drained garden soil but prefers a light more or less sandy soil in a sunny position or light dappled shade[200]. Plants are hardy to about -15°c[200]. Another report says it is hardy to -20°c[187]. A very ornamental and long-lived plant[1, 233], there are several named forms[238]. It is cultivated, especially in China, as a medicinal plant[61, 238]. This species has brittle roots and strongly resents root disturbance. It should be planted out in its permanent position as soon as possible, and preferably when dormant in the winter[111, 238]. Special Features: Suitable for cut flowers. The plant is heat tolerant in zones 9 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of “heat days” experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is a tap root similar to a carrot going directly down [1-2].

### 5.2.539 Symphytum tuberosum

Tuberous comfrey

4 tin 8 cyuc 2 kcaak 0 tcan 0 dwat 0.6 m hkuc hmimhtut cyutli tcup hwicli hrasjltunykfrp hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

drutta Symphytum tuberosum is a PERENNIAL growing to 0.6 m (2ft) by 0.6 m (2ft in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower

from May to June, and the seeds ripen from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Edible Uses: CoffeeWhen roasted until brown and brittle, and then finely ground, the root is used as a coffee substitute. It has a smoothness that is not found in real coffee[183].

tcanta A good, and sometimes rampant, ground cover plant for a shady border or woodland.

dwatta None known

propta Seed - sow spring or autumn in a cold frame.

When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. If you have sufficient seed you can try an outdoor sowing in situ in the spring. Division succeeds at almost any time of the year. Simply use a spade to chop off the top 7cm of root just below the soil level. The original root will regrow and you will have a number of root tops, each of which will make a new plant. These can either be potted up or planted out straight into their permanent positions.

nwatta Tolerates most soils and situations but prefers a moist soil and some shade. Grows well in heavy clay soils. Hardy to about -20°c[187]. Plants form extensive patches, spreading by means of a creeping tuberous rhizome[187]. Plants are dormant in summer[187].

### 5.2.540 Acinos arvensis

Basil Thyme

4 tin 8 cyuc 2 kcaak 0 tcan 1 dwat 0.2 m hkuc htut cyutli kyuctcup hwicli hyishrasjltut hpa7tli flatprikkwisslip hpa7tmwatli fyfjxre7t hjonli

drutta Acinos arvensis is a ANNUAL/PERENNIAL growing to 0.2 m (0ft 8in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: LeavesEdible Uses: Condiment-The flowering tops are used as a flavouring[4, 177, 183] and in salads[238]. Said to be similar to thyme in odour but milder and more pleasant[183]. The plant is only faintly aromatic and does not really make a very good substitute for thyme[238, K].

tcanta The plant makes a good ground cover[244].

dwatta Diuretic Odontalgic Rubefacient StomachicBasil thyme was a great favourite of the ancient herbalists, though it is little used medicinally at present[4]. The herb is diuretic, odontalgic, rubefacient and stomachic[4, 61, 238]. The essential oil has been applied externally as a rubefacient, whilst one drop of it put into a decayed tooth is said to alleviate the pain[4]. The plant has also been added to bath water, especially for children, and is said to be a strengthener and nerve soother[4]. The flowering plant is harvested in the summer and is normally used fresh in infusions[238].

propta Seed - sow early spring in a cold frame. If you have sufficient seed then you could try sowing in situ in April or May. Germination should take place within a month. When large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring. Basal cuttings in late spring. Very easy[K].

nwatta Succeeds in any well-drained soil[244], though it prefers a light well-drained dry soil in full sun[1, 238]. Prefers sandy and alkaline growing conditions[238]. Dislikes shade. A very hardy plant, tolerating temperatures down to at least -15°c[238]. A short-lived perennial, but the plants usually self-sow when they are growing in a suitable position[238].

hmimhtut cyutli tcup hwicli hrasjltunyk hpa7tli flatprikkwis hpa7tmwatli fyfjxre7t hjonli

drutta Angelica atropurpurea is a PERENNIAL growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves Root StemEdible Uses: Young shoots and leaf stalks - raw or cooked[55, 105, 177]. When boiled in two lots of water they form a vegetable that strongly resembles celery. They can be peeled and eaten in salads or blanched and cooked like asparagus[183]. The stems can also be candied and used as a sweetmeat[2]. Root, leafstalks and stems - candied[177, 183].

tcanta None known

dwatta Carminative Diaphoretic Emmenagogue Sedative Stomachic TonicA tea made from the leaves is carminative and stomachic[222]. It is also used in the treatment of colds, rheumatism etc[222]. The seed and roots can also be used and have a stronger effect[222]. The plant has similar properties to angelica, A. archangelica, though it is inferior since it is less aromatic[4]. The root is carminative, diaphoretic, emmenagogue, sedative, stomachic and tonic[257]. An infusion has been used in the treatment of fevers, colds, flatulent colic and other stomach disorders, obstructed menses and as a general tonic for women[257]. Externally it has been used as a gargle for sore throats and mouths and as a poultice for broken bones, swellings etc[257]. It has also been used, both internally and externally, as a treatment for rheumatism[257].

propta Seed - best sown in a cold frame as soon as it is ripe since the seed only has a short viability[200]. Seed can also be sown in the spring, though germination rates will be lower. It requires light for germination[200]. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for their first winter, planting them out into their permanent positions in the spring. The seed can also be sow in situ as soon as it is ripe.

nwatta Requires a deep moist fertile soil in dappled shade or full sun[200]. Plants are reliably perennial if they are prevented from setting seed[200].

### 5.2.440 Eleutherococcus spinosus

4 tin 8 cyuc 2 kcaak 0 tcan 2 dwat 3 m hkuc

hmimhtut cyutli tcup hwicli hyishrasjltunyk hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

drutta Eleutherococcus spinosus is a deciduous Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from July to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. It can tolerate atmospheric pollution.

kcakta Edible Parts: LeavesEdible Uses: TeaLeaves and young budings - cooked[46, 61, 105, 116, 177]. The dried leaves are a tea substitute[105, 177]. Although we have no record of the seed being edible, it is said to contain 5.6 - 30.6% protein, 5.6 - 36.6% fat and 2.1 - 3.5% ash[218].

tcanta Hedge HedgePlants can be used as a hedge[200]. dwatta Antirheumatic TonicThe cortex of the root is tonic and analgesic. It is used to treat general debility, rheumatic pains and many other complaints[178, 218]. A wine made from the root is considered to be a general tonic for restoring vigour and restoring sexual potency[218].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame[200]. It can be slow to germinate. Stored seed requires 6 months warm followed by 3 months cold stratification[113] and can be very slow to germinate[133]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in a cold frame or greenhouse for at least the first winter. Plant out in late spring or early summer. Cuttings of half-ripe wood, July/August in a frame[113, 200]. Cuttings of

ripe wood of the current season’s growth, 15 - 30cm long in a cold frame[238]. Root cuttings in late winter[200]. Division of suckers in the dormant season[200].

nwatta Prefers a light warm open loamy humus-rich soil and a position sheltered from north and east winds[11, 200]. Prefers a well-drained soil and full sun[200]. Tolerates urban pollution and poor soils[200]. Plants are hardy to at least -15°c if they are sheltered from cold winds[200]. Considered to be a part of E. sieboldianus by some botanists, but this species has smaller leaves[200]. It is closely related to and often confused with E. divaricatus[200]. There is a spineless form of this species, known as Eleutherococcus spinosus inermis (Makino) H. Ohashi[275].

### 5.2.441 Helianthus petiolaris

Prairie Sunflower

4 tin 8 cyuc 2 kcaak 0 tcan 1 dwat 3 m hkuc

htut cyutli kyuctcup hwicli hrasjltunyk hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

drutta Helianthus petiolaris is a ANNUAL growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: SeedEdible Uses: Seed - raw or cooked. An oily texture[161, 177]. The seed can be ground into a powder and kneaded into seed butter[257].

tcanta None known

dwatta SalveThe powdered leaves, either on their own or in an ointment, have been used as a dressing for sores and swellings[257].

propta Seed - sow in mid spring in situ. An earlier start can be made by sowing 2 - 3 seeds per pot in a greenhouse in early spring. Use a fairly rich compost. Thin to the strongest seedling, give them an occasional liquid feed to make sure they do not become nutrient deficient and plant them out in late spring or early summer.

nwatta Succeeds in most soils in a sunny position[1]. Requires a rich soil[1]. Dislikes shade[1]. Grows well on dry soils[200]. The young growth is extremely attractive to slugs, plants can be totally destroyed by them[24]. This species hybridizes in the wild with H. annuus[274]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233].

### 5.2.442 Rubus affinis

4 tin 8 cyuc 2 kcaak 0 tcan 0 dwat 3 m hkuc

hmimhtut cyutli tcup hwicli hrasjltunyk hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

drutta Rubus affinis is a deciduous Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from June to September, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105, 177]. Large[150].

tcanta DyeA purple to dull blue dye is obtained from the fruit[168].

dwatta None known

propta Seed - requires stratification and is best sown in early autumn in a cold frame. Stored seed requires one month stratification at about 3°c and is best sown as early as possible in the year. Prick out the seedlings when they are large enough to handle and grow on in a cold frame. Plant them out into their permanent positions in late spring of the following year. Cuttings of half-ripe wood, July/August in a frame[200]. Tip layering in July. Plant out in autumn. Division in early spring or just before leaf-fall in the autumn[200].

nwatta Easily grown in a good well-drained loamy soil in sun or semi-shade[11, 200]. Hardy to at least -15°c. This species is a blackberry with biennial stems[200]. New shoots are produced from the roots each year, these flower and fruit in their second year and then die[200]. Plants in this genus are notably susceptible to honey fungus[200].

### 5.2.443 Malus brevipes

4 tin 8 cyuc 2 kcaak 0 tcan 0 dwat 3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfripr hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Malus brevipes is a deciduous Tree growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105, 177].

tcanta None known
dwatta None known

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. It usually germinates in late winter. Stored seed requires stratification for 3 months at 1°c and should be sown in a cold frame as soon as it is received[200]. It might not germinate for 12 months or more. Prick out the seedlings into individual pots as soon as they are large enough to handle. If given a rich compost they usually grow away quickly and can be large enough to plant out in late summer, though consider giving them some protection from the cold in their first winter. Otherwise, keep them in pots in a cold frame and plant them out in late spring of the following year. Cuttings of mature wood, November in a frame[11].

nwatta An easily grown plant, it succeeds in most fertile soils, preferring a moisture retentive well-drained loamy soil[1, 200]. Grows well in heavy clay soils. Prefers a sunny position but succeeds in partial shade though it fruits less well in such a situation[1, 200]. The fruit is a good wildlife food source, especially for birds[200]. Hybridizes freely with other members of this genus[200]. Plants in this genus are notably susceptible to honey fungus[200].

### 5.2.444 Aronia prunifolia

Purple Chokeberry

4 tin 8 cyuc 2 kcaak 0 tcan 0 dwat 3 m hkuc hmimhtut cyutli kyucctup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Aronia prunifolia is a deciduous Shrub growing to 3 m (9ft) by 2.5 m (8ft). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from July to August, and the seeds ripen from October to December. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - dried and used for making pemmican. The fruit is about 8mm in diameter[200].

tcanta None known
dwatta None known

propta Seed - best sown as soon as it is ripe in pots outdoors or in a cold frame[113]. Pre-soak stored seed overnight and then cold stratify for 3 months at 2°c[113]. The seed germinates in 1 - 3 months at 15°c[134]. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for their first winter. Plant out in late spring. Since this species is believed to be a hybrid it will probably not breed true from seed. Cuttings of half-ripe wood, July/August in a frame[113]. Division of suckers in the dormant season[200]. Very easy, they can be planted straight out into their permanent positions. Layering[200].

nwatta Prefers a moist peaty soil in full sun or partial shade[200]. Succeeds in most soils but dislikes shallow chalk[200]. Plants are hardy to about -25°c[200]. This genus is closely related to Sorbus species[200]. Plants in this genus are notably resistant to honey fungus[200]. This species is probably a naturally occurring hybrid, A. arbutifolia x A. melanocarpa[200].

### 5.2.445 Polygonum sachalinense

Giant Knotweed

4 tin 8 cyuc 2 kcaak 0 tcan 0 dwat 3.6 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Polygonum sachalinense is a PERENNIAL growing to 3.6 m (11ft) by 3 m (9ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to October, and the seeds ripen from August to October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). - The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves Seed StemEdible Uses: Young shoots in spring - raw or cooked[46, 61, 116, 183]. They can be added to salads or cooked as an asparagus substitute[183]. They have an acid flavour and we find that they are more like a rhubarb substitute. Older stems and shoot tips - cooked. The stems are best peeled. Tasting like a mild version of rhubarb, they have a superior quality with a hint of lemon in the flavour[183]. Seed - cooked[105]. The seed can be ground into a powder and used as a thickener and flavouring in soups etc, or as an extender in flour. It is rather small and fiddly to utilize.

tcanta BiomassA potential source of biomass. Plants are very vigorous and could be grown as a ground cover[208].

dwatta None known

propta Seed - sow spring in a cold frame. Germination is usually free and easy. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer if they have reached sufficient size. If not, overwinter them in a cold frame and plant them out the following spring after the last expected frosts. Division in spring or autumn. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Succeeds in ordinary garden soil in sun or shade[1, 111]. Hardy to about -25°c[187]. An extremely invasive plant, capable of sending up new shoots at a considerable distance from the main clump[1]. Considered a pest in many areas, if grown in the garden it should be planted within a barrier to contain its roots. Plants seem to be immune to the predations of rabbits[233]. Dioecious, male and female plants must be grown if seed is required.

### 5.2.446 Calystegia sepium

Hedge Bindweed, Hedge false bindweed, Appalachia false bindweed, Bingham's false bindweed

4 tin 8 cyuc 2 kcaak 1 tcan 1 dwat 3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Calystegia sepium is a PERENNIAL CLIMBER growing to 3 m (9ft 10in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Stalks and root - cooked[2, 46, 128, 153]. Washed and steamed[179]. A pleasant sweet taste[178]. Rich in starch and sugars, it is very nutritious[179]. It should not be eaten

snake bites[147]. The juice of the plant, mixed with butter, is applied to muscular swellings, boils and pimples[272]. An infusion can be used as a wash to rid children of hookworms[257]. The plant is a good source of vitamin C and is used as an antiscorbatic in the treatment of scurvy[240]. The leaves are used as an antidote to poisoning by the seeds of Datura spp, arsenic and mercury[218]. The leaf juice is applied to insect bites, burns and skin eruptions[218]. It has an antibacterial activity[218].

propta Seed - best sown as soon as ripe in a cold frame. This plant does not need any encouragement.

nwatta A very easily grown plant, succeeding in a sandy soil in a warm dry position[1]. It prefers dry open habitats[50]. Spreading rapidly by seed and underground bulbils, this species can quickly become a nuisance, it is a common weed of pot plants in nurseries[200].

### 5.2.535 Chrysosplenium oppositifolium

Golden Saxifrage

4 tin 8 cyuc 2 kcaak 0 tcan 0 dwat 0.2 m hkuc hmimhtut cyutli tucpha7n hwicli hrasjlutnyik hpa7tli frusflatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Chrysosplenium oppositifolium is a PERENNIAL growing to 0.2 m (0ft 8in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from April to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies, beetles. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked[2, 5, 8, 17, 52, 61, 66]. Added to salads or soups[183]. The leaves are rather small, and there is a distinct bitterness in the flavour, especially in hot weather[K].

tcanta The plants creeping habit makes it a good ground cover for the bog garden[200].

dwatta None known

propta Seed - sow spring or autumn in a lightly shaded position in a cold frame. Stand the pot in 2cm of water. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a tray of water in the cold frame for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in light shade in a cold frame until they are rooting well. Plant them out in the summer or following spring.

nwatta Succeeds in most soils if they are moist. Requires a constantly wet but well-drained soil[200]. Prefers a shady position, succeeding in woodland[17, 200].

### 5.2.536 Lamium purpureum

Red Dead Nettle, Purple deadnettle

4 tin 8 cyuc 2 kcaak 0 tcan 1 dwat 0.3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfripr hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Lamium purpureum is a ANNUAL growing to 0.3 m (1ft) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from March to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young leaves - raw or cooked as a potherb[2, 4, 5, 8, 54, 62, 183]. The plant is a short-lived annual, but seeds can germinate at almost any time of the year and so the leaves are often available all year round.

tcanta None known

dwatta Astringent Diaphoretic Diuretic Purgative Styp-ticThe whole plant is astringent, diaphoretic, diuretic, purgative and stypitic[4, 46]. A decoction of the plant is particularly useful for checking any kind of haemorrhage, whilst the fresh bruised leaves can be applied to external cuts and wounds[4].

propta Seed - plants usually self sow freely and should not require human intervention. When required, the seed can be sown in situ as soon as it is ripe.

nwatta An easily satisfied plant, it tolerates most soils and conditions. Grows well in heavy clay soils. Dislikes shade. A common garden weed, usually flowering at almost any time of the year and the seed is capable of germinating even in the winter if the weather is mild[17]. In rich soils the plant can grow quite lushly, in poor soils it will only grow a few centimetres tall before flowering and spreading its seed. The plant is easily controlled, however, and never really becomes a pest[K]. Plants seem to be immune to the predations of rabbits[233]. A good bee plant[4, 24]. Grows well with potatoes[14].

### 5.2.537 Oxalis exilis

Least Yellow Sorrel, Shady woodsorrel

4 tin 8 cyuc 2 kcaak 0 tcan 2 dwat 0.1 m hkuc htut cyutli kyucctup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Oxalis exilis is a ANNUAL/PERENNIAL growing to 0.1 m (0ft 4in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Flowers LeavesEdible Uses: Leaves - raw or cooked[2, 46, 61, 105]. Added to salads, cooked as a potherb with other milder flavoured greens or used to give a sour flavour to other foods[183]. The leaves are available all year round unless the winter is very cold, they have a pleasantly sour taste[114], but are very small and fiddly to harvest[K]. The leaves contain about 86% water, 2.3% protein, 0.8% fat, 8.2% carbohydrate, 150mg calcium, 78mg phosphorus, 8mg iron, 0.6mg niacin, 78mg vitamin C, 6050µg beta carotene[173]. The leaves contain between 7 - 12% oxalate[218]. Use in moderation, see notes at top of sheet. Flowers - raw. A nice acid flavour and a pleasant addition to the salad bowl[K].

tcanta None known

dwatta Urinary Vitamin CThe whole plant is ant-helmintic, antiphlogistic, astringent, depurative, diuretic, emmenagogue, febrifuge, lithontrpic, stomachic and styp-tic[147, 178, 218, 240]. It is used in the treatment of influenza, fever, urinary tract infections, enteritis, diarrhoea, traumatic injuries, sprains and poisonous snake bites[147]. An infusion can be used as a wash to rid children of hookworms[257]. The plant is a good source of vitamin C and is used as an antiscorbatic in the treatment of scurvy[240]. The leaves are used as an antidote to poisoning by the seeds of Datura spp, arsenic and mercury[218]. The leaf juice is applied to insect bites, burns and skin eruptions[218]. It has an antibacterial activity[218].

propta Seed - best sown as soon as ripe in a cold frame. This plant does not need any encouragement.

nwatta A very easily grown plant, succeeding in a sandy soil in a warm dry position[1]. It prefers dry open habitats[50]. Spreading rapidly by seed and underground bulbils, this species can quickly become a nuisance, it is a common weed of pot plants in nurseries[200].

### 5.2.538 Platycodon grandiflorus

Balloon Flower

4 tin 9 cyuc 2 kcaak 0 tcan 3 dwat 0.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Platycodon grandiflorus is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.4 m (1ft 4in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4 and

dwatta Horsetails have an unusual chemistry compared to most other plants[238]. They are rich in silica, contain several alkaloids (including nicotine) and various minerals[238].

propta Spores - best collected as soon as they are ripe in the spring and surface-sown immediately on a sterile compost. Keep moist and pot up as soon as the plants are large enough to handle. Very difficult[200]. Division. The plants usually spread very freely when well sited and should not really need any assistance.

nwatta Prefers a moist soil with a pH between 6.5 and 7.5[200]. Plants are hardy to about -30°c[200]. Plants have a deep and penetrating root system and can be invasive. If grown in the garden they are best kept in bounds by planting them in a large container which can be sunk into the ground[200].

### 5.2.532 Thymus pannonicus

Eurasian thyme

4 tlin 8 cyuc 2 kcaak 0 tcan 2 dwat 0.2 m hkuc htut cyutli hgatkycuycup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Thymus pannonicus is a PERENNIAL growing to 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcaakta Edible Parts: Edible Uses: CondimentThe leaves are sometimes used as a condiment[183]. If the leaves are to be dried, the plants should be harvested in early and late summer just before the flowers open and the leaves should be dried quickly[200].

tcanta Deodorant Disinfectant EssentialThe essential oil obtained from the leaves is also used in perfumery, as a mouth wash, medicinally etc[200].

dwatta Antiseptic Deodorant DisinfectantThe leaves, and especially the essential oil contained in them, are strongly antiseptic, deodorant and disinfectant[200, 238]. The plant can be used fresh at any time of the year, or it can be harvested as it comes into flower and either be distilled for the oil or dried for later use[238].

propta Seed - sow spring in a cold frame. Seed can also be sown in autumn in a greenhouse. Surface sow or barely cover the seed. Germination can be erratic. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring or autumn[200]. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the summer or the following spring. Cuttings of young shoots, 5 - 8cm with a heel, May/June in a frame[200]. Cuttings of half-ripe wood, 5 - 8cm with a heel, July/August in a frame[200]. Layering.

nwatta Requires a light well-drained preferably calcareous soil in a sunny position[1, 200]. Succeeds in dry soils. Thymes dislike wet conditions, especially in the winter. A layer of gravel on the soil around them will help protect the foliage from wet soils[238]. The flowers are rich in nectar and are very attractive to honey bees[200]. This is a very difficult genus taxonomically, the species hybridize freely with each other and often intergrade into each other[200].

### 5.2.533 Campanula lasiocarpa

Mountain harebell

4 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat 0.2 m hkuc htut cyutli tcup hwicli hyishras hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Campanula lasiocarpa is a PERENNIAL growing to 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower in July, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles, Lepidoptera (Moths and Butterflies). The plant

is self-fertile. Suitable for: light (sandy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcaakta Edible Parts: StemEdible Uses: Stems[177]. No more details are given, but the flowers and leaves of this plant should also be edible[K].

tcanta None known dwatta None known propta Seed - surface sow spring in a cold frame. The seed usually germinates in 2 - 4 weeks at 18°c. Easy[221]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Basal cuttings in spring. Harvest the shoots when they are about 10 - 15cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer. Division in spring or autumn. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the summer or following spring.

nwatta Prefers a moist but well-drained rich sandy loam and a neutral or alkaline soil in sun or partial shade[1, 200]. A rock garden plant, it is difficult to grow in the garden needing a very gritty soil and perfect drainage[1]. It grows freely amongst rocks or in a loose scree, but is very impatient of winter wet[221]. Plants are hardy to at least -15°c[200]. Slugs are very partial to this plant[221]. Members of this genus are rarely if ever troubled by browsing deer[233]. The species in this genus do not often hybridize and so seed can generally be relied upon to come true[221]. The plants are self-fertile[221]. Plants produce seed freely in British gardens[221]. There is at least one named variety, selected for its ornamental value. 'Alba' has white flowers[200].

### 5.2.534 Oxalis corniculata

Yellow Sorrel, Creeping woodsorrel

4 tlin 8 cyuc 2 kcaak 0 tcan 2 dwat 0.1 m hkuc htut cyutli kyucucup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Oxalis corniculata is a ANNUAL/PERENNIAL growing to 0.1 m (0ft 4in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcaakta Edible Parts: Flowers LeavesEdible Uses: Gum-Leaves - raw or cooked[2, 46, 61, 105]. Added to salads, cooked as a potherb with other milder flavoured greens or used to give a sour flavour to other foods[183]. The leaves are available all year round unless the winter is very cold, they have a pleasantly sour taste[114], but are very small and fiddly to harvest[K]. The leaves contain about 86% water, 2.3% protein, 0.8% fat, 8.2% carbohydrate, 150mg calcium, 78mg phosphorus, 8mg iron, 0.6mg niacin, 78mg vitamin C, 6050µg beta carotene[173]. The leaves contain between 7 - 12% oxalate[218]. Use in moderation, see notes at top of sheet, Flowers - raw. A nice acid flavour and a pleasant addition to the salad bowl[K].

tcanta Dye Gum MiscellanyaA slimy substance collects in the mouth when the leaves are chewed, this is used by magicians to protect the mouth when they eat glass[114]. Yellow, orange and red to brown dyes are obtained from the flowers[168]. The boiled whole plant yields a yellow dye[257].

dwatta Anthelmintic Antiphlogistic Antiscorbutic Astringent Depurative Diuretic Emmenagogue Febrifuge Lithotropic Miscellany Stomachic Styptic Urinary Vitamin CThe whole plant is anthelmintic, antiphlogistic, astringent, depurative, diuretic, emmenagogue, febrifuge, lithotropic, stomachic and styptic[147, 178, 218, 240]. It is used in the treatment of influenza, fever, urinary tract infections, enteritis, diarrhoea, traumatic injuries, sprains and poisonous

regularly, however, due to its possible purgative effect[179]. Young shoots - cooked[46, 61, 105]. Some caution is advised since they are possibly purgative[179].

tcanta StringThe stems are very flexible and can be used as an emergency string for tying[6]. It is fairly strong but not very long-lasting[K].

dwatta Chologogue Demulcent Diuretic Febrifuge Poul-tice PurgativeThe root is demulcent, diuretic, febrifuge, poul-tice and strongly purgative[9, 21, 178, 222]. Use of the root is believed to increase the flow of bile[222].

propta Seed - sow spring in a cold frame in a free draining compost and only just cover. The seed usually germinates in 1 - 3 months at 15°c[138]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in early spring whilst dormant[200].

nwatta Easily grown in ordinary garden soil in a sunny position, but plants are apt to become invasive[1, 200]. Hedge bindweed is a troublesome garden weed, especially when growing on moist soils[1, 4]. The plant is a vigorous climber with annual shoots 3 metres or more long. These twine around other plants and can kill them by smothering them[4]. Once established, it is very difficult to eradicate the plant because it has very deep roots and is capable of re-growing from any part of the root left in the ground. The flowers open in sunny weather and remain closed during dull weather[4]. Nearly all taxa in Calystegia intergrade geographically into neighboring taxa with the exception of the widespread coastal species, *C. soldanella* (Linnaeus) R. Brown. It is impossible to draw clearly defined specific limits, and intermediate forms are always found where two taxa approximate geographically[266].

### 5.2.447 Cornus quinquenervis

4 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat 3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Cornus quinquenervis is a deciduous Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to August, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: FruitEdible Uses: A specimen of this species seen growing at Kew in September 1994 was carrying a few red fruits about 30mm long and 12mm wide - these were not fully ripe and were slightly astringent but they showed some potential[K]. There must be some doubt about the validity of the name of the Kew plant since the botanical description of the plant says that the fruits are black, globose and 6mm in diameter[266].

tcanta None known dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame or in an outdoors seedbed if there is sufficient seed[80, 113]. The seed must be separated from the fruit flesh since this contains germination inhibitors[80, 164]. Stored seed should be cold stratified for 3 - 4 months and sown as early as possible in the year[164]. Scarification may also help as may a period of warm stratification before the cold stratification[80, 164]. Germination, especially of stored seed, can be very slow, taking 18 months or more[164]. Prick out the seedlings of cold-frame sown seeds into individual pots as soon as they are large enough to handle and grow the plants on for their first winter in a greenhouse, planting out in the spring after the last expected frosts. Cuttings of half-ripe side shoots, July/August in a frame. Cuttings of mature wood of the current year's growth, taken with a heel if possible, autumn in a cold frame. High percentage[78]. Layering of new growth in June/July. Takes 9 months[78].

nwatta An easily grown plant, it succeeds in any soil of good or moderate fertility[1], ranging from acid to shallow chalk[200]. Grows well in heavy clay soils. Succeeds in full

sun or light shade[188]. Plants in this genus are notably resistant to honey fungus[200].

### 5.2.448 Aralia schmidtii

Sakhalin Spikenard

4 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat 3 m hkuc pcimhmm cyutli tcup hwicli hyishrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Aralia schmidtii is a PERENNIAL growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcaakta Edible Parts: Leaves Root StemEdible Uses: The following uses are for the closely related *A. cordata*. It is quite possible that they also apply to this species[K]. Shoots - cooked or raw[2, 46, 61, 105, 177]. They can be up to 1.5 metres long and have a mild and agreeable flavour[116]. They are usually blanched and are crisp and tender with a unique lemon-like flavour[183]. They can be sliced and added to salads, soups etc[206]. The shoots contain about 1.1% protein, 0.42% fat, 0.8% soluble carbohydrate, 0.55% ash[179]. Root - cooked[22, 105, 177]. Used like scorzonera[2].

tcanta None known dwatta None known

propta Seed - best sown as soon as ripe in a cold frame. Stored seed requires 3 - 5 months of cold stratification. Germination usually takes place within 1 - 4 months at 20°c[134]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in a greenhouse for at least their first winter. Once the plants are 25cm or more tall, they can be planted out into their permanent positions, late spring or early summer being the best time to do this. Root cuttings 8cm long, December in a cold frame[11, 78]. Store the roots upside down in sand and pot up in March/April. High percentage[78]. Division of suckers in late winter[11]. Very easy, the suckers can be planted out direct into their permanent positions if required.

nwatta Prefers a deep moderately fertile moisture-retentive well-drained loam and a semi-shady position[1, 11, 200]. Requires a sheltered position[200]. Plants are hardier when grown in poorer soils[200]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. The young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. This species is closely related to *A. racemosa*[200]. The rootstock is similar to *A. cordata*[200]. It is considered to be no more than a subspecies of *A. cordata* by some botanists[275].

### 5.2.449 Aralia chinensis

Chinese Angelica Tree, Pumila Spirea, Chinese Astilbe

4 tlin 8 cyuc 2 kcaak 0 tcan 2 dwat 3.5 m hkuc pcimhmm cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Aralia chinensis is a deciduous Shrub growing to 3.5 m (11ft 6in) at a medium rate. It is frost tender. It is in flower from August to September, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcaakta Edible Parts: LeavesEdible Uses: Young shoots - cooked[46, 61, 105, 177]. Used as a vegetable[206]. Blanched and used in salads[116]. Although no records of edibility have been seen for the seed, it is said to contain 5.8 - 17.5% protein, 4.2 - 46.3% fat and 3.7 - 5.7% ash[218].

tcanta None known dwatta Anodyne Carminative Diuretic SialagogueThe stem and root are anodyne and carminative[147, 218]. It

is used as a warming painkilling herb in the treatment of rheumatoid arthritis[238]. The root is also considered to be useful in the treatment of diabetes and dysmenorrhoea[218]. Some caution is advised since the bark is considered to be slightly poisonous[218]. The stembark is diuretic and sialagogue[218].

propta Seed - best sown as soon as ripe in a cold frame. Stored seed requires 3 - 5 months of cold stratification. Germination usually takes place within 1 - 4 months at 20°c[134]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in a greenhouse for at least their first winter. Once the plants are 25cm or more tall, they can be planted out into their permanent positions, late spring or early summer being the best time to do this. Root cuttings 8cm long, December in a cold frame[11, 78]. Store the roots upside down in sand and pot up in March/April. High percentage[78]. Division of suckers in late winter[11]. Very easy, the suckers can be planted out direct into their permanent positions if required.

nwatta Landscape Uses:Border, Container, Massing, Rock garden, Woodland garden. Prefers a good deep loam and a semi-shady position[1, 11, 200]. Requires a sheltered position[1]. Plants are hardier when grown in poorer soils[200]. The young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. This species is closely allied to *A. elata*[11]. A very ornamental plant[1, 11]. Special Features:Attractive foliage, Suitable for dried flowers.

## 5.2.450 Rubus deliciosus

Rocky Mountain Raspberry. Delicious raspberry
4 tin 8 cyuc 2 kcaak 0 tcan 0 dwat 3 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Rubus deliciosus is a deciduous Shrub growing to 3 m (9ft 10in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from May to June, and the seeds ripen in July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[183]. The fruit is not highly valued[183]. It is delicious[2]. Dry and of no flavour[1, 11]. The fruit is rather on the dry side and has lots of seeds to very little flesh, but the flavour is delicious[K]. The hemispherical fruit is about 15mm in diameter[200].

tcanta DyeA purple to dull blue dye is obtained from the fruit[168].

dwatta None known

propta Seed - requires stratification and is best sown in early autumn in a cold frame. Stored seed requires one month stratification at about 3°c and is best sown as early as possible in the year. Prick out the seedlings when they are large enough to handle and grow on in a cold frame. Plant them out into their permanent positions in late spring of the following year. Cuttings of half-ripe wood, July/August in a frame[200]. Division in early spring or just before leaf-fall in the autumn[200].

nwatta Easily grown in a good well-drained loamy soil in a sunny position[184]. A very ornamental plant[1, 11], it is hardy to about -20°c[184]. The flowers have a delicious perfume[245]. This species is very closely related to *R. trilobus*[200]. The plant has perennial stems and should not be pruned like normal raspberries[200]. Instead it is sufficient to prune out any dead stems. There are no prickles on the stems[200]. Plants in this genus are notably susceptible to honey fungus[200].

## 5.2.451 Ligustrum obtusifolium

Border privet

4 tin 7 cyuc 2 kcaak 0 tcan 0 dwat 3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Ligustrum obtusifolium is an evergreen Shrub growing to 3 m (9ft 10in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 3. It is in leaf all year, in flower in July, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Edible Uses: Coffee TeaThe roasted seed is a coffee substitute[61, 177]. Leaves are a tea substitute[177].

tcanta WaxA commercial insect wax is produced on the branches as a result of eggs being laid by insects[11]. Another report says that the wax is produced by the plant due to the stimulation of the feeding insects[61]. Yet another report says that the wax is produced by the insects[178]. It is used for candles and as a polish for earthenware pots, book edges etc[178]. The sub-species *L. obtusifolium* regelianum and its cultivar 'Dart's Perfection' make a good carpeting ground cover about 1.2 metres tall. They should be spaced about 2.5 metres apart each way[208].

dwatta None known

propta The seed does not require any pre-treatment and can be sown in the spring in a cold frame[113]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 10cm with a heel, July/August in a frame. Very easy[78]. Cuttings of mature wood, 20 - 30cm in a sheltered outdoor bed in November/December. High percentage[78].

nwatta Landscape Uses:Foundation, Hedge, Screen, Superior hedge. A very tolerant and easily grown plant, it succeeds in any soil that is not overwatered or water-logged[11, 182]. Grows well in heavy clay soils. A very ornamental plant[1]. Polymorphic[58]. Prefers hotter summers than are normally experienced in Britain[11]. Closely related to *L. ovalifolium*[200]. This species is notably susceptible to honey fungus[200]. Special Features:Not North American native, Invasive, Attractive flowers or blooms.

## 5.2.452 Berberis gagnepainii

4 tin 8 cyuc 2 kcaak 0 tcan 2 dwat 2.4 m hkuc hmimhtut cyutli kyuctup hwicli hyishrasjlutnyikfrip hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Berberis gagnepainii is an evergreen Shrub growing to 2.4 m (7ft) by 2 m (6ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in leaf all year, in flower in June, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. The fruits are about 10mm long[200].

tcanta Dye Hedge HedgeThe plant makes an impenetrable hedge that can be trimmed or left to its own devices[29, 182, 200]. A yellow dye is obtained from the root.

dwatta Antibacterial Cancer DysenteryBerberine, universally present in rhizomes of Berberis species, has marked antibacterial effects. Since it is not appreciably absorbed by the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not be used with Glycyrhrrhiza species (Liquorice) because this nullifies the effects of the berberine[218]. Berberine has also shown antitumour activity[218].

propta Seed - best sown as soon as it is ripe in a cold frame, when it should germinate in late winter or early spring[78]. Seed from over-ripe fruit will take longer to germinate[78], whilst stored seed may require cold stratification and should be sown in a cold frame as early in the year as possible[80]. The seedlings are subject to damping off, so should be kept well ventilated[113]. When the seedlings are large enough to handle, prick them out into individual pots

as a cure for fresh wounds[4]. An ointment made from the leaves is applied externally to wounds, bruises etc[4, 232] whilst a distilled water is used internally to treat inflammatory disorders of the liver[4]. Chewing the fresh leaves is said to be a cure for mouth ulcers[244]. Daisies also have a reputation for effectiveness in treating breast cancers[7]. The flowers and leaves are normally used fresh in decoctions, ointments and poultices[238]. A strong decoction of the roots has been recommended for the treatment of scorbutic complaints and eczema, though it needs to be taken for some time before its effect becomes obvious[244]. A mild decoction may ease complaints of the respiratory tract, rheumatic pains and painful or heavy menstruation[244]. The plant, harvested when in flower, is used as a homeopathic remedy[232]. Its use is especially indicated in the treatment of bruising etc[232].

propta Seed - sow as soon as the seed is ripe in June. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in late summer[200]. Division after flowering[200]. Very easy, it can be done at almost any time of the year, though spring and early summer are best[K]. The divisions can be planted straight out into their permanent positions.

nwatta Landscape Uses:Alpine garden, Border, Container, Ground cover, Rock garden. Succeeds in most well-drained soils in sun or semi-shade[188, 200]. The daisy is commonly found growing in many lawns, some varieties have been developed for the flower garden[1]. It is a good plant for the spring meadow[24]. The plants have a very long flowering season, they will even produce a few flowers in the middle of mild winters[K]. Special Features: Edible, Not North American native, Naturalizing, Attracts butterflies, Suitable for dried flowers. The plant is heat tolerant in zones 8 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is fibrous dividing into a large number of fine roots [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

## 5.2.529 Arabis alpina

Alpine Rock Cress, Alpine rockcress

4 tin 8 cyuc 2 kcaak 0 tcan 0 dwat 0.2 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Arabis alpina is a PERENNIAL growing to 0.2 m (0ft 8in) by 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from March to May, and the seeds ripen in June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers LeavesEdible Uses: Young leaves - cooked or raw[105, 177]. An agreeable cross-like flavour[183]. Flowers - raw or cooked[105, 177]. A cross-like flavour[183].

tcanta None known

dwatta None known

propta Seed - it is best to surface sow the seed as soon as it is ripe in a light position in a cold frame[134]. Seed can also be sown in spring. It usually germinates in 2 - 3 weeks at 21°c[134]. When large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division after flowering[111]. Very easy, the divisions can

be planted out straight into their permanent positions if required. Cuttings in a shady border in summer[1].

nwatta Easily grown in ordinary well-drained soil[1, 134]. Prefers a sandy loam and a sunny position. Another report says that it prefers partial shade[134]. Plants resent root disturbance and are best put in their final positions whilst still small[134]. The flowers are attractive to bees.

## 5.2.530 Polygonatum humile

4 tin 8 cyuc 2 kcaak 0 tcan 1 dwat 0.3 m hkuc pimhmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Polygonatum humile is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from May to June, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Young shoots - cooked. They can be used as an asparagus substitute. Root - cooked[105]. Rich in starch.

tcanta None known

dwatta Antiperiodic Antirheumatic Demulcent Refrigerant Sedative Sialagogue TonicThe roots are antiperiodic, antirheumatic, demulcent, refrigerant, sedative, sialagogue and tonic[218].

propta Seed - best sown as soon as it is ripe in early autumn in a shady part of a cold greenhouse[200]. Sow stored seed as early in the year as possible. Germination can be slow, they may not come true to type[200] and it takes a few years for them to reach a good size. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a shady position in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in March or October. Larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Prefers a fertile humus rich moisture retentive well-drained soil in cool shade or semi-shade[200]. Plants are intolerant of heat and drought but tolerate most other conditions[200]. This species is hardy to about -20°c[187]. Closely related to *P. hirtum*[200]. Closely allied to *P. odoratum*. Plants are often mistakenly grown as *P. palcatum*[187]. The rhizomes are slender and creeping, the plant forming spreading colonies[187]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. Young shoots are very attractive to slugs. Hybridizes with other members of this genus[200].

## 5.2.531 Equisetum pratense

Meadow Horsetail

4 tin 8 cyuc 2 kcaak 2 tcan 2 dwat 0.6 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta Equisetum pratense is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 5. The seeds ripen in April. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Roots - raw or cooked[46, 61, 85, 161, 257]. Caution is advised, see the notes above on toxicity. A further report says that the peeled stems, base of the plant, root and tubers were eaten raw by the N. American Indians, the report went on to say that this may be inadvisable[85].

tcanta Dynamic accumulator.

ciently, they can be put into their permanent positions in the summer, otherwise keep them in the greenhouse until the following spring and when they are in active growth plant them out into their permanent positions. Give them some protection from slugs until they are established.

nwatta Succeeds in any good soil[187]. Prefers a well-drained light rich or peaty soil[1, 200]. Requires a moist peaty soil and a sunny position[111, 134]. A good bee plant[50, 74]. The flower of many members of this genus can trap insects between its anther cells, the struggles of the insect in escaping ensure the pollination of the plant[207]. The small, pale-lilac flowers are sweetly scented[245]. Many members of this genus seem to be particularly prone to damage by slugs. The young growth in spring is especially vulnerable, but older growth is also attacked and even well-established plants have been destroyed in wet years[K]. Plants resent root disturbance and are best planted into their final positions whilst small[134].

### 5.2.526 Blechnum spicant

Hard Fern, Deer fern

4 tlin 8 cyuc 2 kcaak 0 tcan 1 dwat 0.3 m hkuc pcmhmmhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli frusflatprik hpa7tmwatli hjonli

drutta Blechnum spicant is an evergreen Fern growing to 0.3 m (1ft) by 0.3 m (1ft in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf all year, and the seeds ripen from June to August. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Root - cooked. An emergency food, used when all else fails[177]. Young shoots (often called croziers) - cooked[177]. The young tender stems can be peeled and the centre portion eaten[257]. An emergency food, it is only used when all else fails[177, 213]. It is also chewed to alleviate thirst on long journeys[213].

tcanta A good ground cover plant[208]. Relatively slow growing but succeeding in the dense shade of trees[197, 200].

dwatta Astringent Cancer Skin StomachicThe leaflets have been chewed in the treatment of internal cancer, lung disorders and stomach problems[257]. The fronds are used externally as a medicine for skin sores[257]. A decoction of the root has been used in the treatment of diarrhoea[257].

propta Spores - best sown as soon as they are ripe on the surface of a humus-rich sterilized soil. Keep the compost moist, preferably by putting a plastic bag over the pot. Pot on small clumps of plantlets as soon as they are large enough to handle and keep humid until they are well established. Over-winter for the first year in a greenhouse and plant outside in late spring or early summer. Division in spring or autumn. Larger divisions can be planted straight into their permanent positions whilst smaller clumps are best potted up and kept in a cold frame until they are growing away well.

nwatta A calcifuge plant[17], it prefers a moist shady nook in the rock garden or a position in open woodland in a moist soil[1]. Succeeds in quite dense tree shade if the soil is moist[200]. Prefers a moist position and a northerly aspect but succeeds in sun and in clay soils[1]. A polymorphic and very ornamental species[1], there are several named varieties[200]. Members of this genus are rarely if ever troubled by browsing deer[233].

### 5.2.527 Erythronium helena

Mt. St. Helena Fawm Lily, Pacific fawnlily

4 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat 0.3 m hkuc hmim cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Erythronium helena is a BULB growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from April to May, and the seeds ripen from June to July. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers

well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: The following use has been noted for the closely related E. orionum and probably also applies to this species[K], which has corms 6 - 8cm long and up to 15mm thick[71]. Bulb - raw, cooked or dried for later use[183].

tcanta None known  
dwatta None known

propta Seed - best sown as soon as it is ripe in a shady position in a cold frame. Water lightly in summer, it should germinate in autumn or winter[164, 200]. Stored seed requires a period of cold stratification[164]. Sow as early in spring as possible in a cold frame. Sow the seed thinly so that it will not be necessary to prick them out for their first year of growth. Give an occasional liquid feed to the seedlings to make sure that they do not become nutrient deficient. When the plants are dormant, pot up the small bulbs putting 2 - 3 bulbs in each pot. Grow them on in a shady position in the greenhouse for another 2 3 years and then plant them out into their permanent positions when they are dormant in late summer. Division of the bulbs in the summer as the leaves die down[1]. Larger bulbs can be replanted immediately into their permanent positions, but it is best to pot up smaller bulbs and grow them on in a shady position in a greenhouse for a year before planting them out when dormant in late summer.

nwatta Prefers slightly acid soil conditions but succeeds in chalky soils if these contain plenty of humus[164]. Requires semi-shade, preferably provided by trees or shrubs, and a well-drained soil[42, 164]. Succeeds in almost any light soil, preferring one that is rich in humus[1]. Plants prefer perfect drainage and require drier conditions when dormant[200]. Plants are hardy to at least -15°C[200]. Plants are growing well in the light shade of a woodland garden at Kew[K]. Bulbs should be planted about 7cm deep[1]. This species is closely related to E. californicum, E. orionum, E. citrinum and E. howellii[207].

### 5.2.528 Bellis perennis

Daisy, Lawndaisy, English Daisy

4 tlin 8 cyuc 2 kcaak 1 tcan 3 dwat 0.2 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyfxfre7t hjonli

drutta Bellis perennis is an evergreen Perennial growing to 0.2 m (0ft 8in) by 0.2 m (0ft 8in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in leaf all year, in flower all year, and the seeds ripen from May to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers LeavesEdible Uses: Leaves - raw or cooked[2, 7, 52, 115]. The flavour is somewhat acrid[4]. A pleasant sour flavour according to another report[238] whilst a third says that they are mild and agreeable and are used in salads[217]. The daisy is occasionally used as a potherb[183]. Flower buds and petals - raw[144, 183]. Eaten in sandwiches, soups and salads[183].

tcanta RepellentAn insect repellent spray can be made from an infusion of the leaves[57]. Daisies have traditionally been used for making daisy chains in children's games.

dwatta Anodyne Antidiarrhoeal Antispasmodic Antitusive Cancer Demulcent Digestive Eczema Emollient Expecto-rant Laxative Ophthalmic Purgative TonicDaisies are a popular domestic remedy with a wide range of applications[7]. They are a traditional wound herb[238] and are also said to be especially useful in treating delicate and listless children[7]. Recent research (1994) has been looking at the possibility of using the plant in HIV therapy[238]. The herb is mildly anodyne, antispasmodic, antitussive, demulcent, digestive, emollient, expectorant, laxative, ophthalmic, purgative and tonic[7, 9, 21]. The fresh or dried flowering heads are normally used[9]. An infusion is used in the treatment of catarrh, rheumatism, arthritis, liver and kidney disorders, as a blood purifier etc[9]. The daisy once had a great reputation

and grow them on in a cold frame. If growth is sufficient, it can be possible to plant them out into their permanent positions in the autumn, but generally it is best to leave them in the cold frame for the winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, July/August in a frame. Cuttings of mature wood of the current season's growth, preferably with a heel, October/November in a frame[78]. Suckers, removed in late autumn/early winter and planted out in situ or potted up and planted out in late spring[200].

nwatta Prefers a warm moist loamy soil and light shade but it is by no means fastidious, succeeding in thin, dry and shallow soils[11, 200]. Grows well in heavy clay soils. A number of cultivars have been selected for their ornamental value[200]. Hybridizes freely with other members of this genus[1]. Plants can be pruned back quite severely, they re-sprout well from the base[200].

### 5.2.453 Silphium laciniatum

Compass Plant, Robinson's compassplant

4 tlin 8 cyuc 2 kcaak 0 tcan 2 dwat 2 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Silphium laciniatum is a PERENNIAL growing to 2 m (6ft) by 0.6 m (2ft in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Edible Uses: GumA resin exudes naturally from the plant, and can also be obtained by incision[4]. It is an inexpensive substitute for mastic and is used as a chewing gum to sweeten the breath[4, 61, 105, 257]. It forms on the upper part of the flowering stem[183].

tcanta GumNone known

dwatta Diuretic Emetic Expectorant Tonic VermifugeThe resin obtained from the plant is diuretic[4, 61, 222]. It imparts a strong aromatic odour to urine[4]. A tea made from the roots is vermifuge and a tonic for general debility[4, 61, 222]. It is used as an expectorant in coughs and other pulmonary ailments[4]. A decoction of the smaller roots has been used as an emetic[257]. A tea made from the leaves is emetic, it has also been used in the treatment of coughs, lung ailments and asthma[222].

propta Seed - best sown as soon as it is ripe in a greenhouse[200]. Prick out the seedlings into individual pots as soon as they are large enough to handle and plant them out in the summer. Division in spring[188]. This is very difficult due to the deep and extensive root system.

nwatta Industrial Crop: Hydrocarbon Management: Standard Wild CropSucceeds in any ordinary garden soil[1]. Prefers a deep moisture retentive moderately fertile soil that is not too nitrogen rich, in sun or dappled shade[200]. Prefers a shady position[200]. A very ornamental plant[1]. Leaves of young plants tip vertically and align themselves north to south to minimise exposure to the midday sun[200]. Plants have a deep and extensive root system which makes transplanting difficult[200]. The plant is heat tolerant in zones 9 through 5. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2].

### 5.2.454 Aciphylla squarrosa

Speargrass

4 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat 2.5 m hkuc htut cyutli kyuctup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Aciphylla squarrosa is an evergreen Perennial growing to 2.5 m (8ft) by 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf all year, in flower from June to July. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Gum GumRoot - cooked. Aromatic[173]. A very good taste[177, 183]. The resin is used as a chewing gum[173]. Shoots and young stems[173]. No further details.

tcanta GumThe plant yields a semi-transparent resinous gum that is edible and also used in perfumery[128].

dwatta None known

propta Seed - best sown in a greenhouse as soon as it is ripe[200]. Stored seed should be sown in a greenhouse in late winter or early spring. Germination can be very slow. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter before planting them out in late spring or early summer, after the last expected frosts.

nwatta Requires a perfectly drained gritty soil in full sun[200]. Easily grown in a moist but well-drained soil in full sun[187]. Hardy to about -10°C according to one report[200] whilst another says it is hardy to about -15°C[187]. Dioecious but female plants have occasional male flowers[200]. Male and female plants must normally be grown if seed is required. The flowers are sweetly scented[187].

### 5.2.455 Rosa woodsii

Western Wild Rose, Woods' rose, Tehachapi rose

4 tlin 8 cyuc 2 kcaak 0 tcan 2 dwat 2 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Rosa woodsii is a deciduous Shrub growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from June to July, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers Fruit StemEdible Uses: TeaFruit - raw or cooked[101, 155, 257]. They are used in making jams, jellies etc. The taste and texture are best after a frost[116]. The fruit can also be dried and used to make a pleasant tasting fruity-flavoured tea[183]. The fruit is up to 15mm in diameter[200], but there is only a thin layer of flesh surrounding the many seeds[K]. Some care has to be taken when eating this fruit, see the notes above on known hazards. Young shoots - raw[172]. Harvested whilst still tender in the spring, they are best peeled[257]. Petals - raw. Remove the bitter white base[172]. The seed is a good source of vitamin E, it can be ground into a powder and mixed with flour or added to other foods as a supplement[102, 183]. Be sure to remove the seed hairs[102]. The bark, young shoots, leaves and fruit have all been used to make tea-like beverages[257].

tcanta None known

dwatta Analgesic Astringent Cancer Diuretic Foot care Poulitice Salve Stings Women's complaintsThe seeds have been used as a poultice to produce a drawing effect for treating muscular pains[257]. An infusion of the leaves has been used as a spring tonic[257]. A poultice of the chewed leaves has been used to allay the pain of bee stings[257]. The leaves have been placed in the shoes as a protection from athlete's foot[257]. The roots are blood tonic and diuretic[257]. A decoction of the roots has been used by adults and children in the treatment of diarrhoea and intestinal influenza[257]. A

decoction of the root or inner bark has been used in the treatment of colds[257]. An infusion of the fruits has been used in the treatment of coughs[257]. Various parts of the plant have been used to make poultices to apply to burns, sores, cuts, swellings and wounds[257]. A decoction of the branches, combined with chokecherry (*Prunus virginiana*) and red willow (*Salix bonplandiana*), has been used in the treatment of various women's complaints, diarrhoea and vomiting[257]. The fruit of many members of this genus is a very rich source of vitamins and minerals, especially in vitamins A, C and E, flavonoids and other bio-active compounds. It is also a fairly good source of essential fatty acids, which is fairly unusual for a fruit. It is being investigated as a food that is capable of reducing the incidence of cancer and also as a means of halting or reversing the growth of cancers[214].

**propta Seed.** Rose seed often takes two years to germinate. This is because it may need a warm spell of weather after a cold spell in order to mature the embryo and reduce the seedcoat[80]. One possible way to reduce this time is to scarify the seed and then place it for 2 - 3 weeks in damp peat at a temperature of 27 - 32°C (by which time the seed should have imbeded). It is then kept at 3°C for the next 4 months by which time it should be starting to germinate[80]. Alternatively, it is possible that seed harvested 'green' (when it is fully developed but before it has dried on the plant) and sown immediately will germinate in the late winter. This method has not as yet(1988) been fully tested[80]. Seed sown as soon as it is ripe in a cold frame sometimes germinates in spring though it may take 18 months. Stored seed can be sown as early in the year as possible and stratified for 6 weeks at 5°C[200]. It may take 2 years to germinate[200]. Prick out the seedlings into individual pots when they are large enough to handle. Plant out in the summer if the plants are more than 25cm tall, otherwise grow on in a cold frame for the winter and plant out in late spring. Cuttings of half-ripe wood with a heel, July in a shaded frame. Overwinter the plants in the frame and plant out in late spring[78]. High percentage[78]. Cuttings of mature wood of the current seasons growth. Select pencil thick shoots in early autumn that are about 20 - 25cm long and plant them in a sheltered position outdoors or in a cold frame[78, 200]. The cuttings can take 12 months to establish but a high percentage of them normally succeed[78]. Division of suckers in the dormant season. Plant them out direct into their permanent positions. Layering. Takes 12 months[11].

**nwatta** Succeeds in most well-drained soils[11], preferring a circumneutral soil and a sunny position[200]. Grows well in heavy clay soils. Dislikes water-logged soils[200]. Grows well with alliums, parsley, mignonette and lupins[18, 20]. Garlic planted nearby can help protect the plant from disease and insect predation[18, 20]. Grows badly with box-wood[18]. Closely related to and hybridizes in the wild with *R. blanda*[11]. Hybridizes freely with other members of this genus[80]. Plants in this genus are notably susceptible to honey fungus[200].

## 5.2.456 *Helianthus laetiflorus*

Showy Sunflower, Cheerful sunflower  
4 tin 8 cyuc 2 ckaak 0 tcan 0 dwat 2 m hkuc  
htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

**drutta** *Helianthus laetiflorus* is a PERENNIAL growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from August to October, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

**ckakta** Edible Parts: RootEdible Uses: Tubers - raw or cooked[55, 105, K]. Used like Jerusalem artichokes, to which they are not much inferior in taste though yields are lower[95, 183].

**tcanta** None known

**dwatta** None known

**propta** Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them in the greenhouse for their first winter. Plant them out into their permanent positions in

late spring or early summer, after the last expected frosts. Division in spring or autumn. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring. Basal cuttings in spring. Harvest the shoots when they are about 10 - 15cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

**nwatta** Succeeds in most soils in a sunny position[1]. Requires a rich soil[1]. Dislikes shade[1]. The young growth is extremely attractive to slugs, plants can be totally destroyed by them[K]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. A naturally occurring hybrid, *H. pauciflorus* (or *H. rigidus* in another report) x *H. tuberosus*[200]. Plants have a running root system and can be very invasive[1]. This species is often grown as an ornamental plant, there are several named varieties[1]. The plant is heat tolerant in zones 9 through 5. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2]. The root pattern is tuberous with swollen potato-like roots [1-2].

## 5.2.457 *Oplopanax horridus*

Devil's Club

4 tin 8 cyuc 2 ckaak 0 tcan 2 dwat 2 m hkuc  
pcimhmin cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

**drutta** *Oplopanax horridus* is a deciduous Shrub growing to 2 m (6ft) by 2 m (6ft). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from June to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil. The plant can tolerate maritime exposure.

**ckakta** Edible Parts: Leaves RootEdible Uses: Young shoots - peeled and then cooked[46, 61, 105, 106]. Only the very young shoots are used[172]. The roots can be chewed after peeling[105, 106, 161].

**tcanta** Parasiticide ParasiticideThe berries can be mashed into a pulp and then rubbed onto the scalp to get rid of head lice[257].

**dwatta** Analgesic Antidandruff Antiphlogistic Antirheumatic Hypoglycaemic Parasiticide Parasiticide TonicDevil's club was widely employed medicinally by several native North American Indian tribes who used it especially for its pain-relieving properties[257]. It is little, if at all, used in modern herbalism, though it probably merits further investigation. The root bark and stems are analgesic, antirheumatic, antiphlogistic, appetizer, blood purifier, cathartic, emmenagogue, galactagogue, hypoglycaemic, ophthalmic, pectoral and tonic[172, 157]. An infusion is used in the treatment of coughs and colds, bronchitis, tuberculosis, stomach problems etc[257]. A decoction is drunk in the treatment of rheumatism and is also applied externally as a wash on the affected joints[257]. A poultice of the bark has been used to relieve pain in various parts of the body[257]. A poultice of the bark has been applied to a nursing mother's breasts in order to stop an excessive flow of milk[257]. A decoction has been used as an eye wash in the treatment of cataracts and as a herbal steam bath for treating general body pains[257]. The burnt stems, mixed with oil, are applied as a salve on swellings[257]. An extract of the root bark lowers blood sugar levels and an infusion of the bark

female organs) and is pollinated by Bees, butterflies. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

**ckakta** Edible Parts: Edible Uses: Colouring Condiment TeaThis species has been used as a saffron substitute[200]. The following notes are for the genuine saffron, *C. sativus*:- The flower styles are used as a flavouring and yellow colouring for various foods such as bread, soups, sauces, rice and puddings[2, 4, 7, 14, 21, 27, 34, 183]. Extremely rich in riboflavin[137]. Water soluble[171]. Yields per plant are extremely low, about 4000 stigmas yield 25g of saffron[89]. Saffron is the world's most expensive spice, it takes 150,000 flowers and 400 hours work to produce 1 kilo of dried saffron[238]. About 25 kilos of styles can be harvested from a hectare of the plant[4]. The flower styles are used as a tea substitute[183].

**tcanta** DyeThe yellow dye obtained from the stigmas has been used for many centuries to colour cloth[4, 7, 14, 21]. It is the favoured colouring for the cloth of Indian swamis who have renounced the material world. A blue or green dye is obtained from the petals[168].

**dwatta** Anodyne Antispasmodic Aphrodisiac Appetizer Carminative Diaphoretic Emmenagogue Expectorant SedativeThis species has been used as a saffron substitute[200]. The following notes are for the genuine saffron, *C. sativus*:- Saffron is a famous medicinal herb with a long history of effective use[4, 7]. The flower styles and stigmas are the parts used, but since these are very small and fiddly to harvest they are very expensive and consequently often adulterated by lesser products[7]. They are anodyne, antispasmodic, aphrodisiac, appetizer, carminative, diaphoretic, emmenagogue, expectorant, sedative and stimulant[4, 7, 21, 174, 176, 218]. They are used as a diaphoretic for children and to treat chronic haemorrhages in the uterus of adults[4]. A dental analgesic is obtained from the stigmas[7]. The styles are harvested in the autumn when the plant is in flower and are dried for later use[4], they do not store well and should be used within 12 months[238]. This remedy should be used with caution[21], large doses can be narcotic[240] and quantities of 10g or more can cause an abortion[218].

**propta** Seed - best sown as soon as it is ripe in a light sandy soil in pots in a cold frame[1]. The seed can also be sown in a cold frame in early spring[1]. Sow thinly because the seed usually germinates freely[1], within 1 - 6 months at 18°C[164]. Unless the seed has been sown too thickly, do not transplant the seedlings in their first year of growth, but give them regular liquid feeds to make sure they do not become deficient. Divide the small bulbs once the plants have died down, planting 2 - 3 bulbs per 8cm pot. Grow them on for another 2 years in a greenhouse or frame and plant them out into their permanent positions when dormant in late summer[K]. Plants take 3 - 4 years to flower from seed[200]. Division of the clumps after the leaves die down in spring[1, 200]. The bulbs can be replanted direct into their permanent positions if required.

**nwatta** Prefers a well-drained sandy or loamy soil that is free from clay[137]. Prefers some shade from the hottest sun in summer and at least a modicum of moisture during its summer dormancy[200]. Succeeds in grass, so long as this is not mown until the leaves die down, it also grows well under deep-rooting deciduous trees and shrubs[200]. It can also be grown with very low shallow-rooting groundcover plants such as lawn camomile (*Chamaemelum nobile* 'Treneague')[200]. Plants are very frost hardy[137]. Plants tend to move considerably from their original planting place because of their means of vegetative reproduction, it is therefore wise not to grow different species in close proximity[1]. The corms should be planted about 5 - 8cm deep in the soil[200]. Any planting out is best done in late spring or early summer[245]. Plants take 4 - 5 years to come into flowering from seed. The flowers are only open during the day time, closing at night[245].

## 5.2.525 *Asclepias quadrifolia*

Fourleaf Milkweed

4 tin 8 cyuc 2 ckaak 0 tcan 2 dwat 0.5 m hkuc

hmihtut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

**drutta** *Asclepias quadrifolia* is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to August, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects, Lepidoptera (Moths and Butterflies). It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

**ckakta** Edible Parts: Flowers Leaves Oil Seed See Uses: Gum Oil Oil SweetenerThe following reports refer to other members of this genus and are possibly also appropriate to this species[K]. Unopened flower buds - cooked. They taste somewhat like peas. They are used like broccoli[183]. Flowers and young flower buds - cooked. Used as a flavouring and a thickener in soups etc[55, 102]. The flower clusters can be boiled down to make a sugary syrup[2, 85]. The flowers are harvested in the early morning with the dew still on them[95]. When boiled up it makes a brown sugar[95]. Young shoots - cooked. An asparagus substitute[2, 4, 43, 55, 62, 95, 183]. They should be used when less than 20cm tall[159]. A slightly bitter taste[159]. Tips of older shoots are cooked like spinach[85, 183]. Young seed pods, 3 - 4 cm long, cooked[2, 43, 55, 85]. They are very appetizing. Best used when about 2 - 4cm long and before the seed floss forms, on older pods remove any seed floss before cooking them[85, 159]. If picked at the right time, the pods resemble okra[183]. The sprouted seeds can be eaten[183]. An edible oil is obtained from the seed[55, 171]. The latex in the stems is made into a chewing gum[46, 61]. It is found mainly in the leaves and is destroyed by frost[112]. Yields are higher on dry soils[112].

**tcanta** Fibre Gum Latex Oil Oil Pollution Stuffing Wick-The following reports refer to other members of this genus and are possibly also appropriate for this species[K]. A good quality fibre is obtained from the bark, used in making twine, cloth, paper etc[95, 112, 169]. It is of poor quality in wet seasons[112]. It is easily harvested in late autumn after the plant has died down by simply pulling the fibres off the dried stems[169]. The seed floss is used to stuff pillows etc or is mixed with other fibres to make cloth[112, 159, 169, 171]. It is a Kapok substitute, used in Life Jackets or as a stuffing material[112]. Very water repellent, it can yield up to 550 kilos per hectare[112]. The floss has also been used to mop up oil spills at sea. Candlewicks can be made from the seed floss[112, 207]. Rubber can be made from latex contained in the leaves and the stems[46, 57, 102, 159]. It is found mainly in the leaves and is destroyed by frost[112]. Yields are higher on dry soils[112]. Pods contain an oil and a wax which are of potential importance. The seed contains up to 20% of an edible semi-drying oil[74, 112]. It is also used in making liquid soap[74].

**dwatta** Diuretic Laxative VD WartsA tea made from the roots is diuretic and laxative[222, 257]. It has also been used in the treatment of venereal diseases[257]. The leaves have been rubbed on warts in order to remove them[222]. The latex from the leaves is used, it needs to be applied daily for some time in order to be effective[K].

**propta** Seed - best sown in a greenhouse as soon as it is ripe in the autumn or in late winter[134, 169]. We have also had good results from sowing the seed in the greenhouse in early spring[K], though stored seed might need 2 - 3 weeks cold stratification[134]. Germination usually takes place in 1 - 3 months at 18°C[134]. As soon as the seedlings are large enough to handle, prick them out into individual pots and grow them on in the greenhouse for their first winter. Plant out when they are in active growth in late spring or early summer and give them some protection from slugs until they are growing away strongly. Division in spring. With great care since the plant resents root disturbance. Pot the divisions up and place them in a lightly shaded position in the greenhouse until they are growing away strongly, then plant them out in the summer, giving them some protection from slugs until they are established.. Basal cuttings in late spring. Use shoots about 10cm long with as much of their white underground stem as possible. Pot them up individually and place them in a lightly shaded position in a greenhouse until they are rooting and growing actively. If the plants grow suffi-

be sown in an outdoor seed bed during July, transplanting the plants to their final positions during early autumn[245]. These plants will grow larger and flower earlier than those sown in spring.

nwatta Succeeds in most soils, preferring a sunny position[1]. Prefers a fertile well-drained soil[111]. The flowers are a rich source of nectar and are very attractive to bees[1]. The dry leaves emit a rich musky fragrance, rather like wild strawberry leaves drying.

### 5.2.521 *Lewisia columbiana*

Columbian Bitterroot, Columbian lewisia, Wallowa lewisia 4 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat 0.2 m hkuc hmimhtut cyutli tcup hwicli hyishrasjlut hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Lewisia columbiana is an evergreen Perennial growing to 0.2 m (0ft 8in) by 0.2 m (0ft 8in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in leaf all year, in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Root - cooked[257]. Said to be extremely nutritious. It is easiest to use when the plant is in flower because the outer layer of the root (which is very bitter) slips off easily at this time of the year. The root has a good taste though a decided bitter flavour develops afterwards[105, 161].

tcanta None known
dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame in a very freely draining soil[129]. Sow stored seed as soon as possible in a cold frame. One months cold stratification should improve germination, though this is still likely to be very slow. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first two winters. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in March/April. Very difficult.

nwatta Requires a very well-drained gritty humus-rich deep soil in a sunny position[1, 200]. Prefers a neutral to acid soil and a position in semi-shade[188]. Best if given a north or north-east aspect in order to protect it from the midday sun[200]. Thrives on almost bare rock[1]. It might be worthwhile trying this species in a crevice of a sunny drystone wall[219]. This species prefers a moister soil than most members of the genus[188]. This species is not reliably hardy in Britain. It can withstand consistently very cold weather but does not like alternating periods of mild and cold conditions, nor does it like winter wet[1]. The plant is very susceptible to rotting at the neck in a damp soil[200]. A very ornamental plant[1], it is very apt to hybridize with other members of the genus[1].

### 5.2.522 *Anemone* *thalictroides*

Rue-Anemone

4 tlin 7 cyuc 2 kcaak 0 tcan 1 dwat 0.1 m hkuc pcmhmim cyutli tcup hwicli hras hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

drutta Anemone

*thalictroides* is a PERENNIAL growing to 0.1 m (0ft 4in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower in April. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Root - cooked[46, 61, 222]. Starchy[105, 177]. Some caution is advised, see the notes above on toxicity.

tcanta None known

dwatta AstringentA tea made from the roots is used in the treatment of diarrhoea and vomiting[222]. A prepara-

tion of the root has historically been used in the treatment of piles[222].

propta Seed - best sown in a cold frame as soon as it is ripe in the summer. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out in the spring. Division - this is best done in the autumn by carefully removing pieces from the outside of the clump and growing them on in pots until they are established[1, 200]. Be careful to disturb the main clump as little as possible[1].

nwatta Landscape Uses:Massing, Rock garden, Woodland garden. Requires a moist shady light soil[1], it strongly resents any wetness at the roots[200]. A delicate plant for a loose leafy soil in sun or part shade[187]. Plants dislike any root disturbance, they should be planted in their final positions whilst still young[1]. A greedy plant inhibiting the growth of nearby plants, especially legumes[54]. Plants are slow to establish, often falling victim to slug predations[200]. Special Features:Attractive foliage, North American native.

### 5.2.523 *Polygonatum falcatum*

4 tlin 8 cyuc 2 kcaak 0 tcan 1 dwat 0.6 m hkuc pcmhmim cyutli hgatyuctcup hwicli hrasjlutnyik hpa7tli flatprikkwis hpa7tmwatli fyfjxre7t hjonli

drutta Polygonatum falcatum is a PERENNIAL growing to 0.6 m (2ft) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in April. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Leaves RootEdible Uses: Young shoots - cooked[105]. They can be used as an asparagus substitute. Root - cooked[105]. Rich in starch.

tcanta Miscellany

dwatta Miscellany TonicEnergizer, tonic. Used to remove freckles[174].

propta Seed - best sown as soon as it is ripe in early autumn in a shady part of a cold greenhouse[200]. Sow stored seed as early in the year as possible. Germination can be slow, they may not come true to type[200] and it takes a few years for them to reach a good size. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a shady position in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in March or October. Larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Prefers a fertile humus rich moisture retentive well-drained soil in cool shade or semi-shade[200]. Plants are intolerant of heat and drought but tolerate most other conditions[200]. Thrives in dry shade as long as the soil is rich in humus, the plant is also fairly drought tolerant[190]. Requires a mulch protection for the roots in areas where winter temperatures go below -10°c[200]. The rhizomes are shortly-creeping, the plant forming clumps[187]. This species is often grown mistakenly as *P. pumilum*[200]. *P. humile* is often mistakenly grown as this species[187]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. Young shoots are very attractive to slugs[K]. Hybridizes with other members of this genus[200].

### 5.2.524 *Crocus nudiflorus*

4 tlin 8 cyuc 2 kcaak 0 tcan 3 dwat 0.2 m hkuc hmimhtut cyutli kyuctcup hwicli hyishrasjlut hpa7tli flatprikwisslip hpa7tmwatli xre7t hjonli

drutta *Crocus nudiflorus* is a CORM growing to 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from September to October. The species is hermaphrodite (has both male and

has been used in the treatment of diabetes[213]. The infusion also has a tonic effect on the blood and liver[213]. The inner bark is emetic in large doses and purgative (especially if taken with hot water)[257]. It is used in the treatment of coughs and colds, stomach and bowel cramps[257]. A poultice of the inner bark is used in the treatment of wounds, sores etc[257]. The berries have been rubbed on the scalp to combat lice and dandruff, and to make the hair shiny[256].

propta Seed - best sown in a cold frame as soon as it is ripe in the autumn[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division of suckers in the dormant season. Root cuttings in a greenhouse in the winter[188].

nwatta Requires a cool moist soil[11, 200]. Prefers a position in light shade[182]. Prefers dense shade and is probably best if grown in moist woodland[1, 11]. Tolerates maritime exposure[200]. (Rather a strange report for a plant that needs to be grown in dense shade[K]). A very hardy plant, tolerating temperatures down to at least -15°c, but the young shoots in spring can be damaged by late frosts[11, 200]. It is therefore best not grown in a frost pocket[182]. This species was until recently considered to have its range in N. America and Japan, but the Japanese form has now been separated off into its own species as *O. japonicus*[200]. A very ornamental plant, but it is densely armed with spikes[60]. It transplants easily and also tolerates pruning[200]. The leaves and stems are excessively spiny[182].

### 5.2.458 *Helianthus strumosus*

Paleleaf Woodland Sunflower

4 tlin 8 cyuc 2 kcaak 0 tcan 1 dwat 2 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

drutta *Helianthus strumosus* is a PERENNIAL growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Root[177]. No more details but it is probably used raw or cooked like the Jerusalem artichoke.

tcanta None known

dwatta Anthelmintic PectoralA decoction of the roots has been used to get rid of worms in both adults and children[257]. An infusion of the roots has been used in the treatment of lung problems[257].

propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring or autumn. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Succeeds in most soils in a sunny position[1]. Requires a rich soil[1]. Dislikes shade[1]. Prefers a moist soil[200]. The young growth is extremely attractive to slugs, plants can be totally destroyed by them[K]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. Plants have a running root system and can be invasive[1].

### 5.2.459 *Polygonatum commutatum*

King Solomon’s Seal, Smooth Solomon’s seal

4 tlin 8 cyuc 2 kcaak 0 tcan 1 dwat 2 m hkuc pcmhmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikkwis hpa7tmwatli fyfjxre7t hjonli

drutta *Polygonatum commutatum* is a PERENNIAL growing to 2 m (6ft) by 0.6 m (2ft in). See above for USDA

hardiness. It is hardy to UK zone 5. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Young shoots - cooked. They can be used as an asparagus substitute. Root - cooked[22, 161]. A parsnip-like flavour[212]. Rich in starch, it can be dried and ground into a powder then used as a thickener in soups etc or can be added to flour when making cakes, bread or whatever[46, 61]. The root should be boiled and sun-dried nine times, it is then delicious[179] (if there is anything left!:[K])

tcanta IncenseThe root has been burnt in the house for its pleasant fragrance[257].

dwatta AnalgesicA decoction of the root has been used as a herbal steam inhalant as a treatment for headaches[257].

propta Seed - best sown as soon as it is ripe in early autumn in a shady part of a cold greenhouse[200]. Sow stored seed as early in the year as possible. Germination can be slow, they may not come true to type[200] and it takes a few years for them to reach a good size. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a shady position in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in March or October. Larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Prefers a fertile humus rich moisture retentive well-drained soil in cool shade or semi-shade[200]. Plants are intolerant of heat and drought but tolerate most other conditions[200]. Grows well in woodlands and copses[1, 42]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. The young shoots are very attractive to slugs[K]. Hybridizes with other members of this genus[200]. According to one report this species is no more than a synonym for *P. biflorum*[200].

### 5.2.460 *Berberis thunbergii*

Japanese Barberry

4 tlin 8 cyuc 2 kcaak 2 tcan 2 dwat 2 m hkuc hmimhtut cyutli kyuctcup hwicli hyishrasjlutnyikfrip hpa7tli flatprik hpa7tmwatli fyfjxre7t hjonli

drutta *Berberis thunbergii* is a deciduous Shrub growing to 2 m (6ft) by 3 m (9ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Fruit LeavesEdible Uses: Fruit - raw or cooked[105, 177]. Dry with a very poor flavour[K]. The fruits are about 8mm long[200]. Leaves - cooked.

tcanta Dye Hedge HedgePlants can be grown as a medium-size hedge[29]. They are very tolerant of trimming and have prickles which make them an effective barrier to larger creatures[K]. The cultivar ‘Atropurpurea Nana’ can be used for ground cover[208]. It makes a dense covering when planted 30cm apart each way[208]. A yellow dye is obtained from the root and branches[178]. An Ornamental plant.

dwatta Anthelmintic Antibacterial Antiseptic Cancer Dysentery FebrifugeThe root bark is anthelmintic, antiseptic and febrifuge[178]. Berberine, universally present in rhizomes of *Berberis* species, has marked antibacterial effects. Since it is not appreciably absorbed by the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not be used with *Glycyrrhiza* species (Licorice) because this nullifies the ef-

fects of the berberine[218]. Berberine has also shown antitumour activity[218].

propta Seed - best sown as soon as it is ripe in a cold frame, when it should germinate in late winter or early spring[78]. Seed from over-ripe fruit will take longer to germinate[78], whilst stored seed may require cold stratification and should be sown in a cold frame as early in the year as possible[80]. The seedlings are subject to damping off, so should be kept well ventilated[113]. When the seedlings are large enough to handle, prick them out into individual pots and grow them on in a cold frame. If growth is sufficient, it can be possible to plant them out into their permanent positions in the autumn, but generally it is best to leave them in the cold frame for the winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, July/August in a frame. Fairly easy[11]. Cuttings of mature wood of the current season's growth, preferably with a heel, October/November in a frame[78]. Fairly easy[11]

nwatta Landscape Uses:Border, Erosion control, Foundation, Pest tolerant, Hedge, Massing, Rock garden, Standard, Superior hedge, Specimen, Woodland garden. Prefers a warm moist loamy soil but it is by no means fastidious, succeeding in thin, dry and shallow soils[11, 200]. Prefers a lime-free soil according to one report[182]. Grows well in heavy clay soils. Succeeds in full sun or light shade[11, 200]. Plants are hardy to about -25°C[184]. A commonly grown ornamental plant, there are many named varieties[182]. Plants can be pruned back quite severely, they resprout well from the base[200]. Unlike most other members of this genus, this plant does not usually hybridize with other species[67]. An alternate host of 'black-stem rust' of wheat so it has been extensively grubbed up from its habitats. This species is notably resistant to honey fungus[200]. Special Features: Attractive foliage, Not North American native, Invasive, Inconspicuous flowers or blooms.

## 5.2.461 Ribes inebrians

Whisky Currant

4 tlin 8 cyuc 2 kcaak 0 tcan 1 dwat 2 m hkuc  
hmmihmtu cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Ribes inebrians is a deciduous Shrub growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kckaak Edible Parts: Fruit LeavesEdible Uses: Fruit - raw or cooked[105, 161, 257]. The fruit can also be dried for later use or made into preserves[105, 257]. One report says that although the fruit was eaten by the Hopi Indians, it could make you ill[216]. Another report says that the fruit was highly relished[257]. The fruit is about 5mm in diameter[200]. Leaves - cooked[105, 161].

tcanta None known

dwatta PoulticeA poultice of the plant has been applied to sores[257].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. Stored seed requires 4 - 5 months cold stratification at between 0 to 9°C and should be sown as early in the year as possible[113, 164]. Under normal storage conditions the seed can remain viable for 17 years or more. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter; planting them out in late spring of the following year. Cuttings of half-ripe wood, 10 - 15cm with a heel, July/August in a frame[78, 113]. Cuttings of mature wood of the current year's growth, preferably with a heel of the previous year's growth, November to February in a cold frame or sheltered bed outdoors[78, 200].

nwatta Easily grown in a moisture retentive but well-drained loamy soil of at least moderate quality[11, 200]. Plants are quite tolerant of shade though do not fruit so well in such a position[11]. Hardy to about -20°C[200]. This species is closely related to *R. cereum*[11, 200]. Plants can harbour a stage of 'white pine blister rust', so they should

not be grown in the vicinity of pine trees[155]. Plants in this genus are notably susceptible to honey fungus[200].

## 5.2.462 Prunus pedunculata

4 tlin 8 cyuc 2 kcaak 0 tcan 1 dwat 2 m hkuc  
hmmihmtu cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Prunus pedunculata is a deciduous Shrub growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from May to June, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kckaak Edible Parts: Fruit SeedEdible Uses: Fruit - raw or cooked[177]. The fruit is about 10mm in diameter and contains one large seed[200]. Seed - raw or cooked. Do not eat the seed if it is too bitter - see the notes above on toxicity.

tcanta DyeA green dye can be obtained from the leaves[168]. A dark grey to green dye can be obtained from the fruit[168].

dwatta Although no specific mention has been seen for this species, all members of the genus contain amygdalin and prunasin, substances which break down in water to form hydrocyanic acid (cyanide or prussic acid). In small amounts this exceedingly poisonous compound stimulates respiration, improves digestion and gives a sense of well-being[238].

propta Seed - requires 2 - 3 months cold stratification and is best sown in a cold frame as soon as it is ripe[200]. Sow stored seed in a cold frame as early in the year as possible[200]. Protect the seed from mice etc. The seed can be rather slow, sometimes taking 18 months to germinate[113]. Prick out the seedlings into individual pots when they are large enough to handle. Grow them on in a greenhouse or cold frame for their first winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood with a heel, July/August in a frame[11, 200]. Softwood cuttings from strongly growing plants in spring to early summer in a frame[200]. Layering in spring.

nwatta Industrial Crop: Oil Management: Standard Wild CropThrives in a well-drained moisture-retentive loamy soil[11, 200]. Prefers some lime in the soil but is likely to become chlorotic if too much lime is present[1]. Succeeds in sun or partial shade though it fruits better in a sunny position[11, 200]. Most members of this genus are shallow-rooted and will produce suckers if the roots are damaged[238]. Plants in this genus are notably susceptible to honey fungus[200].

## 5.2.463 Amelanchier parviflora

4 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat 2 m hkuc  
htut cyutli tcup hwicli hrasljutnyikfrip hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Amelanchier parviflora is a deciduous Shrub growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in May, and the seeds ripen in July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kckaak Edible Parts: FruitEdible Uses: Edible fruit - raw or cooked. The fruit is rich in iron and copper[226].

tcanta Wood - fine grained, hard, very heavy, reddish. Used for small articles[74].

dwatta None known

propta Seed - it is best harvested 'green', when the seed is fully formed but before the seed coat has hardened, and then sown immediately in pots outdoors or in a cold frame. If stored seed is obtained early enough in the autumn, it can be given 4 weeks warm stratification before being left out in the winter and it should then germinate in the spring. Otherwise seed can be very slow to germinate, perhaps taking

"heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. An evergreen. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

## 5.2.518 Petasites hyperboreus

Arctic Sweet Coltsfoot

4 tlin 8 cyuc 2 kcaak 0 tcan 1 dwat 0.2 m hkuc  
pcimhmmihmtu cyutli tcuphja7n hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

drutta Petasites hyperboreus is a PERENNIAL growing to 0.2 m (0ft 8in) by 1 m (3ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from April to May, and the seeds ripen from May to June. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kckaak Edible Parts: Flowers Leaves StemEdible Uses: SaltYoung leaves - cooked. A felt-like texture[172]. Young stalks and flower heads - cooked[172]. The burnt leaves are used as a salt substitute[172, 177]. The stems and leaves, whilst still green, are rolled up into balls, dried and then placed on top of a very small fire on a rock and burned[207]. A very acceptable condiment for piñole[207].

tcanta Containers StuffingThe cotton-like seed heads have been used as a stuffing material in mattresses etc[257]. The leaves have been used to make temporary cone-shaped containers for picking fruit[257]. The leaves have occasionally been used to form makeshift funnels[257].

dwatta Antispasmodic Pectoral Poultice SalveAntispasmodic, poultice, salve[172]. An infusion of the dried, stored leaves has been used in the treatment of colds, head and chest congestion[257].

propta Seed - we have no information on this species but suggest sowing the seed in a cold frame as soon as it is ripe or in early spring. Only just cover the seed and do not allow the compost to dry out. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division succeeds at almost any time of the year. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta We have very little information on this species and do not know if it will succeed in Britain, though judging by its native range it should succeed outdoors in most parts of the country. According to one report this species is no more than a synonym of *P. frigidus*[60]. The following notes are based on the general needs of the genus. Succeeds in ordinary garden soil[1], but prefers a deep fertile humus-rich soil that is permanently moist but not stagnant, succeeding in shade, semi-shade or full sun[200]. Prefers partial shade[31]. Plants can be grown in quite coarse grass, which can be cut annually in the autumn[233]. A very invasive plant, too rampant for anything other than the wild garden[187, 200]. Dioecious, male and female plants must be grown if seed is required.

## 5.2.519 Tradescantia virginiana

Spiderwort, Virginia spiderwort

4 tlin 9 cyuc 2 kcaak 0 tcan 1 dwat 0.4 m hkuc  
hmmihmtu cyutli kyuctcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli dyatxre7t hjonli

drutta Tradescantia virginiana is a PERENNIAL growing to 0.4 m (1ft 4in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to October, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs). The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kckaak Edible Parts: Flowers LeavesEdible Uses: Leaves - raw or cooked[61, 103, 105, 213, 257]. The very young shoots and leaves can be chopped and added to salads or cooked as a potherb[183]. Flowers - raw. They make an attractive edible garnish[183].

tcanta None known

dwatta Kidney Laxative Poultice Women's complaints-The roots are laxative[222]. They are also used as a tea in the treatment of kidney and stomach ailments and women's complaints[222, 257]. A poultice of the leaves is applied to stings, insect bites and cancers[222, 257].

propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring or autumn[111]. Cuttings of young shoots, July in a frame. They root easily and quickly.

nwatta Landscape Uses:Border, Container, Ground cover, Woodland garden. An easily grown plant[233], it thrives in any good rather moist soil[1, 111]. Succeeds in dry soils[188]. Succeeds in dappled woodland shade[88, 111] or in full sun[111]. Hybridizes freely with other members of this genus[1]. Plants often self-sow in British gardens[1]. A very variable species, there are a number of named forms selected for their ornamental value[1]. Plants in this genus seem to be immune to the predations of rabbits[233]. Plants are self-sterile, at least two genetically distinct plants (and not divisions from the same plant) must be grown if seed is required. Special Features: Attractive foliage, North American native, Naturalizing, Wetlands plant, Suitable for cut flowers, Extended bloom season in Zones 9A and above, Attractive flowers or blooms. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2].

## 5.2.520 Anchusa officinalis

Alkanet, Common bugloss

4 tlin 8 cyuc 2 kcaak 1 tcan 1 dwat 0.6 m hkuc  
htut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Anchusa officinalis is a BIENNIAL/PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to October, and the seeds ripen from July to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kckaak Edible Parts: Flowers LeavesEdible Uses: ColouringLeaves and young shoots - cooked[9, 115, 166]. Used like spinach[2, 183]. Flowers - cooked or used as a garnish[183]. The red dye obtained from the roots can be used to colour oils and fats[105].

tcanta DyeA red dye is obtained from the roots[13].

dwatta Demulcent Expectorant HomeopathyAll parts of the plant are demulcent and expectorant[9]. They are used externally to treat cuts, bruises and phlebitis and internally to treat coughs and bronchial catarrh[9]. A homeopathic remedy is made from the plant[9]. It is used in the treatment of stomach and duodenal ulcers[9].

propta Seed - sow spring in pots of sandy soil[200]. An overnight drop in temperature helps germination[133]. The seed usually germinates in 1 - 4 weeks at 21°C[133]. When large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. The seed can also

both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

**kcakta Edible Parts:** Flowers**Edible Uses:** Flowers - raw[105, 177]. They make a very attractive addition to salads[183].

**tcanta Plants** can be grown as a ground cover, they are best spaced about 35cm apart each way[208].

**dwatta None known**

**propta Seed** - best sown as soon as it is ripe in a cold frame[133]. Sow stored seed in early spring in a cold frame[1]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Root cuttings[200].

**nwatta** Easily grown in any moist soil in sun or part shade[187, 200]. Prefers a damp position[133, 200]. Grows well in heavy clay soils[208]. Dislikes very light or dry soils[1]. Grows well in the shade of a north-facing wall[208]. Plants are hardy to about -25°C[187]. A very ornamental plant, there are many named varieties[187]. It can be grown in a wild garden, rock garden or the flower border[1].

## 5.2.516 Lilium formosanum pricei

4 tin 8 cyuc 2 kcaak 0 tcan 0 dwat 0.1 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli xre7t hjonli

**drutta** Lilium formosanum pricei is a BULB growing to 0.1 m (0ft 4in) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from August to October, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**kcakta Edible Parts:** Root**Edible Uses:** Bulb - cooked[105, 177]. The bulb is 2 - 4cm in diameter[266]. Rich in starch, it can be used as a vegetable in similar ways to potatoes (Solanum tuberosum).

**tcanta None known**

**dwatta None known**

**propta Seed** - immediate epigeal germination[130]. Sow thinly in pots from late winter to early spring in a cold frame. Should germinate in 2 - 4 weeks[163]. Great care should be taken in pricking out the young seedlings, many people prefer to leave them in the seed pot until they die down at the end of their second years growth. This necessitates sowing the seed thinly and using a reasonably fertile sowing medium. The plants will also require regular feeding when in growth. This species can flower within a year from seed, especially if sown in the early autumn[143]. Division with care in the autumn once the leaves have died down. Replant immediately[200]. Bulb scales can be removed from the bulbs in early autumn. If they are kept in a warm dark place in a bag of moist peat, they will produce bulblets. These bulblets can be potted up and grown on in the greenhouse until they are large enough to plant out[200].

**nwatta** Prefers an open free-draining humus-rich loamy soil with its roots in the shade and its head in the sun[200]. This sub-species tolerates temperatures down to about -10°C and can succeed outdoors in many parts of the country if care is given in its siting[260]. It can flower in the first year from seed[143, 260]. In a warm climate the plant grows continually and will grow happily in pots in a conservatory[260]. The bulbs can be crammed into the pot with crocks below to give good drainage and a good loose compost above[260]. The flowers diffuse a delicious sweet perfume[245]. Stem rooting, the bulbs should be planted 20cm deep[143]. Early to mid autumn is the best time to plant out the bulbs in cool temperate areas, in warmer areas they can be planted out as late as late autumn[143]. The plant should be protected against rabbits and slugs in early spring. If the shoot tip is eaten out the bulb will not grow in that year and will lose vigour[200].

## 5.2.517 Chimaphila umbellata

Pipsissewa

4 tin 8 cyuc 2 kcaak 2 tcan 3 dwat 0.4 m hkuc pcmhnm cyutli tcup hwicli hrasjlutnyik hpa7tli frusflat hpa7tmwatli xre7t hjonli

**drutta** Chimaphila umbellata is an evergreen Shrub growing to 0.4 m (1ft 4in) by 0.5 m (1ft 8in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in leaf all year, in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

**kcakta Edible Parts:** Leaves**Edible Uses:** Condi- ment TeaThe leaves are nibbled[177], brewed into a tea or used as a flavouring in root beer[183]. They have a delicious scent and flavour. An extract of the leaves is used to flavour candy and soft drinks[177, 183]. In Mexico the herb is used in the preparation of 'navaitai', an alcoholic beverage produced from sprouted maize[183]. A tea can be made from an infusion of the stems and roots[161, 177, 212].

**tcanta** Disinfectant EssentialThe plant's stoloniferous root system, and dwarf spreading habit make it a god ground cover, though it is a difficult plant to establish and grow well[245]. The plant is used in perfumery because of its delicate scent[9].

**dwatta** Alternative Antibacterial Astringent Disinfectant Diuretic Rubefacient Stimulant Tonic UrinaryPipsissewa was much used by many tribes of native North American Indians to induce sweating and treat fevers, including typhus[254, 257]. The plant contains hydroquinones which have a pronounced disinfectant effect within the urinary tract and modern day herbalism mainly employs the plant to treat urinary problems such as cystitis and urethritis[254]. The whole plant is alterative, antibacterial, astringent, diaphoretic, diuretic, rubefacient, stimulant and tonic[4, 9, 14, 21, 46, 165, 213, 207, 222]. An infusion is used in the treatment of various problems related to the urinary system, it is also prescribed for more serious conditions such as kidney stones and gonorrhoea[254]. A decoction is very efficacious in the treatment of skin diseases[4]. Used externally, the fresh leaves are rubefacient and internally they are of great use in cardiac and kidney diseases, chronic rheumatism and scrofula[4, 238]. Only the leaves are official, though the whole plant is often used[4]. The plant is loaded with the biologically active compounds arbutin, sitosterol and ursolic acid[222]. Arbutin hydrolyzes to the toxic urinary antiseptic hydroquinone[222]. The plant contains glycosides and an essential oil that are used as an astringent and tonic[212]. The plant is harvested when in flower, and the leaves on their own can be harvested during the growing season. They are dried for later use[238]. A homeopathic remedy is made from the leaves[9]. It is used in the treatment of inflammations of the urinary system[9].

**propta Seed** - this is very difficult to germinate, see the notes above in cultivation details. It is best sown in a shady area of the greenhouse on moist sphagnum peat as soon as it is ripe. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a shady position in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division. Rather difficult because the plant is very sensitive to root disturbance. It is best attempted in the spring as the plant comes into growth[200]. Cuttings of softwood, June in a frame. Use some soil from around an established plant[14].

**nwatta** Requires a light moist but well-drained lime-free soil and shade from direct sunlight[1]. This species is difficult to propagate and grow in cultivation, mainly because it has certain mycorrhizal associations in the wild and these are necessary if the plant is to thrive[200]. It is best to use some soil collected from around an established plant when sowing seed or planting out into a new position[200]. The plant has wide-spreading fibrous feeding roots and will often die or fail to increase in size if these are disturbed. The flowers have a sweet but refreshing perfume[245]. The plant is heat tolerant in zones 8 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of

18 months or more. When large enough to handle, prick the seedlings out into individual pots and grow them on in a sheltered outdoor position, planting them out once they are 20cm or more tall. If there is sufficient seed it is best to sow it thinly in an outdoor seedbed[78, 80]. Grow the seedlings on for two years in the seedbed before planting them out into their permanent positions during the winter. Layering in spring - takes 18 months[78]. Division of suckers in late winter. The suckers need to have been growing for 2 years before you dig them up, otherwise they will not have formed roots. They can be planted out straight into their permanent positions if required.

**nwatta** Prefers a rich loamy soil in a sunny position or semi-shade[1, 200] but thrives in any soil that is not too dry or water-logged[11]. Grows well in heavy clay soils. Fairly lime tolerant[200]. Plants are hardy to about -20°C[184]. All members of this genus have edible fruits and, whilst this is dry and uninteresting in some species, in many others it is sweet and juicy. Many of the species have potential for use in the garden as edible ornamentals. The main draw-back to this genus is that birds adore the fruit and will often completely strip a tree before it is fully ripe[K]. A group of young plants about 5 years old growing at Kew under this name were about 2 metres tall with almost no side-branches in 1995 and flowering at the end of April. They look as though their final height will be substantially more than that given above[K]. This species is closely related to *A. ovalis*[11]. Hybridizes freely with other members of this genus[200]. Grafting onto seedlings of *A. lamarckii* or *Sorbus aucuparia* is sometimes practised in order to avoid the potential problem of hybridizing[1].

## 5.2.464 Lonicera involucrata

Twinberry, Twinberry honeysuckle

4 tin 8 cyuc 2 kcaak 0 tcan 2 dwat 1.2 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

**drutta** Lonicera involucrata is a deciduous Shrub growing to 1.2 m (4ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower in May, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

**kcakta Edible Parts:** Fruit**Edible Uses:** Fruit - raw or dried[2, 46, 65, 155]. A pleasant taste[161]. Not tasty enough to be widely sought[212]. The only form we have tried has an incredibly bitter taste[K]. The fruit is about 8mm in diameter[200].

**tcanta** Disinfectant Dye HairA purple dye is obtained from the fruit[99, 257]. It is grey when tin is used as a mordant[168]. The berries are rubbed onto the scalp as a hair tonic. It is said to prevent greyness[99]. (don't mix the berries with tin though!![K])

**dwatta** Antidandruff Antipruritic Disinfectant Emetic Galactagogue Laxative Ophthalmic Pectoral PoulitceTwinberry was employed medicinally by a number of native North American Indian tribes who used it to treat a range of complaints[257]. It is little, if at all, used in modern herbalism. The bark is disinfectant, galactagogue, ophthalmic and pectoral[257]. A decoction is used in the treatment of coughs and as an eyewash[257]. A decoction of the bark has been applied to a woman's breasts to encourage milk flow[257]. The bark has also been used as a dressing on burns[257]. The leaves are antipruritic and ophthalmic[257]. A poultice of the chewed leaves is applied to venereal sores, itchy skin and boils[128, 257]. A decoction of the leaves is used as an eye wash[257]. The fruits are antidandruff, emetic, laxative and pectoral[218, 257]. An infusion is used to treat chest and stomach complaints and to cleanse the body[257]. The mashed fruit has been rubbed into the scalp as a treatment for dandruff.

**propta Seed** - best sown as soon as it is ripe in a cold frame. Stored seed requires 2 months cold stratification[113] and should be sown as soon as possible in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the

greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm with or without a heel, July/August in a frame. Good percentage[78]. Cuttings of mature wood of the current season's growth, 15 - 20cm with or without a heel, November in a cold frame. Good percentage[78]. Layering in autumn[200].

**nwatta** An easily grown and very tolerant plant, succeeding in any fertile soil, and preferring a good moist soil in a sunny position[11, 200]. It produces less fruit when grown in the shade[200]. Plants have proved to be quite wind resistant when growing on an exposed site in Cornwall[K]. Plants are hardy to about -25°C[184]. Closely allied to *L. ledebourii*[11]. There are some named forms, developed for the ornamental garden[182]. 'Humilis' is a smaller form and 'Serotina' is later flowering[182].

## 5.2.465 Dryopteris dilatata

Shield Fern

4 tin 8 cyuc 2 kcaak 0 tcan 4 dwat 1.2 m hkuc hmim cyutli hgattcup hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli hjonli

**drutta** Dryopteris dilatata is a FERN growing to 1.2 m (4ft) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. The seeds ripen from July to September. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland). It prefers moist soil and can tolerate drought.

**kcakta Edible Parts:** Leaves Root**Edible Uses:** Young fronds - they must be cooked[172. Some caution is advised, see the notes above on toxicity. Root - cooked[118, 161, 177]. Harvested in the spring and baked[213].

**tcanta** Hair PackingAn infusion of the fronds is used as a hair rinse and to treat dandruff[172, 213]. The leaves can be used as a packing material for fruit etc[172]. Plants can be grown as a ground cover when spaced about 60cm apart each way[208].

**dwatta** Antidandruff VermifugeThe root contains 'filicin', a substance that paralyses tapeworms and other internal parasites and has been used as a worm expellent[4, 172, 238]. It is one of the most effective treatments known for tapeworms - its use should be immediately followed by a non-oily purgative such as magnesium sulphate in order to expel the worms from the body[238]. An oily purge, such as castor oil, increases the absorption of the fern root and can be dangerous[238]. The root is harvested in the autumn and can be dried for later use, it should not be stored for longer than 12 months[238]. This remedy should be used with caution and only under the supervision of a qualified practitioner[238]. The root is toxic and the dosage is critical[238]. See also the notes above on toxicity. The root is also used in the treatment of dandruff[4, 172].

**propta** Spores - can be sown at any time of the year in a greenhouse. Surface sow on a sterilised compost and keep moist, possibly by placing the pot in a plastic bag. Germinates in 1 - 3 months at 20°C. Pot up small clumps of the plants when they are large enough to handle and grow on in a shady part of the greenhouse until large enough to plant out. Division in spring. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

**nwatta** An easily grown plant[233], it prefers an acid to neutral soil, succeeding in ordinary fertile soil in a shady position[175, 200]. Prefers a moist soil[188], but is drought tolerant when well established[200]. Plants are evergreen in mild winters[188]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 5.2.466 Juniperus horizontalis

Creeping Juniper, Horizontal Juniper

4 tin 9 cyuc 2 kcaak 3 tcan 1 dwat 1 m hkuc htut cyutli hgatkyuctcup hwicli hrasjlutnyik hpa7tli flatprikli-wissliphson hpa7tmwatli nyanhjen hjonli

**drutta** Juniperus horizontalis is an evergreen Shrub growing to 1 m (3ft 3in) by 3 m (9ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in

leaf all year, and the seeds ripen in October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline and saline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

**kcakta Edible Parts:** Edible Uses: Coffee TeaThe fruits are roasted and used in the preparation of a coffee-like beverage[183]. A tea is made from the young branch tips[183, 257].

**tcanta Baby care IncenseLandscape Uses:** Cascades, Erosion control, Ground cover, Massing, Rock garden, Seashore. A good ground cover plant for a sunny position[208], eventually making a dense cover though it requires weeding for the first year or so[197]. The bark has been crushed and used as a soft hygienic pad in cradles[257]. It has also been used to make mats[257]. The young twigs and leaves have been burnt as an incense[257].

**dwatta Diaphoretic Febrifuge Kidney**An infusion of the branches, or fleshy cones, has been used in the treatment of coughs, colds and fevers[257]. The cones or branches can also be used as a steam bath[257]. An infusion of the seeds has been used in the treatment of kidney problems[257].

**propta** The seed requires a period of cold stratification. The seed has a hard seedcoat and can be very slow to germinate, requiring a cold period followed by a warm period and then another cold spell, each of 2 - 3 months duration[78, 81]. Soaking the seed for 3 - 6 seconds in boiling water may speed up the germination process[11]. The seed is best sown as soon as it is ripe in a cold frame. Some might germinate in the following spring, though most will take another year. Another possibility is to harvest the seed 'green' (when the embryo has fully formed but before the seedcoat has hardened). The seedlings can be potted up into individual pots when they are large enough to handle. Grow on in pots until large enough, then plant out in early summer. When stored dry, the seed can remain viable for several years[1]. Cuttings of mature wood, 5 - 10cm with a heel, September/October in a cold frame. Plant out in the following autumn[1, 78]. Layering in September/October. Takes 12 months[78].

**nwatta** Succeeds in a sunny position in most soils so long as they are well drained, preferring a neutral or slightly alkaline soil[11] and succeeding on chalk[200]. Succeeds in dry soils[200]. An aggregate species[204]. There are many named varieties selected for their ornamental value[200]. 'Bar Harbour' is very salt-resistant[200]. Dioecious, male and female plants must be grown if seed is required. Special Features: North American native, Fragrant foliage, Inconspicuous flowers or blooms. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is flat with shallow roots spreading near the soil surface [2-1].

## 5.2.467 *Pycnanthemum pilosum*

Mountain Mint, Whorled mountainmint

4 tin 8 cyuc 2 kcaak 0 tcan 0 dwat 1.5 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

**drutta** *Pycnanthemum pilosum* is a PERENNIAL growing to 1.5 m (5ft) by 0.6 m (2ft in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from August to September, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

**kcakta Edible Parts:** LeavesEdible Uses: Condiment TeaFlower buds and leaves - raw or cooked[**K**]. A nice addition to salads or used as a condiment. The fresh or dried leaves are brewed into a delicious mint-like tea[183].

**tcanta** None known

**dwatta** None known

**propta** Seed - sow spring or autumn in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. If there are sufficient seeds they can be sown in an outdoor seedbed in April. Division in spring.

**nwatta** Succeeds in most soils[1] but prefers a rich loamy soil in full sun or partial shade with plenty of moisture in the growing season[200]. A good butterfly plant[**K**].

## 5.2.468 *Prinsepia sinensis*

Cherry prinsepia

4 tin 8 cyuc 2 kcaak 0 tcan 0 dwat 1.8 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

**drutta** *Prinsepia sinensis* is a deciduous Shrub growing to 1.8 m (6ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from April to May, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**kcakta Edible Parts:** FruitEdible Uses: Fruit - raw or cooked[1, 105, 177]. Red and juicy[11]. A pleasant sour taste[74], they can be eaten out of hand or made into jellies[183]. The plum-shaped fruit is about 15mm long with one large seed[200].

**tcanta** None known

**dwatta** None known

**propta** Seed - best if given 2 months cold stratification[113]. Sow the seed in autumn if possible, otherwise in late winter or early spring in a cold frame in light shade. Germination may be inhibited by light[113]. Prick out the seedlings when they are large enough to handle into individual pots. Grow them on in a greenhouse or cold frame for their first winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, July/August in a frame[113].

**nwatta** Succeeds in any moderately fertile well-drained soil in full sun or light shade[182, 200]. The plants produce flowers and fruits better when they are growing in full sun[200]. Flowers are produced on the previous seasons wood[200]. They are produced on old wood according to another report[182]. This plant has a potential for commercial fruit production[74]. Unfortunately, it only fruits in Britain after long hot summers[200].

## 5.2.469 *Calligonum aphyllum*

4 tin 8 cyuc 2 kcaak 0 tcan 0 dwat 1.2 m hkuc htut cyutli hgatkuyctcup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

**drutta** *Calligonum aphyllum* is an evergreen Shrub growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 4. It is in leaf all year, in flower in May, and the seeds ripen in July. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

**kcakta Edible Parts:** Fruit LeavesEdible Uses: GumYoung shoots - cooked[105]. An edible gum or mucilage is obtained from the leaves[105]. The pounded root furnishes an edible mucilaginous substance resembling gum tragacanth (see *Ferula* species)[2, 177]. One report says that the plant has an edible fruit[105]. This possibly refers to the seed.

**tcanta** GumNone known

**dwatta** None known

**propta** Seed - we have no information on this species. The seed is probably best sown in late winter in a greenhouse. Prick out the seedlings when they are large enough to handle and grow them on in the greenhouse for their first winter. Plant out in early summer of the following year.

handle and plant them out in the summer. Division in the autumn or just after flowering. Larger divisions can be planted out direct into their permanent positions, though we have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the summer or the following spring.

**nwatta** Prefers a cool moist well-drained humus-rich soil in partial or dappled shade and protection from scorching winds. Tolerates sandstone and limestone soils but becomes chlorotic if the pH is too high. Prefers a pH between 6 and 6.5[200]. All members of this genus have more or less edible leaves and flower buds, though those species, such as this one, with yellow flowers can cause diarrhoea if eaten in large quantities[62, 85, 159].

## 5.2.513 *Polygonum aviculare*

Knotweed, Prostrate knotweed

4 tin 8 cyuc 2 kcaak 0 tcan 3 dwat 0.3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli frusflatprikliwis hpa7tmwatli fyifxre7t hjonli

**drutta** *Polygonum aviculare* is an ANNUAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from June to October, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure.

**kcakta Edible Parts:** Leaves SeedEdible Uses: TeaYoung leaves and plants - raw or cooked[105, 177]. Used as a potherb[183], they are very rich in zinc[179]. A nutritional analysis is available[218]. Seed - raw or cooked. Rather small and fiddly to utilize, they can be used in all the ways that buckwheat (*Fagopyrum esculentum*) is used, either whole or dried and ground into a powder for use in pancakes, biscuits and piñole[4, 55, 106, 161, 183]. The leaves are a tea substitute[183].

**tcanta** DyeYields a blue dye that is not much inferior to indigo[115]. The part used is not specified, but it is likely to be the leaves. Yellow and green dyes are obtained from the whole plant[168]. The roots contain tannins, but the quantity was not given[223].

**dwatta** Anthelmintic Antiphlogistic Astringent Cardiotonic Cholagogue Diuretic Dysentery Emetic Emollient Expectorant Febrifuge Haemostatic Lithontritic Purgative TB Vasoconstrictor VulneraryKnotweed is a safe and effective astringent and diuretic herb that is used mainly in the treatment of complaints such as dysentery and haemorrhoids. It is also taken in the treatment of pulmonary complaints because the silicic acid it contains strengthens connective tissue in the lungs[254]. The whole plant is anthelmintic, astringent, cardiotonic, cholagogue, diuretic, febrifuge, haemostatic, lithontritic and vulnerary[4, 7, 9, 21, 53, 147, 172, 176, 178]. It was formerly widely used as an astringent both internally and externally in the treatment of wounds, bleeding, piles and diarrhoea[4]. Its diuretic properties make it useful in removing stones[4]. An alcohol-based preparation has been used with success to treat varicose veins of recent origin[7]. The plant is harvested in the summer and early autumn and is dried for later use[9]. The leaves are anthelmintic, diuretic and emollient[218]. The whole plant is anthelmintic, antiphlogistic and diuretic[218]. The juice of the plant is weakly diuretic, expectorant and vasoconstrictor[218]. Applied externally, it is an excellent remedy to stay bleeding of the nose and to treat sores[4]. The seeds are emetic and purgative[4, 240]. Recent research has shown that the plant is a useful medicine for bacterial dysentery. Of 108 people with this disease, 104 recovered within 5 days when treated internally with a paste of knotweed[254].

**propta** Seed - sow spring in a cold frame. Germination is usually free and easy. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer if they have reached sufficient size. If not, overwinter them in a cold frame and plant them out the following spring after the last expected frosts. Division in spring or autumn. Very easy, larger divisions can be planted

out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

**nwatta** Succeeds in an ordinary garden soil[1] but prefers a moisture retentive not too fertile soil in sun or part shade[200]. Repays generous treatment, in good soils the plant will cover an area up to a metre in diameter[1, 4]. Prefers an acid soil[20]. Dislikes shade. Knotweed is a common and invasive weed of cultivated ground[7]. It is an important food plant for the caterpillars of many species of butterflies[30]. It also produces an abundance of seeds and these are a favourite food for many species of birds[4]. Plants seem to be immune to the predations of rabbits[233]. The flowers have little or no scent or honey and are rarely visited by pollinating insects. Self-fertilization is the usual method of reproduction, though cross-fertilization by insects does sometimes occur[4]. The plant also produces cleistogamous flowers - these never open and therefore are always self-fertilized[4]. The plant is very variable and is seen by most botanists as an aggregate species of 4 very variable species, viz. - *P. aviculare*. L.; *P. boreale*. (Lange.)Small.; *P. rivivacuum*. Jord. ex Box.; and *P. arenastrum*. Box[17].

## 5.2.514 *Ambrosia artemesiifolia*

Roman Wormwood, Bitterweed, Blackweed, Carrot Weed, Hay Fever Weed, Stickweed, Tassel Weed, Wild Ta 4 tin 8 cyuc 2 kcaak 1 tcan 3 dwat 0.9 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli hjonli

**drutta** *Ambrosia artemesiifolia* is an ANNUAL growing to 0.9 m (3ft) by 0.2 m (0ft 8in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from August to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**kcakta Edible Parts:** OilEdible Uses: OilAn oil is obtained from the seed. It has been suggested for edible purposes because it contains little linolenic acid[61, 183]. The seed contains up to 19% oil[61], it has slightly better drying properties than soya bean oil[183].

**tcanta** Disinfectant OilThere is some indication it has been used as a disinfectant and Oil.

**dwatta** Antidote Astringent Disinfectant Emetic Febrifuge Women's complaintsThe leaves are very astringent, emetic and febrifuge[222, 257]. They are applied externally to insect bites, rheumatic joints and various skin complaints, internally they are used as a tea in the treatment of fevers, pneumonia, nausea, intestinal cramps, diarrhoea and mucous discharges[222, 257]. Juice from the wilted leaves is disinfectant and is applied to infected toes[257]. A tea made from the roots is used in the treatment of menstrual disorders and stroke[222]. The pollen is harvested commercially and manufactured into pharmaceutical preparations for the treatment of allergies to the plant[222].

**propta** Seed - we have no details for this species but suggest sowing the seed in situ in April.

**nwatta** We have very little information on this species but suggest growing it in a sunny position in a well-drained soil. It has been suggested for commercial cultivation[61]. Some plants produce mainly sterile heads[60]. The pollen from the flowers of this species is an important cause of hay-fever in N. America[17]. Special Features:North American native, Invasive, Inconspicuous flowers or blooms.

## 5.2.515 *Primula denticulata*

Drumstick Primula

4 tin 8 cyuc 2 kcaak 0 tcan 0 dwat 0.3 m hkuc hmimhtut cyutli tcuphja7n hwicli hrasjlutnyikfrip hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

**drutta** *Primula denticulata* is a PERENNIAL growing to 0.3 m (1ft) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from May to June. The species is hermaphrodite (has

symbiotic relationship makes them very difficult to cultivate, though they will sometimes appear uninvited in a garden and will then thrive. Transplanting can damage the relationship and plants might also thrive for a few years and then disappear, suggesting that they might be short-lived perennials[230]. Plants can succeed in a lawn in various parts of the country. The lawn should not be mown early in the year before or immediately after flowering[200]. Plant out bulbs whilst the plant is dormant, preferably in the autumn[200]. Bulbs can also be transplanted with a large ball of soil around the roots when they are in leaf, they are impatient of root disturbance[1]. Plants seem to be immune to the predations of rabbits[233]. Cultivated plants are very susceptible to the predation of slugs and snails[230].

### 5.2.509 Elsholtzia ciliata

Crested latesummer mint

4 tlin 8 cyuc 2 kcaak 0 tcan 2 dwat 0.6 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Elsholtzia ciliata is a ANNUAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: CondimentYoung leaves - raw or cooked[105, 177]. Finely cut then added to salads or used as a potherb[183]. The leaves can be used as an aromatic condiment for vegetable dishes[183]. The powdered seeds are used as a condiment for flavouring foodstuffs[272].

tcanta None known

dwatta Antibacterial Antipyretic Antiviral Astringent Carminative Depurative Diaphoretic Diuretic StomachicThe plant contains an essential oil[283]. It is antibacterial, antipyretic, antiviral, astringent, carminative, diaphoretic, diuretic and stomachic[61, 176, 178, 279]. Its use is said to relieve the effects of excess alcohol[61, 178]. It is used in the treatment of common colds, fevers, headaches, diarrhoea, oedema and oliguria[176, 279]. The plant has a broad-spectrum antibacterial action[176]. It is harvested when in flower and dried for later use[283].

propta Seed - sow late spring in situ[200].

nwatta An easily grown plant, it succeeds in most soils. Cultivated for ornament in N. and E. Europe[50].

### 5.2.510 Fritillaria cirrhosa

Chuan Bei Mu

4 tlin 8 cyuc 2 kcaak 0 tcan 3 dwat 0.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Fritillaria cirrhosa is a BULB growing to 0.5 m (1ft 8in) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Bulb - boiled or roasted as a vegetable[272]. The bulb is bitter-sweet. The bulb is about 2cm in diameter[266].

tcanta None known

dwatta Antispasmodic Antitussive Demulcent Expecto-rant Febrifuge PectoralThe bulbs of Chuan bei mu are antitussive, astringent, demulcent, expectorant, febrifuge and pectoral[91, 176, 238]. They contain fritimine which lowers blood pressure, diminishes excitability of respiratory centres, paralyses voluntary movement and counters the effects of opium[61, 176, 238]. The dried bulb is used internally in the treatment of coughs, bronchitis, pneumonia, asthma, feverish illnesses, abscesses etc[238]. The bulbs also have a folk history of use against cancer of the breast and lungs in China[218, 238]. This remedy should only be used under

the supervision of a qualified practitioner, excessive doses can cause breathing difficulties and heart failure[238]. The bulbs are harvested in the winter whilst they are dormant and are dried for later use[238].

propta Seed - best sown as soon as ripe in a cold frame, it should germinate in the spring[1]. Protect from frost[134]. Stored seed should be sown as soon as possible and can take a year or more to germinate[134]. Sow the seed quite thinly to avoid the need to prick out the seedlings. Once they have germinated, give them an occasional liquid feed to ensure that they do not suffer mineral deficiency. Once they die down at the end of their second growing season, divide up the small bulbs, planting 2 - 3 to an 8cm deep pot. Grow them on for at least another year in light shade in the greenhouse before planting them out whilst dormant. Division of offsets in August[1]. The larger bulbs can be planted out direct into their permanent positions, but it is best to pot up the smaller bulbs and grow them on in a cold frame for a year before planting them out in the autumn. Bulb scales[163].

nwatta Succeeds in a well-drained loamy soil[42]. Prefers peat bed conditions, the plant should not be allowed to dry out[134]. In cultivation at Kew[42] and thriving in a sunny stony bed at Keillour Castle in Perthshire[90], this species does not, however, do well in all gardens[1]. It is much valued as a herbal remedy in China[163]. This species is closely related to *F. meleagris*[42].

### 5.2.511 Cardamine impatiens

Narrowleaf bittercress

4 tlin 8 cyuc 2 kcaak 0 tcan 1 dwat 0.6 m hkuc

hmimhtut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyfxre7t hjonli

drutta Cardamine impatiens is a ANNUAL/BIENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from May to August, and the seeds ripen from May to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves and young shoots - raw or cooked[105, 177]. Used as a vegetable[272].

tcanta None known

dwatta Antirheumatic Diuretic StimulantThe plants is antirheumatic, diuretic and stimulant[145, 240].

propta Seed - sow spring or autumn in situ.

nwatta Succeeds in most soils[1]. Prefers a moist humus rich soil in shade or semi-shade[200].

### 5.2.512 Viola glabella

Stream Violet, Pioneer violet

4 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat 0.1 m hkuc

hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Viola glabella is a PERENNIAL growing to 0.1 m (0ft 4in) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: Flowers LeavesEdible Uses: TeaYoung leaves and flower buds - raw or cooked[105]. When added to soup they thicken it in much the same way as okra[85, 159]. Some caution is advised, the yellow flowers of this species can cause diarrhoea if eaten in large quantities[62]. A tea can be made from the leaves[85].

tcanta None known

dwatta None known

propta Seed - best sown in the autumn in a cold frame. Sow stored seed in early spring in a cold frame. Prick out the seedlings into individual pots when they are large enough to

nwatta Requires a dryish sunny position and a sandy loam[1]. Plants are tolerant of extreme cold but they are impatient of shade or excessive moisture[1].

#### 5.2.470 Lilium dauricum

4 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat 1 m hkuc

htut cyutli tcup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Lilium dauricum is a BULB growing to 1 m (3ft 3in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from June to July, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Flowers RootEdible Uses: Bulb - cooked[46, 61, 74, 105]. The bulb is about 2m in diameter[266]. Rich in starch, it can be used as a vegetable in similar ways to potatoes (*Solanum tuberosum*). Flowers[74]. No further details are given.

tcanta None known

dwatta None known

propta Seed - immediate epigeal germination[130]. Sow thinly in pots from late winter to early spring in a cold frame. Should germinate in 2 - 4 weeks[163]. Great care should be taken in pricking out the young seedlings, many people prefer to leave them in the seed pot until they die down at the end of their second years growth. This necessitates sowing the seed thinly and using a reasonably fertile sowing medium. The plants will also require regular feeding when in growth. Divide the young bulbs when they are dormant, putting 2 - 3 in each pot, and grow them on for at least another year before planting them out into their permanent positions when the plants are dormant[K]. Division with care in the autumn once the leaves have died down. Replant immediately[200]. Bulb scales can be removed from the bulbs in early autumn. If they are kept in a warm dark place in a bag of moist peat, they will produce bulblets. These bulblets can be potted up and grown on in the greenhouse until they are large enough to plant out[200]. The formation of bulbils on the stem can be induced by either removing the stem at flowering time and layering it just below the soil surface, or by removing all the flowers before they open.

nwatta Succeeds in ordinary garden soil[143]. Prefers an open free-draining humus-rich loamy soil in a sunny position, it rapidly degenerates if grown in shade[143, 200]. Prefers an acid soil but tolerates lime[47, 200]. The dormant bulb is very hardy and has withstood soil temperatures down to -20°C, though the embryonic flower shoot will be damaged at temperatures around -15°C[214]. Stem rooting with a stoloniferous stem base, plant the bulbs 10 - 12cm deep[42, 143]. Early to mid autumn is the best time to plant out the bulbs in cool temperate areas, in warmer areas they can be planted out as late as late autumn[200]. A very ornamental plant[1]. *L. spectabilis*, which is said to be a synonym of this species by many botanists, differs from this plant and therefore exists in its own right[74]. The plant should be protected against rabbits and slugs in early spring. If the shoot tip is eaten out the bulb will not grow in that year and will lose vigour[200].

#### 5.2.471 Valeriana sambucifolia

4 tlin 8 cyuc 2 kcaak 0 tcan 3 dwat 1.5 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Valeriana sambucifolia is a PERENNIAL growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to August, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: Condiment TeaYoung leaves - cooked[105]. Seed[172]. No further details are given but the seeds of other members of this genus are parched and then eaten. An essential oil from the leaves and root is used as a flavouring in ice cream, baked goods, condiments etc[183]. The leaves can also be used as a condiment[61]. The plant is used in moderation as a herbal tea[183].

tcanta Compost Essential Liquid feed RepellentThe plant yields about 1% of an essential oil from the roots[7, 238]. It is used in perfumery to provide a 'mossy' aroma[57, 61, 238], though the scent is considered to be disagreeable by many people[207]. The dried roots are also placed in linen cupboards and clothes drawers in order to scent the clothes[4]. The dried root attracts rats and cats, it can be used as a bait to lure them away from other areas[100]. An ingredient of 'QR' herbal compost activator[32]. This is a dried and powdered mixture of several herbs that can be added to a compost heap in order to speed up bacterial activity and thus shorten the time needed to make the compost[K]. The plant can also be used to make a very good liquid plant feed[14, 18, 201]. It attracts earthworms[14, 18]. The leaves are very rich in phosphorus[201].

dwatta Antispasmodic Carminative Diuretic Eczema Hypnotic Nerve Sedative StimulantValerian is a well-known and frequently used medicinal herb that has a long and proven history of efficacy. It is noted especially for its effect as a tranquilliser and nerve, particularly for those people suffering from nervous overstrain[4, 222]. Valerian has been shown to encourage sleep, improve sleep quality and reduce blood pressure[254]. It is also used internally in the treatment of painful menstruation, cramps, hypertension, irritable bowel syndrome etc[238, 254]. It should not be prescribed for patients with liver problems[238]. Externally, it is used to treat eczema, ulcers and minor injuries[238]. The root is antispasmodic, carminative, diuretic, hypnotic, powerfully nerveine, sedative and stimulant[4, 7, 9, 14, 21, 46, 147, 165, 192, 218]. The active ingredients are called valepotriates, research has confirmed that these have a calming effect on agitated people, but are also a stimulant in cases of fatigue[222]. The roots of 2 year old plants are harvested in the autumn once the leaves have died down and are used fresh or dried[4, 9, 238]. The fresh root is about 3 times as effective as roots dried at 40° (the report does not specify if this is centigrade or fahrenheit), whilst temperatures above 82° destroy the active principle in the root[240]. Use with caution[21, 238], see the notes above on toxicity.

propta Seed - sow spring in a cold frame and only just cover the seed because it requires light for germination[200]. Prick out the seedlings into individual pots when they are large enough to handle and plant out into their permanent positions in the summer if sufficient growth has been made. If the plants are too small to plant out, grow them on in the greenhouse or frame for their first winter and plant them out early in the following summer. Division in spring. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the summer or the following spring.

nwatta Succeeds in ordinary garden soil[1], preferring a moist site[7, 17]. Succeeds in full sun or in partial shade[233]. This species is considered to be no more than a sub-species of *V. officinalis* by many botanists[200], it has the same uses as that species[4]. Often grown in the herb garden and also sometimes grown commercially as a medicinal herb[1, 200]. Cats are very fond of this plant, particularly the powdered root[1, 4, 20]. The root also attracts rats[14]. A good companion for most plants.

### 5.2.472 Cirsium palustre

Marsh Thistle

4 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat 1.5 m hkuc

hmimhtut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyfxre7t hjonli

drutta Cirsium palustre is a BIENNIAL growing to 1.5 m (5ft) by 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from July to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and

female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies), beetles. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: Leaves Oil StemEdible Uses: Oil-Leaves and young shoots - raw or cooked[52, 100, 183]. Stems - raw or cooked like asparagus or rhubarb[4, 5, 12, 52, 105, 115]. The flower stalks are peeled and eaten raw or cooked[183].

tcanta Oil TinderThe seed fluff is used as a tinder[106]. The seed of all species of thistles yields a good oil by expression[4]. No details of potential yields etc are given[K].

dwatta None known

propta Seed - sow early spring or autumn in situ. Germination usually takes place within 2 - 8 weeks at 20°c[164].

nwatta An easily grown plant, it succeeds in a sunny position in any ordinary garden soil so long as it is moist[200]. Tolerant of light shade, succeeding in woodlands[17]. A good bee and butterfly plant[17].

### 5.2.473 Lilium kelleyanum

Kelley's Lily

4 tin 8 cyuc 2 kcaak 0 tcan 0 dwat 1 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Lilium kelleyanum is a BULB growing to 1 m (3ft 3in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, butterflies. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Bulb - cooked[46, 61]. Rich in starch, it can be used as a vegetable in similar ways to potatoes (Solanum tuberosum).

tcanta None known

dwatta None known

propta Seed - delayed hypogeal germination[130]. Autumnal hypogeal germination[200]. Best sown as soon as it is ripe in a cold frame, it should germinate in spring[143]. Stored seed will require a warm/cold/warm cycle of stratification, each period being about 2 months long[163]. Grow on in cool shady conditions. Great care should be taken in pricking out the young seedlings, many people leave them in the seed pot until they die down at the end of their second years growth. This necessitates sowing the seed thinly and using a reasonably fertile sowing medium. The plants will also require regular feeding when in growth. Divide the young bulbs when they are dormant, putting 2 - 3 in each pot, and grow them on for at least another year before planting them out into their permanent positions when the plants are dormant[K]. Division with care in the autumn once the leaves have died down. Replant immediately[200]. Bulb scales can be removed from the bulbs in early autumn. If they are kept in a warm dark place in a bag of moist peat, they will produce bulblets. These bulblets can be potted up and grown on in the greenhouse until they are large enough to plant out[200].

nwatta Prefers an open free-draining humus-rich loamy soil with its roots in the shade and its head in the sun[200]. Stoloneriferous[200], the bulbs should be planted 10 - 12cm deep in a light, gritty, well-drained soil with added leafmold in sun or light shade[143]. Early to mid autumn is the best time to plant out the bulbs in cool temperate areas, in warmer areas they can be planted out as late as late autumn[200]. The plant should be protected against rabbits and slugs in early spring. If the shoot tip is eaten out the bulb will not grow in that year and will lose vigour[200].

### 5.2.474 Hosta sieboldiana

4 tin 8 cyuc 2 kcaak 0 tcan 0 dwat 1 m hkuc pcmhmmihtut cyutli tcup hwicli hrasjlutnykifrip hpa7tli flat-priklwis hpa7tmwatli xre7t hjonli

drutta Hosta sieboldiana is a PERENNIAL growing to 1 m (3ft 3in) by 1.5 m (5ft). See above for USDA hardness. It is hardy to UK zone 4 and is not frost tender. It is in flower from May to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves StemEdible Uses: Young leaves and leaf stems - cooked[105, 177].

tcanta A useful ground cover plant, succeeding in dense shade, though rather slow spreading[197]. Plants should be spaced about 60cm apart each way[200].

dwatta None known

propta Seed - sow spring in a lightly shaded position in a greenhouse and only just cover the seed. Germination usually takes place within 1 - 3 months at 10°c. Make sure you keep the compost moist. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division is possible at almost any time of the year so long as there is sufficient moisture[233]. It is best carried out in March as growth commences or in early autumn if the soil is not too dry[200]. Hostas can be left undivided for many years and should not be divided any more frequently than once every 3 - 5 years to allow the leaves to reach maturity[200].

nwatta Thrives in most fertile soils if they are rich in humus[200]. Grows well in heavy clay soils and in sandy ones[208]. Very limy soils inhibit growth, but plants can thrive in such a situation if plenty of humus is added[208]. Prefers a pH between 6 and 7[200]. Requires a rich soil that does not dry out readily[1]. Succeeds in full sun as well as in deep shade, growing well in the semi-shade of a woodland[200, 233]. In general, the sunnier the position the moister the soil should be[233]. Plants are best not grown under trees in town gardens since the soil washed from the leaves of the trees in wet weather will tend to remain on the hosta[208]. Plants flower better when grown in a sunny position but the foliage is better when the plant is in a shady position[200]. Plants are in general fully hardy in Britain, but young leaves in spring can be destroyed by frost. New leaves are only produced in the spring and very early summer, so any damage at this time has a deep effect on the plant[233]. A robust plant, densely clump-forming[200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. Plants are very attractive to slugs and snails, the young shoots in spring are especially at risk[111, K]. A very ornamental plant[1], there are many named forms[187]. Hybridizes freely with other members of this genus[200]. This species usually breeds quite true from seed[233].

### 5.2.475 Berberis concinna

4 tin 8 cyuc 2 kcaak 0 tcan 2 dwat 1 m hkuc hmimhtut cyutli kyuctcup hwicli hyishrasjlutnykifrip hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Berberis concinna is a deciduous Shrub growing to 1 m (3ft 3in). See above for USDA hardness. It is hardy to UK zone 5. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruits - raw[272]. The fleshy oblong berries are up to 18mm long[11].

tcanta DyeA yellow dye is obtained from the roots and stems.

dwatta Antibacterial Cancer Dysentery Ophthalmic StomachicBerberine, universally present in rhizomes of Berberis species, has marked antibacterial effects. Since it is not appreciably absorbed by the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not be used with Glycyrrhiza

Divide the young bulbs when they are dormant, putting 2 - 3 in each pot, and grow them on for at least another year before planting them out into their permanent positions when the plants are dormant[K]. Division with care in the autumn once the leaves have died down. Replant immediately[200]. Bulb scales can be removed from the bulbs in early autumn. If they are kept in a warm dark place in a bag of moist peat, they will produce bulblets. These bulblets can be potted up and grown on in the greenhouse until they are large enough to plant out[200].

nwatta Prefers an open free-draining humus-rich loamy soil with its roots in the shade and its head in the sun[200]. Plants are probably lime tolerant[143, 163, 200]. Succeeds in ordinary garden soil. Does well in limy soils and also succeeds in acid soils. Prefers a sunny position. A very ornamental[1] and easily grown plant[163]. The flowers are malodorous according to one report[143], whilst another says that they have a powerful oriental perfume[245]. Stem rooting, it is best planted 15cm deep in semi-shade[143, 200]. The plant should be protected against slugs in early spring. If the shoot tip is eaten out the bulb will not grow in that year and will lose vigour[200]. Bulbs are best planted out into their permanent positions in early to mid-autumn in cool temperate zones and up to late autumn in warmer areas, this allows them to become established before new top growth commences in spring[200].

### 5.2.507 Dianthus superbus

Fringed Pink

4 tin 8 cyuc 2 kcaak 0 tcan 3 dwat 0.6 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlutnyk hpa7tli flat-prikwlissip hpa7tmwatli xre7t hjonli

drutta Dianthus superbus is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardness. It is hardy to UK zone 4 and is not frost tender. It is in flower from June to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Flowers Leaves NectarEdible Uses: The leaves, stems and tops are boiled, steeped in water and eaten as a potherb[105, 177, 179, 183]. Young plants are also eaten[183]. One report says that they contain saponins but that the leaves are apparently not toxic[179]. Probably this is because the content of saponins is too low to be harmful[K]. Children suck the flowers for their sweet edible nectar[105, 177, 183].

tcanta None known

dwatta Abortifacient Antibacterial Astringent Contra-ceptive Diuretic Emmenagogue Febrifuge Haemostatic Ophthalmic Resolvent Tonic Urinary VulneryThe fringed pink, called Qu Mai in Chinese herbalism, has been used in Chinese herbal medicine for over 2,000 years. The whole plant is a bitter tonic herb that stimulates the digestive and urinary system, and also the bowels[238]. It also lowers blood pressure, reduces fevers and controls bacterial infections[218, 238]. Little used on its own, it is often taken with Dan Shen (Salvia multiorrhiza) to induce menstruation[254]. The closely related *D. chinensis* has the same uses as Qu Mai and is more commonly used[238]. The plant is abortifacient, contraceptive, diuretic, emmenagogue, ophthalmic, tonic and vulnery[147, 176, 178, 218]. It is said to promote hair growth[147, 176, 178]. It is ranked 9th in a list of 250 potential antifertility Chinese plants[218]. The plant is taken internally in the treatment of acute urinary tract infections (especially cystitis), urinary stones, constipation and failure to menstruate[238]. Externally, it is applied to skin inflammations and swellings[238]. The leaves are used in the treatment of haemorrhoids, lumbricoid worms, venereal sores etc[218]. The flowers are astringent, diuretic, haemostatic, resolvent and vulnery[218]. Research has shown that the flowers are the most markedly diuretic part of the plant[254].

propta Seed - sow April/June in a greenhouse and only just cover the seed. Germination usually takes place within 1 - 3 weeks at 20°c. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the autumn.

nwatta Prefers an alkaline soil but tolerates slightly acid soils[200]. Succeeds in any well-drained peaty soil in sun or light shade[187]. Plants succeed when grown on the top of a broad or retaining wall[219]. A very hardy plant, tolerating temperatures down to about -20°c[187]. The flowers have a soft sweet perfume[245].

### 5.2.508 Orchis laxiflora

Marsh Orchis

4 tin 8 cyuc 2 kcaak 0 tcan 2 dwat 0.8 m hkuc htut cyutli tcuphja7n hwicli hrasjlutnyk hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Orchis laxiflora is a BULB growing to 0.8 m (2ft 7in). See above for USDA hardness. It is hardy to UK zone 5 and is not frost tender. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist or wet soil.

kcakta Edible Parts: RootEdible Uses: DrinkRoot - cooked[2, 4, 46]. It is a source of 'salep', a fine white to yellowish-white powder that is obtained by drying the tuber and grinding it into a powder[2, 105, 177]. Salep is a starch-like substance with a sweetish taste and a faint somewhat unpleasant smell[4]. It is said to be very nutritious and is made into a drink or can be added to cereals and used in making bread etc[100, 183]. One ounce of salep is said to be enough to sustain a person for a day[100, 115].

tcanta None known

dwatta Antiflatulent Astringent Cancer Demulcent Expectorant NutritiveUsed in the treatment of cancer[148]. Salep (see above for more details) is very nutritive, astringent, expectorant and demulcent[4, 240]. It has been used as a diet of special value for children and convalescents, being boiled with water, flavoured and prepared in the same way as arrowroot[4]. Rich in mucilage, it forms a soothing and demulcent jelly that is used in the treatment of irritations of the gastro-intestinal canal[4]. One part of salep to fifty parts of water is sufficient to make a jelly[4]. The tuber, from which salep is prepared, should be harvested as the plant dies down after flowering and setting seed[4].

propta Seed - surface sow, preferably as soon as it is ripe, in the greenhouse and do not allow the compost to dry out. The seed of this species is extremely simple, it has a minute embryo surrounded by a single layer of protective cells. It contains very little food reserves and depends upon a symbiotic relationship with a species of soil-dwelling fungus. The fungal hyphae invade the seed and enter the cells of the embryo. The orchid soon begins to digest the fungal tissue and this acts as a food supply for the plant until it is able to obtain nutrients from decaying material in the soil[200]. It is best to use some of the soil that is growing around established plants in order to introduce the fungus, or to sow the seed around a plant of the same species and allow the seedlings to grow on until they are large enough to move. Division of the tubers as the flowers fade[230]. This species produces a new tuber towards the end of its growing season. If this is removed from the plant as its flowers are fading, the shock to the plant can stimulate new tubers to be formed. The tuber should be treated as being dormant, whilst the remaining plant should be encouraged to continue in growth in order to give it time to produce new tubers[230]. Division can also be carried out when the plant has a fully developed rosette of leaves but before it comes into flower[230]. The entire new growth is removed from the old tuber from which it has arisen and is potted up, the cut being made towards the bottom of the stem but leaving one or two roots still attached to the old tuber. This can often be done without digging up the plant. The old tuber should develop one or two new growths, whilst the new rosette should continue in growth and flower normally[230].

nwatta Requires a deep rich soil[1]. Plants can succeed in drier areas of bog gardens[230]. Orchids are, in general, shallow-rooting plants of well-drained low-fertility soils. Their symbiotic relationship with a fungus in the soil allows them to obtain sufficient nutrients and be able to compete successfully with other plants. They are very sensitive to the addition of fertilizers or fungicides since these can harm the symbiotic fungus and thus kill the orchid[230]. This

a year if you want the plants to continue growing, three cuts annually will weaken and eventually kill off the plants. The dried ferns produce a very durable thatch[4]. The leaves are used as a packing material for fruit, keeping it fresh and cool without imparting any colour or flavour[4, 66, 99]. They are also used as a lining for baskets, fruit drying racks etc and as a bedding[66, 99]. The leaves repel insects and can help to prevent rot in the fruits etc[99]. Dried bracken fronds are very useful in the garden as a mulch for somewhat tender plants. This will keep the soil warmer, protect from wind damage and also keep off some of the rain[4, K].

dwatta Anthelmintic Antiemetic Antirheumatic Diuretic Febrifuge PoulticeThe young shoots are diuretic, refrigerant and vermifuge[4, 46, 94, 218]. They have been eaten as a treatment for cancer[257]. The leaves have been used in a steam bath as a treatment for arthritis[257]. A decoction of the plant as been used in the treatment of tuberculosis[257]. A poultice of the pounded fronds and leaves has been used to treat sores of any type and also to bind broken bones in place[257]. The root is antiemetic, antiseptic, appetizer and tonic[257]. A tincture of the root in wine is used in the treatment of rheumatism[218]. A tea made from the roots is used in the treatment of stomach cramps, chest pains, internal bleeding, diarrhoea, colds and also to expel worms[4, 46, 94, 222, 257]. The poulticed root is applied to sores, burns and caked breasts[222, 257].

propta Spores can be surface sown in the same way as other ferns but this plant really does not need any help in spreading itself about. Division is also possible but totally unnecessary in most circumstances.

nwatta Prefers a light, acid, deep sandy soil[1]. Dislikes shade according to some reports[13, 17] whilst another says that it tolerates full sun but prefers light shade[200]. Prefers a pH in the range 4 to 6[200]. Members of this genus are rarely if ever troubled by browsing deer[233]. This is an extremely invasive plant and is a noxious weed. Plants can be cut down twice a year to provide compost material, this will not kill the plants. If the plants are cut down three times a year this will gradually weaken and eventually kill them.

## 5.2.505 Dictamnus albus

Burning Bush, Gasplant, White Dittany, 4 tlin 8 cyuc 2 kcaak 0 tcan 3 dwat 1 m hkuc htut cyutli hgtakyuuctcup hwicli hrasjlut hpa7tli flatprikliws hpa7tmwatli xre7t hjonli

drutta Dictamnus albus is a PERENNIAL growing to 1 m (3ft 3in) by 0.6 m (2ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 3. It is in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Edible Uses: TeaA lemon-scented tea is made from the dried leaves[21, 46, 61]. Refreshing and aromatic[183].

tcanta EssentialThe plant contains an essential oil[211]. Yields from the fresh flowering plant are around 3% on a dry weight basis[240]. This oil is used as a cosmetic[4].

dwatta Abortifacient Anthelmintic Antibacterial Anticonvulsant Antirheumatic Antispasmodic Aromatic Digestive Diuretic Eczema Emmenagogue Expectorant Febrifuge Galactagogue Homeopathy Stimulant TonicThe burning bush has been used in Chinese herbal medicine for at least 1,500 years[238]. The root bark is a bitter, strong-smelling herb that lowers fevers and controls bacterial and fungal infections[238]. The plant has an effect similar to rue (Ruta graveolens) in that it strongly stimulates the muscles of the uterus, inducing menstruation and sometimes causing abortion[254]. By contrast, its effect upon the gastro-intestinal tract is antispasmodic and it acts as a mild tonic on the stomach[254]. Both the flowering stems and the root-bark are used medicinally[7]. They are abortifacient, anthelmintic, antispasmodic, aromatic, digestive, diuretic, emmenagogue, expectorant, febrifuge, galactagogue, stimulant and tonic[7, 9, 19, 21, 46, 178, 211]. The plant is used both internally and externally in the treatment of skin diseases (especially scabies and eczema), German measles, arthritic pain and

jaundice[238]. It is little used in Western herbalism nowadays, though it has been recommended for use in nervous complaints, intermittent fevers, scrofulous and scorbutic diseases[4]. Use with caution, in large doses it is poisonous[9, 21]. The root bark is harvested in the autumn and dried for later use[238]. An infusion of the leaves is used as a tea substitute and is a good digestive[7]. A homeopathic remedy is made from the fresh leaves[9]. It is used in the treatment of female complaints and constipation[9].

propta Seed - best sown in a cold frame as soon as it is ripe[175]. Cold stratify stored seed for 6 weeks and sow in the spring in a cold frame[175]. The seed usually germinates in 1 - 6 months at 15°c[175]. As soon as they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring[1]. Take care since the plant resents root disturbance[1]. The plant can also be divided in autumn[200]. We have found it best to tease out divisions from the side of the clump to avoid the need to dig up the main clump. Try to get divisions that already have formed roots. Pot them up in a greenhouse and grow them on for a year to make sure they are well established before planting them out. Root cuttings in November/December.

nwatta Landscape Uses:Border, Foundation, Massing, Rock garden, Specimen, Woodland garden. An easily grown plant, succeeding in ordinary garden soil[1]. It prefers a dry sunny position with some lime[1, 108] and is not suitable for heavy or damp soils[111]. Established plants are drought tolerant[190]. A very ornamental plant[1], it should be planted into its permanent position as soon as possible because it dislikes root disturbance[1, 175]. The whole plant contains a very aromatic essential oil, giving out a scent somewhat like lemon peel[4]. When the plant is bruised, this smell becomes more like fine balsam[4]. This essential oil is emitted from the plant in hot weather and, on a still day, can be ignited and will burn for a second or two without harming the plant, thus giving the plant its common name[1, 4, 13, 187]. Slugs are strongly attracted to this plant and can destroy it by eating all the young growth in spring[K]. There are at least 2 named varieties, 'Pink' produces a tea with a less lemony flavour but with an added taste of almonds and vanilla, 'White' has a lemony fragrance and taste[183]. The flowers are very attractive to bees[108]. Special Features: Attractive foliage, Edible, Fragrant foliage, Not North American native, All or parts of this plant are poisonous. Suitable for cut flowers, Suitable for dried flowers, Fragrant flowers.

## 5.2.506 Lilium amabile

4 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat 1 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprikliws hpa7tmwatli xre7t hjonli

drutta Lilium amabile is a BULB growing to 1 m (3ft 3in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in July, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Bulb - cooked[105, 183]. The bulb is 25 - 30mm in diameter[266]. It can be used as a vegetable in similar ways to potatoes. Flower buds - cooked[105, 177, 183]. Young shoots - cooked[105, 177, 183]. Eating the young shoots will prevent the bulb from growing any more in that year with a consequent loss of vigour or even the death of the plant, so is not to be recommended[K].

tcanta None known dwatta None known propta Seed - immediate epigeal germination[130]. Sow thinly in pots from late winter to early spring in a cold frame. Should germinate in 2 - 4 weeks[163]. Great care should be taken in pricking out the young seedlings, many people prefer to leave them in the seed pot until they die down at the end of their second years growth. This necessitates sowing the seed thinly and using a reasonably fertile sowing medium. The plants will also require regular feeding when in growth.

species (Liquorice) because this nullifies the effects of the berberine[218]. Berberine has also shown antitumour activity[218].

propta Seed - best sown as soon as it is ripe in a cold frame, when it should germinate in late winter or early spring[78]. Seed from over-ripe fruit will take longer to germinate[78], whilst stored seed may require cold stratification and should be sown in a cold frame as early in the year as possible[80]. The seedlings are subject to damping off, so should be kept well ventilated[113]. When the seedlings are large enough to handle, prick them out into individual pots and grow them on in a cold frame. If growth is sufficient, it can be possible to plant them out into their permanent positions in the autumn, but generally it is best to leave them in the cold frame for the winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, July/August in a frame. Cuttings of mature wood of the current season's growth, preferably with a heel, October/November in a frame[78].

nwatta Prefers a warm moist loamy soil and light shade but it is by no means fastidious, succeeding in thin, dry and shallow soils[11, 200]. Grows well in heavy clay soils. Hybridizes freely with other members of this genus[1]. A very ornamental plant[11]. Plants can be pruned back quite severely and resprout well from the base[200].

## 5.2.476 Helianthus doronicoides

4 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat 1.8 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliws hpa7tmwatli xre7t hjonli

drutta Helianthus doronicoides is a PERENNIAL growing to 1.8 m (6ft) by 0.6 m (2ft in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from September to October, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Tubers - cooked[2, 46, 61]. A similar taste to Jerusalem artichokes but less productive because the tubers are very thin[K].

tcanta None known dwatta None known propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring or autumn. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring. Basal cuttings in spring. Harvest the shoots when they are about 10 - 15cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Succeeds in moist soils in a sunny position[1]. Requires a rich soil[1]. Dislikes shade[1]. Plants have a running root system and can be invasive in suitable conditions[233]. The young growth is extremely attractive to slugs, plants can be totally destroyed by them[K]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. Possibly a naturally occurring hybrid, *H. giganteus* x *H. molis*[200].

## 5.2.477 Lilium davidii

4 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat 1 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprikliws hpa7tmwatli xre7t hjonli

drutta Lilium davidii is a BULB growing to 1 m (3ft 3in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to August, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium

(loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Bulb - cooked[105, 143]. One of the larger lily bulbs, it is up to 45mm in diameter[266]. Rich in starch, it can be used as a vegetable in similar ways to potatoes (*Solanum tuberosum*).

tcanta None known dwatta None known propta Seed - immediate epigeal germination[130]. Sow thinly in pots from late winter to early spring in a cold frame. Should germinate in 2 - 4 weeks[163]. Great care should be taken in pricking out the young seedlings, many people prefer to leave them in the seed pot until they die down at the end of their second years growth. This necessitates sowing the seed thinly and using a reasonably fertile sowing medium. The plants will also require regular feeding when in growth. Divide the young bulbs when they are dormant, putting 2 - 3 in each pot, and grow them on for at least another year before planting them out into their permanent positions when the plants are dormant[K]. Division with care in the autumn once the leaves have died down. Replant immediately[200]. Bulb scales can be removed from the bulbs in early autumn. If they are kept in a warm dark place in a bag of moist peat, they will produce bulbets. These bulbets can be potted up and grown on in the greenhouse until they are large enough to plant out[200]. The formation of bulbils on the stem can be induced by either removing the stem at flowering time and layering it just below the soil surface, or by removing all the flowers before they open.

nwatta Prefers an open free-draining humus-rich loamy soil with its roots in the shade and its head in the sun[200]. An easily grown plant, it tolerates some lime in the soil[143, 163, 200]. Stem rooting, the bulbs should be planted 15 - 20cm deep[143]. Early to mid autumn is the best time to plant out the bulbs in cool temperate areas, in warmer areas they can be planted out as late as late autumn[143]. This species is occasionally cultivated for its edible bulb in China[143]. The plant is widely cultivated for its root according to another report[266]. Closely allied to *L. willmotiae*[143]. The plant should be protected against rabbits and slugs in early spring. If the shoot tip is eaten out the bulb will not grow in that year and will lose vigour[200].

## 5.2.478 Lilium formosanum

Formosa lily 4 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat 1 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Lilium formosanum is a BULB growing to 1 m (3ft 3in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from August to October, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Bulb - cooked[105, 177]. The bulb can be up to 4cm in diameter[266]. Rich in starch, it can be used as a vegetable in similar ways to potatoes (*Solanum tuberosum*).

tcanta None known dwatta None known propta Seed - immediate epigeal germination[130]. Sow thinly in pots from late winter to early spring in a cold frame. Should germinate in 2 - 4 weeks[163]. Great care should be taken in pricking out the young seedlings, many people prefer to leave them in the seed pot until they die down at the end of their second years growth. This necessitates sowing the seed thinly and using a reasonably fertile sowing medium. The plants will also require regular feeding when in growth. This species can flower within a year from seed, especially if sown in the early autumn[143]. Division with care in the autumn once the leaves have died down. Replant immediately[200]. Bulb scales can be removed from the bulbs in early autumn. If they are kept in a warm dark place in a bag of moist peat, they will produce bulbets. These bulbets can

be potted up and grown on in the greenhouse until they are large enough to plant out[200].

nwatta Prefers an open free-draining humus-rich loamy soil with its roots in the shade and its head in the sun[200]. This species only tolerates temperatures down to about -3°C[260]. It is not fully hardy outside the mildest parts of Britain and is best grown as an annual or biennial in a cool greenhouse where it can flower in the first year from seed[143, 260]. In a warm climate the plant grows continually and will grow happily in pots in a conservatory[260]. The bulbs can be crammed into the pot with crocks below to give good drainage and a good loose compost above[260]. The form 'Price's var.' is an alpine form of the species, it breeds true from seed and it is hardy if grown in a sheltered spot in the rock garden[143]. The flowers diffuse a delicious sweet perfume[245]. Stem rooting, the bulbs should be planted 20cm deep[143]. Early to mid autumn is the best time to plant out the bulbs in cool temperate areas, in warmer areas they can be planted out as late as late autumn[143]. The plant should be protected against rabbits and slugs in early spring. If the shoot tip is eaten out the bulb will not grow in that year and will lose vigour[200].

## 5.2.479 Allium aflatunense

Persian Onion, Ornamental Onion

4 tin 8 cyuc 2 kcaak 0 tcan 2 dwat 1 m hkuc  
htut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis  
hpa7tmwatli xre7t hjonli

drutta Allium aflatunense is a BULB growing to 1 m (3ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from May to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcaakta Edible Parts: Flowers Leaves RootEdible Uses: Bulb - raw or cooked. The bulb varies greatly in size, from 2 - 6cm[200]. Leaves - raw or cooked. Flowers - raw. Used as a garnish on salads.

tcanta RepellentThe growing plant is said to repel insects and moles[20].

dwatta AntibioticThe plant possesses outstanding germicidal properties, all cultures being destroyed under its influence[240]. Although no other specific mention has been seen for this species, members of this genus are in general very healthy additions to the diet. They contain sulphur compounds (which give them their onion flavour) and when added to the diet on a regular basis they help reduce blood cholesterol levels, act as a tonic to the digestive system and also tonify the circulatory system[K].

propta Seed - sow spring in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle - if you want to produce clumps more quickly then put three plants in each pot. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in spring once they are growing vigorously and are large enough. Division in spring. The plants divide successfully at any time in the growing season, pot up the divisions in a cold frame or greenhouse until they are growing well and then plant them out into their permanent positions.

nwatta Landscape Uses:Container, Foundation, Massing, Rock garden, Seashore, Specimen. Prefers a sunny position in a light well-drained soil[1]. The bulbs should be planted fairly deeply[1]. Most members of this genus are intolerant of competition from other growing plants[203]. This species does not have the characteristic garlic smell of most members of the genus[200]. Grows well with most plants, especially roses, carrots, beet and chamomile, but it inhibits the growth of legumes[18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. Members of this genus are rarely if ever troubled by browsing deer[233]. Special Features: Fragrant foliage, Not North American native, Naturalizing, Attracts butterflies, Suitable for cut flowers, Suitable for dried flowers.

## 5.2.480 Artemisia ludoviciana

White Sage, Louisiana Sage, Prairie Sage, Western Mugwort  
4 tin 9 cyuc 2 kcaak 2 tcan 2 dwat 1 m hkuc  
hmimhtut cyutli hqatkyuctcup hwicli hrasjlut hpa7tli priklwis  
hpa7tmwatli xre7t hjonli

drutta Artemisia ludoviciana is a PERENNIAL growing to 1 m (3ft 3in) by 1 m (3ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from August to October, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcaakta Edible Parts: SeedEdible Uses: Condiment TeaLeaves and flowering heads are used as a flavouring or garnish for sauces, gravies etc[183]. A herb tea is made from the leaves and flowering heads[183]. Seed[105, 161, 177, 183]. No further details are given but the seed is very small and fiddly to use.

tcanta Deodorant RepellentThe plant makes a useful ground cover plant once it is established[190]. The leaves can be placed in the shoes as a foot deodorant[257]. An infusion of the leaves has been used as an underarm deodorant[257]. The soft leaves can be used as a toilet paper[257]. The plant can be burnt to repel mosquitoes[257].

dwatta Astringent Deodorant Eczema Poultice SkinThe leaves are astringent[222]. They were commonly used by the N. American Indians to induce sweating, curb pain and diarrhoea[222]. A weak tea was used in the treatment of stomach ache and menstrual disorders[222]. Externally, a wash of the leaves was applied to itching, rashes, swellings, boils, sores, etc[222]. The wash was also applied to eczema and as an underarm deodorant[257]. A poultice of the leaves can be applied to spider bites, blisters and burst boils[257]. A sniff of the crushed leaves has been used to treat headaches, the sinuses and nosebleeds[257].

propta Seed - surface sow from late winter to early summer in a greenhouse, making sure that the compost does not dry out[200]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant out in late spring or early summer. Division in spring or autumn[200]. Basal cuttings in late spring. Harvest the young shoots when about 10 - 15cm long, pot up in a lightly shaded position in a greenhouse or cold frame and plant them out when well rooted. Very easy.

nwatta Experimental Crop Industrial Crop: Hydrocarbon Management: CoppiceLandscape Uses:Border, Container, Ground cover, Massing, Seashore. Easily grown in a well-drained circumneutral or slightly alkaline loamy soil, preferring a sunny position[1, 200]. Does well in a sandy soil[188]. Established plants are very drought tolerant[190]. Plants are longer lived, more hardy and more aromatic when they are grown in a poor dry soil[245]. A very polymorphic species[43]. Slugs love the young shoots of this plant and have been known to destroy even well-established plants[K]. A very ornamental plant, spreading by stolons to form loose patches[187], it can be invasive[190]. There are many named forms selected for their ornamental value[200]. Members of this genus are rarely if ever troubled by browsing deer[233]. Special Features: Attractive foliage, Fragrant foliage, Invasive, Suitable for dried flowers.

## 5.2.481 Sanguisorba officinalis

Great Burnet

4 tin 8 cyuc 2 kcaak 2 tcan 3 dwat 1 m hkuc  
hmimhtut cyutli kyuctcuphja7n hwicli hyishrasjlutnyik  
hpa7tli flatpriklwisslip hpa7tmwatli fyifkre7t hjonli

drutta Sanguisorba officinalis is a PERENNIAL growing to 1 m (3ft 3in) by 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from June to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can

tolerate in the growing season[200]. Plants are hardy to at least -15°C[238]. The plant is heat tolerant in zones 8 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

## 5.2.502 Polygonatum verticillatum

Whorled Solomon's Seal

4 tin 8 cyuc 2 kcaak 0 tcan 0 dwat 1.2 m hkuc  
pcimhmim cyutli tcup hwicli hrasjlutnyik hpa7tli frusflat-  
priklwis hpa7tmwatli fyifkre7t hjonli

drutta Polygonatum verticillatum is a PERENNIAL growing to 1.2 m (4ft) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcaakta Edible Parts: Leaves RootEdible Uses: Tender leaves and young shoots - cooked as a vegetable[51, 272]. They can be used as an asparagus substitute. Root - cooked[105]. Rich in starch.

tcanta None known

dwatta None known

propta Seed - best sown as soon as it is ripe in early autumn in a shady part of a cold greenhouse[200]. Sow stored seed as early in the year as possible. Germination can be slow, they may not come true to type[200] and it takes a few years for them to reach a good size. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a shady position in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in March or October. Larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Prefers a fertile humus rich moisture retentive well-drained soil in cool shade or semi-shade[200]. Plants are intolerant of heat and drought but tolerate most other conditions[200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. The young shoots are very attractive to slugs[K]. Hybridizes with other members of this genus[200].

## 5.2.503 Elymus glauca

Blue Wild Rye

4 tin 8 cyuc 2 kcaak 0 tcan 0 dwat 1 m hkuc  
htut cyutli kyuctcup hwicli hyishrasjlutnyik hpa7tli flatprik-  
lwis hpa7tmwatli xre7t hjonli

drutta Elymus glauca is a PERENNIAL growing to 1 m (3ft 3in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in August, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH:

mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcaakta Edible Parts: SeedEdible Uses: Seed - cooked[105, 161]. It can be ground into a flour and used to make bread. Very fiddly to use, the seed is small and difficult to extract[K].

tcanta Soil stabilization WeavingThe leaves are used for making mats, rope, paper etc. Often planted near the coast to stabilize sand dunes.

dwatta None known

propta Seed - sow mid spring in situ and only just cover the seed[162]. Germination should take place within 2 weeks. If the supply of seed is limited, it can also be sown in mid spring in a cold frame. Only just cover the seed. When large enough to handle, prick the seedlings out into individual pots and plant them out in summer[K] Division in spring or summer[162]. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta An easily grown plant, it succeeds in most soils, preferring a sandy soil and a sunny position[1, 162].

## 5.2.504 Pteridium aquilinum esculentum

Bracken

4 tin 8 cyuc 2 kcaak 0 tcan 2 dwat 1.2 m hkuc  
hmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli frusflat-  
prik hpa7tmwatli hjonli

drutta Pteridium aquilinum esculentum is a FERN growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 4. The seeds ripen from July to August. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcaakta Edible Parts: Leaves RootEdible Uses: SweetenerRoot - rich in a white starch that can be eaten raw or cooked[193]. It can also be dried and ground into a powder[2, 13, 46, 55, 66, 94, 95, 102]. The root is very fibrous[173]. When dried, it will store for years[173]. The root contains 60% starch[74]. The dry weight content of starch is between 43 and 72%[173]. This starch can be extracted from the roots and is used in making dumplings which are eaten with soya flour and sugar as a delicacy[183]. Young shoots - raw or cooked[2, 13, 55, 62, 94, 102, 183]. They can be used like asparagus or like spinach[9]. Somewhat flavourless, though they are considered to be a delicacy in Japan[4]. The fronds should be used when less than 20cm long, longer ones have a terrible taste[9, 213]. The shoots are somewhat bitter so they are often blanched for a few minutes in boiling water, then left to soak in cold water for two hours before being cooked[4, 9]. Although this might well improve the flavour, it will greatly reduce the nutritional value[K]. The shoots should be steeped in lye first[55]. Occasional use should cause no problems, but regular consumption is not advisable because the shoots might be carcinogenic[9, 65]. The plant yields an edible saccharine substance[55]. (from the cooking root???)

tcanta Adhesive Basketry Biomass Compost Dye Hair Lining Packing Repellent Soap Soap making Stuffing TinderA glue can be made from the rootstock[74]. A brown dye is obtained from the fronds[6, 67, 141]. It is green according to another report[141]. The fibrous remnants from edible roots make a good tinder[99]. The rhizome lathers readily in water and can be used as a soap[74]. A decoction of the root has been used as a hair wash[257]. The roots have been rubbed into the scalp in order to promote hair growth[257]. The roots have been pounded to remove the bark, then split into flat bands and used as the black strands of cheap baskets[257]. The ashes of the plant are rich in potassium and could be used as a fertilizer[4]. They are also used in the manufacture of glass (when mixed with sand) and in making soap (when mixed with vegetable oil)[4, 74]. The roots contain up to 20% potash in early summer, but this reduces to about 5% in the autumn[4]. The whole plant is a very valuable addition to the compost heap, it is rich in potash and makes an excellent compost for tree seeds[67, 94]. Cut twice

be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

**nwatta Landscape Uses:**Border, Massing, Rock garden, Specimen. Requires a sunny position and a well-drained soil containing lime[42]. Easily cultivated in a sunny position in ordinary garden soil[187]. Prefers a pH between 6 and 7.5 or higher[200]. Established plants are drought tolerant[190]. Cultivated, especially in Italy, for the essential oil in its root[4]. The flowers are sweetly scented, reminding some people of orange blossom, others of vanilla and others of civet[245]. A very vigorous species[42]. The rhizome should be planted partly above the soil[1]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. **Special Features:** Attractive foliage, Fragrant foliage, All or parts of this plant are poisonous.

## 5.2.499 Angelica gigas

Giant Angelica, Purple Parsnip, Korean Angelica

drutta Angelica gigas is a PERENNIAL growing to 1.8 m (6ft) at a medium rate. It is not frost tender. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**kcaakta Edible Parts:** Leaves**Edible Uses:** Young leaves - cooked[177, 183].

**tcanta None known**

**dwatta Blood tonic Women's complaints**The root is used in Korea to treat anaemia, hemiplegia and women's diseases[279]. It contains a number of active compounds and has been shown to increase duodenum motility and have an anti-platelet aggregation action[279].

**propta Seed** - best sown in a cold frame as soon as it is ripe since the seed only has a short viability[200]. Seed can also be sown in the spring, though germination rates will be lower. It requires light for germination[200]. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for their first winter, planting them out into their permanent positions in the spring. The seed can also be sown in situ as soon as it is ripe.

**nwatta Landscape Uses:**Specimen, Woodland garden. Requires a deep moist fertile soil in dappled shade or full sun[200]. Hardy to about -20°C[187]. Plants flower in 2 years from seed[187] and are reliably perennial if prevented from setting seed[200]. **Special Features:** Attractive foliage, Naturalizing.

## 5.2.500 Lilium japonicum platyfolium

Bamboo Lily

4 tlin 8 cyuc 2 kcaok 0 tcan 2 dwat 1 m hkuc hmimhtut cyutli tcup hwicli hysjraslut hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Lilium japonicum platyfolium is a BULB growing to 1 m (3ft 3in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in July, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**kcaakta Edible Parts:** Root**Edible Uses:** Bulb - cooked[2, 4, 105]. It contains about 18% starch[174]. A slightly bitter taste[174]. It can be used as a vegetable in similar ways to potatoes(Solanum tuberosum).

**tcanta None known**

**dwatta Antiasthmatic Antitussive Expectorant Nutritive Sedative Tonic**The bulb is antiasthmatic, antitussive, expectorant, sedative and tonic (nutritive)[174, 176]. It is used in the treatment of coughs, haemoptysis, insomnia and fidgetiness in the later stage of febrile disease[176].

**propta Seed** - delayed hypogeal germination[130]. Best sown as soon as ripe in a cold frame, it should germinate in spring[143]. Stored seed will require a warm/cold/warm cycle of stratification, each period being about 2 months long[163]. Grow on in cool shady conditions. Great care should be taken in pricking out the young seedlings, many people leave them in the seed pot until they die down at the end of their second years growth. This necessitates sowing the seed thinly and using a reasonably fertile sowing medium. The plants will also require regular feeding when in growth. Divide the young bulbs when they are dormant, putting 2 - 3 in each pot, and grow them on for at least another year before planting them out into their permanent positions when the plants are dormant[K]. Division with care in the autumn once the leaves have died down. Replant immediately[200]. Bulb scales can be removed from the bulbs in early autumn. If they are kept in a warm dark place in a bag of moist peat, they will produce bulblets. These bulblets can be potted up and grown on in the greenhouse until they are large enough to plant out[200].

**nwatta** Prefers an open free-draining humus-rich loamy soil with its roots in the shade and its head in the sun[200]. Grows well in open woodland[1]. Likes plenty of moisture and some shade[42, 47]. Just to totally confuse matters, one report says that this species prefers a poor gravelly loam with plenty of leafmold and some charcoal, in a sunny position[143]. Requires protection from winter rains[143]. This sub-species is more vigorous than the type and has broader leaves. Stem rooting, the bulbs should be planted 15 - 20cm deep[143]. Early to mid autumn is the best time to plant out the bulbs in cool temperate areas, in warmer areas they can be planted out as late as late autumn[200]. A very ornamental plant[1], it is cultivated for its bulb in Japan[2] and is also a sacred flower in Japanese Shinto rites[174]. The plant should be protected against rabbits and slugs in early spring. If the shoot tip is eaten out the bulb will not grow in that year and will lose vigour[200].

## 5.2.501 Pycnanthemum virginianum

Virginia Mountain Mint

4 tlin 8 cyuc 2 kcaok 0 tcan 2 dwat 1 m hkuc hmimhtut cyutli kyuctup hwicli hrsajlutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Pycnanthemum virginianum is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

**kcaakta Edible Parts:** **Edible Uses:** Condiment TeaFlower buds and leaves - raw or cooked. A mint-like flavour, they make a nice addition to salads or can be used as a condiment[61, 161, 183, 238]. The fresh or dried leaves are brewed into a refreshing mint-like tea[183].

**tcanta None known**

**dwatta Alternative Analgesic Carminative Diaphoretic Febrifuge**A tea made from the leaves is alternative, diaphoretic and carminative[222, 257]. A poultice of the leaves is used in the treatment of headaches[222]. The tea is also used in the treatment of menstrual disorders, indigestion, colic, coughs, colds, chills and fevers[222, 238, 257].The flowering stems are cut as flowering begins and they can be used fresh or dried[238]. There is a suggestion that this plant can cause abortions, so it is best not used by pregnant women[257].

**propta Seed** - sow spring or autumn in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. If there are sufficient seeds they can be sown in an outdoor seedbed in April. Division in spring.

**nwatta** Succeeds in most soils[1] but prefers a rich loamy soil in full sun or partial shade with plenty of mois-

grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry moist or wet soil.

**kcaakta Edible Parts:** Leaves**Edible Uses:** TeaYoung leaves and flower buds - raw or cooked[13, 61, 105]. They should be harvested in the spring before the plant comes into flower[9]. A cucumber flavour[7, 46], they can be added to salads or used as a potherb[183]. The fresh or dried leaves are used as a tea substitute[183].

**tcanta Tannin**The roots contain tannin[7].

**dwatta Anodyne Antidiarrhoeic Astringent Contraceptive Diuretic Dysentery Eczema Febrifuge Haemostatic Tonic Vulnery**Great burnet is employed mainly for its astringent action, being used to slow or arrest blood flow. It is taken both internally and externally internally and is a safe and effective treatment. Modern research in China has shown that the whole herb heals burns more effectively than the extracted tannins (the astringent component of the plant)[254]. Patients suffering from eczema showed marked improvement when treated with an ointment made from the root and petroleum jelly[254]. The leaves are astringent, refrigerant, styptic and tonic[7, 218, 222]. They are used in the treatment of fevers and bleeding[218, 222]. The plant is prevented from flowering and then the leaves are harvested in July and dried for later use[4, 238]. The root is anodyne, astringent, diuretic, febrifuge, haemostatic, tonic and vulnerary[4, 7, 9, 21, 147, 165, 176, 178, 218]. It is used in the treatment of peptic ulcers, haematuria, menorrhagia, bloody stool, dysentery, diarrhoea, haemorrhoids and burns[176]. The root is harvested in the autumn as the leaves die down and dried for later use[4, 238]. All parts of the plant are astringent, but the root is most active[4]. Great burnet is an excellent internal treatment for all sorts of abnormal discharges including diarrhoea, dysentery and leucorrhoea[4]. It is used externally in the treatment of burns, scalds, sores and skin diseases[238]. This species was ranked 19th in a Chinese survey of 250 potential anti-fertility plants[218].

**propta Seed** - sow spring or autumn in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out as soon as they have reached a reasonable size. The seed can also be sown in situ in early spring[4]. Division in the spring or in autumn[4].

**nwatta** Succeeds in ordinary garden soil[1]. Prefers a good moist soil that does not dry out in the summer, in sun or partial shade[187, 200]. Plants grow tolerably well in very poor soils and likes a dry chalky soil[4]. This species is hardy to about -25°C[187]. The plant is heat tolerant in zones 8 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

## 5.2.482 Physalis subglabrata

Longleaf groundcherry

4 tlin 8 cyuc 2 kcaok 0 tcan 0 dwat 1.5 m hkuc hmimhtut cyutli kyuctup hwicli hrsajlutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Physalis subglabrata is a PERENNIAL growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in leaf from May to October, in flower from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

**kcaakta Edible Parts:** Fruit**Edible Uses:** Edible fruit - raw or cooked[85]. The plant conveniently wraps up each fruit in

its own 'paper bag' (botanically, the calyx) to protect it from pests and the elements. This calyx is toxic and should not be eaten.

**tcanta None known**

**dwatta None known**

**propta Seed** - sow March/April in a greenhouse only just covering the seed. Germination usually takes place quickly and freely. Prick out the seedlings into individual pots of fairly rich soil when they are large enough to handle and plant them out after the last expected frosts. Consider giving them some protection such as a cloche until they are growing away well. Diurnal temperature fluctuations assist germination[170]. Division in spring[111]. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer. Basal cuttings in early summer[111]. Harvest the shoots with plenty of underground stem when they are about 8 - 10cm above the ground. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

**nwatta** We have very little information on this species and do not know if it will be hardy in Britain, though judging by its native range it should succeed outdoors at least in the milder parts of this country. If it proves to be tender, it should be possible to treat it as an annual, sowing the seed in early spring in a warm greenhouse and planting out after the last expected frosts[K]. There is some confusion over the name of this species, it might be best treated as a sub-species of *P. virginiana*, when it will be *P. virginiana subglabrata*. (MacKenzie. and Bush.)Waterfall. The plant has a deep rootstock[235]. The following notes are based on the general needs of the genus. Succeeds in any well-drained soil in full sun or light shade[200].

## 5.2.483 Pteridium aquilinum

Bracken, Western brackenfern, Decomposition brackenfern, Hairy brackenfern

4 tlin 7 cyuc 2 kcaok 0 tcan 2 dwat 1.2 m hkuc hmimhtut cyutli kyuctup hwicli hrsajlutnyik hpa7tli frusflat-prik hpa7tmwatli hjonli

drutta Pteridium aquilinum is a FERN growing to 1.2 m (4ft) by 2 m (6ft 7in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4. The seeds ripen from July to August. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

**kcaakta Edible Parts:** Leaves **RootEdible Uses:** Sweetener**Root** - cooked. It can be dried and ground into a powder[2, 13, 46, 55, 66, 94, 95, 102, 257]. The root is very fibrous so traditionally it was baked after being dried, the outer skin was peeled off and the roots pounded into a powder with sticks so that the inner fibres could be removed[173, 256]. The dried root will store for years[173]. The root contains 60% starch[74]. The dry weight content of starch is between 43 and 72%[173]. This starch can be extracted from the roots and is used in making dumplings which are eaten with soya flour and sugar as a delicacy[183]. The root has a somewhat constipating effect upon the body so is best eaten with foods that have a laxative quality[256]. Young shoots, harvested when still unfurling, can be eaten raw or cooked[2, 13, 55, 62, 94, 102, 183, 257]. They can be used like asparagus or like spinach[9, 257]. Somewhat flavourless, though they are considered to be a delicacy in Japan[4]. The fronds should be used when less than 20cm long, longer ones have a terrible taste[9, 213]. The shoots are somewhat bitter so they are often blanched for a few minutes in boiling water, then left to soak in cold water for two hours before being cooked[4, 9]. Although this might well improve the flavour, it will greatly reduce the nutritional value[K]. The shoots should be steeped in lye first[55]. Occasional use should cause no problems, but regular consumption is not advisable because the shoots might be carcinogenic[9, 65]. The plant yields an edible saccharine substance[55]. (From the cooking root???)

**tcanta Adhesive Basketry Biomass Compost Dye Hair Lining Mulch Packing Repellent Soap Soap making Stuffing Thatching Tinder**A glue can be made from the rootstock[74].

A brown dye is obtained from the fronds[6, 67, 141]. It is green according to another report[141]. The fibrous remnants from edible roots make a good tinder[99]. The rhizome lathers readily in water and can be used as a soap[74]. A decoction of the root has been used as a hair wash[257]. The roots have been rubbed into the scalp in order to promote hair growth[257]. The roots have been pounded to remove the bark, then split into flat bands and used as the black strands of cheap baskets[257]. The ashes of the plant are rich in potassium and could be used as a fertilizer[4]. They are also used in the manufacture of glass (when mixed with sand) and in making soap (when mixed with vegetable oil)[4, 74]. The roots contain up to 20% potash in early summer, but this reduces to about 5% in the autumn[4]. The whole plant is a very valuable addition to the compost heap, it is rich in potash and makes an excellent compost for tree seeds[67, 94]. Cut twice a year if you want the plants to continue growing, three cuts annually will weaken and eventually kill off the plants. The dried ferns produce a very durable thatch[4]. The leaves are used as a packing material for fruit, keeping it fresh and cool without imparting any colour or flavour[4, 66, 99]. They are also used as a lining for baskets, fruit drying racks etc and as a bedding[66, 99]. The leaves repel insects and can help to prevent rot in the fruits etc[99]. Dried bracken fronds are very useful in the garden as a mulch for somewhat tender plants. This will keep the soil warmer, protect from wind damage and also keep off some of the rain[4, K].

dwatta Anthelmintic Antiemetic Antiseptic Diuretic Poulitce Refrigerant TonicThe young shoots are diuretic, refrigerant and vermifuge[4, 46, 94, 218]. They have been eaten as a treatment for cancer[257]. The leaves have been used in a steam bath as a treatment for arthritis[257]. A decoction of the plant as been used in the treatment of tuberculosis[257]. A poultice of the pounded fronds and leaves has been used to treat sores of any type and also to bind broken bones in place[257]. The root is antiemetic, antiseptic, appetizer and tonic[257]. A tincture of the root in wine is used in the treatment of rheumatism[218]. A tea made from the roots is used in the treatment of stomach cramps, chest pains, internal bleeding, diarrhoea, colds and also to expel worms[4, 46, 94, 222, 257]. The poulticed root is applied to sores, burns and caked breasts[222, 257].

propta Spores can be sature sown in the same way as other ferns but this plant really does not need any help in spreading itself about. Division is also possible but usually totally unnecessary.

nwatta Landscape Uses:Border, Foundation, Rock garden, Woodland garden. Prefers a light, acid, deep sandy soil[1]. Dislikes shade according to some reports[13, 17] whilst another says that it tolerates full sun but prefers light shade[200]. Prefers a pH in the range 4 to 6[200]. Members of this genus are rarely if ever troubled by browsing deer[233]. This is an extremely invasive plant and is a noxious weed. It is one of the most widespread plants in the world, being found in all parts of the globe other than the extreme north and south[4]. Plants can be cut down twice a year to provide compost material, this will not kill the plants. If the plants are cut down three times a year this will gradually weaken and eventually kill them. Special Features:Attractive foliage, Not North American native, Invasive, All or parts of this plant are poisonous, There are no flowers or blooms.

### 5.2.484 Lilium leichtlinii

4 tin 8 cyuc 2 kcaak 0 tcan 0 dwat 1.2 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Lilium leichtlinii is a BULB growing to 1.2 m (4ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to August, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Bulb - cooked[85, 105]. Rich in starch, it can be used as a vegetable in similar ways to potatoes (*Solanum tuberosum*).

tcanta None known

dwatta None known

propta Seed - immediate epigeal germination[130]. Sow thinly in pots from late winter to early spring in a cold frame. Should germinate in 2 - 4 weeks[163]. Great care should be taken in pricking out the young seedlings, many people prefer to leave them in the seed pot until they die down at the end of their second years growth. This necessitates sowing the seed thinly and using a reasonably fertile sowing medium. The plants will also require regular feeding when in growth. Divide the young bulbs when they are dormant, putting 2 - 3 in each pot, and grow them on for at least another year before planting them out into their permanent positions when the plants are dormant[K]. Division with care in the autumn once the leaves have died down. Replant immediately[200]. Bulb scales can be removed from the bulbs in early autumn. If they are kept in a warm dark place in a bag of moist peat, they will produce bulblets. These bulblets can be potted up and grown on in the greenhouse until they are large enough to plant out[200].

nwatta Requires a light humus-rich acid soil and plenty of moisture in late spring[47]. Should succeed in a cool well-drained peat, leaf-mold and sand mix with shelter from the midday sun[42]. Plants are best grown in a greenhouse border in Britain[1]. This species could be one of the parents of *L. lancifolium*[90]. Stem rooting, the bulbs should be planted 15cm deep[42, 200]. Early to mid autumn is the best time to plant out the bulbs in cool temperate areas, in warmer areas they can be planted out as late as late autumn[200]. It is said that this species is very difficult to grow[143] whilst its variety *L. leichtlinii maximowiczii* is much easier[42], but this is not necessarily the case[47]. The plant should be protected against rabbits and slugs in early spring. If the shoot tip is eaten out the bulb will not grow in that year and will lose vigour[200].

#### 5.2.485 Cicerbita alpina

Blue Sow Thistle

4 tin 8 cyuc 2 kcaak 0 tcan 1 dwat 1 m hkuc hmim cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli fyfexre7t hjonli

drutta Cicerbita alpina is a PERENNIAL growing to 1 m (3ft 3in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from July to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, beetles, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: Leaves StemEdible Uses: Young shoots and stems - raw[4, 105]. The skin is first removed, but the shoots are still rather bitter and unpalatable[4, K]. Older stems can also be peeled and eaten raw[105, 177, 183] but have a bitter taste[2].

tcanta None known

dwatta Antiphlogistic DiureticThe leaves and milky sap were at one time often used in herbal medicine, though are seldom employed nowadays[4]. They are diuretic and are also applied externally to inflammations[4].

propta Seed - sow spring in a cold frame. Only just cover the seed and do not let the compost dry out. When they are large enough to handle, prick the seedlings out into individual pots and plant them out into their permanent positions in the summer. Division in spring[188]. We have found it best to pot up the clumps and grow them on in a cold frame until they are rooting well. Plant them out in the summer or following spring.

nwatta Prefers a moist well-drained humus rich neutral to acid light sandy soil and some shade[1, 187, 200]. Plants are hardy to at least -20°c[187].

#### 5.2.486 Ribes cereum

Wax Currant

4 tin 8 cyuc 2 kcaak 0 tcan 1 dwat 1.8 m hkuc htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatprikliws hpa7tmwatli xre7t hjonli

following spring after the last expected frosts. Division in spring or autumn. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Succeeds in an ordinary garden soil[1] but prefers a moisture retentive not too fertile soil in sun or part shade[200]. Grows well near water[1]. Repays generous treatment[1]. Plants seem to be immune to the predations of rabbits[233]. Plants can be invasive but they are easily controlled by spading around the clump[200].

#### 5.2.497 Yucca glauca

Soapweed, Soapweed yucca, Gurney's yucca, American Vetch, Yucca, Narrowleaf Yucca, Soapweed
4 tin 10 cyuc 2 kcaak 0 tcan 2 dwat 1.5 m hkuc hmimhtut cyutli hgatkyuctcup hwicli hyishrasjlutnyik hpa7tli flatprikliws hpa7tmwatli xre7t hjonli

drutta Yucca glauca is an evergreen Shrub growing to 1.5 m (5ft) by 0.5 m (1ft 8in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in leaf all year, in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Hand. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: Flowers Fruit Leaves Seedpod StemEdible

Uses: Fruit - raw or cooked[2, 46, 61, 161, 257]. Dry, with a bitter skin[85]. The fruit can be baked and either eaten immediately or formed into cakes and dried for later use[257]. The raw fruit can be dried for winter use[1, 257]. The immature fruits are peeled, boiled and served with seasonings[183]. The soaked, cooked fruit can be made into a syrup and used like hot chocolate[257]. The fruit is up to 8cm long and 12mm wide[2]. Flowers and flower buds - raw or cooked[61, 85]. Delicious raw, they can also be dried, crushed and used as a flavouring[164]. A delicious addition to the salad bowl, or used as a potherb[183]. Flowering stem - raw or cooked[62, 85, 161, 257]. It can be cooked and used like asparagus[164]. The white inner portion of the stem is eaten[183]. Seedpods - cooked. They can be boiled or roasted and used as a vegetable[257]. The plant crowns have been roasted and eaten in times of food shortage[257].

tcanta Basketry Broom Brush Fibre Hair Needles Soap String WeavingBoth the leaves, and a fibre obtained from the leaves, can be used for making cloth, ropes and mats[21, 57, 61, 82, 85, 169, 257]. The leaves can be split and used to make baskets[257]. The leaves are used as paint brushes and brooms[46, 85, 92]. The leaves can be split and used as a temporary tying material[257]. The sharp points of the leaves have been used as needles[257]. The roots are rich in saponins and can be used as a soap substitute[82, 85, 95]. The soap obtained from the root makes a good hair shampoo[95], it is said to be effective against dandruff and also to act as a tonic to stop the hair falling out[213, 257]. The shampoo also rids the body of lice and other parasites[257].

dwatta Antidandruff Contraceptive Oxytoxic Poulitce SkinA soap made from the crushed roots is said to be an effective treatment for dandruff and skin irritations[213, 222]. A cold infusion of the root has been used to expedite the delivery of a child or the placenta[257]. The root is poulticed and applied to inflammations, wounds, bleeding cuts, sprains etc[222, 257]. The rotten root can be crushed and boiled to make suds. Drinking these suds is said to induce the menopause in women, thereby rendering them infertile[257].

propta Seed - sow spring in a greenhouse. Pre-soaking the seed for 24 hours in warm water may reduce the germination time. It usually germinates within 1 - 12 months if kept at a temperature of 20°c. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse or cold frame for at least their first two winters. Plant them out into their permanent positions in early summer and consider giving them some winter protection for at least their first winter outdoors - a simple pane of glass is usually sufficient[K]. Seed is not produced in

Britain unless the flowers are hand pollinated. Root cuttings in late winter or early spring. Lift in April/May and remove small buds from base of stem and rhizomes. Dip in dry wood ashes to stop any bleeding and plant in a sandy soil in pots in a greenhouse until established[78]. Division of suckers in late spring. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the following spring.

nwatta Landscape Uses:Border, Erosion control, Massing, Rock garden, Seashore, Specimen. Thrives in most soils but prefers a sandy loam and full exposure to the south[11]. Dislikes chalky or peaty soils[111]. Can succeed in light shade[K]. Plants are hardier when grown on poor sandy soils[200]. Prefers a hot dry position and a poor soil[166]. Established plants are very drought tolerant[200]. Hardy to at least -30°c according to one report[164], whilst another one says that it is hardy to about -15°c[200]. A very ornamental plant[1], it rarely flowers unless in a dry sandy soil[42]. The scent of the flowers is most pronounced at night[245]. In the plants native environment, its flowers can only be pollinated by a certain species of moth. This moth cannot live in Britain and, if fruit and seed is required, hand pollination is necessary. This can be quite easily and successfully done using something like a small paint brush[1]. Individual crowns are monocarpic, dying after flowering[233]. However, the crown will usually produce a number of sideshoots before it dies and these will grow on to flower in later years[233]. Plants in this genus are notably resistant to honey fungus[200]. Members of this genus seem to be immune to the predations of rabbits[233]. Special Features:Attractive foliage, North American native.

#### 5.2.498 Iris pallida

Dalmation Iris, Sweet Iris, Fragrant Iris, Zebra Iris

4 tin 10 cyuc 2 kcaak 0 tcan 1 dwat 1 m hkuc hmimhtut cyutli hgatkyuctcup hwicli hrasjlut hpa7tli flatprikliwssip hpa7tmwatli fyfexre7t hjonli

drutta Iris pallida is a PERENNIAL growing to 1 m (3ft 3in) by 1.5 m (5ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Edible Uses: CondimentThe root can be dried, ground into a powder and used as a food flavouring[46, 171]. The root may take several years of drying to develop its full fragrance[168]. 'Orris oil' is an essential oil derived from the dried root, it is used as a flavouring in soft drinks, sweets, chewing gum etc[183].

tcanta Cosmetic Dye EssentialThe root is a source of Orris powder which has the scent of violets[238]. It is obtained by grinding up the dried root[4, 7, 46]. It is much used as a fixative in perfumery and pot-pourri, as an ingredient of toothpastes, breath fresheners etc and as a food flavouring. The root can take several years of drying to fully develop its fragrance, when fresh it has an acrid flavour and almost no smell[4, 168]. An essential oil is obtained from the fresh root, this has the same uses as the root[57, 61]. The juice of the root is sometimes used as a cosmetic and also for the removal of freckles from the skin[4]. A black dye is obtained from the root[168]. A blue dye is obtained from the flowers[168]. Plants can be grown for ground cover, the dense mat of roots excluding all weeds[208].

dwatta CatharticCathartic[4]. The juice of the fresh root is a strong purg of great efficiency in the treatment of dropsy[4].

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed should be sown as early in the year as possible in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse or cold frame for their first year. Plant out into their permanent positions in late spring or early summer. Division, best done after flowering, though it can be done at almost any time. Very easy, larger clumps can

*P. sinensis*[11, 109]. Flowers are produced very early in the spring and they are then easily damaged by frosts[11]. The flowers are produced on the previous seasons wood[200]. They are produced on old wood according to another report[182]. Plants only fruit in Britain after long hot summers[200].

## 5.2.494 Berberis everstiana

4 tlin 8 cyuc 2 kcaak 0 tcan 2 dwat 1.5 m hkuc hmimhtut cyutli kyuctup hwicli hyshraslutnyikfrp hpa7tli flatpriklwis hpa7tmwatli fyfxre7t hjonli

drutta *Berberis everstiana* is a SHRUB growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from May to June, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw[272]. The fleshy oblong fruit is about 15mm long.

tcanta DyeA yellow dye is obtained from the root and bark.

dwatta Antibacterial Cancer Dysentery Ophthalmic StomachicBerberine, universally present in rhizomes of *Berberis* species, has marked antibacterial effects. Since it is not appreciably absorbed by the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not be used with *Glycyrrhiza* species (Licquorice) because this nullifies the effects of the berberine[218]. Berberine has also shown antitumour activity[218].

propta Seed - best sown as soon as it is ripe in a cold frame, when it should germinate in late winter or early spring[78]. Seed from over-ripe fruit will take longer to germinate[78], whilst stored seed may require cold stratification and should be sown in a cold frame as early in the year as possible[80]. The seedlings are subject to damping off, so should be kept well ventilated[113]. When the seedlings are large enough to handle, prick them out into individual pots and grow them on in a cold frame. If growth is sufficient, it can be possible to plant them out into their permanent positions in the autumn, but generally it is best to leave them in the cold frame for the winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, July/August in a frame[11, 113]. Pot up in the spring[113]. Cuttings of mature wood of the current season's growth, preferably with a heel, October/November in a frame[78].

nwatta Prefers a warm moist loamy soil and light shade but it is by no means fastidious, succeeding in thin, dry and shallow soils[11, 200]. Grows well in heavy clay soils. Hybridizes freely with other members of this genus[1]. Closely related to *B. tsangpoensis*[11]. Plants can be pruned back quite severely, they resprout well from the base[200].

## 5.2.495 Lilium speciosum

Oriental Lily

4 tlin 9 cyuc 2 kcaak 0 tcan 1 dwat 1.2 m hkuc hmimhtut cyutli tcup hwicli hraslut hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta *Lilium speciosum* is a BULB growing to 1.2 m (4ft) by 0.3 m (1ft in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from August to September, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Bulb - cooked[2, 105, 163, 266]. The bulb is about 5cm in diameter[266]. Rich in starch, it can be used as a vegetable in similar ways to potatoes (*Solanum tuberosum*).

tcanta None known

dwatta The bulb is used medicinally[266]. No further information is given.

propta Seed - delayed hypogeal germination[130]. Best sown as soon as ripe in a cold frame, it should germinate in spring[143]. Stored seed will require a warm/cold/warm cycle of stratification, each period being about 2 months long[163]. Grow on in cool shady conditions. Great care should be taken in pricking out the young seedlings, many people leave them in the seed pot until they die down at the end of their second years growth. This necessitates sowing the seed thinly and using a reasonably fertile sowing medium. The plants will also require regular feeding when in growth. Divide the young bulbs when they are dormant, putting 2 - 3 in each pot, and grow them on for at least another year before planting them out into their permanent positions when the plants are dormant[K]. Division with care in the autumn once the leaves have died down. Replant immediately[200]. Bulb scales can be removed from the bulbs in early autumn. If they are kept in a warm dark place in a bag of moist peat, they will produce bulblets. These bulblets can be potted up and grown on in the greenhouse until they are large enough to plant out[200].

nwatta Landscape Uses:Border, Container, Seashore, Specimen. Prefers an open free-draining humus-rich loamy soil with its roots in the shade and its head in the sun[200]. Dislikes lime[42]. Prefers a light sandy loam with plenty of leafmold[47]. Best grown in open woodland or amongst dwarf evergreens[1]. Prefers a sunny position[42, 143]. The dormant bulbs are fairly hardy and will withstand soil temperatures down to at least -5°C[214]. Stem rooting, the bulbs should be planted 25 - 30cm deep[143]. Early to mid autumn is the best time to plant out the bulbs in cool temperate areas, in warmer areas they can be planted out as late as late autumn[200]. A very ornamental plant[1] it is easily grown[163] but requires a long growing season if it is to do well[200]. The flowers diffuse a powerful sweet honey perfume[245]. Cultivated for its edible bulb in Japan[2]. The sub-species *L. speciosum rubrum*. Mast. ex Bak. is said to be inedible whilst *L. speciosum album*. Mast. ex Bak. is said to be acceptable for eating[163]. The variety 'Magnificum' is said to be the best form for growing outdoors in Britain[245]. Plants take 4 years to flower from seed[143]. The plant should be protected against rabbits and slugs in early spring. If the shoot tip is eaten out the bulb will not grow in that year and will lose vigour[200]. Special Features: Not North American native, Attracts butterflies, Suitable for cut flowers, Fragrant flowers, Attractive flowers or blooms.

## 5.2.496 Polygonum alpinum

Alpine Knotweed, Alaska wild rhubarb

4 tlin 8 cyuc 2 kcaak 0 tcan 1 dwat 1 m hkuc hmimhtut cyutli tcup hwicli hraslutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta *Polygonum alpinum* is a PERENNIAL growing to 1 m (3ft 3in) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves Seed StemEdible Uses: DrinkLeaves - raw or cooked[2, 145]. They have an acid flavour and can be used as a sorrel substitute[74]. The chopped leaves and stems have been added to a thick pudding of flour and sugar then eaten[257]. Leaf stems - raw or cooked. An acid flavour, they can be cut into sections and used like rhubarb (*Rheum spp*) [257]. The juice from the plant has been sweetened and used as a refreshing drink[257]. Seed - raw or cooked. It is rather small and fiddly to utilize.

tcanta None known

dwatta Astringent PectoralThe whole plant is astringent[74]. The raw roots and stem bases have been chewed as a treatment for coughs and colds[257].

propta Seed - sow spring in a cold frame. Germination is usually free and easy. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer if they have reached sufficient size. If not, overwinter them in a cold frame and plant them out the

drutta *Ribes cereum* is a deciduous Shrub growing to 1.8 m (6ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in April, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Flowers Fruit LeavesEdible Uses: Fruit - raw or cooked[62, 101, 161, 183]. Not very nice, large quantities can cause nausea[85]. Reports on the quality of the fruit range from insipid and rubbery to highly esteemed as an article of diet[257]. The fruit can also be used to make pemmican, jellies, jams, sauces and pies[183]. Fruits can also be dried for later use[85]. Young leaves[183]. No more details are given. Flowers - raw[183]. A sweet flavour[85].

tcanta None known

dwatta Astringent Emetic OphthalmicAn infusion of the inner bark has been used as a wash for sore eyes[257]. The fruit has been eaten in quantity as an emetic[257]. It has also been used to treat diarrhoea[257].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. Stored seed requires 4 - 5 months cold stratification at between -2 to 0°C and should be sown as early in the year as possible[113, 164]. Under normal storage conditions the seed can remain viable for 17 years or more. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter, planting them out in late spring of the following year Cuttings of half-ripe wood, 10 - 15cm with a heel, July/August in a frame[78, 113]. Cuttings of mature wood of the current year's growth, preferably with a heel of the previous year's growth, November to February in a cold frame or sheltered bed outdoors[78, 200].

nwatta Easily grown in a moisture retentive but well-drained loamy soil of at least moderate quality[11, 200]. Requires a sunny position[11]. Hardy to about -20°C[200]. A very ornamental and free-flowering plant[1]. Often cultivated for its edible fruit in N. America[62]. It is disease-resistant and is being used in modern blackcurrant breeding programmes[119]. Plants can harbour a stage of 'white pine blister rust', so they should not be grown in the vicinity of pine trees[155]. Plants in this genus are notably susceptible to honey fungus[200]. Related to *R. viscosissimum*[182].

## 5.2.487 Lilium hansonii

4 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat 1.2 m hkuc hmimhtut cyutli tcup hwicli hraslut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta *Lilium hansonii* is a BULB growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Bulb - cooked[105, 177]. The bulb can be up to 7cm in diameter[266]. Rich in starch, it can be used as a vegetable in similar ways to potatoes (*Solanum tuberosum*). Young plant - cooked[105, 177].

tcanta None known

dwatta None known

propta Seed - delayed hypogeal germination[130]. Best sown as soon as ripe in a cold frame, it should germinate in spring[143]. Stored seed will require a warm/cold/warm cycle of stratification, each period being about 2 months long[163]. Grow on in cool shady conditions. Great care should be taken in pricking out the young seedlings, many people leave them in the seed pot until they die down at the end of their second years growth. This necessitates sowing the seed thinly and using a reasonably fertile sowing medium. The plants will also require regular feeding when in growth. Divide the young bulbs when they are dormant, putting 2 - 3 in each pot, and grow them on for at least another year before planting them out into their permanent positions when the plants are dormant[K]. Division with care in

the autumn once the leaves have died down. Replant immediately[200]. Bulb scales can be removed from the bulbs in early autumn. If they are kept in a warm dark place in a bag of moist peat, they will produce bulblets. These bulblets can be potted up and grown on in the greenhouse until they are large enough to plant out[200].

nwatta Prefers an open free-draining humus-rich loamy soil with its roots in the shade and its head in the sun[200]. Best grown in partial shade, the flowers are bleached in strong sunlight[143]. Lime tolerant[200]. Plants are hardy, easy to grow and long-lived, succeeding in most soils and positions[143]. Stem rooting, the bulbs should be planted 20 - 25cm deep[143]. Early to mid autumn is the best time to plant out the bulbs in cool temperate areas, in warmer areas they can be planted out as late as late autumn[143]. A very ornamental plant[1]. The flowers have a slight but sweet perfume, this decreasing with the increase of pigment in the blooms[245]. Plants seldom produce fertile seed, even when they are hand pollinated[143]. The plant should be protected against rabbits and slugs in early spring. If the shoot tip is eaten out the bulb will not grow in that year and will lose vigour[200].

## 5.2.488 Peucedanum ostruthium

Masterwort

4 tlin 8 cyuc 2 kcaak 0 tcan 2 dwat 1.2 m hkuc hmimhtut cyutli tcup hwicli hraslutnyik hpa7tli flatpriklwis hpa7tmwatli fyfxre7t hjonli

drutta *Peucedanum ostruthium* is a PERENNIAL growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: CondimentLeaves - cooked[2, 115, 177]. Used as a potherb or as a flavouring[61, 183]. The aromatic roots can be used as a flavouring[183]. They are said to taste hotter than pepper[4]. A particularly popular drink is made from the fermented roots[7].

tcanta None known

dwatta Antispasmodic Aromatic Bitter Carminative Diaphoretic Digestive Diuretic Emmenagogue Expectorant Febrifuge Homeopathy Odontalgic Skin Stimulant StomachicMasterwort is little used in modern herbalism, but it may well be a herb that bears further investigation[254]. It was held in high regard in the Middle Ages where it was especially valued for its ability to resolve all flatulence in the body and stimulate the flow of urine and menstruation[254]. It was also used in treating rheumatic conditions, shortness of breath, kidney and bladder stones, water retention and wounds[254]. The root is antispasmodic, aromatic, bitter, strongly carminative, diaphoretic, digestive, diuretic, emmenagogue, expectorant, febrifuge, stimulant and stomachic[4, 7, 9, 21, 254]. It is of use in the treatment of asthma, dyspepsia and menstrual complaints[4], an infusion helps to relieve migraine[7]. The root is gathered in the spring or autumn and dried for later use[7, 9]. An essential oil from the plant has a euphoric and odontalgic effect[7]. Used externally, it relieves skin irritation[7]. When used externally, the plant or the extracted essential oil can cause an allergic reaction to sunlight[254]. A homeopathic remedy is made from the roots[9]. No details of its applications are given[K].

propta Seed - we have no information on this species but suggest sowing the seed in a cold frame as soon as it is ripe if this is possible otherwise in early spring. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer.

nwatta An easily grown plant, it succeeds in any moisture-retentive soil in a sunny position[200]. Dislikes shade. This report contradicts the report that this plant grows wild in woodlands. Masterwort was at one time cultivated as a pot herb and for medicinal purposes, though it has now fallen into virtual disuse[4, 200]. Suitable for group plantings in the wild garden[200].

## 5.2.489 *Lilium distichum*

4 tlin 8 cyuc 2 kcaok 0 tcan 0 dwat 1 m hkuc  
hmmihmtut cyutli tcup hwicli hyishrasjlut hpa7tli flatprik  
hpa7tmwatli xre7t hjonli

drutta *Lilium distichum* is a BULB growing to 1 m (3ft 3in) by 0.3 m (1ft). See above for USDA hardness. It is hardy to UK zone 5. It is in flower in July, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Bulb - cooked[177]. The bulb can be up to 4cm in diameter[266]. Rich in starch, it can be used as a vegetable in similar ways to potatoes (*Solanum tuberosum*). Young leaves and buds[105, 177]. No more details are given.

tcanta None known  
dwatta None known

propta Seed - delayed hypogeal germination[130]. Best sown as soon as ripe in a cold frame, it should germinate in spring[143]. Stored seed will require a warm/cold/warm cycle of stratification, each period being about 2 months long[163]. Grow on in cool shady conditions. Great care should be taken in pricking out the young seedlings, many people leave them in the seed pot until they die down at the end of their second years growth. This necessitates sowing the seed thinly and using a reasonably fertile sowing medium. The plants will also require regular feeding when in growth. Divide the young bulbs when they are dormant, putting 2 - 3 in each pot, and grow them on for at least another year before planting them out into their permanent positions when the plants are dormant[K]. Division with care in the autumn once the leaves have died down. Replant immediately[200] Bulb scales can be removed from the bulbs in early autumn. If they are kept in a warm dark place in a bag of moist peat, they will produce bulblets. These bulblets can be potted up and grown on in the greenhouse until they are large enough to plant out[200].

nwatta Prefers an open free-draining humus-rich loamy soil with its roots in the shade and its head in the sun[200]. Grows well in open woodland, preferring a shady position[143]. Stem rooting, plant bulbs 10 - 12cm deep[143]. Early to mid autumn is the best time to plant out the bulbs in cool temperate areas, in warmer areas they can be planted out as late as late autumn[200]. Closely allied to *L. tsingtauense*[200]. The plant should be protected against rabbits and slugs in early spring. If the shoot tip is eaten out the bulb will not grow in that year and will lose vigour[200].

## 5.2.490 *Lilium japonicum*

Bamboo Lily

4 tlin 8 cyuc 2 kcaok 0 tcan 2 dwat 1 m hkuc  
hmmihmtut cyutli tcup hwicli hyishrasjlut hpa7tli flatprik  
hpa7tmwatli xre7t hjonli

drutta *Lilium japonicum* is a BULB growing to 1 m (3ft 3in). See above for USDA hardness. It is hardy to UK zone 5. It is in flower in July, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Bulb - cooked[2, 4, 105]. It contains about 18% starch[174]. A slightly bitter taste[174]. It can be used as a vegetable in similar ways to potatoes (*Solanum tuberosum*).

tcanta None known

dwatta Antiasthmatic Antitussive Expectorant Nutritive Sedative TonicThe bulb is antiasthmatic, antitussive, expectorant, sedative and tonic (nutritive)[174, 176]. It is used in the treatment of coughs, haemoptysis, insomnia and fidgetiness in the later stage of febrile disease[176].

propta Seed - delayed hypogeal germination[130]. Best sown as soon as ripe in a cold frame, it should germinate in spring[143]. Stored seed will require a warm/cold/warm cycle of stratification, each period being about 2 months

long[163]. Grow on in cool shady conditions. Great care should be taken in pricking out the young seedlings, many people leave them in the seed pot until they die down at the end of their second years growth. This necessitates sowing the seed thinly and using a reasonably fertile sowing medium. The plants will also require regular feeding when in growth. Divide the young bulbs when they are dormant, putting 2 - 3 in each pot, and grow them on for at least another year before planting them out into their permanent positions when the plants are dormant[K]. Division with care in the autumn once the leaves have died down. Replant immediately[200]. Bulb scales can be removed from the bulbs in early autumn. If they are kept in a warm dark place in a bag of moist peat, they will produce bulblets. These bulblets can be potted up and grown on in the greenhouse until they are large enough to plant out[200].

nwatta Prefers an open free-draining humus-rich loamy soil with its roots in the shade and its head in the sun[200]. Grows well in open woodland[1]. Likes plenty of moisture and some shade[42, 47]. Just to totally confuse matters, one report says that this species prefers a poor gravelly loam with plenty of leafmold and some charcoal, in a sunny position[143]. Requires protection from winter rains[143]. The sub-species *L. japonicum platyfolium* is more vigorous than the type with broader leaves. Stem rooting, the bulbs should be planted 15 - 20cm deep[143]. Early to mid autumn is the best time to plant out the bulbs in cool temperate areas, in warmer areas they can be planted out as late as late autumn[200]. A very ornamental plant[1], it is cultivated for its bulb in Japan[2] and is also a sacred flower in Japanese Shinto rites[174]. The plant should be protected against rabbits and slugs in early spring. If the shoot tip is eaten out the bulb will not grow in that year and will lose vigour[200].

## 5.2.491 *Valeriana officinalis*

Valerian, Garden valerian

4 tlin 8 cyuc 2 kcaok 3 tcan 3 dwat 1.5 m hkuc  
htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwlis  
hpa7tmwatli xre7t hjonli

drutta *Valeriana officinalis* is a PERENNIAL growing to 1.5 m (5ft) by 1 m (3ft 3in). See above for USDA hardness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to August, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: Condiment TeaSeed[172]. No further details are given but the seeds of other members of this genus are parched and then eaten. An essential oil from the leaves and root is used as a flavouring in ice cream, baked goods, condiments etc[183]. It is especially important in apple flavours[238]. The leaves can also be used as a condiment[61]. The plant is used in moderation as a herbal tea[183].

tcanta Compost Essential Liquid feed RepellentThe plant yields about 1% of an essential oil from the roots[7, 238]. It is used in perfumery to provide a 'mossy' aroma[57, 61, 238], though the scent is considered to be disagreeable by many people[207]. The dried roots are also placed in linen cupboards and clothes drawers in order to scent the clothes[4]. The dried root attracts rats and cats, it can be used as a bait to lure them away from other areas[100]. An ingredient of 'QR' herbal compost activator[32]. This is a dried and powdered mixture of several herbs that can be added to a compost heap in order to speed up bacterial activity and thus shorten the time needed to make the compost[K]. The plant can also be used to make a very good liquid plant feed[14, 18, 201]. It attracts earthworms[14, 18]. The leaves are very rich in phosphorus[201]. Dynamic accumulator.

dwatta Anticonvulsant Antispasmodic Carminative Diuretic Eczema Hypnotic Nervine Sedative StimulantValerian is a well-known and frequently used medicinal herb that has a long and proven history of efficacy. It is noted especially for its effect as a tranquilliser and nerve, particularly for those people suffering from nervous overstrain[4, 222]. Valerian has been shown to encourage sleep, improve sleep quality and reduce blood pressure[254]. It is also used internally

in the treatment of painful menstruation, cramps, hypertension, irritable bowel syndrome etc[238, 254]. It should not be prescribed for patients with liver problems[238]. Externally, it is used to treat eczema, ulcers and minor injuries[238]. The root is antispasmodic, carminative, diuretic, hypnotic, powerfully nervine, sedative and stimulant[4, 7, 9, 14, 21, 46, 147, 165, 192, 218]. The active ingredients are called valepotriates, research has confirmed that these have a calming effect on agitated people, but are also a stimulant in cases of fatigue[222]. The roots of 2 year old plants are harvested in the autumn once the leaves have died down and are used fresh or dried[4, 9, 238]. The fresh root is about 3 times as effective as roots dried at 40° (the report does not specify if this is centigrade or fahrenheit), whilst temperatures above 82° destroy the active principle in the root[240]. Use with caution[21, 238], see the notes above on toxicity.

propta Seed - sow spring in a cold frame and only just cover the seed because it requires light for germination[200]. Prick out the seedlings into individual pots when they are large enough to handle and plant out into their permanent positions in the summer if sufficient growth has been made. If the plants are too small to plant out, grow them on in the greenhouse or frame for their first winter and plant them out early in the following summer. Division in spring. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the summer or the following spring.

nwatta A very easily grown plant, it succeeds in ordinary garden soil[1], preferring a rich heavy loam in a moist site[4, 7, 17]. Thrives in full sun or in partial shade[233], doing well in light woodland. A polymorphic species, the more extreme variations are given specific status by some botanists[17]. Valerian is often grown in the herb garden and also sometimes grown commercially as a medicinal herb[1, 200]. When grown for its medicinal root, the plant should not be allowed to flower[4]. The flowers and the dried roots have a strong smell somewhat resembling stale perspiration[245]. Cats are very fond of this plant, particularly the powdered root[1, 4, 20]. Once a cat has discovered a plant they will often destroy it by constantly rolling over it[4]. The dried root also attracts rats and can be used as a bait in traps[4, 14]. A good companion for most plants. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is fleshy. Thick or swollen - fibrous or tap root [2-1].

## 5.2.492 *Asclepias lanceolata*

Purple Silkweed, Fewflower milkweed

4 tlin 8 cyuc 2 kcaok 0 tcan 1 dwat 1.2 m hkuc  
hmmihmtut cyutli kyuctup hwicli hrasjlut hpa7tli flatprikwlis  
hpa7tmwatli fyixre7t hjonli

drutta *Asclepias lanceolata* is a PERENNIAL growing to 1.2 m (4ft). See above for USDA hardness. It is hardy to UK zone 5. It is in flower from June to August, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Flowers Leaves SeedpodEdible Uses: Gum SweetenerThe following uses have been recorded for the closely related *A. rubra*. They probably also apply to this closely related species[K]. Flower buds - cooked as potherbs or added to soups[207]. Young shoots and leaves - cooked as potherbs or added to soups[207]. Young seed pods, 3 - 4 cm long, cooked[207]. Flower clusters can be boiled down to make a sugary syrup[207]. A chewing gum can be made from the latex contained in the stem and leaves, but it is possibly toxic[207].

tcanta Fibre Gum Latex StuffingThe following uses have been recorded for many other members of this genus, it is fairly safe to assume they can also be applied to this species[K]. A fibre is obtained from the bark[92, 99]. It is used in twine, coarse cloth, paper etc[92, 99]. The seed floss

is used to stuff pillows etc or is mixed with other fibres to make cloth[168, 169]. It is a Kapok substitute, used in Life Jackets or as a stuffing material[169]. It is very water repellent. The floss has also been used to mop up oil spills at sea. Rubber can be made from latex contained in the leaves and the stems[57, 92, 112].

dwatta WartsThe latex is used as a cure for warts[168].  
propta Seed - best sown in a greenhouse as soon as it is ripe in the autumn or in late winter[134, 169]. We have also had good results from sowing the seed in the greenhouse in early spring[K], though stored seed might need 2 - 3 weeks cold stratification[134]. Germination usually takes place in 1 - 3 months at 18°C[134]. As soon as the seedlings are large enough to handle, prick them out into individual pots and grow them on in the greenhouse for their first winter. Plant out when they are in active growth in late spring or early summer and give them some protection from slugs until they are growing away strongly. Division in spring. With great care since the plant resents root disturbance. Pot the divisions up and place them in a lightly shaded position in the greenhouse until they are growing away strongly, then plant them out in the summer, giving them some protection from slugs until they are established.. Basal cuttings in late spring. Use shoots about 10cm long with as much of their white underground stem as possible. Pot them up individually and place them in a lightly shaded position in a greenhouse until they are rooting and growing actively. If the plants grow sufficiently, they can be put into their permanent positions in the summer, otherwise keep them in the greenhouse until the following spring and when they are in active growth plant them out into their permanent positions. Give them some protection from slugs until they are established.

nwatta Prefers a well-drained light rich or peaty soil and a sunny position[1, 134, 200]. A very ornamental plant[1], it is closely related to *A. rubra*[200]. This species has less flowers than most other members of the genus[235]. Many members of this genus seem to be particularly prone to damage by slugs. The young growth in spring is especially vulnerable, but older growth is also attacked and even well-established plants have been destroyed in wet years[K]. Plants resent root disturbance and are best planted into their final positions whilst small[134]. The flower of many members of this genus can trap insects between its anther cells, the struggles of the insect in escaping ensure the pollination of the plant[207].

## 5.2.493 *Prinsepia uniflora*

Rui Ren

4 tlin 8 cyuc 2 kcaok 0 tcan 0 dwat 1.8 m hkuc  
hmmihmtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwlis  
hpa7tmwatli xre7t hjonli

drutta *Prinsepia uniflora* is a deciduous Shrub growing to 1.8 m (6ft) by 3 m (9ft). See above for USDA hardness. It is hardy to UK zone 5 and is not frost tender. It is in flower from April to May, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[1, 105, 177]. Juicy[183]. The cherry-like fruit is about 15mm in diameter and contains one large seed[200].

tcanta None known

dwatta None known

propta Seed - best if given 2 months cold stratification[113]. Sow the seed in autumn if possible, otherwise in late winter or early spring in a cold frame in light shade. Germination may be inhibited by light[113]. Prick out the seedlings when they are large enough to handle into individual pots. Grow them on in a greenhouse or cold frame for their first winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, July/August in a frame[113].

nwatta Succeeds in only moderately fertile well-drained soil in full sun or light shade[200]. The plants produce flowers and fruits better when they are growing in full sun[200]. Hardy to about -20°C[184]. This species is closely allied to

well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Edible Uses: CondimentThe root is sometimes used in the manufacture of gentian bitters[183]. The root contains sugar and mucilage[2] (this is probably a reference to its medicinal properties). The root was occasionally used as a flavouring in beer before the use of hops (*Humulus lupulus*) became widespread[4].

tcanta None known

dwatta Anthelmintic Antiinflammatory Antiseptic Appetizer Bitter Cholagogue Emmenagogue Febrifuge Refrigerant Stomachic TonicGentian root has a long history of use as a herbal bitter in the treatment of digestive disorders and is an ingredient of many proprietary medicines. It contains some of the most bitter compounds known and is used as a scientific basis for measuring bitterness[238]. It is especially useful in states of exhaustion from chronic disease and in all cases of debility, weakness of the digestive system and lack of appetite[4]. It is one of the best strengtheners of the human system, stimulating the liver, gall bladder and digestive system[238], and is an excellent tonic to combine with a purgative in order to prevent its debilitating effects[4]. The root is anthelmintic, anti-inflammatory, antiseptic, bitter tonic, cholagogue, emmenagogue, febrifuge, refrigerant and stomachic[4, 7, 9, 14, 21, 165]. It is taken internally in the treatment of liver complaints, indigestion, gastric infections and anorexia[238]. It should not be prescribed for patients with gastric or duodenal ulcers[238]. The root, which can be as thick as a person's arm and has few branches[239], is harvested in the autumn and dried for later use[4]. It is quite likely that the roots of plants that have not flowered are the richest in medicinal properties[4]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve *Gentiana lutea* as a tonic (see [302] for critics of commission E).

propta Seed - best sown as soon as it is ripe in a light position in a cold frame[200]. It can also be sown in late winter or early spring but the seed germinates best if given a period of cold stratification and quickly loses viability when stored, with older seed germinating slowly and erratically[200, 239]. It is advantageous to keep the seed at about 10°C for a few days after sowing, to enable the seed to imbibe moisture[239]. Following this with a period of at least 5 - 6 weeks with temperatures falling to between 0 and -5°C will usually produce reasonable germination[239]. It is best to use clay pots, since plastic ones do not drain so freely and the moister conditions encourage the growth of moss, which will prevent germination of the seed[239]. The seed should be surface-sown, or only covered with a very light dressing of compost. The seed requires dark for germination, so the pots should be covered with something like newspaper or be kept in the dark[239]. Pot up the seedlings into individual pots as soon as they are large enough to handle and grow on in light shade in the greenhouse for at least their first winter. The seedlings grow on very slowly, taking 2 - 7 years to reach flowering size[239]. When the plants are of sufficient size, place them out into their permanent positions in late spring or early summer. Cuttings of basal shoots in late spring[238].

nwatta In general, gentians require a moist well-drained soil in a sheltered position, a certain minimum of atmospheric humidity, high light intensity but a site where temperatures are not too high[239]. They are therefore more difficult to grow in areas with hot summers and in such a region they appreciate some protection from the strongest sunlight[200, 239]. Most species will grow well in the rock garden[200]. This species is easily grown in any good garden soil so long as it is deep enough to accommodate its roots[187, 239], though it prefers alkaline conditions[238]. It prefers full sun but succeeds in partial shade[111]. A slow-growing plant, it takes many years to reach its full stature[239]. A moisture loving plant, growing well by water, it prefers to grow with full exposure to the sun but with plenty of underground moisture in the summer and it grows better in the north and west of Britain[1]. Plants are very deep-rooted and are intolerant of root disturbance[4, 200]. They are very long lived, to 50 years or more[9]. A very ornamental plant[1], it takes about 3 years to reach flowering size from seed[4]. Cultivated as a medicinal plant in Europe[4, 57].

## 5.2.727 *Lolium temulentum*

Darnel

4 tlin 8 cyuc 1 kcaak 0 tcan 1 dwat 1 m hkuc  
htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis  
hpa7tmwatli xre7t hjonli

drutta *Lolium temulentum* is a ANNUAL growing to 1 m (3ft 3in). See above for USDA hardness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: Seed - cooked. Used as a piñole or ground into a flour and used to make bread etc[213, 257]. It is very nutritious, like oats, but it is not advisable to eat the seed due to the risk of fungal infection[114]. This fungal infection, called ergot, causes hallucinations in small doses but can cause severe damage to the nervous system in larger quantities.

tcanta None known

dwatta Anodyne SedativeThe seed is anodyne and sedative[4]. It is not actually the seed, but a fungus that is often found on the seed that has the medicinal properties[K].

propta Seed - sow spring in situ.

nwatta Succeeds in ordinary garden soil[1].

## 5.2.728 *Kalimeris incisa*

4 tlin 8 cyuc 1 kcaak 0 tcan 0 dwat 1.5 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis  
hpa7tmwatli xre7t hjonli

drutta *Kalimeris incisa* is a PERENNIAL growing to 1.5 m (5ft). See above for USDA hardness. It is hardy to UK zone 4. It is in flower from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves and young plants - cooked[105, 177].

tcanta None known

dwatta None known

propta Seed - sow spring in a greenhouse and only just cover. Keep the compost moist. The seed usually germinates in 2 - 3 weeks at 15°C[138]. Grow on in cool conditions, about 10°C[138]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring. This should be done at least every 3 years in order to maintain the vigour of the plant.

nwatta Prefers a moist loamy soil[138] though it succeeds in most soils[1].

## 5.2.729 *Sambucus ebulus*

Dwarf Elder, Dwarf elderberry

4 tlin 8 cyuc 1 kcaak 0 tcan 2 dwat 1.2 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwis  
hpa7tmwatli fyifxre7t hjonli

drutta *Sambucus ebulus* is a PERENNIAL growing to 1.2 m (4ft) by 1 m (3ft 3in) at a fast rate. See above for USDA hardness. It is hardy to UK zone 5. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: TeaFruit - cooked. It is used as a flavouring in soups etc[177]. The fruit is about 6mm in diameter and is borne in large clusters[200]. Some caution is advised, see the notes above on

well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Root - cooked[2, 4, 94, 161]. The root was a staple food of some native North American Indian tribes[257]. It is said to be extremely nutritious, 50 - 80 grams being sufficient to sustain an active person for a day[4, 207]. The root is, however, rather small and tedious to collect in quantity[207]. It is easiest to use when the plant is in flower in the spring, because the outer layer of the root (which is very bitter) slips off easily at this time of the year[85, 95]. Whilst being boiled the roots become soft and swollen and exude a pink mucilaginous substance[183]. The root swells to about 6 times its size and resembles a jelly-like substance[105]. The root has a good taste though a decided bitter flavour develops afterwards[85]. If the root is stored for a year or two the bitterness is somewhat reduced[183]. The root can also be dried, ground into a powder and used as a mush or a thickener in soups etc[212, 257].

tcanta None known

dwatta Blood purifier Cardiac Galactogogue PoulitceThe root is cardiac and galactogogue[257]. An infusion of the root has been used to increase the milk flow in nursing mothers, to relieve heart pain and the pain of pleurisy and also as a blood purifier[257]. The root has been eaten raw to counteract the effects of poison ivy rash and as a treatment for diabetes[257]. The pounded dry root has been chewed in the treatment of sore throats[257]. A poultice of the raw roots has been applied to sores[257].

propta Seed - best sown as soon as it is ripe in a cold frame in a very freely draining soil[129]. Sow stored seed as soon as possible in a cold frame. One month cold stratification should improve germination, though this is still likely to be very slow. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first two winters. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in March/April. Very difficult.

nwatta Requires a very well-drained gritty humus-rich deep soil in a sunny position[1, 200]. This species is not reliably hardy in Britain. It can withstand consistently very cold weather but does not like alternating periods of mild and cold conditions, nor does it like winter wet[1]. The plant is very susceptible to rotting at the neck in a damp soil[200]. The plant is easy to kill by over-watering but extremely difficult to kill by under-watering. Roots that have been dried and stored for a number of years have been known to come back into growth when moistened[95]. The plant dies down after flowering and re-appears in September. It must be kept dry whilst dormant[129]. It is best grown in a greenhouse or bulb frame[200]. A very ornamental plant[1], it is the state flower of Montana[85, 95]. Very apt to hybridize with other members of this genus[1].

## 5.2.571 *Taraxacum obovatum*

4 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat 0.2 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis  
hpa7tmwatli fyifxre7t hjonli

drutta *Taraxacum obovatum* is a PERENNIAL growing to 0.2 m (0ft 8in). See above for USDA hardness. It is hardy to UK zone 5. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Coffee TeaLeaves - raw or cooked. They have a mild flavour[217]. The following uses are also probably applicable to this species, though we have no records for them[K] Root - cooked[183]. Flowers - raw or cooked[183]. The unopened flower buds can be used in fritters[183]. The whole plant is dried and used as a tea[177, 183]. A pleasant tea is made from the flowers. The leaves and the roots can also be used to make tea. The root is dried and roasted to make a coffee substitute.

tcanta None known

dwatta None known

propta Seed - sow spring in a cold frame and either surface-sow or only just cover the seed. Make sure the compost does not dry out. Germination should take place within 2 weeks. Prick out the seedlings into individual pots when they are large enough to handle, choosing relatively deep pots to accommodate the tap root. Plant them out in early summer. Division in early spring as the plant comes into growth.

nwatta Prefers a well-drained humus-rich soil in full sun or light shade. According to one report this species reproduces apomictically and sexually[50], whilst another report says that only apomictic seed production is undergone[110]. Apomixis is an asexual method of seed production where each seed is genetically identical to the parent plant. Occasionally seed is produced sexually, the resulting seedlings are somewhat different to the parent plants and if these plants are sufficiently distinct from the parents and then produce apomictic seedlings these seedlings are, in theory at least, a new species.

## 5.2.572 *Orchis italica*

4 tlin 8 cyuc 2 kcaak 0 tcan 2 dwat 0.3 m hkuc  
htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwisslip  
hpa7tmwatli xre7t hjonli

drutta *Orchis italica* is a BULB growing to 0.3 m (1ft). See above for USDA hardness. It is hardy to UK zone 5 and is not frost tender. It is in leaf from October to June, in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: DrinkRoot - cooked[2, 4, 46]. It is a source of 'salep', a fine white to yellowish-white powder that is obtained by drying the tuber and grinding it into a powder[2, 105, 177]. Salep is a starch-like substance with a sweetish taste and a faint somewhat unpleasant smell[4]. It is said to be very nutritious and is made into a drink or can be added to cereals and used in making bread etc[100, 183]. One ounce of salep is said to be enough to sustain a person for a day[100, 115].

tcanta None known

dwatta Antidiarrhoeal Antiflatulent Demulcent NutritiveSalep (see above for more details) is very nutritive and demulcent[4]. It has been used as a diet of special value for children and convalescents, being boiled with water, flavoured and prepared in the same way as arrowroot[4]. Rich in mucilage, it forms a soothing and demulcent jelly that is used in the treatment of irritations of the gastro-intestinal canal[4]. One part of salep to fifty parts of water is sufficient to make a jelly[4]. The tuber, from which salep is prepared, should be harvested as the plant dies down after flowering and setting seed[4].

propta Seed - surface sow, preferably as soon as it is ripe, in the greenhouse and do not allow the compost to dry out. The seed of this species is extremely simple, it has a minute embryo surrounded by a single layer of protective cells. It contains very little food reserves and depends upon a symbiotic relationship with a species of soil-dwelling fungus. The fungal hyphae invade the seed and enter the cells of the embryo. The orchid soon begins to digest the fungal tissue and this acts as a food supply for the plant until it is able to obtain nutrients from decaying material in the soil[200]. It is best to use some of the soil that is growing around established plants in order to introduce the fungus, or to sow the seed around a plant of the same species and allow the seedlings to grow on until they are large enough to move. Division of the tubers as the flowers fade[230]. This species produces a new tuber towards the end of its growing season. If this is removed from the plant as its flowers are fading, the shock to the plant can stimulate new tubers to be formed. The tuber should be treated as being dormant, whilst the remaining plant should be encouraged to continue in growth in order to give it time to produce new tubers[230]. Division can also be carried out when the plant has a fully developed rosette of leaves but before it comes into flower[230]. The entire new growth is removed from the old tuber from which it has arisen and is potted up, the cut being made towards the bottom of the stem but leaving one or two roots

still attached to the old tuber. This can often be done without digging up the plant. The old tuber should develop one or two new growths, whilst the new rosette should continue in growth and flower normally[230].

nwatta Requires a deep rich soil[1]. Best grown in a sunny position in a well-drained bank and a loamy soil[42]. Plants are fairly hardy in Britain but, because they come into growth in the winter, they are best cultivated in a frame or cold greenhouse[230]. Orchids are, in general, shallow-rooting plants of well-drained low-fertility soils. Their symbiotic relationship with a fungus in the soil allows them to obtain sufficient nutrients and be able to compete successfully with other plants. They are very sensitive to the addition of fertilizers or fungicides since these can harm the symbiotic fungus and thus kill the orchid[230]. This symbiotic relationship makes them very difficult to cultivate, though they will sometimes appear uninvited in a garden and will then thrive. Transplanting can damage the relationship and plants might also thrive for a few years and then disappear, suggesting that they might be short-lived perennials[230]. Plants can succeed in a lawn in various parts of the country. The lawn should not be mown early in the year before or immediately after flowering[200]. Plant out bulbs whilst the plant is dormant, preferably in the autumn[200]. Plants seem to be immune to the predations of rabbits[233]. Cultivated plants are very susceptible to the predation of slugs and snails[230].

### 5.2.573 Blephilia hirsuta

Hairy wood-mint or hairy pagoda plant

4 tlin 7 cyuc 2 kcak 2 tcan 0 dwat 0.7 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlut hpa7tli frusflatprik hpa7tmwatli hjonli

drutta Blephilia hirsuta is a PERENNIAL growing to 0.7 m (2ft 4in) by 0.4 m (1ft 4in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4. The flowers are pollinated by Bees, Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves. Minty leaves eaten raw and used in teas. The fresh or dried leaves are used for tea [1-4].

tcanta A strong scented plant that may act as an aromatic pest confuser reducing their ability to find other nearby crops [1-3]. A good plant for food forests, wild, native plant or open woodland gardens.

dwatta None Known

propta Propagate by division or by Seed

nwatta An herbaceous perennial of the mint family. Hairy wood mint prefers rich moist to mesic soil in hardwood forests, along streams and rivers, in forest openings and thickets underlain by limestone, and is occasionally found near wetlands. A rich loamy soil with decaying leaf mold is ideal. It likes partial sun or light shade. Forests with infrequent, low-intensity disturbances (i.e., gap dynamics) are ideal. This species also grows in soil that is somewhat rocky. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. Fibrous shallow roots. Bloom Time: May to September (Northern Hemisphere). Flower are Showy and the leaf is fragrant.

### 5.2.574 Hypochoeris radicata

Cat’s Ear

4 tlin 8 cyuc 2 kcak 0 tcan 1 dwat 0.3 m hkuc htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Hypochoeris radicata is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to September, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies lepidoptera. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH:

mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young leaves - raw or cooked like spinach[5, 52, 53, 183]. A winter salad[100], it is rather bitter[K]. Young leaves are mild and agreeable[217].

tcanta None known

dwatta PectoralPectoral[100].

propta Seed - sow spring in a cold frame and only just cover the seed. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. If you have sufficient seed it can be sown outdoors in situ in the spring.

nwatta Requires a well-drained soil and a sunny position or light shade. Another report says that it dislikes shade. A common lawn weed[24].

### 5.2.575 Erythronium tuolumnense

Tuolumne Fawn Lily, Dog’s Tooth Violet, Pagoda Lily

4 tlin 9 cyuc 2 kcak 0 tcan 0 dwat 0.3 m hkuc hmim cyutli tcup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Erythronium tuolumnense is a BULB growing to 0.3 m (1ft) by 0.2 m (0ft 8in) at a medium rate. It is not frost tender. It is in flower from April to May, and the seeds ripen from June to July. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Although no specific mention has been found for this species, most if not all members of the genus provide edible bulbs[K]. The ovoid bulb is 5 - 10cm long[270].

tcanta None known

dwatta None known

propta Seed - best sown as soon as it is ripe in a shady position in a cold frame. Water lightly in summer, it should germinate in autumn or winter[164, 200]. Stored seed requires a period of cold stratification[164]. Sow as early in spring as possible in a cold frame. Sow the seed thinly so that it will not be necessary to prick them out for their first year of growth. Give an occasional liquid feed to the seedlings to make sure that they do not become nutrient deficient. When the plants are dormant, pot up the small bulbs putting 2 - 3 bulbs in each pot. Grow them on in a shady position in the greenhouse for another 2 3 years and then plant them out into their permanent positions when they are dormant in late summer. Division of the bulbs in the summer as the leaves die down[1]. Larger bulbs can be replanted immediately into their permanent positions, but it is best to pot up smaller bulbs and grow them on in a shady position in a greenhouse for a year before planting them out when dormant in late summer.

nwatta Landscape Uses:Alpine garden, Container, Rock garden, Woodland garden. Prefers slightly acid soil conditions but succeeds in chalky soils if these contain plenty of humus[164]. Requires semi-shade, preferably provided by trees or shrubs, and a well-drained soil[42, 164]. Succeeds in almost any light soil, preferring one that is rich in humus[1]. Plants are hardy to at least -15°c[200]. Plants are spreading well, but only flowering lightly in the dappled shade of a woodland garden at Kew[K]. Bulbs should be planted about 7cm deep[1]. They increase rapidly by offsets[188]. Special Features: Attractive foliage, North American native, Naturalizing.

### 5.2.576 Petasites albus

Butterbur

4 tlin 8 cyuc 2 kcak 0 tcan 1 dwat 0.6 m hkuc pcmhmimhtut cyutli tcup hwicli hrasjlutnyikprik hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

drutta Petasites albus is a PERENNIAL growing to 0.6 m (2ft) by 1 m (3ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from April to May, and the seeds ripen in May. The species is dioecious (individual flowers are either male or female, but only one

their permanent positions in the autumn. Cuttings of half-ripe wood, June to August in a frame. Very easy.

nwatta Succeeds in most soils, including wet, ill-drained or intermittently flooded soils[1, 11], but prefers a damp, heavy soil in a sunny position[200]. Rarely thrives on chalk[200]. Very tolerant of maritime exposure[200]. Hybridizes freely with other members of this genus[200]. Although the flowers are produced in catkins early in the year, they are pollinated by bees and other insects rather than by the wind[11]. Plants in this genus are notably susceptible to honey fungus[200]. Dioecious. Male and female plants must be grown if seed is required.

### 5.2.723 Cimicifuga simplex

4 tlin 8 cyuc 1 kcak 0 tcan 0 dwat 1.5 m hkuc hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Cimicifuga simplex is a PERENNIAL growing to 1.5 m (5ft) by 0.6 m (2ft in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in October, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: CondimentLeaves - cooked[105, 177, 183]. Some caution is advised, see the notes above on toxicity. The fragrant root is used as a spice[183].

tcanta None known

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame[1]. Only just cover the seed. It germinates in 1 - 12 months or even longer at 15°c[164]. The seed does not store well and soon loses its viability[200], stored seed may germinate better if given 6 - 8 weeks warm stratification at 15°c and then 8 weeks cold stratification[164]. Prick out the young seedlings into individual pots when they are large enough to handle and grow them on in a frame for their first winter. Plant out in late spring or early summer[K]. Division in spring or autumn[1]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the summer or following spring.

nwatta Prefers a moist humus rich soil and some shade[1, 200]. Succeeds in ordinary garden soil[1]. Grows well in the dappled shade of woodland[88]. Plants are hardy to at least -25°c[187]. A number of named varieties have been selected for their ornamental value[187]. A good bee and butterfly plant[88]. The flowers have an unusual, slightly unpleasant smell[188]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

### 5.2.724 Elsholtzia fruticosa

Ji Gu Chai

4 tlin 8 cyuc 1 kcak 0 tcan 1 dwat 1.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Elsholtzia fruticosa is a deciduous Shrub growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from August to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: OilEdible Uses: Condiment OilThe powdered seeds are used as a condiment for flavouring food-stuffs[272]. An edible oil is obtained from the seed[272].

tcanta Incense Miscellany Oil Pot-pourriThe highly aromatic foliage is used in pot-pourri[200]. The powdered plant is used for incense[272].

dwatta Anodyne MiscellanyOne report says that the plant is used medicinally, but gives no more informa-

tion[266]. The juice of the roots is used to relieve headaches[272].

propta Seed - sow spring in a greenhouse or cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring.

nwatta Grows well on woodland margins[200]. This species is a sub-shrub, the woody stems often dying back to the base in severe winters[200].

### 5.2.725 Ribes fasciculatum

4 tlin 8 cyuc 1 kcak 0 tcan 0 dwat 1.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

drutta Ribes fasciculatum is a deciduous Shrub growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in leaf from March to November, in flower in April, and the seeds ripen from September to October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Fruit LeavesEdible Uses: Fruit - raw or cooked[177]. Unpalatable[1]. The reddish-brown fruit is about 5 - 10mm in diameter and contains a lot of fairly large seeds[266]. What little flesh there is remains unpleasant even in the autumn[K]. The fruit hangs well, probably because it is unpalatable[K]. Young leaves - cooked[105, 177].

tcanta None known

dwatta None known

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. Stored seed requires 4 - 5 months cold stratification at between 0 to 9°c and should be sown as early in the year as possible[113, 164]. Under normal storage conditions the seed can remain viable for 17 years or more. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter, planting them out in late spring of the following year. Cuttings of half-ripe wood, 10 - 15cm with a heel, July/August in a frame[78, 113]. Cuttings of mature wood of the current year’s growth, preferably with a heel of the previous year’s growth, November to February in a cold frame or sheltered bed outdoors[78, 200].

nwatta Easily grown in a moisture retentive but well-drained loamy soil of at least moderate quality[11, 200]. Plants are quite tolerant of shade though do not fruit so well in such a position[11]. Hardy to about -20°c[200]. The flowers have a delicious aromatic perfume[245]. The fruit can hang on the plant until winter[182]. Plants can harbour a stage of white pine blister rust, so should not be grown in the vicinity of pine trees[155]. Plants in this genus are notably susceptible to honey fungus[200]. Female flowers appear to be perfect but the pollen in them and the ovules in the male flowers are sterile[11]. Plants are therefore functionally dioecious, male and female plants must be grown if fruit and seed is required.

### 5.2.726 Gentiana lutea

Yellow Gentian

4 tlin 8 cyuc 1 kcak 0 tcan 5 dwat 1.2 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Gentiana lutea is a PERENNIAL growing to 1.2 m (4ft) by 0.6 m (2ft in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles, Lepidoptera (Moths and Butterflies). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers

til they are well established before planting them out in late spring or early summer.

nwatta Easily grown in ordinary garden soil so long as it is not too dry[1]. Requires a moist soil and a sunny position[1, 200]. Likes some shade. A good bee plant. Plants are subject to mildew in dry summers[200].

## 5.2.720 Iris germanica

Purple Flag, German iris, Orris-root, Tall Bearded German Iris, Bearded Iris

4 tlin 10 cyuc 1 kcaak 0 tcan 3 dwat 1 m hkuc hmimhtut cyutli kyuctup hwicli hrasjlut hpa7tli flatprikhwisslip hpa7tmwatli fyfjkre7t hjonli

drutta Iris germanica is a PERENNIAL growing to 1 m (3ft 3in) by 1.5 m (5ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcaakta Edible Parts: Edible Uses: CondimentThe root is dried and used as a flavouring[105, 183].

tcanta Baby care Beads Cosmetic Dye EssentialThe root is a source of Orris powder which has the scent of violets[238]. It is obtained by grinding up the dried root[4, 7, 46]. It is much used as a fixative in perfumery and pot-pourri, as an ingredient of toothpastes, breath fresheners etc and as a food flavouring. The root can take several years of drying to fully develop its fragrance, when fresh they have an acrid flavour and almost no smell[4, 168]. An essential oil is obtained from the fresh root, this has the same uses as the root[57, 61]. The juice of the root is sometimes used as a cosmetic and also for the removal of freckles from the skin[4]. A black dye is obtained from the root[168]. A blue dye is obtained from the flowers[168]. The seeds are used as rosary beads[61].

dwatta Diuretic Emetic Expectorant PurgativeThe root is diuretic, emetic, expectorant and mildly purgative[7, 9, 61]. Another report says that the juice of the fresh root is a strong purge of great efficiency in the treatment of dropsy[4]. In the past, sections of the dried root have been given to teething babies to chew on, though this has been discontinued for hygienic reasons[9]. Roots of plants 2 - 3 years old are dug up after flowering and are then dried for later use[7].

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed should be sown as early in the year as possible in a cold frame. A sterile plant, it does not produce seed[233]. Division, best done after flowering. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Landscape Uses:Border, Container, Massing, Rock garden, Specimen. A very easily grown plant that tolerates considerable neglect[233], it prefers a sunny position in a well-drained soil that contains some lime[1, 79]. Grows well in dry soils in light deciduous shade[187]. Succeeds in full sun or partial shade[79]. Prefers a pH in the range 6 to 7.5 or higher[200]. Many named varieties have been selected for their ornamental value[187]. The plant is also sometimes cultivated for the essential oil in its root[9]. The plant is sterile and does not produce seed[233]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. Special Features:Not North American native, All or parts of this plant are poisonous, Attracts butterflies, Suitable for cut flowers, Fragrant flowers.

## 5.2.721 Lycopus europaeus

Gypswort

4 tlin 8 cyuc 1 kcaak 0 tcan 3 dwat 1 m hkuc hmimhtut cyutli tucphja7nhs6s hwicli hrasjlutnyik hpa7tli flatprikwlis hpa7tmwatli fyfjkre7t hjonli

drutta Lycopus europaeus is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from June to September, and the seeds ripen from August to October. The species is hermaphrodite

(has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can grow in water.

kcaakta Edible Parts: RootEdible Uses: Root - raw or cooked. A famine food, it is only used when all else fails[179].

tcanta Dye MiscellanyA black dye is obtained from the plant[4, 100]. It is said to give a permanent colour and was also used by gypsies in order to darken the skin[4].

dwatta Astringent Miscellany Poultice SedativeThe fresh or dried flowering herb is astringent and sedative[4]. It inhibits iodine conversion in the thyroid gland and is used in the treatment of hyperthyroidism and related disorders[9]. The whole plant is used as an astringent, hypoglycaemic, mild narcotic and mild sedative[4, 238]. It also slows and strengthens heart contractions[238]. The plant has been shown to be of value in the treatment of hyperthyroidism[9, 238], it is also used in the treatment of coughs, bleeding from the lungs and consumption, excessive menstruation etc[4, 238]. The leaves are applied as a poultice to cleanse foul wounds[240]. This remedy should not be prescribed for pregnant women or patients with hypothyroidism[238]. The plant is harvested as flowering begins and can be used fresh or dried, in an infusion or as a tincture[4, 238]. Current uses are predominantly for increased activity of the thyroid gland and for premenstrual syndrome symptoms such as breast pain [301]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve *Lycopus* for nervousness and premenstrual syndrome (see [302] for critics of commission E).

propta Seed - sow spring or autumn in a cold frame[238]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse for their first year. Plant them out into their permanent positions in early summer. Division in spring or autumn[238]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Tolerates most soil types so long as they are wet. Grows well in shallow water. Succeeds in sun or shade.

## 5.2.722 Salix brachycarpa

shortfruit willow

4 tlin 8 cyuc 1 kcaak 3 tcan 2 dwat 1.4 m hkuc htut cyutli tucphja7n hwicli hrasjlutnyikfrip hpa7tli flatprik hpa7tmwatli nyanhjen hjonli

drutta Salix brachycarpa is a deciduous Shrub growing to 1.4 m (4ft 7in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers moist or wet soil. The plant can tolerate maritime exposure.

kcaakta Edible Parts: Inner bark LeavesEdible Uses: Inner bark - raw or cooked. It can be dried, ground into a powder and then added to cereal flour for use in making bread etc. A very bitter flavour, it is a famine food that is only used when all else fails[172]. Young shoots - not very palatable[172].

tcanta ShelterbeltA salt tolerant coastal plant, it can be grown as part of a shelterbelt[200]. Dynamic accumulator.

dwatta Anodyne FebrifugeThe fresh bark of all members of this genus contains salicin[226], which probably decomposes into salicylic acid (closely related to aspirin) in the human body[213]. This is used as an anodyne and febrifuge[226].

propta Seed - must be surface sown as soon as it is ripe in late spring. It has a very short viability, perhaps as little as a few days. Cuttings of mature wood of the current year's growth, November to February in a sheltered outdoor bed or planted straight into their permanent position and given a good weed-suppressing mulch. Very easy. Plant into

sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: StemEdible Uses: The small fleshy petioles (leaf stems) are very palatable when cooked and eaten like asparagus[7].

tcanta A good ground cover for the wilder areas of the garden[200]. It is too invasive to be used in small gardens and is only suitable for covering large areas[208]. The leaves were at one time used by peasants as a head covering[7].

dwatta Antitussive Emmenagogue Homeopathy Hypnotic Sedative VulneryThe root is emmenagogue, hypnotic, sedative and vulnerary[7, 172]. The ground or finely chopped rhizome has a healing effect when applied to slow-healing or weak ulcers, or to suppurating wounds[7]. An infusion of the leaves is a specific remedy for coughs[7]. A homeopathic remedy is made from the roots[7]. It is used in the treatment of wounds, ulcers etc[7].

propta Seed - we have no information on this species but suggest sowing the seed in a cold frame as soon as it is ripe or in early spring. Only just cover the seed and do not allow the compost to dry out. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division succeeds at almost any time of the year. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Succeeds in ordinary garden soil[1], but prefers a deep fertile humus-rich soil that is permanently moist but not stagnant, succeeding in shade, semi-shade or full sun[200]. Prefers partial shade[31]. Prefers a heavy soil[208]. Plants can be grown in quite coarse grass, which can be cut annually in the autumn[233]. A very invasive plant, too rampant for anything other than the wild garden[187, 200]. Dioecious, male and female plants must be grown if seed is required.

## 5.2.577 Potentilla egedei

Pacific Silverweed

4 tlin 8 cyuc 2 kcaak 0 tcan 1 dwat 0.5 m hkuc hmimhtut cyutli tucp hwicli hrasjlutnyik hpa7tli flatprikwlis hpa7tmwatli fyfjkre7t hjonli

drutta Potentilla egedei is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 4. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure.

kcaakta Edible Parts: RootEdible Uses: Root - raw or cooked[118, 172, 257]. The raw root has a bitter flavour but most of the bitterness is lost once the root is cooked and the flavour then becomes somewhat like a sweet potato[256]. The roots are rather thin but were a staple food of some North American Indian tribes[256].

tcanta None known

dwatta Astringent Ophthalmic PoulticeThe whole plant is astringent[172]. A poultice of the boiled roots and oil can be applied to sores and swellings[257]. The juice from the roots has been used as a wash for sore eyes[257].

propta Seed - sow early spring or autumn in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring. Larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Easily grown in a well-drained loam, preferring a position in full sun but tolerating shade[1]. Prefers an alkaline soil but tolerates a slightly acid soil[200]. Members of this genus are rarely if ever troubled by browsing deer[233]. This species is closely related to *P. anserina*[43, 200].

## 5.2.578 Cardamine pennsylvanica

Bittercress

4 tlin 8 cyuc 2 kcaak 0 tcan 1 dwat 0.6 m hkuc hmimhtut cyutli tucphja7n hwicli hrasjlutnyik hpa7tli flatprikwlis hpa7tmwatli fyfjkre7t hjonli

drutta Cardamine pennsylvanica is a BIENNIAL/PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from April to August, and the seeds ripen from May to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcaakta Edible Parts: LeavesEdible Uses: CondimentLeaves - raw or cooked[46, 61, 159, 171]. An excellent water cress substitute[105]. A slightly bitter flavour, but not disagreeable[207]. The grated raw root is used as a condiment[207].

tcanta None known

dwatta Carminative DigestiveThe leaves and the flowering plant are carminative and digestive[172].

propta Seed - sow outdoors in a seedbed in a shady position in April. Plant out in autumn or spring. Division.

nwatta We have very little information on this species and do not know if it will be hardy in Britain, though judging by its native range it should succeed outdoors in most parts of this country. A polymorphic species[43], it is closely related to *C. parviflora*[274]. The following notes are based on the general needs of the genus. Prefers a moist humus rich soil in shade or semi-shade[200] but succeeds in most soils that are not dry[1].

## 5.2.579 Uvularia sessilifolia

Bellwort, Sessileleaf bellwort

4 tlin 8 cyuc 2 kcaak 0 tcan 1 dwat 0.3 m hkuc pcimhmim cyutli tucp hwicli hrasjlut hpa7tli flatprikwlis hpa7tmwatli xre7t hjonli

drutta Uvularia sessilifolia is a PERENNIAL growing to 0.3 m (1ft) by 0.3 m (1ft in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcaakta Edible Parts: Leaves RootEdible Uses: Young shoots - cooked[2, 61, 105, 161, 257]. The shoots are harvested when they are still tender enough to be broken off with a fingernail and are used as an asparagus substitute[46, 183]. Root - cooked[22, 46, 61, 105, 183] or used in diet drinks[183, 207].

tcanta None known

dwatta Blood tonic PoulticeA tea made from the roots is a blood purifier and is used in the treatment of diarrhoea[222, 257]. It is taken internally to aid in healing broken bones[222]. A poultice of the roots is applied to broken bones, boils etc[222, 257].

propta Seed - best sown in a cold frame as soon as it is ripe in the summer[200]. Sow stored seed in late winter in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division after the plants die down in late summer. It is best carried out in early spring before the plants flower[188]. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light

shade in a greenhouse or cold frame until they are growing away well. Plant them out in the following spring.

nwatta Requires a cool moist shady position and a light sandy soil[1, 42, 111]. Likes plenty of humus in the soil[111]. Grows well in a deciduous woodland garden[42, 200] and in the rock garden[200]. Plants grow much taller in rich soils and then succeed in the herbaceous border[222]. They can spread quite quickly when in a suitable position[233]. A very hardy plant, tolerating temperatures down to about -20°c[187]. This species is closely related to *U. caroliniana*[200]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

## 5.2.580 Clintonia umbellulata

Speckled Wood Lily, White clintonia  
4 tin 8 cyuc 2 kcaak 0 tcan 0 dwat 0.2 m hkuc  
pcimhmim cyutli tcup hwicli hrasljut hpa7tli frusflatprik hpa7tmwatli xre7t hjonli

drutta Clintonia umbellulata is a PERENNIAL growing to 0.2 m (0ft 8in) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower in May. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young leaves - raw or cooked[61, 105, 177]. Harvested in spring before they fully unfurl, they have a cucumber flavour[62]. Older leaves can be cooked[62].

tcanta None known  
dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame, it usually germinates in the spring[200]. Stored seed should be sown in late winter or early spring in a cold frame[164]. It sometimes germinates within 1 - 3 months at 15°c, but may take a year. The seed should be completely separated from the fruit and should only just be covered by soil[164, 200]. If the seed has been sown thinly enough, then it is possible to leave the seedlings in the pot for their first growing season, dividing them after they become dormant. Make sure to give them liquid feeds at intervals through the spring and summer. Otherwise prick out the seedlings into individual pots when they are large enough to handle. Plant out in late spring or early summer at the beginning of their second or third years growth. Division in spring as new growth is just commencing[200].

nwatta Prefers a damp peaty sandy soil in a cool damp shady position[1, 42, 200]. Requires a moist neutral to acid soil[200]. Succeeds in acid clay soils[187]. Dormant plants are hardy to at least -25°c, but the new growth in spring can be damaged by late frosts[187]. Plants only produce their fruit in warm seasons in Britain[200]. They have shortly-creeping underground stems and form dense patches[187].

## 5.2.581 Codonopsis ovata

4 tin 8 cyuc 2 kcaak 0 tcan 1 dwat 0.4 m hkuc  
hmimhtut cyutli tcup hwicli hrasljut hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Codonopsis ovata is a PERENNIAL growing to 0.4 m (1ft 4in) by 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from June to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Root - cooked. It can be dried and ground into a powder[105]. A famine food, used when all else fails[145].

tcanta None known

dwatta PoulitceThe roots and leaves are used to make a poultice for the treatment of bruises, ulcers and wounds[211, 240].

propta Seed - surface sow in spring to early summer in an ericaceous compost in a greenhouse. Do not allow the compost to dry out. The seed usually germinates in 1 - 6 weeks at 20°c[164]. Prick out the seedlings into individual pots as soon as they are large enough to handle and grow them on in a greenhouse for their first winter. Plant out in late spring or early summer and protect them from slugs until the plants are well established[K]. Division in spring, with care, since the plant resents root disturbance[200]. We have found it best to take small divisions that are teased out from the sides of the main clump so as to avoid the least possible disturbance to the plants and to avoid having to dig up the clump. These small divisions need to be potted up and placed in light shade in a greenhouse until they are rooting well. They can be planted out into their permanent positions in the summer if they are large enough, otherwise in the following spring[K].

nwatta Prefers a well-drained fertile light soil in full sun or semi shade[1, 200]. Plants only succeed in full sun if the soil remains moist during the growing season[200]. Prefers a slightly acid soil[164]. Dormant plants are hardy to about -20°c, but this species is not easy to grow in cultivation[187]. The young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. This species is not as cold tolerant as most members of the genus, it is best given a good mulch in the winter[200]. The plant resents root disturbance and should be planted out into its permanent position as soon as possible[164]. It is best grown on a high bank in order to give a good view of the flowers[1]. The flowers, when inhaled near to, have the unpleasant odour of fur - likened by some to the smell of ferrets[245]. Plants are very susceptible to the ravages of slugs. The young shoots in spring are particularly at risk, though older growth is also eaten[K].

## 5.2.582 Cirsium arvense

Creeping Thistle, Canada thistle  
4 tin 7 cyuc 2 kcaak 2 tcan 2 dwat 0.9 m hkuc  
htut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikkwis hpa7tmwatli fyifxre7t hjonli

drutta Cirsium arvense is a PERENNIAL growing to 0.9 m (3ft) by 1 m (3ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from July to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies), beetles. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Leaves Oil Root StemEdible Uses: Curdling agent OilRoot of first year plants - raw or cooked[183]. Nutritious but rather bland, they are best used in a mixture with other vegetables[9]. The root is likely to be rich in inulin, a starch that cannot be digested by humans. This starch thus passes straight through the digestive system and, in some people, ferments to produce flatulence[K]. Stems - they are peeled and cooked like asparagus or rhubarb[9, 12, 177, 183]. Leaves - raw or cooked[177, 183]. A fairly bland flavour, but the prickles need to be removed before the leaves can be eaten - not only is this rather fiddly but very little edible leaf remains[K]. The leaves are also used to coagulate plant milks etc[46, 61, 183].

tcanta Oil TinderThe seed fluff is used as a tinder[106]. The seed of all species of thistles yields a good oil by expression[4]. The seed of this species contains about 22% oil[240]. Dynamic accumulator.

dwatta Antiphlogistic Astringent Diuretic Emetic Emmenagogue Hepatic TonicThe root is tonic, diuretic, astringent, antiphlogistic and hepatic[207]. It has been chewed as a remedy for toothache[4]. A decoction of the roots has been used to treat worms in children[257]. A paste of the roots, combined with an equal quantity of the root paste of *Amaranthus spinosus*, is used in the treatment of indigestion[272]. The plant contains a volatile alkaloid and a glycoside called cynin, which has emetic and emmenagogue properties[240].

the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Leaves - cooked[105]. Some caution is advised, see the notes above on toxicity.

tcanta Both the growing and the dried plant can be used to repel bugs and fleas[211].

dwatta Black cohosh is a traditional remedy of the North American Indians where it was used mainly to treat women's problems, especially painful periods and problems associated with the menopause[254]. A popular and widely used herbal remedy, it is effective in the treatment of a range of diseases[4]. The root is alternative, antidote, antirheumatic, antispasmodic, astringent, cardiotoxic, diaphoretic, diuretic, emmenagogue, expectorant, hypnotic, sedative, tonic and vasodilator[4, 7, 21, 46, 57, 165, 192, 222]. It is harvested in the autumn as the leaves die down, then cut into pieces and dried[4]. The root is toxic in overdose, it should be used with caution and be completely avoided by pregnant women[222]. See also the notes above on toxicity. The medicinally active ingredients are not soluble in water so a tincture of the root is normally used[222]. It is used in the treatment of rheumatism, as a sedative and an emmenagogue[213]. It is traditionally important in the treatment of women's complaints, acting specifically on the uterus it eases uterine cramps and has been used to help in childbirth[222, 268]. Research has shown that the root has oestrogenic activity and is thought to reduce levels of pituitary luteinizing hormone, thereby decreasing the ovaries production of progesterone[222, 254]. The root is also hypoglycaemic, sedative and anti-inflammatory[222]. Used in conjunction with St. John's Wort (*Hypericum perforatum*) it is 78% effective in treating hot flushes and other menopausal problems[254]. An extract of the root has been shown to strengthen the male reproductive organ in rats[222]. The root contains salicylic acid, which makes it of value in the treatment of various rheumatic problems - it is particularly effective in the acute stage of rheumatoid arthritis, sciatica and chorea[268]. Its sedative action makes it useful for treating a range of other complaints including tinnitus and high blood pressure[254]. The roots are used to make a homeopathic remedy[232]. This is used mainly for women, especially during pregnancy[232]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve *Cimicifuga racemosa* (*Actaea racemosa*) for climacteric (menopause) complaints, Premenstrual syndrome. (see [302] for critics of commission E).

propta Seed - best sown as soon as it is ripe in a cold frame[1]. Only just cover the seed. It germinates in 1 - 12 weeks or even longer at 15°c[164]. The seed does not store well and soon loses its viability[200], stored seed may germinate better if given 6 - 8 weeks warm stratification at 15°c and then 8 weeks cold stratification[164]. Prick out the young seedlings into individual pots when they are large enough to handle and grow them on in a frame for their first winter. Plant out in late spring or early summer[K]. Division in spring or autumn[1]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them out in a cold frame until they are rooting well. Plant them on in the summer or following spring.

nwatta Landscape Uses:Border, Container, Woodland garden. Prefers a moist humus rich soil and some shade[1, 111, 200]. Grows well in dappled shade[28, 31, 88]. Succeeds in ordinary garden soil[1] and tolerates drier soils[233]. Plants are hardy to at least -20°c[187]. A very ornamental species[233]. The flowers have an unusual, slightly unpleasant smell[188] which is thought to repel insects[213]. Plants grow and flower well in Britain, though they seldom if ever ripen their seed[4]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54]. Special Features:Attractive foliage, North American native, Naturalizing, Suitable for cut flowers, Suitable for dried flowers, Fragrant flowers.

## 5.2.718 Sanguisorba canadensis

American Great Burnet, Canadian burnet  
4 tin 8 cyuc 1 kcaak 0 tcan 0 dwat 1.2 m hkuc

hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

drutta Sanguisorba canadensis is a PERENNIAL growing to 1.2 m (4ft) by 0.6 m (2ft 1in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from August to September, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves - boiled, washed in water to remove the bitterness and then eaten with salt and miso[177, 183].

tcanta None known  
dwatta None known

propta Seed - sow spring or autumn in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in the spring[188].

nwatta Succeeds in ordinary garden soil[1]. Prefers a good moist soil that does not dry out in the summer, in sun or partial shade[187, 200]. Succeeds in the flower border or in moist grass[1], plants can become invasive when they are grown by water[200]. The plant is heat tolerant in zones 8 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°c). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

## 5.2.719 Monarda clinopodia

White Basil-Balm, White bergamot  
4 tin 8 cyuc 1 kcaak 0 tcan 0 dwat 1.3 m hkuc  
hmimhtut cyutli tcup hwicli hrasljutnyikfrip hpa7tli flatprikkwis hpa7tmwatli fyifxre7t hjonli

drutta Monarda clinopodia is a PERENNIAL growing to 1.3 m (4ft 3in). See above for USDA hardiness. It is hardy to UK zone 5. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Edible Uses: TeaThe fresh or dried leaves and flower heads are brewed into a tea. Said to be excellent when mixed with other teas[183].

tcanta None known  
dwatta None known

propta Seed - sow mid to late spring in a cold frame. Germination usually takes place within 10 - 40 days at 20°c. When large enough to handle, prick the seedlings out into individual pots and plant them out into their permanent positions in early summer. The seed can also be sown in situ in late summer in areas where the winters are not too severe and will produce larger plants. Cuttings of soft basal shoots in spring. Harvest the shoots with plenty of underground stem when they are about 8 - 10cm above the ground. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer. Division in spring or autumn. Large divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame un-

## 5.2.714 *Rumex obtusifolius*

Round-Leaved Dock, Bitter dock

4 tlin 8 cyuc 1 ckak 3 tcan 2 dwat 1 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli frusflatprikli-wisslip hpa7tmwatli xre7t hjonli

drutta *Rumex obtusifolius* is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from June to October, and the seeds ripen from July to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

ckakta Edible Parts: Leaves Seed StemEdible Uses: Young leaves - cooked[8, 22, 46, 61]. A bitter taste, especially if the older leaves are used[105, 183]. The leaves are usually cooked in at least one change of water in order to reduce the bitterness[183]. Leaves can also be dried for later use[12]. The leaves have a much milder flavour when they are first produced in early spring[K]. Young stems - cooked[257]. Seed - raw or cooked[102, 172]. The seed can also be ground into a powder and used to make a gruel or added to cereal flours when making bread etc[102]. It is rather small and fiddly to harvest.

tcanta DyeYellow, dark green to brown and dark grey dyes can be obtained from the roots of this plant[14, 168]. They do not need a mordant[168].

dwatta Astringent Blood purifier Contraceptive SalveThe leaves are often applied externally as a rustic remedy in the treatment of blisters, burns and scalds[4, 14]. The root contains tannin and is astringent and blood purifier[257]. A tea made from the roots has been used in the treatment of jaundice, whooping cough, boils and bleeding[4, 257]. An infusion of the root has been used as a wash, especially for children, to treat skin eruptions[257]. One report says that the root has been used as a contraceptive to stop menstruation[257]. The root is harvested in early spring and dried for later use[4].

propta Seed - sow spring in situ. Division in spring.

nwatta Requires a good soil[4]. Plants are occasionally cultivated for their edible leaves[61]. A very important food plant for the caterpillars of many species of butterfly[30]. This species is an alternative host of the turnip fly[4].

## 5.2.715 *Pycnanthemum flexuosum*

Mountain Mint, Appalachian mountainmint

4 tlin 8 cyuc 1 ckak 0 tcan 2 dwat 1 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Pycnanthemum flexuosum* is a PERENNIAL growing to 1 m (3ft 3in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

ckakta One report says that the plant is used for food, but gives no details[257].

tcanta None known

dwatta Analgesic Diaphoretic Febrifuge StomachicThe leaves and flowering stems are popularly used in the treatment of bowel complaints[207]. A hot infusion of the plant is diaphoretic[207]. The plant is also used internally in the treatment of stomach upsets, fevers, colds and sinus headaches[238, 257]. A poultice of the leaves is used in the treatment of headaches[257]. A warm infusion of the plant has been used to bathe an inflamed penis[257]. The plant is harvested as it comes into flower and can be used fresh or dried.

propta Seed - sow spring or autumn in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. If there are sufficient seeds they can be sown in an outdoor seedbed in April. Division in spring.

nwatta Succeeds in most soils[1] but prefers a rich loamy soil in full sun or partial shade with plenty of moisture in the growing season[200]. Hardy to at least -15°C[200]. The correct name for this species should be *P. tenuifolium*. Schrad.[228]. The bruised leaves are very aromatic[200]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

## 5.2.716 *Lysimachia vulgaris*

Yellow Loosestripe, Garden yellow loosestripe

4 tlin 8 cyuc 1 ckak 0 tcan 2 dwat 1.2 m hkuc hmimhtut cyutli tcuphja7nhs6s hwicli hrasjlutnyikfrip hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta *Lysimachia vulgaris* is a PERENNIAL growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from April to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can grow in water.

ckakta Edible Parts: LeavesEdible Uses: Young leaves[105, 177]. No more details are given.

tcanta DyeA yellow dye is obtained from the flowers[13, 100]. A brown dye is obtained from the rhizomes[13]. The growing plant repels gnats and flies, it has been burnt in houses in order to remove these insects[4].

dwatta Antidiarrhoeal Astringent Demulcent Dysentery ExpectorantAn astringent herb, yellow loosestripe is principally used to treat gastro-intestinal conditions such as diarrhoea and dysentery, to stop internal and external bleeding and to cleanse wounds[254]. The herb is astringent, demulcent and expectorant[4, 61]. It is harvested when in flower in July and dried for later use[4]. The plant can be used internally or externally and is useful in checking bleeding of the mouth, nose and wounds, restraining profuse haemorrhages of any kind and in the treatment of diarrhoea[4]. It makes a serviceable mouthwash for treating sore gums and mouth ulcers[254].

propta Seed - sow spring or autumn in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring or autumn[200]. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring. Basal cuttings, March to April in a cold frame. Harvest the shoots with plenty of underground stem when they are about 8 - 10cm above the ground. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta An easily grown plant, succeeding in a moist or wet loamy soil in sun or partial shade[187]. Prefers a shady position[111]. Grows well in heavy clay soils. Hardy to at least -25°C[187]. Most species in this genus seem to be immune to the predations of rabbits[233]. A very ornamental plant[1]. The sub-species *L. vulgaris davurica*. (Ledeb.)Kunth. is the form used for food in China and Japan[177].

## 5.2.717 *Cimicifuga racemosa* (*Actaea racemosa*)

Black Cohosh, Black Snakeroot, Bugbane

4 tlin 10 cyuc 1 ckak 0 tcan 4 dwat 1.5 m hkuc hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Cimicifuga racemosa* (*Actaea racemosa*) is a PERENNIAL growing to 1.5 m (5ft) by 0.6 m (2ft in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from July to October, and

The leaves are antiphlogistic[207]. They cause inflammation and have irritating properties[207].

propta Seed - sow early spring or autumn in situ. Germination usually takes place within 2 - 8 weeks at 20°C. A pernicious weed, not many people would want to invite this plant into their garden.

nwatta The creeping thistle is a pernicious garden weed, spreading freely from its aggressive root system[17, K], It can quickly form dense clumps of growth and really does not need to be introduced into the garden. Succeeds in any ordinary garden soil in a sunny position[200]. Plants are often dioecious[17]. A polymorphic species[17]. Special Features:North American native, Invasive, Attracts butterflies. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is fleshy. Thick or swollen - fibrous or tap root [2-1].

## 5.2.583 *Osmunda cinnamomea*

Cinnamon Fern

4 tlin 8 cyuc 2 ckak 0 tcan 1 dwat 0.6 m hkuc hmimhtut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli frusflatprikliwis hpa7tmwatli hjonli

drutta *Osmunda cinnamomea* is a FERN growing to 0.6 m (2ft) by 0.4 m (1ft 4in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 3. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

ckakta Edible Parts: LeavesEdible Uses: The young un-expanded fronds are eaten as a nibble or cooked in soups[46, 61, 62, 116, 159, 183, 257]. The taste is said to resemble asparagus[200]. The young shoots are seen as a 'spring tonic' to cleanse the body with fresh green food after a long winter eating mainly stored foods[257]. The latent buds can be eaten in early spring, they rival chestnuts in size and flavour[95].

tcanta None known

dwatta Analgesic Antirheumatic GalactogogueA decoction of the root has been rubbed into affected joints as a treatment for rheumatism[257]. The root has been chewed, a small portion swallowed and the remainder applied to a snakebite[257]. The following reports do not state which part of the plant is being used, though it is most likely that the root is being referred to. The plant is analgesic, antirheumatic and galactogogue[257]. A decoction is used internally in the treatment of headaches, joint pain, rheumatism, colds etc, and also to promote the flow of milk in a nursing mother[257].

propta Spores - they very quickly lose their viability (within 3 days) and are best sown as soon as they are ripe on the surface of a humus-rich sterilized soil in a lightly shaded place in a greenhouse. Keep the compost moist, preferably by putting a plastic bag over the pot. Plants develop very rapidly, pot on small clumps of plantlets as soon as they are large enough to handle and keep humid until they are well established. Do not plant outside until the ferns are at least 2 years old. Cultivars usually come true to type[200]. Division of the rootstock in the dormant season. This is a very strenuous exercise due to the mass of wry roots[200].

nwatta Landscape Uses:Border, Container, Ground cover, Rock garden, Specimen, Woodland garden. Easily grown in a damp woodland or by the margins of pools and streams[187]. Likes a soil of swamp mud and loamy or fibrous peat, sand and loam[1]. Succeeds in most moist soils, preferring acid conditions[200]. Requires a constant supply of water, doing well by ponds, streams etc[1]. Plants thrive in full sun so long as there is no shortage of moisture in the soil and also in shady situations beneath shrubs etc[200]. Requires a shady position[188]. Plants are hardy to at least -20°C, they are evergreen in warm winter areas but deciduous elsewhere[200]. This species is sometimes cultivated for its edible fronds[200]. Members of this genus are rarely if ever troubled by browsing deer[233]. A very ornamental plant[1]. The rhizome is large and slowly creeping[187]. Special Features:Attractive foliage, North American native, Naturalizing, Wetlands plant, There are no flowers or blooms.

## 5.2.584 *Pachysandra terminalis*

Japanese Spurge, Japanese pachysandra, Pachysandra

4 tlin 8 cyuc 2 ckak 0 tcan 0 dwat 0.2 m hkuc pcmhimm cyutli hgatkyuctcup hwicli hrasjlutnyik hpa7tli frusflatprikliwsslip hpa7tmwatli hjonli

drutta *Pachysandra terminalis* is an evergreen Shrub growing to 0.2 m (0ft 8in) by 0.5 m (1ft 8in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in leaf all year, in flower from April to May, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and very alkaline soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers dry or moist soil and can tolerate drought.

ckakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. Sweet and juicy[105]. The ovoid fruits are 5 - 6mm long[266]. The fruit is not usually produced in cultivation[200] - this could be because both male and female plants are required and most people only grow one plant.

tcanta A very useful ground cover plant for a shady position, spreading by means of underground runners[182, 190]. A vigorous grower, but it is not too invasive[200].It grows well in the shade of shrubs[K].

dwatta None known

propta Seed - we have no information on this species but suggest sowing the seed in a cold frame as soon as it is ripe if this is possible, otherwise sow it in late winter. Prick out the seedlings into individual pots when they are large enough to handle and grow on in a shady part of the greenhouse or cold frame. Plant out in early summer of the following year. Cuttings of half-ripe wood, 4 - 7cm long taken at a node, June - August in a shady position in a frame[78]. Division in spring[200]. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer[K].

nwatta Landscape Uses:Border, Container, Erosion control, Ground cover, Rock garden, Woodland garden. A very tolerant plant, it thrives in any moist well-drained soil[11, 200]. Easily grown in a loose leafy soil succeeding in dry shade[187] and tolerating drought once it is established[190]. Grows well under trees[11]. Dislikes dry soils, full sun and strong winds[200]. Prefers a lime-free soil[182] according to one report whilst another says that it succeeds in acid and alkaline soils[200]. Hardy to about -25°C[187]. Plants are monoecious and rarely if ever produce fruit in cultivation[187, 200]. The flowers have a pleasant sweet fragrance[245]. At least one named form has been selected for its ornamental value[187]. Special Features: Attractive foliage, Not North American native, Naturalizing, Fragrant flowers, Inconspicuous flowers or blooms.

## 5.2.585 *Hierochloe odorata*

Holy Grass

4 tlin 8 cyuc 2 ckak 0 tcan 2 dwat 0.6 m hkuc hmimhtut cyutli kyuctcuphja7n hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Hierochloe odorata* is a PERENNIAL growing to 0.6 m (2ft) by 0.6 m (2ft in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry moist or wet soil.

ckakta Edible Parts: SeedEdible Uses: Colouring CondimentSeed - cooked[105]. Small and fiddly to use. It almost certainly does not contain coumarin and should be safe to use. An essential oil from the leaves is used as a food flavouring in sweets and soft drinks. It has a strong vanilla-like flavour[183]. The leaves are added to vodka as a flavouring[238]. The plant is said to be used as a colouring agent[183] but no more details are given.

tcanta Basketry Hair Incense Repellent Soil stabilization Strewing StuffingThe dried leaves are used as an incense[46, 61, 99], they were formerly also used as a strewing herb[1, 46, 238] and have been used as a stuffing in pillows and mattresses[257]. They have also been used as an insect repellent in the clothes cupboard where they impart a nice smell to the clothes[99, 238]. The leaves are used to make aromatic baskets[46, 61, 99, 169, 171]. The wet leaves can be sewn together, dried until they are tight and then resin used over the stitches to make a waterproof container[257]. The leaves can be soaked in water to make a tonic hair wash[257]. An essential oil distilled from the leaves is used in perfumery where it acts as an excitant and fixative for other aromas[238]. The plant has a very aggressive root system and has been planted to stabilize banks[74].

dwatta Birthing aid Febrifuge Skin VEDA tea made from the leaves is used in the treatment of fevers, coughs, sore throats, chafing and venereal infections[222, 257]. It is also used to stop vaginal bleeding and to expel afterbirth[222]. The stems can be soaked in water and used to treat wind-burn and chapping and as an eyewash[257]. Some caution is advised when using this plant internally, see the notes above on toxicity[222]. The leaves are harvested in the summer and dried for later use[238]. Smoke from the burning leaves has been inhaled in the treatment of colds[257].

propta Seed - sow spring in situ and only just cover the seed[162]. Germination usually takes place within 2 weeks. If the seed is in short supply it can be sown in the cold frame in the spring. When large enough to handle, prick the seedlings out into individual pots and plant them out in early summer. Division in spring or summer[162]. Very simple, virtually any part of the root will regrow to make a new plant[K].

nwatta Prefers a damp position in a rich soil but succeeds in most soils including quite dry conditions[162]. Grows best in a sunny position[238]. The plants have a running root system and can spread aggressively when grown in suitable conditions[74]. The plant, as it dries, emits a powerful scent of newly mown hay[245].

### 5.2.586 Jovibarba sobolifera

Hen And Chickens Houseleek

4 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat 0.1 m hkuc htut cyutli kyuctcup hwicli hras hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Jovibarba sobolifera is an evergreen Perennial growing to 0.1 m (0ft 4in) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf all year, in flower in July. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaf rosettes and young shoots - raw[74].

tcanta None known

dwatta None known

propta Seed - we have no details for this species but suggest surface sowing the seed in a sunny position in a greenhouse in late winter or early spring. Do not allow the compost to become dry. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division of offsets in the summer[200].

nwatta Succeeds in any sandy soil[1]. Requires a gritty well-drained soil in full sun[200]. Succeeds on a wall[188]. Plants are hardy to about -15°c[200] so long as they are in a well-drained soil. They strongly dislike winter wet[200]. Individual offsets take several years to reach flowering size but then die after flowering, though more offsets are produced[188, 200]. This species does not hybridize naturally[1].

### 5.2.587 Trillium erectum

Beth Root - Indian Balm, Red trillium, Wakerobin, Purple Trillium

4 tlin 9 cyuc 2 kcaak 0 tcan 3 dwat 0.4 m hkuc pcmhmmhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Trillium erectum is a PERENNIAL growing to 0.4 m (1ft 4in) by 0.3 m (1ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked. Used in spring[207], the young unfolding leaves are an excellent addition to the salad bowl, tasting somewhat like sunflower seeds[183]. Leaves can also be cooked as a potherb[183].

tcanta None known

dwatta Antiseptic Aphrodisiac Astringent Birthing aid Expectorant Poultice Tonic Urinary Uterine tonicBeth root was traditionally used by various native North American Indian tribes as a woman’s herb to aid childbirth, as a treatment for irregular menstrual periods, period pains and excessive vaginal discharge[254]. Modern research has shown that the root contains steroidal saponins, which have hormonal effects on the body[222, 238]. These saponins are being used in gynaecological and obstetric medicine[238]. This herb should not be taken during pregnancy except under professional supervision[254]. The root is antiseptic, aphrodisiac, astringent, expectorant, tonic, uterine tonic[4, 46, 61, 165, 222, 238]. It is used internally in the treatment of a wide range of women’s complaints including haemorrhage from the uterus, urinary tract and lungs, and also to curb excessive menstruation[238]. It has proved to be of value in stopping bleeding after parturition[244]. Externally, it is used to treat excessive vaginal discharge, ulcers (especially varicose), skin complaints, gangrene, insect bites and stings[238, 244]. It is also used as a wash for sore nipples[244]. The root is harvested in late summer, after the leaves have died down, and is dried for later use[213, 238]. The whole plant is used as a poultice for tumours, inflammations and ulcers[222].

propta Seed - best sown in a shaded cold frame as soon as it is ripe[134, 200]. Stored seed should be sown in late winter or early spring. Seed usually germinates within 1 - 3 months at 15°c. Another report says that seeds produce a root after the first cold stratification but no shoot is produced until after a second winter[138], whilst yet another report says that the seed can take 3 years to germinate[238]. The seedlings are prone to damp off and must therefore be watered with care and given plenty of fresh air[138]. The young plants need to be overwintered in a cold frame for the first year and can then be planted out in late spring. It is very important that the pots become neither too dry nor too wet[138]. Division with care when the plants die down after flowering[200]. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the following spring.

nwatta Landscape Uses:Border, Ground cover, Woodland garden. Prefers a deep well-drained woodland or humus-rich soil in a somewhat shady position that remains moist in the summer[1, 42]. Prefers a neutral to slightly acid soil[200]. Grows well in open deciduous woodland[1, 90]. Succeeds in a sunny position if the soil does not dry out[42]. Succeeds in deep shade[188]. A very hardy plant, tolerating temperatures down to about -35°c[238]. Plants are long-lived[233]. Any transplanting is best done whilst the plants are in flower[200]. A very variable species[200], it is subject to mutation[90]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233], though slugs are very fond of the leaves[238]. The flowers have an unattractive smell rather like putrefied flesh[42, 207, 245]. The white-flowered form, *blandium*, is almost scentless[245]. Plants can flower in two years from seed[138]. Special Features:Attractive foliage, North American native, Naturalizing, Flowers have an unpleasant odor.

(sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: Flowers LeavesEdible Uses: Flowers - raw or cooked[105, 177, 183]. Some caution is advised, see the notes above on toxicity. Leaves - boiled[105, 177, 183]. Some caution is advised, see the notes above on toxicity.

tcanta Plants can be grown as ground cover when spaced about 1 metre apart each way[208].

dwatta None known

propta Seed - best sown in a greenhouse as soon as it is ripe in the autumn and given artificial light. Alternatively sow the seed in a lightly shaded part of the warm greenhouse in late winter or in a cold greenhouse in April. Surface-sow the seed and do not allow the compost to become dry[200]. Pot up the seedlings when they are large enough to handle and grow on in a greenhouse for at least the first winter. Layering in late July. Takes 15 - 24 months[78]. Cuttings of half-ripe wood, August in a frame. Difficult[78].

nwatta Succeeds in a most humus-rich lime-free soils except those of a dry arid nature or those that are heavy or clayey[1]. Prefers a peaty or well-drained sandy loam[1]. Succeeds in sun or shade, the warmer the climate the more shade a plant requires[200]. A pH between 4.5 and 5.5 is ideal[1]. Plants are hardy to about -20°c[184], but are deciduous in cold climates. Succeeds in a woodland though, because of its surface-rooting habit[200], it does not compete well with surface-rooting trees[1]. Plants need to be kept well weeded, they dislike other plants growing over or into their root system, in particular they grow badly with ground cover plants, herbaceous plants and heathers[200]. Plants form a root ball and are very tolerant of being transplanted, even when quite large, so long as the root ball is kept intact[200]. This species is closely related to *R. indicum*[200]. Plants in this genus are notably susceptible to honey fungus[200].

### 5.2.712 Rhododendron japonicum

Japanese azalea

4 tlin 8 cyuc 1 kcaak 0 tcan 1 dwat 2 m hkuc

hmimhtut cyutli tcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta Rhododendron japonicum is a deciduous Shrub growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves[177]. No more details are given but some caution is advised, see the notes above on toxicity.

tcanta None known

dwatta Diuretic TonicDiuretic, tonic[174].

propta Seed - best sown in a greenhouse as soon as it is ripe in the autumn and given artificial light. Alternatively sow the seed in a lightly shaded part of the warm greenhouse in late winter or in a cold greenhouse in April. Surface-sow the seed and do not allow the compost to become dry[200]. Pot up the seedlings when they are large enough to handle and grow on in a greenhouse for at least the first winter. Layering in late July. Takes 15 - 24 months[78]. Cuttings of half-ripe wood, August in a frame. Difficult[78].

nwatta Succeeds in a most humus-rich lime-free soils except those of a dry arid nature or those that are heavy or clayey[1]. Prefers a peaty or well-drained sandy loam[1]. Succeeds in sun or shade, the warmer the climate the more shade a plant requires[200]. A pH between 4.5 and 5.5 is ideal[1]. This species is closely related to *R. molle* and perhaps not distinct from it[200]. Succeeds in a woodland though, because of its surface-rooting habit[200], it does not compete well with surface-rooting trees[1]. Plants need to be kept well weeded, they dislike other plants growing over or into their root system, in particular they grow badly with ground cover plants, herbaceous plants and heathers[200].

Plants form a root ball and are very tolerant of being transplanted, even when quite large, so long as the root ball is kept intact[200]. Plants in this genus are notably susceptible to honey fungus[200].

### 5.2.713 Belamcanda chinensis

Leopard Lily, Blackberry lily, Leopard Flower

4 tlin 10 cyuc 1 kcaak 0 tcan 3 dwat 1 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Belamcanda chinensis is a PERENNIAL growing to 1 m (3ft 3in) by 0.3 m (1ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from August to October, and the seeds ripen from September to November. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves - cooked[105, 177]. Caution is advised, see the notes above on toxicity.

tcanta TanninThe root contains tannin[272].

dwatta Abortifacient Analgesic Antibacterial Antidote Antifungal Antiinflammatory Depurative Expectorant Febrifuge Hepatic Pectoral Purgative Stomachic TonicThe leopard lily has a very long history of use in traditional Chinese medicine. It is a bitter cooling herb that acts mainly on the lungs and the liver, lowering fevers and reducing inflammation[238]. It is effective against a number of bacterial, fungal and viral organisms[238] and has also been used as an antidote to snakebites[240]. The root contains several medically active constituents including flavonoids and isoflavonoids[279]. It also contains the glucosides belamcandin, tectoridin, shekanin and iridin[283]. It is analgesic, antibacterial, antifungal, anti-inflammatory, depurative, expectorant, febrifuge, pectoral, purgative, stomachic and tonic[46, 61, 147, 176, 178, 218, 238, 279, 283]. It is used in the treatment of acute laryngitis, acute tonsillitis, oedema of the glottis and cough with profuse sputum[176, 279]. The juice of the root is used in Nepal to treat liver complaints, where it has the added benefit of improving the appetite[272]. This juice is also used to abort a foetus during the first trimester of pregnancy[272]. The root should not be prescribed for pregnant women[238]. The root is harvested in the summer and autumn, and dried for later use[238].

propta Seed - best sown as soon as it is ripe in a cold frame. Pre-chill stored seed for 7 days and sow spring in a cold frame. The seed germinates in 2 - 8 weeks at 20°c[134]. Prick out the seedlings into individual pots as soon as they are large enough to handle. They can be planted out in early autumn and should flower in the following year[200]. Division in spring or early autumn[200]. Larger divisions can be planted straight into their permanent positions whilst smaller clumps are best potted up and kept in a cold frame until they are growing away well.

nwatta Landscape Uses:Border, Container, Massing, Woodland garden. Requires a fairly rich sandy or loamy soil in a bright sunny position or light shade. Succeeds in most soils[187]. Requires a position that stays moist in the summer[187]. Plants grow best in areas with long hot summers[238]. A fairly hardy plant, tolerating temperatures down to about -15°c[187] if given a deep dry mulch over the winter. A short lived plant, the bulbs are usually lifted in the autumn and stored in a cool but frost-free place over the winter, replanting them in the spring[233]. They can be left in the ground in the milder areas of the country so long as the soil is well-drained[233]. Individual flowers only live for one day, but the plant produces a succession of blooms over a period of several weeks[238]. Slugs really love this plant and can destroy even quite large clumps as they come into growth in the spring[K]. Special Features:Not North American native, Naturalizing, Attracts butterflies, Suitable for cut flowers, Suitable for dried flowers, Attractive flowers or blooms.

good loamy soil[1]. Succeeds in very poor soils[202]. Grows well in heavy clay soils. Prefers a moist well-drained soil in a sunny position with shade from the midday sun[200]. Hardy to about -20°c[184]. Plants are moderately fast growing[202]. They sucker freely and can be invasive[202]. Some named forms have been developed for their ornamental value[182]. This species is notably resistant to honey fungus[200]. The flowers are said to be usually unisexual but we do not know if the plants are dioecious or monoecious. Special Features: Not North American native, Attractive flowers or blooms.

## 5.2.708 Senecio cannabifolius

Aluetian ragwort  
4 tin 8 cyuc 1 kcaak 0 tcan 2 dwat 2 m hkuc  
htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Senecio cannabifolius is a PERENNIAL growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 5. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves and stems - cooked[46, 61, 105]. A bitter taste should be removed by leaching the leaves or cooking them in more than one change of water[177]. Some caution is advised, see the notes above on toxicity.

tcanta None known  
dwatta Anodyne Antirheumatic Contraceptive SkinThe plant (though the part used is not specified) is anodyne, antirheumatic, contraceptive and used in the treatment of skin complaints. It stimulates the circulation[147, 178]. A decoction is used in the treatment of amenorrhoea, abdominal distension and cramps, traumatic injuries, bruises and swellings[147].

propta Seed - sow spring in a greenhouse and only just cover the seed. Make sure the compost does not dry out. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in early summer if they have grown sufficiently. Otherwise, grow them on in the greenhouse or cold frame for their first winter and plant them out the following year after the last expected frosts. Division in spring[200]. Root cuttings in early spring[200].

nwatta Succeeds in a sunny position in most moderately fertile well-drained soils[200].

## 5.2.709 Euonymus alatus

Winged Spindle Tree, Burningbush, Corky spindletree  
4 tin 8 cyuc 1 kcaak 0 tcan 2 dwat 2 m hkuc  
hmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Euonymus alatus is a deciduous Shrub growing to 2 m (6ft) by 3 m (9ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 3. It is in flower from July to August, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Fruit LeavesEdible Uses: TeaY-oung leaves, boiled[105, 177]. The fruit may be edible[105, 177]. No further details are given, though we would recommend caution in eating any member of this genus[K]. The fruit is about 8mm in diameter[200]. The seed contains 20.5% protein, 44.4% fat and 3.9% ash[218]. These reports of edibility should be treated with some caution, see the notes above on toxicity. The flowers are a tea substitute[178, 218].  
tcanta Hedge HedgeThis species can be grown as a hedge, the var. compactus is normally used[29].

dwatta Anodyne Anthelmintic Antiphlogistic Antipruritic Astringent Blood tonic Cancer Carminative Emmenagogue HypoglycaemicThe stem and branches are alternative,

analgesic, anodyne, anthelmintic, anticoagulant, antiphlogistic, antipruritic, astringent blood tonic, carminative, emmenagogue, hypoglycaemic, and purgative[147, 178, 218, 279]. It is used in Korea to treat intestinal worms, suppressed menstruation and cancer[279]. A decoction is used in China in the treatment of 'cold' headache, general body aches, pruritis, irregular menstruation and other gynaecological diseases[147]. Plants contain the anticancer compound dulcitol[218].

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed requires 8 - 12 weeks warm followed by 8 - 16 weeks cold stratification and can then be sown in a cold frame[78, 98]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 8cm long taken at a node or with a heel, July/August in a frame. Very easy[200].

nwatta Landscape Uses:Border, Erosion control, Foundation, Hedge, Massing, Screen, Standard, Specimen. Thrives in almost any soil, including chalk[200], it is particularly suited to dry shaded areas[200]. Prefers a well-drained loamy soil[1]. A very ornamental and cold-tolerant plant[1], it tolerate temperatures down to about -25°c[184]. There are some named varieties developed for their ornamental value[182]. 'Compactus' is a more dense growing form for small gardens[182]. Special Features:Not North American native, Invasive, All or parts of this plant are poisonous, Inconspicuous flowers or blooms.

## 5.2.710 Euonymus oxyphyllus

4 tin 8 cyuc 1 kcaak 0 tcan 1 dwat 2.5 m hkuc  
hmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Euonymus oxyphyllus is a deciduous Tree growing to 2.5 m (8ft) by 2.5 m (8ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in May, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young leaves - boiled[105, 177]. Some caution is advised, see the notes above regarding possible toxicity.

tcanta WoodWood - hard, elastic, very fine grained. Used for stamps, printing blocks, mosaics etc[46, 61].

dwatta Women's complaintsThe plant is used in gynaecological applications[218].

propta Seed - best sown as soon as it is ripe in a cold frame[121]. Stored seed requires 3 months cold stratification, so should be sown as early in the year as possible in a cold frame[113]. The seed can take 18 months to germinate. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 7cm long taken at a node or with a heel, July/August in a frame. Very easy[200].

nwatta Thriving in almost any soil, including chalk, it is particularly suited to dry shaded areas[200]. Prefers a well-drained loamy soil. A very ornamental plant[11], it is hardy to about -25°c[184]. A slow growing plant, though it makes a large shrub in time[182].

## 5.2.711 Rhododendron kaempferi

4 tin 8 cyuc 1 kcaak 0 tcan 0 dwat 2.5 m hkuc  
hmim cyutli tcup hwicli hrasjlut hpa7tli frusfat hpa7tmwatli xre7t hjonli

drutta Rhododendron kaempferi is an evergreen Shrub growing to 2.5 m (8ft) by 2.5 m (8ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf all year, in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light

## 5.2.588 Mimulus lewisii

Great Purple Monkey Flower, Purple monkeyflower  
4 tin 8 cyuc 2 kcaak 0 tcan 1 dwat 0.6 m hkuc  
hmimhtut cyutli tcuphja7nhs6s hwicli hrasjlutnyikfrp hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Mimulus lewisii is a PERENNIAL growing to 0.6 m (2ft) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to August. The flowers are pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can grow in water.

kcakta Edible Parts: LeavesEdible Uses: Leaves and stems - raw or cooked[172].

tcanta None known  
dwatta PoulitcePoulitce[172].

propta Seed - sow spring in a greenhouse and only lightly cover the seed[200]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. If you have sufficient seed it can also be sown in situ in late spring after the last expected frosts[200]. Division in spring[200]. Very easy, large divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer. Cuttings of softwood, 5cm long in spring or summer[200].

nwatta Prefers rather moist places such as damp borders, margins of streams and boggy spots[1]. Grows well in heavy clay soils. Thrives in full sun so long as the soil does not dry out[200], otherwise it is best grown in partial shade[187]. This species tolerates slightly drier conditions than *M. guttatus*, it prefers a rich soil in light woodland[200]. Hardy to at least -20°c[187]. Another report says that plants are only hardy in the milder parts of Britain[233]. There is some confusion over the naming of this plant, the entry on edibility may refer to *M. luteus*, which is closely related to this species.

## 5.2.589 Cardamine bulbifera

Coral Root, Coralroot bittercress  
4 tin 8 cyuc 2 kcaak 0 tcan 0 dwat 0.5 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyfjxre7t hjonli

drutta Cardamine bulbifera is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from April to June, and the seeds ripen from May to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Leaves - raw or cooked[K]. A hot cross-like flavour. Bulbils - raw or cooked. They are rather small, about the size of a lentil, but have a pleasant mild cross-like flavour[K]. Root - raw or cooked[K]. A hot flavour, it is pleasant but rather small[K].

tcanta None known  
dwatta None known

propta Seed - best sown when ripe, otherwise sow it in the spring. If you have sufficient seed it can be sown in situ, otherwise it is best to sow it in pots in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle and pant out in the summer. The bulbils can be collected in early summer and potted up. Keep them in a cold frame over the winter and plant out when in active growth in the spring.

nwatta Prefers a moist humus rich soil in shade or semi-shade[200]. The flowers are rarely visited by pollinating insects and seed is rarely set, propagation is carried out by means of bulbils formed on the axils of the upper leaf stems[17, K].

## 5.2.590 Nepeta raphanorrhiza

4 tin 8 cyuc 2 kcaak 0 tcan 0 dwat 0.5 m hkuc  
htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Nepeta raphanorrhiza is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. The seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: RootEdible Uses: Root - cooked[177]. An almond flavour[105].

tcanta None known  
dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame in the autumn[200]. The germination of spring sown seed can be erratic[200], it is best sown in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle and plant them out into their permanent positions in the summer. If you have sufficient freshly ripe seed then it is well worth trying a sowing outdoors in situ in the autumn. Division in spring or autumn[200]. Very easy, large divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer. Basal cuttings in late spring or early summer. Harvest the shoots with plenty of underground stem when they are about 8 - 10cm above the ground. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Easily grown in a well-drained soil in a sunny position[200]. Plants are bushier when grown in fertile soils[200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. A good bee plant[108].

## 5.2.591 Muscari neglectum

Grape Hyacinth, Starch grape hyacinth  
4 tin 7 cyuc 2 kcaak 2 tcan 0 dwat 0.3 m hkuc  
htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyfjxre7t hjonli

drutta Muscari neglectum is a BULB growing to 0.3 m (1ft) by 0.1 m (0ft 4in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from April to May, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Flowers RootEdible Uses: Bulb - cooked[2, 132, 177, 183]. The bulb is up to 25mm diameter[200]. One report says that the bulb might be poisonous[4]. The flowers, sprinkled over rhubarb, add a wonderful scented flavour[183].

tcanta Landscape Uses: Border, Container, Massing, Rock garden, forest garden.

dwatta None known  
propta Seed - best sown as soon as ripe in a greenhouse[200]. The seed can also be sown in early spring in a greenhouse. A good proportion of the seed usually germinates within 2 - 3 months. Sow the seed thinly so that the seedlings can be left undisturbed in the pot for their first year of growth. Give them an occasional liquid feed in the growing season to ensure they do not become nutrient deficient. When the plants become dormant in late summer, pot up the small bulbs placing 2 - 3 bulbs in each pot. Grow them on for another one or two years in the greenhouse before planting them out when they are dormant in late summer. Division of offsets in July/August after the leaves die down[1]. It can be done every other year if a quick increase is required[1]. Larger bulbs can be replanted direct into their permanent

positions, but it is best to pot up the smaller bulbs and grow them on in a cold frame for a year before planting them out when they are dormant in late summer.

nwatta Prefers a rich open well-drained soil and a sunny position[1, 90]. Easily grown in any well-drained soil[90]. Grows very well in short grass[1], increasing freely[42] and it can become invasive[200]. A very variable plant[89, 200]. The flowers secrete lots of nectar and are a valuable bee plant in the spring[4]. The flowers are said to have a smell like wet starch[4] whilst another report says that they are deliciously plum-scented[245]. Special Features:Attractive foliage, Naturalizing, Fragrant flowers.

## 5.2.592 Viola tricolor

Heartsease, Johnny jumpup, Field Pansy, 4 tin 9 cyuc 2 kcaak 0 tcan 3 dwat 0.2 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli fyixre7t hjonli

drutta Viola tricolor is a ANNUAL/PERENNIAL growing to 0.2 m (0ft 8in) by 0.2 m (0ft 8in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from April to September, and the seeds ripen from June to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Flowers LeavesEdible Uses: TeaYoung leaves and flower buds - raw or cooked[105]. When added to soup they thicken it in much the same way as okra[85, 159]. A tea can be made from the leaves[85]. The small attractive flowers are added to salads or used as a garnish[183].

tcanta Dye LitmusYellow, green and blue-green dyes are obtained from the flowers[168]. The leaves can be used in place of litmus in testing for acids and alkalis[4].

dwatta Anodyne Antiasthmatic Antiinflammatory Antiseborrheic Antispasmodic Cardiac Demulcent Depurative Diaphoretic Diuretic Eczema Emetic Emollient Epilepsy Expectorant Homeopathy Laxative VulneraryHeartsease has a long history of herbal use and was at one time in high repute as a treatment for epilepsy, asthma, skin diseases and a wide range of other complaints[4]. In modern herbalism it is seen as a purifying herb and is taken internally in the treatment of skin complaints such as eczema[254]. The herb is anodyne, antiasthmatic, anti-inflammatory, cardiac, demulcent, depurative, diaphoretic, diuretic, emollient, expectorant, laxative and vulnerary[4, 7, 9, 13, 21, 46, 165]. Being expectorant, it is used in the treatment of various chest complaints such as bronchitis and whooping cough, whilst its diuretic action makes it useful for treating rheumatism, cystitis and difficulty in passing urine[254]. It is also used as an ointment for treating eczema and other skin complaints and is also useful in cases of rheumatism, bed-wetting etc[4, 9]. The plant is harvested from June to August and dried for later use[4]. The root is emetic[7]. A homeopathic remedy is made from the entire plant[4]. It is used in the treatment of cutaneous eruptions[4].

propta Seed - best sown in the autumn in a cold frame. Division in the autumn or just after flowering. The plant is a short-lived perennial and division is not that worthwhile.

nwatta Landscape Uses:Alpine garden, Border, Container, Massing, Rock garden. Prefers a cool moist well-drained humus-rich soil in partial or dappled shade and protection from scorching winds[31, 53]. Tolerates sandstone and limestone soils but becomes chlorotic if the pH is too high[200]. Prefers a pH between 6 and 6.5[200]. A very variable species[4]. It is normally an annual plant, but it is sometimes a short-lived perennial[187]. A good bee plant[24]. Grows well with rye but dislikes growing with wheat[18]. All members of this genus have more or less edible leaves and flower buds, though those species with yellow flowers can cause diarrhoea if eaten in large quantities[62, 85, 159]. Special Features:Not North American native, Naturalizing, Suitable for cut flowers, Extended bloom season in Zones 9A and above, Fragrant flowers.

## 5.2.593 Fritillaria verticillata

4 tin 8 cyuc 2 kcaak 0 tcan 3 dwat 0.6 m hkuc hmimhtut cyutli hgatkuyctup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Fritillaria verticillata is a BULB growing to 0.6 m (2ft) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from March to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcaakta Edible Parts: Flowers Leaves RootEdible Uses: Bulb - cooked or candied[183]. The bulb is about 2cm in diameter[266]. Young plant - cooked. Used in soups[183]. Eating the young plant will greatly reduce the vigour of the bulb, and could even kill it[K]. Petals and flower buds - cooked. Used in soups[183].

tcanta None known

dwatta Antidote Antitussive Astringent Cancer Expecto-rant GalactogogueThe bulbs are antidote, antitussive, astringent, expectorant, galactogogue and purgative[116, 218]. They contain fritimine which diminishes excitability of respiratory centres, paralyses voluntary movement and counters effects of opium[61]. The bulb is used internally in the treatment of coughs, bronchitis, pneumonia, feverish illnesses, abscesses etc[238]. The bulbs also have a folk history of use against cancer of the breast and lungs in China[218, 238]. This remedy should only be used under the supervision of a qualified practitioner, excessive doses can cause breathing difficulties and heart failure[238]. The bulbs are harvested in the winter whilst they are dormant and are dried for later use[238].

propta Seed - best sown as soon as ripe in a cold frame, it should germinate in the spring[1]. Protect from frost[134]. Stored seed should be sown as soon as possible and can take a year or more to germinate[134]. Sow the seed quite thinly to avoid the need to prick out the seedlings. Once they have germinated, give them an occasional liquid feed to ensure that they do not suffer mineral deficiency. Once they die down at the end of their second growing season, divide up the small bulbs, planting 2 - 3 to an 8cm deep pot. Grow them on for at least another year in light shade in the greenhouse before planting them out whilst dormant. Division of offsets in August[1]. The larger bulbs can be planted out direct into their permanent positions, but it is best to pot up the smaller bulbs and grow them on in a cold frame for a year before planting them out in the autumn. Bulb scales[163].

nwatta Prefers a moist peaty soil in the open garden[90]. Easily grown in a moderately fertile soil in sun or semi-shade[200]. Succeeds in drier soils and is drought tolerant when established[190]. The scaly bulbs are best planted on their sides or surrounded in sand to prevent water collecting in their hollow crowns[238]. Cultivated as a medicinal plant in Japan[90], the sub-species *F. verticillata thunbergii*. Baker. is most often used[61]. (this species is now known as *F. thunbergii*. q.v.). Plants take 3 - 5 years to flower from seed.

## 5.2.594 Aquilegia flavescens

Columbine, Yellow columbine

4 tin 8 cyuc 2 kcaak 0 tcan 1 dwat 0.8 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Aquilegia flavescens is a PERENNIAL growing to 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: FlowersEdible Uses: Flowers - raw. Rich in nectar, they are sweet and delightful[172], they make a very attractive addition to mixed salads and can also be used as a thirst-quenching munch in the garden[K].

drainage can lead to root rot, North Carolina State University advises the use of raised beds if the plant is going to be grown in soil that contains a lot of clay. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is multistemmed with multiple stems from the crown [1-2]. The root pattern is suckering with new plants from underground runners away from the plant [1-2]. The root pattern is flat with shallow roots forming a plate near the soil surface [1-2].

## 5.2.705 Spiraea prunifolia

Bridalwreath Spiraea

4 tin 8 cyuc 1 kcaak 0 tcan 1 dwat 2.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Spiraea prunifolia is a deciduous Shrub growing to 2.5 m (8ft) by 2.5 m (8ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: LeavesEdible Uses: Young leaves - cooked[105, 177].

tcanta None known

dwatta Emetic MalariaThe plant is emetic[218]. It is used in the treatment of malaria and fever[218].

propta Seed - we have no information for this species but suggest sowing the seed as soon as it is ripe in a cold frame if possible. It is likely to require stratification before it germinates, so stored seed should be sown in a cold frame as early in the year as you receive it. Prick out the seedlings into individual pots when they are large enough to handle, and grow them on in a cold frame for their first winter. Plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, July/August in a light sandy soil a frame. Cuttings of mature wood of the current seasons growth, 15cm long, October/November in an outdoor frame[200]. Another report says that September is a good time to do this[11]. Division of suckers in early spring[200]. They can be planted out straight into their permanent positions.

nwatta Tolerates most soils[200], but prefers a good loamy soil, abundant moisture and full sunlight[11, 200]. Hardy to about -20°C[184]. Hybridizes freely with other members of this genus[11]. Flowers are produced on the previous seasons growth and any pruning is best done immediately after flowering in order to promote new growth and plenty of flowers in the following year[182]. This species is notably resistant to honey fungus[200]. Special Features: Not North American native, Fragrant flowers, Blooms are very showy.

## 5.2.706 Convolvulus arvensis

Field Bindweed

4 tin 8 cyuc 1 kcaak 1 tcan 2 dwat 2 m hkuc hmimhtut cyutli kyuctcup hwicli hyishrasjlut hpa7tli priklwis hpa7tmwatli fyixre7t hjonli

drutta Convolvulus arvensis is a PERENNIAL CLIMBER growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from June to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and can grow in nutritionally poor soil. Suitable pH: neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcaakta Edible Parts: Edible Uses: CondimentThe plant has been used as a flavouring in a liqueur called 'Noyeau'[2]. No details are given as to which part of the plant is used[K].

tcanta Dye StringThe stem is used as a twine for tying up plants etc[6, 99]. It is fairly flexible and strong but not long-lasting. A green dye is obtained from the whole plant[168].

dwatta Cholagogue Diuretic Laxative Purgative Stings Women's complaintsThe root, and also a resin made from the root, is cholagogue, diuretic, laxative and strongly purgative[4, 7, 9, 13, 240]. The dried root contains 4.9% resin[240]. The juice of the root is used in the treatment of fevers[272]. A tea made from the flowers is laxative and is also used in the treatment of fevers and wounds[222]. A cold tea made from the leaves is laxative and is also used as a wash for spider bites or taken internally to reduce excessive menstrual flow[222, 257].

propta Seed - best sown in situ as soon as it is ripe, it germinates in the autumn[164]. This species can become a real pest in the garden so it is unwise to encourage it.

nwatta Prefers a lighter basic soil[17] of low to medium fertility[200]. Bindweed is a very deep-rooting plant with a vigorous root system that extends to a considerable distance and is very hard to eradicate from the soil. Even a small piece of the root will grow into a new plant if it is left in the ground. Once established this plant soon becomes a pernicious weed[1, 4]. It is a climbing plant that supports itself by twining around any support it can find and can soon swamp and strangle other plants[4]. The flowers close at night and also during rainy weather[4]. Although visited by numerous insects, the flowers seldom set fertile seed[4]. On sunny days the flowers diffuse a scent of heliotrope[245]. The plant harbours tobacco mosaic virus of the Solanaceae[13] and so should not be grown near potatoes, tomatoes and other members of that family.

## 5.2.707 Kerria japonica

Bachelor's Button, Japanese rose, Jew's Mallow, Japanese Kerria

4 tin 9 cyuc 1 kcaak 0 tcan 1 dwat 2 m hkuc hmimhtut cyutli tcup hwicli hyishrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Kerria japonica is a deciduous Shrub growing to 2 m (6ft) by 2 m (6ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from April to May. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Fruit LeavesEdible Uses: Young leaves - cooked[105, 177]. The leaves contain a small amount (0.002%) of hydrogen cyanide and are also a rich source of vitamin C (200mg per 100g)[218]. Some caution is advised, see the notes above on toxicity. Fruit[177]. No more details are given, but this report is somewhat suspect, the plant does not produce a fleshy fruit and the seed case certainly does not look edible[K]. The fruit is a dry, somewhat plump achene about 5mm in diameter[200].

tcanta None known

dwatta Vitamin C Women's complaintsA decoction of the flowering shoots is used in the treatment of coughs and women's complaints[178, 218].

propta Seed - we have no details on this species but suggest sowing the seed as soon as it is ripe in a cold frame. Sow stored seed as soon as possible in a cold frame, it is likely to require a period of cold stratification. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the cold frame for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division of suckers, removed with care from established plants during the dormant season[200]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring. Cuttings of young shoots. Young basal shoots in early summer work quite well. Harvest the shoots when they are about 10 - 15cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer. Layering.

nwatta Landscape Uses:Container, Foundation, Pest tolerant, Massing, Specimen. Succeeds in most aspects in any

Plants in this genus are notably resistant to honey fungus[200]. Special Features: Attracts birds, Attractive foliage, Not North American native, Naturalizing, Wetlands plant, Attracts butterflies, Attractive flowers or blooms.

## 5.2.702 Sanguisorba stipulata

4 tin 8 cyuc 1 kcaak 0 tcan 1 dwat 2 m hkuc hmimhtut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli  
drutta Sanguisorba stipulata is a PERENNIAL growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 4. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcaakta Edible Parts: LeavesEdible Uses: Leaves - cooked. They are not choice[172].

tcanta None known  
dwatta AstringentBoth the roots and the leaves are astringent[172].

propta Seed - sow spring or autumn in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the cold frame for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in the spring.

nwatta Succeeds in ordinary garden soil[1]. Prefers a good moist soil that does not dry out in the summer, in sun or partial shade[187, 200]. Very closely related to *S. canadensis*[60], and considered to be no more than part of that species by some botanists[200].

## 5.2.703 Euonymus atropurpureus

Wahoo- Indian Arrow Wood - Burning Bush, Eastern wahoo  
4 tin 8 cyuc 1 kcaak 0 tcan 2 dwat 2.5 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Euonymus atropurpureus* is a deciduous Shrub growing to 2.5 m (8ft 2in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower in June, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcaakta Edible Parts: FruitEdible Uses: Although the fruit has sometimes been eaten, it is considered to be poisonous by some writers and so should definitely be avoided[213]. The fruit is about 15mm in diameter[200].

tcanta WoodWood - heavy, hard, tough, very close grained[82, 227]. It weighs 41lb per cubic foot[227], but is too small to be of commercial value[229].

dwatta Alternative Cardiac Cathartic Cholagogue Diuretic Eczema Emetic Expectorant Hepatic Malaria TonicWahoo was used in various ways by the North American Indians, for example as an eye lotion, as a poultice for facial sores and for gynaecological conditions[254]. In current herbalism it is considered to be a gallbladder remedy with laxative and diuretic properties[254]. The bark, however, is toxic and should only be used under professional supervision, it should not be given to pregnant women or nursing mothers[254]. The stem and root bark is alterative, cardiac, cathartic, cholagogue, diuretic, expectorant, hepatic, laxative, stimulant and tonic[4, 21, 46, 61, 222]. The root bark is the part normally used, though bark from the stems is sometimes employed as a substitute[4]. In small doses it stimulates the appetite, in larger doses it irritates the intestines[4]. The bark is especially useful in the treatment of biliousness and liver disorders which follow or accompany fevers[4, 254] and for treating various skin disorders such as eczema which could arise from poor liver and gallbladder function[254]. It is also used as a tea in the treatment of malaria, liver congestion, constipation etc[222]. The powdered bark, applied to the scalp, was believed to eliminate dandruff[222]. The bark and

the root contain digitoxin and have a digitalis-like effect on the heart[213, 222]. They have been used in the treatment of heart conditions[254]. The bark, which has a sweetish taste, is gathered in the autumn and can be dried for later use[213]. A tea made from the roots is used in cases of uterine prolapse, vomiting of blood, painful urination and stomach-aches[222]. The seed is emetic and strongly laxative[222].

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed requires 8 - 12 weeks warm followed by 8 - 16 weeks cold stratification and can then be sown in a cold frame[78, 98]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 8cm long taken at a node or with a heel, July/August in a frame. Very easy[200].

nwatta Thrives in almost any soil, including chalk, it is particularly suited to dry shaded areas[200]. Prefers a well-drained loamy soil[1]. Requires shade from the midday sun[1, 11]. A moderately fast-growing but short-lived tree in the wild[229].

## 5.2.704 Rhododendron periclymenoides

Pink azalea, Pinxter flower  
4 tin 8 cyuc 1 kcaak 2 tcan 0 dwat 2 m hkuc pcmhmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli frusflat hpa7tmwatli hjonli

drutta *Rhododendron periclymenoides* is a deciduous Shrub growing to 2 m (6ft) by 2 m (6ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. The flowers are pollinated by Birds, Bees. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcaakta An irregular growth on the twigs is eaten as a thirst quencher. It can be sliced and mixed with tossed salads. It is also pickled in spiced vinegar [1-4]. *Rhododendron periclymenoides* is highly toxic and all parts of the plant are poisonous and could be fatal if ingested. Honey which is made by bees who collect pollen from genus *Rhododendron* spp. is referred to as "mad honey". Humans who ingest this honey begin exhibiting symptoms including salivation abdominal pain, diarrhea, vomiting, difficulty breathing, paralysis and coma. as well as hypotension and other irregularities of cardiac rhythm.

tcanta *Rhododendron periclymenoides* has been used in horticulture as an ornamental plant. Common landscape uses for the plant are as a foundation plant and as shrub borders. Other locations are shrub borders, mixed borders, woodland gardens and shade gardens. Also effective in foundation plantings or as a hedge.

dwatta None known  
propta Seed - best sown in a greenhouse as soon as it is ripe in the autumn and given artificial light. Alternatively sow the seed in a lightly shaded part of the warm greenhouse in late winter or in a cold greenhouse in April. Surface-sow the seed and do not allow the compost to become dry[200]. Pot up the seedlings when they are large enough to handle and grow on in a greenhouse for at least the first winter. Layering in late July. Takes 15 - 24 months[78]. Cuttings of half-ripe wood, August in a frame. Difficult[78].

nwatta *A Perennial shrub*. Sun Requirements: Full Sun to Full Shade. Water Preferences: Mesic/moist. It is relatively tolerant of dry sites. Soils in which *R. periclymenoides* grows best are typically acidic, rich in hummus and retain moisture but should still have some drainage. Soil pH Preferences: Very strongly acid (4.5 - 5.0) to Slightly acid (6.1 - 6.5). Fruiting Time: Late summer or early fall. Fruit: Edible to birds. Flowers: Showy. Fragrant. Flower Color: Pink, White. Flower Time: Spring. Suitable Locations: Bog gardening. Uses: Windbreak or Hedge. Cut Flower: Will Naturalize. Wildlife Attractant: Bees, Birds, Butterflies. Many animals and birds utilize shrubs like *R. periclymenoides* for cover on the forest floor. The roots also provide erosion control and protection for watersheds. Since lack of proper

tcanta Parasiticide ParasiticideThe seed is used as a parasiticide to rid the hair of lice[172].

dwatta Antispasmodic Diaphoretic Parasiticide Parasiticide Resolvent SalveAntispasmodic, diaphoretic, parasiticide, Resolvent, salve[172].

propta Seed - best sown as soon as it is ripe in a cold frame. The seed can be slow to germinate[200]. Stored seed can be sown in late winter in a cold frame. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for their first winter. Plant out in late spring or early summer. Division in spring[200].

nwatta Succeeds in ordinary garden soil, preferring a moist but not wet soil and a sunny position[1]. Intolerant of heavy clay[200]. A very ornamental plant[1], it is closely related to *A. formosa* and hybridizes with it where their ranges overlap[200, 270]. Most species are short-lived, dying out after 2 - 3 years, though they usually produce seed prolifically[200]. However, they are very apt to hybridize with other members of the genus and so it becomes difficult to keep a species true to type if more than one is grown in the garden[200]. Plants seem to be immune to the predations of rabbits[233]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

## 5.2.595 Chenopodium ficifolium

Fig-Leaved Goosefoot  
4 tin 8 cyuc 2 kcaak 0 tcan 0 dwat 0.9 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Chenopodium ficifolium* is a ANNUAL growing to 0.9 m (3ft). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from July to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcaakta Edible Parts: Leaves SeedEdible Uses: CondimentLeaves and flower buds - cooked[12, 105, 177]. Used like spinach or added to soups etc[183]. The raw leaves should only be eaten in small quantities, see the notes above on toxicity. Seed - roasted and used as a condiment[105]. Used like sesame for flavouring foods[183].

tcanta DyeGold/green dyes can be obtained from the whole plant[168].

dwatta None known  
propta Seed - sow spring in situ. Most of the seed usually germinates within a few days of sowing.

nwatta An easily grown plant, succeeding in most soils but disliking shade[1, 200]. It prefers a moderately fertile soil[200].

## 5.2.596 Aquilegia canadensis

Wild Columbine, Red columbine, Meeting Houses, Common Columbine  
4 tin 10 cyuc 2 kcaak 2 tcan 2 dwat 0.6 m hkuc hmimhtut cyutli tcup hwicli hyishrasjlut hpa7tli flatprikliwis hpa7tmwatli fyixre7t hjonli

drutta *Aquilegia canadensis* is a PERENNIAL growing to 0.6 m (2ft) by 0.3 m (1ft in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 3 and is not frost tender. It is in flower from May to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Flowers RootEdible Uses: Flowers - raw. Sweet and delightful[172]. Rich in nectar[213], they make a very attractive addition to mixed salads and can also be used as a thirst-quenching punch in the garden[K]. Root[2, 105, 177]. These reports possibly refer to the root being chewed for its medicinal virtues[K]. Caution is advised, see notes above on toxicity[172].

tcanta Essential Parasiticide ParasiticideThe seed is rubbed into the scalp to rid the hair of lice[172, 222]. The crushed seed is pleasantly aromatic and is used as a perfume. The fragrance persists for a long time[207].

dwatta Anodyne Antispasmodic Astringent Diaphoretic Diuretic Febrifuge Parasiticide Parasiticide Resolvent SalveAntispasmodic, diaphoretic, parasiticide, resolvent, salve[172, 222]. The root is astringent and diuretic[222, 257]. It is chewed or made into a weak tea for the treatment of diarrhoea and stomach aches[222]. The tea is used in the treatment of uterine bleeding[222]. The boiled plant was used as a hair wash[213]. The seed is anodyne and febrifuge[257]. An infusion is used in the treatment of headaches and fevers[257].

propta Seed - best sown as soon as it is ripe in a cold frame. The seed can be slow to germinate[200]. Stored seed can be sown in late winter in a cold frame. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for their first winter. Plant out in late spring or early summer. Division in spring[200].

nwatta Landscape Uses:Alpine garden, Container, Foundation, Massing, Rock garden, Woodland garden. An easily grown and very tolerant plant[K], it succeeds in ordinary garden soil, preferring a moist but not wet soil and a sunny position[1]. Intolerant of heavy clay[200]. Does well in semi-shade[111]. Prefers a rather poor slightly acid soil[111]. A very ornamental and cold-hardy plant, it tolerates temperatures down to about -25°C[1,187]. Plants seem to be immune to the predations of rabbits[233]. A greedy plant inhibiting the growth of nearby plants, especially legumes[54]. Plants are pollinated by humming birds in the wild[187]. Most species in this genus are short-lived, dying out after 2 - 3 years, though they usually produce seed prolifically[200]. However, they are very apt to hybridize with other members of the genus and so it becomes difficult to keep a species true to type if more than one is grown in the garden[200]. Special Features:Attracts birds, North American native, Naturalizing, Wetlands plant, Attracts butterflies, Suitable for cut flowers. The plant is heat tolerant in zones 8 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is a tap root similar to a carrot going directly down [1-2].

## 5.2.597 Thymus quinquecostatus

4 tin 8 cyuc 2 kcaak 0 tcan 2 dwat 0.1 m hkuc htut cyutli hgatkyuctcup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Thymus quinquecostatus* is an evergreen Shrub growing to 0.1 m (0ft 4in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf all year. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcaakta Edible Parts: Edible Uses: CondimentThe plant is the source of an essential oil that is used as a food flavouring[177, 183]. If the leaves are to be dried, the plants should be harvested in early and late summer just before the flowers open and the leaves should be dried quickly[200].

tcanta Deodorant Disinfectant EssentialThe essential oil obtained from the leaves is also used in perfumery, as a mouth wash, medicinally etc[200].

dwatta Antiseptic Deodorant DisinfectantThe leaves, and especially the essential oil contained in them, are strongly antiseptic, deodorant and disinfectant[200, 238]. The plant can be used fresh at any time of the year, or it can

be harvested as it comes into flower and either be distilled for the oil or dried for later use[238].

propta Seed - sow spring in a cold frame. Seed can also be sown in autumn in a greenhouse. Surface sow or barely cover the seed. Germination can be erratic. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring or autumn[200]. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the summer or the following spring. Cuttings of young shoots, 5 - 8cm with a heel, May/June in a frame[200]. Cuttings of half-ripe wood, 5 - 8cm with a heel, July/August in a frame[200]. Layering.

nwatta Requires a light well-drained preferably calcareous soil in a sunny position[1, 200]. Succeeds in dry soils. Grows well between stepping stones on paths, tolerating light treading[183, 200]. Succeeds on walls. Thymes dislike wet conditions, especially in the winter. A layer of gravel on the soil around them will help protect the foliage from wet soils[238]. The flowers are rich in nectar and are very attractive to honey bees[200]. This is a very difficult genus taxonomically, the species hybridize freely with each other and often intergrade into each other[200].

## 5.2.598 *Salvia lavandulifolia*

Spanish Sage

4 tlin 8 cyuc 2 kcaak 0 tcan 3 dwat 0.3 m hkuic htut cyutli kyuctcup hwicli hrasljut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta *Salvia lavandulifolia* is an evergreen Shrub growing to 0.3 m (1ft) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf all year, in flower in July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Edible Uses: Condiment TeaThe aromatic leaves are used as an adulterant for the common sage[177, 183]. They are used as a substitute for sage in commercial food flavourings[238]. A sage-like tea is made from the dried leaves[238]. The plant is a source of an essential oil that is used commercially to flavour ice cream, sweets, baked goods, chewing gum, soft drinks etc[183, 238].

tcanta EssentialThe essential oil obtained from the leaves is used in perfumery and to perfume soaps and cosmetics[238].

dwatta Alterative Antiseptic Astringent Depurative Digestive Expectorant Febrifuge TonicThe leaves are alterative, antiseptic, astringent, depurative, digestive, expectorant, febrifuge and tonic[238]. They are used internally in the treatment of digestive and respiratory complaints, menstrual problems, infertility, nervous tension and depression[238]. This remedy should not be prescribed to pregnant women[238]. The leaves can be harvested as required and used fresh, or they can be harvested before the flowers open and dried or distilled for their essential oil[238].

propta Seed - sow March/April in a greenhouse[200]. Germination usually takes place within 2 weeks. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in early summer. In areas where the plant is towards the limits of its hardiness, it is best to grow the plants on in a greenhouse for their first winter and plant them out in late spring of the following year. Cuttings of half-ripe wood succeed at almost any time in the growing season[200].

nwatta Requires a light well-drained soil in a sunny position[182, 200]. Soils rich in nitrogen encourage excessive leaf growth at the expense of flowering[11]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°C[200]. It is as hardy as common sage, *S. officinalis*[182], to which it is closely related[11]. Plants can be killed by excessive winter wet[200]. The leaves have a pungent lavender scent[182]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 5.2.599 *Chenopodium vulvaria*

Stinking Goosefoot. Arrach - Wormseed

4 tlin 8 cyuc 2 kcaak 0 tcan 1 dwat 0.3 m hkuic htut cyutli tcup hwicli hrasljutnyik hpa7tli flatpriklwishsom hpa7tmwatli xre7t hjonli

drutta *Chenopodium vulvaria* is an ANNUAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from July to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in saline soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Leaves SeedEdible Uses: Leaves and flower buds - cooked and used like spinach. The raw leaves should only be eaten in small quantities, see the notes above on toxicity. Although edible, the smell of the leaves would discourage most people from using this plant[K]. Seed - cooked. Ground into a powder, mixed with wheat or other cereals and used in making bread etc. The seed is small and fiddly, it should be soaked in water overnight and thoroughly rinsed before it is used in order to remove any saponins.

tcanta DyeGold/green dyes can be obtained from the whole plant[168].

dwatta Antispasmodic Eczema Emmenagogue Women's complaintsThe whole plant is antispasmodic and emmenagogue[4]. Used to expel worms from the bowel. [301] Also used for the fungal infections and as a cardiac stimulant. Form of treatment for acute gout [301]. An infusion of the dried leaves is used in the treatment of hysteria and nervous troubles connected with women's ailments[4]. In Chinese medicine wormseed oil is used for rheumatism, eczema and bites [301].

propta Seed - sow spring in situ. Most of the seed usually germinates within a few days of sowing.

nwatta An easily grown plant, succeeding in most soils but disliking shade[1, 200]. It prefers a moderately fertile soil[200]. The plant contains trimethylamine, and when touched it gives off the nauseous odour of stale salt fish[4, 17].

## 5.2.600 *Lapsana communis*

Nipplewort, Common nipplewort

4 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat 0.9 m hkuic hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli priklwis hpa7tmwatli fyfxre7t hjonli

drutta *Lapsana communis* is an ANNUAL growing to 0.9 m (3ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: LeavesEdible Uses: Young leaves and shoots - raw or cooked[2, 5, 17, 100]. They are best harvested before the plant comes into flower[9]. The leaves can be added to salads, cooked like spinach or added to soups and casseroles[9, 183]. They have a bitter or radish-like taste[183].

tcanta None known

dwatta None known

propta Seed - sow in situ during the spring or as soon as it is ripe and only just cover the seed. Plants usually self sow when they are well-sited.

nwatta A fairly common garden weed, nipplewort will maintain itself in the garden so long as it is given some disturbed soil in which to self-sow. It is a fairly tolerant plant that succeeds in most soils, so long as they are not too acid, and dislikes heavy shade. It was at one time cultivated as a vegetable[17].

propta Seed - sow spring in a cold frame in a free draining compost and only just cover. The seed usually germinates in 1 - 3 months at 15°C[138]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in early spring whilst dormant[200].

nwatta Easily grown in ordinary garden soil in a sunny position, but plants are apt to become invasive[1, 200]. Nearly all taxa in *Calystegia* intergrade geographically into neighboring taxa with the exception of the widespread coastal species, *C. soldanella* (Linnaeus) R. Brown. It is impossible to draw clearly defined specific limits, and intermediate forms are always found where two taxa approximate geographically[266].

## 5.2.699 *Euonymus hamiltonianus maackii*

4 tlin 8 cyuc 1 kcaak 0 tcan 0 dwat m hkuic hmimhtut cyutli kyuctcup hwicli hrasljutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta *Euonymus hamiltonianus maackii* is a deciduous Shrub growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower in June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young leaves - boiled[105, 177]. This report should be treated with some caution since many members of this genus are poisonous.

tcanta LatexRoots yield up to 6% gutta-percha, a non-elastic rubber used as an electrical insulator and in making plastics etc[74].

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame[113]. Stored seed requires 3 months cold stratification so should be sown as early in the year as possible in a cold frame[113]. The seed can take 18 months to germinate[74]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, taken at a node, July/August in a frame. Very easy[200]. Root cuttings in winter[113].

nwatta Thriving in almost any soil, including chalk, it is particularly suited to dry shaded areas[200]. Prefers a well-drained loamy soil[1]. Cultivated for its latex in Russia, producing most when grown in open arid habitats[74].

## 5.2.700 *Pimpinella major*

Greater Burnet Saxifrage, Hollowstem burnet saxifrage

4 tlin 8 cyuc 1 kcaak 0 tcan 2 dwat m hkuic hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatpriklwis hpa7tmwatli fyfxre7t hjonli

drutta *Pimpinella major* is a PERENNIAL growing to 0.8 m (2ft 7in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to July, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Edible Uses: CondimentAn essential oil from the roots is used as a flavouring in candy, liqueurs etc[183].

tcanta None known

dwatta Antiinflammatory Astringent Carminative Digestive ExpectorantThe leaves are diaphoretic, diuretic, resolvent and stomachic[4]. The plant is harvested as it comes into flower and dried for later use[4]. The root is anti-inflammatory, mildly astringent and expectorant[9]. The

fresh root is very hot and acrid, but this pungency is greatly reduced when the root is dried[4]. When chewed, the fresh root is effective in treating toothaches and paralysis of the tongue[4]. An effective diuretic, the root is used in treating disorders arising from obstructions of the viscera[4]. The root is also used for soothing coughs or the effects of laryngitis and bronchitis[9]. The roots can be harvested in the spring or autumn and are dried for later use[9]. The seeds are carminative[4]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve *Pimpinella major* Greater Burnet Saxifrage for cough/bronchitis (see [302] for critics of commission E).

propta The seed requires a period of cold stratification. If you can obtain fresh seed then it is best sown immediately. This can be done in situ if you have sufficient seed, but if you only have a small quantity then it is safer to sow it in pots in a cold frame. Sow stored seed as soon as you can obtain it, this is probably best done in a cold frame. When they are large enough to handle, prick the pot-grown seedlings out into individual pots and plant them out in the summer.

nwatta Easily grown in any good soil[1], preferring rather moist conditions[187]. Grows best in a cool position[233]. Plants are hardy to about -20°C[187].

## 5.2.701 *Cornus amomum*

Silky Dogwood

4 tlin 8 cyuc 1 kcaak 0 tcan 2 dwat 3 m hkuic hmimhtut cyutli tcup hwicli hrasljutnyikfrp hpa7tli flatpriklwisslip hpa7tmwatli xre7t hjonli

drutta *Cornus amomum* is a deciduous Shrub growing to 3 m (9ft 10in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105, 161, 177]. Said to be very good to eat[2]. The fruit is 8mm in diameter[235].

tcanta TeethThe powdered bark is used as a toothpowder[61].

dwatta Antiperiodic Astringent Diuretic Poulitice Stimulant Stomachic VDThe dried root-bark is antiperiodic, astringent, stimulant (mild), tonic[4]. The flowers are said to have similar properties[4]. A tea or tincture of the astringent root bark has been used as a quinine substitute and also in the treatment of chronic diarrhoea[4]. It has also been employed in the treatment of painful urination, chest congestion etc[257]. The bark was also used as a poultice on external ulcers and as a wash for gonorrhoea sores[4, 257]. The glycoside 'cornin' found in the bark has astringent properties[4]. The fruits are used as a bitter digestive tonic. A tincture of them has been used to restore tone to the stomach in cases of alcoholism[4].

propta Seed - best sown as soon as it is ripe in a cold frame or in an outdoors seedbed if there is sufficient seed[80, 113]. The seed must be separated from the fruit flesh since this contains germination inhibitors[80, 164]. Stored seed should be cold stratified for 3 - 4 months and sown as early as possible in the year[164]. Scarification may also help as may a period of warm stratification before the cold stratification[80, 164]. Germination, especially of stored seed, can be very slow, taking 18 months or more[164]. Prick out the seedlings of cold-frame sown seeds into individual pots as soon as they are large enough to handle and grow the plants on for their first winter in a greenhouse, planting out in the spring after the last expected frosts. Cuttings of half-ripe side shoots, July/August in a frame. Cuttings of mature wood of the current year's growth, taken with a heel if possible, autumn in a cold frame. High percentage[78]. Layering of new growth in June/July. Takes 9 months[78].

nwatta Landscape Uses:Border, Massing, Specimen, Woodland garden. An easily grown plant that thrives in Britain, it succeeds in any soil of good or moderate fertility[1], ranging from acid to shallow chalk[200]. Grows well in heavy clay soils. Succeeds in full sun or light shade[188].

for treating complaints such as dizziness, coughs, insomnia, exhaustion[232], arteriosclerosis and prostate problems[7]. propta Seed - best sown in situ as soon as it is ripe in the late summer. It usually germinates in the autumn.

nwatta A fairly common weed in Britain, it succeeds in most soils in sun or light shade and avoids acid soils in the wild. It prefers a damp rich soil[238]. This is the plant that Socrates is said to have used to kill himself, though this is probably an error[207]. It requires a large dose if it is to be lethal (this contradicts with the notes above on toxicity[K]), and death from this plant can be very painful whilst Socrates is said to have died without pain[207]. Another report says that poisonous doses cause paralysis, which starts at the feet and moves up the body. There is no pain, the mind remains clear and lucid until death, which is caused by asphyxia when paralysis reaches the chest[232]. The whole plant has a foetid smell[7].

## 5.2.695 Euonymus macropterus

4 tlin 8 cyuc 1 kcaak 0 tcan 0 dwat m hkuc hmimhtut cyutli kyuctcup hwicli hrasljutnyik hpa7tli flatprikwiw hpa7tmwatli xre7t hjonli

drutta Euonymus macropterus is a deciduous Shrub growing to 4 m (13ft 1in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young leaves - boiled[105, 177]. Some caution is advised, see the notes above on possible toxicity.

tcanta None known

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame[121]. Stored seed requires 3 months cold stratification, so should be sown as early in the year as possible in a cold frame[113]. The seed can take 18 months to germinate. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 7cm long taken at a node or with a heel, July/August in a frame. Very easy[200].

nwatta Thriving in almost any soil, including chalk, it is particularly suited to dry shaded areas[200]. Prefers a well-drained loamy soil[11]. Plants are hardy to about -25°c[184].

## 5.2.696 Cystopteris montana

Mountain Bladder Fern

4 tlin 8 cyuc 1 kcaak 0 tcan 0 dwat m hkuc pcmihmim cyutli tcup hwicli hrasljutnyik hpa7tli flatprikwiw hpa7tmwatli hjonli

drutta Cystopteris montana is a deciduous Fern growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 4. The seeds ripen from July to August. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Root. An emergency food, it is only used when all else fails[172].

tcanta None known

dwatta None known

propta Spores - best sown as soon as ripe on the surface of a humus-rich sterilized soil. Keep the compost moist, preferably by putting a plastic bag over the pot. Germinates in 1 - 3 months at 20°c[164].Pot on small clumps of plantlets as soon as they are large enough to handle and keep humid until they are well established. Do not plant outside until the ferns are at least 2 years old. Division in spring.

nwatta Prefers a shady position in a moist but well-drained soil, succeeding in most soil types[200]. Plants can tolerate up to 4 hours direct sun per day[200]. Prefers a

pH between 6.5 and 7, but tolerates a range from 5.5 to 7.5[200]. Prefers high humidity, plants die back early in dry seasons[200]. Members of this genus are rarely if ever troubled by browsing deer[233]. A very ornamental plant[1]. Plants spread by means of a creeping rhizome[1].

## 5.2.697 Viburnum mongolicum

4 tlin 8 cyuc 1 kcaak 0 tcan 0 dwat m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikwiw hpa7tmwatli dyatxre7t hjonli

drutta Viburnum mongolicum is a deciduous Shrub growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from April to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[179].

tcanta None known

dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe. Germination can be slow, sometimes taking more than 18 months. If the seed is harvested 'green' (when it has fully developed but before it has fully ripened) and sown immediately in a cold frame, it should germinate in the spring[80]. Stored seed will require 2 months warm then 3 months cold stratification and can still take 18 months to germinate[113]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame or greenhouse. Plant out into their permanent positions in late spring or early summer of the following year. Cuttings of soft-wood, early summer in a frame[200]. Pot up into individual pots once they start to root and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, 5 - 8 cm long with a heel if possible, July/August in a frame[78, 113]. Plant them into individual pots as soon as they start to root. These cuttings can be difficult to overwinter, it is best to keep them in a greenhouse or cold frame until the following spring before planting them out[113]. Cuttings of mature wood, winter in a frame. They should root in early spring - pot them up when large enough to handle and plant them out in the summer if sufficient new growth is made, otherwise keep them in a cold frame for the next winter and then plant them out in the spring. Layering of current seasons growth in July/August. Takes 15 months[78].

nwatta An easily grown plant, it succeeds in most soils but is ill-adapted for poor soils and for dry situations[1]. It prefers a deep rich loamy soil in sun or semi-shade[11, 200]. Best if given shade from the early morning sun in spring[200]. Plants are self-incompatible and need to grow close to a genetically distinct plant in the same species in order to produce fruit and fertile seed[11, 200]. This species is closely related to *V. dilatatum*[179].

## 5.2.698 Calystegia subvolubilis

4 tlin 8 cyuc 1 kcaak 0 tcan 0 dwat 3 m hkuc htut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikwiw hpa7tmwatli xre7t hjonli

drutta Calystegia subvolubilis is a PERENNIAL CLIMBER growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Root - cooked[105]. Some caution is advised, see the notes above on toxicity. Young shoots - cooked[105]. Some caution is advised, see the notes above on toxicity.

tcanta None known

dwatta None known

## 5.2.601 Rumex crispus

Curled Dock, Curly dock

4 tlin 8 cyuc 2 kcaak 2 tcan 3 dwat 0.6 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikwiw hpa7tmwatli xre7t hjonli

drutta Rumex crispus is a PERENNIAL growing to 0.6 m (2ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to October, and the seeds ripen from July to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves SeedEdible Uses: Coffee-Leaves - raw or cooked[5, 85, 159]. They can also be dried for later use[12]. The leaves can be added to salads, cooked as a potherb or added to soups[183]. Only the very young leaves should be used, preferably before the stems have developed, and even these are likely to be bitter[12, 95, 257]. If used in early spring and in the autumn they can often be fairly pleasant tasting[85, 159, K]. The leaves are very rich in vitamins and minerals, especially iron and the vitamins A and C[183, 244]. A nutritional analysis is available[218]. Stems - raw or cooked[257]. They are best peeled and the inner portion eaten[257]. Seed - raw or cooked[172, 257]. It can be used as a piñole or can be ground into a powder and used as a flour for making pancakes etc[85, 102, 183, 257]. The seed is very finely used to harvest and prepare[62]. The roasted seed has been used as a coffee substitute[207].

tcanta Compost DyeYellow, dark green to brown and dark grey dyes can be obtained from the roots. They do not need a mordant[168]. An alternative ingredient of 'QR' herbal compost activator[32]. (is it the flowers?) This is a dried and powdered mixture of several herbs that can be added to a compost heap in order to speed up bacterial activity and thus shorten the time needed to make the compost[K].

dwatta Alterative Antiscorbatic Astringent Cancer Cholagogue Depurative Homeopathy Laxative Poulitce Salve TonicCurled dock has a long history of domestic herbal use. It is a gentle and safe laxative, less powerful than rhubarb in its action so it is particularly useful in the treatment of mild constipation[254]. The plant has valuable cleansing properties and is useful for treating a wide range of skin problems[254]. All parts of the plant can be used, though the root is most active medicinally. The root is alterative, antiscorbatic, astringent, cholagogue, depurative, laxative and mildly tonic[4, 21, 46, 94, 165]. It used to be sold as a tonic and laxative[212]. It can cause or relieve diarrhoea according to the dose, harvest time and relative concentrations of tannin(astringent) and anthraquinones (laxative) that are present[222]. It is used internally in the treatment of constipation, diarrhoea, piles, bleeding of the lungs, various blood complaints and also chronic skin diseases[4, 238, 257]. Externally, the root can be mashed and used as a poultice and salve, or dried and used as a dusting powder, on sores, ulcers, wounds and various other skin problems[257]. The root has been used with positive effect to restrain the inroads made by cancer, being used as an alterative and tonic[4]. The root is harvested in early spring and dried for later use[4]. Some caution is advised in its use since excess doses can cause gastric disturbance, nausea and dermatitis[222, 238]. The seed is used in the treatment of diarrhoea[4, 218]. A homeopathic remedy is made from the fresh root, harvested in the autumn before frost has touched the plant[232]. It is only used in the treatment of a specific type of cough[232].

propta Seed - this plant does not require any help in its propagation.

nwatta Succeeds in most soils, preferring a moist moderately fertile well-drained soil in a sunny position[200]. The plant does not need any help in growing, it is doing very nicely in Britain where it is a serious weed of agriculture. A very important food plant for the caterpillars of many species of butterfly[30]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is fleshy. Thick or swollen - fibrous or tap root [2-1].

## 5.2.602 Erythronium oregonum

Giant White Fawnlily

4 tin 8 cyuc 2 kcaak 0 tcan 1 dwat 0.5 m hkuc hmim cyutli tcup hwicli hrasljut hpa7tli flatprikwiw hpa7tmwatli xre7t hjonli

drutta Erythronium oregonum is a BULB growing to 0.5 m (1ft 8in) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from April to May, and the seeds ripen from June to July. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Bulb - raw, cooked or dried for later use[183, 257]. The bulb is from 25 - 60mm long[270]. Some caution should be employed, see the notes above on toxicity[256].

tcanta None known

dwatta PoulitceThe crushed corm is used as a poultice for boils[207, 257].

propta Seed - best sown as soon as it is ripe in a shady position in a cold frame. Water lightly in summer; it should germinate in autumn or winter[164, 200]. Stored seed requires a period of cold stratification[164]. Sow as early in spring as possible in a cold frame. Sow the seed thinly so that it will not be necessary to prick them out for their first year of growth. Give an occasional liquid feed to the seedlings to make sure that they do not become nutrient deficient. When the plants are dormant, pot up the small bulbs putting 2 - 3 bulbs in each pot. Grow them on in a shady position in the greenhouse for another 2 3 years and then plant them out into their permanent positions when they are dormant in late summer. Division of the bulbs in the summer as the leaves die down[1]. Larger bulbs can be replanted immediately into their permanent positions, but it is best to pot up smaller bulbs and grow them on in a shady position in a greenhouse for a year before planting them out when dormant in late summer.

nwatta Prefers slightly acid soil conditions but succeeds in chalky soils if these contain plenty of humus[164]. Requires semi-shade, preferably provided by trees or shrubs, and a well-drained soil[42, 164]. Succeeds in almost any light soil, preferring one that is rich in humus[1]. Plants are hardy to about -15°c[90]. Flowers are produced in 3 - 4 years from seed[164]. Plants increase rapidly by offsets[188]. Bulbs should be planted about 7cm deep[1]. This species is closely related to *E. revolutum* and occasionally hybridizes with it where their ranges meet[270]. In addition, *E. citrinum* and *E. hendersonii* are reported to hybridize with *E. oregonum* in the southern part of its range[270]. This species is closely related to *E. californicum*[200].

## 5.2.603 Apocynum cannabinum

Indian Hemp

4 tin 8 cyuc 2 kcaak 3 tcan 2 dwat 0.6 m hkuc pcmimhmtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikwiw hpa7tmwatli xre7t hjonli

drutta Apocynum cannabinum is a PERENNIAL growing to 0.6 m (2ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Lepidoptera (Moths and Butterflies). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: GumSeed - raw or cooked[257]. It can be ground into a powder and used as a meal[94]. A latex obtained from the plant is used as a chewing gum[61, 94, 177]. After the latex has been squeezed from the plant it s allowed to stand overnight to harden into a white gum[257]. The latex was sometimes mixed with clean clay[257].

tcanta Fibre Gum LatexThe flowers are attractive to bees[418 ]. Other Uses: A very good quality fibre obtained from the bark is used for making clothes, twine, bags, linen, paper etc[1, 46, 61, 92, 94, 95, 189, 257]. It is about 12 -

18mm long[189]. Very strong[99], it is used as a flax substitute[57], it does not shrink and it retains its strength in water[99]. The fibre is produced late in the season[85], it can be harvested after the leaves fall in autumn but are probably at its best as the seed pods are forming[169]. When making paper, the stems can be retted by leaving them in the ground until they are dry in the winter or they can be harvested in late summer, the leaves removed and the stems steamed to remove the fibre[189]. The stems are then cooked for two hours with lye and pounded with mallets[189]. The plant yields a latex which is a possible source of rubber[46, 61, 177]. The latex is also used as chewing gum. Carbon Farming - Industrial Crop: hydrocarbon, fibre. The dogbane-milkweed family Asclepias, Apocynum, Calotropis, and Trachomitum spp) has been used for fiber industrial crops for millennia with a number in cultivation as regional crops. All of these crops are dual-purpose fibres, offering bast fibres from the stem and seed fibre or 'floss' in the fruit pods. Many have also been identified as potential hydrocarbon crops due to high latex content. Could be integrated into various agroforestry systems rather than as monocultures [1-1].

dwatta Antirheumatic Cardiotonic Diaphoretic Diuretic Emetic Expectorant Tonic Urinary VD Vermifuge WartsIndian hemp is an unpleasantly bitter stimulant irritant herb that acts on the heart, respiratory and urinary systems, and also on the uterus[238]. It was much employed by various native North American Indian tribes who used it to treat a wide variety of complaints including rheumatism, coughs, pox, whooping cough, asthma, internal parasites, diarrhoea and also to increase milk flow in lactating mothers[257]. The plant is still used in modern herbalism, but it should be used with great caution, and only under the supervision of a qualified practitioner if taken internally[[4, 222, 238]. See the notes above on toxicity[4, 222]. The root is cardiotonic, diaphoretic, diuretic, emetic and expectorant[4, 46, 61, 94, 238]. It is harvested in the autumn and dried for later use[238]. The fresh root is the most active part medicinally. It has been used in the treatment of syphilis and as a tonic[207]. A weak tea made from the dried root has been used for cardiac diseases[207, 222]. A tea made from the root has been used as a vermifuge[213]. The milky sap is a folk remedy for venereal warts[222].

propta Seed - best sown as soon as it is ripe in late summer and overwintered outdoors. The seed requires a period of cold stratification if it is to germinate well[238]. Prick out the seedlings when large enough to handle and grow them on in a cold frame for their first winter, planting out in late spring of the following year[K]. Division in spring just before active growth begins[200]. Plants can also be divided in the autumn[238].

nwatta Industrial Crop: Fiber Industrial Crop: Hydrocarbon Management: Hay Minor Global CropSucceeds in sun or shade in most well-drained moist soils[169, 238]. Plants can be invasive[200]. The young shoots of this plant are extremely attractive to slugs[K]. Carbon Farming - Cultivation: minor global crop. Management: hay.

### 5.2.604 Carlina acaulis

Stemless Carline Thistle

4 tlin 8 cyuc 2 kcaak 0 tcan 2 dwat 0.2 m hkuc htut cyutli kyuctcup hwicli hyishrasljutnyik hpa7tli flatpriklwissip hpa7tmwatli fyfjxre7t hjonli

drutta Carlina acaulis is a BIENNIAL/PERENNIAL growing to 0.2 m (0ft 8in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower in June, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Flowers Root StemEdible Uses: Flowering head - cooked. Used as a globe artichoke substitute[177, 183], though they are considerably smaller and even more fiddly[K]. The fleshy centre of the plant is edible[7, 105]. Does this refer to the peeled stem?[K]. Root[13]. No more details are given.

tcanta Weather forecastingThe dried flowers respond to the amount of humidity in the air and can be used as hygrometers[100]. Flowers on the growing plant close at the approach of rain[268].

dwatta Antispasmodic Carminative Diaphoretic Digestive Diuretic Eczema Emetic Febrifuge PurgativeStemless carline thistle is seldom used in modern herbalism. The plant was at one time in great demand as an aphrodisiac[7], it is occasionally used nowadays in the treatment of spasms of the digestive tract, gall bladder and liver disorders, dropsy, urine retention etc[9, 268]. The root has also been used in treating a range of skin complaints such as acne and eczema[268]. A decoction of the root can be used externally to cleanse wounds or as an antiseptic gargle[268]. Some caution should be employed since in large doses the root is purgative and emetic[268]. The root is antibiotic, antispasmodic, carminative, diaphoretic, digestive, mildly diuretic, emetic in large doses, febrifuge and purgative in large doses[7, 9, 21, 46]. The root is harvested in the autumn and dried for later use[7].

propta Seed - surface sow in a cold frame in the spring. The seed usually germinates in 4 - 8 weeks at 15°c[138]. As soon as they are large enough to handle, prick the seedlings out into individual pots and plant them out into their permanent positions in the summer.

nwatta Succeeds in a sunny position in ordinary garden soil[[11]. Prefers a neutral to alkaline soil[138, 238]. Prefers a poor soil[200]. Established plants are drought tolerant[190]. Plants are hardy to about -20°c[187]. The stemless carline thistle is a protected plant in the wild because of its rarity[7]. This species resents root disturbance, it should be planted into its final position as soon as possible[138]. Plants are usually short-lived or monocarpic[187]. The plant is popular in dried flower arranging, the dried heads keeping their appearance indefinitely[7].

#### 5.2.605 Epimedium grandiflorum

Barrenwort, Bishop's Hat, Longspur Epimedium

4 tlin 8 cyuc 2 kcaak 0 tcan 3 dwat 0.4 m hkuc hmim cyutli kyuctcup hwicli hrasljutnyik hpa7tli flatprikl hpa7tmwatli dyatxre7t hjonli

drutta Epimedium grandiflorum is a PERENNIAL growing to 0.4 m (1ft 4in) by 0.3 m (1ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland). It prefers dry or moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young plant and young leaves - cooked[105, 179]. Soaked and then boiled[177]. (This suggests that the leaves are bitter and need to be soaked in order to remove the bitterness.)

tcanta A good ground cover plant[200].

dwatta Antiasthmatic Antibacterial Antirheumatic Antitussive Aphrodisiac Hypoglycaemic Tonic VasodilatorThe aerial parts of the plant are antiasthmatic, antibacterial, antirheumatic, antitussive, aphrodisiac, hypoglycaemic, tonic and vasodilator. Its use lowers blood sugar levels[116, 176]. It is used in the treatment of impotence, seminal emissions, lumbago, arthritis, numbness and weakness of the limbs, hypertension and chronic bronchitis[176]. It has an action on the genitals similar to the male sex hormone and can increase the weight of the prostate gland and seminal vesicle, it has increased copulation in animals and increases the secretion of semens[176]. The leaves are used as an aphrodisiac[218]. Administered orally, the leaf extract increases the frequency of copulation in animals[218].

propta Seed - best sown in a cold frame as soon as it is ripe in late summer[200, 280]. Sow stored seed as early as possible in the year in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in the cold frame or greenhouse for at least their first winter[K]. Plant them out in mid to late summer[K]. Division, best carried out in August to September according to one report[280], in late spring according to another[200]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are root-

(loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves and young shoots - cooked[105, 177].

tcanta None known

dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe. Stored seed requires 12 weeks stratification at 5°c[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division just before growth starts in spring to single crowns[175]. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the summer or the following spring.

nwatta Prefers a humus-rich fertile well-drained but moisture-retentive acid or neutral light sandy loam in partial shade[175, 200]. Prefers the dappled shade of a woodland garden but tolerates full sun if the soil is reliably moist throughout the growing season[200], flowering earlier in such a position. Plants require a sunnier position when growing in northern Britain[233]. This species is hardy to about -20°c, but if prolonged cold weather is not accompanied by snow cover the plants will appreciate a good mulch of organic matter[187]. A very ornamental plant[233]. Plants are very susceptible to attacks by slugs[175].

#### 5.2.692 Rhododendron mucronulatum

4 tlin 8 cyuc 1 kcaak 0 tcan 0 dwat m hkuc

hmimhtut cyutli tcup hwicli hrasljut hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta Rhododendron mucronulatum is a deciduous Shrub growing to 2.5 m (8ft 2in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FlowersEdible Uses: Flower petals - raw[105]. Some caution is advised, see the notes above on toxicity.

tcanta None known

dwatta None known

propta Seed - best sown in a greenhouse as soon as it is ripe in the autumn and given artificial light. Alternatively sow the seed in a lightly shaded part of the warm greenhouse in late winter or in a cold greenhouse in April. Surface-sow the seed and do not allow the compost to become dry[200]. Pot up the seedlings when they are large enough to handle and grow on in a greenhouse for at least the first winter. Layering in late July. Takes 15 - 24 months[78]. Cuttings of half-ripe wood, August in a frame. Difficult[78].

nwatta Succeeds in a most humus-rich lime-free soils except those of a dry arid nature or those that are heavy or clayey[1]. Prefers a peaty or well-drained sandy loam[1]. Succeeds in sun or shade, the warmer the climate the more shade a plant requires[200]. A pH between 4.5 and 5.5 is ideal[1]. Hardy to about -25°c[184]. A very ornamental plant[1]. Succeeds in a woodland though, because of its surface-rooting habit[200], it does not compete well with surface-rooting trees[1]. Plants need to be kept well weeded, they dislike other plants growing over or into their root system, in particular they grow badly with ground cover plants, herbaceous plants and heathers[200]. Plants form a root ball and are very tolerant of being transplanted, even when quite large, so long as the root ball is kept intact[200]. Plants in this genus are notably susceptible to honey fungus[200].

### 5.2.693 Pycnanthemum muticum

Cluster Mountain Mint

4 tlin 8 cyuc 1 kcaak 0 tcan 0 dwat m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Pycnanthemum muticum is a PERENNIAL growing to 1 m (3ft 3in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Edible Uses: TeaThe leaves have a pleasant mint-like aroma and flavour and can be used to make a refreshing tea[183]. They can also be used as a mint substitute in cooking[238].

tcanta None known

dwatta None known

propta Seed - sown spring or autumn in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. If there are sufficient seeds they can be sown in an outdoor seedbed in April. Division in spring.

nwatta Succeeds in most soils[1] but prefers a rich loamy soil in full sun or partial shade with plenty of moisture in the growing season[200]. Hardy to at least -15°c[200]. The bruised leaves are very aromatic[200].

#### 5.2.694 Conium maculatum

Hemlock, Poison hemlock

4 tlin 8 cyuc 1 kcaak 0 tcan 2 dwat m hkuc

hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatpriklwis hpa7tmwatli fyfjxre7t hjonli

drutta Conium maculatum is a BIENNIAL growing to 2 m (6ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves - cooked[105]. Although toxic, plants found in the south of England are comparatively harmless and the leaves are used as a pot-herb[2]. They can also be dried for later use. The toxic principle is said to be destroyed by thorough cooking or drying[4, 100]. Caution is advised, especially on the remarks about plants in southern England[K]. See the notes above on toxicity.

tcanta None known

dwatta Analgesic Antirheumatic Antispasmodic Cancer Emetic Epilepsy Galactofuge Homeopathy SedativeHemlock is a very poisonous plant that has a long history of medicinal use, though it is very rarely used in modern herbalism[238, 254]. It is a narcotic plant that sedates and relieves pain[238]. The plant contains conine, an extremely toxic substance that can also cause congenital defects[254]. The whole plant is analgesic, antispasmodic, emetic, galactofuge and sedative[4, 7, 9, 21, 213, 222]. It is a traditional folk treatment for cancer[222] and was formerly widely used internally in very small doses to treat a variety of complaints including tumours, epilepsy, whooping cough, rabies and as an antidote to strychnine poisoning[232, 254]. It is still used externally, usually in ointments and oils, in the treatment of mastitis, malignant tumours (especially breast cancer) anal fissure and haemorrhoids[238]. The leaves and stems should be harvested when the first fruits are forming, since they are then at their most active medicinally[4]. The fruits are gathered either when fully ripe, or before they turn from green to yellow, and are then dried[4]. Because of the extremely toxic nature of this herb, it is seldom employed nowadays[232]. Use with extreme caution and only under the guidance of a qualified practitioner[21, 238]. See also the notes above on toxicity. A homeopathic remedy is prepared from a tincture of the fresh plant, harvested when in flower[232]. It is used

into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of almost ripe wood with a heel, August in a shaded position in a cold frame. Leave for 12 months before potting up. Layering in October. Takes 2 years[78].

nwatta Tolerates most soils except those that are waterlogged[200]. Prefers a cold damp spoil[1]. Seldom fruits well in Britain[11, 182], the seed only matures in reasonable summers[1]. Most of the plants that have been supplied under this name in Britain this century are in fact *Ilex collina*[200]. Dioecious, male and female plants must be grown if seed is required.

## 5.2.688 Rhamnus japonica

Japanese buckthorn

4 tlin 8 cyuc 1 kcak 0 tcan 1 dwat 3 m hkuc  
hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliw  
hpa7tmwatli xre7t hjonli

drutta *Rhamnus japonica* is a deciduous Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves[105, 177]. No more details but some caution is advised, see the notes above on toxicity.

tcanta Dye WoodA green dye is obtained from the branches[178]. Wood - close grained. Used for furniture[46, 61].

dwatta Emetic Febrifuge Laxative SkinFebrifuge, laxative, skin[46, 61, 178]. The fruit and the bark are emetic and laxative[218].

propta Seed - best sown in the autumn in a cold frame. Stored seed will require 1 - 2 months cold stratification at about 5° and should be sown as early in the year as possible in a cold frame or outdoor seedbed[200]. Prick out the seedlings into individual pots when they are large enough to handle, and grow them on in the greenhouse or cold frame for their first winter. Plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, July/August in a frame[113]. Cuttings of mature wood of the current year's growth, autumn in a frame. Layering in early spring[4].

nwatta Succeeds in any reasonably good soil[11]. A polymorphic species[58]. The species in this genus are notably resistant to honey fungus[200].

## 5.2.689 Polystichum munitum

Giant Holly Fern, Western swordfern

4 tlin 8 cyuc 1 kcak 0 tcan 2 dwat m hkuc  
pcimhmim cyutli kyuctcup hwicli hrasljut hpa7tli flatprikliw  
hpa7tmwatli hjonli

drutta *Polystichum munitum* is an evergreen Fern growing to 1 m (3ft 3in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 4. It is in leaf all year. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers dry or moist soil.

kcakta Edible Parts: RootEdible Uses: Root - roasted[2, 105, 118, 161]. Peeled and then baked like potatoes[213]. The roots were generally viewed by the native North American Indians mainly as a famine food for use when little else was available[256]. The roots were generally harvested in the spring, before the plant came into growth then cooked and peeled before being eaten[256].

tcanta Hair LiningThe leaves are used for lining boxes, baskets, fruit drying racks etc and as a stuffing material in bedding[99, 118, 257]. A decoction of the rhizome treats dandruff[172]. Plants can be grown as a ground cover and are best spaced about 1 metre apart each way[208].

dwatta Antidandruff Birthing aid PoulticeAn infusion of the fronds has been used as a wash or poultice to treat boils and sores[213, 257]. The young shoots have been chewed and eaten as a treatment for cancer of the womb and to

treat sore throats and tonsillitis[257]. The leaves have been chewed by women to facilitate childbirth[257]. The sporangia have been crushed and applied as a poultice to burns, sores and boils[213, 257]. A decoction of the rhizomes has been used in the treatment of dandruff[213, 257].

propta Spores - best sown as soon as they are ripe, though they can also be sown in the spring. Sow them on the surface of a humus-rich sterilized soil. Keep the compost moist, preferably by putting a plastic bag over the pot. Pot on small clumps of plantlets as soon as they are large enough to handle and keep humid until they are well established. Do not plant outside until the ferns are at least 2 years old and then only in a very well sheltered position. Division. This is best done in the spring.

nwatta Very hardy and easily grown in light shade in any reasonable soil[187]. Prefers a sandy humus-rich soil in a shady position that is moist even in winter[1]. Tolerates part sun for up to 6 hours a day if the soil remains moist[200]. It is possible that the var. imbricans will succeed in drier soils[K]. Prefers a pH in the range 6.5 to 7.5[200]. Members of this genus are rarely if ever troubled by browsing deer[233]. A very ornamental plant[1], it is a robust clump-forming species[187]. Remove old fronds from the plant in the spring because they may harbour fungal diseases[200].

## 5.2.690 Clethra barbinervis

4 tlin 8 cyuc 1 kcak 0 tcan 0 dwat 3 m hkuc  
hmimhtut cyutli tcup hwicli hrasljut hpa7tli frusflatprik  
hpa7tmwatli xre7t hjonli

drutta *Clethra barbinervis* is a deciduous Shrub growing to 3 m (9ft) by 3 m (9ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from July to September, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves - cooked[46, 61, 105, 179]. Eaten with rice dishes[177].

tcanta None known

dwatta None known

propta Seed - sow early spring in a greenhouse[113]. Only just cover the seed and keep the pot moist. Germination usually takes place within 1 - 3 months at 13°C[164]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out once they are more than 20cm tall in late spring or early summer after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in a frame[11, 113]. Very easy[113]. Root cuttings in December/January[113]. Suckers in the dormant season[113]. They can be planted out direct into their permanent positions if required. Layering of current years growth in late autumn. Takes 18 months. Can also be done in early spring[200].

nwatta Requires a moist well-drained lime-free peaty soil[1, 11, 184] succeeding in a sunny position or partial shade[164]. Plants are hardy to about -20°C according to one report[184], this conflicts with another report that says it only succeeds outdoors in Britain from Sussex and westwards[11]. A third report says that the plant is generally hardy but sometimes fails in very cold districts of Britain[182]. The new growth in spring is very susceptible to damage by late frosts[49]. The flowers are fragrant[245]. Plants in this genus are notably resistant to honey fungus[200].

## 5.2.691 Tricyrtis macropoda

4 tlin 8 cyuc 1 kcak 0 tcan 0 dwat m hkuc  
hmimhtut cyutli tcup hwicli hrasljut hpa7tli flatprikliw  
hpa7tmwatli xre7t hjonli

drutta *Tricyrtis macropoda* is a PERENNIAL growing to 0.7 m (2ft 4in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium

ing well. Plant them out in the spring. Cuttings in late summer[200].

nwatta Landscape Uses:Border, Container, Ground cover, Rock garden, Woodland garden. Succeeds in any fertile humus-rich soil[200], preferring a moist but well-drained peaty loam[1, 280]. Requires a lime-free soil[280]. Grows best in the light dappled shade of a woodland[200, 280]. Plants can succeed in the dry shade of trees[233]. A shallow-rooting plant, the rhizomes creeping just below the soil and the finer roots occupying the top 30cm of the soil[280]. A clump-forming species, the rhizomes making only short new growth each year, it needs to be divided every 3 - 4 years in order to maintain vigour[280]. Plants are hardy to about -20°C[187], though the flowers in spring can be damaged by late frosts[233]. A very ornamental plant[1], there are several named varieties[187]. It grows well in the rock garden or wild garden[1]. Plants are self-sterile and so more than one clone is required for cross-fertilization in order for seed to be produced. Plants will often hybridise with other species growing nearby[280]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. Special Features: Attractive foliage, Naturalizing.

## 5.2.606 Orchis coriophora

Bug Orchis

4 tlin 8 cyuc 2 kcak 0 tcan 2 dwat 0.3 m hkuc  
htut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliw  
hpa7tmwatli xre7t hjonli

drutta *Orchis coriophora* is a BULB growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from April to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies, beetles. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: DrinkRoot - cooked. It is a source of 'salep', a fine white to yellowish-white powder that is obtained by drying the tuber and grinding it into a powder[2, 105, 177]. Salep is a starch-like substance with a sweetish taste and a faint somewhat unpleasant smell[4]. It is said to be very nutritious and is made into a drink or can be added to cereals and used in making bread etc[100, 183]. One ounce of salep is said to be enough to sustain a person for a day[100, 115].

tcanta None known

dwatta Antifatulent Demulcent NutritiveSalep (see above for more details) is very nutritive and demulcent[4]. It has been used as a diet of special value for children and convalescents, being boiled with water, flavoured and prepared in the same way as arrowroot[4]. Rich in mucilage, it forms a soothing and demulcent jelly that is used in the treatment of irritations of the gastro-intestinal canal[4]. One part of salep to fifty parts of water is sufficient to make a jelly[4]. The tuber, from which salep is prepared, should be harvested as the plant dies down after flowering and setting seed[4].

propta Seed - surface sow, preferably as soon as it is ripe, in the greenhouse and do not allow the compost to dry out. The seed of this species is extremely simple, it has a minute embryo surrounded by a single layer of protective cells. It contains very little food reserves and depends upon a symbiotic relationship with a species of soil-dwelling fungus. The fungal hyphae invade the seed and enter the cells of the embryo. The orchid soon begins to digest the fungal tissue and this acts as a food supply for the plant until it is able to obtain nutrients from decaying material in the soil[200]. It is best to use some of the soil that is growing around established plants in order to introduce the fungus, or to sow the seed around a plant of the same species and allow the seedlings to grow on until they are large enough to move. Division of the tubers as the flowers fade[230]. This species produces a new tuber towards the end of its growing season. If this is removed from the plant as its flowers are fading, the shock to the plant can stimulate new tubers to be formed. The tuber should be treated as being dormant, whilst the remaining plant should be encouraged to continue in growth in order to give it time to produce new tubers[230]. Division can also be carried out when the plant has a fully developed rosette of leaves but before it comes into flower[230]. The entire new growth is removed from the old tuber from

which it has arisen and is potted up, the cut being made towards the bottom of the stem but leaving one or two roots still attached to the old tuber. This can often be done without digging up the plant. The old tuber should develop one or two new growths, whilst the new rosette should continue in growth and flower normally[230].

nwatta Easily grown in full sun in a moist sandy loam[42]. Orchids are, in general, shallow-rooting plants of well-drained low-fertility soils. Their symbiotic relationship with a fungus in the soil allows them to obtain sufficient nutrients and be able to compete successfully with other plants. They are very sensitive to the addition of fertilizers or fungicides since these can harm the symbiotic fungus and thus kill the orchid[230]. This symbiotic relationship makes them very difficult to cultivate, though they will sometimes appear uninvited in a garden and will then thrive. Transplanting can damage the relationship and plants might also thrive for a few years and then disappear, suggesting that they might be short-lived perennials[230]. Plants can succeed in a lawn in various parts of the country. The lawn should not be mown early in the year before or immediately after flowering[200]. Plant out bulbs whilst the plant is dormant, preferably in the autumn[200]. Plants seem to be immune to the predations of rabbits[233]. Cultivated plants are very susceptible to the predation of slugs and snails[230]. The flowers have an abominable bug-like smell[42, 230]. The flowers of the commoner sub-species, *O. coriophora* fragrans, however, are sweetly scented[230].

## 5.2.607 Disporum trachycarpum

Fairybells

4 tlin 8 cyuc 2 kcak 0 tcan 1 dwat 0.5 m hkuc  
pcimhmim cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliw  
hpa7tmwatli xre7t hjonli

drutta *Disporum trachycarpum* is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw[105, 161, 177, 257]. A sweet flavour[212]. The fruit is up to 10mm in diameter and is leathery rather than pulpy[235].

tcanta None known

dwatta Ophthalmic PoulticeThe seed has been used to clear foreign objects from the eye. A fresh seed was inserted and the eye closed then rubbed until the seed was watered out with the foreign object clinging to it[257]. The seeds were also placed in the eye overnight and an infusion of the bark used as an eyewash to treat snow-blindness[257]. An infusion of the leaves has been used as a wash for wounds whilst a poultice of the dampened bruised leaves has been applied to bleeding wounds[257].

propta Seed - best sown in a cold frame as soon as it is ripe[175]. Use a lime-free compost and keep it moist[175]. Stored seed requires 6 weeks cold stratification and should be sown as early in the year as possible[175]. Germination usually takes place within 3 - 6 months or more at 15°C[175]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring[200].

nwatta Best grown in partial shade in a moist peaty or woodland soil[1, 175]. A very hardy plant, tolerating temperatures down to about -20°C[187]. Plants spread well by means of creeping rhizomes when they are grown in a leafy soil[187]. This species is closely related to *D. smithii*[233].

## 5.2.608 Lilium concolor

Morning Star Lily

4 tlin 8 cyuc 2 kcak 0 tcan 2 dwat 0.6 m hkuc  
htut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliw  
hpa7tmwatli xre7t hjonli

drutta *Lilium concolor* is a BULB growing to 0.6 m (2ft) by 0.3 m (1ft in). See above for USDA hardiness. It is

hardy to UK zone 4. It is in flower from June to July, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

**kcakta Edible Parts:** Flowers **Leaves** **Root****Edible Uses:** Bulb - cooked[2, 105]. The bulb is up to 35mm in diameter[266]. Rich in starch, it can be used as a vegetable in similar ways to potatoes (*Solanum tuberosum*). Young leaves - cooked[177]. Flowers[178]. No more details are given.

**tcanta** None known

**dwatta** **Carminative** **Expectorant** **Pectoral** **Poultice** **Sedative** **Tonic**The bulb is carminative, expectorant, pectoral, sedative and tonic[147, 218]. It is taken internally in the treatment of bronchial complaints[238]. The flowers invigorate the blood[218]. They are poulticed onto sores and boils[218].

**propta** **Seed** - immediate epigeal germination[130]. Sow thinly in pots from late winter to early spring in a cold frame. Should germinate in 2 - 4 weeks[163]. Great care should be taken in pricking out the young seedlings, many people prefer to leave them in the seed pot until they die down at the end of their second years growth. This necessitates sowing the seed thinly and using a reasonably fertile sowing medium. The plants will also require regular feeding when in growth. Divide the young bulbs when they are dormant, putting 2 - 3 in each pot, and grow them on for at least another year before planting them out into their permanent positions when the plants are dormant[K]. Division with care in the autumn once the leaves have died down. Replant immediately[200]. Bulb scales can be removed from the bulbs in early autumn. If they are kept in a warm dark place in a bag of moist peat, they will produce bulblets. These bulblets can be potted up and grown on in the greenhouse until they are large enough to plant out[200].

**nwatta** **Prefers an open free-draining humus-rich loamy soil with its roots in the shade and its head in the sun**[143, 200]. **Prefers an acid sandy soil but also succeeds on heavy soils**[47, 143]. Plants are lime tolerant[47, 143, 200]. Requires a sheltered position if grown outdoors, doing well on a rock garden, but it is best grown in a greenhouse[163] **Stem** rooting, the bulbs should be planted 7 - 10 cm deep[143, 200]. **Early to mid autumn** is the best time to plant out the bulbs in cool temperate areas, in warmer areas they can be planted out as late as late autumn[200]. A very ornamental plant[1], it is cultivated for its edible bulb in Japan[2]. The plant should be protected against rabbits and slugs in early spring. If the shoot tip is eaten out the bulb will not grow in that year and will lose vigour[200].

## 5.2.609 Allium flavum

Small Yellow Onion, Ornamental Onion

4 tlin 7 cyuc 2 kcaak 0 tcan 2 dwat 0.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

**drutta** **Allium flavum** is a **BULB** growing to 0.5 m (1ft 8in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**kcakta Edible Parts:** Flowers **Leaves** **Root****Edible Uses:** Bulb - raw or cooked. The bulb is rather small, about 15mm tall and 10mm in diameter[203]. **Leaves** - raw or cooked. **Flowers** - raw.

**tcanta** **Insecticide** **Repellent**The juice of the plant is used as a moth repellent. The whole plant is said to repel insects and moles[20].

**dwatta** **Although no specific mention of medicinal uses has been seen for this species, members of this genus are in general very healthy additions to the diet. They contain sulphur compounds (which give them their onion flavour) and when added to the diet on a regular basis they help reduce blood cholesterol levels, act as a tonic to the digestive system and also tonify the circulatory system**[K].

**propta** **Seed** - sow spring in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle - if you want to produce clumps more quickly then put three plants in each pot. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in spring once they are growing vigorously and are large enough. Division of the bulbs in late summer or the autumn. Larger bulbs can be planted straight out into their permanent positions, though it might be best to pot up the smaller bulbs and grow them on for a year before planting them out..

**nwatta** **Landscape Uses:** **Border.** A very easily grown plant, it prefers a sunny position in a light well-drained soil[1, 203]. It succeeds in clay soils and also in areas of higher rainfall, so long as the soil drains fairly well[203]. A very variable species with forms ranging in height from 8 - 50cm[203]. Closely related to *A. carinatum*[203]. The bulbs should be planted fairly deeply[1]. Most members of this genus are intolerant of competition from other growing plants[203]. Grows well with most plants, especially roses, carrots, beet and chamomile, but it inhibits the growth of legumes[18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. Members of this genus are rarely if ever troubled by browsing deer[233]. **Special Features:** Not North American native, Naturalizing, Suitable for cut flowers, Suitable for dried flowers.

## 5.2.610 Polygonatum odoratum

Solomon's Seal

4 tlin 8 cyuc 2 kcaak 0 tcan 3 dwat 0.9 m hkuc pcmhmm cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyixre7t hjonli

**drutta** **Polygonatum odoratum** is a **PERENNIAL** growing to 0.9 m (3ft) by 0.3 m (1ft in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from May to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers dry or moist soil.

**kcakta Edible Parts:** Leaves **Root****Edible Uses:** Young shoots - cooked. They can be used as an asparagus substitute[46, 55, 61]. **Root** - cooked[2, 55, 105, 179]. **Rich in starch.**

**tcanta** **Miscellany**None known

**dwatta** **Antiperiodic** **Antitussive** **Cardiotonic** **Demulcent** **Diuretic** **Hypoglycaemic** **Miscellany** **Ophthalmic** **Resolvent** **Sedative** **Tonic**Solomon's seal has been used for thousands of years in herbal medicine. It is used mainly in the form of a poultice and is believed to prevent excessive bruising and to stimulate tissue repair[254]. The root is antiperiodic, antitussive, cardiotonic, demulcent, diuretic, energizer, hypoglycaemic, ophthalmic, resolvent, sedative and tonic[7, 9, 21, 147, 174, 176, 178, 218]. It is used in the treatment of, dry throat, dry coughs and coronary heart disease[176]. The plant is only used in domestic medicine[9]. An infusion is used as a diuretic and stimulant to the metabolism, though no more than 3 cups per day should be taken and only over short periods[9]. It can also be applied externally as a poultice to treat bruises, small wounds etc[7, 9]. It has also been used to remove freckles[9, 21, 174, 176, 178]. The root is harvested in the autumn and can be dried for later use[9]. It should not be used internally except under expert supervision[254].

**propta** **Seed** - best sown as soon as it is ripe in early autumn in a shady part of a cold greenhouse[200]. Sow stored seed as early in the year as possible. Germination can be slow, they may not come true to type[200] and it takes a few years for them to reach a good size. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a shady position in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in March or October. Larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late

**kcakta Edible Parts:** Leaves**Edible Uses:** Young leaves - cooked. Not very palatable[172].

**tcanta** **Hair** **Mordant**The root can be used as an alum substitute, this is a mordant used in fixing dyes[168, 172]. The root is rich in tannin, is this the active ingredient that acts as a mordant?[172]. A good ground cover plant for the woodland garden[200]. Plants should be spaced about 30cm apart each way[208].

**dwatta** **Antiphlogistic** **Antiseptic** **Astringent** **Febrifuge** **Ophthalmic** **Poultice**The root is antiphlogistic, antiseptic, astringent, febrifuge and ophthalmic[94, 172].

**propta** **Seed** - sow early spring in a warm greenhouse and only just cover the seed. Germination is usually fairly rapid. Prick out the seedlings when they are large enough to handle and plant them out into their permanent positions in late spring or early summer. The seed can also be sown in the middle of spring in an outdoor seedbed and planted out in early summer. Alternatively, you can sow the seed in an outdoor seedbed in the middle of summer for planting out in the following spring. Division in March or October[1, 111]. It is best to divide the plants in August or early September, making sure that the woody roots are planted quite deeply with only the crown of foliage above the ground[233].

**nwatta** **Succeeds in any good sweet garden soil that does not dry out in spring**[1]. **Prefers full sun but tolerates partial shade**[1, 111]. **Prefers a well-drained fairly rich and not too heavy soil**[111]. Plants are hardy to about -15°C[187]. Apt to hybridize with other members of this genus[111]. This species is probably best treated as a sub-species of *H. mirantha*.

## 5.2.685 Tamus communis

Black Bryony

4 tlin 8 cyuc 1 kcaak 0 tcan 2 dwat 3.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikrip hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

**drutta** **Tamus communis** is a **PERENNIAL CLIMBER** growing to 3.5 m (11ft 6in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from May to July, and the seeds ripen from September to November. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Bees, flies. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

**kcakta Edible Parts:** Leaves**Edible Uses:** Young shoots - cooked[2, 4, 61, 65]. A decidedly bitter flavour[7]. An asparagus substitute, it is best if the water is changed once whilst cooking[115]. See notes at top of the page regarding possible toxicity.

**tcanta** **None** known

**dwatta** **Antieccymotic** **Antirheumatic** **Cathartic** **Diuretic** **Emetic** **Haemolytic** **Poultice** **Rubefacient**The root is antieccymotic, diuretic, emetic, haemolytic and rubefacient[4, 7, 9]. Use with caution, the plant is rich in saponins, has a very powerful cathartic affect and ranks as a dangerous irritant poison[4, 7]. It is not normally used internally, but the macerated root is applied externally as a poultice to bruises, rheumatic joints etc[4, 7]. This should not be done without expert advice since it can cause painful blisters[9]. The root is used fresh[9] or can be harvested in the autumn and dried for later use[7].

**propta** **Seed** - sow in a cold frame in early spring or as soon as the seed is ripe in the autumn. Prick out the seedlings into individual pots once they are large enough to handle, and plant out in the summer or in late spring of the following year.

**nwatta** **Requires a moist well-drained fertile soil**[17]. A climbing plant, the weak stems support themselves by twining around other plants and are capable of growing quite high up into shrubs and trees[4]. Dioecious. Male and female plants must be grown if seed is required.

## 5.2.686 Holodiscus discolor

Creambush, Oceanspray

4 tlin 8 cyuc 1 kcaak 0 tcan 2 dwat 3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

**drutta** **Holodiscus discolor** is a deciduous Shrub growing to 3 m (9ft) by 3 m (9ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in July, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**kcakta Edible Parts:** Fruit**Edible Uses:** Fruit - raw or cooked[106, 177, 183]. **Small** and dry[161, 183].

**tcanta** **Wood****Wood** - very hard. Used for making small tools, roasting tongs etc[118]. It does not burn easily[118].

**dwatta** **Blood** **purifier** **Ophthalmic** **Poultice** **Skin** **Tonic** The seeds are a blood purifier[257]. An infusion has been used in the treatment of smallpox, black measles and chickenpox[257]. The blossoms have been used in the treatment of diarrhoea[257]. The inner bark is tonic[257]. An infusion has been used as an eyewash[257]. The bark can be dried, powdered and then used with oil as a dressing on burns[257]. A poultice of the leaves has been applied to sore lips and sore feet[257]. A powder of the dried leaves has been used as a dressing on sores[257]. A decoction of the leaves has been used in the treatment of influenza[257].

**propta** **The seed** requires 4 months stratification at 4°C. It is best sown as soon as it is ripe in a cold frame. Stored seed should be sown as early in the year as possible. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood with a heel, July/August in a frame. Can be difficult[200]. Layering in spring. Easy[200].

**nwatta** **Succeeds in a good loamy soil that does not become too dry in summer, in full sun or light shade**[200]. A fast-growing plant[188], it thrives in thin woodland[11]. A very ornamental plant[1, 11], when fully dormant it is hardy to about -15°C[200], though the young growth in spring can be damaged by late frosts[K]. The flowers emit a perfume similar to meadowsweet[245].

## 5.2.687 Nemopanthus mucronatus

Mountain Hilly

4 tlin 8 cyuc 1 kcaak 0 tcan 1 dwat m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

**drutta** **Nemopanthus mucronatus** is a deciduous Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 5. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). . Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**kcakta Edible Parts:** Fruit**Edible Uses:** Fruit[105, 161]. Quite bitter[257].

**tcanta** **None** known

**dwatta** **Diuretic** **Tonic**The root is diuretic[257]. An infusion of the grated root is used in the treatment of grave[257]. A decoction of the small branches, reduced to a syrup, has been used as a tonic[257].

**propta** **Seed** - best sown as soon as it is ripe in a cold frame. The seed can take 18 months to germinate. Stored seed generally requires two winters and a summer before it will germinate and should be sown as soon as possible in a cold frame. Scarification, followed by a warm stratification and then a cold stratification may speed up the germination time[78, 80]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out

be planted out direct into their permanent positions. Leaf bud cuttings of the current seasons growth in a frame[200].

nwatta Landscape Uses:Border, Foundation, Massing, Specimen. Tolerates most soils[200], thriving in a well-drained loamy soil[1], but resenting dryness at the roots[11, 200]. Requires partial shade[11]. Does well on very acid soils with a pH around 4.5[200]. In frosty areas it is best to site the plant in a position shaded from the early morning sun[238]. A good bee plant[108]. The flowers are sweetly scented[245]. Plants are best left unpruned[49]. Another report says that the previous year's flowering shoots should be cut back in early spring[238]. This species is notably susceptible to honey fungus[200]. Special Features:North American native, Suitable for cut flowers, Suitable for dried flowers, Blooms are very showy.

## 5.2.681 Ranunculus aquatilis

Water Crowfoot, White water crowfoot

4 tin 8 cyuc 1 kcaak 0 tcan 1 dwat m hkuc hmimhtut cyutli tcuphja7nhs6t hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyfixre7t hjonli

drutta Ranunculus aquatilis is a ANNUAL/PERENNIAL. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies, bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can grow in water.

kcaakta Edible Parts: LeavesEdible Uses: The entire plant has been boiled and eaten[257]. Some caution is advised, see the notes above on toxicity.

tcanta None known

dwatta Antiasthmatic Antirheumatic FebrifugeThe subspecies *R. aquatilis capillaceus* is used in India in the treatment of intermittent fevers, rheumatism and asthma[240].

propta Seed - sow spring in a tray of water in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta A plant of boggy soils and shallow water, it prefers a loamy soil and a sunny position. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

## 5.2.682 Taraxacum megalorrhizon

4 tin 8 cyuc 1 kcaak 0 tcan 0 dwat m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyfixre7t hjonli

drutta Taraxacum megalorrhizon is a PERENNIAL growing to 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Flowers Leaves RootEdible Uses: Coffee TeaLeaves - raw or cooked. The following uses are also probably applicable to this species, though we have no records for them[K] Root - cooked[183]. Flowers - raw or cooked[183]. The unopened flower buds can be used in fritters[183]. The whole plant is dried and used as a tea[177, 183]. A pleasant tea is made from the flowers. The leaves and the roots can also be used to make tea. The root is dried and roasted to make a coffee substitute.

tcanta LatexA latex obtained from the roots is used to make a high-class rubber[61, 110].

dwatta None known

propta Seed - sow spring in a cold frame and either surface-sow or only just cover the seed. Make sure the compost does not dry out. Germination should take place within 2 weeks. Prick out the seedlings into individual pots when they are large enough to handle, choosing relatively deep pots to accommodate the tap root. Plant them out in early summer. Division in early spring as the plant comes into growth.

nwatta Prefers a well-drained humus-rich soil in full sun or light shade. According to one report this species reproduces apomictically and sexually[50], whilst another report says that only apomictic seed production is undergone[110]. Apomixis is an asexual method of seed production where each seed is genetically identical to the parent plant. Occasionally seed is produced sexually, the resulting seedlings are somewhat different to the parent plants and if these plants are sufficiently distinct from the parents and then produce apomictic seedlings these seedlings are, in theory at least, a new species.

## 5.2.683 Euphorbia marginata

Mountain Snow, Ghost Spurge, Ghost Weed

4 tin 8 cyuc 1 kcaak 3 tcan 1 dwat m hkuc htut cyutli kyuctcup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta Euphorbia marginata is a ANNUAL growing to 0.6 m (2ft) by 0.3 m (1ft in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower in September. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcaakta Edible Parts: Edible Uses: GumA latex from the plant is used for chewing[61, 177, 257]. Caution is advised, see the notes on toxicity above.

tcanta GumLandscape Uses: Border, Container, Specimen. A very ornamental plant, its long-lasting flowers are used in button holes[1]. Hybridizes with other members of this genus[200]. This genus has been singled out as a potential source of latex (for making rubber) for the temperate zone, although no individual species has been singled out[141]. Special Features: Attractive foliage, North American native, Naturalizing, All or parts of this plant are poisonous, Wetlands plant. Dynamic accumulator.

dwatta Astringent Galactogogue Salve Women's complaintsAstringent, women's complaints. Used in the treatment of leucorrhoea[4]. An infusion of the crushed leaves has been used as a liniment in the treatment of swellings[257]. An infusion of the plant has been used to increase milk flow in nursing mothers[257]. Any medicinal use of this plant should be carried out with great care, see the notes above on toxicity[257].

propta Seed - sow spring in situ. Germination usually takes place within 2 - 3 weeks at 20°C.

nwatta Prefers a light well-drained moderately rich loam in an open position[200]. Succeeds in dry soils[1]. The ripe seed is released explosively from the seed capsules[200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233].

## 5.2.684 Heuchera micrantha

Alum Root, Crevice alumroot

4 tin 8 cyuc 1 kcaak 0 tcan 1 dwat m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Heuchera micrantha is an evergreen Perennial growing to 0.6 m (2ft) by 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in leaf all year, in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

spring or early summer.

nwatta Landscape Uses:Container, Massing, Specimen, Woodland garden. Prefers a fertile humus rich moisture retentive well-drained soil in cool shade or semi-shade[200]. Plants are intolerant of heat and drought but tolerate most other conditions[200]. Prefers a dryish soil[10, 19]. Does well in woodlands and copses[1, 19]. Hardy to about -25°C[187]. The rhizomes are long and creeping, the plant forming large colonies[187]. The flowers are sweetly scented[245]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. The young shoots of most members of this genus are very attractive to slugs[K]. Hybridizes with other members of this genus[200]. A number of named forms have been selected for their ornamental value[187]. Special Features:Attractive foliage, Naturalizing, Suitable for cut flowers, Fragrant flowers.

## 5.2.611 Thymus pulegioides

Broad-Leaved Thyme, lemon thyme

4 tin 8 cyuc 2 kcaak 0 tcan 2 dwat 0.2 m hkuc htut cyutli hgatkyuctcup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Thymus pulegioides is an evergreen Shrub growing to 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf all year, in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcaakta Edible Parts: Edible Uses: CondimentThe leaves of some cultivars can be used as a condiment[183, 238]. They can be used as an ingredient of the herb mix 'bouquet garni', or added to soups, vegetables etc, going particularly well with mushrooms or courgettes[238]. If the leaves are to be dried, the plants should be harvested in early and late summer just before the flowers open and the leaves should be dried quickly[200].

tcanta Deodorant Disinfectant EssentialThe essential oil obtained from the leaves is also used in perfumery, as a mouth wash, medicinally etc[200].

dwatta Antiseptic Deodorant Disinfectant Expectorant-The leaves, and especially the essential oil contained in them, are antiseptic, deodorant, disinfectant and expectorant[200, 222, 238]. The plant can be used fresh at any time of the year, or it can be harvested as it comes into flower and either be distilled for the oil or dried for later use[238].

propta Seed - sow spring in a cold frame. Seed can also be sown in autumn in a greenhouse. Surface sow or barely cover the seed. Germination can be erratic. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring or autumn[200]. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the summer or the following spring. Cuttings of young shoots, 5 - 8cm with a heel, May/June in a frame[200]. Cuttings of half-ripe wood, 5 - 8cm with a heel, July/August in a frame[200]. Layering.

nwatta Requires a light well-drained preferably calcareous soil in a sunny position[1, 200]. Succeeds in dry soils. Grows well between stepping stones on paths, tolerating light treading[183, 200]. Succeeds on walls. Thymes dislike wet conditions, especially in the winter. A layer of gravel on the soil around them will help protect the foliage from wet soils[238]. Plants are hardy to at least -10°C[238]. This is a very difficult genus taxonomically, the species hybridize freely with each other and often intergrade into each other[200]. There are many named forms selected for their ornamental value[183]. The leaves are highly aromatic[200]. The flowers are rich in nectar and are very attractive to honey bees[200].

## 5.2.612 Calypso bulbosa

Fairy slipper

4 tin 8 cyuc 2 kcaak 0 tcan 1 dwat 0.1 m hkuc pcmhmim cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Calypso bulbosa is a PERENNIAL growing to 0.1 m (0ft 4in) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf from October to July, in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid and neutral soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist or wet soil.

kcaakta Edible Parts: RootEdible Uses: Bulb - raw or cooked[22, 46, 61, 105, 155]. Rather small[161]. The roots have a rich, butter-like quality[256]. They were usually boiled by the North American Indians before being eaten, though young maidens would eat them raw as they were believed to increase the size of the bust[256].

tcanta None known

dwatta Antispasmodic EpilepsyThe bulbs have been chewed or the flowers sucked in the treatment of mild epilepsy[257].

propta Seed - we have no information on this species but, like all members of the orchid family, the seed of this species is extremely simple, it has a minute embryo surrounded by a single layer of protective cells. It contains very little food reserves and depends upon a symbiotic relationship with a species of soil-dwelling fungus. The fungal hyphae invade the seed and enter the cells of the embryo. The orchid soon begins to digest the fungal tissue and this acts as a food supply for the plant until it is able to obtain nutrients from decaying material in the soil[200]. Surface sow the seed, preferably as soon as it is ripe, in the greenhouse and do not allow the compost to dry out. It is best to use some of the soil that is growing around established plants in order to introduce the fungus, or to sow the seed around a plant of the same species and allow the seedlings to grow on until they are large enough to move. Division in autumn. Make sure that you keep plenty of soil with each plant. It is also said to be possible to transplant orchids after they have flowered but whilst they are still in leaf. Grow on for at least the first year before potting up and do not plant out until the plants are 2 - 4 years old. Division of the tubers as the flowers fade[230]. This species produces a new tuber towards the end of its growing season. If this is removed from the plant as its flowers are fading, the shock to the plant can stimulate new tubers to be formed. The tuber should be treated as being dormant, whilst the remaining plant should be encouraged to continue in growth in order to give it time to produce new tubers[230]. Division can also be carried out when the plant has a fully developed rosette of leaves but before it comes into flower[230]. The entire new growth is removed from the old tuber from which it has arisen and is potted up, the cut being made towards the bottom of the stem but leaving one or two roots still attached to the old tuber. This can often be done without digging up the plant. The old tuber should develop one or two new growths, whilst the new rosette should continue in growth and flower normally[230].

nwatta Grows well in half shade in a light moist organic-rich soil[1, 42, 200]. Requires a lime-free soil, doing best in full shade[42]. The plant comes into growth in the autumn and, although fairly hardy, is best grown in a frame or unheated greenhouse[230]. Orchids are, in general, shallow-rooting plants of well-drained low-fertility soils. Their symbiotic relationship with a fungus in the soil allows them to obtain sufficient nutrients and be able to compete successfully with other plants. They are very sensitive to the addition of fertilizers or fungicides since these can harm the symbiotic fungus and thus kill the orchid[230]. Plants can be naturalized in the woodland or bog garden[200]. Apply a good organic mulch in the winter[1]. Plants do not always grow every year, the bulb can remain dormant in the soil for 2 years[42].

## 5.2.613 Polygonum arenastrum

Small-Leaved Knotweed, Oval-leaf knotweed

4 tin 8 cyuc 2 kcaak 0 tcan 3 dwat 0.3 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli frusflatprikwis hpa7tmwatli fyifxre7t hjonli

drutta Polygonum arenastrum is a ANNUAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from June to October, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure.

kcakta Young leaves and plants - raw or cooked[105, 177]. Used as a potherb[183], they are very rich in zinc[179]. A nutritional analysis is available[218]. Seed - rich or cooked. Rather small and fiddly to utilize, they can be used in all the ways that buckwheat (*Fagopyrum esculentum*) is used, either whole or dried and ground into a powder for use in pancakes, biscuits and piñole[4, 55, 106, 161, 183]. The leaves are a tea substitute[183].

tcanta Yields a blue dye that is not much inferior to indigo[115]. The part used is not specified, but it is likely to be the leaves. Yellow and green dyes are obtained from the whole plant[168]. The roots contain tannins, but the quantity was not given[223].

dwatta DysenteryKnotweed is a safe and effective astringent and diuretic herb that is used mainly in the treatment of complaints such as dysentery and haemorrhoids. It is also taken in the treatment of pulmonary complaints because the silicic acid it contains strengthens connective tissue in the lungs[254]. The whole plant is anthelmintic, astringent, cardiotoxic, cholagogue, diuretic, febrifuge, haemostatic, lithontronic and vulnerary[4, 7, 9, 21, 53, 147, 172, 176, 178]. It was formerly widely used as an astringent both internally and externally in the treatment of wounds, bleeding, piles and diarrhoea[4]. Its diuretic properties make it useful in removing stones[4]. An alcohol-based preparation has been used with success to treat varicose veins of recent origin[7]. The plant is harvested in the summer and early autumn and is dried for later use[9]. The leaves are anthelmintic, diuretic and emollient[218]. The whole plant is anthelmintic, antiphotic and diuretic[218]. The juice of the plant is weakly diuretic, expectorant and vasoconstrictor[218]. Applied externally, it is an excellent remedy to stay bleeding of the nose and to treat sores[4]. The seeds are emetic and purgative[4, 240]. Recent research has shown that the plant is a useful medicine for bacterial dysentery. Of 108 people with this disease, 104 recovered within 5 days when treated internally with a paste of knotweed[254].

propta Seed - sow spring in a cold frame. Germination is usually free and easy. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer if they have reached sufficient size. If not, overwinter them in a cold frame and plant them out the following spring after the last expected frosts. Division in spring or autumn. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Succeeds in an ordinary garden soil[1] but prefers a moisture retentive not too fertile soil in sun or part shade[200]. Repays generous treatment, in good soils the plant will cover an area up to a metre in diameter[1, 4]. Prefers an acid soil[20]. Dislikes shade. Knotweed is a common and invasive weed of cultivated ground[7]. It is an important food plant for the caterpillars of many species of butterflies[30]. It also produces an abundance of seeds and these are a favourite food for many species of birds[4]. Plants seem to be immune to the predations of rabbits[233]. The flowers have little or no scent or honey and are rarely visited by pollinating insects. Self-fertilization is the usual method of reproduction, though cross-fertilization by insects does sometimes occur[4]. The plant also produces cleistogamous flowers - these never open and therefore are always self-fertilized[4]. The plant is very variable according to habitat and is seen by most botanists as part of an aggregate species of 4 very variable species, viz. - *P. aviculare*. *L.*; *P. boreale*. (Lange.)*Small*; *P. rivivacuum*. *Jord. ex Box.*; and *P. arenastrum*. *Bor*[17].

## 5.2.614 *Lycopus virginicus*

Bugleweed, Virginia water horehound  
4 tin 8 cyuc 2 kcaak 0 tcan 3 dwat 0.6 m hkuc  
hmimhtut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flatprikwis hpa7tmwatli xre7t hjonli  
drutta *Lycopus virginicus* is a PERENNIAL growing to 0.6 m (2ft) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta Edible Parts: RootEdible Uses: Root - cooked[46, 61].

tcanta None known  
dwatta Antianxiety Antidandruff Astringent Cardiac Hypoglycaemic Narcotic SedativeBugleweed has sedative properties and is used in modern herbalism principally to treat an overactive thyroid gland and the racing heartbeat that often accompanies this condition[254]. The whole plant is used as an astringent, hypoglycaemic, mild narcotic and mild sedative[4, 102, 222, 238]. It also slows and strengthens heart contractions[238]. The plant has been shown to be of value in the treatment of hyperthyroidism[222, 238], it is also used in the treatment of coughs, bleeding from the lungs and consumption, excessive menstruation etc[4, 238]. It should not be prescribed for pregnant women or patients with hypothyroidism[238]. The plant is harvested as flowering begins and can be used fresh or dried, in an infusion or as a tincture[4, 238]. The root has been chewed, a portion swallowed and the rest applied externally in the treatment of snakebites[257]. Current uses are predominantly for increased activity of the thyroid gland and for premenstrual syndrome symptoms such as breast pain [301]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve *Lycopus* for nervousness and premenstrual syndrome (see [302] for critics of commission E).

propta Seed - sow spring or autumn in a cold frame[238]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse for their first year. Plant them out into their permanent positions in early summer. Division in spring or autumn[238]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Tolerates most soil types so long as they are wet. Succeeds in full sun or in partial shade[238], in damp meadows or in wet places by ponds or streams[200].

## 5.2.615 *Chrysosplenium alternifolium*

Golden Saxifrage, Alternate-leaf golden saxifrage, Iowa golden saxifrage  
4 tin 8 cyuc 2 kcaak 0 tcan 0 dwat 0.3 m hkuc  
hmimhtut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli frusflatprikwis hpa7tmwatli fyifxre7t hjonli

drutta *Chrysosplenium alternifolium* is a PERENNIAL growing to 0.3 m (1ft) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from April to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Beetles, flies. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw[2, 46, 61, 66, 105, 177]. Added to salads[183]. The leaves are rather small, and there is a distinct bitterness in the flavour, especially during hot weather[K].

tcanta The plants creeping habit makes it a good ground cover for the bog garden[200].

dwatta None known

propta Seed - sow spring or autumn in a lightly shaded position in a cold frame. Stand the pot in 2cm of water. When they are large enough to handle, prick the seedlings out into

plant is demulcent, diuretic and tonic[218]. It is also used as a tonic to correct broken bones and tendons[218].

propta Seed - sow spring in a cold frame in a free draining compost and only just cover. The seed usually germinates in 1 - 3 months at 15°C[138]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in early spring whilst dormant[200].

nwatta Easily grown in ordinary garden soil in a sunny position, but plants are apt to become invasive[1, 200]. Nearly all taxa in *Calystegia* intergrade geographically into neighboring taxa with the exception of the widespread coastal species, *C. soldanella* (Linnaeus) R. Brown. It is impossible to draw clearly defined specific limits, and intermediate forms are always found where two taxa approximate geographically[266].

## 5.2.678 *Salix commutata*

undergreen willow  
4 tin 8 cyuc 1 kcaak 3 tcan 2 dwat 3 m hkuc  
hmimhtut cyutli tcuphja7n hwicli hrasjlutnyikfrip hpa7tli flatprik hpa7tmwatli nyanhjen hjonli

drutta *Salix commutata* is a deciduous Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower in May. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta Edible Parts: Inner bark LeavesEdible Uses: Inner bark - raw or cooked. It can be dried, ground into a powder and then added to cereal flour for use in making bread etc. A very bitter flavour, it is a famine food that is only used when all else fails[172]. Young shoots - raw or cooked. They are not very palatable[172].

tcanta Soil reclamationA pioneer plant for difficult sites[200]. Dynamic accumulator.

dwatta Anodyne FebrifugeThe fresh bark of all members of this genus contains salicin[226], which probably decomposes into salicylic acid (closely related to aspirin) in the human body[213]. This is used as an anodyne and febrifuge[226].

propta Seed - must be surface sown as soon as it is ripe in late spring. It has a very short viability, perhaps as little as a few days. Cuttings of mature wood of the current year's growth, November to February in a sheltered outdoor bed or planted straight into their permanent position and given a good weed-suppressing mulch. Very easy. Plant into their permanent positions in the autumn. Cuttings of half-ripe wood, June to August in a frame. Very easy.

nwatta Succeeds in most soils, including wet, ill-drained or intermittently flooded soils[1, 11], but prefers a damp, heavy soil in a sunny position[200]. Rarely thrives on chalk[200]. Hybridizes freely with other members of this genus[200]. Although the flowers are produced in catkins early in the year, they are pollinated by bees and other insects rather than by the wind[11]. Plants in this genus are notably susceptible to honey fungus[200]. Dioecious. Male and female plants must be grown if seed is required.

## 5.2.679 *Pyrularia pubera*

Oil Nut, Buffalo nut  
4 tin 8 cyuc 1 kcaak 0 tcan 1 dwat 3.5 m hkuc  
hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli nyanhjen hjonli

drutta *Pyrularia pubera* is a deciduous Shrub growing to 3.5 m (11ft 6in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from May to June. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy), medium (loamy)

and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: Fruit OilEdible Uses: OilFruit[2, 46, 61]. Caution is advised since the fruit is said to be permeated with an acrid oil[1, 43]. The pear-shaped fruit is about 25mm long[200]. An edible oil is obtained from the seed[105]. Is this different from the acrid poisonous oil of the fruit?[K]

tcanta OilNone known

dwatta Emetic SalveThe plant has been used as a salve on old sores[257]. The seed has been chewed to cause vomiting in the treatment of colic[257].

propta Seed - best sown in a cold frame as soon as it is ripe into a pot containing a small host tree. Stored seed will require 3 months cold stratification before it is sown[200]. Grow on in a cold frame until the plant is large enough to plant out and then plant it close to a mature host tree. Remove the small host tree once the plant is well established[200].

nwatta Parasitic on the roots of a range of trees and shrubs, but most commonly *Tsuga carolina*, this plant needs to grow close to a host tree. It requires a well-drained but moisture retentive lime-free soil[200].

## 5.2.680 *Hydrangea arborescens*

Seven Barks, Wild hydrangea, Ashy Hydrangea, Snowhill Hydrangea, Smooth Hydrangea  
4 tin 9 cyuc 1 kcaak 0 tcan 3 dwat 3 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli frusflatprikwis hpa7tmwatli xre7t hjonli

drutta *Hydrangea arborescens* is a deciduous Shrub growing to 3 m (9ft) by 2 m (6ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 3 and is not frost tender. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: StemEdible Uses: The peeled branches and twigs have been used to make a tea[257]. The new growth of young twigs has been peeled, boiled thoroughly then fried and eaten[257].

tcanta None known

dwatta Anthelmintic Cathartic Diaphoretic Sialagogue TonicSeven barks was used by the North American Indians as a remedy for kidney and bladder stones and is still used for these purposes in modern herbalism[254]. It is considered to both encourage the expulsion of stones and to help dissolve those that remain[254]. The roots are anthelmintic, cathartic, diaphoretic, diuretic, emetic and tonic[4, 21, 46, 165, 222, 238]. They are used in the treatment of kidney stones, mucous irritations of the bladder, cystitis, nephritis, enlarged prostate and bronchial affections[222, 238, 254]. Excessive doses can cause dizziness and bronchial congestion[238]. The fresh roots are very succulent and can be easily cut, when dry they become very tough and resistant[4]. They are harvested in the autumn and it is best to cut them into short sections before drying them[4, 254]. The scraped bark is used as a poultice on wounds, burns, sore muscles, sprains etc[222]. The bark is chewed in the treatment of stomach and heart ailments[222]. The leaves are cathartic, diuretic, sialagogue and tonic[4].

propta Seed - surface sow in a greenhouse in spring[113]. Cover the pot with paper until the seed germinates[78]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 8cm long, July/August in a frame. Overwinter in a greenhouse and plant out in late spring[78]. Thicker growths make the best cuttings, but these should be placed in individual pots[78]. Good percentage[113]. Cuttings of mature wood in late autumn in a frame[200]. Mound layering in spring. Takes 12 months[78]. Division of suckers in late winter[113]. They can

into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood with a heel, July/August in a frame. Can be difficult[200]. Layering in spring. Easy[200].

nwatta Succeeds in a good loamy soil that does not become too dry in summer[1] in full sun or light shade[200]. Plants are hardy to about -15c[200].

## 5.2.674 Symplocos paniculata

Asiatic Sweetleaf, Sapphire-berry  
4 tlin 8 cyuc 1 kcaak 0 tcan 2 dwat 4 m hkuc  
htut cyutli tcup hwicli hrasjlutnyik hpa7tli frusflat hpa7tmwatli dyatxre7t hjonli

drutta Symplocos paniculata is a deciduous Shrub growing to 4 m (13ft) by 4 m (13ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from May to June, and the seeds ripen from October to December. The species is hermaphrodite (has both male and female organs). The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - cooked[177]. Used in jams, jellies and sauce[183]. The fruit is about 8mm in diameter[200].

tcanta Dye Mordant WoodA yellow or red dye is obtained from the leaves and bark[51, 146, 158, 272]. We have no specific information for this species but many species in this genus contain alum and can be used as mordants when dyeing[168]. Wood - white, soft to moderately hard. close grained, liable to twist and split when seasoning. Of possible use in turnery[146, 158].

dwatta Astringent Ophthalmic TonicThe bark is astringent, cooling and tonic[240]. It is useful in the treatment of menorrhagia, bowel complaints, eye diseases and ulcers[240]. It is also used as a gargle for giving firmness to spongy and bleeding gums[240]. The juice of the bark is applied externally to sprains and muscular swellings[272].

propta Seed - best sown in a cold frame as soon as it is ripe. Stored seed requires stratification and is best sown in a cold frame in late winter, it can take 12 months to germinate[11]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the cold frame for their first winter. Plant out in late spring or early summer. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in individual pots in a cold frame[78, 200]. Roots are formed in about 4 weeks. Good percentage[78].

nwatta Requires an acid soil and a sunny position. Succeeds in a sunny position in any well-drained fertile neutral to acid soil[182, 200]. One report says that plants are hardy to about -10°C, though it is also said that they can survive quite harsh winters outdoors in Britain but that they need a warm, sunny protected position and a hot summer if they are to fruit well[11, 200]. The fruits are sometimes spoiled by frosts[200]. The flowers are sweetly fragrant[200, 245]. Self-sterile, it needs cross-pollination with a different plant in the same species if seed and fruit are to be produced[11, 182]. Plants in this genus are notably resistant to honey fungus[200].

## 5.2.675 Pyrola minor

Wintergreen, Snowline wintergreen

4 tlin 8 cyuc 1 kcaak 0 tcan 1 dwat m hkuc  
pcimhmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli frusflatprikwis hpa7tmwatli fyifxre7t hjonli

drutta Pyrola minor is an evergreen Perennial growing to 0.1 m (0ft 4in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf all year, in flower from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Fruit LeavesEdible Uses: Fruit[5]. No more details are given. Leaves - raw[5, 52].

tcanta None known  
dwatta Antispasmodic Astringent Diuretic TonicThe plant is antispasmodic, astringent, diuretic and tonic[4, 172].  
propta Seed - the only information we have on this species is that it is difficult from seed and germinates infrequently[200]. We would suggest sowing the seed as soon as it is ripe if this is possible. Sow it into soil collected from around an established plant, only just covering the seed, and put the pot in a shady part of a cold frame. Pot up any young seedlings as soon as they are large enough to handle, once again using soil from around an established plant. Plant out into their permanent positions when the plants are large enough. You should not need to use soil from around an established plant to do this since the soil in the pot will contain the necessary micorrhiza. Division with great care in the spring[1, 111]. Pot up the divisions using some soil from around an established plant, grow on in a lightly shaded part of a greenhouse or frame and do not plant out until the plants are growing away vigorously[200].

nwatta Prefers a moist sandy woodland soil[111, 200] in a cool position with partial shade[1, 11, 200]. This is a very ornamental[1] but difficult plant to grow. It requires a mycorrhizal relationship in the soil and therefore needs to be grown initially in soil collected from around an established plant[200]. It is also very difficult from seed as well as being intolerant of root disturbance which makes division difficult[1]. The flowers have a soft almond scent[245].

## 5.2.676 Silphium laeve

4 tlin 8 cyuc 1 kcaak 0 tcan 0 dwat m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

drutta Silphium laeve is a PERENNIAL. See above for USDA hardiness. It is hardy to UK zone 4. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Root[2, 4, 105]. No more details are given in the reports.

tcanta None known  
dwatta None known  
propta Seed - best sown as soon as it is ripe in a greenhouse[200]. Prick out the seedlings into individual pots as soon as they are large enough to handle and plant them out in the summer. Division in spring[188]. This is very difficult due to the deep and extensive root system.

nwatta We have very little information on this species and do not know if it will be hardy in Britain. The following notes are based on the general needs of the genus. Succeeds in any ordinary garden soil[1]. Prefers a deep moisture retentive moderately fertile soil that is not too nitrogen rich, in sun or dappled shade[200]. Plants have a deep and extensive root system which makes transplanting difficult[200].

## 5.2.677 Calystegia pubescens

Japanese Bindweed

4 tlin 8 cyuc 1 kcaak 0 tcan 1 dwat 3 m hkuc  
htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

drutta Calystegia pubescens is a PERENNIAL CLIMBER growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Root - cooked[105, 177, 179]. Said to be purgative[179]. Young shoots - cooked[105, 177, 179].

tcanta None known  
dwatta Demulcent Diuretic Poulitice TonicThe flowers are diuretic, they are helpful in cases of diabetes[218]. The

individual pots and grow them on in a tray of water in the cold frame for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in light shade in a cold frame until they are rooting well. Plant them out in the summer or following spring.

nwatta Succeeds in most soils if they are moist[200]. Requires a constantly wet but well-drained soil[200]. Prefers a shady position, succeeding in woodland[200].

## 5.2.616 Cardamine bulbosa

Bulbous Bittercress

4 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat 0.5 m hkuc  
hmimhtut cyutli tucphja7n hwicli hrasjlutnyik hpa7tli flatprikkwis hpa7tmwatli fyifxre7t hjonli

drutta Cardamine bulbosa is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from April to August, and the seeds ripen from May to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta Edible Parts: LeavesEdible Uses: CondimentLeaves - raw[105, 177]. Added to salads. The rootstock is grated and used as a condiment[207], it is a horse radish substitute[105, 177]. A hot pungent taste.

tcanta None known  
dwatta None known  
propta Seed - sow outdoors in a seedbed in a shady position in April. Plant out in autumn or spring. Division in spring. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the summer or following spring.

nwatta We have very little information on this species and do not know if it will be hardy in Britain, though judging by its native range it should succeed outdoors in many parts of this country. The following notes are based on the general needs of the genus. Prefers a moist humus rich soil in shade or semi-shade[200] but succeeds in most soils that are not dry[1]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is tuberous with swollen potato-like roots [1-2].

## 5.2.617 Aquilegia pubescens

Columbine, Sierra columbine

4 tlin 8 cyuc 2 kcaak 0 tcan 1 dwat 0.5 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

drutta Aquilegia pubescens is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FlowersEdible Uses: Flowers - raw. Rich in nectar, they are sweet and delightful[172], they make a very attractive addition to mixed salads and can also be used as a thirst-quenching munch in the garden[K].

tcanta Parasiticide ParasiticideThe seed is used as a parasiticide to rid the hair of lice[172].

dwatta Antispasmodic Diaphoretic Parasiticide Parasiticide Resolvent SalveAntispasmodic, diaphoretic, parasiticide, resolvent, salve[172].

propta Seed - best sown as soon as it is ripe in a cold frame. The seed can be slow to germinate[200]. Stored

seed can be sown in late winter in a cold frame. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for their first winter. Plant out in late spring or early summer. Division in spring[200].

nwatta Prefers a well-drained friable sandy loam with leaf mold[1]. Intolerant of heavy clay[200]. Most species of Aquilegia are short-lived, dying out after 2 - 3 years, though they usually produce seed prolifically[200]. However, they are very apt to hybridize with other members of the genus and so it becomes difficult to keep a species true to type if more than one is grown in the garden[200]. This species is endemic to the southern Sierra Nevada, it sometimes forms extensive hybrid swarms with *A. formosa pauciflora* in the wild[71, 270]. Plants seem to be immune to the predations of rabbits[233]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

## 5.2.618 Cardamine scutata

4 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat 0.3 m hkuc  
hmimhtut cyutli tucphja7n hwicli hrasjlutnyik hpa7tli flatprikkwis hpa7tmwatli fyifxre7t hjonli

drutta Cardamine scutata is a ANNUAL/BIENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from April to August, and the seeds ripen from May to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked[105, 177]. A hot peppery flavour.

tcanta None known  
dwatta None known  
propta Seed - sow spring or autumn in situ.

nwatta We have very little information on this species and do not know if it will be hardy in Britain, though judging by its native range it should succeed outdoors in most parts of this country. The following notes are based on the general needs of the genus. Prefers a moist humus rich soil in shade or semi-shade[200] but succeeds in most soils that are not dry[1].

## 5.2.619 Aster amellus

Ialian Aster

4 tlin 8 cyuc 2 kcaak 0 tcan 2 dwat 0.7 m hkuc  
htut cyutli tcup hwicli hyishrasjlutnyik hpa7tli flatprikkwis hpa7tmwatli fyifxre7t hjonli

drutta Aster amellus is a PERENNIAL growing to 0.7 m (2ft 4in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from September to October, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves and young plants - cooked[177]. Only certain varieties (not specified in the report) are used[177]. A nutritional analysis is available[218].

tcanta None known  
dwatta Antiinflammatory Antitussive Depurative Haemostatic Malaria PectoralThe roots are anti-inflammatory, antitussive, depurative, haemostatic and pectoral[61, 147].They are used in the treatment of coughs, pulmonary affections and malaria[240]. The root juice is used internally in Nepal to treat indigestion and externally to treat boils[272].

propta Seed - surface sow in spring in a cold frame. Do not allow the compost to become dry. Pre-chilling the seed for two weeks can improve germination rates[134]. The seed usually germinates in 2 weeks at 20°C[134]. When large enough to handle, prick the seedlings out into individual pots

and plant them out in the summer. Division in spring or autumn[200].

nwatta Succeeds in most good garden soils[1], preferring one that is well-drained and moisture retentive[200]. Tolerates poorer soils[233]. Prefers a sunny position[200] but also succeeds in part shade[233]. Plants are hardy to about -25°c[187]. A very ornamental plant[1], there are some named varieties[233]. A polymorphic species[50], it hybridizes freely with other members of this genus[200]. Most species in this genus seem to be immune to the predations of rabbits[233].

### 5.2.620 Cardamine flexuosa

Wavy Bittercress,Woodland bittercress

4 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat 0.5 m hkuc hmimhtut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyfxre7t hjonli

drutta Cardamine flexuosa is a ANNUAL/PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from April to September, and the seeds ripen from May to September. The species is hermaphrodite (has both male and female organs). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta Edible Parts: Leaves RootEdible Uses: Leaves - raw or cooked[8, 52, 105, 183]. A hot cress-like flavour. Nice as a flavouring in salads, it is usually available all year round. Root - raw or cooked[183].

tcanta None known

dwatta None known

propta Seed - sow spring or autumn in situ. This species needs very little encouragement and is quite capable of sowing itself, often too freely.

nwatta Prefers a moist humus rich soil in shade or semi-shade[200] but it succeeds in most soils and positions[1]. A common garden weed, it is found especially in pot-grown plants[8].

### 5.2.621 Taraxacum albidum

4 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat 0.4 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyfxre7t hjonli

drutta Taraxacum albidum is a PERENNIAL growing to 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from March to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Coffee TeaLeaves - raw or cooked[177, 183]. A rather bitter flavour, though it is a good tonic for the digestive system. Root - cooked[183]. Flowers - raw or cooked[183]. The unopened flower buds can be used in fritters[183]. The whole plant is dried and used as a tea[177, 183]. The root is dried and roasted to make a coffee substitute. A pleasant tea is made from the flowers. The leaves and the roots can also be used to make tea.

tcanta None known

dwatta None known

propta Seed - sow spring in a cold frame and either surface-sow or only just cover the seed. Make sure the compost does not dry out. Germination should take place within 2 weeks. Prick out the seedlings into individual pots when they are large enough to handle, choosing relatively deep pots to accommodate the tap root. Plant them out in early summer. Division in early spring as the plant comes into growth.

nwatta Prefers a well-drained humus-rich soil in full sun or light shade. Isozyme analysis suggests that this species is uniclonal and of unique hybrid origin between T. japonicum and an unknown tetraploid species[275]. Many species in this genus produce their seed apomictically. This is an asexual method of seed production where each seed is genetically

identical to the parent plant. Occasionally seed is produced sexually, the resulting seedlings are somewhat different to the parent plants and if these plants are sufficiently distinct from the parents and then produce apomictic seedlings these seedlings are, in theory at least, a new species.

### 5.2.622 Onoclea sensibilis

Sensitive Fern

4 tlin 8 cyuc 2 kcaak 2 tcan 2 dwat 0.5 m hkuc pcmhmim cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli frusflatprik hpa7tmwatli hjonli

drutta Onoclea sensibilis is a deciduous Fern growing to 0.5 m (1ft 8in) by 0.5 m (1ft 8in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. The seeds ripen from June to October. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist or wet soil.

kcakta Edible Parts: Leaves RootEdible Uses: The young uncurled leaves, often called 'fiddleheads', are used as a vegetable or eaten raw[159, 177, 183]. Remove the brown scales and then steam the leaves in very little water[213]. The young shoots have been sold as delicacies in Asian markets[213]. Root - cooked[105, 161, 177, 183]. A famine food, it is only used in times of scarcity[213].

tcanta HairA decoction of the plant has been used as a hair wash to help prevent baldness[257]. This species has a freely-running rootstock and makes an effective ground cover plant[200, 233]. Although it is deciduous its decomposing ferns make an effective weed suppressing mulch[200]. Plants should be spaced about 1 metre apart each way[208].

dwatta Galactogogue Poultrice Women's complaintsSensitive fern has not been much used medicinally. However, one native North American Indian tribe did employ it quite widely to treat various women's complaints[257]. An infusion of the root has been used to treat the pain following childbirth[257]. A decoction of the roots has been used to treat fertility in women, to give strength after childbirth, to treat the menses, and to treat swellings, cramps and a sore abdomen[257]. An infusion of the whole plant, or just the root, has been applied externally to full breasts where the milk will not flow[257]. A poultice of the plant is used in treating deep cuts[257].

propta Spores - best sown as soon as they are ripe on the surface of a humus-rich sterilized soil. Keep the compost moist, preferably by putting a plastic bag over the pot. Pot on small clumps of plantlets as soon as they are large enough to handle and keep them in humid conditions until they are well established. Do not plant outside until the ferns are at least 2 years old. Division of underground rhizomes, October to March.

nwatta Landscape Uses:Container, Foundation, Specimen, Woodland garden. Prefers a moist light soil in partial shade[187]. Requires a damp humus-rich site in partial shade with preferably only 2 - 3 hours of sun daily[200]. Plants require an abundance of water at the roots all year round[1] and they grow well in a bog or woodland garden, or on the water's edge where they may grow out over the water[200]. Requires a pH in the range 5 - 6.5[200]. Plants can colonize most situations that are not too dry and are sheltered from harsh winds[200]. A very hardy plant, the rootstock can tolerate temperatures down to about -30°c[200]. Members of this genus are rarely if ever troubled by browsing deer[233]. A very ornamental[1] and easily grown fern, spreading quite vigorously by means of a slender far-creeping rhizome when it is established[187]. It can become invasive in suitable conditions[200]. The fronds die quickly with the first autumn frosts[187], which is why the plant has gained its common name of the sensitive fern[200]. Special Features:Attractive foliage, North American native, Invasive, Naturalizing, Attracts butterflies. The plant is heat tolerant in zones 9 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Miscanthus sinensis is a PERENNIAL growing to 4 m (13ft) by 1 m (3ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: StemEdible Uses: Immature flowering spike[105, 177]. No further details are given.

tcanta BiomassBeing increasingly grown as a source of biomass, trials are currently (1992) taking place on its potential in Britain[K]. Plants form impenetrably dense clumps and when planted close together in drifts make an excellent ground cover[200].

dwatta Anticoagulant Diuretic FebrifugeThe juice of young stems is used to disperse poisons, dissolve blood clots, dissipate extravasated blood and remove inflammation[218]. The plant is diuretic and refrigerant[147, 218].

propta Seed - surface sow in spring in a greenhouse and keep moist. Germination should take place within a couple of weeks. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring or early autumn[200]. Very easy, large divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Industrial Crop: Biomass Management: Hay Minor Global CropLandscape Uses:Border, Container, Foundation, Ground cover, Rock garden, Seashore, Specimen. Prefers a deep fertile loamy soil that does not dry out in summer[200] but succeeds in any ordinary soil that is not too dry[1, 162], in sun or light shade[200]. Fully dormant plants are hardy to about -20°c[187], though the young growth in spring can be damaged by late frosts. Often grown as an ornamental plant, there are many named varieties[162]. Many forms do not get enough summer heat to flower freely when they are grown in Britain, 'Silberfeder' (syn 'Silver Feather') is the most free-flowering in cooler climates[187]. Plants can be grown as a focal point in lawns, they also succeed in quite coarse grass[233]. The leaves have saw-toothed edges that can cut the unwary gardener, it is best to wear gloves when working with the plant[200]. Plants seem to be immune to the predations of rabbits[233]. Special Features: Attracts birds, Attractive foliage, Not North American native, Suitable for cut flowers, Suitable for dried flowers, Attractive flowers or blooms.

### 5.2.672 Tamarix gallica

Manna Plant, French tamarisk

4 tlin 8 cyuc 1 kcaak 0 tcan 2 dwat 4 m hkuc

htut cyutli kyuctcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwissliphsum hpa7tmwatli xre7t hjonli

drutta Tamarix gallica is a deciduous Shrub growing to 4 m (13ft) by 6 m (19ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline and saline soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: MannaEdible Uses: A manna is produced by the plants in response to insect damage to the stems[2, 105]. It is sweet and mucilaginous[105]. There is some confusion over whether the manna is produced by the plant, or whether it is an exudation from the insects[4]. The insects in question live in the deserts around Israel, it is not known if the manna can be produced in Britain[K].

tcanta Dye Fuel Hedge Hedge Soil stabilization Tannin WoodVery tolerant of maritime exposure, it makes a good shelter hedge in coastal gardens[7, 11, 49, 75]. It dislikes being trimmed[75]. The plant has a rather open habit, however, and so is not tremendously effective at reducing wind speeds[K]. The extensive root system of this plant makes it suitable for use in erosion control in sandy soils[149]. The plant contains a high level of tannin[7]. Galls produced on the plant as a result of insect damage contain up to 40% tannin[240]. The tannin can be used as a dyestuff for fabrics[7]. (No details are given about the colour, though it is likely to be some shade of brown.) Wood - fairly hard, not strong, close grained, takes a high polish, it is often twisted or knotty[61, 149, 227]. Used for general construction, poles, turnery[61, 149]. It makes a good fuel, burning well even when green due to the wax content of the wood[74].

dwatta Astringent Detergent Diuretic Dysentery Expectorant LaxativeThe branchlets and the leaves are astringent and diuretic[7]. An external compress is applied to wounds to stop the bleeding[7]. The manna produced on the plant is detergent, expectorant and laxative[240]. Galls produced on the plant as a result of insect damage are astringent[240]. They are used in the treatment of diarrhoea and dysentery[240].

propta Seed - sow spring in a cold frame and only just cover the seed. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame. Very easy[200]. Cuttings of mature wood of the current seasons growth, 15 - 25cm long, planted outdoors in late autumn in a nursery bed or straight into their permanent position. High percentage[11, 200].

nwatta An easily grown plant, succeeding in most soils and tolerant of saline conditions[11]. Grows well in heavy clay soils as well as in sands and even shingle[182]. Usually found near the coast, it succeeds inland if given a fairly good deep loam and a sunny position[11, 200]. Tolerant of maritime winds and dry soils when grown near the coast[11], plants require a moister soil and shelter from cold drying winds when they are grown inland in non-saline soils because they use the soil salts that are found in saline soils to help them reduce transpiration[200]. This species flowers on the current year's growth[227]. Any pruning is best carried out in spring, hedges are also best trimmed at this time[188]. Plants are tolerant of severe pruning, sprouting freely from old wood[K]. The very closely related T. anglica is often included in this species. A good bee plant[74]. This species is notably resistant to honey fungus[88, 200].

### 5.2.673 Holodiscus dumosus

Rock Spiraea

4 tlin 8 cyuc 1 kcaak 0 tcan 1 dwat 4.5 m hkuc

hmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Holodiscus dumosus is a deciduous Shrub growing to 4.5 m (14ft 9in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower in July, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: FruitEdible Uses: TeaFruit - raw or cooked[105, 177]. Small and dry[161]. The leaves can be steeped in water to make a tea[257].

tcanta None known

dwatta Antiseptic Astringent StomachicA decoction of the root has been used in the treatment of diarrhoea and stomach disorders[257]. A decoction of the stems has been used in the treatment of colds and stomach disorders[257]. A decoction of the flowers, leaves and stems has been used as an antiseptic wash[27].

propta The seed requires 4 months stratification at 4°C. It is best sown as soon as it is ripe in a cold frame. Stored seed should be sown as early in the year as possible. When they are large enough to handle, prick the seedlings out

wood, 7 - 10cm with a heel, July/August in a frame[11, 78]. They take about 2 months to root and should be overwintered in a greenhouse, planting out in late spring[78]. Fair to good percentage[78]. Cuttings of almost ripe side shoots, 7 - 12cm with a heel, October/November in a cold frame[78]. Lift the following autumn and plant in their permanent positions[78]. Layering in autumn. Partially sever the layer about 12 months later and lift in the following spring. High percentage[200].

nwatta Requires a well-drained fertile soil in a sheltered position in sun or light shade[1, 200]. Prefers a warm soil that is not too heavy or close[11]. Dislikes calcareous soils[11, 182, 200]. A very ornamental[1] and polymorphic species[58], there are a number of sub-species[200]. *P. villosa sinica*. Rehd. and Wils. is a taller growing form, to 8 metres, and has larger fruits than the type, up to 12mm in diameter[200]. Plants are susceptible to fireblight[200]. The flowers have a hawthorn-like scent[245]. Plants in this genus are notably resistant to honey fungus[200].

### 5.2.669 Lonicera periclymenum

Honeysuckle, European honeysuckle

4 tlin 8 cyuc 1 kcaak 3 tcan 2 dwat 4.5 m hkuc pcmhimmhut cyutli hgattcup hwicli hrasjlutnyik hpa7tli frusflatprikliwisslip hpa7tmwatli fyfxre7t hjonli

drutta Lonicera periclymenum is a deciduous Climber growing to 4.5 m (14ft 9in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from June to August, and the seeds ripen from July to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and very alkaline soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil and can tolerate drought.

kcakta Edible Parts: Flowers NectarEdible Uses: Children (of all ages) suck the base of the flowers to extract the nectar[66].

tcanta A climbing plant, it can be allowed to scramble on the ground where it makes a good ground cover[208]. Plants should be spaced about 1.2 metres apart each way[208]. A very good moth and butterfly plant[30], it is also an important food for many caterpillars including the larvae of the rare white admiral butterfly[186]. The dense growth of the plant offers good nesting possibilities for birds[186].

dwatta Antispasmodic Astringent Cathartic Depurative Diaphoretic Diuretic Emetic Expectorant Febrifuge Laxative Mouthwash Skin VulneraryThe plant has expectorant and laxative properties[4]. A syrup made from the flowers has been used in the treatment of respiratory diseases whilst a decoction of the leaves is considered beneficial in treating diseases of the liver and spleen[4]. It is used as a mouthwash for ulcers[66] and is considered to be a good ingredient in gargles[4]. The flowers are antispasmodic, astringent, diuretic, expectorant, febrifuge and sudorific[240]. The fruit is emetic and cathartic[4]. The herbage is used as a cutaneous and mucous tonic and as a vulnerary[4]. It is also diaphoretic[4]. The leaves are laxative and slightly astringent[240]. The seed is diuretic[4]. The bark is anticatarrhal, depurative, diuretic and sudorific[240].

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed requires 2 months cold stratification[113] and should be sown as soon as possible in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm with or without a heel, July/August in a frame. Good percentage[78]. Cuttings of mature wood of the current season's growth, 15 - 20cm with or without a heel, November in a cold frame. Good percentage[78]. Layering in autumn[200].

nwatta Succeeds in most soils from acid to base-rich[186]. Prefers its roots in the shade with its shoots climbing up into the sun[200]. Plants succeed even in quite deep shade[219]. Established plants are fairly drought tolerant[190]. Plants are hardy to about -20°c[184]. A very orna-

mental plant[1], there are a number of named varieties[184]. The flowers are very fragrant, especially in the evening when it attracts pollinating moths[186, 245]. New leaves often start to open in January with well-grown leaves in April[186]. The leaves fall in November[186]. Twining plants, they can bind themselves so tightly round young trees that they can prevent the trunk from being able to expand[186]. A very good moth and butterfly plant[30], it is also an important food for many caterpillars including the larvae of the rare white admiral butterfly[186]. The dense growth of the plant offers good nesting possibilities for birds[186]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

### 5.2.670 Clematis ianthina

4 tlin 8 cyuc 1 kcaak 0 tcan 0 dwat 4 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwisslip hpa7tmwatli xre7t hjonli

drutta Clematis ianthina is a deciduous Climber growing to 4 m (13ft 1in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves - cooked[177]. Some caution is advised, see the notes above on toxicity.

tcanta None known

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame[164, 200]. Sow stored seed as soon as it is obtained in a cold frame. Pre-soak the seed for 12 hours in warm water and remove as much of the tail and outer coat as possible[164]. A period of cold stratification is beneficial[164]. The seed germinates in 1 - 9 months or more at 20°c[164]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant out in late spring or early summer, after the last expected frosts. Internodal cuttings of soft to semi-ripe wood, late spring in sandy soil in a frame[200]. Layering of old stems in late winter or early spring[200]. Layering of current seasons growth in early summer[200].

nwatta Prefers a deep moist soil with its roots in the shade[11, 200]. Dislikes poorly-drained heavy clay soils, but grows well in clay if grit is added for drainage[11, 200]. Dislikes light sandy soils[11]. Does well on chalk[1]. Succeeds in acid as well as alkaline soils[200]. Very closely related to *C. fusca*, differing mainly in its short-stalked flowers with small bracts and the more violet coloured flowers[273]. A twining plant[182]. The leafstalks wrap themselves around twigs and branches for support. When a side of the stalk touches an object, the growth on that side slows down whilst the other side grows at its normal rate - this causes the leaf stalk to entwine the object it is touching[212]. Plants flower on the current season's new shoots. They can usually be left unpruned, though weak or dead shoots can be removed and main shoots can be cut back by up to two thirds of their length if they are outgrowing their allotted area[273]. When planting out, in order to avoid the disease 'clematis wilt', it is best to plant the rootball about 8cm deeper in the soil. This will also serve to build up a good root crown of growth buds[200]. Plants in this genus are notably resistant to honey fungus[200]. Plants seem to be immune to the predations of rabbits[233]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

### 5.2.671 Miscanthus sinensis

Eulalia, Chinese silvergrass, Silver Feather, Eulalia Grass, Japanese Silver Grass, Ornamental Grass

4 tlin 9 cyuc 1 kcaak 0 tcan 2 dwat 4 m hkuc

days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

#### 5.2.623 Ribes distans

4 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat 0.6 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

drutta Ribes distans is a deciduous Shrub growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from May to June, and the seeds ripen from August to September. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). . The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Fruit - raw or cooked[177]. An unpleasant taste[74]. The red fruit is up to 8mm in diameter[266].

tcanta None known

dwatta None known

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. Stored seed requires 4 - 5 months cold stratification at between 0 to 9°c and should be sown as early in the year as possible[113, 164]. Under normal storage conditions the seed can remain viable for 17 years or more. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter, planting them out in late spring of the following year. Cuttings of half-ripe wood, 10 - 15cm with a heel, July/August in a frame[78, 113]. Cuttings of mature wood of the current year's growth, preferably with a heel of the previous year's growth, November to February in a cold frame or sheltered bed outdoors[78, 200].

nwatta Easily grown in a moisture retentive but well-drained loamy soil of at least moderate quality[11, 200]. Plants are quite tolerant of shade though do not fruit so well in such a position[11]. Hardy to about -20°c[200]. This species is closely related to *R. alpinum*[200]. Plants can harbour a stage of 'white pine blister rust', so they should not be grown in the vicinity of pine trees[155]. Plants in this genus are notably susceptible to honey fungus[200]. Dioecious, male and female plants must be grown if fruit and seed is required[200].

### 5.2.624 Rubus caesius

Dewberry, European dewberry

4 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat 0.2 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwisslip hpa7tmwatli fyfxre7t hjonli

drutta Rubus caesius is a deciduous Shrub growing to 0.2 m (0ft 8in) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from June to September, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles, Apomictic (reproduce by seeds formed without sexual fusion). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: TeaFruit - raw or cooked[1, 2, 3, 12, 183]. Succulent but not very tasty[74]. A delicious flavour; it is considered to be superior to blackcurrants though the fruit is rather small and consists of just a few drupes[2]. The fruit can be used for making jellies, preserves etc[183]. The fresh or dried leaves are used as a tea substitute[46, 61, 183].

tcanta DyeA purple to dull blue dye is obtained from the fruit[168].

dwatta None known

propta Seed - requires stratification and is best sown in early autumn in a cold frame. Stored seed requires one month stratification at about 3°c and is best sown as early as possible in the year. Prick out the seedlings when they are large enough to handle and grow on in a cold frame. Plant them out into their permanent positions in late spring of the following year. Cuttings of half-ripe wood, July/August in a frame[200]. Tip layering in July. Plant out in autumn. Division in early spring or just before leaf-fall in the autumn[200].

nwatta Easily grown in a good well-drained loamy soil in sun or semi-shade[1, 11, 200]. Succeeds on chalky soils[200]. This species is a blackberry with biennial stems, it produces a number of new stems each year from the perennial rootstock, these stems fruit in their second year and then die[200]. Plants in this genus are notably susceptible to honey fungus[200].

### 5.2.625 Cardamine schinziana

4 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat 0.3 m hkuc hmimhtut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyfxre7t hjonli

drutta Cardamine schinziana is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from April to August, and the seeds ripen from May to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta Edible Parts: LeavesEdible Uses: Leafy stems - raw or cooked[105, 177]. A hot peppery flavour.

tcanta None known

dwatta None known

propta Seed - sow spring in a cold frame. Germination usually takes place within 1 - 3 weeks at 15°c[175]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in a greenhouse or cold frame for the first two years, planting them out when dormant in late summer. Division in early spring or after the plant dies down in the summer. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta We have very little information on this species and do not know if it will be hardy in Britain, though judging by its native range it should succeed outdoors in most parts of this country. The following notes are based on the general needs of the genus. Prefers a moist humus rich soil in shade or semi-shade[200] but succeeds in most soils that are not dry[1].

### 5.2.626 Hosta undulata

4 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat 0.3 m hkuc pcmhimmhut cyutli tcup hwicli hrasjlutnyikrip hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Hosta undulata is a PERENNIAL growing to 0.3 m (1ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from July to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves Root. StemEdible Uses: Young leaves and leaf stems - cooked[105, 177]. Root[105, 177]. No more details are given.

tcanta A good ground cover plant, succeeding in dense shade but rather slow to spread[197]. Plants should be spaced about 25cm apart each way[208]. The sub-species *H. undulata erromena* has been specially mentioned[197] and this can be spaced about 60cm apart each way[208].

dwatta None known

propta Seed - sow spring in a lightly shaded position in a greenhouse and only just cover the seed. Germination usually takes place within 1 - 3 months at 10°C. Make sure you keep the compost moist. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division is possible at almost any time of the year so long as there is sufficient moisture[233]. It is best carried out in March as growth commences or in early autumn if the soil is not too dry[200]. Hostas can be left undivided for many years and should not be divided any more frequently than once every 3 - 5 years to allow the leaves to reach maturity[200].

nwatta Thrives in most fertile soils if they are rich in humus[200]. Grows well in heavy clay soils and in sandy ones[208]. Very limy soils inhibit growth, but plants can thrive in such a situation if plenty of humus is added[208]. Prefers a pH between 6 and 7[200]. Requires a rich soil that does not dry out readily[1]. Succeeds in full sun as well as in deep shade, growing well in the semi-shade of a woodland[200, 233]. In general, the sunnier the position the moister the soil should be[233]. Plants are best not grown under trees in town gardens since the soot washed from the leaves of the trees in wet weather will tend to remain on the hosta[208]. Plants flower better when grown in a sunny position but the foliage is better when the plant is in a shady position[200]. Plants are in general fully hardy in Britain, but young leaves in spring can be destroyed by frost. New leaves are only produced in the spring and very early summer, so any damage at this time has a deep effect on the plant[233]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. Plants are very attractive to slugs and snails, the young shoots in spring are especially at risk[111, K]. A vigorous plant, forming medium sized clumps[200]. A hybrid species of garden origin, the flowers are sterile[200].

## 5.2.627 *Daucus carota*

Wild Carrot, Queen anne's lace, Carrot, Wild Carrot, Queen Anne's Lace

4 tin 8 cyuc 2 kcaak 4 tcan 3 dwat 0.6 m hkuc  
htut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliw  
hpa7tmwatli fyfxre7t hjonli

drutta *Daucus carota* is a BIENNIAL growing to 0.6 m (2ft) by 0.3 m (1ft in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies, beetles. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerate maritime exposure.

ckakta Edible Parts: Flowers RootEdible Uses: Coffee CondimentRoot - cooked[55]. Thin and stringy[K]. The flower clusters can be french-fried to produce a carrot-flavoured gourmet's delight[183]. The aromatic seed is used as a flavouring in stews etc[55, 183]. The dried roasted roots are ground into a powder and are used for making coffee[183].

tcanta Cosmetic EssentialAn essential oil obtained from the seed has an orris-like scent[238]. It is used in perfumery and as a food flavouring[46, 238]. The oil has also been used cosmetically in anti-wrinkle creams[238].

dwatta Anthelmintic Carminative Contraceptive Deobstruent Diuretic Emmenagogue Galactogogue Ophthalmic Stimulant UrinaryThe wild carrot is an aromatic herb that acts as a diuretic, soothes the digestive tract and stimulates the uterus[238]. A wonderfully cleansing medicine, it supports the liver, stimulates the flow of urine and the removal of waste by the kidneys[254]. The whole plant is anthelmintic, carminative, deobstruent, diuretic, galactogogue, ophthalmic, stimulant[4, 7, 9, 13, 21, 165]. An infusion is used in the treatment of various complaints including digestive disorders, kidney and bladder diseases and in the treatment of dropsy[4, 238]. An infusion of the leaves

has been used to counter cystitis and kidney stone formation, and to diminish stones that have already formed[254]. Carrot leaves contain significant amounts of porphyrins, which stimulate the pituitary gland and lead to the release of increased levels of sex hormones[254]. The plant is harvested in July and dried for later use. A warm water infusion of the flowers has been used in the treatment of diabetes[213]. The grated raw root, especially of the cultivated forms, is used as a remedy for threadworms[213, 222, 254]. The root is also used to encourage delayed menstruation[213]. The root of the wild plant can induce uterine contractions and so should not be used by pregnant women[213]. A tea made from the roots is diuretic and has been used in the treatment of urinary stones[222]. The seeds are diuretic[213, 218], carminative, emmenagogue and anthelmintic[4, 218]. An infusion is used in the treatment of oedema, flatulent indigestion and menstrual problems[238]. The seed is a traditional 'morning after' contraceptive and there is some evidence to uphold this belief. It requires further investigation[222]. Carrot seeds can be abortifacient and so should not be used by pregnant women[254].

propta Seed - sow August/September or April in situ. The seed germinates better if it is given a period of cold stratification.

nwatta Landscape Uses:Border, Seashore. Prefers a sunny position and a well-drained neutral to alkaline soil[24, 238]. A good plant for the summer meadow[24], it is a food plant for caterpillars of the Swallow-tail Butterfly[200]. This species is the parent of the cultivated carrot[200]. It can act as an alternative host for pests and diseases of the cultivated carrots. The plant has become a pest weed in N. America, where it is spreading rapidly and crowding out native vegetation[274]. The whole plant, when bruised, gives off an aniseed-like scent[245]. Special Features: Edible, Not North American native, Naturalizing, Attracts butterflies, Suitable for cut flowers. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is fleshy. Thick or swollen - fibrous or tap root [2-1].

## 5.2.628 *Populus trichocarpa*

Western Balsam Poplar, Black cottonwood  
4 tin 8 cyuc 1 kcaak 4 tcan 3 dwat 40 m hkuc  
htut cyutli tcup hwicli hrasljutnyikfrip hpa7tli frusflatprikliw  
hpa7tmwatli nyanhjin hjonli

drutta *Populus trichocarpa* is a deciduous Tree growing to 40 m (131ft) by 12 m (39ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from April to May, and the seeds ripen from May to June. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It cannot grow in the shade. It prefers moist soil.

ckakta Edible Parts: Flowers Inner bark SapEdible Uses: Inner bark - raw or dried. It is usually ground into a powder and used as a flour, this is normally mixed with other flours for making bread etc[172, 177]. It is best used in the spring[172]. The inner bark is mucilaginous[257] and extremely sweet, but it sours or ferments rapidly and so, unlike most inner barks, it cannot be dried for winter use, though it can be sun-dried for more immediate use[256]. Catkins - raw or cooked. A bitter flavour[172]. Sap - used for food[257].

tcanta Adhesive Basketry Containers Cork Dye Fuel Insulation Paint Rooting hormone Scourer Soap Soap making String Stuffing Waterproofing WoodAn extract of the shoots can be used as a rooting hormone for all types of cuttings. It is extracted by soaking the chopped up shoots in cold water for a day[172]. A yellow dye is obtained from the leaf buds[257]. The bark of large trees is thick and corky. It is made into containers for carrying and storing food, also as a lining for underground food stores[99]. The inner bark has been shredded, spun together with red or yellow cedar inner bark (*Thuja plicata*, *Juniperus* spp and *Chamaecyparis nootkatensis*) and used as a twine[257]. A glue is

much disliked by rabbits, so a closely woven fence of this plant can be used as a protective barrier[115]. The bark contains about 10% tannin[223]. Plants can be grown as a hedge[29], the var. 'Gracilis' is suitable for a small hedge on damp sites[182, 200]. It can be kept dense by annual clipping[11]. The plant has an extensive root system and is used in soil reclamation and stabilization projects along estuaries[199]. Dynamic accumulator.

dwatta Anodyne Antiinflammatory Antiperiodic Antiseptic Astringent Diaphoretic Diuretic Dysentery Febrifuge Hypnotic Sedative TonicThe bark is anodyne, anti-inflammatory, antiperiodic, antiseptic, astringent, diaphoretic, diuretic, febrifuge, hypnotic, sedative and tonic[4, 9, 21]. It is a very rich source of salicin, which is used in making aspirin[199]. The bark of this species is used interchangeably with *S. alba*. It is taken internally in the treatment of rheumatism, arthritis, gout, inflammatory stages of auto-immune diseases, diarrhoea, dysentery, feverish illnesses, neuralgia and headache[238]. The bark is removed during the summer and dried for later use[238]. The leaves are used internally in the treatment of minor feverish illnesses and colic[238], cancerous sores and chronic dysentery[218]. The leaves can be harvested throughout the growing season and are used fresh or dried[238]. The twigs are used in the treatment of cancer, dysentery and ulcers[218]. The bark of the stem and roots is anodyne and styptic[218]. It is used in the treatment of rheumatism[218]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve *Salix / Willow* for diseases accompanied by fever, rheumatic ailments, headaches (see [302] for critics of commission E).

propta Seed - must be surface sown as soon as it is ripe in late spring. It has a very short viability, perhaps as little as a few days. Cuttings of mature wood of the current year's growth, November to February in a sheltered outdoor bed or planted straight into their permanent position and given a good weed-suppressing mulch. Very easy. Plant into their permanent positions in the autumn. Cuttings of half-ripe wood, June to August in a frame. Very easy.

nwatta Agroforestry Services: Windbreak Fodder: Bank Industrial Crop: Biomass Management: Coppice Other Systems: SRC Regional CropSucceeds in most soils, including wet, ill-drained or intermittently flooded soils[1, 11], but prefers a damp, heavy soil in a sunny position[200]. Plants prefer an alkaline or neutral soil, rarely doing well in acid conditions[186]. Said to prefer a sandy soil[23, 199], plants are tolerant of dryish soils[11]. Plants are tolerant of salt water[199]. A very ornamental plant[1], it is cultivated for its branches which are used in basket making[11], there are some named varieties[131]. Plants are coppiced annually for this purpose[186] A very important food plant for the caterpillars of many butterfly species[30] and a good bee plant, providing an early source of nectar and pollen[11]. Plants in this genus are notably susceptible to honey fungus[200]. Plants should be put into their permanent positions as soon as possible[11]. Dioecious. Male and female plants must be grown if seed is required.

## 5.2.667 *Viburnum lantana*

Wayfaring Tree, Wayfaring Tree Viburnum  
4 tin 7 cyuc 1 kcaak 0 tcan 0 dwat 5 m hkuc  
hmimhtut cyutli kyucupc hwicli hrasljutnyikfrip hpa7tli flatprikliwssip hpa7tmwatli fyfxre7t hjonli

drutta *Viburnum lantana* is a deciduous Shrub growing to 5 m (16ft) by 4 m (13ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 3. It is in flower from May to June, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil. It cannot tolerate atmospheric pollution.

ckakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. A famine food, it is only used when all else fails[177]. The oblong fruit is about 8mm long and contains a single large seed[200].

tcanta Rootstock StringThe young stems can be used as a twine[6]. This species is used as a rootstock for all forms

of viburnums that require grafting[202].

dwatta None known  
propta Seed - best sown in a cold frame as soon as it is ripe. Germination can be slow, sometimes taking more than 18 months. If the seed is harvested 'green' (when it has fully developed but before it has fully ripened) and sown immediately in a cold frame, it should germinate in the spring[80]. Stored seed will require 2 months warm then 3 months cold stratification and can still take 18 months to germinate[113]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame or greenhouse. Plant out into their permanent positions in late spring or early summer of the following year. Cuttings of soft-wood, early summer in a frame[200]. Pot up into individual pots once they start to root and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, 5 - 8 cm long with a heel if possible, July/August in a frame[78, 113]. Plant them into individual pots as soon as they start to root. These cuttings can be difficult to overwinter, it is best to keep them in a greenhouse or cold frame until the following spring before planting them out[113]. Cuttings of mature wood, winter in a frame. They should root in early spring - pot them up when large enough to handle and plant them out in the summer if sufficient new growth is made, otherwise keep them in a cold frame for the next winter and then plant them out in the spring. Layering of current seasons growth in July/August. Takes 15 months[78].

nwatta Landscape Uses:Border, Massing, Screen, Specimen. An easily grown plant, it succeeds in most soils but is ill-adapted for poor soils and for dry situations[1]. Unlike most members of the genus, this species succeeds on dry soils[186]. It prefers a deep rich moist loamy soil in sun or semi-shade[11, 200], growing well on chalk and on chalky clays[98]. Intolerant of water-logged soils[186]. Best if given shade from the early morning sun in spring[200]. Dislikes atmospheric pollution[186]. Plants regenerate well after cutting[186]. This plant is a good indicator of limy soils[186]. Tolerates light shade in a woodland[186]. One report says the plant is self-sterile[11], another that it is self-fertile[17]. It would be wise to grow at least two genetically distinct plants of the same species in order to make sure that fruit and seed is produced. Special Features: Not North American native, Naturalizing, Fragrant flowers, Blooms are very showy.

## 5.2.668 *Photinia villosa*

Oriental photinia  
4 tin 8 cyuc 1 kcaak 0 tcan 0 dwat 5 m hkuc  
hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprik  
hpa7tmwatli xre7t hjonli

drutta *Photinia villosa* is a deciduous Shrub growing to 5 m (16ft) by 5 m (16ft). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower in May, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

ckakta Edible Parts: Fruit LeavesEdible Uses: Fruit[177]. No more details are given. The fruit is about 8mm in diameter[200], though occasionally forms with fruits up to 16mm are seen[266]. Leaves - cooked. A famine food, it is only used when all else fails[179].

tcanta WoodThe wood is hard and heavy, suitable for making furniture and other small articles[266].

dwatta None known  
propta Seed - best sown in a cold frame as soon as it is ripe in the autumn. Stored seed will probably require stratification and should be sown as early in the year as possible[78]. Germination is usually good[78]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Basal cuttings in a frame[200]. Harvest the shoots with plenty of underground stem when they are about 8 - 10cm above the ground. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer. Cuttings of half-ripe

## 5.2.664 *Magnolia stellata*

Star Magnolia

4 tlin 8 cyuc 1 kcaak 0 tcan 0 dwat 5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikhwis hpa7tmwatli xre7t hjonli

drutta *Magnolia stellata* is a deciduous Shrub growing to 5 m (16ft) by 5 m (16ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from March to April. The species is hermaphrodite (has both male and female organs) and is pollinated by Beetles. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. It can tolerate atmospheric pollution.

kcakta Edible Parts: LeavesEdible Uses: Young leaves - cooked. A famine food, it is only used when all else fails[177]. tcanta None known dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed must be kept cool after the winter and should be sown in late winter in a cold frame[200]. The seed usually germinates in the spring but it can take 18 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in a cold frame or greenhouse for at least their first winter. They can be planted out into their permanent positions when they are more than 15cm tall, though should be well mulched and given some protection from winter cold for their first winter or two outdoors. Layering in early spring[200]. Cuttings of half-ripe wood, early summer in a frame[202].

nwatta Landscape Uses:Border, Firewood, Pest tolerant, Specimen. Best grown in a warm position in a moderately rich free soil of an open texture[1]. Succeeds in acid or neutral soils in sun or part shade[184]. Tolerates alkaline soils so long as they are deep and rich in humus[188]. Prefers plenty of humus in the soil[111]. The branches are brittle so a sheltered position is required[200]. Very tolerant of atmospheric pollution[200]. Dormant plants are hardy to about -15°C[184]. The fleshy roots are easily damaged and any transplanting is best done during a spell of mild moist weather in late spring[182]. A very ornamental plant, the flowers start to be produced when the plant is only 2 years old and have a delicate sweet perfume[245], though they are easily damaged by frost or wind[1]. A number of cultivars have been developed for their ornamental value[200]. Plants are slow-growing[202]. Very closely related to *M. kobus* and possibly no more than a geographical form of that species[182]. Special Features: Not North American native, Fragrant flowers, Blooms are very showy .

## 5.2.665 *Chionanthus virginicus*

Fringe Tree, White fringetree, Old Man's Beard, Fringe Tree 4 tlin 9 cyuc 1 kcaak 0 tcan 3 dwat 5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli frusflatprikhwisslip hpa7tmwatli nyanhjen hjonli

drutta *Chionanthus virginicus* is a deciduous Shrub growing to 5 m (16ft) by 3 m (9ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower in June, and the seeds ripen in October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - used as a pickle like olives[55, 177, 183]. The fruit is up to 18mm long, it has a thin pulp and contains 1 - 3 rounded seeds[227].

tcanta WoodWood - hard, heavy, close grained, weighing about 39lb per cubic foot[82, 227]. Of no commercial value because of the small size of the tree[229].

dwatta Alterative Aperient Cholagogue Diuretic Febrifuge TonicThe fringe tree was commonly used by the North American Indians and European settlers alike to treat inflammations of the eye, mouth ulcers and spongy

gums[254]. In modern herbalism it is considered to be one of the most reliable remedies for disorders of the liver and gall bladder[238]. The dried root bark is alterative, aperient, cholagogue, diuretic, febrifuge and tonic[4, 21, 46, 222, 238]. It is used in the treatment of gallbladder pain, gallstones, jaundice and chronic weakness[254]. A tincture of the bark was once widely used internally in the treatment of hypertrophy of the liver, jaundice, bilious headache, gallstones, rheumatism etc[222, 238]. The root bark also appears to strengthen function in the pancreas and spleen whilst anecdotal evidence indicates that it may substantially reduce sugar levels in the urine[254]. Fringe tree also stimulates the appetite and digestion and is an excellent remedy for chronic illness, especially where the liver has been affected[254]. A tea or a poultice can be made from the root bark for external use as a wash for wounds, inflammations, sores, infections etc[4, 222]. The roots can be harvested at any time of the year, the bark is peeled from them and is then dried for later use[238].

propta Seed - best sown as soon as it is ripe in a cold frame[164, 200]. Germination is usually good. Stored seed can be sown in February or March in a warm greenhouse according to one report[78] but germination can them take 18 months at 15 - 20°C[113]. Alternatively the stored seed can be pre-soaked for 2 - 3 hours in warm water and then given 3 months warm stratification followed by 3 months at 2 - 4°C[113]. Germination can then be fairly rapid. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a greenhouse or cold frame. Plant them out into their permanent positions the following spring or early summer. Layering in early summer as soon as new growth is long enough. Takes 15 months[78]. Layering can also be carried out in spring or autumn[200].

nwatta Landscape Uses:Border, Pest tolerant, Specimen, Woodland garden. Prefers a good loamy neutral to acid soil in full sun[1, 11, 182, 200]. Succeeds in partial shade but does not fruit so well in such a position[200]. Plants flower more freely in areas with hotter summers[188] and are slow-growing in areas with cool summers[238]. A very ornamental plant[1, 11], it is hardy to about -25°C[184]. A fast-growing but short-lived tree in the wild, where it is remarkably free from diseases or insect pests[229]. Plants begin to flower and bear fruit when they are 5 - 8 years old[227]. The flowers have a delicate sweet perfume[245]. Dioecious, male and female plants must be grown if seed and fruit is required. This species transplants easily[11]. Plants in this genus are notably resistant to honey fungus[200]. Special Features:Attracts birds, North American native, Fragrant flowers, Blooms are very showy.

## 5.2.666 *Salix purpurea*

Purple Osier. purpleosier willow

4 tlin 8 cyuc 1 kcaak 4 tcan 3 dwat 5 m hkuc htut cyutli kyuctcuphja7n hwicli hrasjlutnyikfrip hpa7tli flatprikhwisom hpa7tmwatli nyanhjen hjonli

drutta *Salix purpurea* is a deciduous Tree growing to 5 m (16ft) by 5 m (16ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from March to April, and the seeds ripen in May. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Bees. The plant is not self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in saline soils. It cannot grow in the shade. It prefers dry moist or wet soil.

kcakta Edible Parts: Inner bark LeavesEdible Uses: Inner bark - raw or cooked. It can be dried, ground into a powder and then added to cereal flour for use in making bread etc. A very bitter flavour, it is a famine food that is only used when all else fails[172]. Young shoots - raw or cooked. They are not very palatable[172].

tcanta Basketry Fodder Hedge Hedge Repellent Soil reclamation Soil stabilization TanninThe stems are very tough and flexible and are used in basket making[11, 13, 23, 115]. The plant is usually coppiced annually when grown for basket making, though it is possible to coppice it every two years if thick poles are required as uprights. The bark is

made from the aromatic gum on the spring buds[99, 226, 257]. Very strong, it can also be used as a waterproofing for wood etc[99]. When mixed with pigment it can be used as a paint[99]. A string is made from the roots[99]. The supple young branches have been used as lashings or tying thongs[257]. The seed fluff is used as a stuffing material for pillows etc[99]. The wood ashes are a soap substitute[99], they can also be mixed with oil to make a soap[99]. The white inner bark is also a soap substitute, it can be dried and stored for later use[99]. The inner bark has also been used as a scouring pad[257]. The roots have been used for making baskets[257]. Wood - soft, moderately strong, easily worked, rather woolly in texture, without smell or taste, of low flammability, not durable, very resistant to abrasion. Used in making crates, packing material the staves of barrels, woodenware and for pulp[11, 82, 99, 229]. It makes an excellent fuel[99].

dwatta Anodyne Antiinflammatory Antiscorbutic Antiseptic Balsamic Diuretic Expectorant Febrifuge Stimulant TonicWestern balsam poplar has a long history of herbal use. It was commonly used by many native North American Indian tribes who valued it especially for its antiseptic and expectorant properties, using it to treat lung complaints, wounds, skin conditions etc[257]. It is still commonly employed in modern herbalism with much the same uses. The leaf buds are covered with a resinous sap that has a strong turpentine odour and a bitter taste[213]. They also contain salicin, a glycoside that probably decomposes into salicylic acid (aspirin) in the body[213]. The buds are antiscorbutic, antiseptic, balsamic, diuretic, expectorant, stimulant and tonic[4, 226, 238]. They are taken internally in the treatment of bronchitis and upper respiratory tract infections. They should not be prescribed to patients who are sensitive to aspirin[238]. Externally, the buds are used to treat colds, sinusitis, arthritis, rheumatism, muscular pain and dry skin conditions[238]. They can be put in hot water and used as an inhalant to relieve congested nasal passages[213]. The buds are harvested in the spring before they open and are dried for later use[238]. Although no specific mention has been seen for this species, the bark of most, if not all members of the genus contain salicin, a glycoside that probably decomposes into salicylic acid (aspirin) in the body[213, 238]. The bark is therefore anodyne, anti-inflammatory and febrifuge. It is used especially in treating rheumatism and fevers, and also to relieve the pain of menstrual cramps[238].

propta Seed - must be sown as soon as it is ripe in spring[113]. Poplar seed has an extremely short period of viability and needs to be sown within a few days of ripening[200]. Surface sow or just lightly cover the seed in trays in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the old frame. If sufficient growth is made, it might be possible to plant them out in late summer into their permanent positions, otherwise keep them in the cold frame until the following late spring and then plant them out. Most poplar species hybridize freely with each other, so the seed may not come true unless it is collected from the wild in areas with no other poplar species growing[11]. Cuttings of mature wood of the current season's growth, 20 - 40cm long, November/December in a sheltered outdoor bed or direct into their permanent positions. Very easy. Suckers in early spring[78].

nwatta Industrial Crop: Biomass Management: Coppice Management: Standard Minor Global Crop Other Systems: Irreg. Intercrop Other Systems: SRC Other Systems: Strip intercropA very easily grown plant, it does well in a heavy cold damp soil[1]. Prefers a deep rich well-drained circumneutral soil, growing best in the south and east of Britain[11, 200]. Growth is much less on wet soils, on poor acid soils and on thin dry soils[11] but this species is more tolerant of acid soils than other members of the genus[11]. It dislikes shade and is intolerant of root or branch competition[11, 200]. Plants are reasonably wind resistant, but they do not grow well in exposed upland sites[11]. Many forms of this species are susceptible to bacterial canker, the female clone 'Fritzi Pauley' is resistant[11, 200]. A very fast growing[11] and ornamental tree[1], it does well in western Britain where trees have reached 25 metres tall in 20 years[11]. The leaf buds, as they swell in the spring, and the young leaves have a pleasing fragrance of balsam[245]. The fragrance is especially pronounced as the leaves unfold[245]. Poplars have very extensive and aggressive root systems that can invade and damage drainage systems. Especially when

grown on clay soils, they should not be planted within 12 metres of buildings since the root system can damage the building's foundations by drying out the soil[11]. Dioecious. Male and female plants must be grown if seed is required.

## 5.2.629 *Abies amabilis*

Red Fir,Pacific silver fir

4 tin 8 cyuc 1 kcaak 0 tcan 2 dwat 30 m hkuc pcmimhmhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprik hpa7tmwatli hjonli

drutta *Abies amabilis* is an evergreen Tree growing to 30 m (98ft) by 5 m (16ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf all year, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid and neutral soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil. The plant is not wind tolerant. It cannot tolerate atmospheric pollution.

kcakta Edible Parts: Inner barkEdible Uses: Gum TeaYoung shoot tips are used as a substitute for tea[177, 183]. The pitch obtained from the bark can be hardened (probably by immersing it in cold water[K]) and used as a chewing gum[257]. Inner bark[257]. No further information is given, but inner bark can be dried, ground into a powder and then used with grain flours etc to make bread and other preparations[257].

tcanta Gum WoodThe boughs are fragrant and can be hung in the home as an air freshener[257]. Wood - hard, light, not strong, close grained, not very durable. It is used for framing small buildings but is not strong enough for larger buildings. It is also used for crates, pulp etc[46, 61, 82, 226, 229]. This tree yields the resin 'Canadian Balsam'[226]. The report does not mention the uses of this balsam, but the following are the ways that it is used when obtained from *A. balsamea*:- The balsamic resin 'Balm of Gilead'[11, 46] or 'Canada Balsam' according to other reports[64, 226, 238] is obtained during July and August from blisters in the bark or by cutting pockets in the wood[222]. Another report says that it is a turpentine[171]. It is used medicinally and in dentistry, also in the manufacture of glues, candles and as a cement for microscopes and slides - it has a high refractive index resembling that of glass[11, 46, 64, 82, 222, 226, 238]. The average yield is about 8 - 10 oz per tree[171]. The resin is also a fixative in soaps and perfumery[171, 238].

dwatta This plant was used quite widely by native North American Indians. An infusion of the bark was used as a tonic and to treat stomach ailments, TB, haemorrhoids and various minor complaints[257]. The pitch, or resin, was also used to treat colds, sore throats etc[257]. The bark of this tree contains blisters that are filled with a resin called 'Canadian Balsam'[226]. Although the report does not mention the uses of this resin, it can almost certainly be used in the same ways as the resin of *A. balsamea*, as detailed below:- The resin obtained from this tree (see 'Uses notes' below) has been used throughout the world and is a very effective antiseptic and healing agent. It is used as a healing and analgesic protective covering for burns, bruises, wounds and sores[213, 222, 226]. It is also used to treat sore nipples[213] and is said to be one of the best curatives for a sore throat[245]. The resin is also antiscorbutic, diuretic, stimulant and tonic[4, 171, 222]. It is used internally in propriety mixtures to treat coughs and diarrhoea, though taken in excess it is purgative[238]. A warm liquid of the gummy sap was drunk as a treatment for gonorrhoea[212]. A tea made from the leaves is antiscorbutic[4, 171]. It is used in the treatment of coughs, colds and fevers[222]. The leaves and young shoots are best harvested in the spring and dried for later use[238].

propta Seed - sow early February in a greenhouse or outdoors in March[78]. Germination is often poor, usually taking about 6 - 8 weeks[78]. Stratification is said to produce a more even germination so it is probably best to sow the seed in a cold frame as soon as it is ripe in the autumn[80, 113]. The seed remains viable for up to 5 years if it is well stored[113]. When large enough to handle, prick the seedlings out into individual pots and grow them on for at least their first winter in pots. Plant them out into their permanent positions in late

spring or early summer, after the last expected frosts. Alternatively, if you have sufficient seed, it is possible to sow in an outdoor seedbed. One report says that it is best to grow the seedlings on in the shade at a density of about 550 plants per square metre[78] whilst another report says that they are best grown on in a sunny position[80].

nwatta Requires a good moist but not water-logged soil in a sheltered position[1]. Grows well in heavy clay soils. Plants are very shade tolerant[11, 81] but growth is slower in dense shade[81]. Intolerant of atmospheric pollution[1]. Prefers slightly acid conditions down to a pH of about 5[200]. Prefers growing on a north-facing slope[200]. Trees are somewhat shallow rooted and are therefore susceptible to strong winds[229]. Grows best in the Perthshire valleys of Scotland[11]. It does very well on glacial moraines in Scotland[81]. When grown in an open position, the tree clothes itself to the ground with gracefully drooping branches, though on the whole, this species does not grow well in Britain[11]. Trees have been of variable growth in this country and seem to be short-lived[185]. The best and fastest growing specimens are to be found in the north and far west of the country[185]. Growth in girth can be very quick, 1.8 metres in 35 years has been recorded[185]. Trees should be planted into their permanent positions when they are quite small, between 30 and 90cm in height. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200]. The crushed leaves have an odour like orange peel[11]. Plants are strongly outbreeding, self-fertilized seed usually grows poorly[200]. They hybridize freely with other members of this genus[200]. This species is often confused with *A. nordmanniana*[11]. A very ornamental plant[1]. Trees are sometimes grown as 'Christmas trees'[200]. Plants are susceptible to injury by aphids[11].

### 5.2.630 *Liriodendron tulipifera*

Tulip Tree, Tulip Poplar, Yellow Poplar, Canary Whitewood  
4 tlin 9 cyuc 1 kcaak 0 tcan 2 dwat 30 m hkuc  
htut cyutli tcup hwicli hrasjltunyk hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Liriodendron tulipifera is a deciduous Tree growing to 30 m (98ft) by 12 m (39ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from June to July, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Beetles. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Edible Uses: CondimentThe root is used as a lemon-like flavouring in spruce beer, where it also serves to correct the bitterness of the beer[2]. The bark of the root and branches have a pleasant rather pungent scent[11].

tcanta Dye WoodA gold-coloured dye is obtained from the bark[106]. Wood - fine grained, soft, light, easily worked, durable, brittle, not strong but does not split. A valuable timber, it weighs 26lb per cubic foot and is much used for interior finishes, furniture, construction and plywood[11, 46, 61, 171, 229, 235]. Native north americans used the tree for making canoes[270].

dwatta Anthelmintic Aphrodisiac Cardiac Diuretic Dysentery Nerveine Poultice TonicThe intensely acrid bitter inner bark, especially of the roots, is used domestically as a diuretic, tonic and stimulant[82, 213]. The raw green bark is also chewed as an aphrodisiac[222, 257]. The bark contains 'tulipiferine', which is said to exert powerful effects on the heart and nervous system[46, 61, 213]. A tea is used in the treatment of indigestion, dysentery, rheumatism, coughs, fevers etc[222, 257]. Externally, the tea is used as a wash and a poultice on wounds and boils[257]. The root bark and the seeds have both been used to expel worms from the body[213, 257].

propta Seed - best sown as soon as it is ripe in a shady place in a cold frame[80, 113, 200]. Stored seed requires 3 weeks warm then 12 weeks cold stratification[80, 113]. Germination is usually poor, only about 1% of the seed is viable[80]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into

their permanent positions in late spring or early summer, after the last expected frosts[78]. Layering in spring. Do not sever from the parent plant for 2 years[200].

nwatta Landscape Uses:Pest tolerant, Aggressive surface roots possible, Pollard, Specimen. Requires a deep rich soil[11, 43, 200] and a sheltered but not overshadowed position[1]. Prefers a slightly acid soil[188]. Succeeds in sun or semi-shade[188]. A very ornamental plant[1], it is fast-growing and moderately long-lived in its native range[229]. Flowers are first produced when the tree is about 15 - 20 years old[229]. Liriodendron tulipifera is the state tree of both Indiana and Tennessee[270]. Intolerant of root disturbance, plants are best grown in pots and placed into their final positions as soon as possible. Any transplanting is best done in May[11]. Trees flower best in regions with long hot summers[200]. Plants are particularly susceptible to attacks by rabbits and hares[200]. The flowers produce considerable nectar, making this a good bee plant[21, 229]. Cultivated for its wood in Europe[50]. Special Features:North American native, Attracts butterflies, Fragrant flowers, Attractive flowers or blooms.

### 5.2.631 *Platanus occidentalis*

Buttonwood, American sycamore, American Planetree, Sycamore, American Sycamore

4 tlin 9 cyuc 1 kcaak 0 tcan 2 dwat 30 m hkuc  
htut cyutli hgattcuphja7n hwicli hrasjltunyk hpa7tli flatprikliw hpa7tmwatli hjonli

drutta Platanus occidentalis is a deciduous Tree growing to 30 m (98ft) by 30 m (98ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in May, and the seeds ripen from October to March. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist or wet soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: SapEdible Uses: SweetenerThe sweet sap is tapped in the spring and used in the preparation of syrup and sugar[105, 177, 183].

tcanta Shelterbelt WoodA fairly wind resistant tree, it can be grown as part of a shelterbelt planting[200]. Wood - coarse-grained, tough, strong, very durable, difficult to split[46, 61, 171]. Rather weak according to other reports[227, 229]. It weighs 35lb per cubic foot[235], and is used for furniture, chopping boards etc[46, 61, 171, 229]. Trunks of wild trees can be up to 4.5 metres in diameter and these were at one time hollowed out to make barges capable of carrying several tons of goods[226].

dwatta Antirheumatic Astringent Diuretic Dysentery Emetic Laxative Poultice SalveThe inner bark is astringent, diuretic, emetic and laxative[222]. It has been used as a tea in the treatment of dysentery, coughs, colds, lung ailments, haemorrhages, measles, milky and difficult urination etc and also as a blood tonic[222, 257]. Externally, it has been used as a wash on wounds[257]. An infusion of the bark and roots has been used as a foot soak for treating rheumatism[257]. The bark ooze has been used as a wash on infected sores and an infusion has been given in the treatment of infant rash[257]. An infusion of the bark, mixed with honey locust bark (*Gleditsia triacanthos*), has been used as a gargle to treat hoarseness and sore throat[257].

propta Seed - two months cold stratification improves germination[113]. Sow spring in a cold frame in light shade[78, 98]. Home grown seed is often of poor quality and low viability. It is best to harvest the seed in late winter or spring and then sow it immediately in a cold frame[80]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of mature wood of the current years growth, 20 - 30 cm with a heel, autumn in a cold frame[1]. Easy[200]. Layering of stools in spring or autumn. Takes 12 months[78].

nwatta Landscape Uses:Aggressive surface roots possible, Pollard, Seashore, Specimen, Street tree. Prefers a deep moist loam[1], though it tolerates very wet, poorly

coppiced annually for this purpose, they do not respond so well to pollarding. It should be cut back almost to ground level each year when being grown for basket making since this encourages the production of long flexible shoots[11]. In very good conditions plants can put on 4 metres or more of new growth in a year when treated in this way. A very important food source for the caterpillars of many butterfly species[30], it is also a valuable early pollen source for bees[11, 186]. The plants are rich in insect life[186]. Best planted into its permanent position as soon as possible[11]. The root system is rather aggressive and can cause problems with drains[200]. Plants are best not grown within 10 metres of buildings. Plants in this genus are notably susceptible to honey fungus[200]. Dioecious. Male and female plants must be grown if seed is required.

### 5.2.661 *Lonicera caprifolium*

Italian Honeysuckle, Italian woodbine

4 tlin 8 cyuc 1 kcaak 0 tcan 2 dwat 6 m hkuc  
pcimhmihhtut cyutli tcup hwicli hrasjltunyk hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Lonicera caprifolium* is a deciduous Climber growing to 6 m (19ft) by 6 m (19ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from August to September, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Lepidoptera (Moths and Butterflies). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: TeaThe fruit is eaten in small quantities[177]. It is probably cooked first[K]. An infusion of the heavily perfumed flowers is used as a tea substitute[7].

tcanta EssentialAn essential oil has been extracted from the flowers and used to make a very sweet perfume, but yields are extremely low[7].

dwatta Antispasmodic Bach Cathartic Diuretic Emetic Emollient Expectorant Laxative Pectoral Skin VulneraryThe fruit is emetic and cathartic[4]. The pressed juice makes a mild purgative[7, 61]. The leaves and flowers are antispasmodic, emollient and expectorant[7]. They are used as a cutaneous and mucous tonic and as a vulnerary[4]. Recent research has shown that the plant has an outstanding curative action in cases of colitis[7]. The seed is diuretic[4]. The plant is used in Bach flower remedies - the keywords for prescribing it are 'Dwelling upon thoughts of the past', 'Nostalgia' and 'Homesickness'[209].

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed requires 2 months cold stratification[113] and should be sown as soon as possible in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm with or without a heel, July/August in a frame. Good percentage[78]. Cuttings of mature wood of the current season's growth, 15 - 20cm with or without a heel, November in a cold frame. Good percentage[78]. Layering in autumn[200].

nwatta Prefers a good moist soil with its roots in the shade and its top growing into the light[200]. Succeeds even in quite deep shade[219]. Tolerates both acid and alkaline soils, only showing distress on very alkaline soils[202]. Plants are hardy to about -15°C[202]. Plants are moderately fast-growing[202]. They climb by twining around other plants[182]. The flowers are very fragrant, especially of a night time in order to attract pollinating moths, and are produced in abundance[202, 219, 245], but plants only produce fruit after a hot summer[202]. Plants are prone to attacks by mildew and blackfly[202].

### 5.2.662 *Lonicera henryi*

4 tlin 8 cyuc 1 kcaak 0 tcan 1 dwat 6 m hkuc  
hmimhtut cyutli tcup hwicli hrasjltunyk hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Lonicera henryi* is an evergreen Climber growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 4. It is in leaf all year, in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves StemEdible Uses: Edible flowers, leaves and stems[105, 177, 183]. No further details are given, but some caution is advised because this genus contains a number of mildly toxic plants[K].

tcanta MiscellanyA very vigorous climbing plant, it makes a good dense ground cover plant where it has the space to run along the ground, but it will swamp smaller plants[197].

dwatta MiscellanyThe plant is used medicinally in China, but the report gives no more details[218].

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed requires 2 months cold stratification[113] and should be sown as soon as possible in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm with or without a heel, July/August in a frame. Good percentage[78]. Cuttings of mature wood of the current season's growth, 15 - 20cm with or without a heel, November in a cold frame. Good percentage[78]. Layering in autumn[200].

nwatta Prefers a good moist soil with its roots in the shade and its top growing up into the light[200]. Plants are hardy to about -20°C[184]. A vigorous climber, supporting itself by twining around other plants[182, 219]. Any pruning is best carried out in the spring[219].

### 5.2.663 *Euonymus hamiltonianus sieboldianus*

4 tlin 8 cyuc 1 kcaak 0 tcan 0 dwat 6 m hkuc  
hmimhtut cyutli kyuctcup hwicli hrasjltunyk hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Euonymus hamiltonianus sieboldianus* is a deciduous Shrub growing to 6 m (19ft) by 6 m (19ft). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young leaves - they must be well boiled[105, 177].This report should be treated with some caution since many members of this genus are poisonous.

tcanta Latex WoodRoots and stem yield gutta-percha, a non elastic rubber used as an electrical insulator and in making plastics etc[61, 103]. Wood - heavy, hard, close-grained. Used for mosaic, printing blocks etc[46].

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame[113]. Stored seed requires 3 months cold stratification so should be sown as early in the year as possible in a cold frame[113]. The seed can take 18 months to germinate[74]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, taken at a node, July/August in a frame. Very easy[200]. Root cuttings in winter[113].

nwatta Thriving in almost any soil, including chalk, it is particularly suited to dry shaded areas[200]. Prefers a well-drained loamy soil[11]. This species is often called *E. yedoensis* in the garden[11].

the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of greenwood, 5 - 8cm with a heel, May/June in a frame. Roots in 28 days. A fair percentage[78]. Layering in early spring as the buds break. Takes 12 months. High percentage[78].

nwatta Prefers a sunny sheltered position and a deep moist sandy soil[1, 11]. Succeeds in most moist soils[184] and in most positions[11] so long as they are well-drained[202]. Requires a lime-free soil[200]. Dormant plants are hardy to about -25\*c[184]. A very ornamental plant[1, 11], it has a moderate rate of growth and lives about 100 years[229]. It can flower when only 1.2 metres tall[113]. The flowers have a delicate sweet perfume[245]. The sub-species *H. tetraptera monticola* forms a tree about 24 metres tall. Plants in this genus are notably resistant to honey fungus[200].

### 5.2.658 Celastrus flagellaris

4 tlin 8 cyuc 1 kcak 0 tcan 1 dwat 7.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Celastrus flagellaris is a deciduous Climber growing to 7.5 m (24ft 7in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower in June, and the seeds ripen in October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young leaves - cooked[105, 177].

tcanta None known

dwatta CancerMany plants in this genus contain compounds of interest for their antitumor activity[218].

propta Seed - gather when ripe, store in dry sand and sow February in a warm greenhouse[78]. Three months cold stratification leads to a higher germination rate[113]. Remove the aril since this inhibits germination[113]. Germination rates are usually good[78]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Layering in August of the current seasons growth. Takes 12 months[78]. Root cuttings, 6mm thick 25mm long in December. Plant horizontally in pots in a frame[78].

nwatta Prefers a deep loamy soil[11]. A gross feeder, it requires a rich soil[11]. A rampant climber, it requires ample space and is best grown into an old tree[1, 200]. Fruits best when its top growth is in a sunny position[182]. Plants climb by means of twining and by hooked prickles[182]. They do not normally require pruning[219]. Plants in this genus are notably resistant to honey fungus[200]. Dioecious, male and female plants must be grown if seed is required.

### 5.2.659 Rhamnus dahurica

Dahurian Buckthorn

4 tlin 8 cyuc 1 kcak 0 tcan 1 dwat 7 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Rhamnus dahurica is a deciduous Shrub growing to 7 m (23ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in June, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves OilEdible Uses: Oil TeaLeaves - cooked. They can be parboiled and eaten[183]. The leaves are a tea substitute[177, 183].

tcanta Dye Hedge Hedge Miscellany Oil WoodA green dye is obtained from the leaves and branches[46, 61, 151]. A

yellow dye can be obtained from the bark and the fruit[266]. A lubricating oil is obtained from the seeds[266]. Plants can be grown as an informal hedge, they are also amenable to trimming[200]. The hard wood can be used to make furniture[266].

dwatta MiscellanyThe fleshy fruit is used as medicine[266]. No more details are given.

propta Seed - best sown in the autumn in a cold frame. Stored seed will require 1 - 2 months cold stratification at about 5° and should be sown as early in the year as possible in a cold frame or outdoor seedbed[200]. Germination is usually good, at least 80% by late spring. Prick out the seedlings into individual pots when they are large enough to handle, and grow them on in the greenhouse or cold frame for their first winter. Plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, July/August in a frame[113]. Cuttings of mature wood of the current year's growth, autumn in a frame. Layering in early spring[4].

nwatta An easily grown plant, it succeeds in any reasonably good soil[11]. This species is very closely related to *R. cathartica*[11]. The species in this genus are notably resistant to honey fungus[200].

### 5.2.660 Salix viminalis

Osier. Basket Willow

4 tlin 8 cyuc 1 kcak 3 tcan 2 dwat 6 m hkuc htut cyutli tcuphja7n hwicli hrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Salix viminalis is a deciduous Tree growing to 6 m (19ft) by 4 m (13ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from April to May, and the seeds ripen in June. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Bees. The plant is not self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist or wet soil. The plant can tolerates strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: Inner bark LeavesEdible Uses: Inner bark - raw or cooked. It can be dried, ground into a powder and then added to cereal flour for use in making bread etc. A very bitter flavour, it is a famine food that is only used when all else fails[172]. Young shoots - cooked. Not very palatable[172].

tcanta Basketry Fodder Soil stabilization TanninThe stems are very flexible and are used in basket making[11, 23, 46]. The plant is usually coppiced annually when grown for basket making, though it is possible to coppice it every two years if thick poles are required as uprights. The annual yield can be around 12 tonnes per hectare, 40% of which is class 1[74]. The bark contains about 10% tannin[223]. Often planted along the banks of rivers and lakes to prevent soil erosion[11].

dwatta Anodyne Antirheumatic FebrifugeAntirheumatic, febrifuge[13]. The fresh bark of all members of this genus contains salicin[226], which probably decomposes into salicylic acid (closely related to aspirin) in the human body[213]. This is used as an anodyne and febrifuge[226].

propta Seed - must be surface sown as soon as it is ripe in late spring. It has a very short viability, perhaps as little as a few days. Cuttings of mature wood of the current year's growth, November to February in a sheltered outdoor bed or planted straight into their permanent position and given a good weed-suppressing mulch. Very easy. Plant into their permanent positions in the autumn. Cuttings of half-ripe wood, June to August in a frame. Very easy.

nwatta Fodder: Bank Industrial Crop: Biomass Industr. Crop: Tannin Management: Coppice Other Systems: SRC Regional CropSucceeds in most soils, including wet, ill-drained or intermittently flooded soils[1, 11], but prefers a damp, heavy soil in a sunny position[200]. Dislikes heavy shade and dry soils[186]. Rarely thrives on chalk[200]. Tolerates atmospheric pollution[186]. A fast growing tree, it is very wind resistant[K]. Widely cultivated for basket making, there are many named varieties[11, 17]. Trees are usually

drained soils[229]. Requires full sun[200]. Tolerates atmospheric pollution and compacted soils[200]. Established plants are drought tolerant[200]. Fairly wind-resistant[200]. A fast-growing and long-lived tree[200, 229], but it is of no value in Britain, being very susceptible to attack by parasitic fungi[11]. Fairly slow-growing according to another report, which also says that the tree is long-lived in the wild[227]. This species does not do well north of Central France, it requires long hot summers to fully ripen its wood[200]. Special Features:Attracts birds, North American native, Inconspicuous flowers or blooms.

#### 5.2.632 Ulmus villosa

Cherry Bark Elm

4 tlin 8 cyuc 1 kcak 0 tcan 0 dwat 25 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Ulmus villosa is a deciduous Tree growing to 25 m (82ft 0in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked.

tcanta WoodWood - hard, somewhat scented. Used for furniture[146].

dwatta None known

propta Seed - if sown in a cold frame as soon as it is ripe, it usually germinates within a few days[200]. Stored seed does not germinate so well and should be sown in early spring[200]. The seed can also be harvested 'green' (when it has fully developed but before it dries on the tree) and sown immediately in a cold frame. It should germinate very quickly and will produce a larger plant by the end of the growing season[80]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Plants should not be allowed to grow for more than two years in a nursery bed since they form a tap root and will then move badly. Layering of suckers or coppiced shoots[200].

nwatta Prefers a fertile soil in full sun[188], but is easily grown in any soil of at least moderate quality so long as it is well drained[1]. Susceptible to 'Dutch elm disease', a disease that has destroyed the greater part of all the elm trees growing in Britain. The disease is spread by means of beetles. There is no effective cure (1992) for the problem, but most E. Asian, though not Himalayan, species are resistant (though not immune) to the disease so the potential exists to use these resistant species to develop new resistant hybrids with the native species[200]. The various species of this genus hybridize freely with each other and pollen is easily saved, so even those species with different flowering times can be hybridized[200].

#### 5.2.633 Fraxinus americana

White Ash

4 tlin 9 cyuc 1 kcak 0 tcan 2 dwat 25 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwissip hpa7tmwatli nyanhjen hjonli

drutta Fraxinus americana is a deciduous Tree growing to 25 m (82ft) by 15 m (49ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 3 and is not frost tender. It is in flower from April to May, and the seeds ripen in September. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or

no shade. It prefers dry or moist soil. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: Edible Uses: DrinkA bitter tasting syrup is drawn from the tree[226]. The report gives no more details and does not directly say that the syrup was used as food. It was quite possibly only used medicinally[K].

tcanta Dye Repellent Shelterbelt WoodThe leaves are said to repel rattlesnakes and have been worn on the feet of people travelling in rattlesnake country[213]. There are some doubts over the efficacy of this[213]. A yellow dye is obtained from the bark[226]. Wood - strong, hard, heavy, tough, elastic, close grained, moderately durable[46, 82, 227]. It weighs 41lb per cubic foot, seasons well, takes a good polish and is shock resistant[227]. One of the most valuable of the North American timbers[82, 226], it is much used for tool handles, hockey sticks, baseball bats, the interior of buildings, musical instruments, furniture, woodenware etc[46, 82, 227, 274]. As a fuel it is comparable in quality to such excellent species as oak (*Quercus* spp) and hickory (*Carya* spp)[226].

dwatta Aphrodisiac Astringent Bitter Stings TonicThe bark is astringent, emmenagogue and a bitter tonic[46, 61, 254, 257]. An infusion is used to promote menstruation[257]. It has also been used as a wash to treat skin sores, itches and vermin on the scalp[213, 257]. The inner bark is diaphoretic, diuretic, emetic and strongly laxative[222]. It is used as a tea to remove bile from the intestines, as a tonic after child-birth and to relieve stomach cramps and fevers[222, 257]. It is chewed and applied as a poultice to sores[222]. The leaves are used to soothe the itching caused by mosquito bites and bee stings[229]. The seeds are thought to be aphrodisiac[222].

propta The seed is best harvested green - as soon as it is fully developed but before it has fully dried on the tree - and can then be sown immediately in a cold frame[80]. It usually germinates in the spring[80]. Stored seed requires a period of cold stratification and is best sown as soon as possible in a cold frame[200]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant them out into their permanent positions or a nursery bed in late spring or early summer of the following year. If you have sufficient seed then it is possible to sow it directly into an outdoor seedbed, preferably in the autumn. Grow the seedlings on in the seedbed for 2 years before transplanting either to their permanent positions or to nursery beds.

nwatta Landscape Uses:Firewood, Aggressive surface roots possible, Pollard, Street tree. Prefers a deep loamy soil, even if it is on the heavy side[1, 200]. Most members of this genus are gross feeders and require a rich soil[200]. Succeeds in exposed positions[200] and in alkaline soils[11]. Tolerates atmospheric pollution[200]. Young plants tolerate forest shade[226]. One of the most valuable hardwood timber trees in N. America[226], saplings grow slowly at first, but the growth rate speeds up over the next 50 years[229]. This species is planted on a small scale, mainly in E. Europe, as a timber tree[50]. It has the potential as a forestry tree in Britain, succeeding under conditions that are too dry or frosty for the native ash, *F. excelsior*[11]. A very ornamental tree[1], it is often confused in cultivation with *F. pennsylvanica*[50]. Dioecious. Male and female plants must be grown if seed is required. Male trees usually flower heavily each year, but female trees only flower heavily every 2 - 3 years[229]. Special Features: North American native, Attracts butterflies, Inconspicuous flowers or blooms.

### 5.2.634 Populus sieboldii

Japanese Aspen

4 tlin 8 cyuc 1 kcak 2 tcan 1 dwat 20 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Populus sieboldii is a deciduous Tree growing to 20 m (65ft 7in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil.

Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young leaves and young shoots - cooked[105, 177].

tcanta Rooting hormone WoodAn extract of the shoots can be used as a rooting hormone for all types of cuttings. It is extracted by soaking the chopped up shoots in cold water for a day[172]. Wood - soft, rather woolly in texture, without smell or taste, of low flammability, not durable, very resistant to abrasion[11].

dwatta Anodyne Antiinflammatory FebrifugeAlthough no specific mention has been seen for this species, the bark of most, if not all members of the genus contain salicin, a glycoside that probably decomposes into salicylic acid (aspirin) in the body[213, 238]. The bark is therefore anodyne, anti-inflammatory and febrifuge. It is used especially in treating rheumatism and fevers, and also to relieve the pain of menstrual cramps[238].

propta Seed - must be sown as soon as it is ripe in spring[113]. Poplar seed has an extremely short period of viability and needs to be sown within a few days of ripening[200]. Surface sow or just lightly cover the seed in trays in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the old frame. If sufficient growth is made, it might be possible to plant them out in late summer into their permanent positions, otherwise keep them in the cold frame until the following late spring and then plant them out. Most poplar species hybridize freely with each other, so the seed may not come true unless it is collected from the wild in areas with no other poplar species growing[11]. Cuttings of mature wood of the current season's growth, 20-40cm long, November/December in a sheltered outdoor bed or direct into their permanent positions. Very easy. Suckers in early spring[78].

nwatta An easily grown plant, it does well in a heavy cold damp soil[1]. Prefers a deep rich well-drained circum-neutral soil, growing best in the south and east of Britain[11, 200]. Growth is much less on wet soils, on poor acid soils and on thin dry soils[11]. It does not do well in exposed upland sites[11]. It dislikes shade and is intolerant of root or branch competition[200]. Poplars have very extensive and aggressive root systems that can invade and damage drainage systems. Especially when grown on clay soils, they should not be planted within 12 metres of buildings since the root system can damage the building's foundations by drying out the soil[11]. Dioecious. Male and female plants must be grown if seed is required. Hybridizes freely with other members of this genus[200].

## 5.2.635 *Tsuga canadensis*

Canadian Hemlock, Eastern hemlock

4 tlin 7 cyuc 1 ckaak 0 tcan 3 dwat 20 m hkuc pcmhmtut cyutli tcup hwicli hrasjlutnyik hpa7tli frusflat-prikliwis hpa7tmwatli hjonli

drutta *Tsuga canadensis* is an evergreen Tree growing to 20 m (65ft) by 8 m (26ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in leaf all year, in flower in May, and the seeds ripen from November to February. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Inner barkEdible Uses: Condiment TeaInner bark - raw or cooked[213]. Usually harvested in the spring[2], it can be dried, ground into a powder and then used as a thickening in soups etc or mixed with cereals when making bread[2, 46, 161]. An emergency food, it is only used when all else fails[183]. The leaves and twigs yield 'spruce oil', used commercially to flavour chewing gum, soft drinks, ice cream etc[183]. A herbal tea is made from the young shoot tips[2, 62, 95, 159, 183, 257]. These tips are also an ingredient of 'spruce beer'[183].

tcanta Basketry Dye Hedge Hedge Resin Rust Tannin WoodYields a resin similar to Abies balsamea, it is gathered by incisions in the trunk or by boiling the wood[46, 61, 64]. A pitch (called hemlock pitch), is obtained by distillation of

the young branches[46]. 'Oil of Hemlock' is distilled from the young branches according to another report[82]. The bark contains 8 - 14% tannin[46, 171, 223]. The inner bark is used according to one report[82]. The inner bark has been used in making baskets[257]. A red to brown dye is obtained from the bark[21, 46, 257]. A red dye is obtained from the inner bark according to another report[226]. A little rock dust has been added to act as a mordant when boiling the bark[257]. The boiled bark has been used to make a wash to clean rust off iron and steel, and to prevent further rusting[257]. Tolerant of light trimming, plants can be grown as a hedge[81]. This species does not make a good hedge in Britain[200]. Some cultivars can be grown as a ground cover when planted about 1 metre apart each way[208]. 'Pendula' is slow-growing but makes a very good cover[208]. Wood - coarse-grained, light, soft, not strong, brittle, not durable outdoors[21, 46, 61, 82, 171, 229]. Difficult to work because it splits easily[226]. The wood weighs 26lb per cubic foot[235]. The trees do not self-prune and so the wood contains numerous remarkably hard knots that can quickly dull the blade of an axe[226]. A coarse lumber, it is used occasionally for the outside of buildings[21, 46, 61, 82, 171, 229]. It should be used with caution as a fuel for outdoor fires because it can project embers and burning wood several metres from the fire[226].

dwatta Antidiarrhoeal Antipruritic Astringent Diaphoretic Diuretic Dysentery Eczema Skin StypticCanadian hemlock was commonly employed medicinally by several native North American Indian tribes who used it to treat a variety of complaints[257]. It is still sometimes used in modern herbalism where it is valued for its astringent and antiseptic properties. The bark is rich in tannin and is astringent and antiseptic[222, 254]. A decoction is used in the treatment of diarrhoea, colitis, diverticulitis and cystitis[254]. Externally, it is used as a poultice to cleanse and tighten bleeding wounds, as a douche to treat excessive vaginal discharge, thrush and a prolapsed uterus, and as a mouthwash and gargle for gingivitis and sore throats[222, 254]. The poultice has also been applied to the armpits to treat itchininess there[257]. The inner bark is diaphoretic and styptic[21, 213, 257]. An infusion is used in the treatment of colds and abdominal pains[21, 213, 257]. A decoction of the inner bark has been applied externally in the treatment of eczema and other skin conditions[257]. The pulverized inner bark has been applied to cuts and wounds to stop the bleeding[257]. A tea made from the leafy twig tips is used in the treatment of dysentery, kidney ailments, colds and rheumatism[21, 222, 257]. Externally, it is used in steam baths for treating colds, rheumatism and to induce sweating[222]. A decoction of the branches has been boiled down to a syrup or thick paste and used as a poultice on arthritic joints[257]. A poultice of the crushed branch tips has been used to treat infections on an infants navel[257]. Hemlock pitch has been used externally as a counter-irritant in the treatment of rheumatism[213].

propta Seed - it germinates better if given a short cold stratification[80, 113] and so is best sown in a cold frame in autumn to late winter. It can also be sown in early spring, though it might not germinate until after the next winter. If there is sufficient seed, an outdoor sowing can be made in spring[78]. Pot-grown seedlings are best potted up into individual pots once they are large enough to handle - grow them on in a cold frame and plant them out in early summer of the following year. Trees transplant well when they are up to 80cm tall, but they are best put in their final positions when they are about 30-45 cm or less tall, this is usually when they are about 5-8 years old[200]. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200].

nwatta Landscape Uses:Firewood, Hedge, Aggressive surface roots possible, Massing, Screen, Specimen, Woodland garden. An easily grown plant, it thrives best when growing in a deep well-drained soil in the western parts of Britain where it appreciates the higher rainfall[11]. However, it succeeds in most soils and positions, being especially good on acidic sandy soils[81] but also tolerating some lime[11] so long as there is plenty of humus in the soil[208]. Plants are very shade tolerant when young, but need more sunlight as they grow older[81, 200]. Plants are thin and poor when grown in dry or exposed places[200]. A slow-growing but long-lived species in the wild, with specimens nearly 1000 years old recorded[229]. It is occasionally planted as a

frame for their first winter and then plant them out into their permanent positions in late spring.

nwatta Succeeds in most reasonably good soils in an open sunny position[11]. Tolerates very acid or alkaline soils[11]. Tolerates light shade[188], though it fruits better in a sunny position[K]. Plants are susceptible to fire-blight[188]. The trees usually have apomictic flowers. They thus produce seed asexually, each seedling being a clone of the parent[11].

## 5.2.655 *Euonymus hamiltonianus*

Hamilton's spindletree

4 tlin 8 cyuc 1 ckaak 0 tcan 0 dwat 9 m hkuc hmimhtut cyutli kyuctup hwicli hrasjlutnyik hpa7tli flat-prikliwis hpa7tmwatli xre7t hjonli

drutta *Euonymus hamiltonianus* is a deciduous Shrub growing to 9 m (29ft 6in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young leaves - boiled[105, 177].This report should be treated with some caution since many members of this genus are poisonous.

tcanta Latex WoodRoots and stem yield gutta-percha, a non elastic rubber used as an electrical insulator and in making plastics etc[74]. Wood - heavy, hard, close-grained. Used for mosaic, printing blocks etc[46]. Th wood is used to make combs[272].

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame[113]. Stored seed requires 3 months cold stratification so should be sown as early in the year as possible in a cold frame[113]. The seed can take 18 months to germinate[74]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, taken at a node, July/August in a frame. Very easy[200]. Root cuttings in winter[113].

nwatta Thrives in almost any soil, including chalk, it is particularly suited to dry shaded areas[200]. Prefers a well-drained loamy soil. Plants are hardy to about -15°C[184]. A very ornamental plant[1], there are a number of named varieties selected for their good fruiting and autumn colour[184].

## 5.2.656 *Rhus succedanea*

Wax Tree

4 tlin 9 cyuc 1 ckaak 4 tcan 2 dwat 9 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

drutta *Rhus succedanea* is a deciduous Tree growing to 9 m (29ft) by 9 m (29ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in July, and the seeds ripen from September to November. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Fruit OilEdible Uses: Drink OilFruit[105]. The acid pulp is eaten[158, 272]. The edible fruit contains ellagic acid[218]. These reports need to be treated with some caution due to the general toxicity of the species[K].

tcanta Dye Lacquer Mordant Oil Varnish WaxThe leaves contain about 20% tannin[218]. They can be collected as they fall in the autumn and used as a brown dye or as a mordant[169]. The sap is tapped and used as a lacquer[57, 64, 146, 158, 171]. It is much used in Japanese art and needs to be kept in a cool humid place for it to dry properly. The

Japanese traditionally kept their paintings in a damp cave until the lacquer had dried. A yellow dye is obtained from the wood[178]. A wax obtained from the fruit is used to make candles, floor wax, varnish etc[1, 4, 11, 51, 64, 158, 171]. The fruit contains about 17% wax[174]. The fatty acid composition of the wax is 77% palmitic, 5% stearic and arachidic, 6% dibasic, 12% oleic and a trace of linoleic[218]. The seed oil contains 25% glycerides of palmitic, 47% oleic and 28% linoleic[218].

dwatta Antidote Antivinous Cancer Cholagogue Febrifuge OphthalmicAntidote, antivinous, cholagogue, febrifuge, ophthalmic. Used as a wash to counteract varnish poisoning[178]. Use with extreme caution, see notes above on toxicity. The fruit is used in the treatment of phthisis[240]. A wax from the fruits is used in ointments[218]. An ethanolic extract of the leaves exhibits anticancer and antiviral activities[218].

propta Seed - best sown in a cold frame as soon as it is ripe. Pre-soak the seed for 24 hours in hot water (starting at a temperature of 80 - 90c and allowing it to cool) prior to sowing in order to leach out any germination inhibitors[200]. The stored seed also needs hot water treatment and can be sown in early spring in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 10cm with a heel, July/August in a frame[200]. Root cuttings 4cm long taken in December and potted up vertically in a greenhouse. Good percentage[78, 200]. Suckers in late autumn to winter[200].

nwatta Industrial Crop: Oil Industrial Crop: Wax Management: Standard Regional CropSucceeds in a well-drained fertile soil in full sun[11, 200]. Plants are not very hardy in Britain, though they succeed outdoors in the mildest areas of the country[1, 11]. The young growth in spring can be damaged by late frosts. Plants have brittle branches and these can be broken off in strong winds[200]. Plants are also susceptible to coral spot fungus[11]. Plants in this genus are notably resistant to honey fungus[200]. This species is frequently cultivated in Japan for its sap and the wax obtained from its fruit[11]. Many of the species in this genus, including this one, are highly toxic and can also cause severe irritation to the skin of some people, whilst other species are not poisonous. It is relatively simple to distinguish which is which, the poisonous species have axillary panicles and smooth fruits whilst non-poisonous species have compound terminal panicles and fruits covered with acid crimson hairs[1, 4]. The toxic species are sometimes separated into their own genus, Toxicodendron, by some botanists[200]. Dioecious. Male and female plants must be grown if seed is required.

## 5.2.657 *Halesia carolina*

Silver-Bell Tree, Carolina silverbell, Mountain silverbell

4 tlin 8 cyuc 1 ckaak 0 tcan 0 dwat 8 m hkuc htut cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta *Halesia carolina* is a deciduous Tree growing to 8 m (26ft) by 10 m (32ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in May, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: The ripe fruit is chewed for its acidity[183]. Unripe fruits are sometimes pickled[2, 183].The fruit is about 4cm in diameter[200].

tcanta WoodWood - soft, light, close-grained[82]. It weighs 35lb per cubic foot[235]. Trees occasionally grow large enough for saw timber and are then cut and used for panelling and cabinet making[229].

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame[78, 113, 200]. It takes 18 months to germinate[113]. Warm stratifying the seed for 2 - 3 months at 14 - 25°C then cold stratifying for 2 - 3 months at 0 - 5°C can reduce the germination time. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in

some alkalinity so long as there is at least 50cm of good soil above the alkaline layer[202]. The branches are brittle so a sheltered position is required[200]. Plants are very tolerant of atmospheric pollution[200]. Mature dormant plants are hardy to about -20°c but the flowers are easily damaged by frost or wind.[184]. A warmth-loving species, it is best grown in the south and east of Britain[11]. The fleshy roots are easily damaged and any transplanting is best done during a spell of mild moist weather in late spring[182]. A slow growing tree but it flowers whilst young[182]. The flowers have a delicious scent of lemons[182]. A number of cultivars have been developed for their ornamental value. The plant is heat tolerant in zones 9 through 6. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2]. An evergreen. The root pattern is a heart root, dividing from the crown into several primary roots going down and out [1-2].

### 5.2.653 Salix caprea

Goat Willow, Kilmarnock Willow, Pink Pussy Willow, Pussy Willow

4 tlin 9 cyuc 1 kcaak 4 tcan 2 dwat 10 m hkuc hmimhtut cyutli kyuctcuphja7n hwicli hrasjlutnyikfrjp hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Salix caprea is a deciduous Tree growing to 10 m (32ft) by 8 m (26ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from March to April, and the seeds ripen in May. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry moist or wet soil. The plant can tolerate maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: Inner bark Leaves MannaEdible Uses: Inner bark - raw or cooked. It can be dried, ground into a powder and then added to cereal flour for use in making bread etc. A very bitter flavour, it is a famine food that is only used when all else fails[172]. Young shoots - raw or cooked. They are not very palatable[172]. The source of an edible manna[183]. No further details.

tcanta Basketry Charcoal Hedge Hedge Leather Pioneer Shelterbelt Tannin WoodLandscape Uses: Border, Massing, Pollard, Standard, Specimen. The stems are very flexible and are used in basket making[61]. The plant is usually coppiced annually when grown for basket making, though it is possible to coppice it every two years if thick poles are required as uprights. The bark is tough and flexible, it is used as a substitute for leather[115]. The bark contains around 10% tannin[223]. The plant is fast growing and tolerant of maritime exposure, it can be used as a windbreak hedge and shelterbelt though it is of untidy habit[75]. The seeds are very light and so can travel some distance in the wind. The plant is therefore able to find its way to areas such as cleared woodland where the soil has been disturbed. Seedlings will grow away quickly, even in exposed conditions and the plant will provide good shelter for the establishment of woodland plants. Thus it makes a good pioneer species and, except in wetter and moorland-type soils, will eventually be largely out-competed by the other woodland trees. Its main disadvantage as a pioneer plant is that it has an extensive root system and is quite a greedy plant, thus it will not help as much in enriching the soil for the other woodland plants as other pioneer species such as the alders, Alnus species[K].

Some cultivars can be grown as ground cover[208]. 'Pendula' is female whilst 'Kilmarnock' is a male, they should be spaced about 1.5 metres apart each way[208]. Wood - soft, elastic, easily split. Used for baskets, rugs etc[46, 61]. A good quality charcoal is made from the wood[46, 61]. Dynamic accumulator.

dwatta Anodyne Aphrodisiac Astringent Fibrifuge Ophthalmic StimulantThe fresh bark of all members of this genus contains salicin[226], which probably decomposes into salicylic acid (closely related to aspirin) in the human body[213]. This is used as an anodyne and fibrifuge[226]. A decoction of the leaves is used in the treatment of fevers[240]. A distilled water from the flowers is aphrodisiac, cordial and stimulant[240]. It is used externally in the treatment of headaches and ophthalmia[240]. The ashes of the wood are useful in the treatment of haemoptysis[240]. The stems and the leaves are astringent[240]. A gum and the juice of the trees are used to increase visual powers[240].

propta Seed - must be surface sown as soon as it is ripe in late spring. It has a very short viability, perhaps as little as a few days. Cuttings of mature wood of the current year's growth, November to February in a sheltered outdoor bed or planted straight into their permanent position and given a good weed-suppressing mulch. Cuttings of this species do not root well[200]. Plant into their permanent positions in the autumn. Cuttings of half-ripe wood, June to August in a frame. Cuttings of this species do not root well[200].

nwatta Succeeds in most soils, including wet, ill-drained or intermittently flooded soils[1], but prefers a damp, heavy soil in a sunny position. Grows in drier soils than any other British species of Salix[186]. Rarely thrives on chalk[200]. Plants are found most frequently on basic soils in the wild[17]. Tolerates atmospheric pollution and exposed positions, including maritime exposure[75, 186]. A fast growing tree, it establishes well[75]. The tree has an untidy habit[75]. A light demanding tree, it becomes tall and drawn when grown in woodland, though it grows well along the sunnier edges[186]. Hybridizes freely with other members of this genus[200]. Although the flowers are produced in catkins early in the year, they are pollinated by bees and other insects rather than by the wind[11]. Trees are very tolerant of cutting, they coppice well[186]. Plants in this genus are notably susceptible to honey fungus[200]. Dioecious. Male and female plants must be grown if seed is required. Special Features: Not North American native, Wetlands plant, Attractive flowers or blooms.

### 5.2.654 Sorbus hybrida

Swedish Service Tree, Oakleaf mountain ash
4 tlin 8 cyuc 1 kcaak 0 tcan 0 dwat 9 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli frusflatprikli-wisslip hpa7tmwatli fyfjxre7t hjonli

drutta Sorbus hybrida is a deciduous Tree growing to 9 m (29ft 6in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in May, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects, Apomictic (reproduce by seeds formed without sexual fusion). The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[3]. The fruit is up to 10 - 12mm across[200] and is produced in fairly large bunches, making harvesting easier[K].

tcanta None known
dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame[78, 80]. If you have sufficient seed it can be sown in an outdoor seedbed[78, 80]. Stored seed germinates better if given 2 weeks warm then 14 - 16 weeks cold stratification[98], so sow it as early in the year as possible. Prick out the seedlings into individual pots when they are large enough to handle. Seedlings are very slow to put on top-growth for their first year or two[11], but they are busy building up a good root system. It is best to keep them in pots in a cold

timber tree in Germany[50]. It is very slow growing in cultivation for the first few years, it then grows more rapidly with annual shoots up to 60cm long. This rate of growth soon slows as the tree loses apical dominance and it becomes slow growing again[185]. Seed production commences around the age of 20 - 40 years, with good crops produced every 3 - 4 years[229]. The crushed foliage has a sweet lemony scent[185]. Another report says that it emits the unpleasant smell of hemlock[245]. Many named forms have been selected for their ornamental value[185]. Almost all of them are dwarf forms[200]. Plants in this genus are notably resistant to honey fungus[200]. Special Features:Attracts birds, North American native, Inconspicuous flowers or blooms.

#### 5.2.636 Parthenocissus tricuspidata

Boston Ivy, Japanese Ivy, Japanese Creeper
4 tlin 8 cyuc 1 kcaak 0 tcan 0 dwat 18 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Parthenocissus tricuspidata is a deciduous Climber growing to 18 m (59ft 1in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from July to August, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: SapEdible Uses: Sweetener Sap - sweet[177]. The sap flows quite freely when it is harvested in the spring, as the plant comes into new growth, and can be used as a sugar substitute[105].

tcanta This species can be grown as a ground cover plant in a sunny position[188]. Plants should be spaced about 2.5 metres apart each way[208]. They are very vigorous, however, and would soon swamp smaller plants[K].

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame[200]. Stored seed requires stratifying for 6 weeks at 5°c and should be sown as early in the year as possible[200]. Germination is variable. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm taken at a node (ensure that it has at least 2 true buds), July/August in a frame[78]. Easy to root but they do not always survive the first winter[182]. Basal hardwood cuttings of current seasons growth, 10 - 12 cm long, autumn in a frame[200]. Layering[200].

nwatta Landscape Uses:Arbor, Woodland garden. Requires a well-drained moisture retentive fertile soil[200]. Succeeds in any fertile soil in sun or part shade[202]. Dormant plants are hardy to about -15°c[200], though the young growth in spring can be damaged by late frosts. A very ornamental plant[1], there are several named varieties[182]. The flowers are only produced on mature stems[202] and plants usually only fruit after a long hot summer[219]. A rampant climbing plant, clinging by means of round pad-like suckers on the tendrils[11]. It can become a bit of a nuisance by growing into gutters[182]. Plants are very tolerant of trimming and can be cut right back to within 1 metre of the base if required to rejuvenate the plant[202]. Any pruning is best carried out in the spring[219]. Dislikes transplanting[11], plants often put on very little growth in the year after planting out, though they are then fast growing[202]. Plants often hybridize and so do not always come true from seed[200]. Special Features: Not North American native, Invasive, Inconspicuous flowers or blooms.

#### 5.2.637 Tsuga caroliniana

Carolina Hemlock

4 tlin 7 cyuc 1 kcaak 0 tcan 2 dwat 15 m hkuc pcmhmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli frusflatpriklwis hpa7tmwatli hjonli

drutta Tsuga caroliniana is an evergreen Tree growing to 15 m (49ft) by 8 m (26ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower in April, and the seeds ripen from October to November. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil. It can tolerate atmospheric pollution.

kcakta Edible Parts: Inner barkEdible Uses: TealInner bark - raw or dried, ground into a powder and then used as a thickening in soups etc or mixed with cereals when making bread[2, 46, 161]. The leaves and twigs yield 'spruce oil', which is used commercially to flavour chewing gum, soft drinks, ice cream etc[183]. A herbal tea is made from the young shoot tips[2, 62, 95, 159, 183]. These tips are also an ingredient of 'spruce beer'[183].

tcanta Dye Hedge Hedge Resin Rust Tannin WoodThe inner bark has been used to make baskets[257]. A rosy-tan dye can be obtained from the bark[257]. The bark is a source of tannin[257]. All the uses listed below are based on the uses of T. canadensis and reports in [46, 61, 82] that this species has similar uses. Yields a resin similar to Abies balsamea, it is gathered by incisions in the trunk or by boiling the wood[46, 61, 64]. A pitch (called hemlock pitch), is obtained by distillation of the young branches[46]. 'Oil of Hemlock' is distilled from the young branches according to another report[82]. The boiled bark has been used to make a wash to clean rust off iron and steel, and to prevent further rusting[257]. Tolerant of light trimming, plants can be grown as a hedge[81]. This species does not make a good hedge in Britain[200]. Some cultivars can be grown as a ground cover when planted about 1 metre apart each way[208]. 'Pendula' is slow-growing but makes a very good cover[208]. Wood - coarse-grained, light, soft, not strong, brittle, not durable outdoors[21, 46, 61, 82, 171, 229]. Difficult to work because it splits easily[226]. The wood weighs 26lb per cubic foot[235]. The trees do not self-prune and so the wood contains numerous remarkably hard knots that can quickly dull the blade of an axe[226]. A coarse lumber, it is used occasionally for the outside of buildings[21, 46, 61, 82, 171, 229]. It should be used with caution as a fuel for outdoor fires because it can project embers and burning wood several metres from the fire[226].

dwatta Antipiruritic Astringent Birthing aid Diaphoretic Diuretic KidneyThe bark is astringent, diaphoretic and diuretic[21]. A tea made from the inner bark or twigs is helpful in the treatment of kidney or bladder problems, and also makes a good enema for treating diarrhoea[21]. It can also be used as a gargle or mouthwash for mouth and throat problems or externally to wash sores and ulcers[21]. A poultice of the bark has been used to treat itchy armpits[257]. The powdered bark can be put into shoes for tender or sweaty feet or for foot odour[21]. An infusion of the stem tips has been used to treat kidney problems[257]. A decoction of the roots has been used as a birthing aid to help expel the afterbirth[257]. The roots have been chewed in order to treat diarrhoea[257].

propta Seed - it germinates better if given a short cold stratification[80, 113] and so is best sown in a cold frame in autumn to late winter. It can also be sown in early spring, though it might not germinate until after the next winter. If there is sufficient seed, an outdoor sowing can be made in spring[78]. Pot-grown seedlings are best potted up into individual pots once they are large enough to handle - grow them on in a cold frame and plant them out in early summer of the following year. Trees transplant well when they are up to 80cm tall, but they are best put in their final positions when they are about 30 - 45 cm or less tall, this is usually when they are about 5 - 8 years old[200]. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200].

nwatta Landscape Uses:Hedge, Aggressive surface roots possible, Screen, Specimen. An easily grown plant, it thrives best when growing in a deep well-drained soil in the western parts of Britain where it appreciates the higher rainfall[11]. However, it succeeds in most soils and positions, being especially good on acidic sandy soils[81] but also tolerating some lime[11] so long as there is plenty of humus

in the soil[208]. Plants are very shade tolerant when young, but need more sunlight as they grow older[81, 200]. Plants are thin and poor when grown in dry or exposed places[200]. This species is more tolerant of atmospheric pollution than *T. canadensis*[11]. A slow growing tree in Britain, it requires hot humid summers[200]. It is probably less slow in the far west and in Ireland[185]. Trees have not done well in this country even though they are very cold-tolerant[11]. Plants in this genus are notably resistant to honey fungus[200]. Special Features:Attracts birds, North American native, Inconspicuous flowers or blooms.

### 5.2.638 Maclura pomifera

Osage Orange, Bois D’Arc
4 tlin 9 cyuc 1 kcaak 0 tcan 2 dwat 15 m hkuc
htut cyutli kyucutcup hwicli hyishrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

drutta Maclura pomifera is a deciduous Tree growing to 15 m (49ft) by 12 m (39ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from May to June, and the seeds ripen from September to December. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). . The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcaakta One report suggests that the fruit is edible[74] but this is surely a mistake - although very large, the fruit is harsh, hard, dry and astringent. The fruit does, however, contain an anti-oxidant which can be used as a food preservative, especially for oils[61]. The heartwood and the root yield a non-toxic antibiotic that is useful as a food preservative[240].

tcanta Dye Fodder Fuel Hedge Yellow Preservative Repellent Shelterbelt Tannin WoodA hedge dye is obtained from the bark of the root and the wood[46, 57, 95, 149, 169, 257]. Green and orange can also be obtained from it[168]. The sap of the fruit is used as an insect repellent[95]. It is said to be effective against cockroaches[222]. The bark is a source of tannin[82, 149]. The plant is often grown as a hedge in N. America and Europe[1, 20, 50], it is very tolerant of severe pruning[200], makes an effective stock-proof barrier[200] and succeeds in maritime exposure[K]. A hedge in a very exposed position at Rosewarne in N. Cornwall has grown well (1989), though it is very bare in winter[K]. This species is also used in shelterbelt plantings[200]. Wood - coarse-grained, exceedingly hard, heavy, flexible, very strong, very durable, silky, lustrous. It weighs 48lb per cubic foot. One of the most durable woods in N. America, it is seldom used commercially, but is used locally for fence posts,piers, bows etc and makes an excellent fuel[46, 82, 95, 171, 200, 227, 229, 274].

dwatta Cardiac OphthalmicA tea made from the roots has been used as a wash for sore eyes[222, 257]. The inedible fruits contain antioxidant and fungicidal compounds[222]. A 10% aqueous infusion and an extract diluted 1:1 have cardiovascular potentialities[240].

propta Seed - best sown as soon as it is ripe in pots in a cold frame. Pre-soak stored seed for 48 hours in warm water and stratify for 2 months at 4°c then sow in a cold frame[113, 200]. Germination is normally good. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. The seed stores for 3 years[113]. If growing larger quantities of plants, it is probably best to sow the seed in an open seed bed[200]. Grow the plants on for a couple of years in the seed bed before planting them out into their permanent positions. Cuttings of half-ripe wood, July/August in a frame[200]. Cuttings of mature wood, November to January in a frame[113]. Layering in summer[200]. Root cuttings 4cm long in December. Plant horizontally in pots in a greenhouse and plant out as soon as possible. Good percentage[78].

nwatta Agroforestry Services: Living fence Fodder: Insect Industrial Crop: Biomass Industrial Crop:

Dye Industrial Crop: Starch Management: Cop-pice Management: Standard Regional Crop Staple Crop: Protein-oilLandscape Uses:Firewood, Pest tolerant, Aggressive surface roots possible. Prefers a well-drained soil in full sun[200]. Succeeds in poor soils and also in dry ones[20]. Plants are fairly tolerant of maritime exposure[K]. They dislike waterlogged soils[188]. Dormant mature plants are hardy to about -20°c though the young growth in spring can be cut back by late frosts[200] and young plants can be damaged in cold winters[188]. Plants require hot summers to fully ripen their wood if they are to thrive in areas with cold winters[188]. Plants are tolerant of severe pruning[200]. This species is notably resistant to honey fungus[200]. Dioecious. Male and female plants must be grown if seed is required. Special Features:North American native, All or parts of this plant are poisonous, Inconspicuous flowers or blooms.

### 5.2.639 Sorbus alnifolia

Korean Mountain Ash
4 tlin 7 cyuc 1 kcaak 0 tcan 0 dwat 15 m hkuc
hmmihtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Sorbus alnifolia is a deciduous Tree growing to 15 m (49ft) by 8 m (26ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in May, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure.

kcaakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[74, 105]. The fruit is about the size of a pea, up to 14mm long[266], and is produced in fairly large bunches making it easy to harvest[200]. The flavour is reasonably mild and somewhat mealy[K].

tcanta WoodWood - even grained. Used for rulers[74].
dwatta None known
propta Seed - best sown as soon as it is ripe in a cold frame[78, 80]. If you have sufficient seed it can be sown in an outdoor seedbed[78, 80]. Stored seed germinates better if given 2 weeks warm then 14 - 16 weeks cold stratification[98], so sow it as early in the year as possible. Prick out the seedlings into individual pots when they are large enough to handle. Seedlings are very slow to put on top-growth for their first year or two[11], but they are busy building up a good root system. It is best to keep them in pots in a cold frame for their first winter and then plant them out into their permanent positions in late spring.

nwatta Landscape Uses:Specimen. Succeeds in most reasonably good soils in an open sunny position[11]. Dislikes dry soils[188]. Tolerates light shade[188], though it fruits better in a sunny position[K]. Plants are susceptible to fire-light[188]. Special Features:Not North American native, Attractive flowers or blooms.

### 5.2.640 Clematis vitalba

Traveller’s Joy, Evergreen clematis
4 tlin 8 cyuc 1 kcaak 1 tcan 2 dwat 15 m hkuc
hmmihtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwisslip hpa7tmwatli xre7t hjonli

drutta Clematis vitalba is a deciduous Climber growing to 15 m (49ft) by 15 m (49ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from July to September, and the seeds ripen from October to January. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: LeavesEdible Uses: Young shoots - cooked and used like hop shoots (Humulus lupulus)[7, 46, 61]. Caution is advised due to reports of toxicity[7].

kcaakta Edible Parts: Flowers Inner bark Leaves RootEdible Uses: Inner bark - raw or cooked[172, 183]. It can be dried, ground into a powder and then added to cereal flour for use in making bread etc. A very bitter flavour, it is a famine food that is only used when all else fails[172]. Young shoots - raw or cooked. They are not very palatable[172]. Rich in vitamin C[183]. Young catkin-bearing shoots - raw or cooked[183]. The growing tips of underground rhizomes are peeled and eaten[183].

tcanta Basketry Shelterbelt Soil stabilization WoodThe stems are very flexible and are used in basket making[1, 61, 74, 131, 158] or for making wattle and daub walls[158]. The plant is usually coppiced annually when grown for basket making, though it is possible to coppice it every two years if thick poles are required as uprights. Trees are fast growing and tolerate maritime exposure so can be grown as a shelterbelt[166]. Plants have extensive root systems and are often used to stabilize sand dunes[11, 200]. Wood - soft, even grained, smooth. Used for construction, pales, tubs etc[146, 158]. Dynamic accumulator.

dwatta Anodyne Febrifuge Vitamin CThe fresh bark of all members of this genus contains salicin[226], which probably decomposes into salicylic acid (closely related to aspirin) in the human body[213]. This is used as an anodyne and febrifuge[226].

propta Seed - must be surface sown as soon as it is ripe in late spring. It has a very short viability, perhaps as little as a few days. Cuttings of mature wood of the current year’s growth, November to February in a sheltered outdoor bed or planted straight into their permanent position and given a good weed-suppressing mulch. Very easy. Plant into their permanent positions in the autumn. Cuttings of half-ripe wood, June to August in a frame. Very easy.

nwatta Succeeds in most soils, including wet, ill-drained or intermittently flooded soils[1], but prefers a deep damp, heavy soil in a sunny position[11, 200]. Rarely thrives on chalk[200]. Succeeds in poor strong soils[131]. Succeeds in maritime exposure[166]. The root system is rather aggressive and can cause problems with drains[200]. It is best not to plant this species within 10 metres of buildings. Hybridizes freely with other members of this genus. Although the flowers are produced in catkins early in the year, they are pollinated by bees and other insects rather than by the wind[11]. A very ornamental and fast growing plant[1, 74]. There are some named varieties. Plants in this genus are notably susceptible to honey fungus[200]. Dioecious. Male and female plants must be grown if seed is required.

### 5.2.651 Salix acutifolia

Sharp-Leaf Willow
4 tlin 8 cyuc 1 kcaak 3 tcan 2 dwat 10 m hkuc
htut cyutli tcuphja7n hwicli hrasjlutnyikfrip hpa7tli flatprik hpa7tmwatli nyanhjen hjonli

drutta Salix acutifolia is a deciduous Shrub growing to 10 m (32ft 10in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers moist or wet soil. The plant can tolerate maritime exposure.

kcaakta Edible Parts: Inner bark LeavesEdible Uses: Inner bark - raw or cooked. It can be dried, ground into a powder and added to cereal flours for use in making bread etc. A famine food, it is only used when all else fails[172]. Young shoots - cooked. They are not very palatable[172].

tcanta Basketry Shelterbelt Soil stabilizationStems are very flexible and are used in basket making[46, 61]. The plant is usually coppiced annually when grown for basket making, though it is possible to coppice it every two years if thick poles are required as uprights. Trees can be planted in shelter-belts for protection against the wind[166]. The extensive root system of this plant is good for binding sandy soils[11]. Dynamic accumulator.

dwatta Anodyne FebrifugeThe fresh bark of all members of this genus contains salicin[226], which probably decomposes into salicylic acid (closely related to aspirin) in

the human body[213]. This is used as an anodyne and febrifuge[226].

propta Seed - must be surface sown as soon as it is ripe in late spring. It has a very short viability, perhaps as little as a few days. Cuttings of mature wood of the current year’s growth, November to February in a sheltered outdoor bed or planted straight into their permanent position and given a good weed-suppressing mulch. Very easy. Plant into their permanent positions in the autumn. Cuttings of half-ripe wood, June to August in a frame. Very easy.

nwatta Succeeds in most soils, including wet, ill-drained or intermittently flooded soils[1, 11], but prefers a damp, heavy soil in a sunny position[200]. Rarely thrives on chalk[200]. Very wind-resistant, tolerating maritime exposure[166]. Hybridizes freely with other members of this genus[200]. Although the flowers are produced in catkins early in the year, they are pollinated by bees and other insects rather than by the wind[11]. Closely related to *S. daphnoides*[200] and considered to be a part of that species by some authorities[11, 17]. Some named forms have been developed for their ornamental value[182]. There are also named forms cultivated for basket making[46, 61]. Plants in this genus are notably susceptible to honey fungus[200]. Dioecious. Male and female plants must be grown if seed is required.

### 5.2.652 Magnolia virginiana

Laurel Magnolia, Sweetbay
4 tlin 8 cyuc 1 kcaak 2 tcan 3 dwat 10 m hkuc
hmmihtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Magnolia virginiana is a deciduous Tree growing to 10 m (32ft) by 6 m (19ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Beetles. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. It can tolerate atmospheric pollution.

kcaakta Edible Parts: Edible Uses: Condiment TeaThe leaves are used as a condiment in gravies etc[183]. A tea is made from the leaves[183].

tcanta WoodAn essential oil from the flowers has been used in the manufacture of perfumes[227]. Wood - straight-grained, light, soft, easily worked, finishes well, aromatic and yellow in colour[4, 46, 61, 229]. It weighs 31lb per cubic foot[227]. Used for furniture, broom handles, bowls and light woodenware articles etc[46, 61, 227, 229].

dwatta Aromatic Astringent Bitter Diaphoretic Febrifuge Hallucinogenic Malaria StimulantA tea made from the bark is antiperiodic, aromatic, diaphoretic, laxative, stimulant and tonic[4, 222]. It has historically been used as a substitute for quinine in the treatment of malaria[222, 238] and is also taken internally in the treatment of colds, bronchial diseases, upper respiratory tract infections, rheumatism and gout[238, 257]. The bark has been chewed by people trying to break the tobacco habit[222]. The bark is harvested in the autumn and dried for later use[238]. It does not store well so stocks should be renewed annually[238]. A tea made from the fruit is a tonic, used in the treatment of general debility and was formerly esteemed in the treatment of stomach ailments[222]. The leaves or bark have been placed in cupped hands over the nose and inhaled as a mild hallucinogen[257].

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed must be kept cold over the winter and should be sown in late winter in a cold frame[200]. The seed usually germinates in the spring but it can take 18 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in a cold frame or greenhouse for at least their first winter. They can be planted out into their permanent positions when they are more than 15cm tall, though should be well mulched and given some protection from winter cold for their first winter or two outdoors. Layering in early spring[200].

nwatta Requires a sunny sheltered position in a deep soil that does not dry out in the summer[11]. Plants are also tolerant of wet soils[238]. Succeeds in acid or neutral soils in sun or part shade[184]. Dislikes limey soils[11]. Tolerates

can be grown outdoors in Britain[11]. Dioecious. Male and female plants must be grown if seed is required.

### 5.2.647 Idesia polycarpa

Idesia

4 tlin 8 cyuc 1 kcak 0 tcan 0 dwat 12 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikkwis hpa7tmwatli nyanhjen hjonli

drutta Idesia polycarpa is a deciduous Tree growing to 12 m (39ft) by 10 m (32ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to July. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105, 177]. The fruit is a many seeded berry with a pulpy flesh[2], it is about 10mm in diameter[200].

tcanta None known

dwatta None known

propta Seed - sow spring in a greenhouse[78]. Germination is usually very good[78]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse or cold frame for their first two winters. Plant them out into their permanent positions in late spring, after the last expected frosts and consider giving them some protection from the cold for their first winter or two outdoors[K]. Plants cannot be sexed until they flower[78]. Cuttings of half-ripe wood with a heel, July/August in a frame. Fair percentage[78]. Layering in spring. Takes 12 months[78].

nwatta Prefers a neutral to slightly acid loamy soil, but tolerates a chalky sub-soil if the top soil is deep[200]. Succeeds in full sun or semi-shade[188]. The dormant plant is hardy to about -15°C, though the tree is somewhat hardier if the wood is thoroughly ripened by a long hot summer[200]. The young shoots in spring can be damaged by late frosts. A very ornamental plant[1]. The flowers have a most delicious perfume, which can be wafted far and wide by warm breezes[245]. Trees produce fruit regularly at Kew[11]. Dioecious. Male and female plants must be grown if fruit and seed is required. Female plants can produce some fruit in the absence of a male plant[11].

### 5.2.648 Sorbus pohuashanensis

4 tlin 8 cyuc 1 kcak 0 tcan 0 dwat 10 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikkwis hpa7tmwatli fyfxre7t hjonli

drutta Sorbus pohuashanensis is a deciduous Tree growing to 10 m (32ft) by 8 m (26ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in May, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. A rather bitter flavour[K]. The fruit is up to 6 - 8mm in diameter[200] and is borne in fairly large bunches which makes harvesting easier[K].

tcanta None known

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame[78, 80]. If you have sufficient seed it can be sown in an outdoor seedbed[78, 80]. Stored seed germinates better if given 2 weeks warm then 14 - 16 weeks cold stratification[98], so sow it as early in the year as possible. Prick out the seedlings into individual pots when they are large enough to handle. Seedlings are very slow to put on top-growth for their first year or two[11], but they are busy building up a

good root system. It is best to keep them in pots in a cold frame for their first winter and then plant them out into their permanent positions in late spring.

nwatta Succeeds in most reasonably good soils in an open sunny position[11]. Dislikes dry soils[188]. Tolerates light shade[188], though it fruits better in a sunny position[K]. A fast-growing tree, especially in its first few years from seed[K]. Plants are susceptible to firelight[188].

### 5.2.649 Ilex pedunculosa

4 tlin 8 cyuc 1 kcak 0 tcan 1 dwat 10 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikkwis hpa7tmwatli nyanhjen hjonli

drutta Ilex pedunculosa is an evergreen Shrub growing to 10 m (32ft) by 6 m (19ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf all year, in flower in June, and the seeds ripen from October to November. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). . Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young leaves - cooked[177, 178]. Some caution is advised, see the notes above on toxicity.

tcanta Dye WoodA dark red dye is obtained from the leaves[178]. Wood - white, beautifully veined[178].

dwatta Carminative Skin TonicCarminative, skin, tonic[178].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. It can take 18 months to germinate. Stored seed generally requires two winters and a summer before it will germinate and should be sown as soon as possible in a cold frame. Scarification, followed by a warm stratification and then a cold stratification may speed up the germination time[78, 80]. The seedlings are rather slow-growing. Pot them up into individual pots when they are large enough to handle and grow them on in light shade in a cold frame for their first year. It is possible to plant them out into a nursery bed in late spring of the following year, but they should not be left here for more than two years since they do not like being transplanted. Alternatively, grow them on in their pots for a second season and then plant them out into their permanent positions in late spring or early summer. Give them a good mulch and some protection for their first winter outdoors. Cuttings of almost ripe wood with a heel, August in a shaded position in a cold frame. Leave for 12 months before potting up. Layering in October. Takes 2 years.

nwatta Succeeds in most soils so long as they are not water-logged. Plants are hardy to about -10°C[184]. Resents root disturbance, especially as the plants get older[11]. It is best to place the plants into their permanent positions as soon as possible, perhaps giving some winter protection for their first year or two[K]. Plants are very tolerant of pruning and can be cut right back into old wood if required[188]. Dioecious. Male and female plants must be grown if seed is required.

### 5.2.650 Salix daphnoides

Violet Willow, Daphne willow

4 tlin 8 cyuc 1 kcak 3 tcan 2 dwat 10 m hkuc htut cyutli tcuphja7n hwicli hrasjlutnyikfrip hpa7tli flatprik hpa7tmwatli nyanhjen hjonli

drutta Salix daphnoides is a deciduous Tree growing to 10 m (32ft) by 8 m (26ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from February to March, and the seeds ripen from May to June. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers moist or wet soil. The plant can tolerate maritime exposure.

tcanta BasketryThe stems are used in basketry[100, 115].

dwatta Analgesic Bach Diuretic Homeopathy Rubefacient SkinThe leaves are analgesic, diuretic and rubefacient[7, 61]. The boiled roots and stems are used as a cure for the itch[4]. When applied in the nostrils, the plant juice has been used to relieve migraine attacks, but it can also destroy the mucous membranes[7]. The plant should not be taken internally because it is poisonous[7]. A homeopathic remedy is made from the plant. It is used in the treatment of rheumatism and skin eruptions[238]. The plant is used in Bach flower remedies - the keywords for prescribing it are 'Indifference', 'Dreaminess', 'Inattention' and 'Unconsciousness'[209]. It is also one of the five ingredients in the 'Rescue remedy'[209].

propta Seed - best sown as soon as it is ripe in a cold frame[164, 200]. Sow stored seed as soon as it is obtained in a cold frame. Pre-soak the seed for 12 hours in warm water and remove as much of the tail and outer coat as possible[164]. A period of cold stratification is beneficial[164]. The seed germinates in 1 - 9 months or more at 20°C[164]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant out in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, taken between nodes, July/August in a frame[1]. Internodal cuttings of soft to semi-ripe wood, late spring in sandy soil in a frame. Layering of old stems in late winter or early spring[200]. Layering of current seasons growth in early summer[200].

nwatta Prefers a deep moist soil with its roots in the shade[11, 200]. Dislikes poorly-drained heavy clay soils, but grows well in clay if grit is added for drainage[11, 200]. Dislikes light sandy soils[11]. Does well on chalk[1]. Dislikes acid soils below a pH of 6.0[186]. Succeeds in acid as well as alkaline soils[200]. Plants are hardy to about -18°C[202]. A twining plant[182]. The leafstalks wrap themselves around twigs and branches for support. When a side of the stalk touches an object, the growth on that side slows down whilst the other side grows at its normal rate - this causes the leaf stalk to entwine the object it is touching[186, 212]. It is capable of growing 2 metres in a year and can easily smother small trees and shrubs[186]. Another report says that it can grow 5 metres in a year[202]. When planting out, in order to avoid the disease 'clematis wilt', it is best to plant the rootball about 8cm deeper in the soil. This will also serve to build up a good root crown of growth buds[200]. The flowers are almond-scented[202]. They are produced on the current season's growth[219]. The plant is very amenable to pruning and can be cut back severely if required. This is best done in early spring[202]. A greedy plant, inhibiting growth of nearby plants, especially legumes[54]. Plants seem to be immune to the predations of rabbits[233]. This species is notably resistant to honey fungus[88, 200].

#### 5.2.641 Salix fragilis

Crack Willow

4 tlin 8 cyuc 1 kcak 3 tcan 3 dwat 15 m hkuc htut cyutli tcuphja7n hwicli hrasjlutnyikfrip hpa7tli flatprik hpa7tmwatli nyanhjen hjonli

drutta Salix fragilis is a deciduous Tree growing to 15 m (49ft) by 15 m (49ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from April to May, and the seeds ripen from May to June. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Bees. The plant is not self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers moist or wet soil. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: Inner bark LeavesEdible Uses: SweetenerInner bark - raw or cooked. It can be dried, ground into a powder and then added to cereal flour for use in making bread etc. A very bitter flavour, it is a famine food that is only used when all else fails[172]. Young shoots - raw or

cooked. They are not very palatable[172]. A saccharine exudation is obtained from the leaves and young branches[2, 105]. Used as a food[183].

tcanta Basketry Charcoal Tannin WoodStems are very flexible and are used in basket making[46, 61]. The plant is usually coppiced annually when grown for basket making, though it is possible to coppice it every two years if thick poles are required as uprights. The bark contains around 10% tannin[223]. Wood - tough, withstands friction. Used for floors, bases of carts etc[11]. A good quality charcoal is obtained from the wood[61]. Dynamic accumulator.

dwatta Anodyne Astringent Dysentery Febrifuge Poul-tice SypticThe fresh bark of all members of this genus contains salicin[226], which probably decomposes into salicylic acid (closely related to aspirin) in the human body[213]. This is used as an anodyne, astringent and febrifuge[9, 226]. The bark of this species is used interchangeably with *S. alba*. It is taken internally in the treatment of rheumatism, arthritis, gout, inflammatory stages of auto-immune diseases, diarrhoea, dysentery, feverish illnesses, neuralgia and headache[238]. A poultice of the bark has been applied to sores as a styptic and healing agent[257]. The bark is removed during the summer and dried for later use[238]. The leaves are used internally in the treatment of minor feverish illnesses and colic[238]. The leaves can be harvested throughout the growing season and are used fresh or dried[238]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve *Salix* / Willow for diseases accompanied by fever, rheumatic ailments, headaches (see [302] for critics of commission E).

propta Seed - must be surface sown as soon as it is ripe in late spring. It has a very short viability, perhaps as little as a few days. Cuttings of mature wood of the current year's growth, November to February in a sheltered outdoor bed or planted straight into their permanent position and given a good weed-suppressing mulch. Very easy. Plant into their permanent positions in the autumn. Cuttings of half-ripe wood, June to August in a frame. Very easy.

nwatta Succeeds in most soils, including wet, ill-drained or intermittently flooded soils,[1] but prefers a deep damp, heavy soil in a sunny position[11, 200]. Rarely thrives on chalk[200]. Succeeds in an exposed position[186]. Closely allied to *S. alba*, with which it freely hybridizes[11], though it tolerates poorer soils than that species[186]. A very important food plant for the caterpillars of many butterfly species[30] and a good bee plant, providing an early source of nectar and pollen[11]. The cultivar 'Basfordiana' is used for basket making[131]. Best if planted into its permanent position as soon as possible. The root system is rather aggressive and can cause problems with drains[200]. Plants in this genus are notably susceptible to honey fungus[200]. Plants are very amenable to coppicing or pollarding and can be cut back annually if required[186]. Dioecious. Male and female plants must be grown if seed is required.

### 5.2.642 Abies fraseri

She Balsam, Fraser fir, Southern Balsam Fir

4 tlin 7 cyuc 1 kcak 0 tcan 3 dwat 15 m hkuc pcmhmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprik hpa7tmwatli hjonli

drutta Abies fraseri is an evergreen Tree growing to 15 m (49ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in leaf all year, in flower in May, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid and neutral soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil. The plant is not wind tolerant.

kcakta Edible Parts: Inner barkEdible Uses: Condi-ment Gum TeaThe following uses are for the closely related *A. balsamea*. Since this species also has blisters of resin in the bark[81], the uses quite probably also apply here. Inner bark - cooked. It is usually dried, ground into a powder and then used as a thickening in soups etc or mixed with cereals when making bread[105, 177]. An emergency food, it is only used when all else fails[183]. An aromatic resinous pitch is

found in blisters in the bark[64]. When eaten raw it is delicious and chewy[101, 183]. An oleoresin from the pitch is used as a flavouring in sweets, baked goods, ice cream and drinks[183]. Tips of young shoots are used as a tea substitute[177, 183].

tcanta Adhesive Gum Microscope Repellent Resin Stuffing WoodWood - light, soft, coarse grained, not strong[82]. It is occasionally manufactured into lumber[82]. The following uses are for the closely related *A. balsamea*. Since this species also has blisters of resin in the bark[81], the uses quite probably also apply here. The balsamic resin 'Balm of Gilead'[11, 46] or 'Canada Balsam' according to other reports[64, 226] is obtained during July and August from blisters in the bark or by cutting pockets in the wood[222]. Another report says that it is a turpentine[171]. It is used medicinally, also in the manufacture of glues, candles and as a cement for microscopes and slides - it has a high refractive index resembling that of glass[11, 46, 64, 82, 222, 226]. The average yield is about 8 - 10 oz per tree[171]. The resin is also a fixative in soaps and perfumery[171]. Leaves are a stuffing material for pillows etc - they impart a pleasant scent[46, 61] and also repel moths[169]

dwatta Analgesic Antiscorbutic Antiseptic Diuretic Poulce Stimulant Tonic VDThe following uses are for the closely related *A. balsamea*. Since this species also has blisters of resin in the bark[81], the uses quite probably also apply here. The resin obtained from the balsam fir (see 'Uses notes' below) has been used throughout the world and is a very effective antiseptic and healing agent. It is used as a healing and analgesic protective covering for burns, bruises, wounds and sores[213, 222, 226]. It is also used to treat sore nipples[213] and is said to be one of the best curatives for a sore throat[245]. The buds, resin, and/or sap are used in folk remedies for treating cancers, corns, and warts[269]. The resin is also antiscorbutic, diaphoretic, diuretic, stimulant and tonic[4, 171, 222]. It is used internally in proprietary mixtures to treat coughs and diarrhoea, though taken in excess it is purgative[238]. A warm liquid of the gummy sap was drunk as a treatment for gonorrhoea[212]. A tea made from the leaves is antiscorbutic[4, 171]. It is used in the treatment of coughs, colds and fevers[222]. The leaves and young shoots are best harvested in the spring and dried for later use[238]. This plant was widely used medicinally by various North American Indian tribes[257]. The resin was used as an antiseptic healing agent applied externally to wounds, sores, bites etc., it was used as an inhalant to treat headaches and was also taken internally to treat colds, sore throats and various other complaints[257].

propta Seed - sow early February in a greenhouse or outdoors in March[78]. Germination is often poor, usually taking about 6 - 8 weeks[78]. Stratification is said to produce a more even germination so it is probably best to sow the seed in a cold frame as soon as it is ripe in the autumn[80, 113]. The seed remains viable for up to 5 years if it is well stored[113]. When large enough to handle, prick the seedlings out into individual pots and grow them on for at least their first winter in pots. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Alternatively, if you have sufficient seed, it is possible to sow in an outdoor seedbed. One report says that it is best to grow the seedlings on in the shade at a density of about 550 plants per square metre[78] whilst another report says that they are best grown on in a sunny position[80]. Trees often self-layer in the wild[226], so this might be a means of increasing named varieties in cultivation[K].

nwatta Landscape Uses:Christmas tree, Screen, Specimen. Prefers a good moist but not water-logged soil[1]. Grows well in heavy clay soils. Very shade tolerant, especially when young[81, 126], but growth is slower in dense shade[81]. Intolerant of atmospheric pollution[1]. Prefers slightly acid conditions down to a pH of about 5[200]. Prefers growing on a north-facing slope[200]. A shallow-rooted plant, making it vulnerable to high winds[229]. A fast-growing but short-lived species[200]. Trees are very cold hardy but are often excited into premature growth in mild winters and this new growth is susceptible to damage by late frosts[11]. No other member of this genus has proved to be of as little value, or so short-lived as this species; there is scarcely a good tree in the country, though it is attractive when young[11]. Usually short-lived in cultivation, though bearing its interesting cones whilst still young[81]. Young trees can be handsome and vigorous, one grew 120cm in

two years, but growth soon slows[185]. Trees are known to have lived more than 60 years[185]. Trees should be planted into their permanent positions when they are quite small, between 30 and 90cm in height. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200]. Trees have a thin bark and are therefore susceptible to forest fires[229]. This species is closely related to *A. balsamea* and is seen as no more than a form of that species by some botanists[11, 229, 270]. There are some named forms selected for their ornamental value[200]. Trees can produce cones when only 2 metres tall[200]. Plants are strongly outbreeding, self-fertilized seed usually grows poorly[200]. They hybridize freely with other members of this genus[200]. The cones break up on the tree and if seed is required it should be harvested before the cones break up in early autumn[80]. Special Features: North American native, There are no flowers or blooms.

## 5.2.643 Stewartia pseudocamellia

Japanese Stewartia

4 tlin 7 cyuc 1 kcak 2 tcan 0 dwat 15 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Stewartia pseudocamellia is a deciduous Tree growing to 15 m (49ft) by 8 m (26ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kckahta Edible Parts: LeavesEdible Uses: Young leaves - cooked[177].

tcanta Landscape Uses: Espalier, Pest tolerant, Standard, Specimen, Street tree.

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame or in an outdoor seedbed if there is sufficient seed[78]. Stored seed is best soaked for 3 days in warm water and then given 3 - 5 months warm stratification followed by 3 months cold stratification at 5°C, it can take 18 months to germinate[78]. Prick out the seedlings into individual pots once they are large enough to handle and grow them on in a cold frame for their first winter. Plant out in early summer. Cuttings of short side branches, 8cm with a heel, July/August in a frame[1, 200]. One report says it is best to keep the cuttings growing through the winter if possible[1] whilst another says they should be allowed to become dormant once they have rooted[200]. Layering.

nwatta Requires a deep humus-rich moist but not boggy soil[200]. Dislikes limey soils, preferring peaty conditions[11, 200]. Prefers a position with some shade, at least from the midday sun[200]. Another report says that it prefers a sunny sheltered position[11]. Hardy to about -20°C[200]. Resents root disturbance, plants should be put in their permanent positions as soon as possible[11, 200]. Plants in this genus are notably resistant to honey fungus[200]. Special Features:Not North American native, Attractive flowers or blooms.

## 5.2.644 Magnolia kobus

Kobus magnolia, Northern Japanese Magnolia

4 tlin 7 cyuc 1 kcak 0 tcan 1 dwat 12 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

drutta Magnolia kobus is a deciduous Tree growing to 12 m (39ft) by 7 m (23ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Beetles. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. It can tolerate atmospheric pollution.

kckahta Edible Parts: Flowers LeavesEdible Uses: Condiment TeaFlowers and flower buds - cooked[177, 183]. The leaves are eaten or used to make a tea[183]. Older leaves are powdered and sprinkled on foods as a flavouring[183].

tcanta WoodWood - soft, light. Used for engraving, utensils, matches etc[46, 61].

dwatta Treats headaches[174].

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed must be kept cold over the winter and should be sown in late winter in a cold frame[200]. The seed usually germinates in the spring but it can take 18 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in a cold frame or greenhouse for at least their first winter. They can be planted out into their permanent positions when they are more than 15cm tall, though should be well mulched and given some protection from winter cold for their first winter or two outdoors. Layering in early spring[200]. Cuttings of half-ripe wood in early summer[202].

nwatta Landscape Uses:Firewood, Pest tolerant, Specimen. Best grown in a warm position in a moderately rich free soil of an open texture[1]. Succeeds in acid or neutral soils in sun or part shade[184]. Fairly lime tolerant[200, 202]. The branches are brittle so a sheltered position is required[200]. Very tolerant of atmospheric pollution[200]. A very hardy plant, tolerating temperatures down to about -28°C[200]. The fleshy roots are easily damaged and any transplanting is best done during a spell of mild moist weather in late spring[182]. Plants take 10 - 15 years to flower after being planted out[202]. The leaves are slightly aromatic[188]. Very closely related to *M. stellata*, differing in having 3 narrow sepals and 6 - 9 broader petals. Special Features:Not North American native, Fragrant flowers, Attractive flowers or blooms.

## 5.2.645 Celastrus orbiculatus

Oriental Bittersweet

4 tlin 8 cyuc 1 kcak 1 tcan 2 dwat 12 m hkuc pcmhmimhtut cyutli tcup hwicli hyishrasjlut hpa7tli flatprik hpa7tmwatli nyanhjen hjonli

drutta Celastrus orbiculatus is a deciduous Climber growing to 12 m (39ft) by 12 m (39ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from July to August, and the seeds ripen from November to February. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kckahta Edible Parts: LeavesEdible Uses: Young leaves - cooked[105, 177].

tcanta Hedge HedgeUsed as a hedge[58]. Ornamental.

dwatta Antiphlogistic Antirheumatic Cancer Depurative TonicThe roots, stems and leaves are antiphlogistic, antirheumatic, depurative and tonic[147, 218]. A decoction of the roots and stems is used internally whilst the crushed fresh leaves are used for external applications[147]. The plant is used in the treatment of paralysis, numbness of the four extremities, headache, toothache, spontaneous abscess formation and snake bites[147]. Many plants in this genus contain compounds of interest for their antitumour activity[218].

propta Seed - gather when ripe, store in dry sand and sow February in a warm greenhouse[78]. Three months cold stratification leads to a higher germination rate[113]. Remove the flesh of the fruit since this inhibits germination[113]. Germination rates are usually good[78]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame[188]. Layering in August of the current seasons growth. Takes 12 months[78]. Root cuttings, 6mm thick 25mm long in December. Plant horizontally in pots in a frame[78].

nwatta Prefers a deep loamy soil[1] but succeeds in most soils so long as they are not too shallow[202]. Succeeds in full or partial shade[188]. Plants flower more freely if their top-growth is in the sun[182]. Requires a humus-rich soil if it is to be at its best[219]. A very ornamental plant[1], it is hardy to about -25°C[200]. A rampant climber, it requires ample space and is best grown into an old tree[1, 200]. It climbs by means of twining and also by the young stems having prickles[182]. Plants do not normally require pruning[219]. Plants in this genus are notably resistant to honey fungus[200]. Plants are usually dioecious, in which case male and female plants must be grown if seed is required, but hermaphrodite forms are in cultivation[11, 182, 200].

## 5.2.646 Eucommia ulmoides

Gutta-Percha

4 tlin 8 cyuc 1 kcak 0 tcan 3 dwat 12 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikkwis hpa7tmwatli nyanhjen hjonli

drutta Eucommia ulmoides is a deciduous Tree growing to 12 m (39ft) by 8 m (26ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in April, and the seeds ripen from September to October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kckahta Edible Parts: LeavesEdible Uses: Young leaves[178]. No further details are given.

tcanta Latex WoodA rubber is obtained from the sap, but not in commercially viable quantities[11, 46, 61]. The leaves contain 3% dry weight of gutta-percha, a non-elastic rubber, used for insulation of electrical wires etc[74]. The gutta-percha is found in all parts of the tree and is extracted by alcohol[61, 174]. The wood is used for making Pattens (a type of shoe with raised soles)[178].

dwatta Analgesic Anticholesterolemic Aphrodisiac Astringent Depurative Diuretic Hepatic Hypotensive Sedative Tonic VasodilatorGutta-percha, known as Du Zhong in China, is commonly used in Chinese herbalism, where it is considered to be one of the 50 fundamental herbs[218]. It is considered to be an excellent tonic for the kidneys and liver, and is thought to act specifically on the lower part of the body[254]. Much interest has been aroused by Du Zhong's ability to reduce high blood pressure. In a clinical trial involving 119 people, 46% of those treated with the herb showed a significant reduction in blood pressure[254]. However, it seems to have little effect in cases of severe hypertension[254]. The stem bark is analgesic, anticholesterolemic, aphrodisiac, depurative, diuretic, hepatic, hypotensive, sedative, tonic and vasodilator[11, 46, 147, 176, 178, 218, 279]. Its use lowers blood pressure (the stir-fried bark is stronger than raw and a decoction is stronger than a tincture) and reduces the absorption of cholesterol[176]. It is used in the treatment of impotence, frequent urination, lumbago, weakness of the lower part of the body, aching back and knees, hypertension and threatened abortion[176, 254]. The flowers and the fruit are astringent[218].

propta Seed - best sown as soon as it is ripe in a cold frame. Stratify stored seed for 3 months at 2°C[113]. Germination is usually good and takes place in the first spring[K]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame[11].

nwatta Industrial Crop: Hydrocarbon Management: CoppiceSucceeds in any well-drained moisture retentive soil in full sun with shelter from cold winds[200]. Prefers a good loamy soil[11]. A fast growing[1] and very cold-tolerant tree, withstanding temperatures down to about -20°C[74]. Trees are commonly cultivated in Russia and China, both for gutta percha and for the medicinal used of the stem bark[11, 218]. By using different solvents it is possible to obtain both of these products and the residue is then used for energy production[218]. This species is the only hardy rubber tree that

organs) and is pollinated by Flies, midges. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil. It can tolerate atmospheric pollution.

kcakta None known

tcanta Dye Hedge HedgeA rose-tan dye is obtained from the fruit[168]. Plants are often used in informal hedging[200].

dwatta None known

propta Seed. Members of this genus hybridize freely so, if you require seed that breeds true, it is important to obtain it from a known wild source or from a controlled fertilization of garden plants. The seed is best sown as soon as it is ripe in the autumn in a cold frame, when it will usually germinate in the spring[11, 200]. Stored seed germinates faster if given 3 months warm stratification at 15°C and then 3 months cold stratification at 4°C[164]. The seed usually germinates within 1 - 18 months at 15°C but it can take 2 years[164]. Pot the seedlings up as soon as they are large enough to handle and plant them out into nursery beds or into their permanent positions when they are more than 10cm tall. Cuttings of half-ripe wood with a heel, July/August in a frame[11, 200].

nwatta An easily grown plant, it prefers a good soil but also does well in poor soils[1, 11, 200]. It thrives in lime and is also happy in peaty soils[1]. It succeeds in any soil that is not marshy or waterlogged[11, 200]. Succeeds in dry soils[188]. Grows well in heavy clay soils. Succeeds in full sun or semi-shade but does not fruit so freely in a shady position[11, 200]. Tolerates atmospheric pollution[200]. A very hardy species, tolerating temperatures down to at least -15°C[202]. Fairly fast-growing[202]. Hybridizes freely with other members of this genus[200]. The flowers, when inhaled near to, have an unpleasant smell like decaying fish[245]. They are very attractive to bees whilst the fruit is a good winter food source for many species of birds[200]. Trees are notably susceptible to honey fungus[200]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

## 5.2.894 *Artemisia ludoviciana gnaphalodes*

White Sage

4 tlin 8 cyuc 0 kcaak 0 tcan 2 dwat 1 m hkuc hmimhtut cyutli hgatyuctcup hwicli hrasjlut hpa7tli priklwis hpa7tmwatli xre7t hjonli

drutta *Artemisia ludoviciana gnaphalodes* is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardness. It is hardy to UK zone 5. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta None known

tcanta Incense Miscellany MiscellanyBunches of the plants have been used as towels[257]. The plant can be burnt as an incense[257].

dwatta Antirheumatic Fibrifuge Foot care Miscellany Miscellany Ophthalmic Poulitice VulneryAn infusion of the plant is used to treat stomach problems, coughs, colds, headaches etc[61, 257]. A decoction of the leaves is used as a bath to treat fevers and can be applied as a wash to sores, rashes, itches, skin eruptions etc[257]. An infusion of the leaves has been used as an eyewash[257]. The powdered leaves can be applied to the nostrils to stop nose bleeds, sprinkled on sores they will hasten the healing process[257]. The crushed plant can be rubbed on the body as a liniment to treat rheumatic joints, soreness or stiffness[257]. The plant can be placed in the shoes to keep the feet from sweating[257].

propta Seed - surface sow from late winter to early summer in a greenhouse, making sure that the compost does not dry out[200]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant out in late spring or early summer. Division in spring or autumn[200]. Basal cuttings in late spring. Harvest the young shoots when about 10 - 15cm long, put up in a lightly shaded position in a greenhouse or cold frame and plant them out when well rooted. Very easy.

nwatta Easily grown in a well-drained circumneutral or slightly alkaline loamy soil, preferring a warm sunny dry position[1, 200]. Established plants are drought tolerant[200]. Plants are longer lived, more hardy and more aromatic when they are grown in a poor dry soil[245]. Slugs are attracted to the young shoots in spring and have been known to destroy even well-established plants[K]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 5.2.895 *Chamaecrista fasciculata*

Golden Cassia, Partridge pea

4 tlin 8 cyuc 0 kcaak 1 tcan 0 dwat 1 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta *Chamaecrista fasciculata* is a ANNUAL growing to 1 m (3ft 3in). See above for USDA hardness. It is hardy to UK zone 5. It is in flower from August to October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta Soil stabilizationPlants have an extensive root system and are used to stabilize soils. Grown as an ornamental or for honey production.

dwatta None known

propta Seed - scarify and then pre-soak the seed for 2 - 3 hours in warm water before sowing it from early spring to early summer in a warm greenhouse[138]. The seed usually germinates in 1 - 12 weeks at 23°C[138]. Prick out the seedlings into individual pots once they are large enough to handle and grow them on in the greenhouse. Do not plant them out until the following spring[138]. Division as growth commences in spring[11]. Cuttings of moderately ripe wood, July in a frame[1].

nwatta Succeeds in most well-drained soils but prefers an open sandy loam in a sunny sheltered position[1, 200]. Established plants are drought tolerant[200]. Succeeds in light shade, but the plant is much less vigorous when grown in dry shade[200]. Young plants should be mulched each winter until they are well established[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

## 5.2.896 *Aster novae*

New England Aster

4 tlin 9 cyuc 0 kcaak 0 tcan 2 dwat 1.5 m hkuc hmimhtut cyutli tcup hwicli hyishrasjlutnyik hpa7tli flatprikwis hpa7tmwatli fyfexre7t hjonli

drutta *Aster novae-angliae* is a PERENNIAL growing to 1.5 m (5ft) by 1 m (3ft 3in) at a medium rate. See above for USDA hardness. It is hardy to UK zone 2. It is in flower from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles, Lepidoptera (Moths and Butterflies). The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta None known

toxicity. Leaves are used as a tea substitute[105, 177]. Some caution is advised, see the notes above on toxicity.

tcanta Dye Hair Ink RepellentA blue dye and an ink are obtained from the fruit[13, 46, 61, 115]. The root juice is used to dye hair black[4]. The leaves are said to repel mice and moles[4, 115]. Plants make a dense ground cover when spaced about 1 metre apart each way[208]. They are best used in large areas, roadsides etc[208]. Our experience to date (1995) is that the plants spread vigorously but do not form a dense cover and so do not exclude other plants[K].

dwatta Antiphlogistic Antirheumatic Appetite Suppressant Cholagogue Diaphoretic Diuretic Expectorant Homeopathy Poulitice PurgativeThe leaves are antiphlogistic, cholagogue, diaphoretic, diuretic, expectorant and laxative[4, 7, 9, 13, 21, 240]. The fruit is also sometimes used, but it is less active than the leaves[4]. The herb is commonly used in the treatment of liver and kidney complaints[4]. When bruised and laid on boils and scalds, they have a healing effect[4]. They can be made into a poultice for treating swellings and contusions[4]. The leaves are harvested in the summer and can be dried for later use[7]. The root is diaphoretic, mildly diuretic and a drastic purgative[4, 7, 9]. Dried, then powdered and made into a tea, it is considered to be one of the best remedies for dropsy[4, 240]. It should only be used with expert supervision because it can cause nausea and vertigo[9]. A homeopathic remedy is made from the fresh berries or the bark[9]. It is used in the treatment of dropsy[9].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame, when it should germinate in early spring. Stored seed can be sown in the spring in a cold frame but will probably germinate better if it is given 2 months warm followed by 2 months cold stratification first[78, 98, 113]. Prick out the seedlings into individual pots when they are large enough to handle. If good growth is made, the young plants can be placed in their permanent positions during the early summer. Otherwise, either put them in a sheltered nursery bed, or keep them in their pots in a sheltered position and plant them out in spring of the following year. Division of suckers in spring or autumn. Very easy.

nwatta Tolerates moist soils, including chalk[200], but prefers a moist loamy soil[11, 200]. Grows well in heavy clay soils. Tolerates some shade but is best in a sunny position[1]. Tolerates atmospheric pollution and coastal situations[200]. A very invasive plant, sending up new shoots a metre or more away[K]. It can be used for naturalising in the rougher parts of the garden[233], growing well on rough banks etc[1]. The whole plant, when bruised, emits a most unpleasant fur-like smell[245]. The bark, in particular, smells like stale perspiration[245].

## 5.2.730 *Xerophyllum tenax*

Indian Basket Grass, Common beargrass

4 tlin 8 cyuc 1 kcaak 0 tcan 1 dwat 1.2 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta *Xerophyllum tenax* is an evergreen Perennial growing to 1.2 m (4ft) by 2 m (6ft 7in) at a slow rate. See above for USDA hardness. It is hardy to UK zone 5. It is in leaf all year, in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Root - baked[92].

tcanta Basketry Fibre WeavingA watertight basket can be made from the leaves[21, 46, 61, 99, 257]. This basket has been used for cooking food in[257]. The fibres are split from the leaves and then used[92]. The plant is also used to decorate baskets[257]. The small leaves have been used to make dresses[257]. The plants were burnt every year. The leaves were harvested in the spring when they first started to grow out of the charred rhizome. Prior to using, the leaves were soaked in water to make them pliable, but if left too long they turned green[257]. The dried and bleached leaves are used for weaving into hats and capes[207, 257].

dwatta Ophthalmic StypticThe roots are styptic[257]. A poultice of the chewed root has been applied to wounds[257].

A decoction of the grated root has been used as a wash on bleeding wounds, sprains and broken limbs[257]. The washed roots have been rubbed to make a lather and then used to wash sore eyes[257].

propta Seed - we have no information for this species but suggest sowing the seed in a cold frame as soon as it is ripe if possible, otherwise in early spring. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division as the plant comes into growth in the spring.

nwatta Requires a well-drained soil in full sun[187]. Prefers a fairly moisture-retentive sandy peaty soil[1, 200]. Requires a damp peaty soil[233]. Plants can be difficult to cultivate[188]. Plants are hardy to about -20°C[187], especially if the roots are given a good mulch in the winter[200]. If left undisturbed, plants can form quite large colonies, spreading by means of their tough rhizomes[200]. Plants do not flower every year, there are often gaps of 5 - 7 years between flowering[212].

## 5.2.731 *Artemisia absinthium*

Wormwood, Absinthium.

4 tlin 9 cyuc 1 kcaak 2 tcan 3 dwat 1 m hkuc hmimhtut cyutli hgatyuctcup hwicli hyishrasjlut hpa7tli flatprikwisslip hpa7tmwatli xre7t hjonli

drutta *Artemisia absinthium* is a PERENNIAL growing to 1 m (3ft 3in) by 0.6 m (2ft) at a medium rate. See above for USDA hardness. It is hardy to UK zone 4 and is not frost tender. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Edible Uses: CondimentLeaves are occasionally used as a flavouring[27, 177, 183]. Caution is advised, prolonged use is known to have a detrimental effect - see the notes above on toxicity[K]. Absinthe - a distilled, highly alcoholic drink usually produced in France, Switzerland, Australia, Spain, and the Czech Republic.

tcanta Repellent StrewingThe fresh or dried shoots are said to repel insects and mice[6, 18, 20, 169], they have been laid amongst clothing to repel moths and have also been used as a strewing herb[4, 14, 257]. An infusion of the plant is said to discourage slugs and insects[14, 18, 201]. The plant contains substances called sesquiterpene lactones, these are strongly insecticidal[254].

dwatta Anthelmintic Antiseptic Antispasmodic Appetizer Carminative Cholagogue Emmenagogue Fibrifuge Homeopathy Hypnotic Stimulant Stomachic Tonic VermifugeWormwood is a very bitter plant with a long history of use as a medicinal herb. It is valued especially for its tonic effect on the liver, gallbladder and digestive system, and for its vermifugal activity[4, 238, 254]. It is an extremely useful medicine for those with weak and underactive digestion. It increases stomach acid and bile production, improving digestion and the absorption of nutrients[254]. It also eases wind and bloating and, if taken regularly, helps the body return to full vitality after a prolonged illness[254]. The leaves and flowering shoots are anthelmintic, anti-inflammatory, antiseptic, antispasmodic, antitumor, carminative, cholagogue, emmenagogue, fibrifuge, hypnotic, stimulant, stomachic, tonic and vermifuge[4, 9, 21, 46, 165, 222, 254]. The plant is harvested as it is coming into flower and then dried for later use[4]. Use with caution[21], the plant should be taken internally in small doses for short-term treatment only, preferably under the supervision of a qualified practitioner[238]. It should not be prescribed for children or pregnant women[238]. See also the notes above on toxicity. The extremely bitter leaves are chewed to stimulate the appetite[222]. The bitter taste on the tongue sets off a reflex action, stimulating stomach and other digestive secretions[254]. The leaves have been used with some success in the treatment of anorexia nervosa[244]. The plant is applied externally to bruises and bites[238]. A warm compress has been used to ease sprains and strained muscles[257]. A

homeopathic remedy is made from the leaves[9]. It is used to stimulate bile and gastric juice production and to treat disorders of the liver and gall bladder[9].

propta Seed - surface sow from late winter to early summer in a greenhouse. The seed usually germinates within 2 - 26 weeks at 15°c[134]. When they are large enough to handle, prick the seedlings out into individual pots. They can be planted out in the summer, or kept in pots in a cold frame for the winter and then planted out in the spring. Cuttings of half-ripe wood, July/August in a frame. Division in spring or autumn.

nwatta Landscape Uses:Border, Ground cover, Seashore. Succeeds in any soil but it is best in a poor dry one with a warm aspect[37]. Established plants are very drought tolerant[190, 200]. Plants are longer lived, more hardy and more aromatic when they are grown in a poor dry soil[245]. Easily grown in a well-drained circumneutral or slightly alkaline loamy soil, preferring a sunny position[1, 200]. Prefers a shady situation according to another report[4]. Tolerates a pH in the range 4.8 to 8.2. Wormwood is occasionally grown in the herb garden, there are some named forms[187]. The growing plant is said to inhibit the growth of fennel, sage, caraway, anise and most young plants, especially in wet years[14, 18, 20]. Wormwood is a good companion for carrots, however, helping to protect them from root fly[201]. This herb was at one time the principal flavouring in the liqueur ‘Absinthe’ but its use has now been banned in most countries since prolonged consumption can lead to chronic poisoning, epileptiform convulsions and degeneration of the central nervous system[244]. The scent of the plant attracts dogs[169]. Members of this genus are rarely if ever troubled by browsing deer[233]. Special Features: Attractive foliage, Not North American native, Naturalizing, Suitable for dried flowers.

### 5.2.732 Verbena stricta

Hoary Vervain, Hoary verbena

4 tin 8 cyuc 1 kcaak 0 tcan 1 dwat 1 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwv hpa7tmwatli fyifxre7t hjonli

drutta Verbena stricta is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Edible Uses: Teaa tea-like beverage has been made from the leaves[257].

tcanta None known

dwatta Febrifuge StomachicThe plant is thought to be specific for fever and ague[207]. An infusion of the leaves has been used in the treatment of stomach aches[257].

propta Seed - sow early spring in a greenhouse or cold frame[1]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the summer or the following spring. Basal cuttings in early summer. Harvest the shoots with plenty of underground stem when they are about 8 - 10cm above the ground. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Succeeds in any moderately fertile well-drained but moisture retentive soil in a sunny position[1, 200]. Plants are hardy to about -20°c[187]. Plants are often short-lived and sometimes only annual[60]. Hybridizes with *V. hastata*[200].

### 5.2.733 Grindelia lanceolata

Rosin Weed, Narrowleaf gumweed, Texan gumweed
4 tin 8 cyuc 1 kcaak 0 tcan 3 dwat 1.5 m hkuc

htut cyutli hgatkyuctcup hwicli hyishrasjltut hpa7tli flatprikli-wisslip hpa7tmwatli xre7t hjonli

drutta Grindelia lanceolata is a BIENNIAL/PERENNIAL growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Edible Uses: Gum TeaThe following reports are for the related *G. squarrosa*, they probably also apply to this species[222]. The fresh or dried leaves can be used to make an aromatic, slightly bitter but pleasing tea[183]. A sticky resinous sap that covers the leaves can be used as a chewing gum substitute[183].

tcanta Dye GumThe following report is for the related *G. squarrosa*, it probably also applies to this species[222]. Yellow and green dyes are obtained from the flowering heads and pods[168]. Aromatic.

dwatta Antispasmodic Eczema Expectoant SedativeThe following reports are for the related *G. squarrosa*, they also apply to this species[222]. Rosin weed was used by the native North American Indians to treat bronchial problems and also skin afflictions such as reactions to poison ivy[254]. It is still used in modern herbalism where it is valued especially as a treatment for bronchial asthma and for states where phlegm in the airways impedes respiration[254]. In addition, it is believed to desensitize the nerve endings in the bronchial tree and slow the heart rate, thus leading to easier breathing[254]. The plant merits investigation as a treatment for asthma[222]. The herb is contraindicated for patients with kidney or heart complaints[254]. The dried leaves and flowering tops are antiasthmatic, anti-inflammatory, antispasmodic, expectoant and sedative[4, 46, 207, 212, 238, 254]. The principal use of this herb is in the treatment of bronchial catarrh, especially when there is an asthmatic tendency, it is also used to treat whooping cough and cystitis[4, 254]. The active principle is excreted from the kidneys, and this sometimes produces signs of renal irritation[4, 238]. Externally, the plant is used as a poultice to treat burns, poison ivy rash, dermatitis, eczema and skin eruptions[212, 213, 222, 238]. The plant is harvested when in full bloom and can be used fresh as a poultice or dried for infusions etc[254]. A fluid extract is prepared by placing the freshly gathered leaves and flowers in a small quantity of simmering water for about 15 minutes[213]. A homeopathic remedy is prepared from the leaves and flowering stems[4].

propta Seed - sow autumn or spring in a cool greenhouse and only just cover the seed. Prick out the plants into individual pots when they are large enough to handle and plant them out into their permanent positions in early summer. Division as new growth commences in the spring. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring. Cuttings.

nwatta Succeeds in any well-drained soil in full sun[200]. Does well on dry sandy banks and in poor soils[200]. Grows mainly in calcareous soils in the wild[274]. Prefers a peaty loam soil[1]. This is one of the first species to invade disturbed or denuded ground and often becomes a serious weed of grazing land[212]. A very polymorphic plant[43].

### 5.2.734 Staphylea bumalda

4 tin 8 cyuc 1 kcaak 0 tcan 0 dwat 1.8 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwv hpa7tmwatli xre7t hjonli

drutta Staphylea bumalda is a deciduous Tree growing to 1.8 m (6ft). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from May to June, and the seeds ripen from September to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

### 5.2.890 Spiraea douglasii

Steeplebush, Rose spirea, Menzies’ spirea
4 tin 8 cyuc 0 kcaak 0 tcan 1 dwat 2.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwv hpa7tmwatli xre7t hjonli

drutta Spiraea douglasii is a deciduous Shrub growing to 2.5 m (8ft 2in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from June to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta The branches have been used to make brooms[257].

dwatta An infusion of the seeds has been used in the treatment of diarrhoea[257].

propta Seed - we have no information for this species but suggest sowing the seed as soon as it is ripe in a cold frame if possible. It is likely to require stratification before it germinates, so stored seed should be sown in a cold frame as early in the year as you receive it. Prick out the seedlings into individual pots when they are large enough to handle, and grow them on in a cold frame for their first winter. Plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, July/August in a light sandy soil a frame. Cuttings of mature wood of the current seasons growth, 15cm long, October/November in an outdoor frame[200]. Another report says that September is a good time to do this[11]. Division of suckers in early spring[200]. They can be planted out straight into their permanent positions.

nwatta Tolerates most soils[200], but prefers a good loamy soil, abundant moisture and full sunlight[11, 200]. Prefers a moist lime-free soil[182], plants quickly become chlorotic on chalk soils[200]. A very cold hardy plant, tolerating temperatures down to about -25°c[200]. Hybridizes freely with other members of this genus[11]. A rampant suckering shrub, it quickly produces dense thickets and can be used for large-scale naturalistic plantings[200]. It is apt to get thin and poor unless divided up fairly regularly and replanted in fairly good soil[1].

### 5.2.891 Macleaya cordata

Plume Poppy

4 tin 10 cyuc 0 kcaak 0 tcan 1 dwat 2 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwv hpa7tmwatli xre7t hjonli

drutta Macleaya cordata is a PERENNIAL growing to 2 m (6ft) by 1 m (3ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 3. It is in flower from July to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta Insecticide MusicalThe dried hollow stems can be used as whistles[178]. Kills insects and mosquito larvae[147]. The flowers are used to kill maggots whilst the whole plant is used to kill larvae and insects[218].

dwatta Carminative Depurative Diuretic StingsThe whole plant is analgesic, antioedemic, carminative, depurative and diuretic[218]. The juice from the stems of the leaves is used to treat insect bites[4]. A decoction of the leaves and stems is used in the treatment of ringworm[218]. The poisonous sap is used to counter poisonous sores[218].

propta Seed - we have no information on this species but suggest sowing the seed as soon as it is ripe in a cold frame in the autumn. Stored seed should be sown in the early spring. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in the dormant season[200]. Basal cuttings in late spring. Harvest the shoots with plenty of

underground stem when they are about 8 - 10cm above the ground. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer. Cuttings from the axils of larger leaves in early summer[200]. Root cuttings in the winter[188].

nwatta Landscape Uses:Border, Massing, Specimen. Requires a well-drained deep soil[1] preferring a sunny sheltered position but tolerating light shade[200]. Easily grown in sun or partial shade[187]. Hardy to about -15°c[187]. A very ornamental plant, it can be grown as an isolated specimen in a lawn[1]. An excellent plant for sub-tropical bedding[1]. Plants have spreading underground rhizomes[187] and can be invasive[200]. Special Features:Attractive foliage, Invasive, Naturalizing.

### 5.2.892 Apocynum pictum

Kendyr

4 tin 9 cyuc 0 kcaak 3 tcan 2 dwat 2 m hkuc pcimhmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwv hpa7tmwatli hjonli

drutta Apocynum pictum is a PERENNIAL growing to 2 m (6ft) by 0.3 m (1ft in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. The flowers are pollinated by Bees, Lepidoptera (Moths and Butterflies). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in saline soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta Agroforestry Uses: The fragrant flowers are a good source of honey for bees[266 ]. Other Uses: The strong bast fibres obtained from the inner bark are used in making cloth, strings, sails, fishing nests, and high-quality paper[266 ]. The leaves yield up to 5% gum, which is used for making rubber[266 ]. Carbon Farming: Industrial Crop: fiber. The dogbane-milkweed family Asclepias, Apocynum, Calotropis, and Trachomitum spp) has been used for fiber industrial crops for millennia with a number in cultivation as regional crops. All of these crops are dual-purpose fibres, offering bast fibres from the stem and seed fiber or ‘floss’ in the fruit pods. Many have also been identified as potential hydrocarbon crops due to high latex content. Could be integrated into various agroforestry systems rather than as monocultures [1-1].

dwatta The leaves yield up to 5% gum (?latex), which is used for making a medicine used as a sedative and to treat hypertension[266]. The species has fragrant flowers and is grown as a honey plant[266].

propta Seed - best sown as soon as it is ripe in late summer and overwintered outdoors. The seed requires a period of cold stratification if it is to germinate well[238]. Prick out the seedlings when large enough to handle and grow them on in a cold frame for their first winter, planting out in late spring of the following year[K]. Division in spring just before active growth begins[200]. Plants can also be divided in the autumn[238].

nwatta Industrial Crop: Fiber Management: Hay Regional CropSpecies in this genus generally succeed in sun or shade in most well-drained but moisture-retentive soils[1, 200 ]. The species has fragrant flowers and is grown as a honey plant[266 ]. Apocynum species are used as food plants by the larvae of some Lepidoptera species, including the mouse moth and the Queen butterfly. Climate: cold to warm temperate. Humidity: arid to semi-arid. Carbon Farming - Cultivation: regional crop. Management: hay.

### 5.2.893 Cotoneaster divaricatus

Spreading Cotoneaster

4 tin 8 cyuc 0 kcaak 3 tcan 0 dwat 2 m hkuc hmimhtut cyutli kyuctcup hwicli hyishrasjlutnyikfrip hpa7tli flatprikliwv hpa7tmwatli xre7t hjonli

drutta Cotoneaster divaricatus is a deciduous Shrub growing to 2 m (6ft) by 3 m (9ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to August, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female

potted up vertically in a greenhouse. Good percentage[78, 200]. Suckers in late autumn to winter[200].

nwatta Succeeds in a well-drained fertile soil in full sun[11, 200]. The young growth in spring can be damaged by late frosts. A fast-growing but short-lived species in the wild[22]. It has brittle branches and these can be broken off in strong winds[200]. Plants are also susceptible to coral spot fungus[11]. Plants in this genus are notably resistant to honey fungus[200]. The plant has a semi-climbing habit and produces aerial roots[11], and occasionally reaches the size of a small tree[229]. Many of the species in this genus, including this one, are highly toxic and can also cause severe irritation to the skin of some people, whilst other species are not poisonous. It is relatively simple to distinguish which is which, the poisonous species have axillary panicles and smooth fruits whilst non-poisonous species have compound terminal panicles and fruits covered with acid crimson hairs[1, 4]. The toxic species are sometimes separated into their own genus, Toxicodendron, by some botanists[200]. Dioecious. Male and female plants must be grown if seed is required.

## 5.2.888 Veratrum californicum

California False Hellebore

4 tlin 8 cyuc 0 kcaak 0 tcan 2 dwat 2.5 m hkuc  
hminhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwlis hpa7tmwatli xre7t hjonli

drutta Veratrum californicum is a PERENNIAL growing to 2.5 m (8ft) by 0.6 m (2ft in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta None known

tcanta Disinfectant InsecticideThe dried and powdered root is used as an insecticide and a parasiticide[172]. It is also effective against caterpillars and mammals so great caution is advised[1, 19, 20].

dwatta Analgesic Contraceptive Disinfectant Febrifuge Poultrice SalveAlthough a very poisonous plant, California false hellebore was often employed medicinally by a number of native North American Indian tribes who used it mainly as an external application to treat wounds etc[257]. It also had quite a reputation as a contraceptive[257]. It is little, if at all, used in modern herbalism. Any use of this plant, especially internal use, should be carried out with great care and preferably only under the supervision of a qualified practitioner. The root is analgesic, disinfectant and febrifuge[257]. A decoction has been used in the treatment of venereal disease[257]. The roots have been grated then chewed and the juice swallowed as a treatment for colds[257]. A poultice of the mashed raw root has been used as a treatment for rheumatism, boils, sores, cuts, swellings and burns[257]. The dried and ground up root has been used as a dressing on bruises and sores[257]. A poultice of the chewed root has been applied to rattlesnake bites to draw out the poison[257]. The powdered root has been rubbed on the face to allay the pain of toothache[257]. A decoction of the root has been taken orally by both men and women as a contraceptive[61, 257]. A dose of one teaspoon of this decoction three times a day for three weeks is said to ensure permanent sterility in women[207, 254].

propta Unless stored in damp sand at around 4°C the seed has a short viability[200]. Where possible it is best to sow the seed in a lightly shaded position in the greenhouse as soon as it is ripe[200]. Stored seed needs to be stratified but can be very slow to germinate. Germination can be erratic even for seed sown when it was fresh, it usually takes place within 3 - 12 months at 15°C but can be much longer[200]. The plant produces just one seedleaf in its first year, this forms an over-wintering bulb. It takes up to 10 years for the plant to reach maturity[200]. Sow the seed thinly so there is no need to thin or transplant them, and grow the seedlings on undisturbed in the pot for their first two years of growth. Apply a liquid feed at intervals through the growing season to ensure the plants do not become nutrient deficient. At the end of the second year plant out the dormant plants into

individual pots and grow them on in light shade in the greenhouse for a further year or two before planting them out into their permanent positions in late spring or early summer. Division in March/April or in October. Establish the plants in pots in a shaded frame before planting them out[200]. Division is best carried out in the autumn because the plants come into growth very early in the spring[233]. Root cuttings, 6mm long with a bud, rooted in a sandy soil in a cold frame[200].

nwatta Requires a deep fertile moisture retentive humus-rich soil[200]. Succeeds in full sun if the soil does not dry out but prefers a position in semi-shade[200]. Dislikes dry soils[42]. Grows best in a cool woodland garden or a north facing border[42]. Members of this genus are rarely if ever troubled by browsing deer[233]. Plants are long-lived and can be left in the same position for years without attention[233].

## 5.2.889 Salix aurita

Eared Sallow

4 tlin 8 cyuc 0 kcaak 3 tcan 2 dwat 2.5 m hkuc  
htut cyutli kyuctcuphja7n hwicli hyishrasjlutnyikfrip hpa7tli flatprik hpa7tmwatli nyanhjen hjonli

drutta Salix aurita is a deciduous Shrub growing to 2.5 m (8ft 2in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in April, and the seeds ripen from May to June. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers dry moist or wet soil.

kcaakta None known

tcanta Basketry PioneerPlants have an extensive root system and are used to stabilize waste tips and old slag heaps[199]. The seeds are very light and so can travel some distance in the wind. The plant is therefore able to find its way to areas such as cleared woodland where the soil has been disturbed. Seedlings will grow away quickly, even in exposed conditions and the plant will provide good shelter for the establishment of woodland plants. Thus it makes a good pioneer species and, except in wetter and moorland-type soils, will eventually be largely out-competed by the other woodland trees. Its main disadvantage as a pioneer plant is that it has an extensive root system and is quite a greedy plant, thus it will not help as much in enriching the soil for the other woodland plants as other pioneer species such as the alders, *Alnus* species[K]. Dynamic accumulator.

dwatta Anodyne FebrifugeThe fresh bark of all members of this genus contains salicin[226], which probably decomposes into salicylic acid (closely related to aspirin) in the human body[213]. This is used as an anodyne and febrifuge[226].

propta Seed - must be surface sown as soon as it is ripe in late spring. It has a very short viability, perhaps as little as a few days. Cuttings of mature wood of the current year's growth, November to February in a sheltered outdoor bed or planted straight into their permanent position and given a good weed-suppressing mulch. Plant into their permanent positions in the autumn. Cuttings of half-ripe wood, June to August in a frame.

nwatta Succeeds in most soils, including wet, ill-drained or intermittently flooded soils[1, 11], but prefers a damp, heavy soil in a sunny position[200]. Rarely thrives on chalk[200]. Thriving in the most adverse conditions, it is a useful plant for populating dry barren sites[199]. Closely related to *S. caprea* and *S. cinerea*[11]. Hybridizes freely with other members of this genus[200]. Although the flowers are produced in catkins early in the year, they are pollinated by bees and other insects rather than by the wind[11]. When inhaled near to, a scent of white jasmine can be discerned from the flowers[245]. Plants in this genus are notably susceptible to honey fungus[200]. Dioecious. Male and female plants must be grown if seed is required.

kcaakta Edible Parts: LeavesEdible Uses: Young leaves - cooked[105, 177, 179].

tcanta None known

dwatta None known

propta Seed - this can be very slow to germinate, sometimes taking 18 months or more. It is best sown as soon as it is ripe in a cold frame[200], and some of it at least should then germinate in the spring. Stored seed should be sown as early in the year as possible and given cold stratification - it might not germinate until spring of the following year. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in the greenhouse for their first winter. Plant them out early the following summer. Cuttings of half-ripe wood, 5 - 8cm with a heel, July/August in a frame. Fair to good percentage[78]. Layering in July/August. Takes 15 months. Good percentage[78].

nwatta Tolerant of a wide range of soils so long as they are not too dry[182, 200], it prefers a rich loamy soil in full sun or semi-shade[1, 11, 200]. The Japanese form of this species is rather tender in Britain[11], but in general plants are hardy to about -25°C[184]. The plants flower best in years that follow hot summers[200]. Plants in this genus are notably resistant to honey fungus[200].

## 5.2.735 Sanguisorba obtusa

Japanese burnet

4 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 1 m hkuc  
hminhtut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flatprikwlis hpa7tmwatli xre7t hjonli

drutta Sanguisorba obtusa is a PERENNIAL growing to 1 m (3ft 3in) by 0.6 m (2ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcaakta Edible Parts: LeavesEdible Uses: Leaves - cooked[105]. A famine food, they are only used when all else fails[105].

tcanta None known

dwatta None known

propta Seed - sow spring or autumn in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in the spring.

nwatta Succeeds in ordinary garden soil[1]. Prefers a good moist soil that does not dry out in the summer, in sun or partial shade[187, 200]. Hardy to about -20°C[187]. A very ornamental plant[1].

## 5.2.736 Veronica longifolia

Garden Speedwell, Long-Leaf Speedwell

4 tlin 10 cyuc 1 kcaak 0 tcan 0 dwat 1 m hkuc  
htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwlis hpa7tmwatli fyifxre7t hjonli

drutta Veronica longifolia is a PERENNIAL growing to 1 m (3ft 3in) by 0.3 m (1ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcaakta Edible Parts: LeavesEdible Uses: Leaves and young shoots - raw or cooked. A famine food, they are only used when all else fails[179].

tcanta None known

dwatta None known

propta Seed - sow autumn in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in autumn or spring[200]. Larger divisions can be planted out

direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the summer or the following spring.

nwatta Landscape Uses:Border, Massing. Easily grown in a moderately fertile moisture retentive well drained soil[200]. Prefers cool summers[200]. A number of cultivars have been selected for their ornamental value[200]. Special Features:Attractive foliage, Naturalizing, Suitable for cut flowers, Extended bloom season in Zones 9A and above.

## 5.2.737 Potentilla reptans

Cinquefoil, Creeping cinquefoil

4 tlin 8 cyuc 1 kcaak 0 tcan 2 dwat 1 m hkuc  
htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatprikwlis hpa7tmwatli fyifxre7t hjonli

drutta Potentilla reptans is a PERENNIAL growing to 1 m (3ft 3in) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcaakta Edible Parts: LeavesEdible Uses: Young leaves - raw[7]. A useful addition to salads[7].

tcanta CosmeticThe plant is an ingredient in many anti-wrinkle cosmetic preparations for the skin[7].

dwatta Antidiarrhoeal Antispasmodic Astringent Febrifuge OdontalgicBoth the roots and the herb are antispasmodic, astringent and febrifuge[4, 7, 9, 54, 240]. An infusion of the dried herb is used in the treatment of diarrhoea etc, it is also used as a gargle for sore throats and is used externally as an astringent lotion[4]. A concentrated decoction of the root relieves toothache[7].

propta Seed - sow early spring or autumn in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring or autumn. Larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Easily grown in a well-drained loam, preferring a dry position in full sun but tolerating shade[1]. Prefers an alkaline soil but tolerates a slightly acid soil[200]. The plant spreads vigorously by means of runners and can be invasive with new runners up to 1.5 metres long being produced each year[1, 4]. Members of this genus are rarely if ever troubled by browsing deer[233]. The flowers are partially closed in dull weather and close completely of a night time[4]. When closing, self-fertilisation is affected because the anthers are caused to touch the stigmas[4].

## 5.2.738 Lonicera utahensis

Utah Honeysuckle

4 tlin 8 cyuc 1 kcaak 0 tcan 1 dwat 1.5 m hkuc  
htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwlis hpa7tmwatli xre7t hjonli

drutta Lonicera utahensis is a deciduous Shrub growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcaakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[212, 257]. The fruit is about 1cm in diameter[60].

tcanta None known

dwatta Laxative SalveThe branches are mildly laxative[257]. An infusion of the branches and leaves has been used as a wash on sores and infections[257].

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed requires 2 months cold stratification[113] and should be sown as soon as possible in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm with or without a heel, July/August in a frame. Good percentage[78]. Cuttings of mature wood of the current season's growth, 15 - 20cm with or without a heel, November in a cold frame. Good percentage[78]. Layering in autumn[200].

nwatta Grows best in a good moist soil in a sunny position, it does not fruit so well in the shade[200]. Closely related to *L. canadensis*[212].

## 5.2.739 Chasmanthium latifolium

Indian Woodoats, Wild Oats Grass, North American Wild Oats, Northern Sea Oats, Spanglegrass River Oa  
4 tlin 10 cyuc 1 kcaak 0 tcan 0 dwat 1 m hkuc  
hmimhtut cyutli tcup hwicli hrasljut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Chasmanthium latifolium is a PERENNIAL growing to 1 m (3ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: Seed - cooked. It can be used as a cereal in making bread, biscuits etc, or can be ground into a flour and used as a mush[177, 257]. A food crop of the Cocopa Indians of Mexico[236].

tcanta None known  
dwatta None known

propta Seed - sow early spring in situ and only just cover the seed[1]. Division in spring[200].

nwatta Landscape Uses:Container, Erosion control, Massing, Seashore, Specimen. Thrives in full sun or dappled shade on rich, moisture-retentive soils sheltered from strong winds[200]. The dried flower heads are sometimes used in flower arranging[274]. Special Features:Attracts birds, North American native, Invasive,Naturalizing, Wetlands plant, Attracts butterflies, Suitable for cut flowers, Suitable for dried flowers. The plant is heat tolerant in zones 9 through 5. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is fibrous dividing into a large number of fine roots [1-2].

## 5.2.740 Sanguisorba tenuifolia

4 tlin 8 cyuc 1 kcaak 0 tcan 0 dwat 1.2 m hkuc  
hmimhtut cyutli tcuphja7n hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Sanguisorba tenuifolia is a PERENNIAL growing to 1.2 m (4ft) by 0.6 m (2ft in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta Edible Parts: LeavesEdible Uses: Young leaves - cooked[105, 177].

tcanta None known  
dwatta None known

propta Seed - sow spring or autumn in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the cold frame for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in the spring.

nwatta Succeeds in ordinary garden soil[1]. Prefers a good moist soil that does not dry out in the summer, in sun or partial shade[187, 200]. Hardy to about -25°C[187]. A polymorphic species[58].

## 5.2.741 Artemisia abrotanum

Southernwood  
4 tlin 8 cyuc 1 kcaak 0 tcan 3 dwat 1.2 m hkuc  
hmimhtut cyutli hgatkuyctcup hwicli hyishrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Artemisia abrotanum is a deciduous Shrub growing to 1.2 m (4ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in leaf from March to November, in flower from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Edible Uses: Condiment TeaThe young shoots have a bitter, lemony flavour and are used in small quantities as a flavouring in cakes, salads and vinegars[1, 4, 7, 183, 244]. A tea is made from the young bitter shoots[183].

tcanta Dye Essential Hair Hedge Hedge Incense Potpourri RepellentInsect repellent. The growing plant repels fruit tree moths when growing in an orchard[6, 14, 18, 20]. The fresh plant can also be rubbed onto the skin to deter insects[7]. The shoots can be dried for indoor use, they remain effective for 6 - 12 months[169]. They are also said to repel ants[201]. Shoots can be burnt in the fireplace to remove cooking odours from the house[201]. The leaves have a refreshing lemon-like fragrance and are used in potpourri[245]. An essential oil from the leaves and flowering shoots is used in perfumery in order to add certain subtle tones[7]. A yellow dye is obtained from the branches[14, 268]. Plants can be grown as a low hedge, they tolerate quite hard clipping[200, 201]. An infusion of the plant is used as a hair tonic or conditioner[201].

dwatta Anthelmintic Antiseptic Cholagogue Deobstruent Emmenagogue Stomachic TonicSouthernwood has a long history of domestic herbal use, though it is now used infrequently in herbal medicine[254]. It is a strongly aromatic bitter herb that improves digestion and liver function by increasing secretions in the stomach and intestines, it stimulates the uterus and encourages menstrual flow, lowers fevers, relaxes spasms and destroys intestinal worms[238, 254]. The herb, and especially the young flowering shoots, is anthelmintic, antiseptic, cholagogue, deobstruent, emmenagogue, stomachic and tonic[4, 7, 165]. The main use of this herb is as an emmenagogue, though it is also a good stimulant tonic and has some nervine principle[4]. It is sometimes given to young children in order to expel parasitic worms and externally it is applied to small wounds in order to stop them bleeding and help them to heal[7]. The herb is also used externally in aromatic baths and as a poultice to treat skin conditions[268]. Southernwood should be used internally with caution, see the notes above on toxicity. It should not be prescribed for pregnant women, especially in the first trimester of pregnancy, since it can encourage menstrual flow[238].

propta Seed - surface sow from late winter to early summer in a greenhouse. The seed usually germinates in 1 - 2 months at 15°C[134]. When large enough to handle, prick the seedlings out into individual pots. Once the seedlings are more than 15cm tall, plant them out into their permanent positions in late spring or summer. Cuttings of young wood 8cm long, May in a frame[169]. Cuttings of half-ripe wood with a heel, July/August in a frame[1].

## 5.2.885 Aster lanceolatus

White Panicle Aster  
4 tlin 8 cyuc 0 kcaak 2 tcan 1 m hkuc  
hmimhtut cyutli tcup hwicli hyishrasljutnyik hpa7tli flatprikliwis hpa7tmwatli fyixre7t hjonli

drutta Aster lanceolatus is a PERENNIAL growing to 2 m (6ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles, Lepidoptera (Moths and Butterflies). The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known  
tcanta Attracts wildlife

dwatta Febrifuge VulneraryAn infusion of the plant, combined with another unnamed plant, has been used in the treatment of fevers[257]. A decoction of the plant has been used to dress wounds[257]. The dried and powdered plant has been used as a salve on abrasions[257]. Smoke from the crushed blossoms has been inhaled in the treatment of nosebleeds[257].

propta Seed - surface sow in spring in a cold frame. Do not allow the compost to become dry. Pre-chilling the seed for two weeks can improve germination rates[134]. Germination usually takes place within 2 weeks at 20°C[134]. When large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring or autumn[200]. Very easy, larger divisions can be planted straight into their permanent positions whilst smaller clumps are best potted up and kept in a cold frame until they are growing away well. Basal cuttings in late spring. Harvest the shoots when they are about 10 - 15cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Succeeds in most good garden soils[1], preferring one that is well-drained and moisture retentive[200]. Prefers a sunny position[200], but it also succeeds in partial shade[233]. Prefers a rich soil[1], but tolerates poor ones[233]. There are some named varieties, selected for their ornamental value[257]. Plants need to be divided every few years, preferably in the spring, in order to keep the plant vigorous[187]. Most species in this genus seem to be immune to the predations of rabbits[233]. The flowers attract butterflies and moths, it is also a good bee plant providing nectar in autumn[30].

## 5.2.886 Osmunda regalis

Royal Fern, Flowering Fern  
4 tlin 9 cyuc 0 kcaak 0 tcan 2 dwat 2 m hkuc  
hmimhtut cyutli tcuphja7n hwicli hrasljutnyik hpa7tli frusflatprikliwis hpa7tmwatli hjonli

drutta Osmunda regalis is a FERN growing to 2 m (6ft) by 1 m (3ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 2. The seeds ripen from June to August. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta None known  
tcanta Compost FibreThe hairs of the plant are mixed

with wool and are used in making cloth[46, 61]. The roots are the source of 'Osmunda fibre', this was once widely used for potting orchids and other epiphytes[200]. Plants can be grown as a ground cover when spaced about 1 metre apart each way[208].

dwatta Astringent Diuretic Tonic VulneraryThe root is astringent, diuretic, tonic and vulnerary[4, 7, 21]. It is useful in the treatment of jaundice and removing obstructions of the visceras[4]. The fronds are used to make compresses for external application to wounds and rheumatic joints - for which purposes they are fairly effective[7]. An infusion of the fronds, combined with wild ginger roots (Asarum species)

has been used in the treatment of children with convulsions caused by intestinal worms[257].

propta Spores - they very quickly lose their viability (within 3 days) and are best sown as soon as they are ripe on the surface of a humus-rich sterilized soil in a lightly shaded place in a greenhouse. Keep the compost moist, preferably by putting a plastic bag over the pot. Plants develop very rapidly, pot on small clumps of plantlets as soon as they are large enough to handle and keep humid until they are well established. Do not plant outside until the ferns are at least 2 years old. Cultivars usually come true to type[200]. Division of the rootstock in the dormant season. This is a very strenuous exercise due to the mass of wiry roots[200].

nwatta Landscape Uses:Border, Container, Ground cover, Rock garden, Specimen, Woodland garden. An easily grown plant[4, 187], it prefers a soil of swamp mud and loamy or fibrous peat, sand and loam[1, 4]. Succeeds in most moist soils, preferring acid conditions[200]. Requires a constant supply of water, doing well by ponds, streams etc[1]. Plants thrive in full sun so long as there is no shortage of moisture in the soil and also in shady situations beneath shrubs etc[200]. Plants are hardy to at least -20°C, they are ever-green in warm winter areas but deciduous elsewhere[200]. Members of this genus are rarely if ever troubled by browsing deer[233]. Transplants well, even when quite large[4]. Some named forms have been selected for their ornamental value[187]. Special Features:Attractive foliage, North American native, Naturalizing, Wetlands plant, There are no flowers or blooms.

## 5.2.887 Rhus radicans

Poison Ivy  
4 tlin 8 cyuc 0 kcaak 0 tcan 1 dwat 2.5 m hkuc  
htut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

drutta Rhus radicans is a deciduous Climber growing to 2.5 m (8ft 2in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from May to June, and the seeds ripen from September to November. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: OilEdible Uses: OilNone known  
tcanta Dye Ink Mordant OilThe leaves are rich in tannin. They can be collected as they fall in the autumn and used as a brown dye or as a mordant[169]. An oil is extracted from the seeds[4]. It attains a tallow-like consistency on standing and is used to make candles. These burn brilliantly, though they emit a pungent smoke[4]. An excellent marking ink is obtained from this plant[11].

dwatta Hepatic Skin TonicPoison ivy has occasionally been used medicinally, though it is an extremely poisonous plant and great caution should be exercised. Any herbal use should only be undertaken under the supervision of a qualified practitioner. See also the notes above on toxicity. This plant has been used in the past by physicians in the treatment of paralysis and liver disorders[222]. A decoction of the leaves has been used as a tonic and rejuvenator[257]. The whole or the broken leaves have been rubbed over the skin to treat boils and skin eruptions[257]. The leaves have been rubbed on skin that has been affected by a poison ivy reaction[257].

propta Seed - best sown in a cold frame as soon as it is ripe. Pre-soak the seed for 24 hours in hot water (starting at a temperature of 80 - 90c and allowing it to cool) prior to sowing in order to leach out any germination inhibitors[200]. The stored seed also needs hot water treatment and can be sown in early spring in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 10cm with a heel, July/August in a frame[200]. Root cuttings 4cm long taken in December and

begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is fibrous dividing into a large number of fine roots [1-2].

## 5.2.883 Solanum dulcamara

Bittersweet. Bittersweet Nightshade, Climbing nightshade, Bittersweet, Deadly Nightshade, Poisonous
4 tin 8 cyuc 0 kcaak 0 tcan 3 dwat 2.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Solanum dulcamara is a PERENNIAL CLIMBER growing to 2.5 m (8ft) by 2.5 m (8ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from June to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure.

kcakta None known

tcanta None known

dwatta Alternative Anodyne Cancer Depurative Diuretic Eczema Emetic Expectorant Hepatic Homeopathy Narcotic PurgativeBittersweet is a poisonous plant that has a long history of use in the treatment of skin diseases, warts, tumours, felons etc[238]. It should be used with caution and only under the supervision of a qualified practitioner, this is a poisonous plant that, in excess, paralyzes the central nervous system, slows the heart and respiration, and lowers temperature, causing vertigo, delirium, convulsions and death[21, 238]. See also the notes above on toxicity. All parts of the plant are alterative, anodyne, depurative, mildly diuretic, emetic, expectorant, hepatic, mildly narcotic and purgative[4, 7, 9, 13, 21, 165]. The dried stem, usually collected in the autumn and preferably from the ends of branches 2 - 3 years old, is the part that is most valued medicinally, though the leaves are also used[4]. The plant is chiefly used as an alterative when taken internally in the treatment of a range of skin diseases, it is also used in the treatment of arthritis, rheumatism, bronchial congestion, heart ailments, ulcerative colitis and jaundice[4, 218, 238]. Externally, the plant is used to treat skin eruptions, ulcers, rheumatism and cellulite[238]. Two to three year old stems are harvested in the spring, or after the leaves have fallen in the autumn, and dried for later use[238]. The fruits are marinated in vinegar and applied to cancerous sores and other swellings[218]. A decoction of the root is used in the treatment of cancer and swellings[218]. The root is harvested in the autumn and dried for later use[238]. A homeopathic remedy is made from the fresh, green, still pliant stems and leaves, harvested as the plant begins to flower[232]. This is used in treating a variety of complaints including backaches, cough, diarrhoea, eye inflammations and joint pains[232]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve Solanum dulcamara for eczema, furuncles (boils), acne, warts (see [302] for critics of commission E).

propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out into their permanent positions in the summer. If you have sufficient seed then it can be sown outdoors in situ in the spring. Division in spring.

nwatta An easily grown plant, it succeeds in most soils[1, 202]. Prefers a damp shady position and a neutral to alkaline soil[10, 238]. Succeeds in full sun to light shade[202]. If being grown for its medicinal uses, the plant is best placed in a dry and exposed position[4]. Hardy to at least -15°c[202]. Special Features:Attractive foliage, Not North American native, Invasive, Naturalizing, All or parts of this plant are poisonous.

### 5.2.884 Rhus diversiloba

Western Poison Oak, Pacific poison oak
4 tin 8 cyuc 0 kcaak 0 tcan 2 dwat 2.5 m hkuc htut cyutli tcup hwicli hyishrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

drutta Rhus diversiloba is a deciduous Shrub growing to 2.5 m (8ft 2in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: OilEdible Uses: OilNone known

tcanta Basketry Dye Ink Mordant OilThe leaves are rich in tannin. They can be collected as they fall in the autumn and used as a brown dye or as a mordant[169]. An oil is extracted from the seeds[4]. It attains a tallow-like consistency on standing and is used to make candles. These burn brilliantly, though they emit a pungent smoke[4]. The supple stems are used as the warp in basket making[92]. Slender stems are used as circular withes in basket making[257]. An excellent black dye is obtained by exposing the sap to air[92].

dwatta Antidote Contraceptive Eczema Ophthalmic WartsWestern poison oak was employed medicinally by some native North American Indian tribes who used it to treat various complaints[257]. In view of the potential toxicity of the plant, extreme caution is advised in any use of it. See the notes above on toxicity. A leaf has been swallowed in the spring as a contraceptive[257]. A tincture of the fresh leaves has been used in the treatment of eczema and skin diseases[4]. It is also used in the treatment of warts, ringworm etc[92]. A poultice of the fresh leaves has been applied to rattlesnake bites[257]. The leaf buds have been eaten in the spring in order to obtain immunity from the plant poisons[257] A moxa of the plant has been used in the treatment of warts and ringworm[257]. The juice of the plant has been used as a treatment for warts[257]. An infusion of the dried roots has been taken in order to give immunity against any further poisoning[257]. A decoction of the roots has been used as drops in the eyes to heal tiny sores inside the eyelids and to improve vision[257].

propta Seed - best sown in a cold frame as soon as it is ripe. Pre-soak the seed for 24 hours in hot water (starting at a temperature of 80 - 90c and allowing it to cool) prior to sowing in order to leach out any germination inhibitors[200]. The stored seed also needs hot water treatment and can be sown in early spring in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 10cm with a heel, July/August in a frame[200]. Root cuttings 4cm long taken in December and potted up vertically in a greenhouse. Good percentage[78, 200]. Suckers in late autumn to winter[200].

nwatta Succeeds in a well-drained fertile soil in full sun[200]. Plants do not require a rich soil[11]. The young growth in spring can be damaged by late frosts. Plants have brittle branches and these can be broken off in strong winds[200]. Plants are also susceptible to coral spot fungus[11]. This species is closely related to R. toxicodendron[1]. Many of the species in this genus, including this one, are highly toxic and can also cause severe irritation to the skin of some people, whilst other species are not poisonous. It is relatively simple to distinguish which is which, the poisonous species have axillary panicles and smooth fruits whilst non-poisonous species have compound terminal panicles and fruits covered with acid crimson hairs[1, 4]. The toxic species are sometimes separated into their own genus, Toxicodendron, by some botanists[200]. Plants in this genus are notably resistant to honey fungus[200]. Dioecious. Male and female plants must be grown if seed is required.

nwatta Succeeds in most soils, preferring a well-drained one that is not too rich[1, 11]. Easily grown in a well-drained circumneutral or slightly alkaline loamy soil, preferring a sunny position[1, 200]. Plants are longer lived, more hardy and more aromatic when they are grown in a poor dry soil[245]. Tolerates a pH in the range 6.3 to 7.6. Established plants are drought tolerant. Plants succeed in maritime gardens[233]. Southernwood is often grown in the herb garden, the leaves are very aromatic[182]. It is best to cut the plant back fairly hard every spring in order to keep it compact and encourage plenty of new growth[233, 268]. The plant rarely produces flowers in British gardens[11]. A good companion plant for cabbages[14, 18, 20]. It is also a good plant to grow in the orchard, where it can help to reduce insect pests[201]. Plants in this genus are notably resistant to honey fungus[200]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 5.2.742 Cimicifuga dahurica

Xing An Sheng Ma

4 tin 8 cyuc 1 kcaak 0 tcan 3 dwat 1.5 m hkuc hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Cimicifuga dahurica is a PERENNIAL growing to 1.5 m (5ft) by 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from August to September, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young leaves - cooked[177]. Some caution is advised, see the notes above on toxicity.

tcanta None known

dwatta Analgesic Antibacterial Antiviral Depurative Diaphoretic Diuretic Febrifuge Sedative TonicThis plant is an anti-infective herb that lowers fevers and reduces pain[238]. The root is analgesic, antibacterial, antiviral, depurative, diaphoretic, diuretic, febrifuge, sedative, tonic[46, 61, 147, 176, 218]. It is used internally in the treatment of coughs, colds, headaches, gum diseases and feverish infections such as measles[238]. The root is harvested in the autumn and used fresh or dried[238]. Use with caution[176], see the notes above on toxicity.

propta Seed - best sown as soon as it is ripe in a cold frame[1]. Only just cover the seed. It germinates in 1 - 12 months or even longer at 15°c[164]. The seed does not store well and soon loses its viability[200], stored seed may germinate better if given 6 - 8 weeks warm stratification at 15°c and then 8 weeks cold stratification[164]. Prick out the young seedlings into individual pots when they are large enough to handle and grow them on in a frame for their first winter. Plant out in late spring or early summer[K]. Division in spring or autumn[1]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the summer or following spring.

nwatta Prefers a moist humus rich soil and some shade[1, 200]. Succeeds in ordinary garden soil[1]. Grows well in a cool moist site in a woodland[200]. The flowers have an unusual, slightly unpleasant smell[188]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

## 5.2.743 Meconopsis grandis

Blue Poppy

4 tin 8 cyuc 1 kcaak 0 tcan 0 dwat 1 m hkuc hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Meconopsis grandis is a PERENNIAL growing to 1 m (3ft 3in) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in June, and the seeds ripen in August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil.

Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: Seed - roasted and pickled[272].

tcanta None known

dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe in late summer. Spring sown seed is slower to germinate[200]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring or autumn[200]. Some growers prefer to divide the plant immediately after flowering[200].

nwatta Grows best in a woodland soil in partial shade[1, 200]. The soil should be lime-free, moist, well-drained and moderately rich[200]. Dislikes full sun and windy positions[200]. Plants are best divided every three years in order to maintain their vigour[200].

## 5.2.744 Juncus effusus

Soft Rush, Common rush, Lamp rush, Pacific rush

4 tin 8 cyuc 1 kcaak 0 tcan 2 dwat 1.5 m hkuc hmimhtut cyutli tcuphja7hns6s hwicli hrasjlutnyikfrip hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Juncus effusus is a PERENNIAL growing to 1.5 m (5ft) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can grow in water. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: LeavesEdible Uses: Young shoots - raw[118, 257]. Some caution is advised, see the notes above on toxicity.

tcanta Basketry Lighting Paper Strewing String Thatching WeavingStems are used in basket making, thatching, weaving mats etc[23, 46, 66, 99, 115, 171]. The stems can also be dried then twisted or braided into ropes for tying or binding[257]. Stems can be peeled (except for a small spine which is left to keep them upright) and soaked in oil then used as a candle[6, 46, 61, 115]. A fibre obtained from the stems is used for making paper[189]. The stems are harvested in late summer or autumn, they are split and cut into usable pieces and then soaked for 24 hours in clear water. They are then cooked for 2 hours with lye and beaten in a blender. The fibres make an off-white paper[189]. When mixed with mulberry fibres they can be used for making stencil paper[189]. The whole plant was formerly used as a strewing herb[1, 66, 115].

dwatta Antiphlogistic Depurative Diuretic Febrifuge Lenitive Lithontripic Pectoral Sedative UrinaryThe pith of the stem is antiphlogistic, depurative, discutient, diuretic, febrifuge, lenitive, lithontripic, pectoral and sedative[147, 176, 178, 218, 240]. It is used in the treatment of sore throats, jaundice, oedema, acute urinary tract infection and morbid crying of babies[176].

propta Seed - surface sow in pots in a cold frame in early spring and keep the compost moist. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer if they have grown sufficiently, otherwise in late spring of the following year. Division in spring. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Easily grown in a moist soil, bog garden or shallow water[1, 200]. Prefers a heavy soil in sun or light shade[200].

## 5.2.745 Ammophila arenaria

Marram Grass, European beachgrass

4 tin 8 cyuc 1 kcaak 4 tcan 0 dwat 1.2 m hkuc htut cyutli hgatkyuctup hwicli hyishrasjut hpa7tli frusflatprikliwis hpa7tmwatli xre7t hjonli

drutta Ammophila arenaria is a PERENNIAL growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK

zone 5. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

kcakta Edible Parts: RootEdible Uses: Root[74]. No more details, but the root is rather thin and fibrous[K].

tcanta Basketry Broom Fibre Paper Soil stabilization Thatching WeavingThe flowering stems and leaves are used for thatching, in basketry, making brooms etc[61, 66, 100]. The rhizomes are used for making rope and mats[115]. A fibre obtained from the stems is used for making paper[189]. The stems are harvested in the summer, cut into usable pieces and soaked for 24 hours in clear water before cooking for 2 hours with soda ash. Beat the fibres in a ball mill for 1½ hours. The fibres make a tan-brown paper[189]. This plant has an extensive root system and grows naturally in sand dunes along the coast where it is very important for its action of binding the dunes and therefore allowing other plants to grow. It is much planted in sand dunes and other similar habitats for erosion control[200].

dwatta None known  
propta Seed - sow in pots outdoors as soon as it is ripe or sow in situ during March/April. Division in spring or autumn. nwatta Requires a sunny position in a light well-drained soil. Very tolerant of severe maritime exposure[17]. Tolerates a pH in the range 4.5 to 6.8.

## 5.2.746 *Salvia glutinosa*

Jupiter's Distaff, Sticky Sage

4 tin 8 cyuc 1 kcak 0 tcan 0 dwat 1.2 m hkuc  
hmimhtut cyutli kyuctcup hwicli hrasjlut hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Salvia glutinosa* is a PERENNIAL growing to 1.2 m (4ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Edible Uses: Condiment GumThe aromatic leaves are used as a flavouring in country wines[183].

tcanta GumAn aromatic gum is obtained from the plant[244]. No details are given of an uses for this gum[K]. Plants can be grown as a ground cover when spaced about 75cm apart each way[208]. They are useful for colonizing large areas[208].

dwatta None known  
propta Seed - sow March/April in a greenhouse[200]. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in the summer. Cuttings of half-ripe wood succeed at almost any time in the growing season[200].

nwatta Requires a very well-drained light sandy soil in a sunny position[200]. Succeeds in any good soil in full sun or partial shade[187]. Plants can be grown in quite coarse grass, which can be cut annually in the autumn[233]. Plants are hardy to about -20°C[187]. During the summer the whole plant becomes covered in a tacky substance like a fragrant gum[245]. This species has a running root system and can spread freely[233]. Plants can be killed by excessive winter wet[200]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 5.2.747 *Ageratina aromatica*

4 tin 8 cyuc 1 kcak 0 tcan 1 dwat 1.5 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli fyifxre7t hjonli

drutta *Ageratina aromatica* is a PERENNIAL growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 4. The species is hermaphrodite (has both male and

female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: One report says that the root is aromatic and suggests that it could be edible[177].

tcanta None known  
dwatta Antispasmodic Diaphoretic Diuretic Expecto- rantThe plant is antispasmodic, diaphoretic, diuretic and expectorant[61]. It is used in the treatment of inflammation and irritability of the bladder[4], ague, pulmonary diseases, stomach complaints and nervous diseases[207].

propta Seed - sow spring in a cold frame, only just covering the seed. When large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring.

nwatta Succeeds in an ordinary well-drained but moisture retentive garden soil in sun or part shade[200].

## 5.2.748 *Festuca pratensis*

Meadow fescue

4 tin 10 cyuc 1 kcak 3 tcan 0 dwat 1 m hkuc  
hmimhtut cyutli kyuctcup hwicli hyishrasjlutnyik hpa7tli frusflatprikliwsslip hpa7tmwatli hjonli

drutta *Festuca pratensis* is an evergreen Perennial growing to 1 m (3ft 3in) by 0.5 m (1ft 8in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. The flowers are pollinated by Wind. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil. It cannot tolerate atmospheric pollution.

kcakta Possible edible seeds [1-4]  
tcanta FodderF. pratensis has been valued for centuries as a pasture grass in temperate regions. It is more cold tolerant than *Festuca arundinacea*, although it is not as productive. Animal feed, fodder, forage. Environmental: Erosion control or dune stabilization. Genetic importance: Gene source. An ornamental grass [1-8]. Faunal Associations: Insects that feed on Fescue grasses (*Festuca* spp.) include caterpillars of the skipper *Atalopedes campestris* (Sachem), larvae of the moth *Pediasia trisecta* (Larger Sod Webworm), *Camnula pellucida* (Clear-winged Grasshopper), *Oulema melanopus* (Cereal Leaf Beetle), *Sphenophorus parvulus* (Bluegrass Billbug), *Blissus leucopterus hirtus* (Hairy Chinch Bug), *Metopolophium dirhodum* (Rose-Grass Aphid), *Rhopalosiphum oxyacanthae* (Apple-Grass Aphid), *Tetraneura ulmi* (Elm and Grass Root Aphid), and other aphids. Horses, cattle, and other hoofed farm animals graze on the foliage of Meadow Fescue. The seeds of Meadow Fescue are eaten by the Greater Prairie Chicken. Meadow Fescue collapses into sprawling mats of vegetation during the winter, which probably provides good cover for voles and other small rodents [1-6].

dwatta None Known  
propta Slow to establish, this grass requires a clean seedbed. Propagated from sown at a rate of 11?28 kg/ha. Optimum temperature for germination, 20?30°C. In mixtures with clovers sown 9?13 kg/ha; with alfalfa, 3 kg/ha. Combines well with clovers, *Lotus corniculatus*, alfalfa and grasses, as *Phleum pratense* and *Dactylis glomerata*, producing a large proportion of leafy bottom growth (Reed, 1976).

nwatta A perennial grass growing 30-120cm high. It can be erect or spreading [1-4]. Ranging from Boreal Moist to Rain through Subtropical Dry Forest Life Zones, meadow fescue is reported to tolerate annual precipitation of 3.2 to 13.6 dm, annual temperature of 4.3 to 21.1°C, and pH of 4.5 to 8.2 (Duke, 1978, 1979). Adapted to cool climates as a cool-season turfgrass. Thrives in deep rich soil, but also grows well on calcareous or sandy soils provided they are moist. In native areas, found in meadows, forest margins, thin forests (Reed, 1976). In Pakistan it grows at about 2,000 m altitude. In Sichuan and Yunnan [1-4]. Flowering from June until August in the Northern Hemisphere. US Forest Service (2016)

them on in the cold frame for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. The seed can also be sown in outdoor seed beds in the autumn. You can leave the plants to grow on in the seedbed for up to 4 years before planting them out into their permanent positions in the winter. Cuttings of half-ripe wood, 5 - 10cm with a heel, July/August in a frame. Very easy[78]. Cuttings of mature wood, 20 - 30cm in a sheltered outdoor bed in November/December[78]. The cuttings can also be placed in situ if required. High percentage[78].

nwatta A very tolerant and easily grown plant, it succeeds in any soil that is not very impoverished[11]. Grows well in heavy clay soils. Prefers a calcareous soil and succeeds in thin dry soils[186]. Grows well in light woodland or the full shade of a wall but flowers and fruits best in a sunny position[186]. Tolerant of atmospheric pollution, once established they also tolerate drought but are intolerant of water-logging[186]. A suckering shrub, forming dense thickets and making good bird cover[186]. An important food plant for many caterpillars, including the larvae of the privet hawk moth[186]. This species is notably susceptible to honey fungus[200]. Special Features:Not North American native, Invasive, Naturalizing, Attractive flowers or blooms.

## 5.2.880 *Baccharis halimifolia*

Bush Groundsel, Eastern baccharis, High Tide Bush, Sea Myrtle, Salt Bush

4 tin 8 cyuc 0 kcak 0 tcan 1 dwat 3.5 m hkuc  
htut cyutli kyuctcup hwicli hyishrasjlutnyik hpa7tli flatprikliwsslipshom hpa7tmwatli nyanhjen hjonli

drutta *Baccharis halimifolia* is a deciduous Shrub growing to 3.5 m (11ft) by 3.5 m (11ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline and saline soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcakta None known  
tcanta Fuel Hedge Hedge Soil stabilizationA good fast-growing hedge for exposed maritime conditions[11, K]. It retains its leaves into the new year but is rather bare in late winter[K]. Plants have an extensive root system and can be grown on sand or thin coastal soils in order to bind the soil[200]. Resinous secretions on the leaves and wood make this a useful fuel[11]. It is a fairly small plant though and would not be a very productive source.

dwatta DemulcentThe plant is used as a palliative and demulcent in consumption and cough[207].

propta Seed - no pre-treatment is required[113]. Surface sow in pots a cold frame in the spring, do not let the compost dry out. Germination usually takes place within 1 - 2 weeks[113]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the cold frame for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame. Very easy[K]. Cuttings of mature wood of the current seasons growth, November in a frame. Easy[K].

nwatta Landscape Uses:Seashore. Succeeds in a sunny position in any well-drained soil[11, 188], from heavy clays to pure sands[113]. Tolerates saline conditions and dry soils[188, 200]. A useful shrub for coastal situations, resisting maritime exposure[11]. Plants are hardy to about -15°C[200]. A fast-growing plant, it is very tolerant of pruning and can be cut right back to the base if required[K]. The presence of this plant growing wild was supposed to indicate areas where oil might be found[207]. Dioecious. Male and female plants must be grown if seed is required. Special Features:North American native, All or parts of this plant are poisonous, Wetlands plant, Attractive flowers or blooms.

## 5.2.881 *Rudbeckia hirta*

Black Eyed Susan, Coneflower, Gloriosa Daisy, Marguerite Jaune

4 tin 9 cyuc 0 kcak 0 tcan 1 dwat 2 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Rudbeckia hirta* is a BIENNIAL/PERENNIAL growing to 2 m (6ft) by 0.5 m (1ft 8in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from July to October, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, hoverflies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta None known  
tcanta A yellow dye is obtained from the flowers[257].  
dwatta An infusion of the roots has been used in the treatment of colds, dropsy and worms in children[257]. A warm infusion of the root has been used as a wash on sores and snake bites[257]. The ooze from the roots has been used as drops to treat earaches[257].

propta Seed - sow April in a greenhouse. Only just cover the seed. Germination should take place within 2 weeks, prick out the seedlings into individual pots when they are large enough to handle and plant them out in the summer[K]. The seed can also be sown in situ[111].

nwatta Landscape Uses:Border, Container, Foundation, Specimen. Succeeds in an ordinary medium soil in sun or shade[111]. Requires a moist soil[1]. Prefers a well-drained soil[188]. Dormant plants are hardy to about -25°C[187]. This species is a biennial or short-lived perennial[200]. Some named forms have been selected for their ornamental value[200]. Members of this genus are rarely if ever troubled by browsing deer[233]. Special Features: North American native, Naturalizing, All or parts of this plant are poisonous, Attracts butterflies, Suitable for cut flowers.

## 5.2.882 *Mildopogon gerardii*

Big Bluestem

4 tin 8 cyuc 0 kcak 2 tcan 1 dwat 2 m hkuc  
htut cyutli kyuctcup hwicli hras hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Mildopogon gerardii* is a PERENNIAL growing to 2 m (6ft) by 2 m (6ft). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta None known  
tcanta Good forage for horses and cattle, and can also be cut and used for hay. A desirable and ecologically important grass by cattle ranchers and rangeland ecologists. Due to its drought tolerance it is used in wildlife gardens, natural landscaping, and grassland habitat restoration projects. A potential feedstock for ethanol production.

dwatta Analgesic Carminative DiureticThe plant is analgesic, carminative and diuretic[222]. A decoction of the roots is used in the treatment of stomach-aches and flatulence[222, 257]. A tea made from the leaves is used as a wash to relieve fevers and general debility[222, 257].

propta Seed - surface sow in early spring in a greenhouse. When large enough to handle, prick the seedlings out into individual pots and grow them on for the first winter in a cold greenhouse. Plant out in late spring or early summer, after the last expected frosts. Division in spring.

nwatta Requires a light porous sandy soil in full sun[200]. A very ornamental plant, it forms large clumps, spreading by short stolons[200]. The plant is heat tolerant in zones 7 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants

when grown in northern Britain[11]. The fleshy roots are easily damaged and any transplanting is best done during a spell of mild moist weather in late spring[182]. The flowers, which start to be produced when the plant is less than a metre tall, are deliciously scented[245]. The young wood is aromatic[219]. Special Features:Attractive foliage, Extended bloom season in Zones 9A and above, Fragrant flowers, Blooms are very showy.

## 5.2.877 Clematis columbiana

Rock Clematis

4 tlin 8 cyuc 0 kcak 0 tcan 1 dwat 3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Clematis columbiana is a deciduous Climber growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known
tcanta Hair Insulation TinderThe seed floss makes an excellent tinder for starting fires, a spark from a flint will quickly ignite it[212]. The seed floss can be used as an insulation in shoes etc[212]. An infusion of the leaves alone, or the leaves and stems, has been used as a hair wash to prevent gray hair[257].

dwatta Eczema Foot care Salve SkinA poultice of the pounded, dampened leaves has been applied to the feet to treat sweaty feet[257]. A cold infusion of the plant can be used as a lotion on swollen knees and ankles[257]. The plant has been used as a head wash and to treat scabs and eczema[257].

propta Seed - best sown as soon as it is ripe in a cold frame[164, 200]. Sow stored seed as soon as it is obtained in a cold frame. Pre-soak the seed for 12 hours in warm water and remove as much of the tail and outer coat as possible[164]. A period of cold stratification is beneficial[164]. The seed germinates in 1 - 9 months or more at 20°c[164]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for the first winter. Plant out in late spring or early summer, after the last expected frosts. Internodal cuttings of soft to semi-ripe wood, late spring in sandy soil in a frame[200]. Layering of old stems in late winter or early spring[200]. Layering of current seasons growth in early summer[200].

nwatta Prefers a deep moist soil with its roots in the shade[11, 200]. Dislikes poorly-drained heavy clay soils, but grows well in clay if grit is added for drainage[11, 200]. Dislikes light sandy soils[11]. Does well on chalk[1]. Succeeds in acid as well as alkaline soils[200]. When planting out, in order to avoid the disease 'clematis wilt', it is best to plant the rootball about 8cm deeper in the soil. This will also serve to build up a good root crown of growth buds[200]. A twining plant[182]. The leafstalks wrap themselves around twigs and branches for support. When a side of the stalk touches an object, the growth on that side slows down whilst the other side grows at its normal rate - this causes the leaf stalk to entwine the object it is touching[212]. Plants in this genus are notably resistant to honey fungus[200]. Plants seem to be immune to the predations of rabbits[233]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

## 5.2.878 Menispermum davuricum

4 tlin 8 cyuc 0 kcak 0 tcan 2 dwat 3.6 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

drutta Menispermum davuricum is a deciduous Climber growing to 3.6 m (11ft 10in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from June to July, and the seeds ripen from October to November. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). . The plant is not self-fertile. Suitable for: light

(sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta None known

dwatta Antirheumatic Cancer SkinThe root is anti-rheumatic and is also used in the treatment of cancer[218]. The whole plant is used to alleviate skin allergies and is also used in the treatment of cancer[218].

propta Seed - sow late winter in a greenhouse[78, 113]. Two months cold stratification speeds up germination[113] so it might be better to sow the seed as soon as it is ripe in a cold frame[K]. Germination is usually good[78]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of mature wood, autumn in a frame[200]. Division of suckers in early spring[78, 113]. The suckers can be planted out direct into their permanent positions, though we prefer to pot them up and grow them on in light shade in a greenhouse or cold frame until they are established[K].

nwatta Succeeds in any moderately fertile soil that does not dry out excessively in summer, in sun or partial shade[200]. Prefers full sun[219]. This species is hardy to about -30°c, but, due to a lack of summer heat, the plants usually produce soft growth in mild maritime areas and this can be cut to the ground at temperatures around -5 to -10°c[200]. The plants do not require pruning, but can benefit from being cut back to ground level every 2 - 3 years in order to keep them tidy[219]. Closely related to *M. canadense*, differing mainly in its annual or rarely persistent aerial stems[200]. A twining plant, it spreads freely by means of underground suckers[11, 182]. Dioecious. Male and female plants must be grown if seed is required.

## 5.2.879 Ligustrum vulgare

Privet, European privet , Common Privet

4 tlin 7 cyuc 0 kcak 3 tcan 1 dwat 3 m hkuc hmimhtut cyutli hgatkyuctup hwicli hrasjlutnyikfrip hpa7tli flatprikliwisslip hpa7tmwatli xre7t hjonli

drutta Ligustrum vulgare is an evergreen Shrub growing to 3 m (9ft) by 3 m (9ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in leaf all year, in flower from June to July, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure. It can tolerate atmospheric pollution.

kcakta None known

tcanta Basketry Charcoal Dye Ink WoodA yellow dye is obtained from the leaves[6], from the bark, according to other reports[46, 61]. A bluish-green dye is obtained from the berries[6, 46, 61]; it is more permanent than most greens[115]. A black dye can also be obtained from the fruit[61] and an ink[46, 61]. Wood - hard, close-grained. It is valuable for turning if it reaches sufficient size[115] and can also make small tools[46, 61]. The wood is a source of charcoal[46, 61]. The young twigs are used in basketry and hurdle making[46, 61, 100]. Landscape Uses Border, Hedge, Screen, Superior hedge. Naturalizing, Attractive flowers or blooms.

dwatta Astringent Bitter Detergent VulneraryThe leaves are astringent, bitter, detergent, vulnerary[7, 21]. Internal use of this plant should be avoided since it can produce allergic symptoms[7]. Externally it is a safe and effective treatment[7]. The bark has been used as a stomachic[7], though this is not really recommended.

propta Sow the seed in spring in a cold frame. Stored seed germinates better if it is stratified.[113]. Remove any fruit flesh from around the seed before it is sown since this can inhibit germination[113]. When they are large enough to handle, prick the seedlings out into individual pots and grow

records that it is tolerant of acid soils but may also occur in calcareous soils. Although it survives regular mowing, this grass prefers unmowed or little-mowed areas [1-6].

## 5.2.749 Spiraea salicifolia

Bridewort, Willowleaf meadowsweet

4 tlin 8 cyuc 1 kcak 0 tcan 1 dwat 1.8 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Spiraea salicifolia is a deciduous Shrub growing to 1.8 m (6ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from June to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves OilEdible Uses: OilYoung leaves - cooked[177]. Rich in vitamin C[105].

tcanta Hedge Hedge Oil Soil stabilizationA soil stabilizer for river and lakeside banks[200]. Plants are frequently planted in hedges[17].

dwatta Astringent Pectoral Vitamin CThe roots have been used in the treatment of coughs and chest colds[257]. Immature seeds have been used in the treatment of diarrhoea with blood[257].

propta Seed - we have no information for this species but suggest sowing the seed as soon as it is ripe in a cold frame if possible. It is likely to require stratification before it germinates, so stored seed should be sown in a cold frame as early in the year as you receive it. Prick out the seedlings into individual pots when they are large enough to handle, and grow them on in a cold frame for their first winter. Plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, July/August in a light sandy soil a frame. Cuttings of mature wood of the current seasons growth, 15cm long, October/November in an outdoor frame[200]. Another report says that September is a good time to do this[11]. Division of suckers in early spring[200]. They can be planted out straight into their permanent positions.

nwatta Tolerates most soils[200], but prefers a good loamy soil, abundant moisture and full sunlight[11, 200]. Prefers a moist lime-free soil[182], plants quickly become chlorotic on chalk soils[200]. A very cold hardy plant, tolerating temperatures down to about -25°c[184]. Hybridizes freely with other members of this genus[11]. A rampant suckering shrub, it quickly produces dense thickets[182]. It is apt to get thin and poor unless divided up fairly regularly and replanted in fairly good soil[1].

## 5.2.750 Sorbus sitchensis

Sitka Mountain Ash, Western mountain ash

4 tlin 8 cyuc 1 kcak 0 tcan 1 dwat 1.8 m hkuc hmimhtut cyutli tcup hwicli hvihsrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Sorbus sitchensis is a deciduous Shrub growing to 1.8 m (6ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked in pies, preserves etc[62, 105, 161, 183]. Of poor quality[256]. The fruit turns sweeter and so tastes best after a frost[101]. The fruit is produced in clusters, each fruit being about 6 - 12mm in diameter[229].

tcanta Parasiticide Pioneer WoodThis species is capable of growing in exposed conditions in poor soils[229], and so could be used in re-forestation as a pioneer plant to provide suitable conditions for other woodland trees to be established[K]. It is rather slow-growing, however, and would only be used in situations where faster species were not so

suitable[K]. The berries have been rubbed onto the scalp in order to get rid of lice[257]. Wood - moderately light with little strength, it is of no commercial value[229].

dwatta Antirheumatic Enuresis Kidney Parasiticide StomachicAn infusion of the branches has been given to young children with bed-wetting problems[257]. An infusion of the root and branch bark has been drunk in the treatment of stomach problems and rheumatism[257]. The infusion can also be used externally as a bath for treating rheumatism[257]. A decoction of the root and branch bark has been used as an eyewash[257]. The bark has been chewed in the treatment of colds[257]. An infusion of the branches has been used in the treatment of weak kidneys in order to stop the frequent urination[257].

propta Seed - best sown as soon as it is ripe in a cold frame[78, 80]. If you have sufficient seed it can be sown in an outdoor seedbed[78, 80]. Stored seed germinates better if given 2 weeks warm then 14 - 16 weeks cold stratification[98], so sow it as early in the year as possible. Prick out the seedlings into individual pots when they are large enough to handle. Seedlings are very slow to put on top-growth for their first year or two[11], but they are busy building up a good root system. It is best to keep them in pots in a cold frame for their first winter and then plant them out into their permanent positions in late spring.

nwatta Succeeds in most reasonably good soils in an open sunny position[11]. Dislikes dry soils[188]. Tolerates light shade[188], though it fruits better in a sunny position[K]. This species is able to succeed in poor soils and to become established on exposed broken ground[229], it is thus suitable for use as a pioneer species in re-establishing woodland[K]. A slow-growing shrub in the wild, it can sometimes become a small tree up to 9 metres tall[229]. It usually produces abundant crops of fruit every year[229]. Plants are susceptible to fireblight[188].

## 5.2.751 Matteuccia orientalis

4 tlin 8 cyuc 1 kcak 0 tcan 0 dwat 0.6 m hkuc hmim cyutli hgattcup hwicli hrasjlutnyik hpa7tli frusflatprik hpa7tmwatli hjonli

drutta Matteuccia orientalis is a FERN growing to 0.6 m (2ft) by 0.6 m (2ft in). See above for USDA hardiness. It is hardy to UK zone 4. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in semi-shade (light woodland). It prefers moist soil and can tolerate drought.

kcakta Edible Parts: LeavesEdible Uses: Young shoots - cooked. A famine food, used when all else fails[177].

tcanta None known

dwatta None known

propta Spores - surface sow as soon as they are ripe in mid-winter and keep the soil moist. It is best to keep the pot in a sealed plastic bag to hold in the moisture. Put up small clumps of the young plants as soon as they are large enough to handle and grow on in light shade until large enough to plant out. Division during the dormant season between October and March[1]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Requires a moist but well-drained position and light shade[1, 187]. It grows well in heavy clay soils. Prefers a pH between 5 and 6.5[200]. Plants are hardy to about -20°c[200]. Plants have an invasive root system and can send up suckers some distance from the main clump[233]. Members of this genus are rarely if ever troubled by browsing deer[233]. Fertile fronds are produced after the first flush of vegetative fronds and persist throughout the following winter. The spores are shed in mid-winter[200].

## 5.2.752 Orthilia secunda

Sidebells Wintergreen

4 tlin 8 cyuc 1 kcak 0 tcan 1 dwat 0.1 m hkuc pcmimhmhtut cyutli tcup hwicli hrasjlut hpa7tli frusflatprikliwis hpa7tmwatli fyfkrx7t hjonli

drutta Orthilia secunda is an evergreen Perennial growing to 0.1 m (0ft 4in) by 0.3 m (1ft). See above for USDA

hardiness. It is hardy to UK zone 5. It is in leaf all year, in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: TeaSeed[172]. No more details are given. The leaves are occasionally used as a tea[183].

tcanta None known

dwatta OphthalmicA strong decoction of the root has been used as an eye wash[257].

propta Seed - the only information we have on this species is that it is difficult from seed and germinates infrequently[200]. We would suggest sowing the seed as soon as it is ripe if this is possible. Sow it into soil collected from around an established plant, only just covering the seed, and put the pot in a shady part of a cold frame. Pot up any young seedlings as soon as they are large enough to handle, once again using soil from around an established plant. Plant out into their permanent positions when the plants are large enough. You should not need to use soil from around an established plant to do this since the soil in the pot will contain the necessary micorrhiza. Division with great care in the spring[1, 111]. Pot up the divisions using some soil from around an established plant, grow on in a lightly shaded part of a greenhouse or frame and do not plant out until the plants are growing away vigorously[200].

nwatta Prefers a moist sandy woodland soil[111, 200] in a cool position with partial shade[1, 11, 200]. Requires a peaty or leafy but not very acid soil that remains moist in the summer[31, 187]. This is a very difficult plant to grow. It requires a mycorrhizal relationship in the soil and therefore needs to be grown initially in soil collected from around an established plant[200]. It is also very difficult from seed as well as being intolerant of root disturbance which makes division difficult[1].

### 5.2.753 Oenothera odorata

4 tlin 8 cyuc 1 kcaak 2 tcan 0 dwat 0.9 m hkuc htut cyutli kyuctcup hwicli hyhisrasljut hpa7tli flatpriklwis hpa7tmwatli fyfxre7t hjonli

drutta Oenothera odorata is a PERENNIAL growing to 0.9 m (3ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Lepidoptera (Moths and Butterflies), bees. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young leaves[105, 177]. No more details are given.

tcanta None known

dwatta None known

propta Seed - sow early spring in a sandy medium in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Basal cuttings in spring. Harvest the shoots with plenty of underground stem when they are about 8 - 10cm above the ground. Pot them up into individual pots of low-fertility soil and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant out in the following spring.

nwatta Prefers a dryish well-drained sandy loam and full sun[1, 200]. Heavy clay soils may induce winter rots[200]. Succeeds in poor soils. The flowers open in the evening, they are richly scented and are very attractive to moths. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is fleshy. Thick or swollen - fibrous or tap root [2-1].

### 5.2.754 Heuchera glabra

Alpine Heuchera

4 tlin 8 cyuc 1 kcaak 0 tcan 1 dwat 0.6 m hkuc hminhtut cyutli tcup hwicli hrasljut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Heuchera glabra is an evergreen Perennial growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in leaf all year, in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked[172]. Not choice[172].

tcanta Mordant TanninThe root can be used as an alum substitute, this is a mordant used in fixing dyes[172]. The root is rich in tannin(it contains about 9 - 20%), is this the active ingredient that acts as a mordant?[172]. A good ground cover plant for the woodland garden[200].

dwatta Antiseptic Salve Styptic Tonic VDTThe root is anti-septic, salve, styptic and tonic[172]. It has been used to treat inflammation of the testicles caused by syphilis[257].

propta Seed - sow early spring in a warm greenhouse and only just cover the seed. Germination is usually fairly rapid. Prick out the seedlings when they are large enough to handle and plant them out into their permanent positions in late spring or early summer. The seed can also be sown in the middle of spring in an outdoor seedbed and planted out in early summer. Alternatively, you can sow the seed in an outdoor seedbed in the middle of summer for planting out in the following spring. Division in March or October[1, 111]. It is best to divide the plants in August or early September, making sure that the woody roots are planted quite deeply with only the crown of foliage above the ground[233].

nwatta Succeeds in any good sweet garden soil that does not dry out in spring[1]. Prefers full sun but tolerates partial shade[1, 111]. Prefers a well-drained fairly rich and not too heavy soil[111]. Apt to hybridize with other members of this genus[111]. A very ornamental plant[60].

### 5.2.755 Marsilea quadrifolia

Water Clover, European waterclover

4 tlin 8 cyuc 1 kcaak 0 tcan 2 dwat 0.2 m hkuc hminhtut cyutli tcuphja7nhs6s hwicli hrasljut hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Marsilea quadrifolia is a FERN growing to 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can grow in water.

kcakta Edible Parts: Leaves SeedEdible Uses: Young stems and leaves[105, 145]. A famine food, only used in times of scarcity[218]. The spores are produced in a sporocarp (like a fairly large container) and in allied species this is ground up and mixed with flour etc and used in making bread etc. It is rich in starch[144].

tcanta None known

dwatta Antidote Antiphlogistic Depurative Diuretic Febrifuge SkinA juice made from the leaves is diuretic and febrifuge[218]. It is also used to treat snakebite and applied to abscesses etc[218]. The plant is anti-inflammatory, diuretic, depurative, febrifuge and refrigerant[147, 178, 218].

propta Spores. The plant produces sporocarps, these need to be lightly abraded and then immersed in water. The sporocarps will then swell and burst to release the spores. The spores germinate immediately, the highly developed prothallus remains inside the large seed-like spores. The gametophyte generation is completed in 24 hours and the first roots and shoots appear in 2 - 3 days. Mature plants bearing sporocarps can develop in as little as 3 months[200]. Spore germination in the family occurs after rupture of the sporocarp wall allows the sporocarp contents to be hydrated. A gelatinous structure emerges from the sporocarp, breaking it into valves and carrying the sori into the water. Spore ger-

one time used by some native North American Indian tribes in order to commit suicide[4]. Because of its toxicity, it is a remedy that is seldom used in modern herbalism[238], but the leaves have been used externally in herbal medicine and are a good remedy for many skin diseases and inflammation[4]. The leaves are analgesic, astringent, disinfectant, narcotic, salve and sedative[257]. An infusion of the leaves is used as a disinfectant wash and liniment to treat pain, scratches, rheumatism, inflammations and to get rid of body parasites[257]. Used internally, the leaves have a splendid effect in the treatment of active haemorrhages, diarrhoea and flux[4, 21, 61]. They are also used in the treatment of syphilis, inflammatory fevers, neuralgia, paralytic conditions, tinnitus and angina[238]. The leaves should be used with great caution however, and only under the guidance of a qualified practitioner[238]. Excess doses cause vertigo, headache, loss of sight, salivation, thirst, nausea, palpitations, slow pulse and difficulty in breathing[238]. See also the notes above on toxicity. Antifungal [303].

propta Seed - surface sow in late winter in a cool greenhouse in light shade[78, 113]. Prick out the young seedlings into individual pots as soon as they are large enough to handle. The seedlings are rather sensitive to damping off, so water them with care, keep them well-ventilated and perhaps apply a fungicide such as garlic as a preventative. Grow the young plants on in light shade and overwinter them in the greenhouse for their first winter[78]. Plant them out into their permanent positions in early summer. The seed is dust-like and remains viable for many years[113]. Cuttings of half-ripe wood, August in a frame. Very poor results unless the cuttings are taken from very young plants[11, 78]. Layering in August/September. Takes 18 months[78]. The plants can also be dug up and replanted about 30cm deeper in the soil to cover up some of the branches. The plant can then be dug up about 12 months later when the branches will have formed roots and can be separated to make new plants[200].

nwatta Landscape Uses:Border, Foundation, Rock garden, Specimen. Requires an acid humus-rich soil, succeeding in part shade[182] or in full sun in cooler areas. Prefers almost full sun[11]. Dislikes dry soils[182], requiring cool, permanently moist conditions at the roots[21]. Succeeds in open woodland or along the woodland edge[200]. Plants are very cold-hardy, tolerating temperatures down to about -30°c[184]. A very ornamental plant[11], there are many named varieties[182]. This species is not very easy to grow well in Britain, it probably prefers a more continental climate[11]. This species is the state flower of Connecticut[238]. Slow to rejuvenate if the plant is cut back[200]. Special Features: Attracts birds, North American native, All or parts of this plant are poisonous, Blooms are very showy.

### 5.2.875 Buddleia davidii

Butterfly Bush, Summer Lilac, Butterflybush

4 tlin 8 cyuc 0 kcaak 1 tcan 0 dwat 3 m hkuc

htut cyutli hgatkyuctcup hwicli hyhisrasljutnyik hpa7tli flatpriklwisslip hpa7tmwatli hjonli

drutta Buddleia davidii is a deciduous Shrub growing to 3 m (9ft) by 3 m (9ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to October, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure. It can tolerate atmospheric pollution.

kcakta None known

tcanta DyeBlack or green dyes can be obtained from the flowers, leaves and stems combined[168]. An orange-gold to brown dye can be obtained from the flowers[168]. An extremely popular garden plant due to its low maintenance, long flowering season, colourful and fragrant flowers, and its attractiveness to butterflies. The flowering B. davidii has been closely linked with butterflies, moths and humming-birds [1d].

dwatta None known

propta Seed - cold stratify for 4 weeks at 4°c[138] and surface sow the seed in February/March in a greenhouse[78, 113]. Germination usually takes place within 3 - 4 weeks at 21°c[138]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter, planting them out into their permanent positions in late spring or early summer, after the last expected frosts. Seedlings are inclined to damp off and so should be watered with care and kept well-ventilated[78]. Cuttings of half-ripe wood, July/August in a frame[11, 113]. Use short side-shoots[78]. Very high percentage[113]. Cuttings of mature wood of the current season's growth, 15 - 20cm long, October/November in a frame[200].

nwatta Landscape Uses:Border, Container, Pest tolerant, Massing, Standard, Specimen. Requires a sunny position[11, 182]. Prefers a rich loamy well-drained soil[11, 200]. Very tolerant of alkaline soils, atmospheric pollution and maritime exposure[200]. Grows best on dry soils of low fertility, where it can seed itself freely[182]. Plants are hardy to about -15°c[184], they resprout from the base if cut back by cold weather[200]. A very ornamental plant[1], it hybridizes freely with other members of this genus. Polymorphic, there are many named varieties, developed for their ornamental value[182]. The flowers emit a musk-like fragrance like heather honey[245]. Plants flower mainly on the current years growth so a hard pruning in spring will encourage better flowering[200]. An excellent plant for bees and butterflies[30]. Special Features:Attracts birds, Not North American native, Naturalizing, Attracts butterflies, Suitable for cut flowers, Attractive flowers or blooms.

### 5.2.876 Magnolia liliiflora

Mu-Lan, Woody Orchid, Lily Magnolia

4 tlin 9 cyuc 0 kcaak 0 tcan 3 dwat 3 m hkuc

hminhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Magnolia liliiflora is a deciduous Shrub growing to 3 m (9ft) by 4 m (13ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from April to June, and the seeds ripen from September to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Beetles. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. It can tolerate atmospheric pollution.

kcakta None known

tcanta None known

dwatta Analgesic Anodyne Carminative Febrifuge Sedative TonicThe flowers and unopened flower buds are analgesic, anodyne, carminative, febrifuge, sedative and tonic[147, 218]. The main effect of this herb is to constrict blood vessels in the nasal passages and so it is taken internally in the treatment of sinusitis, allergic rhinitis and colds with a runny nose or catarrh[238]. In excess it can cause dizziness[238]. This herb is incompatible with Astragalus membranaceus[238]. The flowers are harvested in the spring and can be used fresh or dried[238].

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed must be kept cold over the winter and should be sown in late winter in a cold frame[200]. The seed usually germinates in the spring but it can take 18 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in a cold frame or greenhouse for at least their first winter. They can be planted out into their permanent positions when they are more than 15cm tall, though should be well mulched and given some protection from winter cold for their first winter or two outdoors. Layering in early spring[200].

nwatta Landscape Uses:Border, Specimen. Best grown in a warm position in a moderately rich free soil of an open texture[1]. Prefers a neutral to acid soil but tolerates alkaline soils so long as they are deep and rich in humus[188]. Plants cannot be grown on limy or chalky soils[219]. The branches are brittle so a sheltered position is required[200]. This species is said to be fairly wind tolerant[200]. It is very tolerant of atmospheric pollution[200]. Plants are hardy to about -20°c[200], but they require the protection of a wall

and plant them out into nursery beds or into their permanent positions when they are more than 10cm tall. Cuttings of half-ripe wood with a heel, July/August in a frame[11, 200].

**nwatta** An easily grown plant, it prefers a good soil but also does well in poor soils[1, 11, 200]. It thrives in lime and is also happy in peaty soils[1]. It succeeds in any soil that is not marshy or waterlogged[11, 200]. Succeeds in dry soils[188]. Grows well in heavy clay soils. Succeeds in full sun or semi-shade but does not fruit so freely in a shady position[11, 200]. Tolerates atmospheric pollution[200]. A very hardy plant, tolerating temperatures down to about -20°C[184]. A fairly fast-growing species[202]. Hybridizes freely with other members of this genus[200]. The flowers, when inhaled near to, have an unpleasant smell like decaying fish[245]. They are very attractive to bees whilst the fruit is a good winter food source for many species of birds[200]. Trees are notably susceptible to honey fungus[200]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

## 5.2.872 *Cornus rugosa*

Round-Leaved Dogwood

4 tlin 8 cyuc 0 kcaak 0 tcan 1 dwat 3 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlutnyikfrip hpa7tli flatprikwiwis hpa7tmwatli xre7t hjonli

**drutta** *Cornus rugosa* is a deciduous Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 5. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta None known  
tcanta None known

**dwatta** Cathartic Febrifuge Kidney TB TonicThe bark is cathartic, febrifuge and tonic[61, 257]. A decoction of the roots has been used in the treatment of kidney complaints and TB[257].

**propta** Seed - best sown as soon as it is ripe in a cold frame or in an outdoors seedbed if there is sufficient seed[80, 113]. The seed must be separated from the fruit flesh since this contains germination inhibitors[80, 164]. Stored seed should be cold stratified for 3 - 4 months and sown as early as possible in the year[164]. Scarification may also help as may a period of warm stratification before the cold stratification[80, 164]. Germination, especially of stored seed, can be very slow, taking 18 months or more[164]. Prick out the seedlings of cold-frame sown seeds into individual pots as soon as they are large enough to handle and grow the plants on for their first winter in a greenhouse, planting out in the spring after the last expected frosts. Cuttings of half-ripe side shoots, July/August in a frame. Cuttings of mature wood of the current year's growth, taken with a heel if possible, autumn in a cold frame. High percentage[78]. Layering of new growth in June/July. Takes 9 months[78].

**nwatta** An easily grown plant, it succeeds in any soil of good or moderate fertility[1], ranging from acid to shallow chalk[200]. Grows well in heavy clay soils. Succeeds in poorly drained soils[200]. Succeeds in full sun or light shade[[188]. A very ornamental[1] and free-flowering plant[182]. Plants in this genus are notably resistant to honey fungus[200].

## 5.2.873 *Codonopsis tangshen*

Chuan Dang

4 tlin 8 cyuc 0 kcaak 0 tcan 3 dwat 3 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli xre7t hjonli

**drutta** *Codonopsis tangshen* is a PERENNIAL CLIMBER growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from June to August, and the seeds ripen from August to September. The species is hermaphrodite (has both

male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known  
tcanta None known

**dwatta** Adaptogen Aphrodisiac TonicThis species is an important herb in Chinese medicine, the root is widely used as a substitute for ginseng[4, 174, 238]. It is a sweet, warm, soothing herb that is taken as an energy tonic[238]. It acts mainly on the spleen, lungs and stomach, raising secretion of body fluids and blood sugar levels, lowering the blood pressure and stimulating the immune system[238]. The root and the whole plant are adaptogen, aphrodisiac and tonic[46, 61, 174, 176, 218]. It is taken internally in the treatment of low energy, poor appetite and digestion, anaemia, shallow breathing and debility after illness[238]. It is often cooked with rice until it is glutinous as a tonic food[238]. The roots of plants at least three years old are harvested in the autumn and can be used fresh or dried[238].

**propta** Seed - surface sow in spring to early summer in an ericaceous compost in a greenhouse. Do not allow the compost to dry out. The seed usually germinates in 1 - 6 weeks at 20°C[164]. Prick out the seedlings into individual pots as soon as they are large enough to handle and grow them on in a greenhouse for their first winter. Plant out in late spring or early summer and protect them from slugs until the plants are well established[K]. Division in spring, with care, since the plant resents root disturbance[200]. We have found it best to take small divisions that are teased out from the sides of the main clump so as to cause the least possible disturbance to the plants and to avoid having to dig up the clump. These small divisions need to be potted up and placed in light shade in a greenhouse until they are rooting well. They can be planted out into their permanent positions in the summer if they are large enough, otherwise in the following spring[K].

**nwatta** Prefers a well-drained fertile light soil in full sun or semi shade[1, 200]. It only succeeds in full sun if the soil remains moist during the growing season[200]. Prefers a slightly acid soil[164]. Dormant plants are hardy to about -20°C[187]. The young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. An important herb in Chinese medicine, it is widely cultivated there[238] and is used as a ginseng substitute[4, 174]. A climbing plant, supporting itself by twining and scrambling over other plants[219]. Plants resent root disturbance and should be planted out into their permanent position as soon as possible[164]. Plants are very susceptible to the ravages of slugs. The young shoots in spring are particularly at risk, though older growth is also eaten[K].

## 5.2.874 *Kalmia latifolia*

Mountain Laurel, Calico Bush, Ivy

4 tlin 8 cyuc 0 kcaak 0 tcan 2 dwat 3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli frusflat hpa7tmwatli xre7t hjonli

**drutta** *Kalmia latifolia* is an evergreen Shrub growing to 3 m (9ft) by 3 m (9ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in leaf all year, in flower from May to June, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known  
tcanta Dye Hedge Hedge WoodA yellow-tan dye is obtained from the leaves[106]. The plant can be grown as an informal hedge[200]. Wood - heavy, hard, strong but rather brittle. It weighs 44lb per cubic foot and is used for making small implements, tool handles etc[21, 46, 61, 82, 235]. The roots are used to make spoons etc, these are fashioned when the wood is green and soft, when dry they become very hard and smooth[207]. The wood is a good fuel[46, 61].

**dwatta** Analgesic Antifungal Antipsoriatic Antiviral Astringent Narcotic Salve Sedative SkinMountain laurel is a very poisonous narcotic plant the leaves of which were at

mination (gametophyte growth) and fertilization occur immediately[270]. Division.

**nwatta** Requires a permanently moist or wet soil, it can be grown by the side of ponds etc or in the shallow edges of the pond[56]. Thrives in a turfy loam or in peat[1]. Hardy to about -15°C[200]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 5.2.756 *Crocus cancellatus*

4 tlin 8 cyuc 1 kcaak 0 tcan 0 dwat 0.1 m hkuc htut cyutli tcup hwicli hrasjlut hpa7tli flatprikwiwis hpa7tmwatli xre7t hjonli

**drutta** *Crocus cancellatus* is a CORM growing to 0.1 m (0ft 4in) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in leaf from March to July, in flower from September to November, and the seeds ripen from March to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, butterflies. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Corm - cooked[89]. Used when the bulb is sprouting, it is prized as a vegetable[2].

tcanta None known  
dwatta None known

**propta** Seed - best sown as soon as it is ripe in a light sandy soil in pots in a cold frame[1]. The seed can also be sown in a cold frame in early spring[1]. Sow thinly because the seed usually germinates freely[1], within 1 - 6 months at 18°C[164]. Unless the seed has been sown too thickly, do not transplant the seedlings in their first year of growth, but give them regular liquid feeds to make sure they do not become deficient. Divide the small bulbs once the plants have died down, planting 2 - 3 bulbs per 8cm pot. Grow them on for another 2 years in a greenhouse or frame and plant them out into their permanent positions when dormant in late summer[K]. Plants take 3 - 4 years to flower from seed[200]. Division of the clumps after the leaves die down in spring[1, 200]. The bulbs can be replanted direct into their permanent positions if required.

**nwatta** Grows best on a gritty well-drained slope[42]. Plants succeed outdoors if they are given perfect drainage in a warm sunny position[200], otherwise they are better grown in a bulb frame[90]. Bulbs should be planted 5 - 7cm deep in the soil[79]. June is the best time to do this[245]. This species includes *C. edulis*, which is a synonym of *C. cancellatus damascenus*[42]. The corms are sold in local markets in Syria[89]. Plants tend to move considerably from their original planting place because of their means of vegetative reproduction, it is therefore wise not to grow different species in close proximity[1]. The flowers are only open during the day time, closing at night[245].

## 5.2.757 *Sedum kamschaticum*

Orange stonecrop, Kamschataka Sedum, Kamschataka Stonecrop

4 tlin 10 cyuc 1 kcaak 0 tcan 2 dwat 0.1 m hkuc htut cyutli hगत्युक्तुप hwicli hrasjlutnyik hpa7tli flatprikwiwis hpa7tmwatli fyifxre7t hjonli

**drutta** *Sedum kamschaticum* is an evergreen Perennial growing to 0.1 m (0ft 4in) by 0.3 m (1ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: LeavesEdible Uses: Young leaves and stems - cooked[105, 177, 179].

tcanta Plants can be grown as a ground cover when planted about 30cm apart each way[208].

**dwatta** *Anodyne Antiphlogistic Poultrice*The whole plant is anodyne and antiphlogistic. It stimulates the circulation[147]. A decoction is used in the treatment of traumatic injuries, bleeding cuts, burns and poisonous snakebites[147]. The fresh plant is crushed and applied externally to cuts, burns, traumatic injuries etc[218].

**propta** Seed - surface sow in spring in well-drained soil in a sunny position in a greenhouse. Do not allow the soil to dry out. Prick out the seedlings into individual pots when they are large enough to handle. If sufficient growth is made, it is possible to plant them out during the summer, otherwise keep them in a cold-frame or greenhouse for their first winter and plant them out in early summer of the following year[K]. Division is very easy and can be carried out at almost any time in the growing season, though is probably best done in spring or early summer. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

**nwatta** Landscape Uses:Border, Container, Ground cover, Rock garden, Specimen. Succeeds in most soils[188] but prefers a fertile well-drained soil[200]. Requires a sunny position[188, 200]. A very drought tolerant plant once established[190, 200]. It can be grown in crevices on walls[219]. Hardy to about -15°C[200]. This species is closely related to *S. hybridum*[1] and *S. aizoon*[200]. All members of this genus are said to have edible leaves, though those species, such as this one, that have yellow flowers can cause stomach upsets if they are eaten in quantity[62, 85]. Plants in this genus seem to be immune to the predations of rabbits[233]. Special Features: Attractive foliage, Not North American native, Naturalizing.

## 5.2.758 *Tricyrtis latifolia*

4 tlin 8 cyuc 1 kcaak 0 tcan 0 dwat 0.6 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli xre7t hjonli

**drutta** *Tricyrtis latifolia* is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves and young shoots - cooked[105, 177].

tcanta None known  
dwatta None known

**propta** Seed - best sown in a cold frame as soon as it is ripe. Stored seed requires 12 weeks stratification at 5°C[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division just before growth starts in spring to single crowns[175]. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the summer or the following spring.

**nwatta** Prefers a humus-rich fertile well-drained but moisture-retentive acid or neutral light sandy loam in partial shade[175, 200]. Prefers the dappled shade of a woodland garden but tolerates full sun if the soil is reliably moist throughout the growing season[200], flowering earlier in such a position. Plants require a sunnier position when growing in northern Britain[233]. This species is hardy to about -20°C, but if prolonged cold weather is not accompanied by snow cover the plants will appreciate a good mulch of organic matter[187]. Plants are very susceptible to attacks by slugs[175].

## 5.2.759 *Helenium hoopesii*

Owls Claws, Orange Sneezeweed  
4 tlin 8 cyuc 1 kcaak 0 tcan 1 dwat 0.9 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Helenium hoopesi is a PERENNIAL growing to 0.9 m (3ft) by 0.5 m (1ft 8in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 3. It is in flower from June to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Edible Uses: GumA chewing gum is obtained from the roots[155, 257].

tcanta Dye Gum MiscellanyA yellow dye is obtained from the flowers[155]. They are usually boiled up with juniper ash to obtain the dye[244].

dwatta Miscellany StomachicThe plant is used as a remedy for vomiting[155, 257]. A snuff made from the crushed blossoms and the leaves of Psoralidium lanceolatum has been inhaled in the treatment of headaches and hay fever[257].

propta Seed - sow spring in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. If you have sufficient seed it might be worthwhile trying a sowing in mid to late spring in situ outdoors[111]. Cuttings of soft wood from the base of the plant, June/July in a frame. Basal cuttings in spring[200]. Harvest the shoots when they are about 10 - 15cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer. Division in spring or autumn[111]. This needs to be done fairly regularly because the clumps soon become congested[233]. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Landscape Uses:Border, Container. Grows well in ordinary garden soil[1, 111], succeeding in most conditions other than boggy soils[233]. It prefers a fertile moisture retentive soil[200] in a sunny position[108, 111]. Dislikes dry soil[200]. This species is hardy to about -25°c[187]. Plants seem to be immune to the predations of rabbits[233]. A good bee and butterfly plant. Special Features:North American native, All or parts of this plant are poisonous, Suitable for cut flowers.

## 5.2.760 Mertensia oblongifolia

Oblongleaf bluebells

4 tlin 8 cyuc 1 kcaak 0 tcan 0 dwat 0.3 m hkuc hmimhtut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flat-priklwis hpa7tmwatli xre7t hjonli

drutta Mertensia oblongifolia is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 4. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta Edible Parts: Flowers LeavesEdible Uses: Flow-ers - raw[172]. Leaves - raw or cooked[172]. The leaves are rather hairy and are not so nice when eaten raw[172].

tcanta None known

dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe[1, 200]. Sow stored seed as early in the year as possible. Protect from direct sunlight[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division, with care, in early spring or autumn[200].

nwatta Succeeds in an ordinary garden soil with some shade[1, 111]. A rather difficult plant to grow, it is best in a moist position[1].

## 5.2.761 Lysimachia barystachys

Manchurian yellow loosestrife

4 tlin 8 cyuc 1 kcaak 0 tcan 0 dwat 0.6 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Lysimachia barystachys is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from May to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neu-tral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young leaves and stems - cooked[177].

tcanta None known

dwatta None known

propta Seed - sow autumn in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring or autumn[200]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta An easily grown plant, succeeding in a moist loamy soil[1]. Most species in this genus seem to be immune to the predations of rabbits[233].

## 5.2.762 Potentilla erecta

Tormentil, Erect cinquefoil

4 tlin 8 cyuc 1 kcaak 0 tcan 3 dwat 0.3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyfxre7t hjonli

drutta Potentilla erecta is a PERENNIAL growing to 0.3 m (1ft) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: TeaThe roots are extremely rich in tannin, long boiling converts this into a gum and it can then be eaten [115]. An emergency food, it is only eaten when all else fails[177]. A tea is made from the rhizomes[183].

tcanta Cosmetic Dye TanninA red dye is obtained from the roots[4, 66, 115]. The plant, and especially the root, is rich in tannin[4, 7]. It s used cosmetically as a compress to tone up flabby skin[7]. The root contains up to 20% tan-nin[238].

dwatta Antibiotic Antidiarrhoeal Astringent Dysentery Enuresis Haemostatic Hypoglycaemic OdontalgicContaining more tannin than oak bark, all parts of tormentil are strongly astringent, finding use wherever that action is required. This plant is considered to be one of the safest native astringents and it is widely used in herbal medicine in the treatment of diarrhoea, dysentery, sore throats etc[4, 238, 254]. The whole plant, and especially the root, is antibiotic, strongly astringent, haemostatic and hypoglycaemic[4, 7, 9, 21, 165]. It is used in the treatment of diarrhoea, dysentery, irritable bowel syndrome, colitis, ulcerative colitis etc[254]. Externally, the plant makes a good styptic for cuts etc., and a strongly made decoction has been recommended as a wash for mouth ulcers, infected gums, piles and inflamed eyes[4, 254]. Ex-tracts are used to treat chapping of the anus and cracked nipples[7]. The plant's effectiveness as a toothache remedy is undeniable and it has also been of benefit in treating bed-wetting by children[7].

propta Seed - sow early spring or autumn in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring. Larger divisions can be planted out direct into their permanent positions. We

Special Features: Not North American native, Inconspicuous flowers or blooms. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is flat with shallow roots spreading near the soil sur-face [2-1].

## 5.2.869 Philadelphus lewisii

Mock Orange, Lewis' mock orange

4 tlin 8 cyuc 0 kcaak 0 tcan 1 dwat 3.6 m hkuc hmimhtut cyutli tcup hwicli hyishrasjlutnyikfrip hpa7tli flat-priklwisslip hpa7tmwatli xre7t hjonli

drutta Philadelphus lewisii is a deciduous Shrub growing to 3.6 m (11ft 10in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta Soap WoodThe leaves and flowers are rich in saponins, when crushed and mixed with water they produce a lather that is an effective cleaner, used on the body, clothes etc[99, 169, 257]. You can wash your hands by merely pick-ing a couple of leaves or a bunch of blossom, wetting your hands and then rubbing the plant material vigorously as if it was a bar of soap[K]. This soap is a very gentle cleaner that does not remove the body's natural oils, but does remove dirt. It is not very effective against oil[K]. An infusion of the bark can also be used[99, 169]. The stems can be used in making fine coiled baskets[257]. Wood - strong, very hard. Used for tool handles[99].

dwatta Antihæmorrhoidal Antirheumatic Eczema Poul-tice SkinThe dried powdered leaves, or the powdered wood, has been mixed with pitch or oil and used as a rub on sores and swollen joints[257]. A poultice of the bruised leaves has been used to treat infected breasts[257]. A strained decoction of the branches, sometimes with the flowers, has been used as a soaking solution in the treatment of sore chests, eczema and bleeding hæmorrhoids[257].

propta Seed - best if given 1 months cold stratifica-tion[113]. Sow February in a light position in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent po-sitions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm long side-shoots, July/August in a shaded frame. Plant out in spring. High per-centage[78]. Cuttings of mature wood of the current year's growth, 15 - 25cm with a heel, December in a sheltered bed outdoors. Fair to good percentage[78]. Layering in summer. Very easy.

nwatta An easily grown plant, succeeding in any moder-ately fertile soil, and also in thin soils over chalk[200]. Tol-erates poor soils[200]. Grows well in heavy clay soils. Suc-ceeds in semi-shade but prefers a position in full sun where it will flower more freely[182, 200]. Plants are hardy to about -15°c. Some named forms have been developed for their or-namental value[182]. Plants are very tolerant of pruning, one third of the stems can be cut down to the ground each year in order to promote fresh growth and heavier flowering[202]. A very ornamental plant with aromatic flowers[182, 200]. This plant is the State flower of Idaho[212].

## 5.2.870 Menispermum canadense

Canada Moonseed, Common moonseed

4 tlin 8 cyuc 0 kcaak 0 tcan 2 dwat 3.6 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Menispermum canadense is a deciduous Climber growing to 3.6 m (11ft 10in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from June to July, and the seeds ripen from October to November. The species is dioecious (individual flowers are either male

or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is re-quired). The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta None known

dwatta Bitter Diuretic Laxative Purgative TonicCanada moonseed has occasionally been used in the past for its medicinal virtues, though it is little, if at all, used in mod-ern herbalism. The roots are a bitter tonic, diuretic, laxative, nerving, purgative (in large doses), stomachic and tonic[4, 21, 46, 218]. A tea made from the root has been used in the treatment of indigestion, arthritis, bowel disorders and as a blood cleanser[222]. The root is applied externally as a salve on chronic sores[222]. Use with caution[21], see notes above on toxicity.

propta Seed - sow late winter in a greenhouse[78, 113]. Two months cold stratification speeds up germination[113] so it might be better to sow the seed as soon as it is ripe in a cold frame[K]. Germination is usually good[78]. When they are large enough to handle, prick the seedlings out into indi-vidual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent posi-tions in late spring or early summer, after the last expected frosts. Cuttings of mature wood, autumn in a frame[200]. Di- vision of suckers in early spring[78, 113]. The suckers can be planted out direct into their permanent positions, though we prefer to pot them up and grow them on in light shade in a greenhouse or cold frame until they are established[K].

nwatta Succeeds in any moderately fertile soil that does not dry out excessively in summer, in sun or partial shade[200]. Prefers a position in full sun[219]. This species is hardy to about -30°c, but, due to a lack of summer heat, the plants usually produce soft growth in mild maritime ar-eas and this can be cut to the ground at temperatures around -5 to -10°c[200]. The plants do not require pruning, but can benefit from being cut back to ground level every 2 - 3 years in order to keep them tidy[219]. A vigorous and fast-growing climbing plant that twines around supports, it also spreads freely by underground suckers[11, 182, 219]. Dioecious. Male and female plants must be grown if seed is required.

## 5.2.871 Cotoneaster simonsii

Simons' cotoneaster

4 tlin 8 cyuc 0 kcaak 2 tcan 0 dwat 3 m hkuc hmimhtut cyutli kyuctcup hwicli hyishrasjlutnyikfrip hpa7tli flatpriklwisslip hpa7tmwatli xre7t hjonli

drutta Cotoneaster simonsii is an evergreen Shrub growing to 3 m (9ft) by 2 m (6ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf all year, in flower from May to July, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies, midges. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil. It can tolerate atmospheric pollution.

kcakta None known

tcanta Dye Hedge HedgeA rose-tan dye is obtained from the fruit[168]. Can be grown as a medium to tall informal hedge[1, 11, 29, 200]. When close trimmed it makes an ex-cellent dense hedge[182].

dwatta None known

propta Seed. Members of this genus hybridize freely so, if you require seed that breeds true, it is important to obtain it from a known wild source or from a controlled fertilization of garden plants. The seed is best sown as soon as it is ripe in the autumn in a cold frame, when it will usually germi-nate in the spring[11, 200]. Stored seed germinates faster if given 3 months warm stratification at 15°c and then 3 months cold stratification at 4°c[164]. The seed usually germinates within 1 - 18 months at 15°c but it can take 2 years[164]. Pot the seedlings up as soon as they are large enough to handle

one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta None known

tcanta Fuel Incense WoodThe cultivar 'Blue Carpet' can be used as a ground cover plant in a sunny position[188]. The wood is very fragrant, it is used as a fuel and an incense[51, 158, 272]. The leaves are used as incense[272].

dwatta SkinThe powdered plant is soaked for half an hour in water and then used for washing skin diseases[272].

propta The seed requires a period of cold stratification. The seed has a hard seedcoat and can be very slow to germinate, requiring a cold period followed by a warm period and then another cold spell, each of 2 - 3 months duration[78, 81]. Soaking the seed for 3 - 6 seconds in boiling water may speed up the germination process[11]. The seed is best sown as soon as it is ripe in a cold frame. Some might germinate in the following spring, though most will take another year. Another possibility is to harvest the seed 'green' (when the embryo has fully formed but before the seedcoat has hardened). The seedlings can be potted up into individual pots when they are large enough to handle. Grow on in pots until large enough, then plant out in early summer. When stored dry, the seed can remain viable for several years[1]. Cuttings of mature wood, 5 - 10cm with a heel, September/October in a cold frame. Plant out in the following autumn[1, 78]. Layering in September/October. Takes 12 months[78].

nwatta Landscape Uses:Cascades, Erosion control, Ground cover, Massing, Rock garden. Succeeds in most soils if they are well drained, preferring a neutral or slightly alkaline soil[1, 11] and succeeding on chalk[200]. A drought tolerant plant once established, succeeding in hot dry positions[200]. This species is closely allied to *J. recurva*[11]. There are many named forms, selected for their ornamental value[188]. The type species is very slow growing in Britain[185] but the cultivar 'Meyeri' is somewhat faster and more successful. Dioecious. Male and female plants must be grown if seed is required. Special Features:Attractive foliage, Fragrant foliage, Not North American native, There are no flowers or blooms.

## 5.2.867 *Miscanthus x giganteus*

Giant Miscanthus

4 tlin 9 cyuc 0 kcak 4 tcan 0 dwat 4 m hkuc

htut cyutli hgatkuyctcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta *Miscanthus x giganteus* is a PERENNIAL growing to 4 m (13ft) by 0.6 m (2ft in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta None Known

tcanta FodderCarbon Farming Solutions - Industrial Crop: biomass (Crops grown for non-food uses. Industrial crops provide resources in three main categories: materials, chemicals, and energy. Traditional materials include lumber and thatch, paper and cardboard, and textiles) [1-1]. Very few perennial industrial crops have been properly domesticated. Those that have show significantly increased yields. *Miscanthus x giganteus* is partly domesticated [1-1]. An outstanding biomass producer in temperate climates needing very little nitrogen fertilizer. Most giant *Miscanthus* is used as biofuel but could also serve as a feedstock for any number of biobased materials [1-1]. Fodder: bank. A possible good candidate for contour hedgerows in agroforestry. An excellent wind break. A popular ornamental - Outstanding fall color with persistent winter interest.

dwatta None Known

propta Vegetative propagation methods are necessary since giant *Miscanthus* does not produce viable seed. Rhizomes

nwatta Fodder: Bank Industrial Crop: Biomass Management Hay New Perennial CropClimate: cold temperate to sub-

tropical. Humidity: humid. A sterile (non-invasive) hybrid of *M. sinensis* and *M. sacchariflorus*. A very fast growing to 4m in 15 months - but manageable plant. Dry to average water needs - sensitive to too much water on roots. Drought Tolerant. well-drained soil. Full sun. Carbon Farming Solutions - Cultivation: new crop. Management: hay (Describes the non-destructive management systems that are used in cultivation) [1-1].

## 5.2.868 *Juniperus sabina*

Savine, Tam Juniper

4 tlin 7 cyuc 0 kcak 4 tcan 2 dwat 4 m hkuc

htut cyutli hgatkuyctcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

drutta *Juniperus sabina* is an evergreen Shrub growing to 4 m (13ft) by 4 m (13ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 3. It is in leaf all year, in flower in April, and the seeds ripen in October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

kcakta None known

tcanta Essential Hedge Hedge Insecticide Parasiticide RepellentLeaves are used as an insect repellent, a decoction of them is used against lice[46, 61]. An essential oil from the leaves and shoots has strong diuretic properties and is also used in perfumery[1, 61]. Yields of around 4% are obtained, this oil is also used as an insecticide[7]. A good dense ground cover plant, though it is slow to cover the ground[197]. The species type eventually forms a high ground cover, but there are many named forms that are lower-growing[208]. The sub-species *J. sabina tamariscifolia* has been particularly recommended[188]. Plants should be spaced about 1.2 metres apart each way[208]. The taller forms of this species make a good hedge[245].

dwatta Abortifacient Diuretic Emetic Emmenagogue Irritant Parasiticide WartsThe young shoots are abortifacient, diuretic, emetic, powerfully emmenagogue and irritant[4, 7]. The plant is rarely used internally but is useful as an ointment and dressing to blisters etc in order to promote discharge[4]. The powdered leaves are also used in the treatment of warts[1, 4, 7, 21]. The shoots are harvested in spring and dried for later use[4]. Use with great caution and never during pregnancy[4, 21]. See notes above on toxicity.

propta The seed requires a period of cold stratification. The seed has a hard seedcoat and can be very slow to germinate, requiring a cold period followed by a warm period and then another cold spell, each of 2 - 3 months duration[78, 81]. Soaking the seed for 3 - 6 seconds in boiling water may speed up the germination process[11]. The seed is best sown as soon as it is ripe in a cold frame. Some might germinate in the following spring, though most will take another year. Another possibility is to harvest the seed 'green' (when the embryo has fully formed but before the seedcoat has hardened). The seedlings can be potted up into individual pots when they are large enough to handle. Grow on in pots until large enough, then plant out in early summer. When stored dry, the seed can remain viable for several years[1]. Cuttings of mature wood, 5 - 10cm with a heel, September/October in a cold frame. Plant out in the following autumn[1, 78]. Layering in September/October. Takes 12 months[78].

nwatta Landscape Uses:Alpine garden, Erosion control, Ground cover, Massing, Rock garden. Succeeds in most soils if they are well drained, preferring a neutral or slightly alkaline soil[1, 11]. Prefers a limestone soil[1]. Succeeds in poor soils and in light shade[197]. Established plants are drought tolerant, succeeding in hot dry positions[200]. Tolerates maritime exposure[200]. A very ornamental plant[1], there are many named varieties[188]. All parts of the plant have a powerful pungent smell[245]. Plants can be dioecious or monoecious. Male and female plants must be grown if fruit and seed are required. The plant is sometimes attacked by *rust*, this is a fungus with an aecidial stage on the leaves of pear trees[1]. Plants are resistant to honey fungus[88].

have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Easily grown in a well-drained loam, preferring a position in full sun but tolerating shade[1]. Prefers a light acid soil, disliking heavy and strongly calcareous soils[17]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 5.2.763 *Iris setosa*

Beachhead Iris, Canada beachhead iris, Wild flag

4 tlin 8 cyuc 1 kcak 0 tcan 1 dwat 0.6 m hkuc

hmimhtut cyutli tucphja7n hwicli hrasjut hpa7tli flatprikhsnon hpa7tmwatli fyfikre7t hjonli

drutta *Iris setosa* is a PERENNIAL growing to 0.6 m (2ft) by 1 m (3ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in June, and the seeds ripen in August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid and neutral soils and can grow in saline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta Edible Parts: RootEdible Uses: CoffeeRoot - yields an edible starch[2, 105, 177, 183]. Caution is advised, see the notes above on toxicity. Roasted and ground seed is a coffee substitute[46, 61, 183, 257].

tcanta DyeA dye is obtained from the petals, but the colour is not specified[257].

dwatta LaxativeA decoction of the root is used as a laxative[257].

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed should be sown as early in the year as possible in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse or cold frame for their first year. Plant out into their permanent positions in late spring or early summer. Division, best done in September after flowering. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Landscape Uses:Container, Massing, Specimen. Prefers a well-drained moist soil[79] but succeeds in most soils[42]. Dislikes lime and dry soils[42, 79]. The form from N. Hokkaido does not require an acid soil[187]. Cultivated for its edible root in Japan[2]. Many named forms have been selected for their ornamental value[187]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. Special Features:Attractive foliage, North American native, Naturalizing, All or parts of this plant are poisonous, Suitable for cut flowers.

## 5.2.764 *Cardamine raphanifolia*

4 tlin 8 cyuc 1 kcak 0 tcan 0 dwat 0.5 m hkuc

pcimhmim cyutli tucphja7n hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyfikre7t hjonli

drutta *Cardamine raphanifolia* is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist or wet soil.

kcakta Edible Parts: LeavesEdible Uses: We have no information on the edibility of this plant but the leaves are almost certainly edible[K].

tcanta Plants can be grown as a ground cover, making a fairly good carpet in a moist position[208].

dwatta None known

propta Seed - sow spring in a cold frame. Germination usually takes place within 1 - 3 weeks at 15°C[175]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in a greenhouse or

cold frame for the first two years, planting them out when dormant in late summer. Division in early spring or after the plant dies down in the summer. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Prefers a moist humus rich soil in shade or semi-shade[200] but succeeds in most soils that are not dry[1]. Plants are closely related to *C. pratensis*[17].

## 5.2.765 *Arabis hirsuta*

Hairy rockcress, Mountain rockcress, Creamflower rockcress

4 tlin 8 cyuc 1 kcak 0 tcan 0 dwat 0.6 m hkuc

hmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Arabis hirsuta* is a BIENNIAL/PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies), insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young leaves - cooked[177].

tcanta None known

dwatta None known

propta Seed - it is best to surface sow the seed as soon as it is ripe in a light position in a cold frame[134]. Seed can also be sown in spring. It usually germinates in 2 - 3 weeks at 21°C[134]. When large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division after flowering[111]. Very easy, the divisions can be planted out straight into their permanent positions if required. Cuttings in a shady border in summer[11].

nwatta Easily grown in ordinary well-drained soil. Succeeds in dry soils and on walls[K].

## 5.2.766 *Dianthus barbatus*

Sweet William

4 tlin 10 cyuc 1 kcak 0 tcan 0 dwat 0.6 m hkuc

htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Dianthus barbatus* is a PERENNIAL growing to 0.6 m (2ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: FlowersEdible Uses: The flowers have a mild flavour and are used as a garnish for vegetable and fruit salads, cakes, desserts, cold drinks etc[183].

tcanta None known

dwatta None known

propta Seed - sow May/June in a cold frame. The seed usually germinates in 2 - 3 weeks. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer or autumn[1]. The seed can also be sown thinly in an outdoor seedbed in late spring, the young plants being planted out in late spring or the autumn. Cuttings of half-ripe shoots, July in a frame[1]. Division in September[1]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Landscape Uses:Border, Container, Rock garden, Seashore, Specimen. Prefers a rich well-drained loamy soil in a sunny position, but succeeds in most soils including dry ones[1]. A very ornamental plant[1], its flowers are very

attractive to butterflies and moths[17, 30]. The flowers have a strong clove-like scent[245]. Plants self-sow freely when grown in a suitable position[1]. Although the Sweet William is a perennial species, it is quite short-lived and degenerates after its second year. It is best treated as a biennial in the garden[200]. Special Features:Attracts butterflies, Suitable for cut flowers, Suitable for dried flowers, Fragrant flowers.

### 5.2.767 *Mertensia paniculata*

drutta *Verbena officinalis* is a PERENNIAL growing to 0.6 m (2ft) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in leaf from April to October, in flower from July to September, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: Flowers LeavesEdible Uses: TeaLeaves - parboiled, seasoned and then eaten[183]. The leaves are used as a tea substitute[7, 183]. The flowers are used as a garnish[183].

tcanta None known

dwatta Analgesic Antibacterial Anticoagulant Antipruritic Antirheumatic Antispasmodic Antitumor Astringent Bach Birthing aid Depurative Diaphoretic Diuretic Dysentery Eczema Emmenagogue Galactagogue Stimulant Tonic VulneraryVervain, which has tonic and restorative properties, is sometimes used as a domestic herbal remedy. It is useful when taken internally in the treatment of headaches, fevers, nervous exhaustion, depression, gall bladder problems, insufficient lactation etc[4, 238]. It should not be given to pregnant women, though it can be used to assist contractions during labour[238]. Externally, it is used to treat minor injuries, eczema, sores, neuralgia and gum disease[238].

The leaves and flowering stems are analgesic, antibacterial, anticoagulant, antispasmodic, astringent, depurative, diaphoretic, mildly diuretic, emmenagogue, galactagogue, stimulant, tonic and vulnerary[4, 9, 21, 147, 165, 176, 218, 238]. The plant is harvested as flowering begins in the summer and dried for later use[7, 238]. Some remarkable results have been obtained when using this plant in the treatment of certain tumours, but further research needs to be carried out before definite claims can be made[7]. The root is astringent, it is used in the treatment of dysentery[218]. This species was ranked 12th in a Chinese survey of 250 potential antifertility plants[218]. The plant is used in Bach flower remedies - the keywords for prescribing it are 'Strain', 'Stress', 'Tension' and 'Over-enthusiasm'[209].

propta Seed - sow early spring in a greenhouse and only just cover the seed. Germination should take place within 3 weeks. Prick out the seedlings into individual pots once they are large enough to handle and plant them out in early summer. If you have sufficient seed, it can also be sown in situ in late spring. Division in spring. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the summer or the following spring. Basal cuttings in early summer: Harvest the shoots with plenty of underground stem when they are about 8 - 10cm above the ground. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta A very easily grown plant, it succeeds in any moderately fertile well-drained but moisture retentive soil in a sunny position[1, 200]. Plants are very tolerant of neglect and will maintain themselves for a number of years even when growing in dense weed competition[K]. Self-sows freely when growing in a suitable position[K]. The growing plant attracts butterflies and moths[30].

### 5.2.769 *Trillium undulatum*

Painted Trillium

4 tin 8 cyuc 1 kcak 0 tcan 1 dwat 0.2 m hkuc  
pcimhmmihmtu cyutli tcup hwicli hrasjlutnyik hpa7tli frusflatprik hpa7tmwatli xre7t hjonli

drutta *Trillium undulatum* is a PERENNIAL growing to 0.2 m (0ft 8in) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves - cooked. The young unfolding leaves make a good potherb[183].

tcanta None known

dwatta OxytoxicThe flowers, sepals and leaves have been eaten to accelerate the delivery of a child[257].

propta Seed - best sown in a shaded cold frame as soon as it is ripe[134, 200]. Stored seed should be sown in late winter or early spring. Seed usually germinates within 1 - 3 months at 15°C. Another report says that seeds produce a root after the first cold stratification but no shoot is produced until after a second winter[138], whilst yet another report says that the seed can take 3 years to germinate[238]. The seedlings are prone to damp off and must therefore be watered with care and given plenty of fresh air[138]. The young plants need to be overwintered in a cold frame for the first year and can then be planted out in late spring. It is very important that the pots become neither too dry nor too wet[138]. Division with care when the plants die down after flowering[200]. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the following spring.

nwatta Prefers a deep well-drained woodland or humus-rich soil in a somewhat shady position that remains moist in the summer[1, 42]. Prefers a neutral to slightly acid

The bark also contains fraxetin. This has an inhibitory effect on the central nervous system, is a stronger and safer antidote than aspirin and has some antibacterial activity[176].

propta The seed is best harvested green - as soon as it is fully developed but before it has fully dried on the tree - and can then be sown immediately in a cold frame[80]. It usually germinates in the spring[80]. Stored seed requires a period of cold stratification and is best sown as soon as possible in a cold frame[200]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant them out into their permanent positions or a nursery bed in late spring or early summer of the following year. If you have sufficient seed then it is possible to sow it directly into an outdoor seedbed, preferably in the autumn. Grow the seedlings on in the seedbed for 2 years before transplanting either to their permanent positions or to nursery beds.

nwatta Prefers a deep loamy soil, even if it is on the heavy side[1, 200]. Most members of this genus are gross feeders and require a rich soil[200]. Plants succeed when growing in exposed positions[200] and also in alkaline soils[11]. They tolerate atmospheric pollution[200]. A very ornamental plant[1]. This species might be dioecious, in which case male and female plants must be grown if seed is required.

### 5.2.864 *Clematis ligusticifolia*

White Clematis, Western white clematis, California clematis, 4 tin 8 cyuc 0 kcak 0 tcan 2 dwat 5 m hkuc  
hmmihmtu cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliws hpa7tmwatli xre7t hjonli

drutta *Clematis ligusticifolia* is a deciduous climber growing to 5 m (16ft 5in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from August to September, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta Fibre Hair Insulation Miscellany TinderThe seed floss makes an excellent tinder for starting fires, a spark from a flint will quickly ignite it[212]. The seed floss can be used as an insulation in shoes etc[212]. It has also been used in baby's nappies[257]. The stems have been used to make a string[257]. A shampoo made from the roots can be used as a hair shampoo[257].

dwatta Analgesic Contraceptive Eczema Febrifuge Miscellany Odontalgic Poultice Skin Stomachic Tonic VDWhite clematis was employed medicinally by a number of native North American Indian tribes who used it to treat a variety of complaints, but especially as an external application on sores etc[257]. It is rarely used in modern herbalism but probably merits investigation[K]. A decoction of the plant is used to treat colds and sore throats[212, 257]. It has also been used as a general tonic when feeling out of sorts[257]. An infusion of the white bark has been used as a febrifuge[213, 257]. An infusion of the roots has been used to treat headaches and stomach aches[257]. A poultice of the foliage has been used to treat chest pains and rheumatic joints[257]. An infusion of the plant has been used as a wash for skin eruptions, sores, wounds, backaches, swollen limbs, tired feet, syphilitic sores, eczema etc[257]. The stalks and roots have been used to make a woman's contraceptive[257]. A poultice made from the cut stems has been applied to the teeth for treating toothache[257]. A poultice of the mashed, moistened seeds has been applied to severe burns[257].

propta Seed - best sown as soon as it is ripe in a cold frame[164, 200]. Sow stored seed as soon as it is obtained in a cold frame. Pre-soak the seed for 12 hours in warm water and remove as much of the tail and outer coat as possible[164]. A period of cold stratification is beneficial[164]. The seed germinates in 1 - 9 months or more at 20°C[164]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant out in late spring or early summer, after the last expected frosts. Internodal cuttings of soft to semi-ripe wood, late spring in sandy soil in a frame[200].

Layering of old stems in late winter or early spring[200]. Layering of current seasons growth in early summer[200].

nwatta Prefers a deep moist soil with its roots in the shade[11, 200]. Dislikes poorly-drained heavy clay soils, but grows well in clay if grit is added for drainage[11, 200]. Dislikes light sandy soils[11]. Does well on chalk[1]. Succeeds in acid as well as alkaline soils[200]. When planting out, in order to avoid the disease 'clematis wilt', it is best to plant the rootball about 8cm deeper in the soil. This will also serve to build up a good root crown of growth buds[200]. A twining plant[182]. The leafstalks wrap themselves around twigs and branches for support. When a side of the stalk touches an object, the growth on that side slows down whilst the other side grows at its normal rate - this causes the leaf stalk to entwine the object it is touching[212]. Plants seem to be immune to the predations of rabbits[233]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

### 5.2.865 *Rhododendron campanulatum*

4 tin 8 cyuc 0 kcak 0 tcan 1 dwat 4.5 m hkuc  
hmmihmtu cyutli tcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta *Rhododendron campanulatum* is an evergreen shrub growing to 4.5 m (14ft 9in). See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf all year, in flower from April to May, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta Fuel MiscellanyAn excellent fuel wood is obtained from this plant[272].

dwatta MiscellanyThe leaves are mixed with tobacco and used as a snuff in the treatment of colds and headaches that affect only one side of the head[240]. The juice of the leaves is also used in the treatment of chronic rheumatism, sciatica and syphilis[240, 272]. The dried twigs and wood are used in the treatment of phthisis and chronic fevers[240].

propta Seed - best sown in a greenhouse as soon as it is ripe in the autumn and given artificial light. Alternatively sow the seed in a lightly shaded part of the warm greenhouse in late winter or in a cold greenhouse in April. Surface-sow the seed and do not allow the compost to become dry[200]. Pot up the seedlings when they are large enough to handle and grow on in a greenhouse for at least the first winter. Layering in late July. Takes 15 - 24 months[78]. Cuttings of half-ripe wood, August in a frame. Difficult[78].

nwatta Succeeds in most humus rich lime free soils except those of a dry arid nature or heavy or clayey[1]. Prefers a peaty or well-drained sandy loam[1]. Succeeds in sun or shade, the warmer the climate the more shade a plant requires[200]. Requires a pH between 4.5 and 5.5[200]. Succeeds in a woodland though, because of its surface-rooting habit[200], it does not compete well with surface-rooting trees[1]. Plants need to be kept well weeded, they dislike other plants growing over or into their root system, in particular they grow badly with ground cover plants, herbaceous plants and heathers[200]. There are many named varieties selected for their ornamental value[200]. Plants form a root ball and are very tolerant of being transplanted, even when quite large, so long as the root ball is kept intact[200]. Plants in this genus are notably susceptible to honey fungus[200].

### 5.2.866 *Juniperus squamata*

Flaky Juniper

4 tin 7 cyuc 0 kcak 0 tcan 1 dwat 4 m hkuc  
htut cyutli hगत्यuctcup hwicli hrasjlutnyik hpa7tli flatprikliwispil hpa7tmwatli nyanhjen hjonli

drutta *Juniperus squamata* is an evergreen shrub growing to 4 m (13ft) by 5 m (16ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf all year, and the seeds ripen in October. The species is dioecious (individual flowers are either male or female, but only

growth. Takes 12 months[78]. Root cuttings, 6mm thick 25mm long in December. Plant horizontally in pots in a frame[78].

nwatta Prefers a deep loamy soil[1] but succeeds in most soils so long as they are not too shallow[202]. Succeeds in full or partial shade[188]. Plants flower more freely if their top-growth is in the sun[182]. Requires a humus-rich soil if it is to be at its best[219]. A rampant climber, it requires ample space and is best grown into an old tree[1, 200]. It climbs by means of twining and also by the young stems having prickles[182]. Plants do not normally require pruning[219]. Plants in this genus are notably resistant to honey fungus[200]. Plants are dioecious, male and female plants must be grown if seed is required[200].

## 5.2.861 Cephalanthus occidentalis

Button Bush, Common buttonbush, Button Willow, Honey Bells, Buttonbush

4 tin 10 cyuc 0 kcaak 0 tcan 2 dwat 7 m hkuc hmimhtut cyutli tucphja7n hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Cephalanthus occidentalis is a deciduous Shrub growing to 7 m (23ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in August, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcaakta None known  
tcanta WoodWood - light, tough. Of no commercial value[229].

dwatta Astringent Diaphoretic Diuretic Dysentery Emetic Febrifuge Laxative Malaria Odontalgic Ophthalmic TonicButton bush was often employed medicinally by native North American Indian tribes who used it to treat a range of ailments[257]. It is little used in modern herbalism. A tea made from the bark is astringent, emetic, febrifuge and tonic[61, 222]. A strong decoction has been used to treat diarrhoea and dysentery, stomach complaints, haemorrhages etc[257]. It has been used as a wash for eye inflammations[222]. A decoction of either the roots or the fruits have been used as a laxative to treat constipation[257] The leaves are astringent, diaphoretic, diuretic and tonic[61, 222]. A tea has been used to check menstrual flow and to treat fevers, kidney stones, pleurisy etc[222]. The plant has a folk reputation for relieving malaria[222]. The inner bark has been chewed in the treatment of toothaches[222].

propta Seed - we have no details on this plant but would suggest sowing the seed as soon as it is ripe in an acid compost in a cold frame. Sow stored seed in late winter in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of soft or semi-ripe wood, July in a frame[200]. Layering,

nwatta Landscape Uses:Border, Massing. An easily grown plant[1], it prefers an open position in a moisture retentive or wet neutral to acid humus-rich soil[200]. Dislikes dryness at the roots[11]. A calcifuge plant, it dislikes alkaline soils[200]. Requires a sunny position[184]. Plants are hardy to about -25°C[184]. A fast-growing but short-lived species in the wild[229]. The flowers, and the dried leaves, have a soft sweet fragrance like newly mown hay[245]. A good bee plant[149]. Plants are sometimes evergreen[200]. Special Features:North American native, All or parts of this plant are poisonous, Wetlands plant, Attracts butterflies, Fragrant flowers, Attractive flowers or fruits.

## 5.2.862 Lonicera sempervirens

Trumpet Honeysuckle, Coral Honeysuckle  
4 tin 9 cyuc 0 kcaak 0 tcan 1 dwat 5 m hkuc htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta Lonicera sempervirens is an evergreen Shrub growing to 5 m (16ft 5in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 3. It is in flower in June.

The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcaakta None known  
tcanta None known  
dwatta Antiasthmatic Cathartic Emetic StingsThe fruit is emetic and cathartic[207]. The expressed juice of the plant is beneficial in the treatment of bee stings[207]. The leaves have been dried and smoked as a treatment for asthma[213].

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed requires 2 months cold stratification[113] and should be sown as soon as possible in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm with or without a heel, July/August in a frame. Good percentage[78]. Cuttings of mature wood of the current season's growth, 15 - 20cm with or without a heel, November in a cold frame. Good percentage[78]. Layering in autumn[200].

nwatta Landscape Uses:Arbor, Specimen. Succeeds in most soils but prefers a good moist soil in a sunny position[182]. Does not fruit so well when grown in the shade[200]. Plants are very hardy, tolerating temperatures down to -15°C or lower[260], though they can be deciduous in cold winters[219]. Special Features: Attracts birds, North American native, Wetlands plant, Attracts butterflies, Extended bloom season in Zones 9A and above, Fragrant flowers, Attractive flowers or blooms. The plant is heat tolerant in zones 9 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. Woody. Growth habit is a single or multiple shooting vine from a crown [1-2].

## 5.2.863 Fraxinus bungeana

Xiao Ye Qin  
4 tin 8 cyuc 0 kcaak 0 tcan 2 dwat 5 m hkuc htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatprik-wisslip hpa7tmwatli xre7t hjonli

drutta Fraxinus bungeana is a deciduous Shrub growing to 5 m (16ft 5in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcaakta None known  
tcanta Wax Weather protectionA commercial insect wax is produced on the branches[178]. We are not sure how the wax is produced, one report says that it is as a result of eggs being laid by insects. Another report says that the wax is produced by the plant due to the stimulation of the feeding insects. Yet another report says that the wax is produced from secretions of the insects[178]. The wax is used for making candles and as a polish for earthenware pots, book edges etc[178]. The plant (extract?) is said to be used as a barrier to protect the skin from ultra-violet light[176].

dwatta Analgesic Antiinflammatory Antitussive Diuretic Dysentery ExpectorantThe bark is analgesic, anti-inflammatory, antitussive, diuretic and expectorant[176, 238]. It controls bacterial infections and coughs[238]. It is used in the treatment of diarrhoea, dysentery, cataracts, cough and asthma[176]. The bark contains aesculin, this has anti-inflammatory, anticoagulant and analgesic actions[176].

soil[200]. This species is often found in quite acid soils, seldom in alkaline soils[270]. Grows well in open woodland[1]. Succeeds in deep shade[188]. Succeeds in a sunny position if the soil does not dry out[42]. Any transplanting is best done whilst the plants are in flower[200]. Plants can flower in two years from seed[138]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233], though slugs are very fond of the leaves[238].

## 5.2.770 Geranium incanum

Geranium, Cranesbill  
4 tin 9 cyuc 1 kcaak 0 tcan 0 dwat 0.4 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta Geranium incanum is a PERENNIAL growing to 0.4 m (1ft 4in) by 0.6 m (2ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 9 and is not frost tender. It is in flower from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcaakta Edible Parts: Edible Uses: TeaThe leaves are a tea substitute[183].

tcanta None known  
dwatta None known  
propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring or autumn. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Landscape Uses:Border, Container, Ground cover, Massing, Rock garden. Succeeds in any moderately fertile retentive soil in a sunny position[200]. Tolerates a wide range of soil types[200]. Plants are not very hardy in Britain[200]. They tolerate occasional falls in temperature down to about -10°C, though if killed by cold they usually reappear from seed[187]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. The plant often adopts a climbing habit, sprawling through scrub[187]. Special Features:Attractive foliage, Fragrant foliage, Suitable for cut flowers, Extended bloom season in Zones 9A and above, Attractive flowers or blooms.

## 5.2.771 Trillium tschonoskii

4 tin 8 cyuc 1 kcaak 0 tcan 2 dwat 0.2 m hkuc pcmhmmhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta Trillium tschonoskii is a PERENNIAL growing to 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from April to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: FruitEdible Uses: Fruit[105, 177]. No more details are given.

tcanta MiscellanyNone known  
dwatta MiscellanyThe root contains steroidal saponins, which have hormonal effects on the body[222, 238]. They are being used in gynaecological and obstetric medicine[238].

propta Seed - best sown in a shaded cold frame as soon as it is ripe[134, 200]. Stored seed should be sown in late winter or early spring. Seed usually germinates within 1 - 3 months at 15°C. Another report says that seeds produce a root after the first cold stratification but no shoot is produced until after a second winter[138], whilst yet another report says that the seed can take 3 years to germinate[238]. The seedlings are prone to damp off and must therefore be watered with care and given plenty of fresh air[138]. The young plants need to be overwintered in a cold frame for the first year and can then be planted out in late spring. It is very important that the pots become neither too dry nor too

wet[138]. Division with care when the plants die down after flowering[200]. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the following spring.

nwatta Prefers a deep well-drained woodland or humus-rich soil in a somewhat shady position that remains moist in the summer[1, 42]. Prefers a neutral to slightly acid soil[200]. Grows well in open woodland[1]. Succeeds in deep shade[188]. Succeeds in a sunny position if the soil does not dry out[42]. This species is closely related to *T. kamtschaticum*[200]. Any transplanting is best done whilst the plants are in flower[200]. Plants can flower in two years from seed[138]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233], though slugs are very fond of the leaves[238].

## 5.2.772 Spiraea betulifolia aemiliana

4 tin 8 cyuc 1 kcaak 0 tcan 0 dwat 0.3 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta Spiraea betulifolia aemiliana is a deciduous Shrub growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcaakta Edible Parts: Edible Uses: TeaThe leaves are a tea substitute[177, 183].

tcanta None known  
dwatta None known  
propta Seed - we have no information for this species but suggest sowing the seed as soon as it is ripe in a cold frame if possible. It is likely to require stratification before it germinates, so stored seed should be sown in a cold frame as early in the year as you receive it. Prick out the seedlings into individual pots when they are large enough to handle, and grow them on in a cold frame for their first winter. Plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, July/August in a light sandy soil a frame. Cuttings of mature wood of the current seasons growth, 15cm long, October/November in an outdoor frame[200]. Another report says that September is a good time to do this[11]. Division of suckers in early spring[200]. They can be planted out straight into their permanent positions.

nwatta Tolerates most soils[200], but prefers a good loamy soil, abundant moisture and full sunlight[11, 200]. Hybridizes freely with other members of this genus[11].

## 5.2.773 Centaurea nigra

Black Knapweed, Lesser Knapweed  
4 tin 8 cyuc 1 kcaak 0 tcan 2 dwat 0.6 m hkuc htut cyutli hgatkyutcup hwicli hysihrasjlutnyik hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta Centaurea nigra is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcaakta Edible Parts: FlowersEdible Uses: Flower petals - raw. Added to salads[183].

tcanta None known  
dwatta Diaphoretic Diuretic TonicThe roots and seeds are diaphoretic, diuretic, tonic and vulnerary[4, 61]. The plant once had a very high reputation as a healer of wounds[4].

propta Seed - sow April in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out into their permanent positions in the summer. Division in autumn. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the summer or following spring. This should be done at least once every three years in order to maintain the vigour of the plant. Basal cuttings in spring. Harvest the shoots when they are about 10 - 15cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Succeeds in ordinary garden soil[1, 200]. Prefers a well-drained fertile soil and a sunny position[200]. Tolerates dry, low fertility and alkaline soils[200]. Established plants are tolerant of considerable neglect, thriving and even self-sowing in dense weed growth[K]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 5.2.774 Arisaema dracontium

Green-Dragon

4 tlin 8 cyuc 1 kcaak 0 tcan 1 dwat 0.8 m hkuc pcimhmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikwiw hpa7tmwlati nyanhjen hjonli

drutta Arisaema dracontium is a PERENNIAL growing to 0.8 m (2ft 7in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower in May. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Flies. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

ckakta Edible Parts: RootEdible Uses: Root. Considered to be edible once it has been dried, aged and elaborately processed[222]. The root contains calcium oxalate crystals - these are destroyed by drying the plant or by thorough cooking[K].

tcanta None known

dwatta Antiasthmatic Women's complaintsThe dried and aged root was used by the N. American Indians in the treatment of 'female disorders'[222, 257]. The plant (leaves?) were chewed in the treatment of asthma[213].

propta Seed - best sown as soon as it is ripe in a shady position in a cold frame[134]. Stored seed remains viable for at least a year and can be sown in spring in the greenhouse but it will probably require a period of cold stratification. Germination usually takes place in 1 - 6 months at 15°C[134]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least a couple of years until the corms are more than 20mm in diameter. Plant out into their permanent positions whilst they are dormant. Division of tubers when the plant dies down in late summer.

nwatta Prefers a cool peaty soil in the bog garden, woodland garden or a sheltered border in semi-shade[90, 134, 200]. Prefers a loamy or peaty soil and will tolerate a sunny position if the soil is moist but not water-logged and the position is not too hot or exposed[1, 200]. Tubers should be planted about 10cm deep[233]. Only plant out full sized tubers and mulch them with organic matter in the winter[200]. Plants need protection from slugs[200]. Most species in this genus are dioecious, but they are sometimes monoecious and can also change sex from year to year.

## 5.2.775 Pulmonaria saccharata

Jerusalem Sage, Bethlehem lungwort, Lungwort

4 tlin 8 cyuc 1 kcaak 0 tcan 0 dwat 0.3 m hkuc pcimhmimhtut cyutli hgtaccup hwicli hrasljutnyik hpa7tli flatprikwiw hpa7tmwlati xre7t hjonli

drutta Pulmonaria saccharata is an evergreen Perennial growing to 0.3 m (1ft) by 0.6 m (2ft in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 3 and

is not frost tender. It is in leaf all year, in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil and can tolerate drought.

ckakta Edible Parts: Edible Uses: CondimentThe plant is said to be used as a spice[177, 183]. No more details are given.

tcanta A good ground cover plant for a shady position[188, 197]. Plants should be spaced about 60cm apart each way[208].

dwatta None known

propta Seed - sow spring in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring or autumn or after flowering in early summer if the soil is not too dry[200]. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Landscape Uses:Border, Container, Ground cover, Massing, Specimen, Woodland garden. Grows well in any moderately good soil including heavy clay soils[1, 31]. Prefers full to part shade in a moist humus rich soil[200]. Succeeds in the sunless shade of buildings[200]. Dislikes dry soils[200]. Plants growing in shady positions tolerate drought if the soil is rich in humus[190]. The leaves tend to wilt in hot weather when the plant is grown in full sun[190]. Hardy to about -20°C[187]. A very ornamental plant[233], it is semi-evergreen, forming small overwintering rosettes[200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. A valuable early nectar source for bees[200]. Plants seen growing in dappled shade at Hilliers Arboretum in April 1999 were self-sowing quite freely[K]. Hybridizes freely with other members of this genus[200]. There are many named varieties, selected for their ornamental value[200]. Special Features: Attractive foliage.

## 5.2.776 Trillium kamschaticum

4 tlin 8 cyuc 1 kcaak 0 tcan 2 dwat 0.3 m hkuc

pcimhmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikwiw hpa7tmwlati xre7t hjonli

drutta Trillium kamschaticum is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from June to July, and the seeds ripen in August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

ckakta Edible Parts: FruitEdible Uses: Fruit[105]. No more details are given.

tcanta MiscellanyNone known

dwatta MiscellanyThe root contains steroidal saponins, which have hormonal effects on the body[222, 238]. They are being used in gynaecological and obstetric medicine[238].

propta Seed - best sown in a shaded cold frame as soon as it is ripe[134, 200]. Stored seed should be sown in late winter or early spring. Seed usually germinates within 1 - 3 months at 15°C. Another report says that seeds produce a root after the first cold stratification but no shoot is produced until after a second winter[138], whilst yet another report says that the seed can take 3 years to germinate[238]. The seedlings are prone to damp off and must therefore be watered with care and given plenty of fresh air[138]. The young plants need to be overwintered in a cold frame for the first year and can then be planted out in late spring. It is very important that the pots become neither too dry nor too wet[138]. Division with care when the plants die down after flowering[200]. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade

can be found on the same plant) and is pollinated by Wind. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry moist or wet soil. The plant can tolerate strong winds but not maritime exposure. It cannot tolerate atmospheric pollution.

ckakta None known

tcanta Hedge Hedge WoodPlants can be grown as a tall hedge[200] They are very tolerant of clipping so long as this does not extend into the brown barked wood since trees cannot regenerate from this[200]. Any trimming should be done in the summer[200]. Wood - soft, not strong, close grained, very durable, easily worked, light, slightly fragrant. It weighs 211b per cubic foot. It is commonly used for woodenware, cooperage, fence posts, interior finish of houses etc[43, 46, 61, 82, 171, 235]. Wood found buried in swamps for hundreds of years is perfectly sound and not water-logged[11].

dwatta A decoction of the leaves has been used as a herbal steam for treating headaches and backaches[257]. A poultice made from the crushed leaves and bark has been applied to the head to treat headaches[257].

propta Seed - sow March/April in a seedbed outdoors[78]. The seed is best sown in pots in a frame[K]. Seed can take 18 months to germinate. One month warm then one month cold stratification has produced good results[113]. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for their first winter, planting them out in late spring after the last expected frosts. Cuttings in late summer or autumn in sandy soil in a cold frame[1, 11, 200]. Difficult, it may be best done in late winter to early spring[113].

nwatta Landscape Uses:Pest tolerant, Screen, Specimen. Succeeds in most soils and situations, but prefers abundant moisture and a deep loamy soil and a sheltered position[1, 11]. Grows well in heavy clay soils. Survives on dry alkaline soils[200]. Growth of trees is hardly affected by a lack of phosphate in the soil. Plants are moderately shade tolerant, especially when young[81, 200]. Plants are tolerant of atmospheric pollution according to one report[200], whilst another says that they do not do well in a polluted atmosphere[1]. This species is especially well adapted for planting in cold wet places[1]. Plants are hardy to about -35°C[200]. A long-lived tree in the wild with specimens more than 1,000 years old[229]. It is slow growing in cultivation[200], trees rarely grow more than 20cm in a year[185]. The branches become brittle with age[1]. A very polymorphic species, there are many named varieties[200]. The crushed foliage has a rather gingery hot aroma[185]. Favoured by many birds for roosting, high cover and especially for nesting, large specimens of this tree help to attract songbirds to the garden[200]. Trees are notably susceptible to honey fungus[200]. Special Features:Attracts birds, North American native, Wetlands plant, Inconspicuous flowers or blooms.

## 5.2.859 Phellodendron chinense

Chinese Cork Tree

4 tlin 8 cyuc 0 kcaak 0 tcan 3 dwat 10 m hkuc htut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikwiwssilp hpa7tmwlati nyanhjen hjonli

drutta Phellodendron chinense is a deciduous Tree growing to 10 m (32ft) by 10 m (32ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in June, and the seeds ripen from September to October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). . The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers moist soil.

ckakta None known

tcanta None known

dwatta Antibacterial Bitter Cholagogue Diuretic Dysentery Expectorant Hypoglycaemic Ophthalmic Skin Stomachic Urinary VasodilatorThis species is used in Chinese herbalism in the same way as *P. amurense*[238, 254]. These uses

are as follows:- Amur cork tree, called Huang Bai in China, is commonly used in Chinese herbalism, where it is considered to be one of the 50 fundamental herbs, but one that should be used with care[218, 254]. A strongly bitter remedy, the bark acts strongly on the kidneys and is regarded as a detoxicant for hot damp conditions[238]. Recent research has shown that the plant is useful in the treatment of meningitis and conjunctivitis[254]. Huang Bai should only be used under professional supervision and should not be taken during pregnancy[254]. The bark is alterative, antibacterial, antirheumatic, aphrodisiac, bitter stomachic, cholagogue, diuretic, expectorant, febrifuge, hypoglycaemic, ophthalmic, skin, vasodilator and tonic[4, 61, 174, 176, 178, 281, 238]. It is taken internally in the treatment of acute diarrhoea, dysentery, jaundice, vaginal infections including Trichomonas, acute urinary tract infections, enteritis, boils, abscesses, night sweats and skin diseases[238, 254]. It is commonly used in conjunction with *Scutellaria baicalensis* and *Coptis chinensis* in a preparation called 'injection of three yellow herbs'[238]. It is given intramuscularly for upper respiratory tract infections[238]. The bark of 10 year old trees is harvested in the winter or spring and dried for later use[238, 254]. The fruit is expectorant[218].

propta Seed - best sown in the autumn in a cold frame[200]. Stored seed requires 2 months cold stratification, sow in late winter in a cold frame[78, 113]. Germination is usually good. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the cold frame for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in a frame. Pot up in autumn and over winter in a cold frame. Fair to good percentage[78]. Root cuttings - obtain in December and store in leafmold in a warm place for 3 weeks. Cut into 4cm lengths and plant horizontally in pots. Grow on in a warm greenhouse. Good percentage[78].

nwatta Prefers a moisture retentive well-drained deep rich loam in full sun[11, 200]. Prefers a neutral to alkaline soil[238]. Succeeds on shallow chalky soils[245]. Grows best in areas with long hot summers[200]. Plants are gross feeders and require a rich soil if they are to perform well[11]. Dormant plants are fully hardy in Britain, tolerating temperatures down to at least -20°C[188, 200], but the young growth is liable to damage from late spring frosts[11, 188, 200]. The leaves are aromatic[188]. Dioecious. Male and female plants must be grown if seed is required.

## 5.2.860 Celastrus angulatus

4 tlin 8 cyuc 0 kcaak 0 tcan 1 dwat 7.3 m hkuc

pcimhmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikwiw hpa7tmwlati nyanhjen hjonli

drutta Celastrus angulatus is a deciduous Climber growing to 7.3 m (24ft) by 10 m (32ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to August, and the seeds ripen from November to February. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

ckakta None known

tcanta InsecticideThe plant has insecticidal properties[218].

dwatta CancerMany plants in this genus contain compounds of interest for their antitumour activity[218].

propta Seed - gather when ripe, store in dry sand and sow February in a warm greenhouse[78]. Three months cold stratification leads to a higher germination rate[113]. Remove the flesh of the fruit since this inhibits germination[113]. Germination rates are usually good[78]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame[188]. Layering in August of the current seasons

nwatta Landscape Uses:Screen. Succeeds in most soils and situations, but prefers a moist deep loamy soil and a sheltered position[1, 11]. Grows well in heavy clay soils. Survives on dry alkaline soils[200]. Does not grow well on peat or shallow chalky soils[11]. Growth of trees is hardly affected by a lack of phosphate in the soil. Plants are moderately shade tolerant, especially when young[81, 200]. Plants are tolerant of atmospheric pollution according to one report[200], whilst another says that they do not do well in a polluted atmosphere[1]. Plants are hardy to about -35c, they also tolerate low summer temperatures[200]. A very polymorphic species, there are many named varieties[200]. This species establishes well and grows fairly quickly when young[11]. Trees can reach 20 metres tall in 35 years but growth slows as the trees get older[185]. It is cultivated as a timber tree in Europe[50]. Trees in the wild can live for 1,000 years or longer[226], one specimen is believed to be 3,500 years old[229]. This longevity is probably due to the presence of toxic chemical compounds from microscopic fungi concentrated in the heartwood[226]. The wood and foliage have an acrid odour[226]. The bruised foliage releases a smell of turpentine[245]. Favoured by many birds for roosting, high cover and especially for nesting, large specimens of this tree help to attract songbirds to the garden[200]. Trees are notably susceptible to honey fungus[200]. Special Features:North American native, Inconspicuous flowers or blooms.

### 5.2.856 Campsis radicans

Trumpet Vine, Trumpet creeper

4 tlin 10 cyuc 0 kcaak 1 tcan 1 dwat 12 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliws hpa7tmwatli xre7t hjonli

drutta Campsis radicans is a deciduous Climber growing to 12 m (39ft 4in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in leaf from June to October, in flower from August to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta None known

tcanta Can be used as a ground cover plant in a sunny position[188]. They can be allowed to scramble on the ground and will form an effective ground cover, rooting at intervals along the branches[208]. They should be planted about 2.5 metres apart each way[208]. The form C. radicans f. flava has gained the Royal Horticultural Society's Award of Garden Merit.

dwatta Diaphoretic VulneraryThe root is diaphoretic and vulnerary[61, 218].

propta Seed - sow spring in a greenhouse at 10°c. Two months stratification at 5°c assists germination[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of almost ripe wood, 7 - 10cm long, July/August in a frame. Slow to root but a fair percentage[78, 200]. Root cuttings 5cm long in December. Fair to good percentage[78]. Suckers, removed in the dormant season.

nwatta Landscape Uses:Arbor, Seashore, Woodland garden. Succeeds on a warm wall in a good loamy soil[1] in full sun[166] or light shade[200]. Plants can become rampant when growing in rich soils[200]. A very ornamental plant[1], it is hardy to about -20°c according to some reports[184, 200] whilst another says that it is not hardy in all parts of the country but it succeeds in more open positions such as a pergola or an old tree in the southern part of England[1]. Plants require the extra warmth of a sunny wall to induce better flowering[184]. Plants are self-clinging by aerial roots like ivy but are best if given some support[1, 166]. Any pruning is best done in the spring[188]. The seed only ripens outdoors in Britain in hot summers[11]. There are some named forms selected for their ornamental value[202]. Hybridizes freely with other members of this genus[200]. Special Features: Attracts birds, North American native, Invasive, All or parts of this plant are poisonous, Attracts butterflies, Attractive flowers or blooms.

### 5.2.857 Rhus potaninii

4 tlin 8 cyuc 0 kcaak 0 tcan 2 dwat 12 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliws hpa7tmwatli nyanhjen hjonli

drutta Rhus potaninii is a deciduous Tree growing to 12 m (39ft) by 8 m (26ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in June, and the seeds ripen from August to October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required) and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: OilEdible Uses: OilNone known tcanta Dye Ink Mordant OilThe leaves are rich in tannin. They can be collected as they fall in the autumn and used as a brown dye or as a mordant[169]. An oil is extracted from the seeds[4]. It attains a tallow-like consistency on standing and is used to make candles. These burn brilliantly, though they emit a pungent smoke[4]. An indelible black ink is obtained from galls on the leaves[46, 61]. The report does not say if the galls are used before or after the insect leaves them.

dwatta Antiseptic Astringent HaemostaticAn excretion produced on the leaf by an insect Melaphis chinensis or M. paitan is antiseptic, astringent and haemostatic[176]. It is used in the treatment of persistent cough with blood, chronic diarrhoea, spontaneous sweating, night sweats, bloody stool, urorrhoea and bloody sputum. It is used applied externally to burns, bleeding due to traumatic injuries, haemorrhoids and ulcers in the mouth[176].

propta Seed - best sown in a cold frame as soon as it is ripe. Pre-soak the seed for 24 hours in hot water (starting at a temperature of 80 - 90c and allowing it to cool) prior to sowing in order to leach out any germination inhibitors[200]. This soak water can be drunk and has a delicious lemon-flavour. The stored seed also needs hot water treatment and can be sown in early spring in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 10cm with a heel, July/August in a frame[200]. Root cuttings 4cm long taken in December and potted up vertically in a greenhouse. Good percentage[78, 200]. Suckers in late autumn to winter[200].

nwatta Succeeds in a well-drained fertile soil in full sun[11, 200]. The young growth in spring can be damaged by late frosts. A very ornamental plant[1], but it rarely flowers in Britain[11]. This species is very closely related to R. punjabensis[109]. Plants have brittle branches and these can be broken off in strong winds[200]. Plants are also susceptible to coral spot fungus[11]. Plants in this genus are notably resistant to honey fungus[200]. Many of the species in this genus are highly toxic and can also cause severe irritation to the skin of some people, whilst other species such as this one are not poisonous. It is relatively simple to distinguish which is which, the poisonous species have axillary panicles and smooth fruits whilst non-poisonous species have compound terminal panicles and fruits covered with acid crimson hairs[1, 4]. The toxic species are sometimes separated into their own genus, Toxicodendron, by some botanists[200]. Dioecious. Male and female plants must be grown if seed is required.

### 5.2.858 Chamaecyparis thyoides

White Cypress, Atlantic white cedar, Coast White Cedar, Southern White Cedar, White Cypress

4 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 10 m hkuc hmimhtut cyutli kyuctcuphja7n hwicli hrasjlutnyikfrip hpa7tli frusflatprikliwsslip hpa7tmwatli hjonli

drutta Chamaecyparis thyoides is an evergreen Tree growing to 10 m (32ft) by 3 m (9ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf all year, in flower from March to April, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes

in a greenhouse or cold frame until they are growing away well. Plant them out in the following spring.

nwatta Prefers a deep well-drained woodland or humus-rich soil in a somewhat shady position that remains moist in the summer[1, 42]. Prefers a neutral to slightly acid soil[200]. Grows well in open woodland[1]. Succeeds in deep shade[188]. Succeeds in a sunny position if the soil does not dry out[42]. Any transplanting is best done whilst the plants are in flower[200]. Plants can flower in two years from seed[138]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233], though slugs are very fond of the leaves[238].

### 5.2.777 Polygonum persicaria

Red Leg, Spotted ladysthumb

4 tlin 8 cyuc 1 kcaak 0 tcan 2 dwat 0.6 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliws hpa7tmwatli fyfxre7t hjonli

drutta Polygonum persicaria is a ANNUAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from June to October, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves SeedEdible Uses: Leaves and young shoots - raw or cooked[55, 62, 105, 183]. They contain about 1.9% fat, 5.4% pectin, 3.2% sugars, 27.6% cellulose, 1% tannin[178]. Seed - raw or cooked. It is rather small and fiddly to utilize.

tcanta DyeA yellow dye is obtained from the plant when alum is used as a mordant[207].

dwatta Astringent Diuretic Lithotropic Poultrice Rubefacient VermifugeThe leaves are astringent, diuretic, rubefacient and vermifuge[9, 21, 53, 178, 222]. An infusion has been used as a treatment for gravel and stomach pains[257]. A decoction of the plant, mixed with flour, has been used as a poultice to help relieve pain[257]. A decoction of the plant has been used as a foot and leg soak in the treatment of rheumatism[257]. The crushed leaves have been rubbed on poison ivy rash[257].

propta Seed - sow spring in situ.

nwatta Succeeds in an ordinary garden soil[1] but prefers a moisture retentive not too fertile soil in sun or part shade[200]. Repays generous treatment[1]. Plants seem to be immune to the predations of rabbits[233].

### 5.2.778 Lithospermum ruderale

Western Gromwell, Western Stoneseed

4 tlin 8 cyuc 1 kcaak 0 tcan 2 dwat 0.8 m hkuc htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatprikliws hpa7tmwatli xre7t hjonli

drutta Lithospermum ruderale is a PERENNIAL growing to 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 4. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: SeedEdible Uses: The seeds have been used for food[257].

tcanta Beads DyeThe plant has been used as a dye and body paint[238]. No more details are given in the report, but it is likely that the root is used and the colour is some shade of red[K]. The hard, white, shiny seeds have been used as beads[257].

dwatta Antirheumatic Astringent Contraceptive Diuretic KidneyAn infusion or decoction of the root has been used as a diuretic in the treatment of kidney complaints and also to treat internal haemorrhaging, diarrhoea etc[61, 257]. A poultice of the dried powdered leaves and stems has been used to relieve the pain of rheumatic joints[257]. Some N. American Indian women drank a cold water infusion of the roots daily for six months to ensure permanent sterility[213]. Alcoholic extracts of the plant have been shown to eliminate

the oestrus cycle and decrease the weight of the thymus and pituitary glands[213].

propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings. Division.

nwatta Prefers a sunny position in a moderately fertile well-drained soil[200].

### 5.2.779 Bromus carinatus

Californian Brome

4 tlin 8 cyuc 1 kcaak 1 tcan 0 dwat 0.8 m hkuc hmimhtut cyutli hgatkyuctcup hwicli hrasjlutnyik hpa7tli flatprikliws hpa7tmwatli fyfxre7t hjonli

drutta Bromus carinatus is a ANNUAL/BIENNIAL growing to 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 5. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind, Cleistogomy is self-pollinating without flowers ever opening). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: SeedEdible Uses: Seed - cooked[161, 177]. Used as a piñole[183]. The dried seed can be ground into a powder and mixed with water to make a mush or made into bread[257]. The seed is rather small and fiddly to utilize[K].

tcanta Used for control of erosion and revegetation of damaged land, as well as a highly palatable forage for livestock.

dwatta None known

propta Seed - sow spring or autumn in situ and only just cover. Germination should take place within 2 weeks. If seed is in short supply it can be surface sown in a cold frame in early spring. When large enough to handle, prick out the seedlings into individual pots and plant them out in early summer. Division in spring. Large clumps can be planted out direct into their permanent positions whilst it is best to pot up smaller clumps and grow them on in a cold frame until they are ready to be planted out.

nwatta We have very little information on this species and do not know if it will be hardy in Britain, though judging by its native range it should succeed outdoors in many parts of this country. A potential perennial cereal crop, it is able to survive summer droughts without needing irrigation[183]. Tolerates a pH in the range 5.3 to 7.8. The plant has cleistogamous flowers - these do not open in the usual way but are self-pollinated by the plant. The following notes are based on the general needs of the genus. Succeeds in a sunny position in most well-drained soils[138, 200].

### 5.2.780 Gentiana pannonica

4 tlin 8 cyuc 1 kcaak 0 tcan 3 dwat 0.6 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliws hpa7tmwatli xre7t hjonli

drutta Gentiana pannonica is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bumblebees, butterflies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta The root is sometimes used in the manufacture of gentian bitters[183].

tcanta None known

dwatta Antihelmintic Antiinflammatory Antiseptic Bitter Cholagogue Emmenagogue Febrifuge Refrigerant Stomachic TonicThis species is one of several that are the source of the medicinal gentian root[4], the following notes are based on the general uses of G. lutea which is the most commonly used species in the West[K]. Gentian root has a long history of use as a herbal bitter in the treatment of digestive disorders and

is an ingredient of many proprietary medicines. It contains some of the most bitter compounds known and is used as a scientific basis for measuring bitterness[238]. It is especially useful in states of exhaustion from chronic disease and in all cases of debility, weakness of the digestive system and lack of appetite[4]. It is one of the best strengtheners of the human system, stimulating the liver, gall bladder and digestive system[238], and is an excellent tonic to combine with a purgative in order to prevent its debilitating effects[4]. The root is anthelmintic, anti-inflammatory, antiseptic, bitter tonic, cholagogue, emmenagogue, febrifuge, refrigerant, stomachic[4, 7, 9, 14, 21, 165, 238]. It is taken internally in the treatment of liver complaints, indigestion, gastric infections and anorexia[238]. It should not be prescribed for patients with gastric or duodenal ulcers[238]. The root is harvested in the autumn and dried for later use[4]. It is quite likely that the roots of plants that have not flowered are the richest in medicinal properties[4].

propta Seed - best sown as soon as it is ripe in a light position in a cold frame[200]. It can also be sown in late winter or early spring but the seed germinates best if given a period of cold stratification and quickly loses viability when stored, with older seed germinating slowly and erratically[200, 239]. It is advantageous to keep the seed at about 10°C for a few days after sowing, to enable the seed to imbibe moisture[239]. Following this with a period of at least 5 - 6 weeks with temperatures falling to between 0 and -5°C will usually produce reasonable germination[239]. It is best to use clay pots, since plastic ones do not drain so freely and the moister conditions encourage the growth of moss, which will prevent germination of the seed[239]. The seed should be surface-sown, or only covered with a very light dressing of compost. The seed requires dark for germination, so the pots should be covered with something like newspaper or be kept in the dark[239]. Pot up the seedlings into individual pots as soon as they are large enough to handle and grow on in light shade in the greenhouse for at least their first winter. The seedlings grow on very slowly, taking 2 - 7 years to reach flowering size[239]. When the plants are of sufficient size, place them out into their permanent positions in late spring or early summer. Division of older plants in March[111, 239]. Cuttings of basal shoots in late spring[238].

nwatta In general, gentians require a moist well-drained soil in a sheltered position, a certain minimum of atmospheric humidity, high light intensity but a site where temperatures are not too high[239]. They are therefore more difficult to grow in areas with hot summers and in such a region they appreciate some protection from the strongest sunlight[200, 239]. Most species will grow well in the rock garden[200]. This species is not particular about soil type, so long as it is deep enough to accommodate the plant's roots[239]. Although sometimes found wild on alkaline soils, it prefers a neutral to slightly acid soil in cultivation[239]. A moisture loving plant, preferring to grow with full exposure to the sun but with plenty of underground moisture in the summer, it grows better in the north and west of Britain[1]. This species is closely related to *G. punctata* and *G. purpurea*[239]. Plants are intolerant of root disturbance[200]. The flowers have the scent of the old tea rose[245].

## 5.2.781 Campanula rotundifolia

Harebell, Bluebell bellflower  
4 tin 9 cyuc 1 kcaak 0 tcan 1 dwat 0.4 m hkuc  
hmimhtut cyutli kyuctcup hwicli hyishrasjlit hpa7tli prikwiw hpa7tmwatli fyifxre7t hjonli

drutta *Campanula rotundifolia* is a PERENNIAL growing to 0.4 m (1ft 4in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 3 and is not frost tender. It is in flower from July to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Leaves - raw or cooked[K].

tcanta None known

dwatta The root has been chewed in the treatment of heart and lung problems[257]. An infusion of the roots has been used as ear drops for a sore ear[257]. A decoction of the plant has been drunk or used as a wash in the treatment of sore eyes[257].

propta Seed - surface sow in spring in a cold frame. Three or four weeks pre-chilling of the seed improves the germination rate[138]. The seed usually germinates in 2 - 4 weeks at 18°C[138]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. The seed can also be sown outdoors in situ during the spring. Basal cuttings in spring[1]. Harvest the shoots when they are about 10 - 15cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer. Division in spring or autumn[111]. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the summer or following spring.

nwatta Landscape Uses:Border, Container, Massing, Rock garden, Seashore, Specimen. A very easily grown plant, it succeeds in most fertile well-drained soils[233, 271], though it prefers a moist but well-drained rich sandy loam and a neutral or alkaline soil in sun or partial shade[1, 200]. Succeeds in poor soils[17]. This species can be naturalized in finer turfs, on grassy banks and in chalk downland and heath associations[200]. Plants are hardy to at least -15°C[200]. A very variable species in the wild[271]. When established, plants can spread fairly freely and also self-sow, though they are quite easily contained by hoeing[271]. The species in this genus do not often hybridize and so seed can generally be relied upon to come true[221]. The plants are self-fertile[221]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. A very ornamental plant, there are some named varieties[200]. Special Features:Attractive foliage, Invasive, Naturalizing, Attracts butterflies, Suitable for cut flowers.

## 5.2.782 Ophioglossum vulgatum

Adder's Tongue, Southern adderstongue  
4 tin 8 cyuc 1 kcaak 0 tcan 2 dwat 0.3 m hkuc  
htut cyutli tcup hwicli hrasjlitnyik hpa7tli flatprikwiw hpa7tmwatli hjonli

drutta *Ophioglossum vulgatum* is a FERN growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5. The seeds ripen from May to August. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Used as a vegetable[145]. No more details are given.

tcanta None known

dwatta Emetic Skin VulneraryThe root and the leaves are antiseptic, detergent, emetic, haemostatic, styptic and vulnerary[4, 61, 218]. An ointment made from the plant is considered to be a good remedy for wounds and is also used in the treatment of skin ulcers[4, 145]. The expressed juice of the leaves is drunk as a treatment for internal bleeding and bruising[4].

propta Spores - best sown as soon as they are ripe on the surface of a humus-rich sterilized soil. Keep the compost moist, preferably by putting a plastic bag over the pot. Pot on small clumps of plantlets as soon as they are large enough to handle and keep them in humid conditions until they are well established. Do not plant outside until the ferns are at least 2 years old. Division of underground rhizomes with care because the roots are brittle[200]

nwatta Prefers a moist free-draining soil[1]. Plants are hardy to about -15°C[200]. The prothalli (a small plant formed when the spore germinates) of this species form a symbiotic relationship with a mycorrhizal fungus in much the same way as orchid seedlings[200]. Members of this genus are rarely if ever troubled by browsing deer[233]. Plants can be hard to establish, they can be naturalized in a meadow

erosion along the banks of rivers etc[226]. It is also a good pioneer species, readily invading any cleared-out area if there is sufficient moisture[226, 229]. It is short-lived and not very shade tolerant and so, having provided good conditions for other woodland trees to become established, it is eventually out-competed by them[K]. Wood - light, close-grained, soft, weak[82, 226, 229, 235]. It weighs 28lb per cubic foot[235]. It is sometimes cut for timber which is used for fence posts, but its uses are mainly limited to charcoal and firewood[226, 229]. Dynamic accumulator.

dwatta Anodyne Antispasmodic Astringent FebrifugeAn infusion of the bark shavings has been used in the treatment of diarrhoea and stomach ailments[257]. A poultice of the bark has been applied to bleeding cuts[257]. A decoction of the branch tips has been used as a soak for treating cramps in the legs and feet[257]. The fresh bark of all members of this genus contains salicin[226], which probably decomposes into salicylic acid (closely related to aspirin) in the human body[213]. This is used as an anodyne and febrifuge[226].

propta Seed - must be surface sown as soon as it is ripe in late spring. It has a very short viability, perhaps as little as a few days. Cuttings of mature wood of the current year's growth, November to February in a sheltered outdoor bed or planted straight into their permanent position and given a good weed-suppressing mulch. Very easy. Plant into their permanent positions in the autumn. Cuttings of half-ripe wood, June to August in a frame. Very easy.

nwatta Succeeds in most soils, including wet, ill-drained or intermittently flooded soils[1, 11], but prefers a damp, heavy soil in a sunny position[200]. Rarely thrives on chalk[200]. A fast-growing but relatively short-lived species in the wild[229]. A good bee plant, providing an early source of nectar[11]. Trees are impatient of root disturbance and should be moved regularly before being planted in their permanent positions, which is best done whilst the plants are young[11]. The root system is rather aggressive and can cause problems with drains[200]. Hybridizes freely with other members of this genus[200]. Although the flowers are produced in catkins early in the year, they are pollinated by bees and other insects rather than by the wind[11]. Plants in this genus are notably susceptible to honey fungus[200]. Dioecious. Male and female plants must be grown if seed is required.

## 5.2.854 Juniperus chinensis

Chinese Juniper, Sargent juniper  
4 tin 10 cyuc 0 kcaak 0 tcan 2 dwat 15 m hkuc  
htut cyutli kyuctcup hwicli hrasjlitnyik hpa7tli flatprikwiw hpa7tmwatli nyanhjen hjonli

drutta *Juniperus chinensis* is an evergreen Tree growing to 15 m (49ft) by 3 m (9ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in leaf all year, in flower in April, and the seeds ripen in October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta None known

tcanta Parasiticide ParasiticideA number of cultivars are suitable for use as a ground cover, though they are rather slow-growing[208]. They should be spaced about 90cm apart each way[208]. 'Parsonsii' can grow up to 2 metres across, with its branches horizontal to and about 5cm above the ground but never touching the ground[208].

dwatta Antirheumatic Haemostatic Hepatic Parasiticide Parasiticide ResolventThe stems are used in the treatment of parasitic skin problems and rheumatism[218]. The fruit is used in the treatment of convulsions, excessive sweating and hepatitis[218]. The root is used in the treatment of burns and scalds[218]. The resin, mixed with the resin of *Pinus* species, is used as a resolvent on tumours[218].

propta The seed requires a period of cold stratification. The seed has a hard seedcoat and can be very slow to germinate, requiring a cold period followed by a warm period and then another cold spell, each of 2 - 3 months duration[78, 81]. Soaking the seed for 3 - 6 seconds in boiling water may

speed up the germination process[11]. The seed is best sown as soon as it is ripe in a cold frame. Some might germinate in the following spring, though most will take another year. Another possibility is to harvest the seed 'green' (when the embryo has fully formed but before the seedcoat has hardened). The seedlings can be potted up into individual pots when they are large enough to handle. Grow on in pots until large enough, then plant out in early summer. When stored dry, the seed can remain viable for several years[1]. Cuttings of mature wood, 5 - 10cm with a heel, September/October in a cold frame. Plant out in the following autumn[1, 78]. Layering in September/October. Takes 12 months[78].

nwatta Landscape Uses:Screen. Succeeds in most soils if they are well drained, preferring a neutral or slightly alkaline soil[1, 11, 200]. Succeeds in chalky soils[200]. Established plants are drought tolerant, succeeding in hot dry positions[200]. A slow growing and rather short-lived tree[185]. The plants produce new growth from early May to the end of August and can make 50cm a year increases in height when young[185]. A very ornamental plant[1], there are many named varieties[200]. The crushed foliage has a rather sour resinous scent[185]. Trees are usually dioecious but occasional monoecious trees occur[11]. Male and female flowers are required if fruit and seed is to be produced. Special Features: Fragrant foliage, Not North American native, Inconspicuous flowers or blooms.

## 5.2.855 Chamaecyparis nootkatensis

Nootka Cypress, Nootka Cypress, Yellow Cypress, Alaska Cedar

4 tin 8 cyuc 0 kcaak 0 tcan 1 dwat 15 m hkuc  
hmimhtut cyutli kyuctcup hwicli hrasjlitnyikfrip hpa7tli flatprikwiw hpa7tmwatli hjonli

drutta *Chamaecyparis nootkatensis* is an evergreen Tree growing to 15 m (49ft) by 6 m (19ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf all year, in flower from March to April, and the seeds ripen from October to November. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerate strong winds but not maritime exposure. It cannot tolerate atmospheric pollution.

kcakta None known

tcanta Fibre Hedge Hedge Miscellany Tinder Wood-Plants can be grown as a tall hedge[200] They are very tolerant of clipping so long as this does not extend into the brown barked wood since trees cannot regenerate from this[200]. Any trimming should be done in the summer[200]. The fibre of the inner bark is fine and soft, it is pounded and spun then used for making blankets, clothing, caps, mats etc[99, 226, 257]. Torn into pieces, it can be used as bandages or for washing babies[226]. The finely shredded inner bark can be used as a tinder[257]. Wood - hard, very durable, fragrant with an agreeable resinous odour, close grained, has low-shrinkage, is somewhat brittle, but does not splinter. Easily worked, it is used for carving, cabinet work, making boats, implements etc[1, 46, 61, 82, 99, 171, 226].

dwatta Antirheumatic Miscellany Poultice SkinThe plant has been used in sweat baths for treating rheumatism and arthritis[257]. An infusion of the branch tips has been used as a wash for sores and swellings[257]. A poultice of the crushed leaves has been applied to sores[257]. The soft bark has been used as a cover for poultices[257].

propta Seed - sow March/April in a seedbed outdoors[78]. The seed is best sown in pots in a frame[K]. Seed can take 18 months to germinate. One month warm then one month cold stratification has produced good results[113]. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for their first winter, planting them out in late spring after the last expected frosts. Cuttings in late summer or autumn in sandy soil in a cold frame[1, 11, 200]. Difficult, it may be best done in late winter to early spring[113].

Wetlands plant, Attracts butterflies, Inconspicuous flowers or blooms.

### 5.2.851 Populus 'Balsam Spire'

Tacatricho 32

4 tin 8 cyuc 0 ckak 2 tcan 3 dwat 30 m hkuc htut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprikklwis hpa7tmwatli nyanhjen hjonli

drutta Populus 'Balsam Spire' is a deciduous Tree growing to 30 m (98ft 5in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta None known

tcanta Pot-pourri Rooting hormone Shelterbelt WoodAn extract of the shoots can be used as a rooting hormone for all types of cuttings. It is extracted by soaking the chopped up shoots in cold water for a day[172]. The dried buds are used in pot-pourri[238]. Wood - soft, rather woolly in texture, without smell or taste, of low flammability, not durable, very resistant to abrasion. Of low quality, it is mainly used as a source of pulp[11, 46].

dwatta Anodyne Antiinflammatory Antiscorbutic Antiseptic Balsamic Diuretic Expectorant Refrigere Stimulant TonicThe leaf buds are covered with a resinous sap that has a strong turpentine odour and a bitter taste[213]. They also contain salicin. The buds are antiscorbutic, antiseptic, balsamic, diuretic, expectorant, stimulant and tonic[4, 21, 57, 165, 238]. They are taken internally in the treatment of bronchitis and upper respiratory tract infections. They should not be prescribed to patients who are sensitive to aspirin[238]. Externally, the buds are used to treat colds, sinusitis, arthritis, rheumatism, muscular pain and dry skin conditions[238]. They can be put in hot water and used as an inhalant to relieve congested nasal passages[213]. The buds are harvested in the spring before they open and are dried for later use[238]. Although no specific mention has been seen for this species, the bark of most, if not all members of the genus contain salicin, a glycoside that probably decomposes into salicylic acid (aspirin) in the body[213, 238]. The bark is therefore anodyne, anti-inflammatory and febrifuge. It is used especially in treating rheumatism and fevers, and also to relieve the pain of menstrual cramps[238].

propta Seed - must be sown as soon as it is ripe in spring[113]. Poplar seed has an extremely short period of viability and needs to be sown within a few days of ripening[200]. Surface sow or just lightly cover the seed in trays in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the cold frame. If sufficient growth is made, it might be possible to plant them out in late summer into their permanent positions, otherwise keep them in the cold frame until the following late spring and then plant them out. Most poplar species hybridize freely with each other, so the seed may not come true unless it is collected from the wild in areas with no other poplar species growing[11]. This species is a hybrid and will not come true from seed. Cuttings of mature wood of the current season's growth, 20 - 40cm long, November/December in a sheltered outdoor bed or direct into their permanent positions. Very easy, the cuttings grow away strongly and can be 2 metres tall by the end of their first year[K]. Suckers in early spring[78].

nwatta An easily grown plant, it grows well in a heavy cold damp soil[1]. It prefers a deep rich well-drained circum-neutral soil, growing best in the south and east of Britain[11, 200]. Growth is much less on wet soils, on poor acid soils and on thin dry soils[11]. Reasonably wind tolerant, though it does not do well in exposed upland sites or in maritime exposure[11, K]. It dislikes shady positions, and is intolerant of root or branch competition[200]. A very fast growing hybrid, this plant is a female clone that is sometimes planted for forestry[11]. It comes into leaf early in the year[11]. Poplars have very extensive and aggressive root systems that can invade and damage drainage systems. Especially when grown

on clay soils, they should not be planted within 12 metres of buildings since the root system can damage the building's foundations by drying out the soil[11]. Dioecious. Male and female plants must be grown if seed is required.

### 5.2.852 Betula schmidtii

Schmidt's Birch

4 tin 8 cyuc 0 ckak 3 tcan 0 dwat 30 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprikklwis hpa7tmwatli hjonli

drutta Betula schmidtii is a deciduous Tree growing to 30 m (98ft 5in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in April, and the seeds ripen in September. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta WoodWood - hard, heavy (it does not float). Used for rollers, mallets etc[151].

dwatta Antiseborrheic UrinaryThe German Commission E Monographs, a therapeutic guide to herbal medicine, approve Betula species for infections of the urinary tract, kidney and bladder stones, rheumatism (see [302] for critics of commission E).

propta Seed - best sown as soon as it is ripe in a light position in a cold frame[78, 80, 113, 134]. Only just cover the seed and place the pot in a sunny position[78, 80, 134]. Spring sown seed should be surface sown in a sunny position in a cold frame[113, 134]. If the germination is poor, raising the temperature by covering the seed with glass can help[134]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. If you have sufficient seed, it can be sown in an outdoor seedbed, either as soon as it is ripe or in the early spring - do not cover the spring sown seed. Grow the plants on in the seedbed for 2 years before planting them out into their permanent positions in the winter[78, 80, 113, 134].

nwatta Succeeds in a well-drained loamy soil in a sheltered position[11, 200]. Grows well in heavy clay soils. Dislikes wet soils[200]. Shade tolerant[200]. Hybridizes freely with other members of this genus[50]. Trees are succeeding very well at Kew[11]. Trees are notably susceptible to honey fungus[200].

### 5.2.853 Salix amygdaloides

Peach Leaved Willow

4 tin 8 cyuc 0 ckak 3 tcan 2 dwat 20 m hkuc htut cyutli tcuphja7n hwicli hrasjlutnyikfrip hpa7tli flatprik hpa7tmwatli nyanhjen hjonli

drutta Salix amygdaloides is a deciduous Tree growing to 20 m (65ft 7in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in April, and the seeds ripen in May. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers moist or wet soil.

kcakta None known

tcanta Basketry Charcoal Dye Pioneer Soil stabilization Tannin WoodThe bark is a source of tannin[226]. A light brown dye is obtained from the bark[226]. The young stems are very flexible and can be used in basket making[257]. The plant is usually coppiced annually when grown for basket making, though it is possible to coppice it every two years if thick poles are required as uprights. The tenacious root system of this tree makes it very useful for preventing soil

or cultivated in the border where they should be left undisturbed[200]. Unlike most species of ferns, the fronds of this species grow up straight and not curled inward, crozier fashion[4].

### 5.2.783 Festuca ovina

Sheep's Fescue

4 tin 8 cyuc 1 ckak 0 tcan 0 dwat 0.3 m hkuc hmimhtut cyutli hgatkyuctcup hwicli hyishrasjlut hpa7tli flatprikkwisslip hpa7tmwatli xre7t hjonli

drutta Festuca ovina is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: SeedEdible Uses: Seed[105, 161]. No further details but the seed is rather small and would be very fiddly to utilise[K].

tcanta None known

dwatta None known

propta Seed - sow spring in situ[162]. The seed usually germinates within three weeks. Division in spring[162]. Very easy, the clumps can be replanted direct into their permanent positions.

nwatta Prefers a light well-drained soil in full sun[200]. A drought resistant plant once established[1], it succeeds on shallow chalky soils[61]. Tolerant of constant cutting, this plant is often grown in lawns[1].

### 5.2.784 Artemisia glacialis

Glacier Wormwood

4 tin 8 cyuc 1 ckak 0 tcan 2 dwat 0.2 m hkuc htut cyutli hgatkyuctcup hwicli hyishrasjlutnyik hpa7tli flatprikklwis hpa7tmwatli xre7t hjonli

drutta Artemisia glacialis is a PERENNIAL growing to 0.2 m (0ft 8in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Edible Uses: CondimentThe herb is used as a flavouring in vermouth and liqueurs[183].

tcanta None known

dwatta Digestive Expectorant Sedative StomachicGlacier wormwood has similar medicinal properties to common wormwood, A, absinthum[7]. It is used locally where it grows wild. The whole plant is digestive, expectorant, sedative and stomachic[7]. An infusion of the herb has a marked effect upon mountain sickness[7]. A poultice of the plant is used as a first-aid remedy in the treatment of wounds[7].

propta Seed - surface sow from late winter to early summer in a greenhouse, making sure that the compost does not dry out[200]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant out in late spring or early summer. Division in spring or autumn[200]. Basal cuttings in late spring. Harvest the young shoots when about 10 - 15cm long, pot up in a lightly shaded position in a greenhouse or cold frame and plant them out when well rooted. Very easy.

nwatta Requires a very well-drained light or medium soil and a sunny position[190]. Very intolerant of winter wet[190]. Established plants are drought tolerant[190]. Plants are longer lived, more hardy and more aromatic when they are grown in a poor dry soil[245]. Indiscriminate collection of this plant from the wild has made it an endangered species[7]. Members of this genus are rarely if ever troubled by browsing deer[233].

### 5.2.785 Sedum acre

Common Stonecrop, Goldmoss stonecrop, Gold Moss Sedum 4 tin 9 cyuc 1 ckak 0 tcan 2 dwat 0.1 m hkuc htut cyutli hgatkyuctcup hwicli hyishrasjlutnyik hpa7tli flatprikklwis hpa7tmwatli fyifxre7t hjonli

drutta Sedum acre is an evergreen Perennial growing to 0.1 m (0ft 4in) by 0.3 m (1ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in leaf all year, in flower from June to July, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

kcakta Edible Parts: LeavesEdible Uses: CondimentLeaves - raw or cooked[13, 100]. Rich in vitamin C, but it has a bitter acrid taste[1, 244]. The main interest in the edible qualities of this plant is as a survival food, since it grows wild in the driest deserts as well as in arctic conditions[244]. Large quantities can cause stomach upsets[19]. It is best to dry the leaves (which can be difficult because they are very fleshy) and then powder them and use them to add a peppery taste to foods[244]. The leaves are dried and ground into a powder to make a spicy seasoning[183].

tcanta The plant spreads aggressively and can be used for ground cover in a sunny position amongst plants tall enough not to be overrun by it. Many species of the stronger-growing bulbs such as lilies can grow successfully through it[K].

dwatta Astringent Foot care Hypotensive Laxative Rubefacient Vermifuge Vitamin C VulneraryThe herb is astringent, hypotensive, laxative, rubefacient, vermifuge and vulnerary[4, 7, 9, 13, 46]. It is considered to be a useful medicinal plant by some herbalists, though others do not use it because of the violence of its operation when taken internally[4, 7]. One of its best uses is as an effective and harmless corn-remover, it can also be used to bring boils to a head, though this can also cause some local irritation[7]. The bruised fresh plant is applied as a poultice to wounds and minor burns[9], though some care should be exercised because the plant can cause blisters or skin irritations[244]. The herb is difficult to dry and so is best used when fresh, it can be gathered at any time during the spring and summer[7]. A homeopathic remedy is made from the plant[9]. It is used in the treatment of piles and anal irritations[9].

propta Seed - surface sow in spring in well-drained soil in a sunny position in a greenhouse. Do not allow the soil to dry out. It can also be sown in the autumn in a cold frame, some seed germinates immediately whilst others germinate in the spring. Prick out the seedlings into individual pots when they are large enough to handle. If sufficient growth is made, it is possible to plant them out during the summer, otherwise keep them in a cold-frame or greenhouse for their first winter and plant them out in early summer of the following year[K]. Division is very easy and can be carried out at almost any time in the growing season, though is probably best done in spring or early summer. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Landscape Uses:Container, Ground cover, Rock garden, Seashore, Specimen. A very easily grown plant, it succeeds in most soils[188] but prefers a sunny position in a fertile well-drained soil[200]. Established plants are drought tolerant[190]. Grows well on walls[190]. Plants can be very aggressive and invasive, spreading freely at the roots[200]. If clearing the plant from an area it is quite important to try and remove every part of the plant since even a small part of the stem, if left in the ground, can form roots and develop into a new plant[200]. All members of this genus are said to have edible leaves, though those species, such as this one, that have yellow flowers can cause stomach upsets if they are eaten in quantity[62, 85]. Plants in this genus seem to be immune to the predations of rabbits[233]. Special Features: Attractive foliage, Not North American native, Invasive, Naturalizing.

## 5.2.786 *Gentiana scabra buergeri*

4 tlin 8 cyuc 1 kcaok 0 tcan 3 dwat 0.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Gentiana scabra buergeri* is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bumblebees, butterflies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young plant and old leaves - cooked[105]. A famine food, used when all else fails[177, 179].

tcanta None known

dwatta Anodyne Anthelmintic Antiinflammatory Antiseptic Bitter Cholagogue Eczema Emmenagogue Expecto- rant Febrifuge Pectoral Refrigerant Stomachic Tonic UrinaryThe root is antibacterial and stomachic[176]. It is used in the treatment of jaundice, leucorrhoea, eczema, conjunctivitis, sore throat, acute infection of the urinary system, hypertension with dizziness and tinnitus[176]. The root is harvested in the autumn and dried for later use. This species is one of several that are the source of the medicinal gentian root[4], the following notes are based on the general uses of *G. lutea* which is the most commonly used species in the West[K]. Gentian root has a long history of use as a herbal bitter in the treatment of digestive disorders and is an ingredient of many proprietary medicines. It contains some of the most bitter compounds known and is used as a scientific basis for measuring bitterness[238]. It is especially useful in states of exhaustion from chronic disease and in all cases of debility, weakness of the digestive system and lack of appetite[4]. It is one of the best strengtheners of the human system, stimulating the liver, gall bladder and digestive system[238], and is an excellent tonic to combine with a purgative in order to prevent its debilitating effects[4]. The root is anthelmintic, anti-inflammatory, antiseptic, bitter tonic, cholagogue, emmenagogue, febrifuge, refrigerant, stomachic[4, 7, 9, 14, 21, 165, 238]. It is taken internally in the treatment of liver complaints, indigestion, gastric infections and anorexia[238]. It should not be prescribed for patients with gastric or duodenal ulcers[238]. The root is harvested in the autumn and dried for later use[4]. It is quite likely that the roots of plants that have not flowered are the richest in medicinal properties[4].

propta Spores - best sown as soon as it is ripe in a light position in a cold frame[200]. It can also be sown in late winter or early spring but the seed germinates best if given a period of cold stratification and quickly loses viability when stored, with older seed germinating slowly and erratically[200, 239]. It is advantageous to keep the seed at about 10°C for a few days after sowing, to enable the seed to imbibe moisture[239]. Following this with a period of at least 5 - 6 weeks with temperatures falling to between 0 and -5°C will usually produce reasonable germination[239]. It is best to use clay pots, since plastic ones do not drain so freely and the moister conditions encourage the growth of moss, which will prevent germination of the seed[239]. The seed should be surface-sown, or only covered with a very light dressing of compost. The seed requires dark for germination, so the pots should be covered with something like newspaper or be kept in the dark[239]. Pot up the seedlings into individual pots as soon as they are large enough to handle and grow on in light shade in the greenhouse for at least their first winter. The seedlings grow on very slowly, taking 2 - 7 years to reach flowering size[239]. When the plants are of sufficient size, place them out into their permanent positions in late spring or early summer. Division in March[111]. Most members of this genus have either a single tap-root, or a compact root system united in a single root head, and are thus unsuitable for division[239]. Cuttings of basal shoots in late spring[238].

nwatta In general, gentians require a moist well-drained soil in a sheltered position, a certain minimum of atmospheric humidity, high light intensity but a site where temperatures are not too high[239]. They are therefore more difficult to grow in areas with hot summers and in such a region they appreciate some protection from the strongest sunlight[200, 239]. Most species will grow well in the rock garden[200].

This species is happy in any reasonable soil[239]. A moisture loving plant, preferring to grow with full exposure to the sun but with plenty of underground moisture in the summer, it grows better in the north and west of Britain[1]. A very ornamental plant[1]. Plants are intolerant of root disturbance[200].

## 5.2.787 *Polystichum aculeatum*

Hard Shield Fern

4 tlin 8 cyuc 1 kcaok 0 tcan 0 dwat 0.8 m hkuc pcmhmim cyutli tcup hwicli hrasjlut hpa7tli flatprikliw hpa7tmwatli hjonli

drutta *Polystichum aculeatum* is an evergreen Fern growing to 0.8 m (2ft 7in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf all year, and the seeds ripen from July to August. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Eaten in curries[177]. We have no more details, it is probably the young leaves that are used though it might be the root.

tcanta Plants can be grown as a ground cover and are best placed about 60cm apart each way[208].

dwatta None known

propta Spores - best sown as soon as they are ripe, though they can also be sown in the spring. Sow them on the surface of a humus-rich sterilized soil. Keep the compost moist, preferably by putting a plastic bag over the pot. Pot on small clumps of plantlets as soon as they are large enough to handle and keep humid until they are well established. Do not plant outside until the ferns are at least 2 years old and then only in a very well sheltered position. Division. This is best done in the spring.

nwatta Very hardy and easily grown in light shade in any reasonable soil[187]. Prefers a sandy humus-rich soil in a shady position that is moist even in winter[1]. Tolerates part sun for up to 6 hours a day if the soil remains moist[200]. Prefers a pH in the range 6.5 to 7.5[200]. A very ornamental plant[1]. Members of this genus are rarely if ever troubled by browsing deer[233]. Remove old fronds from the plant in the spring because they may harbour fungal diseases[200]. Some named forms have been selected for their ornamental value[187].

## 5.2.788 *Lycopodium lucidulum*

Shining Club Moss

4 tlin 8 cyuc 1 kcaok 0 tcan 0 dwat 0.2 m hkuc pcmhmim cyutli tcup hwicli hrasjlut hpa7tli flatprikliw hpa7tmwatli hjonli

drutta *Lycopodium lucidulum* is a FERN growing to 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: The plant is edible[161, 177].

tcanta MordantThe plant can be used as a mordant in dyeing[172].

dwatta None known

propta Spores - best sown as soon as they are ripe on the surface of a humus-rich sterilized soil. Keep the compost moist, preferably by putting a plastic bag over the pot. Pot on small clumps of plantlets as soon as they are large enough to handle and keep humid until they are well established. Do not plant outside until the ferns are at least 2 years old and then only in a very well sheltered position. The spores are generally produced in abundance but are difficult to grow successfully[200]. Layering of growing tips[200].

nwatta Thrives in a rough spongy peat in a shady position[1]. Requires a humid atmosphere[200]. Terrestrial members of this genus are hard to establish. The roots are delicate and liable to rot, most water being absorbed through the foliage[200]. Members of this genus are rarely if ever

nwatta A very easily grown plant, it does well in a heavy cold damp soil[1]. Prefers a deep rich well-drained circum-neutral soil, growing best in the south and east of Britain[11, 200]. Growth is much less on wet soils, on poor acid soils and on thin dry soils[11]. This species is fairly wind resistant, though it does not do well in exposed upland sites[11]. It dislikes shade and is intolerant of root or branch competition[200]. A very fast growing tree, it grows for a longer period in the season than other poplars. This hybrid species contains a number of named forms, several of which have been selected for their ornamental value[11, 200]. Many of them are fast growing trees that are used in forestry and for shelterbelts[11, 200]. 'Serotina' and 'Robusta', in particular, are often used in shelter belt plantings. 'Serotina' is a male that responds well to pollarding but is slower in growth than some other cultivars[11]. 'Robusta' is a male and is frequently grown in forestry, as a screen and in shelterbelts[11]. The var. 'Regenerata' is tolerant of urban pollution[200]. Poplars have very extensive and aggressive root systems that can invade and damage drainage systems. Especially when grown on clay soils, they should not be planted within 12 metres of buildings since the root system can damage the building's foundations by drying out the soil[11]. Dioecious. Male and female plants must be grown if seed is required. Hybridizes freely with other members of this genus[200]. Special Features: Not North American native, Inconspicuous flowers or blooms.

## 5.2.849 *Populus x canescens*

Grey Poplar

4 tlin 9 cyuc 0 kcaok 2 tcan 1 dwat 30 m hkuc htut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprikliw hpa7tmwatli nyanhjen hjonli

drutta *Populus x canescens* is a deciduous Tree growing to 30 m (98ft) by 15 m (49ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from February to March. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerate maritime exposure.

kcakta None known

tcanta Shelterbelt WoodA fast growing tree, tolerant of salt winds, it can be grown in a shelterbelt[200]. Wood - soft, rather woolly in texture, without smell or taste, of low flammability, not durable, very resistant to abrasion[11].

dwatta Anodyne Antiinflammatory FebrifugeAlthough no specific mention has been seen for this species, the bark of most, if not all members of the genus contain salicin, a glycoside that probably decomposes into salicylic acid (aspirin) in the body[213, 238]. The bark is therefore anodyne, anti-inflammatory and febrifuge. It is used especially in treating rheumatism and fevers, and also to relieve the pain of menstrual cramps[238].

propta Seed - must be sown as soon as it is ripe in spring[113]. Poplar seed has an extremely short period of viability and needs to be sown within a few days of ripening[200]. Surface sow or just lightly cover the seed in trays in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the cold frame. If sufficient growth is made, it might be possible to plant them out in late summer into their permanent positions, otherwise keep them in the cold frame until the following late spring and then plant them out. Most poplar species hybridize freely with each other, so the seed may not come true unless it is collected from the wild in areas with no other poplar species growing[11]. This species is a hybrid and will not come true from seed. Cuttings of mature wood of the current season's growth, 20 - 40cm long, November/December in a sheltered outdoor bed or direct into their permanent positions. Very easy. Suckers in early spring[78]. Layering[200]. Root cuttings in winter[200].

nwatta An easily grown plant, it does well in a heavy cold damp soil[1]. Prefers a deep rich well-drained circum-neutral soil, growing best in the south and east of Britain[11,

200]. Growth is much less on wet soils, on poor acid soils and on thin dry soils[11]. Plants are reasonably wind tolerant, though they do not grow well in exposed upland sites[11]. They also tolerate salt-laden winds but not saline soils[200]. They dislike shade and are intolerant of root or branch competition[200]. This species is a spontaneous natural hybrid, *P. alba* x *P. tremula*[200]. There are several named forms selected for their ornamental value[200]. Poplars have very extensive and aggressive root systems that can invade and damage drainage systems. Especially when grown on clay soils, they should not be planted within 12 metres of buildings since the root system can damage the building's foundations by drying out the soil[11]. Dioecious. Male and female plants must be grown if seed is required. Hybridizes freely with other members of this genus[200]. Special Features: Not North American native, Inconspicuous flowers or blooms.

## 5.2.850 *Taxodium distichum*

Swamp Cypress, Bald cypress, Common Bald Cypress

4 tlin 10 cyuc 0 kcaok 0 tcan 1 dwat 30 m hkuc hmimhtut cyutli tcuphja7nhs6s hwicli hrasjlutnyik hpa7tli flatprikliwssilphsom hpa7tmwatli hjonli

drutta *Taxodium distichum* is a deciduous Tree growing to 30 m (98ft) by 8 m (26ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in April, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline and saline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can grow in water. It can tolerate atmospheric pollution.

kcakta None known

tcanta Fibre WoodThe bark has been used to make cordage[257]. Wood - light, soft, not strong, moderately hard, easily worked, straight grained, very durable in damp soil, takes a good polish. It weighs 28lb per cubic foot[227]. The wood is not given to excessive warping or shrinking[227], it is used for construction, water pipes, vats etc[1, 46, 61, 82, 149, 171, 227].

dwatta AnalgesicThe resin in the cones is used as an analgesic for wounds[149, 227].

propta Seed - sow late winter in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. If sowing a lot of seed you could sow it in early spring in an outdoor seedbed[78]. Allow the plants to grow on in the seedbed for two years and then plant them into their permanent positions in late autumn or early spring. Cuttings in the late summer.

nwatta Landscape Uses:Firewood, Pest tolerant, Massing, Screen, Specimen, Street tree. Although this plant can be grown in wet soils and shallow water, it thrives in any soil and trees actually grow faster in normal unflooded soils[81]. Established plants succeed in standing water up to 60cm deep[200] - in such a situation the roots develop 'knees', curious cone-shaped structures that grow above the ground[227]. Tolerates the high pH of chalk streams[200]. Tolerates atmospheric pollution[200]. Fairly cold-tolerant, but branches can be damaged by temperatures below -10°C[200]. A fairly vigorous tree, it can grow up to 45cm in a year with up to 4cm increase in girth[185]. It has been planted for its timber in S. Europe, especially on alluvial soils[50]. Buds often begin to break in March, but trees do not come properly into leaf until June and growth in height rarely starts before June[185]. A very healthy species in Britain, rarely seen in anything but good health. It seems to be a very long-lived tree in this country with several specimens more than 250 years old[185]. Trees are thought to live for over 1,000 years in the wild[227]. Plants grow best in areas with warm summers[200]. They only produce fertile seeds after long hot summers[200]. The branches are brittle and subject to wind damage, but the tree usually recovers well[81]. Unlike most conifers, this species responds well to coppicing[81]. Special Features:North American native,

htut cyutli tcup hwicli hrasljutnyik hpa7tli frusflatprikliw hpa7tmwatli hjonli

drutta Chamaecyparis obtusa is an evergreen Tree growing to 40 m (131ft) by 25 m (82ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. The flowers are pollinated by Wind. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It cannot grow in the shade. It prefers moist soil. It cannot tolerate atmospheric pollution.

kcakta None known

tcanta Agroforestry: Shade and shelter. A good pioneer species. General:Ornamental. Materials: Essential oils, Pesticide, Wood/timber. Wood Products: Sawn or hewn building timbers,Carpentry/joinery (exterior/interior), For light construction. Shingles, Wall panelling [1-7].

dwatta None Known

propta Seed - sow March/April in a seedbed outdoors[78]. The seed is best sown in pots in a frame[K]. Seed can take 18 months to germinate. One month warm then one month cold stratification has produced good results[113]. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for their first winter, planting them out in late spring after the last expected frosts. Cuttings in late summer or autumn in sandy soil in a cold frame[1, 11, 200]. Difficult, it may be best done in late winter to early spring[113].

nwatta Prefers full sun on moist, well-drained soil, in areas of moderate to high humidity, and preferably where the trees can be protected from harsh winds. It is fairly free of pests and diseases. There are many cultivars, some quite dwarf. Other cultivars have excellent foliage coloration or unusual growth habit. Cultivars include:'Aurea' -golden foliage; 'Caespitosa' - rare, miniature, about six inches tall;'Compacta' - dwarf, about three feet tall,dense, conical;'Coraliformis' - branchlets reddish and contorted; 'Crippsii' - broad pyramid with spreading branches and golden foliage; 'Erecta' - columnar habit;'Ericoides' - low, blue-gray foliage, 'Filicoides' -fern-like; 'Graclilis' - compact growth habit, tips of branchlets pendulous;'Kosteri' - dwarf, three to four feet tall, branch tips curved;'Mariesii' - dwarf, foliage variegated with yellowish white; 'Nana' - very dwarf, height and spread of two feet;'Pygmaea' - dwarf, two feet tall, wider than tall; 'Stoneham' - slow, dwarf, tiered branching; 'Tetragona' - slow, dwarf, erect.

## 5.2.847 Chamaecyparis pisifera

Sawara cypress

4 tin 8 cyuc 0 kcak 3 tcan 0 dwat 40 m hkuc hmimhtut cyutli hgtaccup hwicli hrasljutnyik hpa7tli flatprikliw hpa7tmwatli hjonli

drutta Chamaecyparis pisifera is an evergreen Tree growing to 40 m (131ft) by 25 m (82ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. The flowers are pollinated by Wind. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil and can tolerate drought. It cannot tolerate atmospheric pollution.

kcakta None known

tcanta Agroforestry: Boundary, barrier or support. Pioneer. General: Ornamental tree. Limited as a source of timber, but widely cultivated as an ornamental, with many named cultivars. As of other members of the genus, the wood is valued in Japan for traditional construction work, but its relative scarcity and the often poor shape of layering trees limit its commercial use [1-7]. Wood Products: Containers including boxes, cases and cooerage. Furniture. Sawn or hewn building timbers. Beams For heavy and light construction. Shingles. Veneers. Musical instruments [1-7]. Good pioneer species with durable wood. Species and large growing cultivars for lawn specimen, shrub borders and screen. Dwarf cultivars for rock gardens, foundation plantings or specimen.

dwatta None Known

propta Seed - sow March/April in a seedbed outdoors[78]. The seed is best sown in pots in a frame[K]. Seed

can take 18 months to germinate. One month warm then one month cold stratification has produced good results[113]. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for their first winter, planting them out in late spring after the last expected frosts. Cuttings in late summer or autumn in sandy soil in a cold frame[1, 11, 200]. Difficult, it may be best done in late winter to early spring[113].

nwatta Average, medium moisture, well-drained soils in full sun to part shade. Best in part shade. Prefers moist, fertile soils. Avoid wet, poorly-drained soils. Shelter from strong winds. Pruning is rarely needed. Winter Interest. Tolerates drought. Good pioneer species with durable wood. A number of varieties exist including: Chamaecyparis pisifera form. crassa Hayashi. Chamaecyparis pisifera form. intermedia Hornib. Chamaecyparis pisifera var. filifera Beiss. et Hochst. Chamaecyparis Chamaecyparis pisifera var. plumosa form. argenta Beiss. Chamaecyparis pisifera var. plumosa form. aurea Beiss. Chamaecyparis pisifera var. squarrosa form. leptoc Sieb. A large number of more compact cultivars including some dwarfs are available.

## 5.2.848 Populus x canadensis

Canadian Poplar, Carolina Poplar

4 tin 9 cyuc 0 kcak 3 tcan 1 dwat 40 m hkuc

htut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliw hpa7tmwatli nyanhjen hjonli

drutta Populus x canadensis is a deciduous Tree growing to 40 m (131ft) by 12 m (39ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta None known

tcanta Rooting hormone Shelterbelt WoodAn extract of the shoots can be used as a rooting hormone for all types of cuttings. It is extracted by soaking the chopped up shoots in cold water for a day[172]. A fast-growing and wind resistant tree, it can be used in a shelterbelt planting[11, 200]. In more exposed sites there is some wind-pruning[11]. The tree is late coming into leaf and so often escapes the spring storms[11]. Wood - soft, rather woolly in texture, without smell or taste, of low flammability, not durable, very resistant to abrasion[11]. Wood - soft, moderately strong, easily worked, rather woolly in texture, without smell or taste, of low flammability, not durable, very resistant to abrasion[11]. Used in making the staves of barrels and woodenware, it turns well. It makes an excellent fuel[99].

dwatta Anodyne Antiinflammatory FebrifugeAlthough no specific mention has been seen for this species, the bark of most, if not all members of the genus contain salicin, a glycoside that probably decomposes into salicylic acid (aspirin) in the body[213, 238]. The bark is therefore anodyne, anti-inflammatory and febrifuge. It is used especially in treating rheumatism and fevers, and also to relieve the pain of menstrual cramps[238].

propta Seed - must be sown as soon as it is ripe in spring[113]. Poplar seed has an extremely short period of viability and needs to be sown within a few days of ripening[200]. Surface sow or just lightly cover the seed in trays in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the cold frame. If sufficient growth is made, it might be possible to plant them out in late summer into their permanent positions, otherwise keep them in the cold frame until the following late spring and then plant them out. Most poplar species hybridize freely with each other, so the seed may not come true unless it is collected from the wild in areas with no other poplar species growing[11]. This species is a hybrid and will not come true from seed. Cuttings of mature wood of the current season's growth, 20 - 40cm long, November/December in a sheltered outdoor bed or direct into their permanent positions. Very easy. Suckers in early spring[78].

troubled by browsing deer[233]. Although looking more like a moss, this genus is closely related to the ferns[200].

## 5.2.789 Pulsatilla cernua

4 tin 8 cyuc 1 kcak 0 tcan 2 dwat 0.2 m hkuc

htut cyutli tcup hwicli hrasljut hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Pulsatilla cernua is a PERENNIAL growing to 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from April to May, and the seeds ripen from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Young leaves and roots - cooked with other foods[177]. Some caution is advised, see the notes above on toxicity.

tcanta None known

dwatta Analgesic Antiinflammatory Antispasmodic Astringent Cardiotonic Dysentery Haemostatic Hypnotic SedativeHaemostatic[174]. The root is anodyne, anti-inflammatory, antispasmodic, astringent and sedative[174, 176, 218]. The root is an effective cure for bacterial and amoebic dysentery[176, 218]. It is also used in the treatment of nose bleeds and haemorrhoids and is used externally to treat Trichomonas vaginitis[176]. The fresh herb is a cardiac and venous sedative, producing a hypnotic state with a diminution of the senses followed by a paralysing action[218]. A constituent similar to digitalis can be extracted from the whole herb with the roots removed[176]. This is cardiotonic[176].

propta Seed - best sown as soon as it is ripe in early summer in a cold frame. The seed usually germinates in about 2 - 3 weeks. Sow stored seed in late winter in a cold frame. Germination takes about 1 - 6 months at 15°C. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in the spring. Root cuttings, 4cm long taken in early winter, potted up in a mixture of peat and sand[175]. They can also be taken in July/August, planted vertically in pots in a greenhouse or frame.

nwatta Requires a well-drained humus-rich gritty soil and a sunny position[200]. Tolerant of alkaline soils[200]. This species is closely related to P dahurica[200]. Large plants have a deep woody rootstock and transplant badly[200]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

## 5.2.790 Campanula parryi

Parry's Bellflower, Idaho bellflower

4 tin 8 cyuc 1 kcak 0 tcan 1 dwat 0.3 m hkuc

hmimhtut cyutli tcup hwicli hrasljut hpa7tli prikliw hpa7tmwatli fyifxre7t hjonli

drutta Campanula parryi is a PERENNIAL growing to 0.3 m (1ft) by 0.5 m (1ft 8in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Leaves - raw or cooked.

tcanta Miscellany MiscellanyThe chewed blossoms are depilatory[155].

dwatta Antiphlogistic Miscellany Miscellany Poultice SkinThe root is antiphlogistic[155]. A poultice made from the chewed root has been applied to bruises[257]. The plant has been taken by pregnant women who desired a female child[257]. The dried plant has been used as a dusting powder to treat sores[257]. The chewed blossoms have been applied to the skin as a depilatory[257].

propta Seed - surface sow spring in a cold frame. The seed usually germinates in 2 - 4 weeks at 18°C[138]. When

they are large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Basal cuttings in spring[1]. Harvest the shoots when they are about 10 - 15cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer. Division in spring or autumn[111]. Difficult, because the long runners do not take kindly to separation from the parent plant and are difficult to establish[221].

nwatta Prefers a moist but well-drained rich sandy loam and a neutral or alkaline soil in sun or partial shade[1, 200]. Plants grow and spread freely in any light soil and do well when hanging over a wall[221]. Plants are hardy to at least -15°C[200]. The species in this genus do not often hybridize and so seed can generally be relied upon to come true[221]. The plants are self-fertile[221]. Seed is freely produced in British gardens[221]. Plants are very attractive to slugs[221]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 5.2.791 Disporum sessile

Japanese Fairy Bells

4 tin 8 cyuc 1 kcak 0 tcan 0 dwat 0.6 m hkuc

hmim cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Disporum sessile is a PERENNIAL growing to 0.6 m (2ft) by 1 m (3ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from April to May. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young leaves - cooked[105, 177].

tcanta None known

dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe[175]. Use a lime-free compost and keep it moist[175]. Stored seed requires 6 weeks cold stratification and should be sown as early in the year as possible[175]. Germination usually takes place within 3 - 6 months or more at 15°C[175]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring[200].

nwatta Landscape Uses:Border, Woodland garden. Best grown in partial shade in a moist peaty or woodland soil[1, 175]. Plants spread rapidly[188] by means of creeping rhizomes when they are grown in a leafy soil[187]. This species is very closely related to Disporum nantouense, and both species could be identical[266]. Special Features:Attractive foliage.

## 5.2.792 Epigaea asiatica

4 tin 8 cyuc 1 kcak 0 tcan 0 dwat 0.1 m hkuc

pcimhmim cyutli tcup hwicli hrasljut hpa7tli frusflatprik hpa7tmwatli xre7t hjonli

drutta Epigaea asiatica is an evergreen Shrub growing to 0.1 m (0ft 4in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 4. It is in leaf all year, in flower from April to May. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit[58, 105, 177]. No more details are given. The fruit is about 10mm in diameter[200].

tcanta A ground cover plant for a shady position[188], forming a carpet of growth[208]. Plants should be spaced about 25cm apart each way[208]. This species is probably

not very worthwhile for ground cover in Britain because of its difficulty to cultivate[208].

dwatta None known

propta Seed - best sown as soon as it is ripe in a shady position in a cold frame[200]. Another report says that the seed requires no pre-treatment and can be sown in late winter in a cold frame[113]. Surface sow and place the pot in light shade, do not allow it to dry out[113]. The seed usually germinates in 3 - 5 weeks[113]. As soon as they are large enough to handle, pot up the seedlings into individual pots. Be very careful since they strongly resent root disturbance. Grow them on in light shade in the greenhouse and plant them out in their permanent positions in the late spring of their second years growth. Cuttings of half-ripe wood, July/August in a frame[200].Take the cutting with a part of the previous year's growth[113]. (This report is unclear as to whether it means a heel of older wood or just a small section of older wood[K]) Plants self-layer and can be divided in the spring but this must be done with great care since they deeply resent root disturbance[200].

nwatta Requires an open lime-free humus-rich soil and shade from direct sunlight[1, 200], succeeding also in deep shade[182]. Grows well in the shade of rhododendrons and other calcifuge shrubs[245]. A difficult plant to grow in cultivation[200], though it is easier than *E. repens*[182]. The flower buds require a period of chilling to about 2°c before they will open[200]. The flowers are sweetly scented[245]. They are produced in terminal racemes on the previous year's shoots[275].

## 5.2.793 Dicentra canadensis

Squirrel Corn

4 tlin 8 cyuc 1 kcak 0 tcan 2 dwat 0.2 m hkuc pcmhmmt cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Dicentra canadensis is a PERENNIAL growing to 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in May. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid and neutral soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Root. No further details are given.

tcanta None known

dwatta Alterative Diuretic Tonic VDThe dried tubers are alternative, diuretic and tonic[4, 46, 61]. The tubers are useful in the treatment of chronic cutaneous affections, syphilis, scrofula and some menstrual complaints[4, 213].

propta Seed - best sown as soon as it is ripe in a cold frame[134]. Stored seed should be sown in early spring[175]. Germination usually takes place within 1 - 6 months at 15°c[175]. Two weeks warm stratification at 18°c followed by six weeks at 2°c can shorten up the germination time[134]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in early spring[200]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring. Root cuttings 7 - 10cm long in sandy soil in a cold frame[200].

nwatta Easily grown in a rich light soil[1], preferably neutral to slightly acid[200]. Prefers light shade and a sheltered position according to one report[175] whilst another says that it prefers heavier shade[200]. Grows well in a sheltered corner of the rock garden. The seed is very difficult to harvest, it ripens and falls from the plant very quickly[134]. This species is closely related to *D. cucullaria*[270]. After fruit set, the bulblets of *Dicentra canadensis* remain dormant until autumn, when stored starch is converted to sugar. At this time also, flower buds and leaf primordia are produced below ground; these then remain dormant until spring[270]. Members of this genus are rarely if ever troubled by browsing deer[233].

### 5.2.794 Fumaria officinalis

Fumitory, Drug fumitory

4 tlin 8 cyuc 1 kcak 0 tcan 3 dwat 0.3 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli fyfxfre7t hjonli

drutta Fumaria officinalis is a ANNUAL growing to 0.3 m (1ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from May to September, and the seeds ripen from July to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Edible Uses: Curdling agentThe fresh or dried herb can be added to sour plant milks. A few sprays are added to each litre of liquid and left until the liquid has soured thickly. The sprays are then removed. It gives a tangy taste to the milk, acts as a preservative and prevents the rancid taste that can accompany soured milk[183].

tcanta Baby care DyeA yellow dye is obtained from the flowers[4, 21]. A decoction makes a curative lotion for 'milk-crust' on the scalps of babies[4].

dwatta Antirheumatic Antispasmodic Aperient Cholagogue Diaphoretic Diuretic Eczema Laxative TonicFumitory has been highly valued since at least Roman times for its tonic and blood cleansing effect upon the body[244]. It is particularly valuable in the treatment of all visceral obstructions, particularly those of the liver, in scorbutic affections and in troublesome eruptive diseases of the skin, especially eczema (for which it can be taken internally and externally)[4, 9, 238]. The herb is antispasmodic, aperient, cholagogue, slightly diaphoretic, mildly diuretic, laxative and weakly tonic[4, 9, 21, 165, 240]. The plant is harvested as flowering begins in the summer and can be used fresh or can be dried for later use[9, 238]. Some caution should be exercised in the use of this herb since excess doses cause hypnotic and sedative effects, especially if it is taken for more than about 8 days[238, 244].

propta Seed - sow spring in situ. There is normally very little need to sow this seed, the plant normally self-sows freely and should manage quite nicely by itself.

nwatta Prefers a light well-drained soil in a sunny position[9, 17, 238]. This plant can be a common weed in some gardens, self-sowing freely, though it is fairly easy to control by hand weeding[K]. The flowers are seldom visited by insects, but they are self-fertile and usually set every seed[4].

## 5.2.795 Anthemis cotula

Mayweed, Stinking chamomile

4 tlin 8 cyuc 1 kcak 1 tcan 2 dwat 0.6 m hkuc htut cyutli kyucutcp hwicli jlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli fyfxfre7t hjonli

drutta Anthemis cotula is a ANNUAL growing to 0.6 m (2ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies, beetles. The plant is self-fertile. Suitable for: medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: LeavesEdible Uses: TeaThe herb is used as a flavouring in Peru[183]. It is aromatic. Caution is advised, there are some reports of toxicity. A herb tea is made from the flowers in a similar way to camomile tea[183] and it has a similar though weaker effect medicinally[4]. The odour is not very pleasant and so it is not commonly used[4].

tcanta Dye RepellentThe growing and the dried plant is said to repel mice and fleas[4, 20], it can also be used as an insecticide[21, 61, 100]. A gold dye is obtained from the whole plant[168, 169].

dwatta Antispasmodic Astringent Diaphoretic Diuretic Emetic Emmenagogue Epilepsy Stings TonicMayweed is closely related to camomile, but is far less effective as a medicine[254]. It has been used as an antispasmodic and to induce menstruation and was traditionally used to treat sup-posedly hysterical conditions related to the uterus[254]. It

A poultice of the root is used in the treatment of rheumatism[222]. A decoction of the root has been massaged into rheumatic joints[257]. The powdered root has been inhaled and then coughed up in order to restore the voice[257].

propta Spores - best sown as soon as they are ripe, though they can also be sown in the spring. Sow them on the surface of a humus-rich sterilized soil. Keep the compost moist, preferably by putting a plastic bag over the pot. Pot on small clumps of plantlets as soon as they are large enough to handle and keep humid until they are well established. Do not plant outside until the ferns are at least 2 years old and then only in a very well sheltered position. Division. This is best done in the spring[188].

nwatta Landscape Uses:Border. Container. Erosion control, Foundation, Ground cover, Massing, Rock garden, Woodland garden. Prefers a sandy humus-rich soil in a shady position that is moist even in winter[1]. Tolerates part sun for up to 6 hours a day if the soil remains moist[200]. Prefers a pH in the range 6.5 to 7.5[200]. A very ornamental plant, it is hardy in all parts of Britain but is best grown in a greenhouse[1]. Members of this genus are rarely if ever troubled by browsing deer[233]. Remove old fronds from the plant in the spring because they may harbour fungal diseases[200]. Special Features:Attractive foliage, North American native, Attracts butterflies, There are no flowers or blooms. The plant is heat tolerant in zones 8 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. An evergreen. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

## 5.2.844 Lysimachia nummularia

Creeping Jenny, Moneywort, Creeping Charlie
4 tlin 8 cyuc 1 kcak 0 tcan 2 dwat 0.2 m hkuc hmimhtut cyutli tcuphja7nhs6s hwicli hrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli fyfxfre7t hjonli

drutta Lysimachia nummularia is an evergreen Perennial growing to 0.2 m (0ft 8in) by 0.6 m (2ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in leaf all year, in flower from June to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can grow in water.

kcakta Edible Parts: Edible Uses: TeaA tea is made from the leaves and flowers[46, 61, 177, 183].

tcanta Can be used as a ground cover plant in moist soils but requires weeding for the first year or so. Plants should be spaced about 60cm apart each way and form a carpet, rooting as they spread[208].

dwatta Antidiarrhoeal Antiscorbutic Astringent Diuretic VulneryThe whole herb, used fresh or dried, is antiscorbutic, mildly astringent, diuretic and vulnerary[4, 9, 46]. For drying, the herb is harvested in June[4]. Creeping Jenny is a very good wound-herb, the fresh leaves being bruised and applied externally to the affected area[4]. An infusion is used to treat internal bleeding and diarrhoea[9].

propta Seed - sow spring or autumn in a cold frame[200]. This species rarely produces seed in Britain[17]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring or autumn[200]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot

up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Landscape Uses:Container, Ground cover, Rock garden, Woodland garden. An easily grown plant, succeeding in a moist loamy soil[1]. Grows well in heavy clay soils. Grows well in marshy soil and in shallow water in pond margins[24, 56]. Prefers a shady position[111] but also succeeds in full sun[188]. Plants are hardy to at least -25°c[187]. Most species in this genus seem to be immune to the pre-dations of rabbits[233]. A very ornamental plant[1]. Special Features:Attractive foliage, Invasive, Naturalizing, Fragrant flowers, Inconspicuous flowers or blooms.

## 5.2.845 Linaria vulgaris

Yellow Toadflax, Butter and eggs

4 tlin 8 cyuc 1 kcak 3 tcan 2 dwat 0.6 m hkuc hmimhtut cyutli hkaqyuctcp hwicli hrasjlutnyik hpa7tli flat-priklwis hpa7tmwatli xre7t hjonli

drutta Linaria vulgaris is a PERENNIAL growing to 0.6 m (2ft) by 0.6 m (2ft in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from July to October, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: LeavesEdible Uses: Young shoots - cooked[7]. Use with caution, see the notes above on toxicity.

tcanta Dye InsecticideA yellow dye is obtained from the whole plant[7, 13]. It is obtained from the flowers according to other reports[4, 100]. A tea made from the plant has been used as an insecticide[222]. A good bee plant[24]. Dynamic accumulator.

dwatta Antiphlogistic Astringent Cathartic Detergent Diuretic Hepatic Homeopathy Ophthalmic PurgativeYellow toadflax has a long history of herbal use. It acts mainly on the liver and was once widely employed as a diuretic in the treatment of oedema[238]. It is little used now, but undoubtedly merits investigation[238]. The whole plant is antiphlogistic, astringent, cathartic, detergent, depurative, diuretic, hepatic, ophthalmic and purgative[4, 7, 9, 21]. It is gathered when just coming into flower and can be used fresh or dried[4, 238]. The plant is especially valued for its strongly laxative and diuretic activities[4]. It is employed internally in the treatment of oedema, jaundice, liver diseases, gall bladder complaints and skin problems[4, 222, 238]. Externally it is applied to haemorrhoids, skin eruptions, sores and malignant ulcers[238]. The plant should be used with caution. It should preferably only be prescribed by a qualified practitioner and should not be given to pregnant women[238]. Dosage is critical, the plant might be slightly toxic[21, 238]. The fresh plant, or an ointment made from the flowers, is applied to piles, skin eruptions etc[4, 222]. The juice of the plant, or the distilled water, is a good remedy for inflamed eyes and cleaning ulcerous sores[4]. A homeopathic remedy is made from the plant[9]. It is used in the treatment of diarrhoea and cystitis[9].

propta Seed - sow early spring in situ. Division in April or the autumn. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring. This species can be divided successfully at almost any time in the growing season.

nwatta Succeeds in a moderately good well-drained soil[1]. Grows best in a neutral to alkaline soil[238]. It prefers a sunny position[111] but also succeeds in semi-shade[219]. A very drought resistant plant once established[200], it can be grown in a drystone wall[219]. Plants can spread fairly aggressively at the roots when they are in a suitable position[K]. They also often self-sow freely[238].

## 5.2.846 Chamaecyparis obtusa

Japanese cypress

4 tlin 8 cyuc 0 kcak 3 tcan 0 dwat 40 m hkuc

dried for later use[4]. It is quite likely that the roots of plants that have not flowered are the richest in medicinal properties[4].

propta Seed - best sown as soon as it is ripe in a light position in a cold frame[200]. It can also be sown in late winter or early spring but the seed germinates best if given a period of cold stratification and quickly loses viability when stored, with older seed germinating slowly and erratically[200, 239]. It is advantageous to keep the seed at about 10°c for a few days after sowing, to enable the seed to imbibe moisture[239]. Following this with a period of at least 5 - 6 weeks with temperatures falling to between 0 and -5°c will usually produce reasonable germination[239]. It is best to use clay pots, since plastic ones do not drain so freely and the moister conditions encourage the growth of moss, which will prevent germination of the seed[239]. The seed should be surface-sown, or only covered with a very light dressing of compost. The seed requires dark for germination, so the pots should be covered with something like newspaper or be kept in the dark[239]. Pot up the seedlings into individual pots as soon as they are large enough to handle and grow on in light shade in the greenhouse for at least their first winter. The seedlings grow on very slowly, taking 2 - 7 years to reach flowering size[239]. When the plants are of sufficient size, place them out into their permanent positions in late spring or early summer. Division in March[111]. Most members of this genus have either a single tap-root, or a compact root system united in a single root head, and are thus unsuitable for division[239]. Cuttings of basal shoots in late spring[238].

nwatta In general, gentians require a moist well-drained soil in a sheltered position, a certain minimum of atmospheric humidity, high light intensity but a site where temperatures are not too high[239]. They are therefore more difficult to grow in areas with hot summers and in such a region they appreciate some protection from the strongest sunlight[200, 239]. Most species will grow well in the rock garden[200]. This species requires a moist well-drained neutral to acid soil[200, 238]. Another report says that it is happy in any reasonable soil[239]. A moisture loving plant, preferring to grow with full exposure to the sun but with plenty of underground moisture in the summer, it grows better in the north and west of Britain[1]. A very ornamental plant[1]. Plants are intolerant of root disturbance[200].

## 5.2.841 Polygonum lapathifolium

Curlytop Knotweed

4 tin 8 cyuc 1 kcaak 0 tcan 1 dwat 0.8 m hkuc hmimhtut cyutili tucphja7n hwicli hrasjlutnyik hpa7tli flat-prikliwis hpa7tmwatli xre7t hjonli

drutta Polygonum lapathifolium is a ANNUAL growing to 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 5. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta Edible Parts: Leaves SeedEdible Uses: Young leaves - raw or cooked[105, 177]. Seed - raw or cooked. It is rather small and fiddly to utilize.

tcanta SoapThe plant produces a soft white mass, a froth like that of soap. It is used for bathing and washing clothes[272].

dwatta Antiseptic Astringent Febrifuge StomachicThe whole plant is antiseptic and astringent[178]. An infusion has been used in the treatment of stomach complaints and fevers[257]. The plant produces a soft white mass, a froth like that of soap. It is applied externally to burns[272].

propta Seed - sow spring in a cold frame. Germination is usually free and easy. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer if they have reached sufficient size. If not, overwinter them in a cold frame and plant them out the following spring after the last expected frosts.

nwatta Succeeds in an ordinary garden soil[1] but prefers a moisture retentive not too fertile soil in sun or part shade[200]. Repays generous treatment[1]. Plants seem to be immune to the predations of rabbits[233].

### 5.2.842 Sedum aizoon

Sedum

4 tin 10 cyuc 1 kcaak 0 tcan 1 dwat 0.4 m hkuc htut cyutili hgatkyuctcup hwicli hyishrasjlutnyik hpa7tli flat-prikliwis hpa7tmwatli fyixre7t hjonli

drutta Sedum aizoon is an evergreen Perennial growing to 0.4 m (1ft 4in) by 0.4 m (1ft 4in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: LeavesEdible Uses: Leaves and young stems - raw or cooked[105, 177]. There is a definite bitterness in the flavour, few people would want to eat them as a regular part of their diet[K].

tcanta None known

dwatta The plant is used medicinally[266]. No further information is given.

propta Seed - surface sow in spring in well-drained soil in a sunny position in a greenhouse. Do not allow the soil to dry out. Prick out the seedlings into individual pots when they are large enough to handle. If sufficient growth is made, it is possible to plant them out during the summer, otherwise keep them in a cold-frame or greenhouse for their first winter and plant them out in early summer of the following year[K]. Division is very easy and can be carried out at almost any time in the growing season, though is probably best done in spring or early summer. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Landscape Uses:Border, Container, Ground cover, Rock garden. A very easily grown plant, it succeeds in most soils[188], tolerating those on the poor side[233], though it prefers a fertile well-drained soil[200]. Established plants are drought tolerant[200] although it prefers a soil that stays moist in the summer[187]. Requires a sunny position[188]. Hardy to -15°c according to one report[200] whilst another says that it is hardy to about -25°c[187]. A polymorphic species[1]. Butterflies are attracted to the flowers of this plant[233]. All members of this genus are said to have edible leaves, though those species, such as this one, that have yellow flowers can cause stomach upsets if they are eaten in quantity[62, 85]. Plants in this genus seem to be immune to the predations of rabbits[233]. Special Features:Attractive foliage, Not North American native, Naturalizing, Attracts butterflies, Attractive flowers or blooms.

## 5.2.843 Polystichum acrostichoides

Christmas Fern

4 tin 9 cyuc 1 kcaak 0 tcan 2 dwat 0.6 m hkuc pcmhmmim cyutili tcup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta Polystichum acrostichoides is an evergreen Fern growing to 0.6 m (2ft) by 0.5 m (1ft 8in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in leaf all year. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young fronds[159, 257]. No more details are given, but they are probably harvested as they unfurl and eaten cooked.

tcanta None known

dwatta Antiaphonic Emetic PoulitceChristmas fern was employed medicinally by several native North American Indian tribes, who used it to treat a variety of complaints[257]. It is little, if at all, used in modern herbalism. A tea made from the root is blood purifier, emetic and febrifuge[222, 257]. It is used in the treatment of chills, fevers, pneumonia, stomach or bowel complaints and rheumatism[222, 257].

is rarely used in contemporary herbal medicine[254]. The whole plant is antispasmodic, astringent, diaphoretic, diuretic, emetic, emmenagogue and tonic[4, 61]. It is used internally as a tea, which can be made either from the flowers or the whole plant, though the flowers are less unpleasant and so are more commonly used[4]. An infusion is used in the treatment of a variety of complaints such as rheumatism, epilepsy, asthma, colds and fevers[257]. Applied externally, it is used as a poultice on piles or to draw splinters out of the body, and can also be applied to the bath water[4, 257]. The leaves are rubbed onto insect stings[222]. Some people are allergic to the plant and this remedy could give them painful blisters[240]. This herb is contraindicated for pregnant women or nursing mothers[254].

propta Seed - best sown outdoors as soon as it is ripe. Most of the seed germinates in the autumn.

nwatta Prefers a sunny position and a well-drained soil that is neutral to slightly acid[1, 200]. Succeeds in heavy clay soils. Bees dislike this plant[4]. The leaves contain glands which release a most disagreeable odour when the plant is handled and can cause allergic reactions in people.

### 5.2.796 Scabiosa fischeri

4 tin 8 cyuc 1 kcaak 0 tcan 0 dwat 0.5 m hkuc hmimhtut cyutili kyuctcup hwicli hrasjlutnyik hpa7tli flat-prikliwisslip hpa7tmwatli xre7t hjonli

drutta Scabiosa fischeri is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from July to October, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves - cooked[105, 177].

tcanta None known

dwatta None known

propta Seed - sow spring in a cold frame. The seedlings are subject to damping off[1] so water with care and make sure to give adequate ventilation. Prick out the seedlings into individual pots once they are large enough to handle and plant them out into their permanent positions in the summer. Division in spring. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Prefers a neutral or alkaline soil and a sunny position[200]. Succeeds in ordinary garden soil[1]. A very ornamental plant[1]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 5.2.797 Tulipa gesneriana

Tulip, Didier's tulip

4 tin 8 cyuc 1 kcaak 0 tcan 0 dwat 0.5 m hkuc htut cyutili tcup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Tulipa gesneriana is a BULB growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from April to May. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Bulb - cooked[22, 61]. It can be dried and ground into a powder and then mixed with cereals when making bread etc[46, 105]. Some caution is advised, see the notes above on toxicity.

tcanta PollutionPlants have been grown indoors in pots in order to help remove toxins from the atmosphere. It has been shown to help remove formaldehyde, xylene and ammonia[259].

dwatta None known

propta Seed - best sown in a shady part of the cold frame as soon as it is ripe in early summer[1], or in the early autumn[200]. A spring sowing of stored seed in the greenhouse also succeeds[K]. Sow the seed thinly so that the seedlings can be grown on without disturbance for their first growing season - apply liquid feeds to the pot if necessary. Divide the bulbs once the plants have become dormant, putting 3 - 4 bulbs in each pot. Grow the on in the greenhouse for at least the next year, planting them out when dormant. Division of offsets in July. Larger bulbs can be planted out straight into their permanent positions, or can be stored in a cool place and then be planted out in late autumn. It is best to pot up smaller bulbs and grow them on in a cold frame for a year before planting them out when they are dormant in late summer to the middle of autumn.

nwatta Easily grown in a sunny position in a well-drained sandy soil with added leafmould[1]. The bulbs are very hardy, surviving soil temperatures down to about -12°c[214]. This is a complicated species, or perhaps a group of very closely related species, some members of which are probably native to Europe[50]. It is a parent of the cultivated garden tulips[50]. The flowers are sweetly scented[245]. Bulbs can be harvested in June after they have died down and then stored in a cool dry place, being planted out again in October[1].

## 5.2.798 Arabis lyrata

Rock Cross, Kamchatka rockcross, Lyrate rockcross

4 tin 8 cyuc 1 kcaak 0 tcan 0 dwat 0.3 m hkuc hmimhtut cyutili kyuctcup hwicli hrasjlutnyik hpa7tli flat-prikliwis hpa7tmwatli xre7t hjonli

drutta Arabis lyrata is a BIENNIAL/PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young leaves - raw or cooked[177]. Rosettes of the lobed leaves are added to tossed salads or served as a green vegetable[257].

tcanta None known

dwatta None known

propta Seed - it is best to surface sow the seed as soon as it is ripe in a light position in a cold frame[134]. Seed can also be sown in spring. It usually germinates in 2 - 3 weeks at 21°c[134]. When large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division after flowering[111]. Very easy, the divisions can be planted out straight into their permanent positions if required. Cuttings in a shady border in summer[11].

nwatta We have very little information on this species and do not know if it will be hardy in Britain, though judging by its native range it should succeed outdoors in many parts of this country. This species of rockcross is considered an important first brood nectar plant for "Kärner Blue" butterfly (Lycaeides melissa samuelis Nabokov), an endangered species in North America. The following notes are based on the general needs of the genus. Easily grown in ordinary well-drained soil[1].

## 5.2.799 Heuchera diversifolia

Alum Root, Crevice aluroot

4 tin 8 cyuc 1 kcaak 0 tcan 1 dwat 0.6 m hkuc hmimhtut cyutili tcup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Heuchera diversifolia is an evergreen Perennial growing to 0.6 m (2ft) by 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in leaf all year, in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can

grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: LeavesEdible Uses: Young leaves - cooked. Not very palatable[172].

tcanta MordantThe root can be used as an alum substitute, this is a mordant used in fixing dyes[168, 172]. The root is rich in tannin, is this the active ingredient that acts as a mordant?[172]. A good ground cover plant for the woodland garden[200]. Plants should be spaced about 30cm apart each way[208].

dwatta Antiphlogistic Antiseptic Astringent Febrifuge OphthalmicThe root is antiphlogistic, antiseptic, astringent, febrifuge and ophthalmic[94, 172].

propta Seed - sow early spring in a warm greenhouse and only just cover the seed. Germination is usually fairly rapid. Prick out the seedlings when they are large enough to handle and plant them out into their permanent positions in late spring or early summer. The seed can also be sown in the middle of spring in an outdoor seedbed and planted out in early summer. Alternatively, you can sow the seed in an outdoor seedbed in the middle of summer for planting out in the following spring. Division in March or October[1, 111]. It is best to divide the plants in August or early September, making sure that the woody roots are planted quite deeply with only the crown of foliage above the ground[233].

nwatta Succeeds in any good sweet garden soil that does not dry out in spring[1]. Prefers full sun but tolerates partial shade[1, 111]. Prefers a well-drained fairly rich and not too heavy soil[111]. Plants are hardy to about -15°c[187]. Apt to hybridize with other members of this genus[111]. This species is probably best treated as a sub-species of *H. micrantha*.

## 5.2.800 Mertensia ciliata

Mountain Bell, Tall fringed bluebells

4 tlin 8 cyuc 1 kcak 0 tcan 1 dwat 0.8 m hkuc hmimhtut cyutli tcuphja7n hwicli hrasljutnyik hpa7tli flat-prikliwis hpa7tmwatli xre7t hjonli

drutta Mertensia ciliata is a PERENNIAL growing to 0.8 m (2ft 7in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from May to July. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcaakta Edible Parts: Flowers LeavesEdible Uses: Flowers - raw[172]. Leaves - raw or cooked[172]. The leaves are rather hairy and are not so nice when eaten raw[172].

tcanta None known

dwatta Antipruritic GalactagogueThe plant is galactagogue[257]. An infusion has been used to increase the milk flow of nursing mothers[257]. An infusion of the powdered root has been used to relieve the itching caused by smallpox and measles[257].

propta Seed - best sown in a cold frame as soon as it is ripe[1, 200]. Sow stored seed as early in the year as possible. Protect from direct sunlight[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division, with care, in early spring or autumn[200].

nwatta Easily grown in an ordinary garden soil with some shade[1, 111]. Requires a moist peaty soil in full sun or light shade[187]. Plants are hardy to about -20°c[187]. A very ornamental plant[1].

## 5.2.801 Hosta clausa

4 tlin 8 cyuc 1 kcak 0 tcan 0 dwat 0.2 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyikfripr hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Hosta clausa is a PERENNIAL growing to 0.2 m (0ft 8in) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from July to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil.

Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: LeavesEdible Uses: Young leaves - cooked[105, 177].

tcanta This plant has a stoloniferous habit and makes an excellent dense ground cover[251].

dwatta None known

propta Seed - sow spring in a lightly shaded position in a greenhouse and only just cover the seed. Germination usually takes place within 1 - 3 months at 10°c. Make sure you keep the compost moist. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division is possible at almost any time of the year so long as there is sufficient moisture[233]. It is best carried out in March as growth commences or in early autumn if the soil is not too dry[200]. Hostas can be left undivided for many years and should not be divided any more frequently than once every 3 - 5 years to allow the leaves to reach maturity[200].

nwatta Thrives in most fertile soils if they are rich in humus[200]. Grows well in heavy clay soils and in sandy ones[208]. Very limy soils inhibit growth, but plants can thrive in such a situation if plenty of humus is added[208]. Prefers a pH between 6 and 7[200]. Requires a rich soil that does not dry out readily[1]. Succeeds in full sun as well as in deep shade, growing well in the semi-shade of a woodland[200, 233]. In general, the sunnier the position the moister the soil should be[233]. Plants are best not grown under trees in town gardens since the soot washed from the leaves of the trees in wet weather will tend to remain on the hosta[208]. Plants flower better when grown in a sunny position but the foliage is better when the plant is in a shady position[200]. Plants are in general fully hardy in Britain, but young leaves in spring can be destroyed by frost. New leaves are only produced in the spring and very early summer, so any damage at this time has a deep effect on the plant[233]. A spreading plant with stoloniferous roots, forming medium size clumps[200, 233]. A triploid species that is not often found in the wild, it does not flower very freely and indeed there are forms that do not flower at all[251]. The cultivar 'Normalis' flowers more freely and is very showy, but is less stoloniferous and therefore less suitable for ground cover[251]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. Plants are very attractive to slugs and snails, the young shoots in spring are especially at risk[111, K]. Hybridizes freely with other members of this genus[200].

## 5.2.802 Lycopus americanus

Water Horehound, American water horehound

4 tlin 8 cyuc 1 kcak 0 tcan 3 dwat 0.5 m hkuc hmimhtut cyutli tcuphja7n hwicli hrasljutnyik hpa7tli flat-prikliwis hpa7tmwatli xre7t hjonli

drutta Lycopus americanus is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcaakta Edible Parts: RootEdible Uses: Root - raw or cooked[207]. This contradicts with the report in [200] that the plant does not form tubers on its rhizomes.

tcanta DyeThe juice gives a permanent colour to linen and wool and does not wash out[207]. The colour is not mentioned[K].

dwatta Astringent Narcotic SedativeThe whole plant is used as an astringent, hypoglycaemic, mild narcotic and mild sedative[4, 102, 222, 238]. It also slows and strengthens heart contractions[238]. The plant has been shown to be of value in the treatment of hyperthyroidism[222, 238], it is also used in the treatment of coughs, bleeding from the lungs and consumption, excessive menstruation etc[4, 238]. It should not be prescribed for pregnant women or patients with hypothyroidism[238]. The plant is harvested as flowering be-

hmim cyutli tcuphja7n hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Astilbe chinensis is a PERENNIAL growing to 0.7 m (2ft 4in) by 0.5 m (1ft 8in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist or wet soil.

kcaakta Edible Parts: LeavesEdible Uses: Young shoots[177]. No more details are given.

tcanta Landscape Uses: Border, Container, Massing, Rock garden, Woodland garden. There are some named varieties, selected for their ornamental value[233]. A first class ground cover plant, the lower-growing cultivar 'Pumila' is particularly recommended[233]. Special Features:Attractive foliage, Suitable for dried flowers. Dynamic accumulator.

dwatta None known

propta Seed - we have no details for this species but suggest sowing the seed in a greenhouse in early spring. Only just cover the seed. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame until they are at least 20cm tall. Plant them out in the summer, or late in the following autumn. Division in spring. This is best done every 3 - 4 years in order to maintain the vigour of the plant[200]. Larger divisions can be planted straight into their permanent positions whilst smaller clumps are best potted up and kept in a cold frame until they are growing away well.

nwatta Prefers a rich garden soil, but succeeds in most soils so long as they stay reliably moist in the summer[1, 233]. Requires a wet or moist peaty soil in sun or partial shade[187], growing well under shrubs[233]. Prefers a pH in the range 5.5 to 7[200]. Prefers partial shade[200], especially if the soil is on the dry side[233]. Plants are hardy to about -20°c[187]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. There are some named varieties, selected for their ornamental value[233].

### 5.2.839 Hosta plantaginæa

August Lily

4 tlin 8 cyuc 1 kcak 0 tcan 1 dwat 0.6 m hkuc pcmhmimhtut cyutli tcup hwicli hrasljutnyikfripr hpa7tli flat-prikliwis hpa7tmwatli xre7t hjonli

drutta Hosta plantaginæa is a PERENNIAL growing to 0.6 m (2ft) by 1.2 m (4ft in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from July to September, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Leaves StemEdible Uses: Young leaves and leaf stems - cooked[105, 177]. One report suggests the plant may be poisonous[178].

tcanta EssentialAn essential oil is obtained from the leaves, used in perfumery[178]. A useful ground cover plant, succeeding in dense shade, though rather slow spreading[197]. Plants should be spaced about 60cm apart each way[208].

dwatta CancerThe flowers are said to have anticancer activity[218].

propta Seed - sow spring in a lightly shaded position in a greenhouse and only just cover the seed. Germination usually takes place within 1 - 3 months at 10°c. Make sure you keep the compost moist. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division is possible at almost any time of the year so long as there is sufficient moisture[233]. It is best carried out in March as growth commences or in early autumn if the soil is not too dry[200]. Hostas can be left undivided for many years and

should not be divided any more frequently than once every 3 - 5 years to allow the leaves to reach maturity[200].

nwatta Thrives in most fertile soils if they are rich in humus[200]. Grows well in heavy clay soils and in sandy ones[208]. Very limy soils inhibit growth, but plants can thrive in such a situation if plenty of humus is added[208]. Prefers a pH between 6 and 7[200]. Requires a rich soil that does not dry out readily[1]. Succeeds in full sun as well as in deep shade, growing well in the semi-shade of a woodland[200, 233]. In general, the sunnier the position the moister the soil should be[233]. Plants are best not grown under trees in town gardens since the soot washed from the leaves of the trees in wet weather will tend to remain on the hosta[208]. Plants flower better when grown in a sunny position but the foliage is better when the plant is in a shady position[200]. This species tolerates quite a lot of sun[187]. Plants are in general fully hardy in Britain, but young leaves in spring can be destroyed by frost. New leaves are only produced in the spring and very early summer, so any damage at this time has a deep effect on the plant[233]. The plant forms open clumps[200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. Plants are very attractive to slugs and snails, the young shoots in spring are especially at risk[111, K]. A very ornamental plant[1], there are some named varieties[187]. The flowers open in the evening[188] and have a delicious lily-like fragrance[233]. The plant only flowers well when grown in a warm position[233], and is not really satisfactory when grown in most areas north of London[251]. Hybridizes freely with other members of this genus[200].

### 5.2.840 Gentiana scabra

Long Dan Cao

4 tlin 8 cyuc 1 kcak 0 tcan 3 dwat 0.3 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Gentiana scabra is a PERENNIAL growing to 0.3 m (1ft) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bumblebees, butterflies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: LeavesEdible Uses: Young plant and old leaves - cooked[105]. A famine food, used when all else fails[177, 179].

tcanta None known

dwatta Anodyne Anthelmintic Antiinflammatory Antiseptic Bitter Cholagogue Eczema Emmenagogue Expecto-rant Febrifuge Pectoral Refrigerant Stomachic Tonic UrinaryLong Dan Cao is used as a bitter tonic in Chinese herbalism where it promotes digestive secretions and treats a range of illnesses associated with the liver[254, 279]. The root is antibacterial and stomachic[176]. It is used in the treatment of anorexia, dyspepsia, jaundice, leucorrhoea, eczema, conjunctivitis, sore throat, acute infection of the urinary system, hypertension with dizziness and tinnitus[176, 279]. The root is harvested in the autumn and dried for later use. This species is one of several that are the source of the medicinal gentian root[4], the following notes are based on the general uses of *G. lutea* which is the most commonly used species in the West[K]. Gentian root has a long history of use as a herbal bitter in the treatment of digestive disorders and is an ingredient of many proprietary medicines. It contains some of the most bitter compounds known and is used as a scientific basis for measuring bitterness[238]. It is especially useful in states of exhaustion from chronic disease and in all cases of debility, weakness of the digestive system and lack of appetite[4]. It is one of the best strengtheners of the human system, stimulating the liver, gall bladder and digestive system[238], and is an excellent tonic to combine with a purgative in order to prevent its debilitating effects[4]. The root is anthelmintic, anti-inflammatory, antiseptic, bitter tonic, cholagogue, emmenagogue, febrifuge, refrigerant, stomachic[4, 7, 9, 14, 21, 165, 238]. It is taken internally in the treatment of liver complaints, indigestion, gastric infections and anorexia[238]. It should not be prescribed for patients with gastric or duodenal ulcers[238]. The root is harvested in the autumn and

well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Edible Uses: TeaA pleasant tasting tea is made from the leaves and flower heads[161, 177, 183, 257].

tcanta None known

dwatta Analgesic FebrifugeThe leaves and stems are analgesic[257]. An infusion is used to relieve the pain of headaches and to treat stomach aches and fevers[257]. A decoction is used as a wash to relieve pain and to treat poison ivy rash[257]. The decoction is also used as a wash to draw the poison out of a rattlesnakes bite[257].

propta Seed - we have no information for this species but suggest sowing the seed in a cold frame in early spring. Only just cover the seed and put the pot in a sunny position. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in early summer. Division in spring is possible but very difficult because the plant has a long taproot[200].

nwatta Landscape Uses:Border. Prefers a sunny well-drained border of fairly rich soil[1]. Established plants are extremely drought tolerant[200]. A very ornamental plant[1]. Although perennial, plants are sometimes grown as annuals, they flower in their first year from seed[200]. Special Features:North American native, Naturalizing, Suitable for cut flowers.

## 5.2.836 Crocus kotschyanus

4 tin 8 cyuc 1 kcak 0 tcan 0 dwat 0.3 m hkuc htut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Crocus kotschyanus is a CORM growing to 0.3 m (1ft) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in leaf from February to June, in flower from September to November, and the seeds ripen from March to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, butterflies. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: RootEdible Uses: Corm - cooked[124].

tcanta None known

dwatta None known

propta Seed - best sown as soon as it is ripe in a light sandy soil in pots in a cold frame[1]. The seed can also be sown in a cold frame in early spring[1]. Sow thinly because the seed usually germinates freely[1], within 1 - 6 months at 18°c[164]. Unless the seed has been sown too thickly, do not transplant the seedlings in their first year of growth, but give them regular liquid feeds to make sure they do not become deficient. Divide the small bulbs once the plants have died down, planting 2 - 3 bulbs per 8cm pot. Grow them on for another 2 years in a greenhouse or frame and plant them out into their permanent positions when dormant in late summer[K]. Plants take 3 - 4 years to flower from seed[200]. Division of the clumps after the leaves die down in spring[1, 200]. The bulbs can be replanted direct into their permanent positions if required.

nwatta Prefers a sandy loam[1]. Plants are easily grown in a bulb frame or in a sunny position outdoors[90], succeeding in a well-drained moisture-retentive soil[200]. A very ornamental plant[1]. Plants tend to move considerably from their original planting place because of their means of vegetative reproduction, it is therefore wise not to grow different species in close proximity[1]. Any planting out is best done in late spring and early summer[245]. Protect the corms from mice[1]. The flowers are only open during the day time, closing at night[245].

## 5.2.837 Trillium grandiflorum

White Trillium, Large Flower Trillium, White Trillium, Large Flower Wakerobin, Large Flowered Tril  
4 tin 9 cyuc 1 kcak 0 tcan 2 dwat 0.4 m hkuc pcmhmmihtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Trillium grandiflorum is a PERENNIAL growing to 0.4 m (1ft 4in) by 0.3 m (1ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from April to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young leaves - cooked and used like spinach[46, 61, 105, 183]. A famine food, it is only used when all else fails[177].

tcanta None known

dwatta Antispasmodic Diuretic Emmenagogue OphthalmicThe root is diuretic[257]. The raw root is grated and applied as a poultice to the eye in order to reduce swelling[207, 213]. The raw root s also used as a poultice on aching rheumatic joints[257]. A decoction of the root bark can be used as drops in treating a sore ear[257]. The grated root is steeped in water and drunk as a tea for the treatment of cramps[207]. The grated root is simmered in water and drunk for the treatment of irregular menses[207, 213].

propta Seed - best sown in a shaded cold frame as soon as it is ripe[134, 200]. Stored seed should be sown in late winter or early spring. Seed usually germinates within 1 - 3 months at 15°c. Another report says that seeds produce a root after the first cold stratification but no shoot is produced until after a second winter[138], whilst yet another report says that the seed can take 3 years to germinate[238]. The seedlings are prone to damp off and must therefore be watered with care and given plenty of fresh air[138]. The young plants need to be overwintered in a cold frame for the first year and can then be planted out in late spring. It is very important that the pots become neither too dry nor too wet[138]. Division with care when the plants die down after flowering[200]. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the following spring.

nwatta Landscape Uses:Border, Ground cover, Woodland garden. Prefers a deep well-drained woodland or humus-rich soil in a somewhat shady position that remains moist in the summer[1, 42]. Prefers a neutral to slightly acid soil but succeeds in acid or limey soils[200]. Grows well in open woodland[1, 90]. Succeeds in deep shade[188]. Succeeds in a sunny position if the soil does not dry out[42, 138]. A very ornamental and long-lived plant[1, 138, 233]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233], though slugs are very fond of the leaves[238]. A polymorphic species, it is very subject to mutation[90]. Some named varieties have been selected for their ornamental value[200]. Any transplanting is best done whilst the plants are in flower[200]. Plants can flower in two years from seed[138]. Special Features: Attractive foliage, North American native, Naturalizing, Attracts butterflies. The plant is heat tolerant in zones 7 through 3. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2]. Ephemeral emerging in spring and dying back by summer every year [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

## 5.2.838 Astilbe chinensis

Pumila Spirea,Chinese Astilbe  
4 tin 8 cyuc 1 kcak 3 tcan 0 dwat 0.7 m hkuc

gins and can be use fresh or dried, in an infusion or as a tincture[4, 238].

propta Seed - sow spring or autumn in a cold frame[238]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse for their first year. Plant them out into their permanent positions in early summer. Division in spring or autumn[238]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Succeeds in damp meadows or in wet places by ponds or streams[200].

## 5.2.803 Trillium smallii

Alpine Calamint

4 tin 8 cyuc 1 kcak 0 tcan 1 dwat 0.5 m hkuc htut cyutli hgatkyyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Acinos alpinus is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Edible Uses: Condiment TeaThe leaves are used as a flavouring in cooked dishes[183] and also as a tea substitute[148].

tcanta None known

dwatta Diaphoretic FebrifugeDiaphoretic, febrifuge[148].

propta Seed - sow early spring in a cold frame. If you have sufficient seed then you could try sowing in situ in April or May. Germination should take place within a month. When large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring. Basal cuttings in late spring.

nwatta Succeeds in almost any well-drained soil, doing well in a hot dry soil[200].

## 5.2.805 Potentilla rupestris

Rock Cinquefoil

4 tin 8 cyuc 1 kcak 0 tcan 0 dwat 0.5 m hkuc hmihtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyfxc7t hjonli

drutta Potentilla rupestris is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Edible Uses: TeaThe leaves are used as a tea[2, 46, 61, 183].

tcanta None known

dwatta None known

propta Seed - sow early spring or autumn in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring. Larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Easily grown in a well-drained loam, preferring a position in full sun but tolerating shade[1]. Prefers an alkaline soil but tolerates a slightly acid soil[200]. Succeeds in dry soils in the wild[187]. Hardy to about -25°c[187]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 5.2.806 Astilbe thunbergii

Astilbe

4 tin 9 cyuc 1 kcak 3 tcan 0 dwat 0.5 m hkuc hmihtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Astilbe thunbergii is a PERENNIAL growing to 0.5 m (1ft 8in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: TeaYoung leaves - cooked[177, 183]. The leaves are a tea substitute[183].

tcanta Landscape Uses: Border, Container, Massing, Woodland garden. Special Features: Attractive foliage. Dynamic accumulator.

dwatta None known

propta Seed - we have no details for this species but suggest sowing the seed in a greenhouse in early spring. Only just cover the seed. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame until they are at least 20cm tall. Plant them out in the summer, or late in the following autumn. Division in spring. This is best done every 3 - 4 years in order to maintain the vigour of the plant[200]. Larger divisions can be planted straight into their permanent positions whilst smaller clumps are best potted up and kept in a cold frame until they are growing away well.

nwatta Succeeds in a rich garden soil if this stays reliably moist in the summer[1]. Requires a wet or moist peaty soil in sun or partial shade[187]. Prefers a pH in the range 5.5 to 7[200]. Prefers partial shade[200]. The plant is found in sunny habitats in the wild[58]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233].

### 5.2.807 Dianthus plumarius

Pink Feathered pink, Cottage Pink
4 tin 9 cyuc 1 kcaak 0 tcan 0 dwat 0.4 m hkuc
htuc cyutli kyucocup hwicli hyihstrasjlutnyik hpa7tli prikriwis hpa7tmwatli xre7t hjonli

drutta Dianthus plumarius is an evergreen Perennial growing to 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 3. It is in leaf all year, in flower from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcaakta Edible Parts: FlowersEdible Uses: The petals are made into cordials, syrups, sauces, vinegars etc[183].

tcanta None known
dwatta None known

propta Seed - sow spring in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings, taken at flowering time, with four pairs of leaves and trimmed just below a joint[200].

nwatta Landscape Uses:Alpine garden, Border, Container, Rock garden, Seashore, Specimen. Prefers a neutral to slightly alkaline soil in a sunny well-drained position[200]. Succeeds in dry soils and in poor soils[200]. Plants can be grown on walls[200]. There are many named forms, selected for their ornamental value[200]. The flowers are very fragrant[17], diffusing a powerful clove-like scent[245]. Individual plants become rather untidy after a few years and are best replaced every 2 - 4 years[200]. Some older cultivars, such as 'Sops in Wine' have a tendency to flower themselves to death. These should be grown in a richer soil in order to encourage the production of more foliage and should not be allowed to flower in their first year[200]. Special Features:Attractive foliage, Suitable for cut flowers, Fragrant flowers.

### 5.2.808 Paeonia officinalis

Peony, Common peony
4 tin 10 cyuc 1 kcaak 0 tcan 2 dwat 0.6 m hkuc
hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli fyixre7t hjonli

drutta Paeonia officinalis is a PERENNIAL growing to 0.6 m (2ft) by 0.6 m (2ft in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in flower in May, and the seeds ripen in July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: FlowersEdible Uses: Condiment-Flowers - cooked. They can be used as a vegetable[177] or to scent tea[183]. The hot seeds are ground into a powder and used as a spice in ale or in the food that accompanies it[183]. (Does this mean that the seed is heated before grinding, or that it has a hot flavour?[K])

tcanta None known

dwatta Anticonvulsant Antirheumatic Antispasmodic Diuretic Epilepsy Sedative TonicPeony root has been used medicinally for over 2,000 years and it gained a reputation as a treatment for epilepsy and to promote menstruation. This species was very popular up to the 16th century, but is little used in contemporary European herbalism, though it is sometimes employed where an antispasmodic and sedative are required[238, 254]. The root is antispasmodic, diuretic,

sedative and tonic[4, 7, 21]. The root is harvested in the autumn from plants that are at least two years old and is dried for later use[4]. It has been successfully employed in the treatment of convulsions and spasmodic nervous affections such as epilepsy[4, 7]. It has also been used in the treatment of whooping cough whilst suppositories are sometimes made of the root to relieve anal and intestinal spasms[254]. This remedy should be used with caution and not at all by pregnant women. Large doses can be toxic[7, 21, 254]. A tea made from the dried crushed petals of various peony species has been used as a cough remedy, and as a treatment for haemorrhoids and varicose veins[250].

propta Seed - best sown as soon as it is ripe in a cold frame[250]. When sown fresh, the seed produces a root about 6 weeks after sowing with shoots formed in the spring[200]. Stored seed is much slower, it should be sown as soon as possible in a cold frame but may take 18 months or more to germinate[200]. The roots are very sensitive to disturbance, so many growers allow the seedlings to remain in their pots for 2 growing seasons before potting them up. This allows a better root system to develop that is more resilient to disturbance[250]. If following this practice, make sure you sow the seed thinly, and give regular liquid feeds in the growing season to ensure the plants are well fed. We usually prick out the seedlings into individual pots as soon as they are large enough to handle, and then grow them on in a cold frame for at least two growing seasons before planting them out when they are in growth in the spring[K]. Division with great care in spring or autumn. Each portion must have a leaf bud. If the lifted root is stood in shade for several hours it becomes less brittle and easier to divide[200]. Divisions that have several buds will usually flower in the second year, but those that only have one or two buds will take a number of years before they have grown sufficiently to flower[250].

nwatta Landscape Uses:Border, Foundation, Seashore, Specimen. Requires a deep rich soil, preferably neutral or slightly alkaline[1, 233], doing quite well in sun or light shade[200]. Plants are tolerant of a wide range of soil conditions, but will not survive if the soil becomes waterlogged or is too dry[250]. This species is lime tolerant[200]. Plants grown on sandy soils tend to produce more leaves and less flowers, whilst those growing on clay take longer to become established but produce better blooms[250]. Plants can be naturalised in grass so long as the soil is good[233]. Hardy to about -25˚c[187]. A very variable plant, there are at least 4 sub-species[250]. There are a number of named forms, selected for their ornamental value[187]. A long-lived plant, living for 50 years or more in gardens[200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. A very greedy plant inhibiting the growth of nearby plants, especially legumes[54]. This species can spread fairly freely by means of its tuberous rootstock[233]. Strongly resents root disturbance, taking some time to recover after being divided[1]. Peony species are usually self-fertile, though they will also hybridise with other species if these flower nearby at the same time[250]. Plants take 4 - 5 years to flower from seed[200]. They generally breed true from seed[1]. Special Features:Not North American native, All or parts of this plant are poisonous, Suitable for cut flowers, Fragrant flowers.

### 5.2.809 Carex disticha

Two-rank sedge

4 tin 8 cyuc 1 kcaak 0 tcan 0 dwat 0.5 m hkuc
hmimhtut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Carex disticha is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from June to July, and the seeds ripen from July to August. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcaakta Edible Parts: Root SeedEdible Uses: Root - cooked[172]. Seed[172]. No further details are given, but the seed is small and fiddly to use[K].

tcanta BeddingThe leaves are used for bedding[61].

This species is easily grown in a sandy, lime-free soil enriched with organic matter, so long as this is deep enough to accommodate the plant's roots[239]. A moisture loving plant, preferring to grow with full exposure to the sun but with plenty of underground moisture in the summer, it grows better in the north and west of Britain[1]. Plants are intolerant of root disturbance[200].

### 5.2.833 Gentiana punctata

Spotted Gentian

4 tin 8 cyuc 1 kcaak 0 tcan 3 dwat 0.6 m hkuc
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Gentiana punctata is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bumblebees, butterflies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta The root is sometimes used in the manufacture of gentian bitters[183].

tcanta None known

dwatta Anthelmintic Antiinflammatory Antiseptic Bitter Cholagogue Emmenagogue Febrifuge Refrigerant Stomachic TonicThis species is one of several that are the source of the medicinal gentian root[4], the thick rootstock can be up to 1 metre long[239]. The following notes are based on the general uses of *G. lutea* which is the most commonly used species in the West[K]. Gentian root has a long history of use as a herbal bitter in the treatment of digestive disorders and is an ingredient of many proprietary medicines. It contains some of the most bitter compounds known and is used as a scientific basis for measuring bitterness[238]. It is especially useful in states of exhaustion from chronic disease and in all cases of debility, weakness of the digestive system and lack of appetite[4]. It is one of the best strengtheners of the human system, stimulating the liver, gall bladder and digestive system[238], and is an excellent tonic to combine with a purgative in order to prevent its debilitating effects[4]. The root is anthelmintic, anti-inflammatory, antiseptic, bitter tonic, cholagogue, emmenagogue, febrifuge, refrigerant, stomachic[4, 7, 9, 14, 21, 165, 238]. It is taken internally in the treatment of liver complaints, indigestion, gastric infections and anorexia[238]. It should not be prescribed for patients with gastric or duodenal ulcers[238]. The root is harvested in the autumn and dried for later use[4]. It is quite likely that the roots of plants that have not flowered are the richest in medicinal properties[4].

propta Seed - best sown as soon as it is ripe in a light position in a cold frame[200]. It can also be sown in late winter or early spring but the seed germinates best if given a period of cold stratification and quickly loses viability when stored, with older seed germinating slowly and erratically[200, 239]. It is advantageous to keep the seed at about 10˚c for a few days after sowing, to enable the seed to imbibe moisture[239]. Following this with a period of at least 5 - 6 weeks with temperatures falling to between 0 and -5˚c will usually produce reasonable germination[239]. It is best to use clay pots, since plastic ones do not drain so freely and the moister conditions encourage the growth of moss, which will prevent germination of the seed[239]. The seed should be surface-sown, or only covered with a very light dressing of compost. The seed requires dark for germination, so the pots should be covered with something like newspaper or be kept in the dark[239]. Pot up the seedlings into individual pots as soon as they are large enough to handle and grow on in light shade in the greenhouse for at least their first winter. The seedlings grow on very slowly, taking 2 - 7 years to reach flowering size[239]. When the plants are of sufficient size, place them out into their permanent positions in late spring or early summer. Division in March[111]. Most members of this genus have either a single tap-root, or a compact root system united in a single root head, and are thus unsuitable for division[239]. Cuttings of basal shoots in late spring[238].

nwatta In general, gentians require a moist well-drained soil in a sheltered position, a certain minimum of atmospheric humidity, high light intensity but a site where temperatures

are not too high[239]. They are therefore more difficult to grow in areas with hot summers and in such a region they appreciate some protection from the strongest sunlight[200, 239]. Most species will grow well in the rock garden[200]. This species is not particular about soil type, so long as it is deep enough to accommodate the plant's roots[239]. A moisture loving plant, preferring to grow with full exposure to the sun but with plenty of underground moisture in the summer, it grows better in the north and west of Britain[1]. Plants are intolerant of root disturbance[200].

### 5.2.834 Heuchera cylindrica

Alum Root, Roundleaf alumroot, Alpine alumroot, Beautiful alumroot, Poker alumroot

4 tin 8 cyuc 1 kcaak 0 tcan 2 dwat 0.5 m hkuc
hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Heuchera cylindrica is an evergreen Perennial growing to 0.5 m (1ft 8in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in leaf all year, in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: LeavesEdible Uses: Leaves - cooked[172].

tcanta MordantThe root can be used as an alum substitute, this is a mordant that is used in fixing dyes[168, 257]. The root is rich in tannin and it has been suggested that this is the mordant[168, 172]. A good ground cover plant for the woodland garden[200]. Plants should be spaced about 30cm apart each way[208].

dwatta The whole plant, but especially the roots, is as-tringen[257]. A decoction of the roots is used in the treatment of diarrhoea and stomach cramps[257]. Externally, a decoction is used as a wash on aching joints[257]. A poultice of the mashed peeled roots is used in treating rashes, sores and cuts[257]. When mixed with the spores of puffballs, it has been used as a salve for treating nappy rash[257].

propta Seed - sow early spring in a warm greenhouse and only just cover the seed. Germination is usually fairly rapid. Prick out the seedlings when they are large enough to handle and plant them out into their permanent positions in late spring or early summer. The seed can also be sown in the middle of spring in an outdoor seedbed and planted out in early summer. Alternatively, you can sow the seed in an outdoor seedbed in the middle of summer for planting out in the following spring. Division in March or October[1, 111]. It is best to divide the plants in August or early September, making sure that the woody roots are planted quite deeply with only the crown of foliage above the ground[233].

nwatta Succeeds in any good sweet garden soil that does not dry out in spring[1]. Prefers full sun but tolerates partial shade[1, 111]. Prefers a well-drained fairly rich and not too heavy soil[111]. Plants are hardy to about -20˚c[187]. Closely related to *H. chlorantha*[200], it is apt to hybridize with other members of this genus[111]. A very ornamental plant[60], a number of named forms have been selected for their ornamental value[187]. The subspecies *H. cylindrica* glabella has been specifically mentioned for its use as a mordant[168, 172].

### 5.2.835 Ratibida columnifera

Prairie Coneflower, Upright prairie coneflower, Woolly Cinquefoil, Praire Coneflower, Mexican Hat

4 tin 9 cyuc 1 kcaak 0 tcan 1 dwat 0.8 m hkuc
htut cyutli hgatkyucocup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Ratibida columnifera is a PERENNIAL growing to 0.8 m (2ft 7in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 3. It is in flower in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers

for a number of disorders. In particular, it is a valuable astringent remedy treating wounds and bleeding, whilst it is particularly useful in the treatment of urinary tract disorders, being used both for serious ailments such as nephritis and for more common problems such as cystitis[254]. The plant contains saponins that are antifungal and act specifically against the *Candida* fungus which is the cause of vaginal and oral thrush[238, 254]. It also contains rutin which is used to treat capillary fragility, and phenolic glycosides which are anti-inflammatory[238]. The leaves and flowering tops are anthelmintic, anti-inflammatory, antiseptic, aromatic, astringent, carminative, diaphoretic, mildly diuretic, febrifuge and stimulant[4, 7, 9, 21, 147, 165]. A good vulnerary herb, it has also proved of value when used internally in the treatment of urinary infections, chronic catarrh, skin diseases, influenza, whooping cough, bladder and kidney stones etc[4, 238]. Due to its mild action, goldenrod is used to treat gastro-enteritis in children[254]. It makes an excellent mouthwash in the treatment of thrush[7]. The plant is gathered in the summer and dried for later use[7]. The seed is anticoagulant, astringent and carminative[218]. A homeopathic remedy is made from the plant[9]. It is used in the treatment of kidney and bladder disorders, rheumatism and arthritis[9]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve *Solidago virgaurea* for infection of the urinary tract, kidney and bladder stones (see [302] for critics of commission E).

propta Seed - sow spring in a cold frame. Only just cover the seed and do not allow the compost to become dry. Prick out the seedlings into individual pots when they are large enough to handle, and grow them on for their first winter in pots. Plant them out into their permanent positions in spring or early summer. Division in spring or autumn. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta An easily grown plant, it succeeds in any moderately fertile moisture retentive soil in sun or semi-shade[200]. Grows well in heavy clay soils. A rather greedy plant, it is apt to impoverish the soil[1]. The bruised plant smells like wild carrots[4]. The sub-species *S. virgaurea* minuta is only 10cm tall and wide[188]. The plant attracts various beneficial insects such as ladybirds, lacewings and hoverflies to the garden, these insects will help to control insect pests in the garden[201, 238].

### 5.2.831 *Scutellaria indica*

4 tlin 8 cyuc 1 kcaak 0 tcan 1 dwat 0.3 m hkuu  
htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Scutellaria indica* is a PERENNIAL growing to 0.3 m (1ft) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from June to August, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcaakta Edible Parts: LeavesEdible Uses: Young plant - cooked[105, 177].

tcanta None known  
dwatta Used as a folk remedy for traumatic injuries[266].

propta Seed - sow in situ outdoors in late spring. If there is only a small quantity of seed it is better to sow it in a pot in a cold frame in early spring. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the spring. Division in spring just before new growth begins. Very easy, larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer. Basal cuttings in early summer in a frame. Very easy. Harvest the shoots with plenty of underground stem when they are about 8 - 10cm above the ground. Pot them up into individual pots and keep them in

light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Succeeds in a sunny position in any ordinary garden soil that does not dry out during the growing season[200]. This species grows well in a rock garden[188].

### 5.2.832 *Gentiana purpurea*

4 tlin 8 cyuc 1 kcaak 0 tcan 3 dwat 0.6 m hkuu  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta *Gentiana purpurea* is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bumblebees, butterflies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta The root is sometimes used in the manufacture of gentian bitters[183].

tcanta None known  
dwatta Anthelmintic Antiinflammatory Antiseptic Bitter Cholagogue Emmenagogue Febrifuge Refrigerant Stomachic TonicThis species is one of several that are the source of the medicinal gentian root[4], the following notes are based on the general uses of *G. lutea* which is the most commonly used species in the West[K]. Gentian root has a long history of use as a herbal bitter in the treatment of digestive disorders and is an ingredient of many proprietary medicines. It contains some of the most bitter compounds known and is used as a scientific basis for measuring bitterness[238]. It is especially useful in states of exhaustion from chronic disease and in all cases of debility, weakness of the digestive system and lack of appetite[4]. It is one of the best strengtheners of the human system, stimulating the liver, gall bladder and digestive system[238], and is an excellent tonic to combine with a purgative in order to prevent its debilitating effects[4]. The root is anthelmintic, anti-inflammatory, antiseptic, bitter tonic, cholagogue, emmenagogue, febrifuge, refrigerant, stomachic[4, 7, 9, 14, 21, 165, 238]. It is taken internally in the treatment of liver complaints, indigestion, gastric infections and anorexia[238]. It should not be prescribed for patients with gastric or duodenal ulcers[238]. The root is harvested in the autumn and dried for later use[4]. It is quite likely that the roots of plants that have not flowered are the richest in medicinal properties[4].

propta Seed - best sown as soon as it is ripe in a light position in a cold frame[200]. It can also be sown in late winter or early spring but the seed germinates best if given a period of cold stratification and quickly loses viability when stored, with older seed germinating slowly and erratically[200, 239]. It is advantageous to keep the seed at about 10°C for a few days after sowing, to enable the seed to imbibe moisture[239]. Following this with a period of at least 5 - 6 weeks with temperatures falling to between 0 and -5°C will usually produce reasonable germination[239]. It is best to use clay pots, since plastic ones do not drain so freely and the moister conditions encourage the growth of moss, which will prevent germination of the seed[239]. The seed should be surface-sown, or only covered with a very light dressing of compost. The seed requires dark for germination, so the pots should be covered with something like newspaper or be kept in the dark[239]. Pot up the seedlings into individual pots as soon as they are large enough to handle and grow on in light shade in the greenhouse for at least their first winter. The seedlings grow on very slowly, taking 2 - 7 years to reach flowering size[239]. When the plants are of sufficient size, place them out into their permanent positions in late spring or early summer. Division in March[111]. Most members of this genus have either a single tap-root, or a compact root system united in a single root head, and are thus unsuitable for division[239]. Cuttings of basal shoots in late spring[238].

nwatta In general, gentians require a moist well-drained soil in a sheltered position, a certain minimum of atmospheric humidity, high light intensity but a site where temperatures are not too high[239]. They are therefore more difficult to grow in areas with hot summers and in such a region they appreciate some protection from the strongest sunlight[200, 239]. Most species will grow well in the rock garden[200].

dwatta None known

propta Seed - sow in situ in the spring in a moist soil in light shade. If seed is in short supply it can be sown in a cold frame and be planted out in the summer. The seed usually germinates in 2 - 6 weeks at 15°C[138]. Division in spring[200]. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the summer or following spring.

nwatta Easily grown in a damp to wet soil in full sun or shade[162, 200]. Members of this genus are rarely if ever troubled by browsing deer[233].

### 5.2.810 *Scutellaria baicalensis*

Baikal Skullcap - Huang-Qin

4 tlin 8 cyuc 1 kcaak 0 tcan 3 dwat 0.3 m hkuu  
hmimhtut cyutli kyuctup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Scutellaria baicalensis* is a PERENNIAL growing to 0.3 m (1ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in August, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcaakta Edible Parts: LeavesEdible Uses: TeaYoung leaves - cooked as a vegetable[105, 177, 183]. The whole plant is dried and used as a tea substitute[105, 183].

tcanta None known

dwatta Anodyne Antibacterial Anticholesterolemic Antipyretic Antispasmodic Astringent Cancer Cholagogue Diuretic Dysentery Expectorant Febrifuge Haemostatic Laxative Nervine Sedative Stomachic TB Tonic UrinaryBaikal skullcap is commonly used in the Chinese herbalism, where it is considered to be one of the 50 fundamental herbs and is used primarily in treating "hot and damp" conditions such as dysentery and diarrhoea[218, 254]. It has been used medicinally for over 2,000 years and recent research has found that the roots contain flavonoids that greatly enhance liver function and also have anti-inflammatory and anti-atherogenic effects[238]. The root is anodyne, antibacterial, anticholesterolemic, antipyretic, antispasmodic, astringent, cholagogue, diuretic, expectorant, febrifuge, haemostatic, laxative, nervine, mildly sedative, stomachic and tonic (for TB)[46, 61, 147, 174, 176, 218, 238]. It reputedly calms the foetus in pregnant women[238]. The root is used internally in the treatment of enteritis, dysentery, diarrhoea, jaundice, chronic hepatitis, urinary tract infections, hypertension, threatened miscarriage, nosebleed and haemorrhage from the lungs or bowel[238]. It is one of the ingredients of the Chinese drug 'injection of three yellow herbs'[238]. The root is harvested in the autumn or spring from plants 3 - 4 years old and is dried for later use[238]. The seed is used to cleanse the bowels of blood and pus[218]. For the treatment of prostate cancer [301].

propta Seed - sow outdoors in situ in late spring[200] If there is only a small quantity of seed it is better to sow it in a pot in a cold frame in early spring. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring just before new growth begins. Very easy, larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Succeeds in a sunny position in any ordinary garden soil that does not dry out during the growing season[200]. Prefers a light well-drained soil in sun or partial shade[238]. This species requires sharp drainage and, once established, is drought tolerant[238]. Plants are hardy to at least -15°C[238]. A very ornamental plant[1].

### 5.2.811 *Iris sibirica*

Siberian Iris

4 tlin 9 cyuc 1 kcaak 0 tcan 1 dwat 0.6 m hkuu  
hmimhtut cyutli tcuphja7n hwicli hrasjlutnyikfrip hpa7tli flatprikliwis hpa7tmwatli fyfkrx7t hjonli

drutta *Iris sibirica* is a PERENNIAL growing to 0.6 m (2ft) by 1 m (3ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in June, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcaakta Edible Parts: RootEdible Uses: Root - an edible starch is said to be extracted from it[2, 105, 177]. The root is not eaten in China[178]. Some caution is advised since there are reports that the plant might be poisonous. Perhaps the extracted starch is edible.

tcanta InsecticideAn insecticide is obtained from the plant[178]. (from the root?)

dwatta ExpectorantExpectorant[178].

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed should be sown as early in the year as possible in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse or cold frame for their first year. Plant out into their permanent positions in late spring or early summer. Division, best done in August/September after flowering but can also be done in April. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Landscape Uses:Border, Container, Foundation, Massing, Specimen, Woodland garden. Prefers a humus-rich soil[79], succeeding in a moist border or by water[42, 79]. Grows well in heavy clay soils. The plants are very cold tolerant, but they can be damaged when dormant if the soil is too moist[79]. A very ornamental plant, there are many named varieties[187]. Plant the roots out very shallowly[79]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. Special Features: Attractive foliage, Not North American native, Naturalizing, All or parts of this plant are poisonous, Wetlands plant, Suitable for cut flowers.

### 5.2.812 *Lobelia sessilifolia*

4 tlin 8 cyuc 1 kcaak 0 tcan 0 dwat 0.7 m hkuu  
hmimhtut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Lobelia sessilifolia* is a PERENNIAL growing to 0.7 m (2ft 4in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcaakta Edible Parts: LeavesEdible Uses: The buds and young plants are cooked and used as a famine food[177, 179]. Caution is advised because they contain a toxic alkaloid[179].

tcanta None known

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring[200]. Basal cuttings in spring[1]. Harvest the shoots when they are about 10cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer. Layering in moist sand, it forms roots at the nodes[200].

nwatta Requires a wet soil[1].

### 5.2.813 Pimpinella saxifraga

Greater Burnet Saxifrage, Hollowstem burnet saxifrage  
4 tlin 8 cyuc 1 kcaak 0 tcan 2 dwat 0.8 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikkwis  
hpa7tmwatli fyfxre7t hjonli

drutta Pimpinella saxifraga is a PERENNIAL growing to 0.8 m (2ft 7in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to July, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves SeedEdible Uses: ConditionAn essential oil from the roots is used as a flavouring in candy, liqueurs etc[183].

tcanta None known

dwatta Antispasmodic Astringent Carminative Cholagogue Diaphoretic Diuretic Emmenagogue Ophthalmic Resolvent Skin Stomachic UrinaryThe leaves are diaphoretic, diuretic, resolvent and stomachic[4]. The plant is harvested as it comes into flower and dried for later use[4]. The root is anti-inflammatory, mildly astringent and expectorant[9]. The fresh root is very hot and acrid, but this pungency is greatly reduced when the root is dried[4]. When chewed, the fresh root is effective in treating toothaches and paralysis of the tongue[4]. An effective diuretic, the root is used in treating disorders arising from obstructions of the viscera[4]. The root is also used for soothing coughs or the effects of laryngitis and bronchitis[9]. The roots can be harvested in the spring or autumn and are dried for later use[9]. The seeds are carminative[4]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve Pimpinella major Greater Burnet Saxifrage for cough/bronchitis (see [302] for critics of commission E).

propta The seed requires a period of cold stratification. If you can obtain fresh seed then it is best sown immediately. This can be done in situ if you have sufficient seed, but if you only have a small quantity then it is safer to sow it in pots in a cold frame. Sow stored seed as soon as you can obtain it, this is probably best done in a cold frame. When they are large enough to handle, prick the pot-grown seedlings out into individual pots and plant them out in the summer.

nwatta Easily grown in any good soil[1], preferring rather moist conditions[187]. Grows best in a cool position[233]. Plants are hardy to about -20°c[187].

### 5.2.814 Solidago spathulata

Coast Goldenrod, Creeping Goldenrod  
4 tlin 9 cyuc 1 kcaak 0 tcan 1 dwat 0.6 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikkwis  
hpa7tmwatli xre7t hjonli

drutta Solidago spathulata is a PERENNIAL growing to 0.6 m (2ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from June to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: Leaves SeedEdible Uses: TeaLeaves and flowering stems - cooked[172]. Seed - used as a thickener in soups etc[172]. The seed is very small and fiddly to harvest[K]. A tea is made from the leaves and flowers[172].

tcanta Mustard, orange and brown dyes can be obtained from the whole plant[168].

dwatta Antiseptic Haemostatic SalveThe flowering stems are antiseptic, haemostatic and salve[168, 172]. An infusion of the dried powdered herb can be used as an antiseptic[168]. A poultice of the toasted, powdered leaves has been mixed with oil and used in the treatment of mumps[257].

propta Seed - sow spring in a cold frame. Only just cover the seed and do not allow the compost to become dry. Prick out the seedlings into individual pots when they are large

enough to handle, and grow them on for their first winter in pots. Plant them out into their permanent positions in spring or early summer. Division in spring or autumn. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Landscape Uses:Border, Ground cover, Specimen, Woodland garden. Succeeds in any moderately fertile moisture retentive soil in sun or semi-shade[200]. Grows well in heavy clay soils. Judging by the plants native habitat, it is likely to be tolerant of maritime exposure[K]. This species is not hardy in the colder areas of Britain, it tolerates temperatures down to between -5 and -10°c[200]. A rather greedy plant, it is apt to impoverish the soil[1]. The plant attracts various beneficial insects such as ladybirds, lacewings and hoverflies to the garden, these insects will help to control insect pests in the garden[201, 238]. Special Features:Attractive foliage, North American native, Invasive, Naturalizing, Attracts butterflies, Suitable for cut flowers, Suitable for dried flowers, Extended bloom season in Zones 9A and above.

### 5.2.815 Ruta graveolens

Rue, Common rue, Herb of Grace, Garden Rue  
4 tlin 10 cyuc 1 kcaak 0 tcan 3 dwat 0.5 m hkuc  
hmimhtut cyutli hqatkyuctup hwicli hyishrasjlutnyik hpa7tli  
flatprikkwis hpa7tmwatli xre7t hjonli

drutta Ruta graveolens is an evergreen Shrub growing to 0.5 m (1ft 8in) by 0.5 m (1ft 8in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in leaf all year, in flower from June to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: LeavesEdible Uses: Condition Rutin TeaLeaves - raw or used as a seasoning[2, 7, 19, 21, 27, 89]. It is occasionally eaten in salads[4], but is strongly aromatic and slightly toxic, so should only be used in small quantities[7, 19, 148, 183]. The taste is strong and bitter[238]. The leaves contain rutin, which has a beneficial effect upon the circulatory system[218]. Some caution is advised, see notes on toxicity above. The leaves can be brewed into a tea[183].

tcanta Dye Essential Repellent StrewingThe growing or the dried plant can be used to repel insects, it is most useful when the plant is grown near roses and raspberries[4, 14, 18, 20, 148]. The dried herb can also be put in the linen cupboard to repel moths[14, 18]. The growing plant is also said to repel cats[20]. A red dye is obtained from the plant[148]. An essential oil is obtained from the leaves and young shoots, it is used in perfumery and as a food flavouring[61]. The plant was formerly used as a strewing herb[148]. Plants can be grown for ground cover when planted about 45cm apart each way[208]. They can be trimmed back in spring to keep them bushy[208].

dwatta Abortifacient Anthelmintic Antidiarrhoeal Antidote Antiinflammatory Antispasmodic Carminative Emetic Emmenagogue Expectorant Haemostatic Homeopathy Ophthalmic Rubefacient Stimulant StomachicRue has a long history of use as a domestic remedy, being especially valued for its strengthening action on the eyes[4]. The plant contains flavonoids (notably rutin) that reduce capillary fragility, which might explain the plants reputation as an eye strengthener[238]. Some caution is advised in its use internally, however, since in large doses it is toxic and it can also cause miscarriages[4, 7, 238]. The whole herb is abortifacient, anthelmintic, antidote, antispasmodic, carminative, emetic, emmenagogue, expectorant, haemostatic, ophthalmic, rubefacient, strongly stimulant, mildly stomachic and uterotoxic[4, 7, 21, 165, 218]. The tops of fresh shoots are the most active medicinally, they should be gathered before the plant flowers and can be used fresh or dried[4]. An infusion is used in the treatment of hysterical affections,

drutta Hosta rectifolia is a PERENNIAL growing to 0.6 m (2ft) by 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from August to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves StemEdible Uses: Young leaves and leaf stems - cooked[105]. Not very tasty[116].

tcanta A useful ground cover plant, succeeding in dense shade, though rather slow spreading[197]. Plants should be spaced about 45cm apart each way[208].

dwatta None known

propta Seed - sow spring in a lightly shaded position in a greenhouse and only just cover the seed. Germination usually takes place within 1 - 3 months at 10°c. Make sure you keep the compost moist. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division is possible at almost any time of the year so long as there is sufficient moisture[233]. It is best carried out in March as growth commences or in early autumn if the soil is not too dry[200]. Hostas can be left undivided for many years and should not be divided any more frequently than once every 3 - 5 years to allow the leaves to reach maturity[200].

nwatta Thrives in most fertile soils if they are rich in humus[200]. Grows well in heavy clay soils and in sandy ones[208]. Very limy soils inhibit growth, but plants can thrive in such a situation if plenty of humus is added[208]. Prefers a pH between 6 and 7[200]. Requires a rich soil that does not dry out readily[1]. Succeeds in full sun as well as in deep shade, growing well in the semi-shade of a woodland[200, 233]. In general, the sunnier the position the moister the soil should be[233]. Plants are best not grown under trees in town gardens since the soot washed from the leaves of the trees in wet weather will tend to remain on the hosta[208]. Plants flower better when grown in a sunny position but the foliage is better when the plant is in a shady position[200]. Plants are in general fully hardy in Britain, but young leaves in spring can be destroyed by frost. New leaves are only produced in the spring and very early summer, so any damage at this time has a deep effect on the plant[233]. A robust plant, forming medium-size to large clumps, the rhizome is slightly stoloniferous[200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. Plants are very attractive to slugs and snails, the young shoots in spring are especially at risk[111, K]. Hybridizes freely with other members of this genus[200].

### 5.2.828 Stachys hyssopifolia ambigua

hyssopleaf hedgenettle  
4 tlin 8 cyuc 1 kcaak 0 tcan 1 dwat 0.8 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikkwis  
hpa7tmwatli xre7t hjonli

drutta Stachys hyssopifolia ambigua is a PERENNIAL growing to 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 5. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Eaten as a vegetable[178]. No more details are given, it is likely to be the roots or the leaves that are eaten[K].

tcanta DeodorantNone known

dwatta Astringent Carminative DeodorantThe plant is astringent, carminative and deodorant[178, 218].

propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in

late spring or early summer, after the last expected frosts. Division in spring.

nwatta Succeeds in any deep well-drained moderately fertile soil in full sun or light shade[200]. A good bee plant[200].

### 5.2.829 Narcissus jonquilla

Jonquil  
4 tlin 8 cyuc 1 kcaak 0 tcan 0 dwat 0.3 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprikkwisslip hpa7tmwatli xre7t hjonli

drutta Narcissus jonquilla is a BULB growing to 0.3 m (1ft) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower in April. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FlowersEdible Uses: Flowers - raw or candied and made into desserts[183].

tcanta EssentialAn essential oil obtained from the flowers is used in perfumery[61, 100, 171]. 1 kg of flowers yields 1g absolute of essential oil[46].

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame. A short stratification will improve the germination of stored seed. Sow the seed thinly so that the seedlings can be left undisturbed in the pot for their first two years of growth. Give them an occasional liquid feed in the growing season to ensure they do not become nutrient deficient. When the plants become dormant in the summer, pot up the small bulbs placing 2 - 3 bulbs in each pot. Grow them on for another one or two years in the greenhouse before planting them out when they are dormant in late summer. Division of bulbs after the leaves die down in early summer[1]. Larger bulbs can be replanted immediately into their permanent positions, or can be stored in a cool place and then be planted out in the autumn. It is best to pot up the smaller bulbs and grow them on for a year before planting them out when dormant in the autumn.

nwatta Prefers a deep rather stiff soil but succeeds in moist soils[1]. Grows well in heavy clay soils. Easily grown in a dry sunny position[90]. Prefers an alkaline soil with a pH between 7 and 8[200]. A very ornamental plant[1], it is widely cultivated around the Mediterranean for its essential oil[50]. The blooms, which are almost intoxicatingly scented, have an undertone of orange in their perfume[245]. The double form, 'flora Pleno' is even more powerfully scented[245].

### 5.2.830 Solidago virgaurea

Goldenrod  
4 tlin 8 cyuc 1 kcaak 0 tcan 3 dwat 0.6 m hkuc  
hmimhtut cyutli kcaak0 tcup hwicli hrasjlutnyikfrip hpa7tli flatprikkwis hpa7tmwatli fyfxre7t hjonli

drutta Solidago virgaurea is a PERENNIAL growing to 0.6 m (2ft) by 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to October, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Edible Uses: TeaA tea is obtained from the leaves[46, 61, 183].

tcanta DyeMustard, orange and brown dyes can be obtained from the whole plant[168]. A yellow dye is obtained from the leaves and flowers[4, 100].

dwatta Anthelmintic Anticoagulant Antifungal Antiinflammatory Antirheumatic Antiseptic Aromatic Astringent Carminative Diaphoretic Diuretic Febrifuge Hypoglycaemic Stimulant TB UrinaryGoldenrod is a safe and gentle remedy

on mammalian intestines, it also reduces blood pressure, reduces body temperature caused by fever and protects against stress ulcers[250]. A tea made from the dried crushed petals of various peony species has been used as a cough remedy, and as a treatment for haemorrhoids and varicose veins[250].

propta Seed - best sown as soon as it is ripe in a cold frame[250]. When sown fresh, the seed produces a root about 6 weeks after sowing with shoots formed in the spring[200]. Stored seed is much slower, it should be sown as soon as possible in a cold frame but may take 18 months or more to germinate[200]. The roots are very sensitive to disturbance, so many growers allow the seedlings to remain in their pots for 2 growing seasons before potting them up. This allows a better root system to develop that is more resilient to disturbance[250]. If following this practice, make sure you sow the seed thinly, and give regular liquid feeds in the growing season to ensure the plants are well fed. We usually prick out the seedlings into individual pots as soon as they are large enough to handle, and then grow them on in a cold frame for at least two growing seasons before planting them out when they are in growth in the spring[K]. Division with great care in spring or autumn. Each portion must have a leaf bud. If the lifted root is stood in shade for several hours it becomes less brittle and easier to divide[200]. Divisions that have several buds will usually flower in the second year, but those that only have one or two buds will take a number of years before they have grown sufficiently to flower[250].

nwatta An easily grown plant, it does best in a deep rich soil, preferably neutral or slightly alkaline[1], doing quite well in sun or light shade[1, 200]. Plants are tolerant of a wide range of soil conditions, but will not survive if the soil becomes waterlogged or is too dry[250]. This species is lime tolerant[200]. Plants grown on sandy soils tend to produce more leaves and less flowers, whilst those growing on clay take longer to become established but produce better blooms[250]. Very cold resistant[74], tolerating temperatures down to at least -25°C[187]. A very ornamental[74] and long-lived plant, specimens can survive in the garden for at least 50 years[200]. This species is closely related to *P. veitchii*, differing mainly in only having one flower to a stem[250]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. A very greedy plant inhibiting the growth of nearby plants, especially legumes[54]. Strongly resents root disturbance, taking some time to recover after being divided[1]. Peony species are usually self-fertile, though they will also hybridise with other species if they flower nearby at the same time[250]. Plants take 4 - 5 years to flower from seed[200]. They generally breed true from seed[1].

### 5.2.825 Incarvillea sinensis

4 tin 8 cyuc 1 kcaak 0 tcan 1 dwat 0.9 m hkuc hmimhtut cyutli hgattcup hwicli hrasjlut hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Incarvillea sinensis is a ANNUAL/PERENNIAL growing to 0.9 m (3ft). See above for USDA hardiness. It is hardy to UK zone 4. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: LeavesEdible Uses: Leaves and young shoots - cooked. A famine food, it is only used when all else fails[179]. Some caution is advised, see the notes above on toxicity.

tcanta None known

dwatta SkinThe plant is used to treat skin ailments, spongy gums and ulcers[218].

propta Seed - sow autumn or spring in a greenhouse. Prick out the seedlings into individual pots as soon as they are large enough to handle. Grow on for at least their first winter in a greenhouse and plant out into their permanent positions in spring after the last expected frosts. Division with care in early spring or autumn.

nwatta Easily grown in a deep well-drained sandy but rich soil in full sun[1, 200]. Plants grow better if they are given some shade around midday[200]. Dislikes dry summer soils and winter wet[200]. One report says that this species

should be grown in a greenhouse[1] whilst another says that it is hardy to about -15°, tolerating lower temperatures if the roots are well mulched, preferably with dry bracken[200]. The crown of the plant requires protection from slugs in the winter[187]. A very ornamental plant, it usually takes about 1 - 2 years to come into flower from seed[1]. A variable species[214], some forms are perennial whilst others are annual[1]. *I. sinensis sinensis* is an annual whilst *I. sinensis variabilis* (Batal.)Grierson is a perennial[200]. Plants are intolerant of root disturbance, it is best to place them in their permanent positions whilst small[200]. The plants will often sulk for several years if they are divided[214].

### 5.2.826 Hosta sieboldii

4 tin 8 cyuc 1 kcaak 0 tcan 0 dwat 0.5 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlutnyikfrip hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Hosta sieboldii is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from August to September, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Leaves StemEdible Uses: Young leaves and leaf stems - cooked[105, 177]. Not very tasty[116].

tcanta Suitable for ground cover, the plants should be spaced about 35cm apart each way[208].

dwatta None known

propta Seed - sow spring in a lightly shaded position in a greenhouse and only just cover the seed. Germination usually takes place within 1 - 3 months at 10°C. Make sure you keep the compost moist. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division is possible at almost any time of the year so long as there is sufficient moisture[233]. It is best carried out in March as growth commences or in early autumn if the soil is not too dry[200]. Hostas can be left undivided for many years and should not be divided any more frequently than once every 3 - 5 years to allow the leaves to reach maturity[200].

nwatta Thrives in most fertile soils if they are rich in humus[200]. Grows well in heavy clay soils and in sandy ones[208]. Very limy soils inhibit growth, but plants can thrive in such a situation if plenty of humus is added[208]. Prefers a pH between 6 and 7[200]. Requires a rich soil that does not dry out readily[1]. This species tolerates dryish conditions[121]. Succeeds in full sun as well as in deep shade, growing well in the semi-shade of a woodland[200, 233]. In general, the sunnier the position the moister the soil should be[233]. Plants are best not grown under trees in town gardens since the soot washed from the leaves of the trees in wet weather will tend to remain on the hosta[208]. Plants flower better when grown in a sunny position but the foliage is better when the plant is in a shady position[200]. The leaves turn yellowish when the plant is grown in full sun[121]. Plants are in general fully hardy in Britain, but young leaves in spring can be destroyed by frost. New leaves are only produced in the spring and very early summer, so any damage at this time has a deep effect on the plant[233]. Forming medium-sized clumps, the rhizome is short and creeping[200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. Plants are very attractive to slugs and snails, the young shoots in spring are especially at risk[111, K]. There are some named forms, selected for their ornamental value[187]. Hybridizes freely with other members of this genus[200].

### 5.2.827 Hosta rectifolia

4 tin 8 cyuc 1 kcaak 0 tcan 0 dwat 0.6 m hkuc pcmihmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

coughs, flatulence etc[4]. The juice of the plant has been used in treating earaches and chewing a leaf or two is said to quickly bring relief from giddiness, nervous headaches, palpitations etc[4]. An alkaloid found in the plant is abortifacient, anti-inflammatory and antispasmodic[218]. A homeopathic remedy is obtained from the fresh herb, harvested in early summer shortly before flowering begins[232]. This is used in the treatment of a variety of complaints including eye strain, headache and sprains[232].

propta Seed - best sown as soon as it is ripe in a cold frame[200], it can also be sown in early to mid spring in a cold frame[14, 27]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of young shoots in late spring[1]. Cuttings of half-ripe wood, July/August in a frame[200]. Very easy[K]. Layering in early summer. Old plants often self-layer[200].

nwatta Landscape Uses:Border, Container, Massing, Rock garden, Specimen. Succeeds in any soil but is hardier in a poor dry soil[4, 37, 200]. Prefers an open sunny position[7, 182]. Prefers a partially shaded sheltered dry position but succeeds in full sun[1, 4, 200]. Prefers a well-drained or rocky soil[200]. Likes some lime in the soil[1]. Established plants are drought tolerant[190]. Hardy to about -10°C, possibly to lower temperatures when it is grown in a dry soil[187]. Often cultivated as a culinary and medicinal herb, there are some named varieties[187]. The bruised leaves have a pleasant orange-like fragrance[245]. It is one of the most pleasant herbs to inhale[245]. Rue releases its scent in a remarkable way. The essential oil is contained in a cavity immediately beneath the surface of the leaf, above which is a thin layer of cells pierced by a cavity in the middle. The cells swell up and bend inwards, pressing on the essential oil beneath, which is driven to the surface of the leaf and there released[245]. Rue is a poor companion plant for many other species, growing badly with sage, cabbage and sweet basil[14, 18, 20, 201]. It is a good companion for roses and raspberries[201]. Plants in this genus are notably resistant to honey fungus[200]. Special Features:Attractive foliage, Edible, Not North American native, Suitable for cut flowers, Suitable for dried flowers.

### 5.2.816 Carlina acanthifolia

4 tin 8 cyuc 1 kcaak 0 tcan 0 dwat 0.6 m hkuc htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli fyixre7t hjonli

drutta Carlina acanthifolia is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in June, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: FlowersEdible Uses: Flowering head - cooked. Used as a globe artichoke substitute[2, 105, 177, 183], though they are considerably smaller and even more fiddly[K].

tcanta None known

dwatta None known

propta Seed - surface sow in a cold frame in the spring. The seed usually germinates in 4 - 8 weeks at 15°C[138]. As soon as they are large enough to handle, prick the seedlings out into individual pots and plant them out into their permanent positions in the summer. Division in spring[111]. Difficult to do successfully because the plant resents root disturbance[138].

nwatta Succeeds in a sunny position in ordinary garden soil[111]. Prefers an alkaline soil[138]. Prefers a poor soil[200]. Plants are hardy to about -15°C[200]. A very ornamental plant[1]. This species resents root disturbance, it should be planted into its final position as soon as possible[138].

### 5.2.817 Trillium ovatum

Wakerobin, Pacific trillium, Oettinger's trillium, Hibberson's trillium

4 tin 8 cyuc 1 kcaak 0 tcan 1 dwat 0.4 m hkuc pcmihmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Trillium ovatum is a PERENNIAL growing to 0.4 m (1ft 4in) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from May to June. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: The leaves are sometimes cooked for greens[212].

tcanta None known

dwatta Birthing aid Ophthalmic SkinA decoction of the fresh or dried powdered root is used as a treatment for sore eyes[207]. The fresh root juice can be dripped into an afflicted eye[257]. The juice of the plant can be applied externally as a treatment for boils[257]. A poultice of the root can be used as a treatment for boils[257]. The thick underground root stalks were used by some native North American Indian tribes during childbirth[212].

propta Seed - best sown in a shaded cold frame as soon as it is ripe[134, 200]. Stored seed should be sown in late winter or early spring. Seed usually germinates within 1 - 3 months at 15°C. Another report says that seeds produce a root after the first cold stratification but no shoot is produced until after a second winter[138], whilst yet another report says that the seed can take 3 years to germinate[238]. The seedlings are prone to damp off and must therefore be watered with care and given plenty of fresh air[138]. The young plants need to be overwintered in a cold frame for the first year and can then be planted out in late spring. It is very important that the pots become neither too dry nor too wet[138]. Division with care when the plants die down after flowering[200]. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the following spring.

nwatta Prefers a deep well-drained woodland or humus-rich soil in a somewhat shady position that remains moist in the summer[1, 42]. Prefers a neutral to slightly acid soil[200]. Grows well in open woodland[1]. Succeeds in deep shade[188]. Succeeds in a sunny position if the soil does not dry out[42]. Any transplanting is best done whilst the plants are in flower[200]. Plants can flower in two years from seed[138]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233], though slugs are very fond of the leaves[238].

### 5.2.818 Paeonia lactiflora

Chinese Peony, Peony

4 tin 10 cyuc 1 kcaak 0 tcan 3 dwat 0.8 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlutnyikfrip hpa7tli flatprikliw hpa7tmwatli fyixre7t hjonli

drutta Paeonia lactiflora is a PERENNIAL growing to 0.8 m (2ft 7in) by 0.5 m (1ft 8in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in June, and the seeds ripen in August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Root. Seed StemEdible Uses: Root - cooked and eaten in a broth[2, 4, 46, 183]. Stems - cooked[177]. Seed - powdered and mixed with tea[4, 183].

tcanta None known

dwatta Alterative Analgesic Anodyne Antibacterial Anti-inflammatory Antiseptic Antispasmodic Astringent Carmine-ant Diuretic Emmenagogue Expectorant Febrifuge Hypotensive Nervine Tonic Women's complaintsThe root of Chinese peony has been used for over 1,500 years in Chinese

medicine. It is known most widely as one of the herbs used to make 'Four Things Soup', a woman's tonic, and it is also a remedy for gynaecological problems and for cramp, pain and giddiness[254]. When the whole root is harvested it is called Chi Shao Yao, if the bark is removed during preparation then it is called Bai Shao Yao[250]. The root is alterative, analgesic, anodyne, antibacterial, anti-inflammatory, antiseptic, antispasmodic, astringent, carminative, diuretic, emmenagogue, expectorant, febrifuge, hypotensive, nervine and tonic[176, 218, 238, 279]. The most important ingredient medicinally in the root is paeoniflorin, which has been shown to have a strong antispasmodic effect on mammalian intestines, it also reduces blood pressure, reduces body temperature caused by fever and protects against stress ulcers[250]. It is taken internally in the treatment of menstrual disorders, injuries, high blood pressure, pre-menstrual tension and liver disorders[238]. It should only be used under the supervision of a qualified practitioner and should not be prescribed for pregnant women[238]. The roots are harvested in the autumn from cultivated plants that are 4 - 5 years old and are boiled before being sun-dried for later use[238, 250]. The roots of wild plants are harvested in the spring or (preferably) in the autumn and are sun-dried for later use[238]. The root is an ingredient of 'Four Things Soup', the most widely used woman's tonic in China[254]. The other species used are *Rehmannia glutinosa*, *Ligusticum wallichii* and *Angelica sinensis*[254]. A tea made from the dried crushed petals of various peony species has been used as a cough remedy, and as a treatment for haemorrhoids and varicose veins[250].

propta Seed - best sown as soon as it is ripe in a cold frame[250]. When sown fresh, the seed produces a root about 6 weeks after sowing with shoots formed in the spring[200]. Stored seed is much slower, it should be sown as soon as possible in a cold frame but may take 18 months or more to germinate[200]. The roots are very sensitive to disturbance, so many growers allow the seedlings to remain in their pots for 2 growing seasons before potting them up. This allows a better root system to develop that is more resilient to disturbance[250]. If following this practice, make sure you sow the seed thinly, and give regular liquid feeds in the growing season to ensure the plants are well fed. We usually prick out the seedlings into individual pots as soon as they are large enough to handle, and then grow them on in a cold frame for at least two growing seasons before planting them out when they are in growth in the spring[K]. Division with great care in spring or autumn. Each portion must have a leaf bud. If the lifted root is stood in shade for several hours it becomes less brittle and easier to divide[200]. Divisions that have several buds will usually flower in the second year, but those that only have one or two buds will take a number of years before they have grown sufficiently to flower[250].

nwatta Landscape Uses:Border, Foundation, Massing, Seashore, Specimen. An easily grown and undemanding plant[250], it does best in a deep rich soil, preferably neutral or slightly alkaline[1], doing quite well in sun or light shade[1, 200]. Plants are tolerant of a wide range of soil conditions, but will not survive if the soil becomes waterlogged or is too dry[250]. This species is lime tolerant[200]. Plants grown on sandy soils tend to produce more leaves and less flowers, whilst those growing on clay take longer to become established but produce better blooms[250]. Prefers a rich heavy soil that is well-drained but remains moist in the summer[187]. The species is hardy to about -25°c, but there are many named varieties some of which are hardy to about -50°[187]. Cultivated as a medicinal plant in China[178]. A very ornamental[1] and long-lived plant, surviving in gardens for 50 years or more[200]. Many hundreds of named varieties have been developed for their ornamental value[250]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54]. Strongly resents root disturbance, taking some time to recover if it is transplanted[1]. Plants should be planted with their crowns no more than 3cm below soil level. If planted deeper they do not flower so well[187]. Peony species are usually self-fertile, though they will also hybridise with other species if these flower nearby at the same time[250]. Plants take 4 - 5 years to flower from seed[200]. They generally breed true from seed[1]. Special Features:Attractive foliage, Naturalizing, Suitable for cut flowers, Suitable for dried flowers, Fragrant flowers.

### 5.2.819 Sedum telephium

Orpine

4 tlin 8 cyuc 1 kcaak 0 tcan 2 dwat 0.5 m hkuc pcmhmmihtut cyutli hgatkyuctcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Sedum telephium is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcaakta Edible Parts: Leaves RootEdible Uses: Leaves - raw or cooked[2, 12, 55, 66, 115, 183]. They have occasionally been used in salads[4]. Root - cooked. Used in soups, stews etc[12].

tcanta None known

dwatta Astringent Cytostatic SkinThe whole plant is astringent and cytostatic[4, 66]. It is a popular remedy for diarrhoea, stimulates the kidneys and has a reputation in the treatment of cancer[4]. A poultice of the crushed leaves has been used in the treatment of boils and carbuncles[257].

propta Seed - surface sow in spring in well-drained soil in a sunny position in a greenhouse. Do not allow the soil to dry out. Prick out the seedlings into individual pots when they are large enough to handle. If sufficient growth is made, it is possible to plant them out during the summer, otherwise keep them in a cold-frame or greenhouse for their first winter and plant them out in early summer of the following year[K]. Division is very easy and can be carried out at almost any time in the growing season, though is probably best done in spring or early summer. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer. Cuttings can be taken at almost any time in the growing season, though early in the season is probably best.

nwatta Succeeds in most soils[188] but prefers a fertile well-drained soil that is not too dry[187]. Tolerates poor soils[233]. Succeeds in most soils and is tolerant of quite deep shade[219]. Established plants are drought tolerant[190], they grow well in dry soils and can be grown in crevices on walls[219]. Hardy to about -20°c[187]. This species has pink to red flowers[200]. All members of this genus are said to have edible leaves, though those species that have yellow flowers can cause stomach upsets if they are eaten in quantity[62, 85]. Polymorphic, intergrading with *S. caucasicum* where their ranges meet. Plants in this genus seem to be immune to the predations of rabbits[233]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. An evergreen. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is tuberous with swollen potato-like roots [1-2].

### 5.2.820 Rhodiola rhodantha

Queen's Crown, Redpod stoncrop

4 tlin 8 cyuc 1 kcaak 0 tcan 0 dwat 0.4 m hkuc htut cyutli hgatkyuctcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Rhodiola rhodantha is a PERENNIAL growing to 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcaakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked as a potherb[183, 212]. Chopped finely and added to salads[183]. Best used when they are young[83].

tcanta None known

dwatta None known

propta Seed - surface sow in spring in well-drained soil in a sunny position in a greenhouse. Do not allow the soil to dry out. Prick out the seedlings into individual pots when they are large enough to handle, and grow them on in the greenhouse for their first winter. Plant out in early summer of the following year. Division in spring or early summer. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Prefers a fertile well-drained soil in a sunny position[200]. Established plants are drought tolerant[200]. A good plant for the flower border[83]. This species has pink to white flowers[200]. All members of this genus are said to have edible leaves, though those species that have yellow flowers can cause stomach upsets if they are eaten in quantity[62, 85].

### 5.2.821 Cystopteris bulbifera

Berry Bladder Fern, Bulblet bladderfern

4 tlin 8 cyuc 1 kcaak 0 tcan 0 dwat 0.2 m hkuc pcmhmmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta Cystopteris bulbifera is a deciduous Fern growing to 0.2 m (0ft 8in) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. The seeds ripen from August to October. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcaakta Edible Parts: RootEdible Uses: Root. An emergency food, it is only used when all else fails[172].

tcanta A good ground cover plant[200]. Forming a slowly spreading clump, it should be planted 30cm apart each way[208].

dwatta None known

propta Spores - best sown as soon as ripe on the surface of a humus-rich sterilized soil. Keep the compost moist, preferably by putting a plastic bag over the pot. Germinates in 1 - 3 months at 20°c[164].Pot on small clumps of plantlets as soon as they are large enough to handle and keep humid until they are well established. Do not plant outside until the ferns are at least 2 years old. Division in spring. Bulbils are produced at intervals along the midrib and these can be planted into pots as soon as they are ripe[188, 219].

nwatta Prefers a shady position in a moist but well-drained soil, succeeding in most soil types[200]. Plants can tolerate up to 4 hours direct sun per day[200]. Prefers a pH between 6.5 and 7, but tolerates a range from 5.5 to 7.5[200]. Plants can be grown on old mortared walls if they are in a shady position[219]. Members of this genus are rarely if ever troubled by browsing deer[233]. Plants die back early in dry seasons[200]. This plant produces bulbils on the leaves, these fall off when mature and grow into new plants[200, 235]. In this way the plant can become invasive[200].

### 5.2.822 Hordeum jubatum

Foxtail Barley, Intermediate barley

4 tlin 8 cyuc 1 kcaak 0 tcan 1 dwat 0.3 m hkuc htut cyutli hgatkyuctcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Hordeum jubatum is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in June. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcaakta Edible Parts: SeedEdible Uses: CoffeeSeed - raw or cooked[2, 105, 161, 257]. The seed can be ground

into a flour and used as a cereal in making bread, porridge etc[177, 183]. Native North Americans would eat the dry flour raw[257]. The seed is exceedingly small and fiddly to use[K]. The roasted seed is used as a coffee substitute[183].

tcanta None known

dwatta The dry root can be wrapped, then moistened and used as a compress for styes in the eyes or on swollen eyelids[257].

propta Seed - sow in situ in March or October and only just cover the seed. Make sure the soil surface does not dry out if the weather is dry. Germination takes place within 2 weeks. Division in spring. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Prefers a rather dry soil[1] and a sunny position[200]. Succeeds in most soils and in climates ranging from sub-arctic to sub-tropical[171]. Easily grown in light soils[162]. Established plants are drought resistant[190]. A very short-lived plant, it is often only an annual[162], though it often self sows a little[190].

### 5.2.823 Acinos rotundifolius

4 tlin 8 cyuc 1 kcaak 0 tcan 1 dwat 0.3 m hkuc htut cyutli hgatkyuctcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Acinos rotundifolius is a ANNUAL/PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcaakta Edible Parts: Edible Uses: CondimentThe leaves are used as a flavouring with beans etc, and are said to be a substitute for summer savoury, *Satureia hortensis*[200], though we prefer that species[K].

tcanta None known

dwatta Aphrodisiac StimulantAphrodisiac, stimulant[61].

propta Seed - sow early spring in a cold frame. If you have sufficient seed then you could try sowing in situ in April or May. Germination should take place within a month. When large enough to handle, prick the seedlings out into individual pots and plant them out in the summer.

nwatta Succeeds in almost any well-drained soil, doing well in a hot dry soil[200].

### 5.2.824 Paeonia anomala

Anomalous peony, Common Peony

4 tlin 8 cyuc 1 kcaak 0 tcan 3 dwat 0.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Paeonia anomala is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Leaves RootEdible Uses: Root - dried and cooked with protein foods[74, 250]. Young shoots - cooked[177].

tcanta None known

dwatta Antispasmodic Antitussive Astringent Febrifuge Hypotensive StomachicThe root is astringent and stomachic[61]. The Chinese herb Chi Shao Yao is made from the whole root of a number of peony species, especially *P. lactiflora*, but also occasionally this species[250]. The most important ingredient medicinally in the root is paeoniflorin, which has been shown to have a strong antispasmodic effect

conditions and so this species gradually dies out as the other trees become established[K].

dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe and only just covered[200]. Spring sown seed should also germinate successfully so long as it is not covered[200, K]. The seed should germinate in the spring as the weather warms up. When large enough to handle, prick the seedlings out into individual pots. If growth is sufficient, it is possible to plant them out into their permanent positions in the summer, otherwise keep them in pots outdoors and plant them out in the spring. If you have sufficient quantity of seed, it can be sown thinly in an outdoor seed bed in the spring[78]. The seedlings can either be planted out into their permanent positions in the autumn/winter, or they can be allowed to grow on in the seed bed for a further season before planting them. Cuttings of mature wood, taken as soon as the leaves fall in autumn, outdoors in sandy soil.

nwatta Thrives on poor and dryish soils, even on chalk, but prefers to be near water[11, 200]. Prefers a heavy soil and a damp situation[1, 11]. Grows well in heavy clay soils. Tolerates very infertile sites[11, 200]. This species has a symbiotic relationship with certain soil micro-organisms, these form nodules on the roots of the plants and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. A very ornamental tree[1], it is very fast growing, reaching 12 metres tall in 20 years in an exposed maritime position at Rosewarne in N. Cornwall[75]. Very tolerant of salt winds, it establishes rapidly in exposed positions[75]. According to World Economic Plants, the correct author of this species is (Loisel.)Loisel. and not Desf. as we have given here. However, since all our other sources have quoted Desf., we have decided not to alter it at this time (1999)[K]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

## 6.1.34 Gleditsia aquatica

Water Locust

tfo2n 5 tlin 9 cyuc 0 kcaak 0 tcan 0 dwat 12 m hkuc htut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flatprikklwis hpa7tmwatli xre7t hjonli

drutta Gleditsia aquatica is a deciduous Tree growing to 12 m (39ft 4in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf from June to October, in flower from July to August, and the seeds ripen from October to December. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist or wet soil. It can tolerate atmospheric pollution.

kcakta None known

tcanta Soil stabilization WoodHaving an extensive root system, it is planted for stabilizing wet banks and marshes[200]. Wood - heavy, very hard, strong, durable in contact with the soil, coarse-grained[82, 229]. It weighs 46lb per cubic foot[235]. The wood is extremely durable and is used primarily for making fence posts[229].

dwatta None known

propta Seed - pre-soak for 24 hours in warm water and then sow in spring in a greenhouse[78]. The seed should have swollen up, in which case it can be sown, if it has not swollen then soak it for another 24 hours in warm water. If this does not work then file away some of the seed coat but be careful not to damage the embryo[78]. Further soaking should then cause the seed to swell. One it has swollen, the seed should germinate within 2 - 4 weeks at 20°C. As soon as they are large enough to handle, prick the seedlings out into individual deep pots and plant them out into their permanent

positions in the summer. Give the plants some protection from the cold for their first few winters outdoors.

nwatta Easily grown in a loamy soil, requiring a sunny position[11]. Succeeds in most soils[200]. Tolerates atmospheric pollution[200]. Rather tender when young, it grows best in S. Britain[11]. A slow-growing tree[11], it is growing well at the Hillier Arboretum in Hampshire where a tree was 7 metres tall and 8 metres wide in 1993[K]. Trees have a light canopy, they come into leaf late in the spring and drop their leaves in early autumn[200] making them an excellent top storey tree in a woodland garden. Plants in this genus are notably resistant to honey fungus[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

## 6.1.35 Caragana decorticans

tfo2n 5 tlin 9 cyuc 0 kcaak 0 tcan 0 dwat 5.4 m hkuc htut cyutli hgatkuyctcup hwicli hyishrasjtut hpa7tli flatprikklwis hpa7tmwatli xre7t hjonli

drutta Caragana decorticans is a deciduous Shrub growing to 5.4 m (17ft 9in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in June, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It can fix Nitrogen. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta None known

tcanta Leather StringThe bark is used as a binding material[146], it takes a good polish and when new resembles leather in appearance[11].

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame[200]. It usually germinates in 2 weeks[K]. Stored seed should be pre-soaked for 24 hours in warm water then sown in a cold frame[78, 113, 200]. If the seed has not swollen then scarify it and re-soak for another 12 hours before sowing[138]. Germination usually takes place within 2 - 3 weeks at 20°C[138]. Good percentage[11]. As soon as they are large enough to handle, prick the seedlings out into individual pots and grow them on in a greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in a frame[113]. Layering in spring.

nwatta Prefers full sun and a light sandy dry or well-drained soil[1, 11, 200]. Does not require a rich soil, succeeding on marginal land[11]. This species is hardy to at least -15°C[200], it prefers a continental climate with hot summers and cold winters so it does not grow so well in the milder western half of Britain[200]. Plants in this genus are notably resistant to honey fungus[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

## 6.1.36 Ceanothus species

tfo2n 5 tlin 9 cyuc 0 kcaak 0 tcan 0 dwat 2 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatprikklwis hpa7tmwatli xre7t hjonli

drutta Ceanothus species is an evergreen Shrub growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from August to October. The species is hermaphrodite (has both male and female organs). It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta None known

tcanta A green dye is obtained from the flowers[168]. All parts of the plant are rich in saponins - when crushed and

dwatta The root is analgesic, astringent, expectorant and febrifuge[257]. A poultice has been used in the treatment of pain, fevers and diarrhoea[257]. The ooze of the roots has been sniffed in the treatment of catarrh[257]. A decoction of the whole plant has been used in the treatment of all kinds of fevers and in the treatment of weak skin[257].

propta Seed - surface sow in spring in a cold frame. Do not allow the compost to become dry. Pre-chilling the seed for two weeks can improve germination rates[134]. Germination usually takes place within 2 weeks at 20°C[134]. When large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring or autumn[200]. Very easy, larger divisions can be planted straight into their permanent positions whilst smaller clumps are best potted up and kept in a cold frame until they are growing away well. Basal cuttings in late spring. Harvest the shoots when they are about 10 - 15cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Landscape Uses:Container, Foundation, Massing, Rock garden, Seashore. Succeeds in most good garden soils[1], preferring one that is well-drained and moisture retentive[200]. Prefers a sunny position[200], but it also succeeds in partial shade[233]. Prefers a rich soil[1], but tolerates poor ones[233]. Plants are hardy to about -25°C[187]. A polymorphic species, there are many named varieties selected for their ornamental value[200]. Hybridizes freely with other members of this genus[200]. Plants need to be divided every few years, preferably in the spring, in order to keep the plant vigorous[187]. Most species in this genus seem to be immune to the predations of rabbits[233]. Attracts butterflies and moths, it is also a good bee plant providing nectar in autumn[30]. Special Features: Attracts birds, North American native, Wetlands plant, Attracts butterflies, Suitable for cut flowers, Suitable for dried flowers. The plant is heat tolerant in zones 8 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

## 5.2.897 Astrantia major

Great Masterwort

4 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikklwis hpa7tmwatli fyifxre7t hjonli

drutta Astrantia major is a PERENNIAL growing to 0.8 m (2ft 7in) by 0.5 m (1ft 8in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to July, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Beetles, insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta None known

dwatta Diuretic PurgativeA decoction of the root is purgative[7]. The root is harvested in summer to early autumn and can be dried for later use[7]. An infusion of the whole plant is a gentle diuretic[7].

propta Seed - best sown in a cold frame as soon as it is ripe[200]. Sow stored seed as early in the year as you can obtain it. When large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. If you have sufficient seed then it can be sown in situ either as soon as it is ripe or in the following spring. Division in

spring. Large clumps can be planted out straight into their permanent positions. Smaller clumps are best potted up and kept in a cold frame until they are growing away well and can then be planted out in the summer.

nwatta Landscape Uses:Alpine garden, Border, Massing, Seashore, Woodland garden. Prefers a fertile moisture-retentive soil[200]. Succeeds in most well-drained soils[233] in full sun or part shade[200, 233]. Succeeds in an open woodland and along the sides of streams so long as the soil is well above the water level[200]. Plants are hardy to at least -17°C[200]. Plants spread by means of underground runners[233]. There are some named varieties, selected for their ornamental value[200]. The flowers are sometimes dried and used for winter decoration[200]. Special Features:Attractive foliage, Suitable for cut flowers, Suitable for dried flowers, Attractive flowers or blooms.

## 5.2.898 Gillenia stipulata

American Ipecacuanca, American ipecac

4 tlin 8 cyuc 0 kcaak 0 tcan 3 dwat 1.2 m hkuc hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Gillenia stipulata is a PERENNIAL growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta None known

tcanta None known

dwatta Cathartic Diaphoretic Emetic Expectorant Odonatalgic Stings TonicThe dried powdered root bark is cathartic, slightly diaphoretic, a mild and efficient emetic, expectorant and tonic[4, 61, 213, 238]. Minute doses are used internally in the treatment of colds, chronic diarrhoea, constipation, asthma and other bronchial complaints[238, 257]. The roots have been used externally in the treatment of rheumatism[257]. A cold infusion of the roots has been given, or the root chewed, in the treatment of bee and other stings[257]. The roots are harvested in the autumn, the bark is removed and dried for later use[213, 238]. A tea made from the whole plant is strongly laxative and emetic[222]. Minute doses are used internally in the treatment of colds, indigestion, asthma and hepatitis[222]. A poultice or wash is used in the treatment of rheumatism, bee stings and swellings[222]. A decoction or strong infusion of the whole plant has been taken a pint at a time as an emetic[257]. A poultice of the plant has been used to treat leg swellings[257]. The plant has been used in the treatment of toothaches[257].

propta Seed - sow spring or autumn in a cold frame[200].

Prick out the seedlings when they are large enough to handle and grow on for the first year in a lightly shaded area of the greenhouse or cold frame. Plant out in late spring and protect from slugs until well established. Division in spring or autumn[238].

nwatta Easily grown in a rather moist but well-drained lime-free peaty soil in semi-shade[4, 200]. Succeeds in a sunny position but requires shade at the hottest part of the day[200].

## 5.2.899 Peucedanum oreoselinum

4 tlin 8 cyuc 0 kcaak 0 tcan 1 dwat 1 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikklwis hpa7tmwatli fyifxre7t hjonli

drutta Peucedanum oreoselinum is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 5. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta None known

tcanta EssentialThe plant yields an essential oil[61]. No further details on use or what part of the plant the oil is obtained from.

dwatta DiureticDiuretic[61].

propta Seed - we have no information on this species but suggest sowing the seed in a cold frame as soon as it is ripe if this is possible otherwise in early spring. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer.

nwatta We have very little information on this species and do not know if it will be hardy in Britain, though since its native range is all of Europe except the islands and extreme north and south, it should succeed outdoors in this country. The following notes are based on the general needs of the genus. An easily grown plant, it succeeds in any moisture-retentive soil in a sunny position[200]. Suitable for group plantings in the wild garden[200].

## 5.2.900 Dactylis glomerata

Cock's Foot, Orchardgrass, Ascherson's orchardgrass 4 tlin 8 cyuc 0 kcaak 2 tcan 1 dwat 1 m hkuc hmimhtut cyutli hgattcup hwicli hrasjltutnykfrp hpa7tli frusflatprikwissip hpa7tmwatli xre7t hjonli

drutta Dactylis glomerata is an evergreen Perennial growing to 1 m (3ft 3in) by 0.3 m (1ft). It is leafy for USDA hardness. It is hardy to UK zone 5. It is in bloom all year, in flower from May to August, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil and can tolerate drought.

kcaakta None known

tcanta Fodder Miscellany Soil stabilizationEnvironmental:Erosion control or dune stabilization, Land reclamation, Revegetation, Soil conservation. Plants form impenetrably dense clumps and when planted close together in drifts make an excellent ground cover[200]. Having a deep root system, the plant is also useful for checking soil erosion[269]. The plant can be grown for biomass, annual productivity ranges from 2 to 37 tonnes per hectare[269]. If soil fertility is low, a large portion of the total production occurs in the spring, but if the soil is highly fertile, production is well distributed throughout the growing season[269]. Animal feed, fodder, forage.

dwatta MiscellanyReported to be oestrogenic. the plant is a folk remedy for treating tumours, kidney and bladder ailments

propta Seed - surface sow in a cold frame in the spring and do not allow the compost to dry out[162]. Germination should take place within three weeks. When they are large enough to handle, prick the seedlings out into individual pots and plant them out into their permanent positions in the summer. There is between 725,000 and 1,450,000 seeds per kilo[269]. If you have sufficient seed it can be sown outdoors in situ in the spring. Division in spring[162]. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Succeeds in most good soils and also under the shade of trees[1, 115, 162]. Prefers a light well-drained soil, it does not thrive on heavy or poorly drained soils[200]. Plants tolerate an annual precipitation in the range of 31 to 176cm, an annual temperature range of 4.3 to 23.8°C and a pH in the range of 4.5 to 8.2[269]. The plant is adapted to humid temperate climates. It grows on almost any type of soil, but thrives best on heavier types, such as clays and clay loams. A drought-resistant plant, it will withstand high temperatures. Prefers areas with 480-750 mm annual rainfall, but will produce on rather poor dry soils[269]. Plants are hardy in all parts of Britain, though they are less winter-hardy than *Phleum pratense* or *Bromus inermis* and do not extend as far north in Europe[269]. A very variable plant[1]. There are both diploid and triploid forms[274]. Numerous strains have been developed, some coarse and stemmy, others good for hay and early grazing. Local ecotypes in the Mediterranean region are adapted to long hot dry summers. In Europe two types have been developed, one for pasture and one

for hay. Pasture types produce more basal leaves and generally are more spreading than the hay types. Selections made in Canada, Sweden and Finland are improved for winter hardiness. Improved strains are more leafy, persistent and later flowering than unimproved commercial types[269]. An important food plant for the caterpillars of several lepidoptera species[30]. The plant is occasionally grown for lawns and is particularly well adapted for growing under shade[269]. However, this species does not make a good lawn grass because it is too coarse[1].

## 5.2.901 Hyoscyamus niger

Henbane, Black henbane

4 tlin 8 cyuc 0 kcaak 0 tcan 4 dwat 1 m hkuc htut cyutli kyuctcup hwicli hrasjltutnyk hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Hyoscyamus niger is an ANNUAL/BIENNIAL growing to 1 m (3ft 3in) by 1 m (3ft 3in). See above for USDA hardness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcaakta None known

tcanta RepellentThe leaves scattered about a house will drive away mice[207].

dwatta Anodyne Anthelmintic Antispasmodic Antitumor Diuretic Epilepsy Febrifuge Hallucinogetic Hypnotic Mydriatic Narcotic Sedative UrinaryHenbane has a very long history of use as a medicinal herb, and has been widely cultivated to meet the demand for its use[4]. It is used extensively as a sedative and pain killer and is specifically used for pain affecting the urinary tract, especially when due to kidney stones[254]. Its sedative and antispasmodic effect makes it a valuable treatment for the symptoms of Parkinson's disease, relieving tremor and rigidity during the early stages of the disease[254]. This species is the form generally considered best for external use, whilst the white henbane (*H. albus*) is considered the most appropriate for internal use[4]. All parts of the plant, but especially the leaves and the seeds, can be used - they are anodyne, antispasmodic, mildly diuretic, hallucinogenic, hypnotic, mydriatic, narcotic and sedative[4, 9, 13, 21, 100, 165, 192, 218]. The plant is used internally in the treatment of asthma, whooping cough, motion sickness, Meniere's syndrome, tremor in senility or paralysis and as a pre-operative medication[238]. Henbane reduces mucous secretions, as well as saliva and other digestive juices[254]. Externally, it is used as an oil to relieve painful conditions such as neuralgia, dental and rheumatic pains[238, 254]. The leaves should be harvested when the plant is in full flower and they can then be dried for later use[4]. There is an annual and a biennial form of this species, both can be used medicinally but the biennial form is considered to be superior[4]. This is a very poisonous plant that should be used with great caution, and only under the supervision of a qualified practitioner[21, 238]. See the notes above on toxicity. The seed is used in the treatment of asthma, cough, epilepsy, myalgia and toothache[218]. The seeds are used in Tibetan medicine, they are said to have a bitter, acrid taste with a neutral and poisonous potency[241]. Anthelmintic, antitumor and febrifuge, they are used in the treatment of stomach/intestinal pain due to worm infestation, toothache, inflammation of the pulmonary region and tumours[241].

propta Seed - sow summer in a cold frame and pot on as soon as possible before the taproot is too long[200].

nwatta Prefers a sunny position[4] and a dry soil[19]. Succeeds in ordinary garden soil[1] but prefers an alkaline soil[200]. Plants succeed in sandy spots near the sea[4]. Cultivated commercially as a medicinal plant[57], only the biennial form is considered official[4]. Grows well in maritime areas, often self-sowing freely[200]. Older plants do not transplant well due to a brittle taproot[200]. The growing plant inhibits the growth of clover[18]. The flowers emit a sickly fishy smell[245].

are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Plants are very intolerant of root disturbance and so should be planted into their permanent positions as soon as possible, though not until after the last expected frosts[78]. Cuttings of half-ripe wood, 7cm with a heel, July/August in a frame. Pot up in spring as soon as rooting commences and plant out into their permanent positions as soon as possible[78].

nwatta An easily grown plant, it requires a poor soil and a sunny position to be at its best[11]. It does well on dry sunny banks or in poor gravelly soils[11]. It is intolerant of shade, nor does it do well on rich soils[11, 182]. Prefers a neutral to slightly acid soil[200], disliking alkaline soils[17]. Plants are very intolerant of root disturbance[11]. Very tolerant of maritime exposure and, once established, drought[75, 186, 200]. Although native to Britain and said to be hardy to about -20°C[184], gorse often suffers badly in severe winters[4, 17], but the plants usually recover[186]. They often accumulate dry dead spines at their centre, this can be a fire risk in dry summers[186, 200]. The plants often re-sprout from the base after a fire[200] and, even if killed, numerous seedlings will soon spring up to replace the dead plants[186]. Hybridizes freely with other members of this genus[200]. The flowers are strongly scented of coconut[K]. Another report says that the flowers have a smell of vanilla with undertones of orange or pineapple[245]. It is one of the most refreshing of all flower scents[245]. A food plant for the caterpillars of several lepidoptera species[30]. Plants often form dense thickets and these are ideal nesting areas for many species of birds[186]. Plants in this genus are notably resistant to honey fungus[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is suckering with new plants from underground runners away from the plant [2-1].

## 6.1.31 Lespedeza buergeri

tfo2n 5 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 1.5 m hkuc htut cyutli tcup hwicli hrasjltut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Lespedeza buergeri is a deciduous Shrub growing to 1.5 m (5ft). See above for USDA hardness. It is hardy to UK zone 6 and is not frost tender. It is in flower from July to August, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcaakta Edible Parts: LeavesEdible Uses: Young leaves and plant tops - cooked[105, 177].

tcanta None known

dwatta None known

propta Pre-soak the seed for 24 hours in warm water and then sow it in spring in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in individual pots in a frame. It can be difficult to get the cuttings through their first winter, it is best to plunge the pots in a bed of ashes in a sheltered border outdoors[78].

nwatta Easily grown in a light loam in full sun[1]. The top growth is not very cold tolerant, although the rootstock is considerably hardier. Plants are usually cut back to the ground in all but very mild winters, though they generally re-sprout well from the base in the following spring and flower in late summer[182]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules

on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

## 6.1.32 Psoralea orbicularis

Roundleaf Leather Root

tfo2n 5 tlin 9 cyuc 1 kcaak 0 tcan 1 dwat 0.1 m hkuc htut cyutli kyuctcup hwicli hrasjltutnyk hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Psoralea orbicularis is a PERENNIAL growing to 0.1 m (0ft 4in) by 0.6 m (2ft). See above for USDA hardness. It is hardy to UK zone 6. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcaakta Edible Parts: LeavesEdible Uses: Leaves - cooked[105, 161, 257].

tcanta Soil stabilizationThe plant is a good soil stabilizer in its natural environment[200].

dwatta Blood purifier FebrifugeA decoction of the root used as a blood purifier and in the treatment of fevers[257].

propta Pre-soak the seed for 24 hours in warm water and then sow in early to mid spring in a greenhouse. Either sow the seed in individual pots or pot up the young seedlings as soon as possible in order to avoid root disturbance. Grow them on in the pots until planting out in their final positions. It is usually impossible to transplant this species without fatal damage to the root[200]. Division in spring. With great care since the plant resents root disturbance. It is virtually impossible to divide this species successfully[200].

nwatta Succeeds in an ordinary garden soil[1]. We have very little information on this species but it is growing at Kew in the system beds and seems to be thriving there[K]. Plants are very intolerant of root disturbance, they are best planted out into their permanent positions whilst still small[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

## 6.1.33 Alnus cordata

Italian Alder

tfo2n 5 tlin 9 cyuc 0 kcaak 4 tcan 0 dwat 25 m hkuc hmimhtut cyutli kyuctcuphja7n hwicli hysjltutnykfrp hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Alnus cordata is a deciduous Tree growing to 25 m (82ft) by 8 m (26ft) at a fast rate. See above for USDA hardness. It is hardy to UK zone 6. It is in leaf from April to December, in flower in March. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. It can fix Nitrogen. Suitable for: medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry moist or wet soil. The plant can tolerate maritime exposure.

kcaakta None known

tcanta Hedge Pioneer ShelterbeltAn excellent wind-break for maritime areas[75], it grows quite quickly and establishes well even in very windy sites[K]. Trees 5 years old from seed have reached 4 metres in height and are showing no signs of wind-shaping in a very exposed site in Cornwall[K]. It is an excellent pioneer species for re-establishing woodlands on disused farmland, difficult sites etc. Its fast rate of growth means that it quickly provides sheltered conditions to allow more permanent woodland trees to become established. In addition, bacteria on the roots fix atmospheric nitrogen - whilst this enables the tree to grow well in quite poor soils it also makes some of this nitrogen available to other plants growing nearby. Alder trees also have a heavy leaf canopy and when the leaves fall in the autumn they help to build up the humus content of the soil. Alder seedlings do not compete well in shady woodland

nwatta An easily grown plant, succeeding in any moderately good garden soil but preferring a position in full sun[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

## 6.1.28 Onobrychis viciifolia

Sainfoin  
tfo2n 5 tlin 9 cyuc 1 kcaak 4 tcan 0 dwat 1 m hkuc  
htut cyutli tcup hwicli hyhshrasjlut hpa7tli priklwisslip hpa7tmwatli dyatkre7t hjonli

drutta Onobrychis viciifolia is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is not self-fertile. It can fix Nitrogen. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: One report says that the plant is edible[20], but does not say what part of the plant is used.

tcanta Soil conditioner Soil stabilizationA good soil conditioner for poor light soils[115]. The plants can be grown on the land for a number of years, the deep tap roots breaking up the sub-soil and bringing up minerals from below. Plants can be cut during the growing season but care must be taken not to cut too low because the tap root tends to rise above ground level and the plant can be killed if this is cut off[115]. The plant has an extensive root system and is useful for stabilizing soils[160, 200]. Nitrogen Fixer.

dwatta None known  
propta Seed - pre-soak for 12 hours in warm water and sow in situ in the spring[1, 200]. Seed can also be sown in situ in the autumn. If seed is in short supply then it might be wiser to sow it in pots in a cold frame in early spring. Prick out the seedlings into individual pots as soon as they are large enough to handle and plant them out into their permanent positions in early summer. Division in the spring just before new growth commences[200]. Large divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Prefers a well-drained neutral to alkaline sandy loam in full sun[1, 200]. Succeeds in poor soils[115] and in shallow soils over chalk[200]. Dislikes shade. Does not succeed in wet soils[115]. A good border plant for the vegetable garden[18, 20], the deep tap root helps to break up the sub-soil[115]. Plants are resistant to alfalfa stem nematodes[160] and are immune to bacterial wilt disease and attacks by the alfalfa stem weevil[160]. A good bee plant[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

## 6.1.29 Melilotus indicus

Annual Yellow Sweetclover  
tfo2n 5 tlin 9 cyuc 1 kcaak 0 tcan 2 dwat 1 m hkuc  
htut cyutli kyuctup hwicli hrasjlutnyik hpa7tli priklwis hpa7tmwatli xre7t hjonli

drutta Melilotus indicus is a ANNUAL growing to 1 m (3ft 3in) by 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves - cooked[105].

tcanta Fodder RepellentThe leaves repel insects. They have been placed in beds to repel bedbugs[257].

dwatta Antibacterial Anticoagulant Astringent Emollient Laxative Narcotic PouliticeThe seed is made into a gruel and used in the treatment of bowel complaints and infantile diarrhoea[218, 240]. The plant is discutient, emollient, astringent, strongly laxative and narcotic[218, 240, 257]. It is used externally as a poultice or plaster on swellings[218, 240]. The plant contains coumarin, which is an anticoagulant[218]. The plant also contains dicumarol, which is a broad spectrum bactericide[218].

propta Seed - sow spring to mid-summer in situ[87]. Pre-soaking the seed for 12 hours in warm water will speed up the germination process, particularly in dry weather[K]. Germination will usually take place within 2 weeks.

nwatta Dislikes shade. This species is often cultivated as a fodder crop and cultivars low in coumarin have been developed[218]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. When removing plant remains at the end of the growing season, it is best to only remove the aerial parts of the plant, leaving the roots in the ground to decay and release their nitrogen.

## 6.1.30 Ulex europaeus

Gorse, Common gorse  
tfo2n 5 tlin 9 cyuc 1 kcaak 5 tcan 1 dwat 1.5 m hkuc  
htut cyutli hgatkyuctup hwicli hyhshrasjlutnyik hpa7tli frusflatprik hpa7tmwatli xre7t hjonli

drutta Ulex europaeus is a deciduous Shrub growing to 1.5 m (5ft) by 1.5 m (5ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in leaf all year, in flower all year, and the seeds ripen all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles. It can fix Nitrogen. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

kcakta Edible Parts: FlowersEdible Uses: TeaThe flower buds are pickled in vinegar and then used like capers in salads[183]. A tea is made from the shoot tips[177, 183].

tcanta Dye Fertilizer Fuel Hedge Hedge Insecticide Pioneer Soap making Soil stabilizationA beautiful yellow dye is obtained from the flowers[4]. It is orange according to another report[168]. Gorse is very tolerant of maritime exposure, it can be used as a windbreak hedge in the most exposed positions, making an impenetrable barrier with its vicious thorns[4, 49, 75, 200]. Planted for soil stabilization on sandy substrates[200], it is very good for stabilizing roadside banks on poor soils[186]. Gorse is an excellent pioneer species for poor soils and areas with maritime exposure. It is fast-growing, feeds the soil with nitrogen and provides good conditions for woodland trees to become established. These trees will eventually out-compete the gorse, which is unable to reproduce well in the shady conditions and will thus gradually die out[K]. The plant has an old reputation as a pesticide, the soaked seed being used against fleas[4]. The wood burns very well, it was much used in the past for kindling, heating bakers ovens etc[11, 66]. The ashes from the burnt wood are rich in potassium and can be used in making soap[4, 115]. This soap can be made by mixing the ashes with a vegetable oil, or mixing them with clay and forming them into balls[4]. The ashes are also an excellent fertilizer[4, 115].

dwatta BachGorse has never played much of a role in herbal medicine, though its flowers have been used in the treatment of jaundice and as a treatment for scarlet fever in children[4]. The seed is said to be astringent and has been used in the treatment of diarrhoea and stones[4]. The plant is used in Bach flower remedies - the keywords for prescribing it are 'Hopelessness' and 'Despair'[209].

propta Seed - pre-soak 24 hours in hot water and sow in individual pots in a greenhouse in late winter to early spring. Germination should take place within 2 weeks. When they

## 5.2.902 Veratrum album

White Hellebore, White false hellebore  
4 tlin 8 cyuc 0 kcaak 0 tcan 2 dwat 1.5 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta Veratrum album is a PERENNIAL growing to 1.5 m (5ft) by 0.6 m (2ft in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known  
tcanta InsecticideThe dried and powdered root contains pyrethrums and is used as an insecticide and a parasiticide[1, 7, 19, 20]. It is also effective against caterpillars and mammals so great caution is advised[1, 19, 20].

dwatta Analgesic Anthelmintic Antiemetic Cathartic Emetic Errhine Expectorant Hypnotic SternutatoryThe root is analgesic, anthelmintic, cathartic, emetic, errhine, expectorant, hypnotic and sternutatory[4, 7, 9, 178, 192]. The root is very poisonous, with a paralyzing effect on the nervous system, and is scarcely if ever used internally[4, 7], though the alkaloids it contains are used in the pharmaceutical industry[9]. It is occasionally used externally as a local analgesic, though even this is not without its dangers since it can be absorbed through broken skin[4, 7]. It is also used in veterinary medicine[244]. The root is harvested in early autumn and is dried for later use[7].

propta Unless stored in damp sand at around 4°C the seed has a short viability[200]. Where possible it is best to sow the seed in a lightly shaded position in the greenhouse as soon as it is ripe[200]. Stored seed needs to be stratified but can be very slow to germinate. Germination can be erratic even for seed sown when it was fresh, it usually takes place within 3 - 12 months at 15°C but can be much longer[200]. The plant produces just one seedleaf in its first year, this forms an over-wintering bulb. It takes up to 10 years for the plant to reach maturity[200]. Sow the seed thinly so there is no need to thin or transplant them, and grow the seedlings undisturbed in the pot for their first two years of growth. Apply a liquid feed at intervals through the growing season to ensure the plants do not become nutrient deficient. At the end of the second year plant out the dormant plants into individual pots and grow them on in light shade in the greenhouse for a further year or two before planting them out into their permanent positions in late spring or early summer. Division in March/April or in October. Establish the plants in pots in a shaded frame before planting them out[200]. Division is best carried out in the autumn because the plants come into growth very early in the spring[233]. Root cuttings, 6mm long with a bud, rooted in a sandy soil in a cold frame[200].

nwatta Requires a deep fertile moisture retentive humus-rich soil[200]. Succeeds in full sun if the soil does not dry out but prefers a position in semi-shade[200]. Dislikes dry soils[42]. Grows best in a cool woodland garden or a north facing border[42]. Members of this genus are rarely if ever troubled by browsing deer[233]. Plants are long-lived and can be left in the same position for years without attention[233].

## 5.2.903 Herniaria hirsuta

Hairy Rupture Wort  
4 tlin 8 cyuc 0 kcaak 0 tcan 1 dwat m hkuc  
htut cyutli hgatkyuctup hwicli hyhshrasjlut hpa7tli flatprikwis hpa7tmwatli fyifxre7t hjonli

drutta Herniaria hirsuta is a ANNUAL/PERENNIAL. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to August, and the seeds ripen in August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and

can tolerate drought. The plant can tolerates strong winds but not maritime exposure.

kcakta None known  
tcanta SoapA good ground cover plant, allowing spring bulbs to grow through it[200]. An aqueous extract of the plant is a hand cleanser, making the skin soft and supple[240].

dwatta DiureticThe plant is diuretic[240]. It is used in the treatment of sore throats[240]. The plant contains coumarins and saponins, which are toxic, and so it should be used with some caution.

propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts.

nwatta Grows well in hot dry soils[1]. Dislikes excessive moisture[1]. Succeeds in very poor soils[1]. Useful for covering rocks or as a carpet bedding[1], it makes a good ground cover for spring bulbs since they can grow through it easily[200].

## 5.2.904 Echinacea pallida

Cone Flower, Pale purple coneflower  
4 tlin 8 cyuc 0 kcaak 0 tcan 5 dwat 1 m hkuc  
htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta Echinacea pallida is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta None known  
tcanta None known  
dwatta Adaptogen Alternative Antiseptic Appetizer Depurative Diaphoretic Digestive Sialogogue UrinaryPlants in this genus were probably the most frequently used of N. American Indian herbal remedies, though this species is considered to be less active than E. angustifolia[222]. They had a very wide range of applications and many of these uses have been confirmed by modern science. The plant has a general stimulatory effect on the immune system and is widely used in modern herbal treatments[222]. There has been some doubt over the ability of the body to absorb the medically active ingredients orally (intravenous injections being considered the only effective way to administer the plant), but recent research has demonstrated significant absorption from orally administered applications[222]. In Germany over 200 pharmaceutical preparations are made from Echinacea[222]. The roots and the whole plant are considered particularly beneficial in the treatment of sores, wounds, burns etc, possessing cortisone-like and antibacterial activity[222]. The plant was used by N. American Indians as a universal application to treat the bites and stings of all types of insects[213]. An infusion of the plant was also used to treat snakebites[213]. The plant is adaptogen, alternative, antiseptic, depurative, diaphoretic, digestive, sialogogue[4, 21, 61, 165, 213]. It is harvested in the autumn and dried for later use[238]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve Echinacea for common cold, cough and bronchitis, fevers and cold, urinary tract infections, inflammation of the mouth and pharynx, increase resistance to infection, wounds and burns (see [302] for critics of commission E).

propta Seed - sow March/April in a greenhouse and only just cover the seed[175, K]. Diurnal temperature fluctuations aid germination[175]. The seed usually germinates in 10 - 21 days at 25°C[175]. Prick out the seedlings into individual pots once they are large enough to handle and grow them on in the greenhouse for the first summer. Plant them out in the late spring or early summer of the following year and give them some protection from slugs at least until they are established[K]. Division in spring or autumn[111]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well.

Plant them out in the spring. Root cuttings, October in a frame[200].

nwatta Succeeds in ordinary garden soil[111] but prefers a deep rich loam with plenty of leafmold[1] and a sunny position[175]. Slugs love this plant[K].

### 5.2.905 Populus maximowiczii

Doronoki, Japanese poplar

4 tin 8 cyuc 0 kcaak 2 tcan 1 dwat m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Populus maximowiczii is a deciduous Tree growing to 30 m (98ft) by 8 m (26ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from May to June, and the seeds ripen from July to August. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta None known

tcanta Rooting hormone WoodAn extract of the shoots can be used as a rooting hormone for all types of cuttings. It is extracted by soaking the chopped up shoots in cold water for a day[172]. Wood - soft, rather woolly in texture, without smell or taste, of low flammability, not durable, very resistant to abrasion. Used for wood pulp, boxes, timber for construction, ship building, and matchwood[11, 46, 61, 266].

dwatta Anodyne Antiinflammatory FebrifugeAlthough no specific mention has been seen for this species, the bark of most, if not all members of the genus contain salicin, a glycoside that probably decomposes into salicylic acid (aspirin) in the body[213, 238]. The bark is therefore anodyne, anti-inflammatory and febrifuge. It is used especially in treating rheumatism and fevers, and also to relieve the pain of menstrual cramps[238].

propta Seed - must be sown as soon as it is ripe in spring[113]. Poplar seed has an extremely short period of viability and needs to be sown within a few days of ripening[200]. Surface sow or just lightly cover the seed in trays in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the old frame. If sufficient growth is made, it might be possible to plant them out in late summer into their permanent positions, otherwise keep them in the cold frame until the following late spring and then plant them out. Most poplar species hybridize freely with each other, so the seed may not come true unless it is collected from the wild in areas with no other poplar species growing[11]. Cuttings of mature wood of the current season's growth, 20- 40cm long, November/December in a sheltered outdoor bed or direct into their permanent positions. Very easy. Suckers in early spring[78].

nwatta An easily grown plant, it does well in a heavy cold damp soil[1]. Prefers a deep rich well-drained circum-neutral soil, growing best in the south and east of Britain[11, 200]. Growth is much less on wet soils, on poor acid soils and on thin dry soils[11]. It does not do well in exposed upland sites[11]. It dislikes shade and is intolerant of root or branch competition[200]. Trees are susceptible to bacterial canker[11]. Poplars have very extensive and aggressive root systems that can invade and damage drainage systems. Especially when grown on clay soils, they should not be planted within 12 metres of buildings since the root system can damage the building's foundations by drying out the soil[11]. Dioecious. Male and female plants must be grown if seed is required. Hybridizes freely with other members of this genus[200].

### 5.2.906 Delphinium elatum

Candle larkspur, English Larkspur

4 tin 7 cyuc 0 kcaak 0 tcan 1 dwat 1 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Delphinium elatum is a PERENNIAL growing to 1 m (3ft 3in) by 0.3 m (1ft) at a medium rate. See above for

USDA hardiness. It is hardy to UK zone 3. It is in flower from June to July, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta None known

tcanta The seed contains 1.7% alkaloids and is used as an insecticide[240].

dwatta Anthelmintic Aperient Diuretic EmeticThe whole plant, but especially the seeds, is anthelmintic, aperient, diuretic and emetic[240].

propta Seed - sow March/April in a cold frame or May outdoors[111]. Keep moist and in a shady position until germination takes place[175]. The seed has a limited viability so it should be stored in a sealed container at about 3°C[200]. Temperatures above 15°C inhibit germination[175]. The seed usually germinates in 2 - 9 weeks at 15°C[175]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out into their permanent positions in the summer. Cuttings of basal shoots in April/May, taken before they become hollow at the base, and planted in a cold frame[111]. Division in spring[111] or early autumn[200].

nwatta Landscape Uses:Border, Foundation, Massing, Seashore, Specimen. Prefers a rich well-drained soil that stays moist in the summer[111, 187]. Dislikes water-logged soils[200], it is liable to die out in heavy soils over winter[111]. Requires an open sunny position[188]. This species is the main parent of the many tall hybrid forms of delphiniums that are commonly grown as garden ornamentals[200]. A variable species in the wild, varying in height from 40cm to 2 metres[200]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54]. Special Features: Attracts birds, All or parts of this plant are poisonous, Suitable for cut flowers, Suitable for dried flowers.

### 5.2.907 Saponaria officinalis

Soapwort, Bouncingbet

4 tin 8 cyuc 0 kcaak 0 tcan 3 dwat 1 m hkuc hhmihmt cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Saponaria officinalis is a PERENNIAL growing to 1 m (3ft 3in) by 1 m (3ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from July to September, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Lepidoptera (Moths and Butterflies). It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta SoapA soap can be obtained by boiling the whole plant (but especially the root) in water[6, 13]. It is a gentle effective cleaner[7, 95], used especially on delicate fabrics that can be harmed by modern synthetic soaps (it has been used to clean the Bayeaux tapestry). It effects a lustre in the fabric[171]. The best soap is obtained by infusing the plant in warm water[169]. The roots can be dried and stored for later use[169]. The plant is sometimes recommended as a hair shampoo, though it can cause eye irritations[238]. The plant spreads vigorously and can be used as a ground cover when planted about 1 metre apart each way[208].

dwatta Alternative Antipruritic Antirheumatic Antiscrophulatic Cholagogue Cytotoxic Depurative Diaphoretic Diuretic Expectorant Purgative Skin Sternutatory TonicSoapwort's main medicinal use is as an expectorant. Its strongly irritant action within the gut is thought to stimulate the cough reflex and increase the production of a more fluid mucus within the respiratory passages[254]. The whole plant, but especially the root, is alterative, antiscrophulatic, cholagogue, depurative, diaphoretic, mildly diuretic, expectorant, purgative, sternutatory and tonic[4, 7, 9, 13, 21, 218]. A decoction of the whole plant can be applied externally to treat itchy skin[4, 201, 238]. The plant has proved of use in the treatment of jaundice and other visceral obstructions[4], but

tcanta BasketryThe branchlets may be used for making baskets[266].

dwatta None known

propta Pre-soak the seed for 24 hours in warm water and then sow it in spring in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in individual pots in a frame. It can be difficult to get the cuttings through their first winter, it is best to plunge the pots in a bed of ashes in a sheltered border outdoors[78].

nwatta Easily grown in a light loam in full sun[1]. The top growth is not very cold tolerant, although the rootstock is considerably hardier. Plants are usually cut back to the ground in all but very mild winters, though they generally resprout well from the base in the following spring and flower in late summer[182]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

### 6.1.25 Caragana sinica

Chinese Pea Shrub

tfo2n 5 tin 9 cyuc 1 kcaak 0 tcan 2 dwat 1.5 m hkuc htut cyutli hgatkyuctcup hwicli hyhshrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Caragana sinica is a deciduous Shrub growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to June, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It can fix Nitrogen. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: FlowersEdible Uses: Flowers - raw or cooked[46, 61, 105, 177]. Boiled and washed[179].

tcanta None known

dwatta Antiinflammatory Restorative Tonic VDThe root contains a number of medically active constituents including saponins, stilbenes and caraganosides[279]. It has been shown to have antiinflammatory activity and is used in Korea in the treatment of arthritis, neuralgia, diarrhoea and bone weakness[279]. It is said to be restorative and tonic[74]. The stem is made into a broth with other foods and used in the treatment of advanced syphilis[218].

propta Seed - best sown as soon as it is ripe in a cold frame[200]. It usually germinates in 2 weeks[K]. Stored seed should be pre-soaked for 24 hours in warm water then sown in a cold frame[78, 113, 200]. If the seed has not swollen then scarify it and re-soak for another 12 hours before sowing[138]. Germination usually takes place within 2 - 3 weeks at 20°C[138]. Good percentage[11]. As soon as they are large enough to handle, prick the seedlings out into individual pots and grow them on in a greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in a frame[113]. Layering in spring.

nwatta Prefers full sun and a light sandy dry or well-drained soil[1, 11, 200]. Does not require a rich soil, succeeding on marginal land[11]. This species prefers a continental climate with hot summers and cold winters, it does not grow so well in mild maritime areas such as western Britain. The bark smells like liquorice[182]. This plant is closely related to *C. ussuriensis*. (Rel.)Pojark. (with which it was once united), a low shrub of rocks, forest glades and roadsides[74]. Plants in this genus are notably resistant to honey fungus[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

### 6.1.26 Lupinus polyphyllus

Big-Leaf Lupin, Lupine

tfo2n 5 tin 9 cyuc 1 kcaak 4 tcan 1 dwat 1.5 m hkuc htut cyutli hgattcup hwicli hyhshrasjlutnyik hpa7tli frusflat-prik hpa7tmwatli xre7t hjonli

drutta Lupinus polyphyllus is a PERENNIAL growing to 1.5 m (5ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 3. It is in flower from July to August, and the seeds ripen from July to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It cannot grow in the shade. It prefers moist soil and can tolerate drought. The plant can tolerates strong winds but not maritime exposure.

kcakta Root - raw or cooked[257].

tcanta Landscape Uses: Border, Container, Ground cover, Massing, Specimen, Woodland garden. Special Features: Attracts birds, Attractive foliage, North American native, Naturalizing. Attracts butterflies, Suitable for cut flowers, Suitable for dried flowers. Nitrogen fixer.

dwatta A decoction of the plant has been used as a tonic[257].

propta Pre-soak the seed for 24 hours in warm water and then sow in early spring in a greenhouse[1, 200]. Germination should take place within a couple of weeks. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. It should also be possible to sow the seed in situ in mid spring. It might be necessary to protect the sowing from mice. Division in March. Difficult. Basal cuttings, April in a cold frame. Harvest the shoots when they are about 10cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Agroforestry Services: Nitrogen Management: Standard New Crop Staple Crop: ProteinAn easily grown plant, succeeding in any moderately good soil in a sunny position[1, 200]. It strongly dislikes excessive winter wet[1]. Requires an acid to neutral soil[200]. Succeeds in poor soils[60]. Plants can be naturalized in the wild garden, especially on stream banks and for flowering above rough grass, where they may be short-lived but will self-seed[200]. Plants dislike root disturbance. There are some named varieties, selected for their ornamental value[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

### 6.1.27 Lathyrus davidii

tfo2n 5 tin 9 cyuc 1 kcaak 0 tcan 0 dwat 1.2 m hkuc hhmihmt cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Lathyrus davidii is a PERENNIAL growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves Seed SeedpodEdi Uses: Seed - cooked[105, 177]. Some caution is advised, see the notes above on toxicity. Young seedpod - cooked[105, 177]. Young plant, including the inflorescence - cooked and used as a potherb or added to soups etc[105, 177, 183].

tcanta None known

dwatta None known

propta Pre-soak the seed for 24 hours in warm water and then sow in early spring in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. If you have sufficient seed, then it can also be sown in situ in mid spring[200]. Division in spring. It may not transplant well so care should be taken[200].

very drought tolerant once established and grow well on dry banks[4, 11]. Tolerates a smoky atmosphere, growing well in polluted areas[186]. Plants are hardy to about -20°c[184]. A number of named forms have been developed for their ornamental value[182]. New leaves are formed in April but these soon drop off the plant, photosynthesis being carried out by means of the green stems[186]. Very tolerant of cutting, it regenerates quickly from the base[186]. Plants are usually killed by fire but the seeds quickly germinate after the fire and rapidly become established[186]. A good bee plant and food plant for many caterpillars[24, 30, 46], it provides the food for the larvae of the green hairstreak butterfly[186]. Ants are attracted to the seeds, feeding on the juicy attachment that holds them to the pods and thus distributing the seed[186]. Dislikes root disturbance, especially when more than 20cm tall[11]. It is best to plant out into their permanent positions as early as possible. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. Special Features:Not North American native, Naturalizing, Fragrant flowers, Attractive flowers or blooms.

### 6.1.22 Sophora davidii

Sophora  
tfo2n 5 tlin 8 cyuc 1 kcaak 0 tcan 0 dwat 2.5 m hkuc  
htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatprik-wisslip hpa7tmwatli xre7t hjonli  
drutta Sophora davidii is a deciduous Shrub growing to 2.5 m (8ft) by 2.5 m (8ft) at a slow rate. It is in flower from June to July, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs). It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: FlowersEdible Uses: Flowers[177, 183]. No further details are given.  
tcanta None known  
dwatta None known  
propta Seed - best sown as soon as it is ripe in a greenhouse[200]. Pre-soak stored seed for 12 hours in hot (not boiling) water and sow in late winter in a greenhouse[78]. Prick out the seedlings as soon as they are large enough to handle into individual pots in the greenhouse, and grow them on for 2 years under protected conditions. Plant them out into their permanent positions in early summer of their third year. Cuttings of young shoots with a heel, July/August in a frame[11]. Air-layering[200].

nwatta Landscape Uses:Specimen. Succeeds in a sunny position in most dry or moist well-drained soils[184]. Requires a good loamy soil[11]. Grows well on chalk[184]. It grows best in the warmer areas of the country where the wood will be more readily ripened and better able to withstand winter cold[219]. Hardy to about -20°c but requires the extra warmth of a wall if it is to flower well[184]. However, a free-standing shrub at Kew is growing very well[184]. A very ornamental plant[1]. Plants should be container-grown and planted out whilst young, older plants do not transplant well[219]. Plants in this genus are notably resistant to honey fungus[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. Special Features: Not North American native, Fragrant flowers, Attractive flowers or blooms.

### 6.1.23 Lathyrus latifolius

Perennial Sweet Pea, Perennial pea  
tfo2n 5 tlin 9 cyuc 1 kcaak 2 tcan 0 dwat 2 m hkuc  
hmimhtut cyutli hgatyuctcup hwicli hrasjlutnyik hpa7tli flatprikwis hpa7tmwatli xre7t hjonli  
drutta Lathyrus latifolius is a PERENNIAL CLIMBER growing to 2 m (6ft) by 2 m (6ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost

tender. It is in flower from July to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Leaves Seed SeedpodEdible Uses: Seed - cooked[105, 177]. Some caution is advised, see the notes above on toxicity. Young seedpod - cooked[105, 177]. Young plant - cooked[105, 177].

tcanta Plants can be grown without supports when they will sprawl on the ground and can be used as a ground cover plant in a sunny position[188, 202]. They should be spaced about 1.5 metres apart each way[208]. They are very vigorous and so are best not used with small plants[K]. They also die down completely in the winter, giving weeds a chance to become established[K].

dwatta None known  
propta Pre-soak the seed for 24 hours in warm water and then sow in early spring in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. If you have sufficient seed, then it can also be sown in situ in mid spring[200]. Division in spring. It may not transplant well so care should be taken[200].

nwatta Landscape Uses:Arbor, Container. An easily grown plant, succeeding in any moderately good garden soil[200], whether acid or alkaline[202]. Prefers a position in full sun but tolerates part day shade[200]. Succeeds in dry soils and is drought tolerant when established[190]. Grows well on dry slopes[208]. Plants can be grown in quite coarse grass, which can be cut annually in the autumn[233]. Plants are hardy to at least -10°c[202]. A very ornamental plant[1], there are many named varieties[187]. It is fast-growing and, when in a suitable position, can become invasive[202]. Plants climb by means of tendrils[188]. Resents root disturbance and can take a year or two to settle down after being moved[219]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. Special Features:All or parts of this plant are poisonous. Suitable for cut flowers. The plant is heat tolerant in zones 9 through 5. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also available and given here if available. Herbaceous. A suckering vine sending up suckers some distance main plant [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

### 6.1.24 Lespedeza cyrtobotrya

Leafy lespedeza  
tfo2n 5 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 2 m hkuc  
htut cyutli tcup hwicli hrasjlut hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta Lespedeza cyrtobotrya is a deciduous Shrub growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in August, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young leaves and plant tops - cooked[105, 177].

is rarely used internally in modern herbalism due to its irritant effect on the digestive system[238]. When taken in excess, it destroys red blood cells and causes paralysis of the vasomotor centre[238]. See also the notes above on toxicity[4, 7]. The root is harvested in the spring and can be dried for later use[7]. One of the saponins in this plant is proving of interest in the treatment of cancer, it is cytotoxic to the Walker Carcinoma in vitro[218]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve Saponaria officinalis Soapwort. Bouncingbet for coughs/bronchitis (see [302] for critics of commission E).

propta Seed - best if given a short cold stratification. Sow autumn or late winter in a cold frame. The seed usually germinates within 4 weeks. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in early summer. Division in spring or autumn. Very easy, it can be successfully done at any time in the growing season if the plants are kept moist until they are re-established. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Landscape Uses:Border, Rock garden. Succeeds in any moderately fertile well-drained soil in sun or semi-shade[200]. Prefers a neutral to alkaline soil[238]. Hardy to about -20°c[187]. A very ornamental plant[1], soapwort is often grown in the herb garden and is sometimes cultivated for the soap that can be obtained from the roots. There are some named forms, usually with double flowers, that have been selected for their ornamental value[187]. Plants can be very invasive when grown in good conditions[K]. Soapwort should not be grown next to a pond with amphibians or fish in it since if the plant trails into the water it can cause poisoning[238]. The flowers are slightly scented with a sweet aroma that has an undertone of clove[245]. Hybridizes with other members of this genus[200]. A good moth plant[13, 24]. Special Features:Edible, Fragrant foliage, Not North American native, Invasive, Naturalizing, Attracts butterflies, Suitable for cut flowers, Fragrant flowers.

### 5.2.908 Vinca minor

Lesser Periwinkle, Flower of Death, English Holly, Creeping Myrtle, Creeping Vinca, Common Periwink  
4 tlin 9 cyuc 0 kcaak 0 tcan 3 dwat m hkuc  
pcimhimhtut cyutli hgatyuctcup hwicli hrasjlutnyikfrip hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta Vinca minor is an evergreen Shrub growing to 0.2 m (0ft 8in) by 1 m (3ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in leaf all year, in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta None known  
tcanta BasketryThe stems are used in basket making[7]. A very good ground cover for covering steep banks and shady places, spreading rapidly once established and forming a dense cover within 2 years[11, 28, 31, 190, 200]. It is less dense on dry or exposed sites[197]. Plants are best spaced about 60cm apart each way[208].

dwatta Antispasmodic Astringent Bitter Detergent Homeopathy Hypotensive Sedative Stomachic TonicThe plant is sedative and tonic[21, 53, 165]. It contains the alkaloid 'vincamine', which is used by the pharmaceutical industry as a cerebral stimulant and vasodilator[238]. Since the discovery of vincamine in the leaves, the plant has been used herbally to treat arteriosclerosis and for dementia due to insufficient blood supply to the brain[254]. The leaves are bitter, detergent and stomachic[7]. Taken internally, they are used in the treatment of internal bleeding, heavy menstrual bleeding and nosebleeds[254]. When crushed and applied to wounds they have astringent and healing properties[7]. A mouthwash is used to treat gingivitis, sore throats and mouth ulcers[254]. The leaves are gathered in the spring

and dried for later use[7]. The root is antispasmodic and hypotensive[7, 19]. It is used to lower the blood pressure[19]. The root is gathered in the autumn and dried for later use[7]. The fresh flowers are gently purgative, but lose their effect on drying[4]. A homeopathic remedy is made from the fresh leaves[4]. It is used in the treatment of haemorrhages[4].

propta Seed - we have no information on this species but suggest sowing the seed in a cold frame as soon as it is ripe if possible. Sow stored seed in late winter in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring just before active growth commences[78], or in autumn[1]. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the summer or the following spring. Cuttings of mature wood of the current seasons growth, 5 - 10 cm long, October in a cold frame. Roots quickly. High percentage[78].

nwatta Landscape Uses:Border, Container, Erosion control, Ground cover, Massing, Specimen. A very easily grown plant, it succeeds in almost any soil[200] but prefers those that are on the richer side[17]. It grows well in heavy clay soils. Plants are very shade tolerant but they do not flower so well in deep shade[11, 28, 31]. It grows well under deciduous trees[187], and in such a position it can succeed in dry soils[190]. Established plants are drought tolerant[190]. A very ornamental[1] and polymorphic plant[200], there are some named forms selected for their ornamental value[187]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. This species rarely if ever sets seed in Britain[4]. It spreads rapidly by long trailing and rooting stems once it is established and will swamp out smaller plants[4]. Special Features:Attractive foliage, Not North American native, Naturalizing, Attractive flowers or blooms.

### 5.2.909 Nabalus serpentarius

Lion's Foot  
4 tlin 8 cyuc 0 kcaak 0 tcan 1 dwat 1.5 m hkuc  
pcimhimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Nabalus serpentarius is a PERENNIAL growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 5. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta None known  
tcanta RepellentThe juice of the plant repels snakes[207].

dwatta AntidoteThe plant is said to be an antidote for snake bites[207].

propta Seed - surface sow in a greenhouse in spring. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts.

nwatta Succeeds in shade or semi-shade in a moist but well-drained humus-rich neutral to acid soil[200].

### 5.2.910 Coreopsis auriculata

Tickseed, Lobed tickseed, Mouse-eared Coreopsis, Eared Coreopsis

4 tlin 8 cyuc 0 kcaak 3 tcan 0 dwat 1.5 m hkuc  
htut cyutli hgatyuctcup hwicli hrasjlut hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta Coreopsis auriculata is a PERENNIAL growing to 1.5 m (5ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils

and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta None known

tcanta DyeLandscape Uses: Border, Container, Massing.An orange to red/orange dye is obtained from the flowers and stems[168]. Established plants are drought resistant[1]. Special Features: Attracts birds, North American native, Naturalizing, Attracts butterflies, Suitable for cut flowers. The shorter cultivar *Coreopsis auriculata* ‘Nana’ (Dwarf Mouse-ear Tickseed, Lobed Tickseed ‘Nana’) is a good low ground cover performing best with consistent moisture.

dwatta None known

propta Seed - sow March in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out into their permanent positions in the summer[111]. The seed can also be sown in an outdoor seedbed in mid spring. Once they are more than 15cm tall, plant the seedlings out into their permanent positions in the summer. Division in spring or autumn[111]. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the summer or following spring. Cuttings of young basal shoots, May/June in a frame[200]. Harvest the shoots when they are about 10cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Succeeds in ordinary garden soil[1]. Prefers a fertile well-drained moisture retentive medium soil[111, 200]. Requires a sunny position[111, 200]. Established plants are drought resistant[1]. Plants are apt to die overwinter if they are grown on clay soils[111]. A good bee plant[200]. The plant is heat tolerant in zones 9 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of “heat days” experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is fibrous dividing into a large number of fine roots [1-2]. The root pattern is stoloniferous rooting from creeping stems above the ground [1-2]. The shorter cultivar *Coreopsis auriculata* ‘Nana’ (Dwarf Mouse-ear Tickseed, Lobed Tickseed ‘Nana’) is useful for borders, edging, rock gardens and ground cover performing best with consistent moisture. It spreads by stolons but is not invasive. Height: 15-30 cm (6-12 in) Spread: 15-30 cm (6-12 in).

## 5.2.911 Aconitum hemsleyanum

4 tlin 8 cyuc 0 kcaak 0 tcan 1 dwat 1.5 m hkc hnmihmtt cyutli tcup hwicli hrasjltunykfrp hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta Aconitum hemsleyanum is a PERENNIAL growing to 1.5 m (5ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from July to August. The flowers are pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta None known

dwatta A widely used herbal remedy in China, where it is cultivated for its root[4]. This is harvested in the autumn as the plant dies down and is then dried before being used. The root is anaesthetic, analgesic, anti-inflammatory, antirheumatic, cardiotoxic, stimulant and vasodilator[4]. Use with caution, the plant is very poisonous and should not be used internally[218].

propta Seed - best sown as soon as it is ripe in a cold frame[111]. The seed can be stratified and sown in spring but will then be slow to germinate[133]. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for their first winter. Plant them out in late spring or early summer. Division - best done in spring but it can also be done in autumn[1, 111]. Another report says that division is best carried out in the autumn or late winter because the plants come into growth very early in the year[233].

nwatta Thrives in most soils and in the light shade of trees[1]. Grows well in heavy clay soils. Prefers a moist soil in sun or semi-shade[200]. Prefers a calcareous soil. Grows well in open woodlands[1, 4]. Members of this genus seem to be immune to the predations of rabbits and deer[233]. A greedy plant, inhibiting the growth of nearby species, especially legumes[54]. Closely related to *A. fischeri* and considered to be part of that species by some botanists[1].

## 5.2.912 Dipsacus sativus

Fuller’s Teasel, Indian teasel

4 tlin 8 cyuc 0 kcaak 2 tcan 2 dwat 1.8 m hkc htut cyutli tcup hwicli hrasjltunykfrp hpa7tli flatprikliwis hpa7tmwatli fyfxre7t hjonli

drutta *Dipsacus sativus* is a BIENNIAL/PERENNIAL growing to 1.8 m (6ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from July to August, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta None known

tcanta Brush DyeThe dried flower heads are used for carding wool and as a clothes brush for raising the nap on woollen cloth[7, 46, 74, 169]. They are harvested with about 20cm of stem as soon as the flowers wither and are dried for later use[4]. A blue dye is obtained from the dried plant, an indigo substitute[74]. It is water soluble[74]. The colour is yellow when mixed with alum[148].

dwatta Cancer Diaphoretic Diuretic Homeopathy Stomachic WartsThe root is diaphoretic, diuretic and stomachic[7]. An infusion is said to strengthen the stomach, create an appetite, remove obstructions of the liver and treat jaundice[4]. The root is harvested in early autumn and dried for later use[7]. The plant has a folk history of use in the treatment of cancer, an ointment made from the roots is used to treat warts, wens and whitlows[4, 218]. A homeopathic remedy is made from the flowering plant[7]. It is used in the treatment of skin diseases[7].

propta Seed - best sown in early spring in situ[115]. The seed can also be sown from February to May or from August to October. All but the earlier sowings can be made outdoors.

nwatta Succeeds in most soils[1] but prefers clay[17]. Prefers a deep rich soil[169]. Requires a sunny position[169]. A good butterfly plant[24]. Fuller’s teasel is occasionally cultivated for its seed head, which is used for carding cloth[1, 2, 46]. The flowering heads are also much prized by flower arrangers because they keep their colour almost indefinitely when dried[7].

## 5.2.913 Senecio jacobaea

Ragwort, Stinking willie

4 tlin 8 cyuc 0 kcaak 0 tcan 2 dwat 1 m hkc hnmihmtt cyutli tcup hwicli hrasjltunykfrp hpa7tli flatprikliwis hpa7tmwatli fyfxre7t hjonli

drutta *Senecio jacobaea* is a PERENNIAL growing to 1 m (3ft 3in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to October, and the seeds ripen from July to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy)

can be planted to control banks from erosion[226]. The bark and the strobils are a source of tannin[82]. A dark dye is obtained from the bark[226]. The colour can range from orange through red to brown[257]. Wood - soft, straight-grained, very durable in water[82]. It is of no commercial value, though it is used locally as a fuel[229].

dwatta Anodyne Astringent Emetic Febrifuge Haemostatic Stomachic TonicThe bark is astringent, emetic, haemostatic, stomachic and tonic[172]. The bark also contains salicin[226], which probably decomposes into salicylic acid (closely related to aspirin) in the human body[213]. This is used as an anodyne and febrifuge[226]. The outer bark is astringent and is applied as a poultice to bleeding wounds, it also reduces swellings[226].

propta Seed - best sown in a cold frame as soon as it is ripe and only just covered[200]. Spring sown seed should also germinate successfully so long as it is not covered[200, K]. The seed should germinate in the spring as the weather warms up. When large enough to handle, prick the seedlings out into individual pots. If growth is sufficient, it is possible to plant them out into their permanent positions in the summer, otherwise keep them in pots outdoors and plant them out in the spring. If you have sufficient quantity of seed, it can be sown thinly in an outdoor seed bed in the spring[78]. The seedlings can either be planted out into their permanent positions in the autumn/winter, or they can be allowed to grow on in the seed bed for a further season before planting them. Cuttings of mature wood, taken as soon as the leaves fall in autumn, outdoors in sandy soil.

nwatta Landscape Uses: Erosion control. Prefers a heavy soil and a damp situation[1, 11]. Grows well in heavy clay soils[11]. Tolerates very infertile sites[200]. A fast-growing but short-lived tree[229]. There is some confusion over the correct name of this tree with one authority citing the European species *A. incana* as the correct name[60]. Another report says that this species is closely related to *A. incana*, but distinct[229]. Some modern works treat it as a subspecies (*Alnus incana tenuifolia*). This species has a symbiotic relationship with certain soil micro-organisms, these form nodules on the roots of the plants and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. Special Features:Not North American native, Wetlands plant, Inconspicuous flowers or blooms. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

## 6.1.21 Cytisus scoparius

Broom, Scotch broom, Common Broom  
tfo2n 5 tlin 8 cyuc 1 kcaak 4 tcan 3 dwat 2.4 m hkc hnmihmtt cyutli hgatkyuctcup hwicli hyishrasjltunyk hpa7tli frusflatprikliwis hpa7tmwatli dyatxre7t hjonli

drutta *Cytisus scoparius* is a deciduous Shrub growing to 2.4 m (7ft) by 1 m (3ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from May to June, and the seeds ripen from August to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is not self-fertile. It can fix Nitrogen. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: FlowersEdible Uses: Coffee CondimentThe flower buds are pickled and used as a substitute for capers[4, 46, 183, 244]. They can also be added to salads[183]. Some caution is advised, see the notes above on toxicity. The tender green tops of the plant have been used like hops to give a bitter flavour to beer and to render it more intoxicating[4, 183]. The roasted seed is a coffee substitute[2, 4, 115, 183].

tcanta Basketry Broom Dye Essential Fibre Paper Repellent Soil stabilization Tannin WoodAn excellent fibre is obtained from the bark, it is used in the manufacture of paper, cloth and nets[4, 100, 115]. It is not as strong as the fibre from the Spanish broom (*Spartium junceum*)[4]. The fibre is obtained from the root according to other reports[13, 46]. The bark fibre is used to make paper, it is 2 - 9mm long[189]. The branches are harvested in late summer or autumn, the leaves removed and the stems steamed until the fibres can be stripped. The fibres are cooked for 3 hours in lye then put in a ball mill for 3 hours. The paper is pale tan in colour[189]. The bark is a good source of tannin[4]. A yellow and a brown dye are obtained from the bark[46]. A yellow dye is obtained from the flowering stem[169]. A green dye is obtained from the leaves and young tops[4]. The branches are used to make baskets, brushes, brooms and besoms[4, 6, 13, 46, 55, 115]. They are also sometimes used for thatching roofs and as substitutes for reeds in making fences or screens[4]. An essential oil from the flowers is used in perfumery[57]. Growing well on dry banks and on steep slopes, it is an effective sand binder and soil stabiliser[4, 11, 46]. Broom is one of the first plant to colonize sand dunes by the coast[4]. The plant attracts insects away from nearby plants[14]. The var. *prostratus* (= *C. scoparius maritimus*)[208] makes a good fast growing ground cover plant to 30cm tall, though it needs weeding in its first year[197]. The cultivar ‘Andreasus Prostratus’ can also be used[208]. Wood - very hard, beautifully veined[4]. The plant seldom reaches sufficient size for its wood to be of much value, but larger specimens are valued by cabinet makers and for veneer[4].

dwatta Antiarrhythmic Antirheumatic Cardiotonic Cathartic Diuretic Emetic VasoconstrictorBroom is a bitter narcotic herb that depresses the respiration and regulates heart action[238]. It acts upon the electrical conductivity of the heart, slowing and regulating the transmission of the impulses[254]. The young herbaceous tips of flowering shoots are cardiotoxic, cathartic, diuretic, emetic and vasoconstrictor[4, 13, 21, 46, 165]. The seeds can also be used[4]. The plant is used internally in the treatment of heart complaints, and is especially used in conjunction with *Convallaria majalis*[238]. The plant is also strongly diuretic, stimulating urine production and thus countering fluid retention[254]. Since broom causes the muscles of the uterus to contract, it has been used to prevent blood loss after childbirth[254]. Use this herb with caution since large doses are likely to upset the stomach[4, 21]. The composition of active ingredients in the plant is very changeable, this makes it rather unreliable medicinally and it is therefore rarely used[9]. This herb should not be prescribed to pregnant women or patients with high blood pressure[238]. Any treatment with this plant should only be carried out under expert supervision[9]. See also the notes above on toxicity. The young herbaceous tips of flowering shoots are harvested in spring, generally in May[4]. They can be used fresh or dried[4, 238]. They should not be stored for more than 12 months since the medicinally active ingredients break down[238].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame[80]. Pre-soak stored seed for 24 hours in warm water then cold stratify for 1 month and sow in a cold frame[80]. The seed usually germinates in 4 weeks at 20°C[98, 113]. Seedlings should be potted up as soon as possible since plants quickly become intolerant of root disturbance[186]. Plant them out into their permanent positions in late summer if they have made sufficient growth, otherwise in late spring of the following year[K]. The seed has a long viability[186]. Seed can also be sown in situ as soon as it is ripe in the late summer and autumn[4]. Cuttings of half-ripe wood, 4 - 7 cm with a heel, August in a frame[11]. Produces roots in the spring[11]. Pot up as soon as possible[11]. Cuttings of mature wood, October/November in a frame. Layering.

nwatta Agroforestry Services: Nitrogen Management; Coppice Minor Global CropLandscape Uses:Border, Container, Foundation, Massing, Specimen. Succeeds in most soils, preferring a fairly good but not rich soil[11]. Prefers a poor well-drained soil[14]. Succeeds in slightly acid, neutral and limy soils but dislikes shallow soils over chalk[200]. Plants are strongly calcifuge according to other reports and intolerant of a pH much above 6.5[17, 186]. Prefers a sunny position but tolerates some shade[11, 14, 17]. Plants succeed in exposed conditions, and are very tolerant of maritime exposure[4, K]. Plants have a deep root system, they are

situ[200]. The seed can also be sown in a cold frame in the autumn. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in late spring[200]. Division just before new growth begins in spring[200]. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer. Cuttings, September in a cold frame[111].

nwatta Prefers a sunny position in a well-drained neutral to alkaline soil[200]. Succeeds on the tops of walls and on dry banks[200]. Similar to *O. spinosa*, but this species is rhizomatous[200]. It can spread rapidly when well sited[1] and has become an obnoxious weed in some areas[245]. Mature roots are very tough and the plant gained its common name of 'Rest Harrow' because ploughs and harrows would be unable to break through it (in the days before heavy machinery was used on the land!). The whole plant emits a delicious resinous odour when bruised[245]. A food plant for the common blue butterfly[200]. Dislikes root disturbance[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

### 6.1.19 Wisteria sinensis

Chinese Wisteria  
tfo2n 5 tlin 9 cyuc 1 kcak 3 tcan 1 dwat 25 m hkuc  
htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik  
hpa7tmwatli xre7t hjonli

drutta Wisteria sinensis is a deciduous Climber growing to 25 m (82ft) by 20 m (65ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in May, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Flowers SeedEdible Uses: TeaSeed - cooked[105, 177, 183]. Some caution is advised, see notes on toxicity at the top of the page. Flowers - cooked. They are thoroughly washed and then boiled or made into fritters[105, 177, 179, 183]. The flowers are also cured in sugar then mixed with flour and made into a famous local delicacy called 'Teng Lu'[249]. The leaves contain allantoin acid[218]. They are used as a tea substitute[218]. The young leaves have also been eaten[249].

tcanta PaperA fibre from the stems can be used to make paper, the fibre is about 1.3 - 3.7mm long[189]. Stems are harvested in the summer, the leaves removed and the stems steamed until the fibre can be stripped. The fibres are cooked for 2 hours with lye and then put in a ball mill for 3 hours. The paper is a buff colour[189]. Nitrogen Fixer.

dwatta Cardiac DiureticThe seed is diuretic[178, 218]. It is used in the treatment of heart ailments[178, 218]. One report says that the stems and flowers are also used in Chinese medicine, but gives no more information[249].

propta The seed does not exhibit any dormancy habits. It can be sown as soon as it is ripe in a cold frame and should germinate in the spring. Pre-soaked seed for 24 hours in warm water and then sow in a greenhouse in early spring. The seed can also be sown in an outdoor seedbed in late spring[126]. Germination should take place in the first spring, though it can sometimes be delayed for another 12 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant them out in late spring or early summer. Plants are very slow from seed and can take up to 20 years to come into flower[200]. Basal cuttings of side-shoots in early to mid summer in a frame[200]. Take the cuttings as soon as the new growth has hardened sufficiently, each cutting should have 2 - 3 leaves[249]. It can also help to remove a shallow slice of bark from the bottom 15mm of the cutting to expose extra cambium, since this will encourage more callusing and better rooting[249]. When kept in a mist frame with a bottom heat of 27 - 30°C, they will root within 4 weeks and produce well-established plants by the autumn[249]. Layering in spring. Simply lay any convenient

long shoot along the ground and cover it with a shallow layer of soil. The shoot will readily produce roots at intervals along the stem. When these are well formed, the shoot can be divided up into a number of plants. These should be potted up and kept in a lightly shaded position in a greenhouse until well established and can then be planted out as required. Division of suckers in the winter[249]. If growing named varieties, it is of course necessary to ensure they are growing on their own roots if the suckers are to be true to type[249].

nwatta Landscape Uses:Arbor, Espalier, Pollard, Standard. Prefers a good loamy soil in a sunny south or south-west facing position, sheltered from cold winds and from early morning sun on frosty mornings[11, 200]. Succeeds in partial shade. Plants can become chlorotic on alkaline soils[200]. A soil that is too rich results in excessive foliage at the expense of flowering[200]. Hardy to about -15°C[184, 200]. Plants can take a few years to settle down after planting out[219]. Too much shade or too rich a soil are normally the culprits, some form of root restriction can be beneficial[219]. There are several named forms selected for their ornamental value[188]. Sparrows and other birds frequently eat the young buds of this plant and this is the commonest cause of poor flowering on established plants[184]. Plants sometimes have a second season of flowering in August[219]. The plants flower mainly on short spurs so, if removing unwanted side-branches, it is best to cut them back to 2 - 3 leaves rather than removing them completely since this will encourage the formation of flowering spurs[249]. Any drastic pruning is best carried out in the spring, immediately after flowering[249]. Plants are very tolerant of even the most drastic pruning and will re-grow even if cut right back to the base[249]. A climbing plant supporting itself by twining around other plants, the shoots twine in an anticlockwise direction[182]. Very tolerant of pruning, plants can regenerate from old wood[202]. Plants in this genus are notably susceptible to honey fungus[200]. Closely related to *W. floribunda*[126]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. The plants also form a symbiotic relationship with a mycorrhizal fungus which makes more water, phosphorus and other minerals available to the plants[249]. Special Features:Not North American native, Invasive, Naturalizing, All or parts of this plant are poisonous, Attracts butterflies, Fragrant flowers, Blooms are very showy.

### 6.1.20 Alnus tenuifolia

Mountain Alder, Thinleaf alder  
tfo2n 5 tlin 7 cyuc 1 kcak 0 tcan 2 dwat 9 m hkuc  
hmimhtut cyutli tcuphja7n hwicli hysjlutnyikfrip hpa7tli flat-  
prikliwis hpa7tmwatli hjonli

drutta Alnus tenuifolia is a deciduous Tree growing to 9 m (29ft 6in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 2. It is in flower in March, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. It can fix Nitrogen. Suitable for: medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta Edible Parts: FlowersEdible Uses: Catkins - raw or cooked. A bitter taste[172].

tcanta Pioneer Soil stabilization Tannin WoodThis is an excellent pioneer species for re-establishing woodlands on disused farmland, difficult sites etc[226]. Its fast rate of growth means that it quickly provides sheltered conditions to allow more permanent woodland trees to become established. In addition, bacteria on the roots fix atmospheric nitrogen - whilst this enables the tree to grow well in quite poor soils it also makes some of this nitrogen available to other plants growing nearby. Alder trees also have a heavy leaf canopy and when the leaves fall in the autumn they help to build up the humus content of the soil. Alder seedlings do not compete well in shady woodland conditions and so this species gradually dies out as the other trees become established[K]. The tree has an extensive root system and

and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure.

kcakta None known  
tcanta DyeA good green dye is obtained from the leaves, though it is not very permanent[4, 115]. A yellow dye is obtained from the flowers when alum is used as a mordant[4, 115, 168]. Brown and orange can also be obtained[168].

dwatta Antirheumatic Astringent Diaphoretic Diuretic Emmenagogue Expectorant HomeopathyThe plant is astringent, diaphoretic, diuretic, emmenagogue and expectorant[9, 21]. The plant is harvested as it comes into flower and is dried for later use[9]. Use with caution[21], when applied internally it can cause severe damage to the liver[9]. See also the notes above on toxicity. An emollient poultice is made from the leaves[4]. The juice of the plant is cooling and astringent, it is used as a wash in burns, sores, cancerous ulcers and eye inflammations[4]. It makes a good gargle for ulcerated mouths and throats and is also said to take away the pain of a bee sting[4]. Caution is advised here since the plant is poisonous and some people develop a rash from merely touching this plant[K]. A decoction of the root is said to be good for treating internal bruises and wounds[4]. A homeopathic remedy is made from the plant[9]. It is used in the treatment of dysmenorrhoea and other female complaints, internal haemorrhages and other internal disorders[9].

propta A noxious weed, it doesn't need any help in spreading itself about.

nwatta Succeeding on all but the poorest soils, this plant is a declared noxious weed in Britain spreading freely by seed. It should not be cultivated other than in controlled conditions for scientific research. Ragwort can be eradicated by pulling it up just before it comes into flower, or by cutting it down as the flowers begin to open (this latter may need to be repeated about six weeks later)[4]. Ragwort is a good food plant for the caterpillars of many butterfly and moth species, and is one of only two species that provide food for cinnabar moth caterpillars.

### 5.2.914 Petasites hybridus

Butterbur, Pestilence wort  
4 tlin 8 cyuc 0 kcak 0 tcan 3 dwat 1 m hkuc  
pcimhmimhtut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli  
flatprikliwis hpa7tmwatli nyanhjen hjonli

drutta Petasites hybridus is a PERENNIAL growing to 1 m (3ft 3in) by 3 m (9ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in leaf from April to December, in flower from March to May. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta None known  
tcanta None known

dwatta Analgesic Antispasmodic Appetizer Cardiotonic Diaphoretic Diuretic Homeopathy UrinaryButterbur is widely considered to be an effective cough remedy and recent experiments have shown it to have remarkable antispasmodic and pain-relieving properties[244]. It acts specifically on the bile ducts, stomach and duodenum[254]. The plant contains pyrrolizidine alkaloids, in isolation these are toxic to the liver[254]. The root and the leaves are analgesic, antispasmodic, cardiotonic, diaphoretic and diuretic[4, 9]. A decoction is taken as a remedy for various respiratory problems such as asthma, colds, bronchitis and whooping cough and also other complaints such as fevers and urinary complaints[4, 254]. It is also very effective in the treatment of gastrointestinal complaints and biliary dyskinesia[244, 254]. Externally it can be used as a poultice to speed the healing of wounds and skin eruptions[254]. The leaves are harvested in early summer, the root in late summer to autumn. Both can be dried for later use[9]. Because the plant contains potentially toxic alkaloids its internal use cannot be recommended[254]. A homeopathic remedy is made from the

roots[4]. It is used in the treatment of severe and obstinate neuralgia[4].

propta Seed - we have no information on this species but suggest sowing the seed in a cold frame as soon as it is ripe or in early spring. Only just cover the seed and do not allow the compost to dry out. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division succeeds at almost any time of the year. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Succeeds in ordinary garden soil[1], but prefers a deep fertile humus-rich soil that is permanently moist but not stagnant, succeeding in shade, semi-shade or full sun[200]. Requires a moist shady position[187]. Plants can be grown in quite coarse grass, which can be cut annually in the autumn[233]. A very invasive plant, too rampant for anything other than the wild garden[187, 200]. Its roots are very difficult to eradicate[200]. It is best to only grow the male form in the garden to prevent unwanted seedlings popping up all over the place[200]. The growth is so dense and vigorous, with large leaves that can be 75cm or more across, that virtually no other plant is able to grow amongst this species[4]. Plants are a useful early nectar source for bees[200]. Dioecious, male and female plants must be grown if seed is required.

### 5.2.915 Dipsacus fullonum

Teasel, Fuller's teasel  
4 tlin 8 cyuc 0 kcak 2 tcan 2 dwat 1.8 m hkuc  
htut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprikliwis  
hpa7tmwatli fyfxre7t hjonli

drutta Dipsacus fullonum is a BIENNIAL/PERENNIAL growing to 1.8 m (6ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to August, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta None known  
tcanta DyeA blue dye obtained from the dried plant is an indigo substitute[74]. It is water soluble[74]. A yellow is obtained when the plant is mixed with alum[148]. Teasels are also occasionally grown as ornamental plants, and the dried heads are used in floristry. The seeds are an important winter food resource for some birds, notably the European goldfinch. Teasels are often grown in gardens and encouraged on some nature reserves to attract them. A rich source of pollen and nectar for bees and other insects. Formerly widely used in textile processing, providing a natural comb for cleaning, aligning and raising the nap on fabrics, particularly wool.

dwatta Cancer Diaphoretic Diuretic Homeopathy Skin Stomachic WartsTeasel is little used in modern herbalism, and its therapeutic effects are disputed[254]. Traditionally it has been used to treat conditions such as warts, fistulae (abnormal passages opening through the skin) and cancerous sores[254]. The root is diaphoretic, diuretic and stomachic[7]. An infusion is said to strengthen the stomach, create an appetite, remove obstructions of the liver and treat jaundice[4, 254]. The root is harvested in early autumn and dried for later use[7]. An infusion of the leaves has been used as a wash to treat acne[257]. The plant has a folk history of use in the treatment of cancer, an ointment made from the roots is used to treat warts, wens and whitlows[4, 218]. A homeopathic remedy is made from the flowering plant[7]. It is used in the treatment of skin diseases[7].

propta Seed - best sown in early spring in situ[115]. The seed can also be sown from February to May or from August to October. All but the earlier sowings can be made outdoors.

nwatta Succeeds in most soils[1] but prefers clay[17]. Prefers a deep rich soil[169]. Requires a sunny position[169]. A good butterfly plant[24]. This is the true wild species of teasel, its bracts are too flexible to be used for combing cloth[17]. The flowering heads are much prized by flower

arrangers because they keep their colour almost indefinitely when dried[7].

### 5.2.916 Lobelia spicata

Pale Spike, Palespike lobelia

4 tin 8 cyuc 0 kcak 0 tcan 1 dwat 1 m hkuc hmimhtut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Lobelia spicata is a PERENNIAL growing to 1 m (3ft 3in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from June to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta None known

tcanta MiscellanyNone known

dwatta Emetic MiscellanyA tea made from the leaves is emetic[222]. A wash made from the stalks was used to treat neck and jaw sores[222]. A tea made from the root was used in the treatment of trembling limbs - it was applied to scratches made in the limb[222].

propta Seed - best sown as soon as it is ripe in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring[200]. Basal cuttings in spring[1]. Harvest the shoots when they are about 10cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer. Layering in moist sand, it forms roots at the nodes[200].

nwatta Requires a moist soil, succeeding in full sun or partial shade[111, 187, 200].

### 5.2.917 Silphium trifoliatum

Whorled rosinweed

4 tin 6 cyuc 0 kcak 2 tcan 0 dwat 1.8 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta Silphium trifoliatum is a PERENNIAL growing to 1.8 m (6ft) by 1.8 m (6ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. The flowers are pollinated by Bees, Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Dave Jacke in his book Edible Forest Gardens has noted that this plant is edible although we have been unable to find any confirmation. Other Silphium species are edible for example Silphium integrifolium produces an protein-oil staple Crop and Silphium laciniatum resin is used as a chewing gum to sweeten the breath[4, 61, 105, 257].

tcanta Invertebrates shelter: beneficial for insects and other arthropods. Nectary: provides nectar or pollen for beneficial insects [1-2]. Garden Ornamental. More manageable than most perennial sunflowers as it spreads slowly, and it is not known to be allelopathic. Adapts well to prairies, wild-flower/native plant gardens, naturalized areas, meadows or moist, open woodland areas. Attracts birds and butterflies

dwatta None known

propta Seed. Plants may be slow to establish in the garden, particularly when grown from seed. Plants often self seed in optimum growing conditions. Division.

nwatta A tall perennial forb for full to partial shade. Leaves are attached to the stem in a 'whorled' formation. Sun Exposure: Full, Partial. Soil Moisture: Medium, Medium-Dry. Drought-tolerant; suitable for xeriscaping. Bloom Time: July to September. Bloom Color: Yellow. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available.

The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2].

### 5.2.918 Silphium terebinthinaceum

Prairie Dockm, Prairie rosinweed, Lucy Braun's rosinweed

4 tin 8 cyuc 0 kcak 0 tcan 2 dwat 1.5 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Silphium terebinthinaceum is a PERENNIAL growing to 1.5 m (5ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from July to August, and the seeds ripen in August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Edible Uses: GumNone known

tcanta GumA gum or resin that is obtained from the stem can be chewed to cleanse the mouth and teeth[207].

dwatta Diuretic Emetic Expectorant Tonic VermifugeA tea made from the roots is vermifuge and a tonic for general debility[4, 61, 222]. A tea made from the leaves is emetic, it has been used in the treatment of coughs, lung ailments and asthma[4, 61, 222]. A resin in the plant is diuretic[4, 61, 222].

propta Seed - best sown as soon as it is ripe in a greenhouse[200]. Prick out the seedlings into individual pots as soon as they are large enough to handle and plant them out in the summer. Division in spring[188]. This is very difficult due to the deep and extensive root system.

nwatta Succeeds in any ordinary garden soil[1]. Prefers a deep moisture retentive moderately fertile soil that is not too nitrogen rich, in sun or dappled shade[200]. Succeeds in the wild or woodland garden[200]. Plants have a deep and extensive root system which makes transplanting difficult[200].

### 5.2.919 Aster novi

Michaelmas Daisy, New York Aster

4 tin 8 cyuc 0 kcak 2 tcan 0 dwat 1.2 m hkuc

hmimhtut cyutli tcup hwicli vyhshrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Aster novi-belgii is a PERENNIAL growing to 1.2 m (4ft) by 1 m (3ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 2. It is in flower from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles, Lepidoptera (Moths and Butterflies). The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta Landscape Uses: Woodland Garded ;Border, Rock garden, Seashore. A forest garden plant that can be grown in dappled shade. Attracts wildlife.

dwatta None known

propta Seed - surface sow in spring in a cold frame. Do not allow the compost to become dry. Pre-chilling the seed for two weeks can improve germination rates[134]. Germination usually takes place within 2 weeks at 20°C[134]. When large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring or autumn[200]. Very easy, larger divisions can be planted straight into their permanent positions whilst smaller clumps are best potted up and kept in a cold frame until they are growing away well. Basal cuttings in late spring. Harvest the shoots when they are about 10 - 15cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Succeeds in most good garden soils[1], preferring one that is well-drained and moisture retentive[200]. Prefers a sunny position[200], but it also succeeds in partial shade[233]. Prefers a rich soil[1], but tolerates poor

North American native, Attracts butterflies, Attractive flowers or blooms. The plant is heat tolerant in zones 9 through 7. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is multi-stemmed with multiple stems from the crown [1-2].

### 6.1.16 Ononis spinosa

Spiny Rest Harrow

tfo2n 5 tin 9 cyuc 2 kcak 3 tcan 2 dwat 0.6 m hkuc

htut cyutli kyuctcup hwicli hyshrasjlutnyik hpa7tli flatprikliwisslip hpa7tmwatli xre7t hjonli

drutta Ononis spinosa is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Young shoots - cooked[2, 105]. Used as a potherb[183]. Roots - chewed for their liquorice-like flavour[183]. Flowers - raw. They are used as a decoration on salads[7].

tcanta Nitrogen Fixer

dwatta Antirheumatic Antitussive Aperient Diuretic LithontripicThe roots, leaves and flowers are antitussive, aperient, diuretic and lithontripic[7, 9, 13, 21, 46]. The root contains a fixed oil that is anti-diuretic and an essential oil that is diuretic. If the diuretic action is required then the root should be infused and not decocted or the essential oil will be evaporated[254]. An infusion is used in the treatment of dropsy, inflammation of the bladder and kidneys, rheumatism and chronic skin disorders[9]. The roots are used occasionally, they are harvested in the autumn, cut into slices and carefully dried for later use[9]. The young shoots are more commonly used, either fresh or dried[9]. They can be harvested throughout the summer[9]. A cough mixture is made from the bark[13].

propta Scarify or pre-soak the seed for 24 hours in warm water and sow the seed in the middle of spring in situ[200]. The seed can also be sown in a cold frame in the autumn. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in late spring[200]. Division just before new growth begins in spring[200]. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer. Cuttings, September in a cold frame[111].

nwatta Prefers a sunny position in a well-drained neutral to alkaline soil[200]. Succeeds in poor soils, the plant often becoming spiny in such a situation[17]. Similar to *O. repens* but this species is not rhizomatous[200]. Mature roots are very tough and the plant gained its common name of 'Rest Harrow' because ploughs and harrows would be unable to break through it (in the days before heavy machinery was used on the land!). The whole plant is pleasantly scented when bruised[245]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

### 6.1.17 Lathyrus linifolius montanus

Bitter Vetch

tfo2n 5 tin 9 cyuc 2 kcak 3 tcan 0 dwat m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Lathyrus linifolius montanus is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to July, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Root SeedEdible Uses: Seed - cooked[2, 177]. Used as a vegetable, they are served in the same manner as sweet chestnuts[2]. Some caution is advised in the use of this seed, see the notes above on toxicity. Root - cooked[5, 61, 105]. Boiled or roasted, they have a sweet flavour and are very nutritious[2, 115].

tcanta Nitrogen fixer.

dwatta None known

propta Pre-soak the seed for 24 hours in warm water and then sow in early spring in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. If you have sufficient seed, then it can also be sown in situ in mid spring[200]. Division in spring. It may not transplant well so care should be taken[200].

nwatta An easily grown plant, succeeding in any moderately good garden soil but preferring a position in full sun[200]. Formerly cultivated for its edible seed[2]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. The plant is heat tolerant in zones 9 through 6. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. Growth habit is a single or multiple shooting vine from a crown [1-2]. Herbaceous.

### 6.1.18 Ononis repens

Rest Harrow, Common restharrow

tfo2n 5 tin 9 cyuc 2 kcak 0 tcan 1 dwat 0.6 m hkuc

htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Ononis repens is a PERENNIAL growing to 0.6 m (2ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It can fix Nitrogen. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: Leaves RootEdible Uses: Drink-Root - raw or cooked. A liquorice substitute[5, 66]. Soaked in cold water it makes a refreshing cold drink[66]. The young shoots were at one time much used as a vegetable, being boiled, pickled or eaten in salads[4].

tcanta None known

dwatta LithontripicThe whole herb has been used in the treatment of bladder stones and to subdue delirium[4].

propta Scarify or pre-soak the seed for 24 hours in warm water and sow the seed in the middle of spring in

a symbiotic relationship with a mycorrhizal fungus which makes more water, phosphorus and other minerals available to the plants[249]. Special Features:Not North American native, Invasive, Naturalizing, All or parts of this plant are poisonous, Fragrant flowers, Blooms are very showy. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. Woody. Growth habit is a single or multiple shooting vine from a crown [1-2].

## 6.1.14 Indigofera tinctoria

Indigo, True Indigo, dye indigo  
tfo2n 5 tlin 12 cyuc 2 kcaak 4 tcan 2 dwat 2 m hkuc  
hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikwis  
hpa7tmwatli hjonli

drutta Indigofera tinctoria is a deciduous Shrub growing to 2 m (6ft) by 2 m (6ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: ColouringThe deep blue dye obtained from the leaves is sometimes used to counteract the slightly yellow colour of icing sugar[301].

tcanta Dye Green manure Insecticide Soil conditioner TeethAgroforestry Uses: The plant is sometimes grown as a cover crop and green manure[418 ]. Indigofera tinctoria is useful as a green manure, it is used in India, for example, in coffee plantations and as a cover crop preceding rice, maize, cotton and sugarcane[299 ]. In traditional rainfed rice cropping systems in the Philippines, this plant is a popular green manure, increasing rice yield whilst also reducing by 50% the need to supply expensive nitrogen fertilizer[299 ]. The residue remaining after indigo extraction is also applied to the land as manure[299 ]. Another reason to grow Indigofera tinctoria as a green manure is because it is a good nitrogen catch crop, reducing the amount of fertilizer NO3 leaching to the groundwater[299 ]. Other Uses: A deep blue dye is obtained from the leaves[46 , 299 , 301 ]. The leaves and twigs do not actually contain indigo but colourless precursors that must be extracted and then processed in order to produce the indigo dye[299 ]. The harvested leafy branches are placed in a tank containing water to which some lime has been added, and are weighted down with planks[303 ]. After some hours of fermentation, during which enzymic hydrolysis leads to the formation of indoxyl, the liquid is drained off and then stirred continuously for several hours to stimulate oxidation of the indoxyl[303 ]. Afterwards the solution is left to rest and the insoluble indigo settles to the bottom as a bluish sludge[303 ]. The water is drained and after the indigo has dried, it is cut into cubes or made into balls[303 ]. To dye textiles, indigo is reduced to a soluble form by a fermentation process under alkaline conditions. In traditional preparations of the dye, various reducing agents such as molasses are used, together with coconut-milk, bananas and the leaves of Psidium guajava[303 ]. The alkalinity is maintained by adding lime. After the textile has been dipped into solution it turns blue when exposed to the air[303 ]. The twigs are used as toothbrushes[299 ].

dwatta Antiasthmatic Antihemorroidal Epilepsy Febrifuge Kidney Mouthwash Skin Stings StomachicA leaf infusion (sometimes combined with honey or milk) is used to treat a range of disorders including epilepsy and nervous disorders; asthma and bronchitis; fever; complaints of the stomach, liver, kidney and spleen; and as a rabies prophylactic[299 ]. Applied externally, the leaves are made into an ointment for treating skin diseases, wounds, sores, ulcers and haemorrhoids[299 ]. A tincture of the seed is used in India to kill lice[299 ]. A root preparation is applied to relieve toothache, syphilis, gonorrhoea and kidney stones[299 ]. A watery root paste is applied topically in India to treat worm-infested wounds[299 ]. A root infusion is used there as an antidote against snakebites and to treat insect and scorpion stings[299 ].

propta Seed - pre-soak overnight in warm water and sow in a seedbed with partial shade. Germination takes about

4 days[299 ]. Semi-ripe cuttings of lateral shoots with a heel[200 ]. Root cuttings.

nwatta Agroforestry Services: Nitrogen Industrial Crop: Dye Management: Coppice Minor Global CropA plant of the tropics and subtropics, where it is found at elevations up to 1,600 metres. It grows best in areas where annual daytime temperatures are within the range 22 - 28°C, but can tolerate 7 - 32°C[418 ]. It prefers a mean annual rainfall in the range 1,300 - 1,700mm, but tolerates 640 - 3,000mm[418 ]. Requires a position in full sun, succeeding in any deep, well-drained and moderately retentive and fertile soil[200 ]. Prefers a pH in the range 6 - 7, tolerating 4.3 - 8.7[418 ]. Requires a position sheltered from hot winds[418 ]. Branches are harvested by cutting 10 - 20cm above ground level when the plants are 4 - 5 months old and have formed a closed stand, usually at the flowering stage[299 ]. The crop should be harvested promptly because heavy rains or flooding can destroy it in a few hours. In India harvested branches are tied into bundles of about 130 kg and transported to the dye factory. Up to 3 harvests are possible per year[299 ]. Dye yields can be 1.6 - 5.4 tonnes per hectare[418 ]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[755 ]. Flowering Time: Mid Spring. Bloom Color: Red-Orange or Pink. Spacing: 36-48 in. (90-120 cm).

## 6.1.15 Indigofera decora

Chinese indigo  
tfo2n 5 tlin 7 cyuc 2 kcaak 3 tcan 1 dwat 1 m hkuc  
htut cyutli tcup hwicli hrasljut hpa7tli flatprikwlisslip  
hpa7tmwatli xre7t hjonli

drutta Indigofera decora is a deciduous Shrub growing to 1 m (3ft 3in) by 1 m (3ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: Seed - cooked[105, 177]. It can also be dried and ground into a powder then mixed with wheat flour or other cereals when making bread, cakes etc[179].

tcanta MiscellanyNitrogen Fixer.  
dwatta MiscellanyA broth made from the leafy shoots is used in the treatment of cough, dyspepsia, haemorrhage and poisoning[218].

propta Pre-soak the seed for 12 hours in warm water and sow February in a warm greenhouse. The germination can be variable. Prick out the seedlings when large enough to handle and overwinter the young plants in a greenhouse for the first winter, planting out in late spring or early summer after the last expected frosts[78]. Cuttings of half-ripe wood, 5 - 8cm with a heel if possible, July/August in individual pots in a frame. Good percentage[78]. Overwinter the young plants in a greenhouse for the first winter and plant out in late spring or early summer[11]. Root cuttings 3cm long in December. Good percentage[78]. Suckers. Remove them in the dormant season, preferably towards the end of winter, and plant out into their permanent positions.

nwatta Landscape Uses:Border, Foundation, Massing, Specimen. Requires a light or medium well-drained soil and a warm sunny position[11, 200, 260]. Succeeds on chalk[11]. Prefers growing in areas with warm summers[260]. Plants are hardy to about -10°C[260]. The top-growth is not very winter-hardy however, the stems are often cut back by cold weather but new shoots are produced in spring and these flower in late summer[182]. A very ornamental plant[1], it is closely related to *I. fortunei*[182]. The flowers, which are borne over a period of about 20 weeks, have a vanilla scent[245]. Plants in this genus are notably resistant to honey fungus[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. Special Features:Not

ones[233]. Plants are hardy to about -25°C[187]. A polymorphic species, there are many named varieties selected for their ornamental value[1]. Hybridizes freely with other members of this genus[200]. Plants need to be divided every few years, preferably in the spring, in order to keep the plant vigorous[187]. Most species in this genus seem to be immune to the predations of rabbits[233]. Attracts butterflies and moths, it is also a good bee plant providing nectar in autumn[30]. Special Features: Attracts birds, Naturalizing, Attracts butterflies, Suitable for cut flowers.

## 5.2.920 Nabalus albus

White Lettuce  
4 tlin 8 cyuc 0 kcaak 0 tcan 2 dwat 1.5 m hkuc  
pimhmim cyutli tcup hwicli hrasljutnyik hpa7tli flatprik  
hpa7tmwatli xre7t hjonli

drutta Nabalus albus is a PERENNIAL growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta None known  
tcanta None known  
dwatta Antidote Diuretic GalactagogueThe powdered root is sprinkled on food to stimulate milk flow after childbirth[222]. A tea made from the roots is used as a wash for weakness[222]. A latex in the stems is diuretic, it is used in female diseases[222]. It is also taken internally in the treatment of snakebite[222]. A poultice of the leaves or roots is applied to snakebites, dog bites etc[222].

propta Seed - surface sow in a greenhouse in spring. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts.

nwatta Succeeds in shade or semi-shade in a moist but well-drained humus-rich neutral to acid soil[200].

## 5.2.921 Digitalis purpurea

Foxglove, Purple foxglove, Common Foxglove  
4 tlin 8 cyuc 0 kcaak 2 tcan 4 dwat 1.2 m hkuc  
hmimhtut cyutli kyuctup hwicli hrasljutnyik hpa7tli flatprikkwis  
hpa7tmwatli xre7t hjonli

drutta Digitalis purpurea is a BIENNIAL growing to 1.2 m (4ft) by 0.6 m (2ft in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta None known  
tcanta Dye PreservativeAn infusion of the plant prolongs the life of cut flowers[54]. Root crops growing near this plant store better[54]. An apple-green dye is obtained from the flowers[168]. Cut flower. Cultivars have gained the Royal Horticultural Society's Award of Garden Merit.

dwatta Cardiac Diuretic Homeopathy Stimulant Tonic-The foxglove is a widely used herbal medicine with a recognised stimulatory effect upon the heart. It is also used in allopathic medicine in the treatment of heart complaints. It has a profound tonic effect upon a diseased heart, enabling the heart to beat more slowly, powerfully and regularly without requiring more oxygen[254]. At the same time it stimulates the flow of urine which lowers the volume of the blood and lessens the load on the heart[254]. The plant contains cardiac glycosides (including digoxin, digitoxin and lanatosides). Digitoxin rapidly strengthens the heartbeat but is excreted very slowly. Digoxin is therefore preferred as a long-term medication[254]. The leaves are cardiac, diuretic, stim-

ulant and tonic[4, 9, 21, 46, 171]. The leaves should only be harvested from plants in their second year of growth, picked when the flowering spike has grown and about two thirds of the flowers have opened[4]. Harvested at other times, there is less of the medically active alkaloid present[4]. The seed has also been used in the past[4]. The leaves also have a very beneficial effect on the kidneys, they are strongly diuretic and are used with benefit in the treatment of dropsy[4]. Great care should be exercised in the use of this plant, the therapeutic dose is very close to the lethal dose[222]. See also the notes above on toxicity. A homeopathic remedy is made from the leaves[9]. It is used in the treatment of cardiac disorders[9].

propta Seed - surface sow early spring in a cold frame. The seed usually germinates in 2 - 4 weeks at 20°C[175]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. If you have sufficient seed it can be sown outdoors in situ in the spring or autumn.

nwatta Landscape Uses:Border, Container, Massing, Specimen, Woodland garden. Easily grown in ordinary garden soil, especially if it is rich in organic matter[1]. Prefers a light dry soil in semi-shade[17] but succeeds in full sun if the soil is moist[200]. Grows well in acid soils[17]. Plants are hardy to about -25°C[187]. The foxglove is a very ornamental plant that is easily naturalized in the semi-shade of a woodland[1]. It contains glycosides and forms the basis of an important heart medicine for which it is cultivated commercially[4]. This species is commonly used by herbalists, whereas *D. lanata* is more commonly grown for supplying the pharmaceutical industry[238]. The plant contains much greater concentrations of the medically active ingredients when it is grown in a sunny position[115]. The flowers are very attractive to bees[4, 24]. Individual plants can produce up to 2 million seeds[4]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. A good companion plant, it stimulates the growth of nearby plants, growing well with pine trees[18, 20, 54]. Special Features:Attractive foliage, Not North American native, Naturalizing, All or parts of this plant are poisonous, Suitable for cut flowers. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is fibrous dividing into a large number of fine roots [2-1].

## 5.2.922 Anemone vitifolia

4 tlin 8 cyuc 0 kcaak 0 tcan 2 dwat 1 m hkuc  
hmim cyutli tcup hwicli hrasljut hpa7tli flatprikkwis  
hpa7tmwatli fyfxre7t hjonli

drutta Anemone vitifolia is a PERENNIAL growing to 1 m (3ft 3in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in July, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta None known  
tcanta Insecticide TinderWoolly hairs from the achenes are used as a tinder[51, 272]. The root has insecticidal properties[218].

dwatta Anodyne Antirheumatic Dysentery Odontalgic VermifugeThe fresh root is antirheumatic and vermifuge[218]. The juice from the roots is taken internally in the treatment of dysentery[272]. It is also applied to aching teeth to relieve the pain and to the forehead to relieve headaches[218, 272]. A paste made from the roots is used externally to treat scabies[272]. The leaves are powdered and rubbed into the scalp to treat head lice[272].

propta Seed - best sown in a cold frame as soon as it is ripe in the summer[1]. Surface sow or only just cover the seed and keep the soil moist. Sow stored seed as soon as possible in late winter or early spring. The seed usually germinates in 1 - 6 months at 20°C[133]. When large enough to handle, prick the seedlings out into individual pots and grow them on for at least their first year in a lightly shaded place in a greenhouse. When large enough, plant them out into

their permanent positions in the spring. Division in March just before active growth commences. Root cuttings[200].

nwatta Succeeds in ordinary garden soil but prefers a rich sandy loam[1]. Requires a moist fertile soil in dappled shade[200]. Hardy to at least -20°c[187]. A very ornamental plant[1], it grows well in a woodland garden[200]. Plants can be far spreading by means of underground stolons[187]. Plants seem to be immune to the predations of rabbits[233]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

### 5.2.923 Phleum pratense

Timothy

4 tin 8 cyuc 0 kcak 0 tcan 1 dwat 1 m hkuc hmimhtut cyulti tcup hwicli hrasljutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Phleum pratense is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in July. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta Biomass Fodder HairThe stems have been used to make hair brushes[257]. The plant can yield up to 15 tonnes of plant material per hectare and is a potential source of biomass[269].

dwatta CancerStored sterile timothy extracts arrested the growth of Sarcoma 45 and other tumour types[269].

propta Seed - sow spring in situ, only just covering the seed. If seed is in short supply, it can be surface sown in a pot in a cold frame. Ensure the pot does not dry out. When large enough to handle, prick the seedlings out into individual pots and plant out in the summer. Division in spring.

nwatta Fodder: Pasture Management: Hay Management: Standard Staple Crop: Balanced carbAn easily grown plant, it succeeds in a sunny position in any ordinary soil[200]. The plant is not drought tolerant[269]. Timothy grass is reported to tolerate an annual precipitation in the range of 35 to 176cm, an annual temperature range of 4.4 to 18.6°C, and a pH of 4.5 to 7.8[269]. The plant is best adapted to a cool, humid, temperate climate, growing best on rather heavy, deep and moist or even wet soils[269]. Yields are lower on light dry soils and sands[269]. The optimum temperature for growth is 18.3° - 21.6°C varying with day/night temperatures of 15°/10°C and 21°/15°C[269]. Timothy grass is a very variable species that is commonly grown as a hay grass. Several named forms have been developed[17, 269]. A short-lived perennial it is a common cause of hayfever[257]. An attractive addition to the wild flower meadow, the inflorescence dries and dyes well so is used in dried flower displays[200].

### 5.2.924 Geranium macrorrhizum

Bigroot Geranium

4 tin 8 cyuc 0 kcak 0 tcan 1 dwat m hkuc pcmhmimhtut cyulti hgatkycuctup hwicli hrasljutnyik hpa7tli prikwlisslp hpa7tmwatli xre7t hjonli

drutta Geranium macrorrhizum is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.6 m (2ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta None known

tcanta Essential Pot-pourriThe very aromatic leaves have been used in the past as a source of geranium oil[187]. They are used in pot-pourri and perfumery[244]. A good dense ground cover plant[197, 200]. A very effective weed smotherer[187, 190]. Plants grow rampantly, rooting as they

spread[208]. They should be spaced about 60cm apart each way[208].

dwatta AphrodisiacAphrodisiac[61].

propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring or autumn. Very easy, virtually every bit of a divided plant, whether it has roots or not, will grow away and produce roots[190]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Easily grown in dry or moist situations, in sun or light shade[187, 200]. Succeeds even in deep shade[208]. Tolerates a wide range of soil types, succeeding in any moderately fertile retentive soil[200]. Calcicole[50]. Established plants are drought resistant[190]. A very ornamental plant, there are many named varieties[187]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233].

### 5.2.925 Artemisia campestris

Field Southernwood

4 tin 8 cyuc 0 kcak 1 tcan 2 dwat 1.5 m hkuc hmimhtut cyulti hgatkycuctup hwicli hrasljut hpa7tli priklwis hpa7tmwatli hjonli

drutta Artemisia campestris is a PERENNIAL growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from August to September, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta None known

tcanta EssentialThe pulverized roots are aromatic and have been used as a perfume[257].

dwatta Abortifacient Anthelmintic Antiseptic Cholagogue Deobstruent Eczema Emmenagogue Ophthalmic Poulrice Stomachic TonicRelated to the southernwood, A. abrotanum, this species has similar though milder medicinal properties[4]. The herb is anthelmintic, antiseptic, cholagogue, deobstruent, emmenagogue, stomachic and tonic[4, 7, 165]. The main use of this herb is as an emmenagogue, it is also a good stimulant tonic and has some nervine principle[4]. The leaves have been chewed in order to treat stomach problems[257]. The plant was used by some native North American Indian tribes as an abortifacient to terminate difficult pregnancies[257]. Externally, the plant has been crushed and applied to rheumatic joints, eczema, bruises and sores[257]. A poultice of the crushed leaves has been applied to sore eyes[257]. An infusion of the roots has been used, especially on children, as a hair tonic and to treat scalp infections[257]. It has been taken internally to promote urination and bowel movements[257].

propta Seed - surface sow from late winter to early summer in a greenhouse. When large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring or autumn.

nwatta Easily grown in a well-drained circumneutral or slightly alkaline loamy soil, preferring a sunny position[1, 200]. Established plants are drought tolerant[200]. Plants are longer lived, more hardy and more aromatic when they are grown in a poor dry soil[245]. Members of this genus are rarely if ever troubled by browsing deer[233].

### 5.2.926 Euphorbia corollata

Wild Spurge, Flowering spurge

4 tin 8 cyuc 0 kcak 2 tcan 2 dwat 1 m hkuc hmimhtut cyulti kyuctup hwicli hrasljut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Euphorbia corollata is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils. Suitable pH:

press the growth of the nitrogen bacteria by means of a root exudate[201]. The plant is heat tolerant in zones 9 through 6. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is a tap root similar to a carrot going directly down [1-2].

### 6.1.12 Lupinus luteus

Yellow Lupin, European yellow lupine

tfo2n 5 tin 9 cyuc 3 kcak 3 tcan 0 dwat 0.6 m hkuc htut cyulti tcup hwicli hyishrasljut hpa7tli frusflatprik hpa7tmwatli xre7t hjonli

drutta Lupinus luteus is a ANNUAL growing to 0.6 m (2ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to July, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: CoffeeSeed - cooked[2, 46, 105]. Used as a protein-rich vegetable or savoury dish in any of the ways that cooked beans are used. The seed can also be ground into a powder and be mixed with cereal flours for making bread etc[183]. If the seed is bitter this is due to the presence of toxic alkaloids and the seed should not be eaten without treatment[183]. These alkaloids can usually be removed by soaking the seed in 2 or 3 changes of water. Low alkaloid varieties were developed prior to 1930 by Von Sengbusch[183]. The roasted seed is a coffee substitute[183].

tcanta Green manureA good green manure for poor soils, it is quite fast growing and fixes atmospheric nitrogen[50, 61, 87]. It is commonly grown as a soil improver in southern Europe[245].

dwatta None known

propta Pre-soak the seed for 24 hours in warm water and sow in mid spring in situ[1, 200]. You may need to protect the seed from mice. Germination should take place within 2 weeks. The seed can also be sown in situ as late as early summer as a green manure crop.

nwatta An easily grown plant, succeeding in any moderately good soil in a sunny position[1, 200]. Succeeds in poor soils[46]. Requires an acid to neutral soil[200]. Cultivated for its edible seed in Italy[2], there are a number of varieties with sweet tasting seeds[183]. The flowers have a delicious vanilla-like perfume, the cultivar 'Romulus' has been especially mentioned[245]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. When removing plant remains at the end of the growing season, it is best to only remove the aerial parts of the plant, leaving the roots in the ground to decay and release their nitrogen.

### 6.1.13 Wisteria floribunda

Japanese Wisteria

tfo2n 5 tin 9 cyuc 2 kcak 2 tcan 0 dwat 8 m hkuc htut cyulti tcup hwicli hrasljutnyik hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Wisteria floribunda is a deciduous Climber growing to 8 m (26ft) by 8 m (26ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from June to July, and the seeds ripen from September to

October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves SeedEdible Uses: TeaSeed - cooked[105, 177, 183]. When baked in a fire they have much the same flavour as chestnuts[249]. Some caution is advised, see the notes on toxicity at the top of the page. Young leaves - cooked[105, 177, 183]. The tender young leaves are sometimes eaten and are also used as a tea substitute[249]. Flowers - cooked[105, 177, 183]. Used as a food in parts of China[249].

tcanta FibreThe bark is used for making ropes and sandals[249]. The branches can be used as cables and also for making bridges, for which purpose it is said to be very durable[249].

dwatta None known

propta The seed does not exhibit any dormancy habits. It can be sown as soon as it is ripe in a cold frame and should germinate in the spring. Pre-soak stored seed for 24 hours in warm water and then sow in a greenhouse in early spring. The seed can also be sown in an outdoor seedbed in late spring[126]. Germination should take place in the first spring, though it can sometimes be delayed for another 12 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant them out in late spring or early summer. Plants are very slow from seed and can take up to 20 years to come into flower[200]. Basal cuttings of side-shoots in early to mid summer in a frame[200]. Take the cuttings as soon as the new growth has hardened sufficiently, each cutting should have 2 - 3 leaves[249]. It can also help to remove a shallow slice of bark from the bottom 15mm of the cutting to expose extra cambium, since this will encourage more callusing and better rooting[249]. When kept in a mist frame with a bottom heat of 27 - 30°c, they will root within 4 weeks and produce well-established plants by the autumn[249]. Layering in spring. Simply lay any convenient long shoot along the ground and cover it with a shallow layer of soil. The shoot will readily produce roots at intervals along the stem. When these are well formed, the shoot can be divided up into a number of plants. These should be potted up and kept in a lightly shaded position in a greenhouse until well established and can then be planted out as required.

nwatta Landscape Uses:Arbor, Espalier, Pollard. Prefers a good loamy soil in a sunny south or south-west facing position, sheltered from cold winds and from early morning sun on frosty mornings[11, 200]. Plants can become chlorotic on alkaline soils[200]. A soil that is too rich results in excessive foliage at the expense of flowering[200]. Although they are winter hardy to about -20°c[200], when growing in areas with cool summers the plants require the extra summer warmth of a sunny wall if they are to do well[184]. Plants can take a few years to settle down after planting out[219]. Too much shade or too rich a soil are normally the culprits, some form of root restriction can be beneficial[219]. A vigorous climbing plant, supporting itself by twining around shrubs and trees, though it also succeeds as a free-standing shrub, growing to about 2 metres in height. The shoots twine in a clock-wise direction[182]. This species is closely related to *W. sinensis*[50, 126]. Often grown as an ornamental plant, there are many named varieties[182, 200]. The flowers have a strong perfume which can be sweet or musty according to the variety being grown[249]. The plants flower mainly on short spurs so, if removing unwanted side-branches, it is best to cut them back to 2 - 3 leaves rather than removing them completely since this will encourage the formation of flowering spurs[249]. Any drastic pruning is best carried out in the spring, immediately after flowering[249]. Plants are very tolerant of even the most drastic pruning and will re-grow even if cut right back to the base[249]. Plants are self-fertile and usually produce good crops of seeds in cultivation, there are several cultivars such as 'Geisha' and 'Royal Purple' that are particularly good at this[249]. Plants in this genus are notably susceptible to honey fungus[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. The plants also form

tussive, cholagogue, demulcent, emollient, expectorant and laxative[61, 176, 218, 238]. It is used internally in the treatment of Addison's disease, asthma, coughs and peptic ulcers[238]. Externally, it is used to treat acne, boils and sore throats[238]. It is included in almost all Chinese herbal formulae, where it is said to harmonize and direct the effects of the various ingredients[238]. It precipitates many compounds and is therefore considered to be unsuitable for use with some herbs such as *Daphne genkwa*, *Euphorbia pekinensis* and *Corydalis solida*[238]. It increases the toxicity of some compounds such as ephedrine, salicylates, adrenaline and cortisone[238]. It should not be prescribed for pregnant women or for people with high blood pressure, kidney disease or anyone taking digoxin-based medications[238]. Excessive doses cause water retention and high blood pressure[238]. It can cause impotence in some people[238]. The roots are harvested in early autumn, preferably from plants 3- 4 years old, and is dried for later use[238]. The flowers are alterative and expectorant[218].

propta Pre-soak the seed for 24 hours in warm water and then sow spring or autumn in a greenhouse[200]. Prick out the seedlings into individual pots when they are large enough to handle, and grow them on for their first winter in a greenhouse. Plant out in late spring or early summer when in active growth. Plants are rather slow to grow from seed[238]. Division of the root in spring or autumn. Each division must have at least one growth bud. Autumn divisions can either be replanted immediately or stored in clamps until the spring and then be planted out[200]. It is best to pt up the smaller divisions and grow them on in a cold frame until they are established before planting them out in the spring or summer.

nwatta Requires a deep well cultivated fertile moisture-retentive soil for good root production[200]. Prefers a sandy soil with abundant moisture[238]. Slightly alkaline conditions produce the best plants[238]. Plants are hardy to at least -15°c[238]. This species is widely cultivated in China as a medicinal plant. Unless seed is required, the plant is usually prevented from flowering so that it puts more energy into producing good quality roots[238]. A very deep-rooted plant, it can be difficult to eradicate once it is established[238]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. The plant is heat tolerant in zones 10 through 7. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

### 6.1.11 *Trifolium pratense*

Red Clover  
tfo2n 5 thin 9 cyuc 3 ckak 4 tcan 3 dwat 0.6 m hkuc  
htut cyutli tcup hwicli hyishraslutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Trifolium pratense* is a PERENNIAL growing to 0.6 m (2ft) by 0.6 m (2ft in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from May to September, and the seeds ripen from July to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). It can fix Nitrogen. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil. The plant can

tolerates strong winds but not maritime exposure.

kcakta Edible Parts: Flowers Leaves Root SeedEdible Uses: Condiment TeaLeaves and young flowering heads - raw or cooked[2, 55, 105, 183]. The young leaves are harvested before the plant comes into flower, and are used in salads, soups etc[9]. On their own they can be used as a vegetable, cooked like spinach[9].The leaves are best cooked[172]. They can be dried, powdered and sprinkled on foods such as boiled rice[183]. The leaves contain 81% water, 4% protein, 0.7% fat, 2.6% fibre and 2% ash[218]. The seed can be sprouted and used in salads. A crisp texture and more robust flavour than alfalfa (*Medicago sativa*)[183]. The seeds are reported as containing trypsin inhibitors[218]. These can interfere with certain enzymes that help in the digestion of proteins, but are normally destroyed if the seed is sprouted first. Flowers and seed pods - dried, ground into a powder and used as a flour[115]. The young flowers can also be eaten raw in salads[144, 172]. Root - cooked[172, 177]. A delicate sweet herb tea is made from the fresh or dried flowers[21, 55, 183]. The dried leaves impart a vanilla flavour to cakes etc[172].

tcanta Dye Green manure Miscellany Soil reclamationA yellow dye is obtained from the flowers[46, 61]. The plant makes a good green manure, it is useful for over-wintering, especially in a mixture with *Lolium perenne*[54]. Deep rooting, it produces a good bulk[87]. It is a host to 'clover rot' however, so should not be used too frequently[87]. It can be undersown with cereals though it may be too vigorous[87]. It is also grown with grass mixtures for land reclamation, it has good nitrogen fixing properties[200]. A dynamic accumulator gathering minerals or nutrients from the soil and storing them in a more bioavailable form - used as fertilizer or to improve mulch.

dwatta Alternative Antipsoriatic Antiscrophulatic Antispasmodic Aperient Cancer Detergent Diuretic Eczema Expectorant Miscellany Sedative Skin TonicRed clover is safe and effective herb with a long history of medicinal usage. It is commonly used to treat skin conditions, normally in combination with other purifying herbs such as *Arctium lappa* and *Rumex crispus*[254]. It is a folk remedy for cancer of the breast, a concentrated decoction being applied to the site of the tumour in order to encourage it to grow outwards and clear the body[254]. Flavonoids in the flowers and leaves are oestrogenic and may be of benefit in the treatment of menopausal complaints[254]. The flowering heads are alterative, antiscrofulous, antispasmodic, aperient, detergent, diuretic, expectorant, sedative and tonic[4, 21, 165, 218, 238]. It has also shown anticancer activity[172, 218], poultices of the herb have been used as local applications to cancerous growths[4]. Internally, the plant is used in the treatment of skin complaints (especially eczema and psoriasis), cancers of the breast, ovaries and lymphatic system, chronic degenerative diseases, gout, whooping cough and dry coughs[238]. The plant is normally harvested for use as it comes into flower[222, 238] and some reports say that only the flowers are used[4]. The toxic indolizidine alkaloid 'slaframine' is often found in diseased clover (even if the clover shows no external symptoms of disease). This alkaloid is being studied for its antidiabetic and anti-AIDS activity[222].

propta Pre-soak the seed for 12 hours in warm water and then sow in spring in situ. If the seed is in short supply it might be better to sow it in pots in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in late spring. Division in spring[238].

nwatta Succeeds in a moist, well-drained circum-neutral soil in full sun[200]. Prefers a medium-heavy loam[87]. A short-lived perennial[200]. A very hardy plant, tolerating temperatures down to at least -23°c[238]. A very important food plant for the caterpillars of many butterfly and moth species[30]. It is also a good bee plant[54], but not so valuable as the white clover, *T. repens*[4]. It grows well in an apple orchard, the trees will produce tastier fruit that stores better[201]. It should not be grown with camellias or gooseberries because it harbours a mite that can cause fruit drop in the gooseberries and premature budding in the camellias[201]. Very polymorphic, there are many subspecies and varieties. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. Buttercups growing nearby de-

mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta None known  
tcanta This genus has been singled out as a potential source of latex (for making rubber) for the temperate zone, although no individual species has been singled out[141]. Dynamic accumulator.

dwatta Diuretic Purgative Skin UrinaryThe dried root is an excellent purgative, though it sometimes causes vomiting, it opens the body when other more violent purgatives fail to move it[4, 207, 222]. The plant has irritating and uncertain qualities and so is seldom used in herbal medicine[4]. A tea made from the leaves is used in the treatment of diabetes[222]. An infusion of the bruised roots has been taken in the treatment of urinary diseases[257]. The juice of the plant has been rubbed on the skin as a treatment for sores, eruptions etc, especially on children's heads[257]. A decoction of the plant, mixed with other herbs (these are not specified) has been used in the treatment of cancer[257].

propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts.

nwatta Prefers a light well-drained moderately rich loam in an open position[200]. Succeeds in dry soils[1]. Hybridizes with other members of this genus[200]. The ripe seed is released explosively from the seed capsules[200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233].

## 5.2.927 *Stachys germanica*

Downy Woundwort, German hedgenettle  
4 thin 8 cyuc 0 ckak 0 tcan 2 dwat 1 m hkuc  
hmimhtut cyutli tcup hwicli hraslutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Stachys germanica* is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to August, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known  
tcanta PlasterNone known  
dwatta Antiseptic PlasterThe leaves are densely covered with long white silky hairs, they have been used as a substitute for lint in dressing wounds[4]. The thick, lint-like leaves are both soft and strongly antiseptic[245].

propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring.

nwatta Easily grown in any deep, well-drained and moderately fertile soil, preferring a position in full sun[200]. The plant is a short-lived perennial and is sometimes biennial[17]. Closely related to *S. cretica* and *S. byzantina*[200].

## 5.2.928 *Dirca palustris*

Leather Wood, Eastern leatherwood  
4 thin 8 cyuc 0 ckak 0 tcan 2 dwat 1.8 m hkuc  
hmimhtut cyutli tcup hwicli hraslutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Dirca palustris* is a deciduous Shrub growing to 1.8 m (6ft). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower in March. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta Basketry Fibre Hair Paper StringThe tough flexible shoots are used in basket making and as a tying material[1, 11, 43, 46, 95]. A rope can be made from the bark fibres[1, 11, 46, 61]. The bark fibres are also used in making paper[189]. The stems are harvested in summer, the leaves are removed and the stems steamed until the fibres can be stripped. The outer and inner barks are separated by scraping or peeling. The fibres are cooked for 2 hours or less with soda ash and then beaten with mallets or put through a blender. The paper is greenish cream in colour[189]. A compound infusion of the roots has been used as a wash to strengthen the hair and make it grow[257].

dwatta Emetic Laxative Pectoral Poultice VDLeatherwood was employed medicinally by a number of native North American Indian tribes who used it to treat a wide variety of ailments[257]. It is little used in modern herbalism and any use should be carried out with caution since even minute doses can cause salivation and burning of the tongue[222]. A tea made from the bark is laxative[222]. Another report says that it is purgative and emetic, and can produce violent vomiting[235, 257]. An infusion of the roots has been used in the treatment of pulmonary problems[257]. A decoction of the branches has been applied as a poultice to swellings on the limbs[257]. The plant is a folk remedy for toothaches, facial neuralgia and paralysis of the tongue, venereal disease, and has also been used to try and induce pregnancy[222, 257].

propta Seed - best sown in a cold frame as soon as it is ripe[113]. Remove the fruit flesh since this can inhibit germination[113]. Dried seed will require 2 - 3 months cold stratification[113]. The seed usually germinates in 1 - 6 months at 15°c[175]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Layering.

nwatta Thrives in a moist peaty soil[1, 11] and a sheltered position[175]. Prefers a reasonably moist humus-rich limy soil according to another report[182]. The flowers are produced in early spring and they are often damaged by frost[1, 200]. They have a soft sweet perfume[245]. The species *D. occidentalis* A.Gray. is very closely related to this plant[200], so it might have the same uses[K].

## 5.2.929 *Eryngium yuccifolium*

Button Eryngo  
4 thin 8 cyuc 0 ckak 0 tcan 2 dwat 1 m hkuc  
htut cyutli kyuctcup hwicli hyishraslut hpa7tli flatprikliwisslip hpa7tmwatli fyfxre7t hjonli

drutta *Eryngium yuccifolium* is an evergreen Perennial growing to 1 m (3ft 3in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 4. It is in leaf all year, in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta None known  
tcanta None known  
dwatta Diaphoretic Diuretic Emetic Expectorant Febrifuge Infertility SialagogueThe plant is diaphoretic, diuretic, emetic (in large doses), expectorant and febrifuge[46, 61]. A decoction of the roots has been found useful in cases of exhaustion from sexual depletion, with loss of erectile power, seminal emissions and orchitis[207]. A tincture of the roots is used in the treatment of female reproductive disorders[222]. The pounded roots are used as a diuretic[213]. An infusion of them is used to reduce fevers[213]. Chewing the root increases the flow of saliva[222]. The plant is used as an antidote to snakebites[257]. The roots are chewed and applied as a poultice to the bite[213, 274].

propta Seed - best sown as soon as it is ripe in early autumn on the surface of a well-drained compost in a cold frame[200]. The seed can also be sown in spring. It usually germinates in 5 - 90 days at 20°C. When they are large enough to handle, prick the seedlings out into individual

pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in early spring or autumn. Take care since the plant resents root disturbance[200]. Root cuttings in autumn or winter[200].

nwatta Requires a well-drained soil and a sunny position[1]. Prefers a light sandy soil but tolerates most soil types including lime and poor gravels[200]. Plants should be put in their final position whilst small since they resent root disturbance[200]. Where this species is found growing wild in N. America, it is an indicator of native prairie[274].

### 5.2.930 Erysimum cheiranthoides

Wormseed Mustard

4 tin 8 cyuc 0 kcak 0 tcan 1 dwat 1 m hkuc htuc cyutli kyucctup hwicli hyishrasjlutnyik hpa7tli prikIwIs hpa7tmwatli xre7t hjonli

drutta Erysimum cheiranthoides is a ANNUAL growing to 1.5 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta None known

tcanta None known

dwatta Skin VermifugeA drink made from the crushed seed is used as a vermifuge[207]. It is intensely bitter but has been used on children and expels the worms both by vomit and by excretion[4, 207]. A decoction of the root has been applied to skin eruptions[257].

propta Seed - sow in situ in the spring[200]. Germination should take place within 3 weeks.

nwatta Requires a well-drained soil and a sunny position[200]. Dislikes acid soils[200]. Tolerates poor soils[200].

### 5.2.931 Amianthium musciticum

Fly Poison

4 tin 8 cyuc 0 kcak 0 tcan 1 dwat m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikIwIs hpa7tmwatli dyatxre7t hjonli

drutta Amianthium musciticum is a BULB growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from May to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Beetles. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta InsecticideRoot extracts mixed with molasses or honey have been used as a housefly insecticide[270].

dwatta SkinNative Cherokee used the plant as a dermatological cure for itch[270].

propta Seed - best sown as soon as it is ripe in a cold frame[134]. The seed can also be sown in a cold frame in spring[134]. It usually germinates in 1 - 6 months at 15°C, but it can be erratic[138]. Sow the seed thinly so that it does not need to be thinned and allow the seedlings to grow on undisturbed for their first year. Give an occasional liquid feed to ensure that the plants do not become nutrient deficient. When the plants are dormant in late summer, pot up the small bulbs putting 2 - 3 bulbs in each pot. Grow them on for another one or two years in a cold frame before planting them out when dormant in late summer.

nwatta Prefers a deep rich moisture-retentive soil in partial shade[200]. Plants like plenty of moisture in the spring and summer when they are in full growth[200]. Grows well in a woodland garden[200].

### 5.2.932 Artemisia lactiflora

White Mugwort

4 tin 8 cyuc 0 kcak 0 tcan 2 dwat 1.5 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikIwIs hpa7tmwatli xre7t hjonli

drutta Artemisia lactiflora is a PERENNIAL growing to 1.5 m (5ft) by 0.5 m (1ft 8in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from August to October, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta None known

dwatta Emmenagogue TonicWhite mugwort is a bitter aromatic tonic herb. The leaves and flowering stems are used internally in traditional Chinese medicine to treat menstrual and liver disorders[238].

propta Seed - surface sow from late winter to early summer in a greenhouse, making sure that the compost does not dry out[200]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant out in late spring or early summer. Division in spring or autumn. Basal cuttings in late spring. Harvest the young shoots when about10 - 15cm long, pot up in a lightly shaded position in a greenhouse or cold frame and plant them out when well rooted. Very easy.

nwatta Landscape Uses:Border, Container, Seashore, Woodland garden. Easily grown in a well-drained circum-neutral or slightly acid loamy soil, preferring a sunny position and a moisture-retentive soil[200]. Plants are tolerant of light shade[200]. Plants are longer lived, more hardy and more aromatic when they are grown in a poor dry soil[245]. There are some named varieties selected for their ornamental value[200]. Members of this genus are rarely if ever troubled by browsing deer[233]. Special Features:Suitable for dried flowers.

### 5.2.933 Digitalis ferruginea

Rusty Foxglove

4 tin 9 cyuc 0 kcak 0 tcan 2 dwat 1.2 m hkuc

hmimhtut cyutli hgatkycuctup hwicli hrasjlutnyik hpa7tli flatprikIwIs hpa7tmwatli xre7t hjonli

drutta Digitalis ferruginea is a BIENNIAL/PERENNIAL growing to 1.2 m (4ft) by 0.3 m (1ft in) at a medium rate. It is in flower in July, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta None known

tcanta None known

dwatta Cardiac Stimulant TonicThe leaves are cardiac, stimulant and tonic[46, 61]. They are often used in the treatment of certain heart complaints.

propta Seed - surface sow early spring in a cold frame. The seed usually germinates in 2 - 4 weeks at 20°C[175]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Another report says that the seed is best sown in the autumn[188].

nwatta Landscape Uses:Border, Container, Massing, Specimen, Woodland garden. An easily grown plant, succeeding in ordinary garden soil, especially if it is rich in organic matter[1]. It also succeeds in dry soils and, once established, is drought tolerant[188, 190]. It prefers semi-shade but succeeds in full sun if the soil is moist[188, 200]. Plants are hardy to about -15°C[187]. This species is a short-lived perennial[187] and is best grown as a biennial[188]. Members of this genus are rarely if ever troubled by browsing deer and rabbits[233]. Special Features: Attractive foliage, Suitable for cut flowers.

propta Seed - best sown as soon as it is ripe in a cold frame[200]. Pre-soak stored seed for 24 hours in warm water then cold stratify for 3 months[113]. Sow spring in the greenhouse[78]. As soon as they are large enough to handle, prick the seedlings out into individual pots and grow them on in a greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Plants resent root disturbance and are best planted out in their permanent positions as soon as possible[11]. Cuttings of half-ripe wood, July/August in a frame[200].

nwatta Landscape Uses:Specimen. Succeeds in most soils and pH types, but dislikes growing in wet soils, especially when these are of clay[200]. Prefers a deep damp sandy loam and a very sunny position[11, 182]. Succeeds in light shade[200]. Dislikes drought[200]. Repays generous treatment[11]. This species does not flower very freely in Britain. Plants do not thrive at Kew, they prefer a hotter climate[11]. The flowers are produced on the branches of the previous or earlier years, and also on the trunk of the plant[82]. Plants are susceptible to coral spot fungus, especially when growing in areas with cooler summers where the wood is not fully ripened[11]. Plants in this genus are notably resistant to honey fungus[200]. Resents root disturbance, plants should be planted into their permanent positions as soon as possible, preferably in May, and should be kept well watered until established[11]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. Special Features:North American native, Blooms are very showy.

### 6.1.9 Myrica heterophylla

Bayberry

tfo2n 5 tin 9 cyuc 3 kcak 3 tcan 2 dwat 3 m hkuc

hmimhtut cyutli kyucctup hwicli hrasjlutnyik hpa7tli flatprikIwIs hpa7tmwatli nyanhjen hjonli

drutta Myrica heterophylla is an evergreen Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower in May, and the seeds ripen in September. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: FruitEdible Uses: Condiment TeaThe following notes are for the closely related M. cerifera. It is assumed that they also apply to this species[K]. Fruit - raw or cooked[105, 177, 183]. The fruit is about 2 - 4mm in diameter with a single large seed[200]. There is very little edible flesh and this is of poor quality[K]. Leaves and berries are used as a food flavouring[62, 105, 177]. An attractive and agreeable substitute for bay leaves, used in flavouring soups, stews etc[183]. The dried leaves are brewed into a robust tea[183].

tcanta Dye Hedge Hedge Wax WoodThe following notes are for the closely related M. cerifera. It is assumed that they also apply to this species[K]. A wax covering on the fruit is extracted by scalding the fruit with boiling water and immersing them for a few minutes, the wax floats to the surface and is then skimmed off. The fruit is then boiled in water to extract the wax from the pulp and once more the wax is skimmed off. It is then strained through a muslin cloth and can be used to make aromatic candles, sealing wax etc[1, 4, 6, 11, 62, 95, 171, 245]. Candles made from this wax are quite brittle but are less greasy in warm weather[213]. They are slightly aromatic, with a pleasant balsamic odour[245], and do not smoke when put out, making them much more pleasant to use that wax or tallow candles[213]. The wax is also used in making soaps[213]. About 1 kilo of wax can be obtained from 4 kilos of berries[4]. A blue dye is obtained from the fruit[6]. The plant can be grown as an informal hedge[200], succeeding in windy sites[K]. Wood - light, soft,

brittle, fine-grained[82, 227]. The wood weighs 35lb per cubic foot[227]. It is of no commercial value[229].

dwatta Astringent Dysentery Emetic Stimulant TonicThe following notes are for the closely related M. cerifera. It is assumed that they also apply to this species[K]. The root bark is astringent, emetic (in large doses), sternutatory, stimulant and tonic[4, 21, 46, 165, 213]. It is harvested in the autumn, thoroughly dried then powdered and kept in a dark place in an airtight container[4]. It is used internally in the treatment of diarrhoea, jaundice, fevers, colds, influenza, catarrh, excessive menstruation, vaginal discharge etc[4, 238]. Externally, it is applied to indolent ulcers, sore throats, sores, itching skin conditions, dandruff etc[4, 238]. The wax is astringent and slightly narcotic[4]. It is regarded as a sure cure for dysentery and is also used to treat internal ulcers[4]. A tea made from the leaves is used in the treatment of fevers and externally as a wash for itchy skin[222].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame[78]. Stored seed germinates more freely if given a 3 month cold stratification and then sown in a cold frame[78]. Germination is usually good[78]. Prick out the seedlings into individual pots when they are large enough to handle and grow on in a cold frame for the first winter. Plant out in late spring or early summer[K]. Cuttings of half-ripe wood, 5 - 8cm with a heel, July/August in a frame. Pot up and overwinter in a cold frame then plant out in late spring or early summer. Fair to good percentage[78]. Layering in spring[200].

nwatta Prefers a moist soil[200]. Grows well in an open position in a well-drained soil in sun or light shade[200]. Thrives in any ordinary garden soil according to one report[11] whilst another says that it thrives in an acid soil[182]. Prefers a lime-free loamy or peaty soil[1]. Succeeds in dry and maritime climates[200]. Closely related to M. pensylvanica and M. cerifera[200]. Dioecious, male and female plants must be grown if seed is required. Plants in this genus are notably resistant to honey fungus[200]. Many species in this genus have a symbiotic relationship with certain soil micro-organisms, these form nodules on the roots of the plants and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

### 6.1.10 Glycyrrhiza uralensis

Gan Cao

tfo2n 5 tin 9 cyuc 3 kcak 3 tcan 4 dwat 0.6 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikIwIs hpa7tmwatli xre7t hjonli

drutta Glycyrrhiza uralensis is a PERENNIAL growing to 0.6 m (2ft) by 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to August, and the seeds ripen from July to October. The species is hermaphrodite (has both male and female organs). It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: SweetenerThe fibrous root is used as a sweetener for foods[183]. It is boiled in water to extract the sugars etc and used as a liquorice substitute in sweets, medicines, drinks etc[74, 174, 177]. The root contains glycyrrhizin, which is 50 times sweeter than sugar[218].

tcanta Fire retardant InsulationLiquorice root, after the medicinal and flavouring compounds have been removed, is used in fire extinguishing agents, to insulate fibreboards and as a compost for growing mushrooms[218]. Nitrogen fixer. A dynamic accumulator gathering minerals or nutrients from the soil and storing them in a more bioavailable form - used as fertilizer or to improve mulch.

dwatta Antiphlogistic Antispasmodic Antitussive Cholagogue Emollient ExpectorantGan Cao is commonly used in Chinese herbalism, where it is considered to be one of the 50 fundamental herbs[218]. It is considered to be second in importance only to Ginseng (Panax spp)[218]. Used in excess, however, it can cause cardiac dysfunction and severe hypertension[218]. The root is a sweet tonic herb that stimulates the corticosteroidal hormones, neutralizes toxins and balances blood sugar levels[238]. It is also antibacterial, anti-inflammatory, antiphlogistic, antispasmodic, anti-

the seed[21, 183].

tcanta Cosmetic Dye Essential Green manure Hair Par-  
asiticideAn essential oil is obtained from the seed - used as a  
food flavouring and medicinally. The dried plant has a strong  
aroma of hay[4]. The crushed seed, mixed with oil and mas-  
saged into the scalp, is recommended for glossy hair[244].  
An infusion of the seed, used as a skin lotion, is said to be  
good for the complexion[244]. A good green manure crop,  
it is fast growing and vigorous[200], producing a lot of bulk  
and fixing a large quantity of atmospheric nitrogen[87]. A  
yellow dye is obtained from the seed[61].

dwatta Anticholesterolemic Antinflammatory Antiphlo-  
gistic Antitumor Appetizer Cardiotoxic Carminative Demul-  
cent Deobstruent Diuretic Emollient Expectorant Febrifuge  
Galactogogue Hypoglycaemic Hypotensive Laxative Parasiti-  
cide RestorativeFenugreek is much used in herbal medicine,  
especially in North Africa, the Middle East and India. It has  
a wide range of medicinal applications[254]. The seeds are  
very nourishing and are given to convalescents and to en-  
courage weight gain, especially in anorexia nervosa[254].  
The seeds should not be prescribed medicinally for preg-  
nant women since they can induce uterine contractions[238,  
254]. Research has shown that the seeds can inhibit can-  
cer of the liver, lower blood cholesterol levels and also have  
an antiadipic effect[254]. The seed and leaves are anti-  
cholesterolemic, anti-inflammatory, antitumor, carminative,  
demulcent, deobstruent, emollient, expectorant, febrifuge,  
galactogogue, hypoglycaemic, laxative, parasiticide, restora-  
tive and uterine tonic[4, 7, 21, 147, 165, 176, 238]. The  
seed yields a strong mucilage and is therefore useful in the  
treatment of inflammation and ulcers of the stomach and in-  
testines[4, 254]. Taken internally, a decoction of the ground  
seeds serves to drain off the sweat ducts[7]. The seed is very  
nourishing and body-building and is one of the most effica-  
cious tonics in cases of physical debility caused by anaemia  
or by infectious diseases, especially where a nervous fac-  
tor is involved[7, 244]. It is also used in the treatment of  
late-onset diabetes, poor digestion (especially in conva-  
lescence), insufficient lactation, painful menstruation, labour  
pains etc[238, 244]. The seeds freshen bad breath and re-  
store a dulled sense of taste[254]. Externally, the seeds can  
be ground into a powder and used as a poultice for abscesses,  
boils, ulcers, burns etc, or they can be used as a douche  
for excessive vaginal discharge[4, 244, 254]. The leaves are  
harvested in the growing season and can be used fresh or  
dried[238]. The seeds are harvested when fully ripe and  
dried for later use[238]. Compounds extracted from the plant  
have shown cardiotoxic, hypoglycaemic, diuretic, antiphlo-  
gistic and hypotensive activity[218]. One of its constituent  
alkaloids, called 'trigonelline', has shown potential for use  
in cancer therapy. The seed contains the saponin diosgenin,  
an important substance in the synthesis of oral contracep-  
tives and sex hormones[244], whilst saponins in the plant  
have been extracted for use in various other pharmaceuti-  
cal products[238]. The German Commission E Monographs,  
a therapeutic guide to herbal medicine, approve *Trigonella*  
foenum-graecum for loss of appetite, inflammation of the skin  
(see [302] for critics of commission E).

propta Pre-soak the seed for 12 hours in warm water and  
then sow in spring in situ.

nwatta Succeeds in ordinary garden soil[1], preferring  
a well-drained loamy soil in full sun[200]. Requires a warm,  
sheltered position in Britain[244]. Plants are hardy to about  
-15°c[238]. Fenugreek is widely cultivated for its edible  
seed in warm temperate and tropical regions, there are some  
named varieties[183]. Seed production is more problematic  
in Britain due to the cooler and moister summers. The seed  
is ripened intermittently over a period of some weeks mak-  
ing harvesting more complicated[87]. Plants take about 16  
weeks to mature in warmer climes, probably about 4 weeks  
longer in Britain[200]. This species has a symbiotic relation-  
ship with certain soil bacteria, these bacteria form nodules  
on the roots and fix atmospheric nitrogen. Some of this ni-  
trogen is utilized by the growing plant but some can also be  
used by other plants growing nearby[200]. When removing  
plant remains at the end of the growing season, it is best to  
only remove the aerial parts of the plant, leaving the roots in  
the ground to decay and release their nitrogen.

## 6.1.7 Gleditsia japonica

tfo2n 5 tlin 9 cyuc 3 kcaak 0 tcan 1 dwat 20 m hkuc  
htut cyutli hgatkuyctup hwicli hrasjlutnyik hpa7tli flatprikl-  
wis hpa7tmwatli xre7t hjonli

drutta Gleditsia japonica is a deciduous Tree growing  
to 20 m (65ft) by 12 m (39ft) at a medium rate. See above  
for USDA hardiness. It is hardy to UK zone 6. The species  
is hermaphrodite (has both male and female organs) and is  
pollinated by Insects. It can fix Nitrogen. Suitable for: light  
(sandy), medium (loamy) and heavy (clay) soils and prefers  
well-drained soil. Suitable pH: mildly acid, neutral and basic  
(mildly alkaline) soils. It cannot grow in the shade. It prefers  
dry or moist soil and can tolerate drought. It can tolerate  
atmospheric pollution.

kcaakta Edible Parts: Leaves SeedEdible Uses: Seed -  
cooked. The seed is roasted, dehusked, soaked until soft then  
boiled and eaten with sugar[179]. The seed contains 22.4%  
protein and 2.8% fat[218]. Young leaves - cooked[105]. A  
famine food used when all else fails[177].

tcanta SoapA soap is obtained from the pulp contained  
in the seedpods[11, 46, 61, 174]. It is obtained from the seed  
according to another report[105]. Wood - strong, durable,  
coarse-grained[82].

dwatta Antitussive Astringent Expectorant Haemostatic  
Skin VDAntitussive, astringent, expectorant, haemostatic,  
skin[174]. Treats syphilitic skin diseases[174].

propta Seed - pre-soak for 24 hours in warm water and  
then sow in spring in a greenhouse[78]. The seed should  
have swollen up, in which case it can be sown, if it has not  
swollen then soak it for another 24 hours in warm water. If  
this does not work then file away some of the seed coat but  
be careful not to damage the embryo[78]. Further soaking  
should then cause the seed to swell. One it has swollen, the  
seed should germinate within 2 - 4 weeks at 20°c. As soon as  
they are large enough to handle, prick the seedlings out into  
individual deep pots and plant them out into their permanent  
positions in the summer. Give the plants some protection  
from the cold for their first few winters outdoors.

nwatta Easily grown in a loamy soil, requiring a sunny  
position[11]. Succeeds in most soils[200]. Tolerates drought  
once established[1] and atmospheric pollution[200]. A  
rather tender plant, especially when young, it is seen at its  
best in southern Britain[11]. Older trees, however, are com-  
pletely hardy in Britain[11]. Trees at Kew produced lots  
of pods and fertile seeds in the hot summer of 1989, they  
also fruited well in the cool summer of 1993 and also in  
1994, 95 and 96[K]. Trees are cultivated for their seedpods  
in Japan[61]. Trees have a light canopy, they come into leaf  
late in the spring and drop their leaves in early autumn[200]  
making them an excellent canopy tree for a woodland gar-  
den. Plants in this genus are notably resistant to honey fun-  
gus[200]. This species has a symbiotic relationship with cer-  
tain soil bacteria, these bacteria form nodules on the roots  
and fix atmospheric nitrogen. Some of this nitrogen is uti-  
lized by the growing plant but some can also be used by other  
plants growing nearby[200].

## 6.1.8 Cercis occidentalis

Western Redbud, California Redbud  
tfo2n 5 tlin 9 cyuc 3 kcaak 3 tcan 0 dwat 4.5 m hkuc  
hmimhtut cyutli kyucup hwicli hrasjlut hpa7tli flatpriklwis  
hpa7tmwatli xre7t hjonli

drutta Cercis occidentalis is a deciduous Shrub growing  
to 4.5 m (14ft 9in) at a medium rate. See above for USDA  
hardiness. It is hardy to UK zone 7 and is not frost tender.  
It is in flower from April to May. The species is hermaphrodite  
(has both male and female organs) and is pollinated by Bees.  
It can fix Nitrogen. It is noted for attracting wildlife. Suit-  
able for: light (sandy) and medium (loamy) soils and prefers  
well-drained soil. Suitable pH: mildly acid, neutral and bas-  
ic (mildly alkaline) soils. It can grow in semi-shade (light  
woodland) or no shade. It prefers dry or moist soil.

kcaakta Edible Parts: Flowers Seed SeedpodEdible  
Uses: Flowers - raw. Added to salads[183], they have a  
pleasant acid taste[K]. The flower buds are pickled like ca-  
pers[183]. Seedpods - roasted[161, 177, 183]. The pods are  
up to 9cm long[229]. Seed - cooked[183].

tcanta Nitrogen Fixer

dwatta None known

## 5.2.934 Verbascum nigrum

Dark Mullein, Black mullein  
4 tlin 8 cyuc 0 kcaak 2 tcan 3 dwat 1 m hkuc  
htut cyutli kyucup hwicli hrasjlutnyik hpa7tli flatprikl-  
wisslip hpa7tmwatli fyfxfre7t hjonli

drutta Verbascum nigrum is a BIENNIAL/PERENNIAL  
growing to 1 m (3ft 3in) by 0.6 m (2ft). See above for USDA  
hardiness. It is hardy to UK zone 5. It is in flower from  
June to October, and the seeds ripen from August to Octo-  
ber. The species is hermaphrodite (has both male and fe-  
male organs) and is pollinated by Flies, Lepidoptera (Moths  
and Butterflies). The plant is self-fertile. Suitable for: light  
(sandy), medium (loamy) and heavy (clay) soils and prefers  
well-drained soil. Suitable pH: mildly acid, neutral and basic  
(mildly alkaline) soils and can grow in very alkaline soils. It  
cannot grow in the shade. It prefers dry or moist soil.

kcaakta None known

tcanta Dynamic accumulator

dwatta Anodyne Antiseptic Demulcent Diuretic Expec-  
torant PectoralThe flowers and leaves are anodyne, antiseptic,  
astringent, demulcent, emollient, expectorant, pectoral  
and vulnerary[21, 238]. An infusion is used internally in  
the treatment of various respiratory complaints including  
coughs, bronchitis, asthma and throat irritations[238]. An  
infusion of the fresh or dried flowers in olive oil is used to  
treat earaches, sores, wounds, boils etc[238]. The plant is  
harvested when in flower and should be dried quickly and  
with care or it will lose its medicinal qualities[238].

propta Seed - sow late spring to early summer in a cold  
frame and only just cover the seed[200]. Germination usually  
takes place within 2 - 3 weeks. When they are large enough to  
handle, prick out the seedlings into individual pots and plant  
them out in late summer. The seed has a long viability[200].  
Division in spring. This plant is a short-lived perennial that  
grows away very well from seed, so we do not try and divide  
it.

nwatta An easily grown plant, it succeeds in most well-  
drained soils, including dry ones, preferring a sunny posi-  
tion[111, 200]. Dislikes shade and wet soils[124, 200].  
Plants only really thrive when they are grown on chalky  
soils[200]. Prefers a light soil[200]. This species is fairly  
reliably perennial[200], but only when grown on light or  
medium soils[111]. A very ornamental plant, it often self-  
sows[1, 111]. Hybridizes with other members of this genus,  
though the progeny are usually sterile[200]. In garden de-  
sign, as well as the above-ground architecture of a plant, root  
structure considerations help in choosing plants that work  
together for their optimal soil requirements including nutri-  
ents and water. The root pattern is fleshy. Thick or swollen  
- fibrous or tap root [2-1].

## 5.2.935 Daphne genkwa

Lilac Daphne  
4 tlin 8 cyuc 0 kcaak 0 tcan 3 dwat 1.5 m hkuc  
hmimhtut cyutli tcup hwicli jlutnyik hpa7tli flatprikl

drutta Daphne genkwa is a deciduous Shrub growing to  
1.5 m (5ft) by 1.5 m (5ft). See above for USDA hardiness.  
It is hardy to UK zone 5. It is in flower from April to May.  
The species is hermaphrodite (has both male and female or-  
gans) and is pollinated by Bees, flies, Lepidoptera (Moths and  
Butterflies). Suitable for: medium (loamy) and heavy (clay)  
soils. Suitable pH: mildly acid and neutral soils. It can grow  
in semi-shade (light woodland) or no shade. It prefers moist  
soil.

kcaakta None known

tcanta None known

dwatta Abortifacient Anticoagulant Antiseptic Antitus-  
sive Antiviral Diuretic Purgative Stomachic VesicantThis  
plant has a history of herbal use going back over 3,500  
years[238]. It is commonly used in Chinese herbalism, where  
it is considered to be one of the 50 fundamental herbs[218].  
The flower buds are a bitter acrid herb that is used to control  
coughs. The buds are anticoagulant, antiseptic, antitussive,  
antiviral, diuretic, purgative and stomachic[147, 174, 175,  
176, 178, 218]. They are used internally in the treatment  
of bronchitis, constipation, oedema and skin diseases[238].  
The buds are also used as an abortifacient[238]. They are ap-  
plied externally in the treatment of frostbite[238]. The buds

are harvested and dried in the spring[238] and are used af-  
ter they have been stored for several years[174]. The root is  
abortifacient, anticoagulant, diuretic, purgative and vesi-  
cant[218].

propta Seed - best sown in a greenhouse as soon as it is  
ripe with the pot sealed in a polythene bag to hold in the  
moisture. Remove this bag as soon as germination takes  
place[164]. The seed usually germinates better if it is har-  
vested 'green' (when it has fully developed but before it dries  
on the plant) and sown immediately. Germination should nor-  
mally take place by spring, though it sometimes takes a fur-  
ther year. Stored seed is more problematic. It should be  
warm stratified for 8 - 12 weeks at 20°c followed by 12 - 14  
weeks at 3°c. Germination may still take another 12 months  
or more at 15°c[164]. Prick out the seedlings into individual  
pots as soon as they are large enough to handle. Grow the  
plants on in the greenhouse for their first winter and then  
plant out in spring after the last expected frosts. Cuttings  
of half-ripe wood, July/August in a frame. Root cuttings, De-  
cember in a greenhouse.

nwatta There is some disagreement over whether this  
species needs an acid or alkaline soil. According to some  
reports it requires a lime-free porous soil and semi-shade[1,  
200] whilst another report says that it is probably best in  
a deep rubbly well-drained soil in a warm corner and kept  
well watered in a dry growing season[11]. Yet another report  
says that it grows best in a neutral to alkaline soil in sun or  
semi-shade[238]. A good sandy loam suits most members of  
this genus[11]. Plants are hardy to about -20°c, but they are  
short-lived and difficult to grow in cultivation in Britain[11,  
184]. This might be because our summers are not warm  
enough for the plants to develop properly[11, 184], they  
seem to be fully hardy after hot summers[188]. It is tricky  
to get this plant to flower because the buds are formed in the  
autumn on wood of that year's growth and they may not sur-  
vive our variable winters[11, 182]. Produces suckers when  
growing in its native habitat. Plants are best grown on their  
own roots, grafted plants tend to be unsatisfactory. Plants  
are resentful of root disturbance and should be planted into  
their permanent positions as soon as possible[188].

## 5.2.936 Stratiotes aloides

Water Soldier  
4 tlin 8 cyuc 0 kcaak 0 tcan 1 dwat 1 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis  
hpa7tmwatli xre7t hjonli

drutta Stratiotes aloides is a PERENNIAL growing to 1  
m (3ft 3in) by 1 m (3ft 3in). See above for USDA hardiness.  
It is hardy to UK zone 5. It is in flower from June to August.  
The species is hermaphrodite (has both male and female organs).  
Suitable for: light (sandy), medium (loamy) and heavy (clay)  
soils. Suitable pH: mildly acid, neutral and basic (mildly al-  
kaline) soils. It can grow in semi-shade (light woodland) or  
no shade. It prefers moist soil.

kcaakta None known

tcanta None known

dwatta The herb has had a high reputation for treating  
wounds, especially when these are made by an iron imple-  
ment. It is applied externally[4]. The plant is also said to  
be of use in the treatment of St. Anthony's Fire and also of  
bruised kidneys[4].

propta Seed - best sown in situ as soon as it is ripe. The  
seed is seldom if ever produced in Britain[17]. Division at  
almost any time of the year, though spring is best.

nwatta A water plant, it requires a neutral to alkaline  
water[200]. The herb is submerged at most times of the  
year, rising to the surface only when it is flowering[17]. The  
leaves accumulate calcium carbonate and by the autumn  
this makes them heavy enough to sink to the bottom of the  
pond. The new leaves in spring do not have this calcium car-  
bonate and so rise to the surface[200]. A vigorous-growing  
plant, it will tend to swamp out other plants when grown in  
a small pond[200]. Plants are dioecious, male and female  
plants must be grown if seed is required[17]. Only the fe-  
male plant occurs naturally in Britain, though plants with  
hermaphrodite flowers are also found occasionally[17]. Seed  
is never set in Britain, the plants increasing mainly by off-  
sets[17].

## 5.2.937 Rhododendron ferrugineum

Alpenrose

4 tlin 8 cyuc 0 kcaak 0 tcan 1 dwat 1.5 m hkuc  
hminhtut cyutli tcup hwicli hrasjlut hpa7tli frusflat  
hpa7tmwatli xre7t hjonli

drutta Rhododendron ferrugineum is an evergreen Shrub growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 4. It is in leaf all year, in flower in June, and the seeds ripen in August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta HerbicidePlants can be grown as ground cover when spaced about 1 metre apart each way[208]. Some substances in this plant have shown herbicidal activity, though more research needs to be carried out[7].

dwatta Antirheumatic Diaphoretic Diuretic HomeopathyThe flowers, leaves and the galls are antirheumatic, diaphoretic and diuretic[7, 9, 61]. It is used in the treatment of certain forms of arthritis and rheumatism, but can cause diarrhoea and vomiting so should only be used with expert supervision[9]. A homeopathic remedy is made from the plant[7]. It is used in treating a variety of complaints involving flatulence[7].

propta Seed - best sown in a greenhouse as soon as it is ripe in the autumn and given artificial light. Alternatively sow the seed in a lightly shaded part of the warm greenhouse in late winter or in a cold greenhouse in April. Surface-sow the seed and do not allow the compost to become dry[200]. Pot up the seedlings when they are large enough to handle and grow on in a greenhouse for at least the first winter. Layering in late July. Takes 15 - 24 months[78]. Cuttings of half-ripe wood, August in a frame. Difficult[78].

nwatta Succeeds in a most humus-rich lime-free soils except those of a dry arid nature or those that are heavy or clayey[1]. Prefers a peaty or well-drained sandy loam[1]. Succeeds in sun or shade, the warmer the climate the more shade a plant requires[200]. A pH between 4.5 and 5.5 is ideal[1]. This species grows better in the midlands and north Britain, disliking the hotter conditions in the south[11]. Succeeds in a woodland though, because of its surface-rooting habit[200], it does not compete well with surface-rooting trees[1]. Plants need to be kept well weeded, they dislike other plants growing over or into their root system, in particular they grow badly with ground cover plants, herbaceous plants and heathers[200]. Plants form a root ball and are very tolerant of being transplanted, even when quite large, so long as the root ball is kept intact[200]. Plants in this genus are notably susceptible to honey fungus[200].

## 5.2.938 Corydalis vaginans

4 tlin 8 cyuc 0 kcaak 0 tcan 1 dwat m hkuc  
hminhtut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis  
hpa7tmwatli fyfxxre7t hjonli

drutta Corydalis vaginans is a ANNUAL/BIENNIAL. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta None known

dwatta OphthalmicThe sap of the plant is used in the treatment of eye diseases[240].

propta Seed - surface sow in situ in the spring[222].

nwatta Prefers a moist, well-drained rather light soil, thriving in semi-shade[1]. Grows well in a woodland garden or peat bed. Plants in this genus seem to be immune to the predations of rabbits[233].

## 5.2.939 Daphne mezereum

Mezereon, Paradise plant, February Daphne

4 tlin 7 cyuc 0 kcaak 0 tcan 2 dwat m hkuc  
hmin cyutli tcup hwicli jlytnyikfrip hpa7tli flatpriklwis  
hpa7tmwatli fyfxxre7t hjonli

drutta Daphne mezereum is a deciduous Shrub growing to 1.5 m (5ft) by 1.5 m (5ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from February to March, and the seeds ripen from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). The plant is self-fertile. It is noted for attracting wildlife. Suitable for: medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: OilEdible Uses: OilNone known

tcanta Dye OilA yellow to greenish-brown dye is obtained from the leaves, fruit and bark[13]. The seed contains up to 31% of a fatty oil[74]. No further details are given.

dwatta Antirheumatic Antiseborrhic Cancer Cathartic Diuretic Emetic Homeopathy Rubefacient Stimulant VesicantMezereum has been used in the past for treating rheumatism and indolent ulcers, but because of its toxic nature it is no longer considered to be safe[238]. The plant contains various toxic compounds, including daphnetoxin and mezerein, and these are currently being investigated (1995) for their anti-leukaemia effects[238, 254]. The bark is cathartic, diuretic, emetic, rubefacient, stimulant and vesicant[4, 7, 9, 21, 46]. The root bark is the most active medically, but the stem bark is also used[4]. It has been used in an ointment to induce discharge in indolent ulcers[4] and also has a beneficial effect upon rheumatic joints[254]. The bark is not usually taken internally and even when used externally this should be done with extreme caution and not applied if the skin is broken[4, 21, 254]. The bark is harvested in the autumn and dried for later use[7]. The fruits have sometimes been used as a purgative[4]. A homeopathic remedy is made from the plant[7]. It is used in the treatment of various skin complaints and inflammations[7, 9].

propta Seed - best sown in a greenhouse as soon as it is ripe with the pot sealed in a polythene bag to hold in the moisture. Remove this bag as soon as germination takes place[164]. The seed usually germinates better if it is harvested 'green' (when it has fully developed but before it dries on the plant) and sown immediately. Germination should normally take place by spring, though it sometimes takes a further year. Stored seed is more problematic. It should be warm stratified for 8 - 12 weeks at 20°C followed by 12 - 14 weeks at 3°C. Germination may still take another 12 months or more at 15°C[164]. Prick out the seedlings into individual pots as soon as they are large enough to handle. Grow the plants on in the greenhouse for their first winter and then plant out in spring after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame. Layering.

nwatta Landscape Uses:Border, Foundation, Specimen. A good sandy loam suits most members of this genus[11]. Prefers a good heavy soil and some shade[31, 49]. Prefers a calcareous soil[13, 17, 19] and cool moist conditions[11, 49]. There is no evidence to suggest it requires a calcareous soil, but all members of this genus do well on acid soils[11]. A very ornamental plant[1], it is hardy to about -30°C[184]. Plants tend to be short-lived in cultivation, probably due to excessive seed bearing[11, 200]. Plants are resentful of root disturbance and should be planted into their permanent positions as soon as possible[188]. They also resent being cut and so should not be pruned unless it is essential[245]. A good bee plant, providing a source of nectar very early in the year[108]. The flowers have a delicious sweet perfume[245]. Special Features:Attractive foliage, Not North American native, Naturalizing, All or parts of this plant are poisonous, Fragrant flowers, Attractive flowers or blooms.

## 5.2.940 Eupatorium cannabinum

Hemp Agrimony

4 tlin 8 cyuc 0 kcaak 0 tcan 3 dwat 1.5 m hkuc  
hminhtut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flatpriklwis  
hpa7tmwatli fyfxxre7t hjonli

and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil and can tolerate drought.

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Root - cooked[105, 171]. Rich in starch[109]. The root can be up to 1.8 metres long[174] and has been known to weigh 35 kilos or more[269]. The root contains about 10% starch, this can be extracted and used as a crispy coating in deep fried foods, or for thickening soups etc[174, 183]. It can also be made into noodles, or like agar or gelatine is used as a gelling agent for salads[183]. This plant is a staple food in Japan, the peeled root contains about 2.1% protein, 0.1% fat, 27.1% carbohydrate, 1.4% ash[179]. The starch of the roots contains (per 100 g) 340 calories, 16.5 percent moisture, 0.2 g protein, 0.1 g fat, 83.1 g total carbohydrate, 0.1 g ash, 35 mg Ca, 18 mg P, 2.0 mg Fe, and 2 mg Na[269]. A nutritional analysis for the whole root is available. Flowers - cooked or made into pickles[183]. Stems and young leaves - raw or cooked[105]. A very nutritious food, the fresh young shoots taste like a cross between a bean and a pea[183]. The cooked leaves contain (per 100 g) 36 calories, 89.0 percent moisture, 0.4 g protein, 0.1 g fat, 9.7 g total carbohydrate, 7.7 g fiber, 0.8 g fat, 34 mg Ca, 20 mg P, 4.9 mg Fe, 0.03 mg thiamin, 0.91 mg riboflavin, 0.8 mg niacin[269].

tcanta Fibre Fodder Paper Soil reclamation Soil stabilizationA tough, strong fibre from the stems is used to make ropes, cables, coarse cordage and textiles[61, 109, 151, 169, 189]. The fibre is 2 - 3mm long and can be used to make paper. Straight first year stems, 2 - 2.7 metres long, are harvested in mid summer, the leaves are removed and the stems steamed until the fibres can be stripped. The fibres are then cooked for 2 hours with lye, tough vines might require 4 hours cooking, and the fibre put in a ball mill for 3 hours. The resulting paper is greenish/cream in colour[189]. Can be used as a ground cover plant in a sunny position[188]. Plants have an extensive root system which can be 1.8 metres deep, they are used for erosion control and for rebuilding depleted soils[171, 174]. A member of the Leguminosae, so it adds nitrogen to the soil through the actions of root bacteria.

dwatta Antidiarrhoeal Antidote Antiemetic Antihistamine Antineoplastics Antipruritic Antipsoriatic Antipyretic Antispasmodic Antivinous Cardiac Demulcent Depurative Diaphoretic Dysentery Fibrifuge Galactogogue Hypoglycaemic Hypotensive StypticThe kudzu vine, known as Ge Gen in China, is commonly used in Chinese herbalism, where it is considered to be one of the 50 fundamental herbs[218]. Recent research has shown that compounds called 'daidzin' and 'daidzein', which are contained in the roots and the flowers, are a safe and effective method for treating alcohol abuse[238]. They work by suppressing the appetite for alcohol, whereas existing treatments interfere with the way the alcohol is metabolised and can cause a build-up of toxins[238]. The plant is often used in combination with Chrysanthemum x morifolium in treating alcohol abuse[254]. The flowers and the roots are antidote, antiemetic, antipyretic, antispasmodic, demulcent, diaphoretic, digestive, fibrifuge, hypoglycaemic and hypotensive[174, 176, 218, 222, 238]. A concoction of the flowers and tubers is used to treat alcoholism, fever, colds, diarrhoea, dysentery, acute intestinal obstruction etc[174, 176, 218, 222]. It is useful in the treatment of angina pectoris and migraine[218]. The root is frequently used as a remedy for measles, often in combination with Cimicifuga foetida[254]. The root contains puerarin. This increases the blood flow to the coronary artery and protects against acute myocardial ischaemia caused by the injection of pitiuitrin[176]. The root can be harvested from the autumn to the spring and is used fresh or dried[238]. The flowers are harvested just before they are fully open and are dried for later use[238]. The stems are galactogogue and are also applied as a poultice to incipient boils, swellings, sore mouths etc[218, 222]. The seed is used in the treatment of hangover and dysentery[218, 222]. The leaves are styptic[218].

propta Pre-soak the seed for 12 hours in warm water and sow in a warm greenhouse in early spring. Germination should take place within 2 weeks. Prick out the seedlings into individual pots when they are large enough to handle and plant them out after the last expected frosts[200]. Cover the young plants with a frame or cloche until they are growing away well. Division of young shoots from the crown. The young shoots are removed in the spring with some of the underground part of the stem, preferably with some roots already formed. They are potted up and will usually develop

new roots from the nodes. They are planted out in the summer if growth is sufficient, otherwise they are grown on in pots for a year and planted out late the following spring.

nwatta Agroforestry Services: Nitrogen Fodder: Bank Fodder: Pasture Industrial Crop: Fiber Management: Hay Minor Global Crop Staple Crop: ProteinGrows best on well-drained loam soil of good fertility[269]. Succeeds in most well-drained soils in a sunny position[200], though it does not make good growth on very light poor sand or on poorly drained heavy clay[269]. Plants cannot stand waterlogging on any soil[269]. A deep-rooted plant, once established it is very drought resistant[171, 269]. The plant is reported to tolerate an annual precipitation in the range of 97 to 214cm, an annual mean temperature in the range of 12.2 to 26.7°C, and a pH of 5.0 to 7.1[269]. Plants are hardy to about -15°C, they can resprout from the base if they are cut down by frosts[200]. A twining plant, the top growth is not generally hardy in Britain and plants do not always flower here[1]. Plants can be grown as annuals in Britain, the seed is started off in a greenhouse and is planted out after the last frosts[1]. They can grow up to 6 metres in their first year and make good temporary screens[1]. The plant succeeds outdoors in Berlin, but it has to be propagated vegetatively there[74]. This plant is cultivated for its edible root in Japan and China[183]. The flowers have a sweet vanilla scent[245]. When grown in warmer climates than Britain the root can be invasive and plants have become weeds[182, 219]. Introduced into the southern N. American states in 1876 as a soil stabilizer, the plant has spread very widely (it can grow up to 30cm in a day), has swamped out native vegetation, including large trees. It is considered to be one of the most obnoxious weeds in that region[274]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

## 6.1.6 Trigonella foenum

Fenugreek, Sicklefruit fenugreek

tfo2n 5 tlin 9 cyuc 4 kcaak 0 tcan 5 dwat 0.6 m hkuc  
htut cyutli kyuctup hwicli hrasjlutnyik hpa7tli flatpriklwis  
hpa7tmwatli xre7t hjonli

drutta Trigonella foenum-graecum is a ANNUAL growing to 0.6 m (2ft) by 0.4 m (1ft 4in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Leaves Seed SeedpodEdible Uses: Coffee Condiment TeaSeed - cooked or sprouted and eaten raw[2, 4, 21, 34]. It has quite a strong spicy flavour, not unlike lovage or celery[4, 183]. When ground into a powder, the seed is a principal ingredient of curries and mango chutney[244], it is also used in pickles and spice mixes, as a flavouring in bread etc[4, 183, 238]. The seed is usually lightly roasted before use in order to reduce the bitterness[238]. The seed is about 3mm long, about 10 - 20 seeds being produced in each pod[4]. A good source of many essential elements such as iron, phosphorus and sulphur[244], the seed contains about 6% moisture, 23% protein, 10% carbohydrate, 8% fat, 10% fibre and 4.3% ash[61]. The ground seeds are used to give a maple syrup flavour to foods[183]. The seed can be soaked for 12 hours in warm water and then allowed to sprout for 3 - 5 days[244]. These sprouted seeds have a spicy flavour and can be added to salads or cooked[238, KJ]. An essential oil obtained from the seed is used as a food flavouring in imitation maple syrup, vanilla compositions, liquorice, pickles etc[183]. It also has medicinal virtues[57]. The ground up seeds can also be used as a substitute for maple syrup[4]. Leaves - raw or cooked[2, 4, 7, 34]. Very aromatic, in small quantities they can be added to salads, otherwise they are used as a potherb, a flavouring for root vegetables, an ingredient of curries etc[183, 238]. Seedpods - cooked[105]. The roasted seed is a coffee substitute[2, 177, 183]. A soothing tea is made from the leaves and

out when they are at least 15cm tall. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in a frame. Good percentage[78]. Cuttings of mature wood of the current year's growth, 10 - 12cm with a heel, November in a frame. Leave for 12 months. Fair to good percentage[78]. Layering in September/October. Takes 12 months[78].

nwatta An easily grown plant[184]. It succeeds in most soils that are well-drained[11, 200]. Prefers a soil that is only moderately fertile, succeeding in poor soils and in dry soils[11, 200]. Prefers a light sandy loam and a sunny position but succeeds in light shade[11, 200]. Very drought and wind resistant[1, 11, 200]. Tolerates atmospheric pollution[160]. Plants are hardy to about -20°c[184], but the roots are hardy to -30°c (although top growth will be killed at this temperature). Cultivated for its edible fruit in Japan, there are some named varieties[3, 11, 183]. Plants can crop in 4 years from cuttings[160]. They bear heavily in Britain[11]. The fruit is well hidden in the shrub and is quite difficult to harvest without damaging the plant[K]. This sub-species produces brown fruits on long stalks[200], would this be any easier to harvest?[K] This species is notably resistant to honey fungus[88, 200]. Birds love the fruits[160]. There is some confusion over the correct name for this species. In the on-line version of the Flora of Japan it is referred to as *Elaeagnus montana ovata*[275]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. An excellent companion plant, when grown in orchards it can increase yields from the fruit trees by up to 10%. The small flowers are deliciously scented, their aroma pervading the garden on calm days[K].

### 6.1.4 Elaeagnus x ebbingei

Elaeagnus, Ebbing’s Silverberry
tfo2n 5 tlin 9 cyuc 5 kcak 4 tcan 2 dwat 5 m hkuc
pcimhmimhtut cyutli hgatkyuctup hwicli hyishrasjlutnyik hpa7tli flatprklwis hpa7tmwatli xre7t hjonli

drutta Elaeagnus x ebbingei is an evergreen Shrub growing to 5 m (16ft) by 5 m (16ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in leaf all year, in flower from October to January, and the seeds ripen from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

kcakta Edible Parts: Fruit SeedEdible Uses: Fruit - raw or cooked[177]. A reasonable size, it is about 20mm long and 13mm wide although it does have a large seed[K]. The fully ripe fruit has a very rich flavour and makes pleasant tasting with a slight acidity[K]. The fruit should be deep red in colour and very soft when it is fully ripe, otherwise it will be astringent[K]. The flavour improves further if the fruit is stored for a day or two after being picked. The fruit ripens intermittently over a period of about 6 weeks from early to mid April until May[K]. Seed - raw or cooked. It can be eaten with the fruit though the seed case is rather fibrous[K]. The taste is vaguely like peanuts[K].

tcanta Companion Hedge HedgePlants can be grown as a hedge in very exposed positions, tolerating maritime exposure. The plants provide a very good protection from the wind, they are very resistant to damage by salt winds and are also tolerant of regular trimming[75]. They have a strong vigorous growth and are faster growing than *E. macrophylla*[75, 200]. Because they fix atmospheric nitrogen, they make good companion plants and improve the growth of neighbouring species[K]. They can be planted in the line of an old shelterbelt of trees that is becoming bare at the base and will in time fill up the empty spaces and climb into the bottom parts of the trees[K].

dwatta CancerThe fruit of many members of this genus is a very rich source of vitamins and minerals, especially in vitamins A, C and E, flavanoids and other bio-active compounds. It is also a fairly good source of essential fatty acids,

which is fairly unusual for a fruit. It is being investigated as a food that is capable of reducing the incidence of cancer and also as a means of halting or reversing the growth of cancers[214].

propta Seed - this is a hybrid and it will not breed true from seed. If this is not a problem, then the seed is best sown as soon as it is ripe in a cold frame[78]. It should germinate freely within 4 weeks, though it may take 18 months[K]. Stored seed can be very slow to germinate, often taking more than 18 months. A warm stratification for 4 weeks followed by 12 weeks cold stratification can help[98]. The seed usually (eventually) germinates quite well[78]. Prick out the seedlings into individual pot as soon as they are large enough to handle and plant out when they are at least 15cm tall. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in a frame. Rather slow, but you usually get a good percentage rooting[78]. June is the best time to take cuttings[202]. Cuttings of mature wood of the current year's growth, 10 - 12cm with a heel, November in a frame. Leave for 12 months. Fair to good percentage[78]. Layering in September/October. Takes 12 months[78].

nwatta A very easily grown plant, it succeeds in most soils that are well-drained[11, 200]. Prefers a soil that is only moderately fertile, succeeding in poor soils and in dry soils[11, 200]. A drought resistant plant once established, it can be grown on top of Cornish hedges (drystone walls with earth between two vertical layers of stones). It is very tolerant of shade and grows well under trees[200]. Plants are very tolerant of maritime exposure, growing well right by the coast[K]. Plants are hardy to about -20°c, but they can be deciduous in very cold winters[200]. Fruiting as it does in early April to May, this plant has excellent potential as a commercial fruit crop in Britain. The fruit is of a reasonable size and when fully ripe is very acceptable for dessert[K]. It should be fairly easy to selectively breed for improved fruit size and flavour[K]. Not all plants bear many fruits, though many specimens have been seen that produce very heavy crops on a regular basis[K]. Since this is a hybrid species, yields may be improved by growing a selection of cultivars or one of the parent plants nearby for cross pollination. *E. pungens* is perhaps the best candidate for this and its cultivar *E. pungens* 'Variegata' has been seen on a number of occasions with good crops of fruit next to *E. x ebbingei* plants that are also laden with fruit[K]. The cultivar *E. x ebbingei* 'Gilt Edge' is also probably a good pollinator[K]. Other cultivars worth looking at are 'Salcombe Seedling', which is said to flower more abundantly than the type[200] and 'Limelight', which has been seen with a good crop of fruits even on small bushes[K]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. An excellent companion plant, when grown in orchards it can increase yields from the fruit trees by up to 10%. Plants produce very aromatic flowers in late autumn and early winter[182]. This species is notably resistant to honey fungus[88, 200]. Sometimes whole branches die out for no apparent reason. This happens most frequently when it is grafted onto *E. multiflora*[182]. These branches should be removed from the plant. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

### 6.1.5 Pueraria montana lobata

Kudzu Vine
tfo2n 5 tlin 9 cyuc 4 kcak 4 tcan 5 dwat m hkuc
htut cyutli hgattcup hwicli hrasjlutnyik hpa7tli flatprklwis hpa7tmwatli xre7t hjonli

drutta Pueraria montana lobata is a PERENNIAL CLIMBER growing to 10 m (32ft 10in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral

drutta Eupatorium cannabinum is a PERENNIAL growing to 1.5 m (5ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from July to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles, Lepidoptera (Moths and Butterflies). The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta None known
tcanta Preservative RepellentThe leaves have been laid on bread in order to prevent it from becoming mouldy[4]. The leaf juice has been rubbed onto the coats of animals as an insect repellent[7].

dwatta Alternative Antitumor Cholagogue Depurative Diaphoretic Diuretic Emetic Expectorant Febrifuge Homeopathy Laxative Purgative TonicHemp agrimony has been employed chiefly as a detoxifying herb for fevers, colds, flu and other viral conditions. It also stimulates the removal of waste products via the kidneys[254]. Due to its content of alkaloids, the plant should only be used under professional supervision[254]. The leaves and flowering tops are alterative, cholagogue, depurative, diuretic, emetic, expectorant, febrifuge, purgative and tonic[4, 7, 9, 21, 46, 238]. The plant has a long history of use as a gentle laxative that does not provoke irritation[7], though excessive doses cause purging and vomiting[238]. A tea made from the dried leaves will give prompt relief if taken at the onset of influenza[4]. Recent research has shown that the plant might have anti-tumour activity, though the plant also contains pyrrolizidine alkaloids that can cause damage or cancer to the liver[238]. The plant is harvested in the summer and dried for later use[7]. The roots are diaphoretic, laxative and tonic[7]. They are harvested in the autumn and dried for later use[238]. Recently the plant has been found of use as an immune system stimulant, helping to maintain resistance to acute viral and other infections[254]. A homeopathic remedy is made from the leaves[4]. It is used in the treatment of influenza and feverish chills[4] and also for disorders of the liver, spleen and gall bladder[9].

propta Seed - sow spring in a cold frame and only just cover the seed. Prick out the seedlings into individual pots when they are large enough to handle and plant them out into their permanent positions in the summer. If you have sufficient seed it can be sown outdoors in situ. Division in spring or autumn[111]. Very easy, the clumps can be replanted direct into their permanent positions.

nwatta An easily grown plant[233], it succeeds in ordinary garden soil in sun or part shade[200]. Prefers a rich moist soil[187]. Grows well in marshy soils[21]. Plants are hardy to about -25°c[187]. A very ornamental plant[1], it has a pleasant aromatic smell when cut[4]. Often found as a weed in British gardens, it can be allowed to naturalize in short grass in the wild garden[233]. Plants seem to be immune to the predations of rabbits[233]. An excellent bee and butterfly plant[24, 108].

### 5.2.941 Gillenia trifoliata

Indian Physic, Bowman’s root
4 tlin 9 cyuc 0 kcak 0 tcan 3 dwat 1.2 m hkuc
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprk hpa7tmwatli xre7t hjonli

drutta Gillenia trifoliata is a PERENNIAL growing to 1.2 m (4ft) by 0.6 m (2ft in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower in June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known
tcanta None known
dwatta Cathartic Diaphoretic Emetic Expectorant Odontalgic Stings TonicThe dried powdered root bark is cathartic, slightly diaphoretic, a mild and efficient emetic, expectorant and tonic[4, 61, 213, 238]. Minute doses are used inter-

nally in the treatment of colds, chronic diarrhoea, constipation, asthma and other bronchial complaints[238, 257]. The roots have been used externally in the treatment of rheumatism[257]. A cold infusion of the roots has been given, or the root chewed, in the treatment of bee and other stings[257]. The roots are harvested in the autumn, the bark is removed and dried for later use[213, 238]. A tea made from the whole plant is strongly laxative and emetic[222]. Minute doses are used internally in the treatment of colds, indigestion, asthma and hepatitis[222]. A poultice or wash is used in the treatment of rheumatism, bee stings and swellings[222]. A decoction or strong infusion of the whole plant has been taken a pint at a time as an emetic[257]. A poultice of the plant has been used to treat leg swellings[257]. The plant has been used in the treatment of toothaches[257].

propta Seed - sow spring or autumn in a cold frame[200]. Prick out the seedlings when they are large enough to handle and grow on for the first year in a lightly shaded area of the greenhouse or cold frame. Plant out in late spring and protect from slugs until well established. Division in spring or autumn[238].

nwatta Landscape Uses:Border, Rock garden, Specimen, Woodland garden. Easily grown in a rather moist but well-drained lime-free peaty soil in semi-shade[4, 200]. Succeeds in any well-drained soil[188]. Succeeds in a sunny position but requires shade at the hottest part of the day[200]. A very ornamental plant, but it can be difficult to establish due to slug damage[187]. The stems usually require support[188]. Special Features:North American native, Naturalizing.

### 5.2.942 Aconitum japonicum

4 tlin 8 cyuc 0 kcak 0 tcan 2 dwat 1 m hkuc
hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprklwis hpa7tmwatli hjonli

drutta Aconitum japonicum is a PERENNIAL growing to 1 m (3ft 3in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from August to October. The flowers are pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known
tcanta None known
dwatta Analgesic AntirheumaticThis is a widely used herbal remedy in China, where it is cultivated for its root[218]. The root is analgesic, antirheumatic, cardiotonic and stimulant[174, 218]. Used in the treatment of neuralgia[174]. Use with caution, and only under the supervision of a qualified practitioner. The plant is very poisonous and should not be used internally[218].

propta Seed - best sown as soon as it is ripe in a cold frame[111]. The seed can be stratified and sown in spring but will then be slow to germinate[133]. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for their first winter. Plant them out in late spring or early summer. Division - best done in spring but it can also be done in autumn[1, 111]. Another report says that division is best carried out in the autumn or late winter because the plants come into growth very early in the year[233].

nwatta Thrives in most soils and in the light shade of trees[1]. Grows well in heavy clay soils. Prefers a moist soil in sun or semi-shade[200]. Prefers a calcareous soil. A very ornamental plant[233], it grows well in open woodlands[1, 4]. Members of this genus seem to be immune to the predations of rabbits and deer[233]. A greedy plant, inhibiting the growth of nearby species, especially legumes[54]. Closely related to *A. chinensis*[1].

### 5.2.943 Verbascum densiflorum

Mullein
4 tlin 8 cyuc 0 kcak 2 tcan 2 dwat 1.2 m hkuc
htut cyutli kyuctup hwicli hrasjlutnyik hpa7tli flatprklwisslip hpa7tmwatli fyfjxre7t hjonli

drutta Verbascum densiflorum is a BIENNIAL growing to 1.2 m (4ft) by 0.6 m (2ft in). See above for USDA hardi-

ness. It is hardy to UK zone 5. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta None known

tcanta Dynamic accumulator.

dwatta Anodyne Antirheumatic Antiseptic Astringent Demulcent Diuretic Emollient Expectorant Pectoral VulneraryThe flowers and leaves are anodyne, antiseptic, astringent, demulcent, emollient, expectorant and vulnerary[4, 9, 13, 21, 46, 53, 165, 238]. An infusion is used internally in the treatment of various respiratory complaints including coughs, bronchitis, asthma and throat irritations[9, 238]. An infusion of the fresh or dried flowers in olive oil is used to treat earaches, sores, wounds, boils etc[238]. The plant is harvested when in flower and should be dried quickly and with care or it will lose its medicinal qualities[9, 238].

propta Seed - sow late spring to early summer in a cold frame and only just cover the seed[200]. Germination usually takes place within 2 - 3 weeks. When they are large enough to handle, prick out the seedlings into individual pots and plant them out in late summer. The seed has a long viability[200].

nwatta Succeeds in most well-drained soils, including dry ones, preferring a sunny position[200]. Dislikes shade and wet soils[200]. Thrives on chalk[200]. Prefers a light soil[200]. Plants are hardy to about -20°c[187]. This species is closely related to *V. phlomoides*[200]. Hybridizes with other members of this genus, though the progeny are usually sterile[200].

## 5.2.944 *Bromus ramosus*

Hairy Brome

4 tlin 8 cyuc 0 kcak 0 tcan 1 dwat 1.5 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flat-prikwiw hpa7tmwatli xre7t hjonli

drutta *Bromus ramosus* is a PERENNIAL growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta None known

tcanta None known

dwatta BachThe plant is used in Bach flower remedies - the keywords for prescribing it are 'Uncertainty', 'Despondency' and 'Dissatisfaction'[209].

propta Seed - sow spring or autumn in situ and only just cover. Germination should take place within 2 weeks. If seed is in short supply it can be surface sown in a cold frame in early spring. When large enough to handle, prick out the seedlings into individual pots and plant them out in early summer. Division in spring. Large clumps can be planted out direct into their permanent positions whilst it is best to pot up smaller clumps and grow them on in a cold frame until they are ready to be planted out.

nwatta Succeeds in a sunny position in most well-drained soils[138, 200].

## 5.2.945 *Herniaria glabra*

Rupture Wort, Smooth rupturewort

4 tlin 8 cyuc 0 kcak 0 tcan 2 dwat m hkuc htut cyutli hgatyuctcup hwicli hyshrasjlut hpa7tli flatprikliw hpa7tmwatli fyfxre7t hjonli

drutta *Herniaria glabra* is a BIENNIAL/PERENNIAL. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in July, and the seeds ripen in August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor

soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure.

kcakta None known

tcanta CleanserA good ground cover plant, allowing spring bulbs to grow through it[200]. An aqueous extract of the plant is a hand cleanser, making the skin soft and supple[240].

dwatta Antirheumatic Astringent Diuretic Expectorant-The whole plant, gathered when in flower, is astringent, very actively diuretic and expectorant[4, 9, 61, 240, 254]. It appears to have an antispasmodic effect upon the bladder and is used in the treatment of dropsy, catarrh of the bladder, cystitis and kidney stones[240, 254]. It has also gained a reputation for treating hernias[4, 9, 61]. Externally, it has been used as a poultice to speed the healing of ulcers[254].

propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts.

nwatta Grows well in hot dry soils[1]. Dislikes excessive moisture[1]. Succeeds in very poor soils[1]. Useful for covering rocks or as a carpet bedding[1], it makes a good ground cover for spring bulbs since they can grow through it easily[200]. The leaves emit a musky smell when they are handled[245].

## 5.2.946 *Melanthium virginicum*

Bunchflower

4 tlin 8 cyuc 0 kcak 0 tcan 1 dwat 1.7 m hkuc hmimhtut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli frusflatprikliw hpa7tmwatli xre7t hjonli

drutta *Melanthium virginicum* is a PERENNIAL growing to 1.7 m (5ft 7in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta None known

tcanta None known

dwatta AnthelminticThe root has been used to kill internal parasites[207].

propta Unless the seed is stored in damp sand at around 4°C it has a short viability[200]. Where possible it is best to sow the seed in a lightly shaded position in a cold frame as soon as it is ripe[200]. Stored seed needs to be cold stratified but can be very slow to germinate. Germination can be erratic even for seed sown when it was fresh, it usually takes place within 3 - 12 months at 15°C but can be much longer[200]. Sow the seed thinly so that it can be grown on in the pot without disturbance for the first couple of years. Give an occasional liquid feed in the growing season to ensure the plants do not become nutrient deficient. The plant produces just one seed leaf in its first year; this forms an over-wintering bulb. At the end of the second year's growth, pot up the over-wintering bulbs, placing one or two bulbs in each pot. Grow them on in a lightly shaded position in a cold frame for at least another couple of years before planting them out into their permanent positions. It takes up to 10 years for the plant to reach maturity[200]. Division in March/April or in October. Establish the plants in pots in a shaded frame before planting them out[200]. Root cuttings, 6mm long with a bud, rooted in a sandy soil in a cold frame[200].

nwatta Requires a deep fertile moisture retentive humus-rich soil[200]. Succeeds in full sun if the soil does not dry out but prefers a position in semi-shade[200]. Dislikes dry soils[42]. Grows best in a cool woodland garden or a north facing border[42]. Succeeds in acid soils in a bog garden[200].

## 5.2.947 *Pulsatilla pratensis*

Pasque Flower

4 tlin 8 cyuc 0 kcak 0 tcan 2 dwat 0.5 m hkuc

and size shown above) information on the habit and root pattern is also useful and given here if available. A suckering vine sending up suckers some distance main plant [1-2]. The root pattern is tuberous with swollen potato-like roots [1-2].

## 6.1.2 *Elaeagnus multiflora*

Goumi, Cherry silverberry

tfo2n 5 tlin 9 cyuc 5 kcak 3 tcan 2 dwat m hkuc hmimhtut cyutli hgatyuctcup hwicli hyshrasjlutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Elaeagnus multiflora* is a deciduous Shrub growing to 3 m (9ft) by 2 m (6ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from April to May, and the seeds ripen in July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: Fruit SeedEdible Uses: Fruit - raw or cooked[1, 3, 11, 15, 46, 177]. Pleasantly acid when ripe, they make a very good dessert fruit[K] though they are usually made into pies, preserves etc[183]. Quite fiddly and difficult to pick without breaking the young shoots[200]. The fruit must be fully ripe before it can be enjoyed raw, if even slightly under-ripe it will be quite astringent[K]. The fruit contains a single large seed[K]. Seed - raw or cooked. It can be eaten with the fruit though the seed case is rather fibrous[K].

tcanta Companion Hedge Hedge RootstockPlants can be grown as a hedge in exposed positions, tolerating maritime exposure. Reasonably fast growing and providing a good screen in the summer, though much more open in the winter. It is a good companion hedge to grow, the plants enriching the soil and improving the growth of neighbouring plants[K]. A hedge in a very exposed position at Rosewarne in N. Cornwall was 3.5 metres tall in 1989[K]. Often used as a rootstock for evergreen species that are hard to grow from cuttings. It frequently sprouts from the base and can out-compete the scion[182].

dwatta Antitussive Astringent CancerThe fruit of many members of this genus is a very rich source of vitamins and minerals, especially in vitamins A, C and E, flavanoids and other bio-active compounds. It is also a fairly good source of essential fatty acids, which is fairly unusual for a fruit. It is being investigated as a food that is capable of reducing the incidence of cancer and also as a means of halting or reversing the growth of cancers[214]. The leaves are used in the treatment of coughs[218]. The fruit is prescribed in the treatment of watery diarrhoea[218]. The root is astringent, a decoction is used to treat itch and foul sores[218].

propta Seed - best sown as soon as it is ripe in a cold frame[78]. It should germinate in late winter or early spring, though it may take 18 months[K]. Stored seed can be very slow to germinate, often taking more than 18 months. A warm stratification for 4 weeks followed by 12 weeks cold stratification can help[98]. The seed usually (eventually) germinates quite well[78]. Prick out the seedlings into individual pot as soon as they are large enough to handle and plant out when they are at least 15cm tall. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in a frame. Good percentage[78]. Cuttings of mature wood of the current year's growth, 10 - 12cm with a heel, November in a frame. Leave for 12 months. Fair to good percentage[78]. Layering in September/October. Takes 12 months[78].

nwatta An easily grown plant[184], it succeeds in most soils that are well-drained[11, 200]. Prefers a soil that is only moderately fertile, succeeding in poor soils and in dry soils[11, 200]. Prefers a light sandy loam and a sunny position but succeeds in light shade[11, 200]. Very drought and wind resistant[1, 11, 200]. Tolerates atmospheric pollution[160]. Plants are hardy to about -20°c[184], but the roots are hardy to -30°c (although top growth will be killed at this temperature). A very variable species[266], it is often cultivated for its edible fruit in Japan, there are some named varieties[3, 11, 183]. Plants can crop in 4 years from

cuttings[160]. They bear heavily in Britain[11]. The synonym *E. longipes* is sometimes accepted as a distinct species, differing mainly in having very long peduncles about 2.5cm in length[214]. The fruit is well hidden in the shrub and is quite difficult to harvest without damaging the plant[K]. The ssp. *E. multiflora ovata*. (Maxim.)Servettaz. produces brown fruits on long stalks[200], would this be any easier to harvest?[K]. This species is notably resistant to honey fungus[88, 200]. Birds love the fruits[160]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. An excellent companion plant, when grown in orchards it can increase yields from the fruit trees by up to 10%. The small flowers are deliciously scented with a lilac-like smell, their aroma pervading the garden on calm days[K]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is multistemmed with multiple stems from the crown [1-2]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

## 6.1.3 *Elaeagnus multiflora ovata*

Goumi

tfo2n 5 tlin 9 cyuc 5 kcak 3 tcan 2 dwat m hkuc hmimhtut cyutli hgatyuctcup hwicli hyshrasjlutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Elaeagnus multiflora ovata* is a deciduous Shrub growing to 3 m (9ft) by 2 m (6ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from April to May, and the seeds ripen in July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: Fruit SeedEdible Uses: Fruit - raw or cooked[1, 3, 11, 15, 46, 177]. Pleasantly acid when ripe, they are usually made into pies, preserves etc[183]. Quite fiddly and difficult to pick without breaking the young shoots[200], this sub-species carries the fruit on longer stalks than the species and might therefore be easier to pick[K]. The fruit must be fully ripe before it can be enjoyed raw, if even slightly under-ripe it will be quite astringent[K]. The fruit is about 10mm long and contains a single large seed[275, K] Seed - raw or cooked. It can be eaten with the fruit though the seed case is rather fibrous[K].

tcanta Hedge Hedge RootstockPlants can be grown as a hedge in exposed positions, tolerating maritime exposure. A hedge in a very exposed position at Rosewarne in N. Cornwall was 3.5 metres tall in 1989[K]. Often used as a rootstock for evergreen species that are hard to grow from cuttings. It frequently sprouts from the base and can out-compete the scion[182].

dwatta CancerThe fruit of many members of this genus is a very rich source of vitamins and minerals, especially in vitamins A, C and E, flavanoids and other bio-active compounds. It is also a fairly good source of essential fatty acids, which is fairly unusual for a fruit. It is being investigated as a food that is capable of reducing the incidence of cancer and also as a means of halting or reversing the growth of cancers[214].

propta Seed - best sown as soon as it is ripe in a cold frame[78]. It should germinate in late winter or early spring, though it may take 18 months[K]. Stored seed can be very slow to germinate, often taking more than 18 months. A warm stratification for 4 weeks followed by 12 weeks cold stratification can help[98]. The seed usually (eventually) germinates quite well[78]. Prick out the seedlings into individual pot as soon as they are large enough to handle and plant

The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta MordantThe root can be used as an alum substitute, this is a mordant that is used in fixing dyes[168]. The root is rich in tannin and it has been suggested that this is the mordant[168]. A good ground cover plant for the woodland garden[200]. Plants should be spaced about 35cm apart each way[208].

dwatta Astringent Cancer Dysentery VulneraryThe root is very astringent and has been used in the treatment of cancer and also as an external remedy in sores, wounds, vaginal discharges and ulcers[207, 238]. It can be dried, ground into a powder and sprinkled onto wounds etc[213]. It is taken internally in the treatment of diarrhoea, dysentery and gastric ulcers[238]. It should be used with some caution since excess irritates the stomach and can cause kidney and liver failure[238]. The root is harvested in the autumn and is dried for use in decoctions or as a powder[238].

propta Seed - sow early spring in a warm greenhouse and only just cover the seed. Germination is usually fairly rapid. Prick out the seedlings when they are large enough to handle and plant them out into their permanent positions in late spring or early summer. The seed can also be sown in the middle of spring in an outdoor seedbed and planted out in early summer. Alternatively, you can sow the seed in an outdoor seedbed in the middle of summer for planting out in the following spring. Division in March or October[1, 111]. It is best to divide the plants in August or early September, making sure that the woody roots are planted quite deeply with only the crown of foliage above the ground[233].

nwatta Landscape Uses:Border, Foundation, Specimen. Succeeds in any good sweet garden soil that does not dry out in spring[1]. Prefers full sun but tolerates partial shade[1, 111]. Prefers a well-drained fairly rich and not too heavy soil[111]. A polymorphic species[4], it is apt to hybridize with other members of this genus[111]. Special Features:Attractive foliage, North American native, Suitable for cut flowers. The plant is heat tolerant in zones 8 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of “heat days” experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. An evergreen. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

## 5.2.1022 Pulsatilla patens

Pasque Flower, Eastern pasqueflower, Cutleaf anemone
4 tlin 8 cyuc 0 kcaak 0 tcan 2 dwat 0.5 m hkuc htut cyutli tcup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Pulsatilla patens is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from March to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta None known

tcanta None known

dwatta Appetizer Digestive Diuretic Emmenagogue Expecto­rant Irritant Oxytoxic StimulantAppetizer, digestive, diuretic, emmenagogue, expecto­rant, stimulant[61, 207, 213].

Use of the plant lessens sexual excitement. It does not diminish sexual power but rather strengthens it by lessening morbid excitement[207]. A drug derived from the chopped whole plant induces vomiting and irritation of the kidneys[213]. In high doses it acts as a depressant on the central nervous system and the heart[213]. A decoction of the plant has been used to speed delivery of a child[257]. A poultice of the fresh crushed leaves has been applied in the treatment of rheumatism and neuralgia[257]. A volatile oil contained in the plant is used as an irritant[212].

propta Seed - best sown as soon as it is ripe in early summer in a cold frame. The seed usually germinates in about 2 - 3 weeks. Sow stored seed in late winter in a cold frame. Germination takes about 1 - 6 months at 15°C. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in the spring. Root cuttings, 4cm long taken in early winter, potted up in a mixture of peat and sand[175]. They can also be taken in July/August, planted vertically in pots in a greenhouse or frame.

nwatta Requires a well-drained humus-rich gritty soil and a sunny position[200]. Lime tolerant[1, 200]. A very ornamental plant[1]. Large plants transplant badly[200]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

# 6 5 tlin

## 6.1 bwon

### 6.1.1 Lathyrus tuberosus

Earthnut Pea, Tuberous sweetpea
tfo2n 5 tlin 9 cyuc 5 kcaak 3 tcan 0 dwat 1.2 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Lathyrus tuberosus is a PERENNIAL growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from June to July, and the seeds ripen in August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It can fix Nitrogen. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Root - cooked or raw[2, 27, 46, 61, 105]. Sweet and starchy, it is delicious when baked with a flavour that is somewhat like a sweet potato[183, K]. Taste trials consistently place this root very highly, it is certainly one of our favourites[K]. Unfortunately, yields are rather low and so the plant is only worthwhile growing as a taste treat, not as a staple crop[K].

tcanta Nitrogen fixer. Attractive flowers. Attracts wildlife.

dwatta None known

propta Pre-soak the seed for 24 hours in warm water and then sow in early spring in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. If you have sufficient seed, then it can also be sown in situ in mid spring[200]. Division of the tubers when the plant is dormant in spring or autumn.

nwatta An easily grown plant, succeeding in any moderately good garden soil[200]. It prefers a limestone soil in a warm position[13], and likes some shade[1]. A climbing plant, scrambling through other plants and supporting itself by tendrils[219]. It tends to be slightly invasive[187] with new stems emerging at some distance from the parent plant[219]. The earthnut pea has occasionally been cultivated for its edible root[2, 183]. Slugs are inordinately fond of this plant and will totally destroy it given a chance[K]. A good bee plant. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc.

htut cyutli hgatkyuctcup hwicli hrasjlut hpa7tli flatprikliwissip hpa7tmwatli fyifxre7t hjonli

drutta Pulsatilla pratensis is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from May to June, and the seeds ripen from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta None known

tcanta Plants can be grown to form a ground cover, they are best spaced about 30cm apart each way[208].

dwatta Homeopathy Ophthalmic SkinConsidered by herbalists to be of highly valuable modern curative use as a herbal simple[4], the whole plant is alterative, antispasmodic, diaphoretic and nervine[4]. The plant is harvested soon after flowering and should be carefully preserved by drying[4]. It should not be stored for longer than 12 months before being used[4]. Use with caution, see notes above on toxicity. The whole plant is used externally to treat ulcers and inflammations of the eyes[232]. A homeopathic remedy is made from the whole fresh plant, gathered when in flower[232]. It has a wide range of applications and is especially useful in the treatment of babies and children[232].

propta Seed - best sown as soon as it is ripe in early summer in a cold frame. The seed usually germinates in about 2 - 3 weeks. Sow stored seed in late winter in a cold frame. Germination takes about 1 - 6 months at 15°C. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in the spring. Root cuttings, 4cm long taken in early winter, potted up in a mixture of peat and sand[175]. They can also be taken in July/August, planted vertically in pots in a greenhouse or frame. Some care is needed since the plant resents root disturbance[200].

nwatta Requires a well-drained humus rich gritty soil in a sunny position[200]. Tolerates alkaline soils[200]. Prefers lime[187]. Established plants are fairly drought tolerant[190]. Plants are hardy to about -20°C[187]. Large plants transplant badly[200]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

### 5.2.948 Anemone obtusiloba

4 tlin 8 cyuc 0 kcaak 0 tcan 1 dwat 0.3 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Anemone obtusiloba is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta None known

tcanta None known

dwatta Antirheumatic Emetic Ophthalmic Rubefacient-The roots, mixed with milk, are administered internally in the treatment of contusions[240]. They are used externally as a blistering agent[240]. The juice of the root is ophthalmic[272]. The seeds taken internally induce vomiting[211, 240], whilst an oil extracted from them is used in the treatment of rheumatism[211].

propta Seed - best sown in a cold frame as soon as it is ripe in the summer[1]. Surface sow or only just cover the seed and keep the soil moist. Sow stored seed as soon as possible in late winter or early spring. The seed usually germinates in 1 - 6 months at 15°C[133]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least their first year. When the plants are large enough, plant them out in the spring. Division in late summer after the plant dies down, or in early spring.

nwatta Succeeds in ordinary garden soil but prefers a rich sandy loam[1]. Requires a well-drained humus-rich

soil in full sun[200]. Requires a warm sheltered position[1]. Plants seem to be immune to the predations of rabbits[233]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54]. This species is very closely related to *A. rupestris*[211].

### 5.2.949 Scopolia carniolica

Scopolia, European scopolia
4 tlin 8 cyuc 0 kcaak 0 tcan 2 dwat 0.6 m hkuc pcmhmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Scopolia carniolica is a PERENNIAL growing to 0.6 m (2ft) by 0.6 m (2ft in). See above for USDA hardness. It is hardy to UK zone 5. It is in flower from April to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers dry or moist soil.

kcakta None known

tcanta None known

dwatta Antispasmodic Dysentery Hypnotic Mydriatic NarcoticThe dried root is hypnotic, mydriatic and narcotic[4, 46, 61]. It causes a sleep that resembles normal sleep[4]. The medicinal activity of this plant resembles belladonna (*Atropa belladonna*) but it is more narcotic[46]. It is used internally in the treatment of chronic diarrhoea, dysentery, stomach ache and manic-depressive states[238]. A very toxic plant, it should only be used under the supervision of a qualified practitioner[238]. The root is harvested in the autumn and normally processed for extraction of the alkaloids which are used in the pharmaceutical industry[238]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve *Scopolia carniolica* for liver and gallbladder complaints (see [302] for critics of commission E).

propta Seed - sow spring in a greenhouse[K]. The seed is best sown in the autumn[188]. Germination is quick and easy[K]. Prick out the seedlings into individual pots once they are large enough to handle and plant them out in the summer[K]. Division in spring[188]. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Prefers a light, fertile, well-drained dry soil in a shady position[1, 200]. A very ornamental plant[1], it is occasionally cultivated for its medicinal uses[46].

### 5.2.950 Eupatorium hyssopifolium

Hyssopleaf thoroughwort
4 tlin 8 cyuc 0 kcaak 0 tcan 1 dwat 0.6 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Eupatorium hyssopifolium is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardness. It is hardy to UK zone 5. It is in flower from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta The plant is used as a strewing herb and to discourage insects[61].

dwatta StingsThe entire plant is applied externally as a remedy for the bites of reptiles and insects[207].

propta Seed - sow spring in a cold frame and only just cover the seed. Prick out the seedlings into individual pots when they are large enough to handle and plant them out into their permanent positions in the summer. Division in spring or autumn[111]. Very easy, the clumps can be replanted direct into their permanent positions.

nwatta Succeeds in ordinary well-drained but moisture retentive garden soil in sun or part shade[200]. Plants seem to be immune to the predations of rabbits[233].

## 5.2.951 *Iris versicolor*

Blue Flag, Harlequin blueflag

4 tlin 8 cyuc 0 kcaak 0 tcan 3 dwat 0.6 m hkuc  
hnmihmtut cyutli tucphja7n hwicli hrasjlut hpa7tli flatprikklwis  
hpa7tmwatli fyfxre7t hjonli

drutta *Iris versicolor* is a PERENNIAL growing to 0.6 m (2ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta None known

tcanta Litmus Repellent WeavingA fine blue infusion is obtained from the flowers and this can be used as a litmus substitute to test for acids and alkalis[4]. The leaves have been used to weave baskets and mats[257]. Some native North American Indian tribes used the root as a protection against rattlesnakes. It was believed that, so long as the root was handled occasionally to ensure the scent permeated the person and their clothes, rattlesnakes would not bite them. Some tribes even used to chew the root and then hold rattlesnakes with their teeth and were not bitten so long as the scent persisted[257].

dwatta Alterative Antiinflammatory Cathartic Cholagogue Diuretic Emetic Sialagogue StimulantBlue flag was one of the most popular medicinal plants amongst various native North American Indian tribes[213]. In modern herbalism it is mainly employed to detoxify the body - it increases urination and bile production and has a mild laxative effect[254]. Some caution should be exercised in its use, however, since there are reports that it is poisonous[222]. The fresh root is quite acrid and when taken internally causes nausea, vomiting, colic and purging[4, 238]. The dried root is much less acrid[4]. This remedy should not be prescribed for pregnant women[238]. The root is alterative, anti-inflammatory, cathartic, cholagogue, diaphoretic, diuretic, emetic and sialagogue[21, 46, 165, 238]. Taken internally as a tea, the root has been used as a strong laxative or emetic that also acts strongly on the liver and promotes the excretion of excess body fluids[4, 213]. It is also stimulant for the circulatory and lymphatic system[165]. Its detoxifying effect make it useful in the treatment of psoriasis, acne, herpes, arthritis, swollen glands, pelvic inflammatory disease etc[238, 254]. Externally, it is applied to skin diseases, wounds and rheumatic joints[238]. The roots are harvested in late summer and early autumn and are usually dried for later use[4, 238]. The roots were boiled in water and then mashed to make a poultice which was used to relieve the pain and swelling associated with sores and bruises[213].

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed should be sown as early in the year as possible in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse or cold frame for their first year. Plant out into their permanent positions in late spring or early summer. Division, best done in early autumn after flowering, but can also be done in mid-spring. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Prefers growing in marshy conditions[1]. Very easily grown in any damp soil[42]. Prefers a heavy rich moist soil[4] and partial shade[188]. Prefers a sunny position[233]. Plants are hardy to about -25°C[187]. This species has been cultivated by the N. American Indians as a medicinal plant[207, 213]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233].

## 5.2.952 *Anemone nemorosa*

Wood Anemone, European thimbleweed

4 tlin 8 cyuc 0 kcaak 0 tcan 1 dwat 0.2 m hkuc  
pcimhnmihmtut cyutli hgatkyuctcup hwicli hrasjlutnyik  
hpa7tli flatprikklwisslip hpa7tmwatli fyfxre7t hjonli

drutta *Anemone nemorosa* is a PERENNIAL growing to 0.2 m (0ft 8in) by 0.3 m (1ft) at a fast rate. See above for

USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from March to May, and the seeds ripen from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta None known

tcanta None known

dwatta Antirheumatic Homeopathy Rubefacient Tonic-The leaves are antirheumatic, rubefacient and tonic[7, 19, 46]. The plant is sometimes used externally as a counter-irritant in the treatment of rheumatism[7]. The herb is gathered in spring before the plant comes into flower[7]. Various parts of this herb used to be recommended for a variety of complaints such as headaches and gout, though the plant is virtually not used nowadays[4]. A homeopathic remedy has been made from the leaves[7].

propta Seed - best sown in a cold frame as soon as it is ripe in the summer[1]. Surface sow or only just cover the seed and keep the soil moist. Sow stored seed as soon as possible in late winter or early spring. The seed usually germinates in 1 - 6 months at 15°C[133]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least their first year. When the plants are large enough, plant them out in the spring. Division in late summer after the plant dies down.

nwatta Prefers a moist soil[1, 90, 200] but tolerates dry conditions during its summer dormancy[200]. Plants tolerate dry conditions and drought so long as there is plenty of humus in the soil[190]. Prefers a well-drained humus-rich soil[200]. Dislikes very acid soils[13]. Prefers a shady position, growing well on woodland edges[24, 90], but plants can also be naturalized in thin turf[200]. Plants seem to be immune to the predations of rabbits[233]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54]. The plant has a running rootstock and can spread rapidly when well-sited[4]. A very ornamental plant[1], there are several named varieties[190].

## 5.2.953 *Asperula cynanchica*

Squinancy Wort

4 tlin 8 cyuc 0 kcaak 0 tcan 1 dwat 0.4 m hkuc  
hnmihmtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli prikl-  
wisslip hpa7tmwatli xre7t hjonli

drutta *Asperula cynanchica* is a PERENNIAL growing to 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta None known

tcanta DyeA red dye is obtained from the root[4].

dwatta The plant was at one time esteemed as a remedy for quinsy, but it is no longer used in herbal medicine[4].

propta Seed - sow spring to early summer in a light position in a cold frame[134]. 2 weeks pre-chilling improves the germination rate[134]. The seed usually germinates in 1 month at 10°C[134]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring or early summer[200]. Basal cuttings of soft young shoots in early summer[200].

nwatta Succeeds in almost any soil, including dry ones[1]. Prefers a well-drained moisture retentive soil in sun or semi-shade[200].

## 5.2.954 *Apocynum androsaemifolium*

Spreading Dogbane

4 tlin 8 cyuc 0 kcaak 1 tcan 2 dwat 0.6 m hkuc

grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta None known

dwatta Antidiarrhoeal Antispasmodic Diaphoretic Hypnotic Nervine Sedative TonicNerve root has a high reputation for its sedative and relaxing effect on the nervous system[238, 254]. The root is a pungent bitter-sweet herb with an unpleasant odour. It was much used by the North American Indians who used it as a sedative and antispasmodic to ease menstrual and labour pains and to counter insomnia and nervous tension[238, 254]. The root is antispasmodic, diaphoretic, hypnotic, nervine, sedative, tonic[21, 46, 165, 192, 222, 238]. It is taken internally in the treatment of anxiety, nervous tension, insomnia, depression and tension headaches[238]. The active ingredients are not water soluble and so the root is best taken in the form of a tincture[222]. The plant is said to be the equivalent of Valerian (*Valeriana officinalis*) in its effect as a nervine and sedative, though it is less powerful[1, 4]. Another report says that its restorative effect appears to be more positive than that of valerian[254]. The roots are harvested in the autumn and are dried for later use[238]. In the interests of conservation, it is best not to use this herb unless you can be certain it was obtained from a cultivated source - see the notes above under cultivation details[K].

propta Seed - surface sow, preferably as soon as it is ripe, in the greenhouse and do not allow the compost to dry out. The seed of this species is extremely simple, it has a minute embryo surrounded by a single layer of protective cells. It contains very little food reserves and depends upon a symbiotic relationship with a species of soil-dwelling fungus. The fungal hyphae invade the seed and enter the cells of the embryo. The orchid soon begins to digest the fungal tissue and this acts as a food supply for the plant until it is able to obtain nutrients from decaying material in the soil[200]. It is best to use some of the soil that is growing around established plants in order to introduce the fungus, or to sow the seed around a plant of the same species and allow the seedlings to grow on until they are large enough to move. Division with care in early spring, the plants resent disturbance[200]. Remove part of the original rootball with the soil intact[200]. Division is best carried out towards the end of the growing season, since food reserves are fairly evenly distributed through the rhizome[230]. Small divisions of a lead and two buds, or divisions from the back (older) part of the rhizome without any developed buds, establish quickly using this method[230]. Replant immediately in situ[230].

nwatta Succeeds in shade or full sun so long as there is adequate moisture[42]. Grows well in a woodland garden[230]. Plants are best grown on a north or north-west aspect in order to slow down early growth[1]. Requires a humus rich soil with plenty of moisture in the growing season[42], it also succeeds in chalky soils[200]. Must not be planted too deeply[42]. A very ornamental plant[1] it is long-lived when once established, though it is very difficult to establish a plant[233]. The flowers have a soft, rose-like aroma[245]. Plants are growing very well at the Savill Gardens in Windsor[233]. This plant is becoming very rare in the wild due to overcollecting for medicinal usage[238]. Reports that the plant is cultivated for its medicinal uses are largely spurious and, unless you can be certain that the root has come from a cultivated source, it is best not to use this plant medicinally but to use suitable substitutes such as *Scutellaria laterifolia* and *Lavandula angustifolia*[238]. Orchids are, in general, shallow-rooting plants of well-drained low-fertility soils. Their symbiotic relationship with a fungus in the soil allows them to obtain sufficient nutrients and be able to compete successfully with other plants. They are very sensitive to the addition of fertilizers or fungicides since these can harm the symbiotic fungus and thus kill the orchid[230].

## 5.2.1020 *Adiantum pedatum*

Northern Maidenhair,American Maidenhair Fern

4 tlin 9 cyuc 0 kcaak 2 tcan 2 dwat 0.5 m hkuc  
hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikklwis  
hpa7tmwatli hjonli

drutta *Adiantum pedatum* is a FERN growing to 0.5 m (1ft 8in) by 0.5 m (1ft 8in) at a slow rate. See above for USDA

hardiness. It is hardy to UK zone 3. The seeds ripen from August to October. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta None known

tcanta Basketry Hair LiningThe stipe of the plant is used as an ornament in basketry[172, 157]. The leaves can be used as a lining for carrying or storing fruits in baskets and on racks[257]. The plant is used as a hair conditioner[172]. The stems have been used as a hair wash to make the hair shiny[222]. Plants can be used for ground cover when planted about 30cm apart either way, they form a slowly spreading clump[208].

dwatta Antirheumatic Astringent Demulcent Emmenagogue Expectorant Febrifuge Haemostatic Pectoral TonicThe whole plant is considered to be antirheumatic, astringent, demulcent, emmenagogue, expectorant, febrifuge, haemostatic, pectoral and tonic[172, 222, 240]. A tea or syrup is used in the treatment of nasal congestion, asthma, sore throats etc[222]. A decoction of the root was massaged into rheumatic joints[257]. The N. American Indians chewed the fronds and then applied them to wounds to stop bleeding[213]. A strong infusion of the whole plant was has been used as an emetic in the treatment of ague and fevers[257]. This plant was highly valued as a medicinal plant in the 19th century and merits scientific investigation[222].

propta Spores - best sown as soon as ripe on the surface of a humus-rich sterilized soil. Keep the compost moist, preferably by putting a plastic bag over the pot. Pot on small clumps of plantlets as soon as they are large enough to handle and keep them humid until they are well established. Do not plant outside until the ferns are at least 2 years old and then only in a very well sheltered position. Division in spring or autumn.

nwatta Landscape Uses:Container, Foundation, Ground cover, Massing, Rock garden, Woodland garden. Easily grown in a cool moist shady position[1, 187]. Requires an abundance of moisture in the air and soil[1]. Prefers an alkaline soil[200]. Requires an acid soil according to another report. A very ornamental plant[1], it does not always succeed outdoors in Britain[1]. It probably prefers to be covered in snow overwinter - could a mulch help[1]? This species is often divided into three separate species by botanists - the type species is found in eastern N. America. A. aleuticum is found in western N. America and a third species is found in eastern Asia[270]. Members of this genus are rarely if ever troubled by browsing deer[233]. Plants have a slowly-increasing root-stock[233]. Special Features:Attractive foliage, North American native, Naturalizing, Wetlands plant, There are no flowers or blooms. The plant is heat tolerant in zones 8 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

## 5.2.1021 *Heuchera americana*

Rock Geranium, American alumroot, Alumroot, Coral Bells, Rock Geranium

4 tlin 9 cyuc 0 kcaak 2 tcan 3 dwat 0.5 m hkuc  
hnmihmtut cyutli tcup hwicli hrasjlut hpa7tli flatprikklwis  
hpa7tmwatli xre7t hjonli

drutta *Heuchera americana* is an evergreen Perennial growing to 0.5 m (1ft 8in) by 0.3 m (1ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in leaf all year, in flower from July to August, and the seeds ripen from August to September.

flowering size[239]. When the plants are of sufficient size, place them out into their permanent positions in late spring or early summer. Division in March[111]. Most members of this genus have either a single tap-root, or a compact root system united in a single root head, and are thus unsuitable for division[239]. Cuttings of basal shoots in late spring[238].

nwatta In general, gentians require a moist well-drained soil in a sheltered position, a certain minimum of atmospheric humidity, high light intensity but a site where temperatures are not too high[239]. They are therefore more difficult to grow in areas with hot summers and in such a region they appreciate some protection from the strongest sunlight[200, 239]. Most species will grow well in the rock garden[200]. Plants are intolerant of root disturbance[200].

### 5.2.1016 Eriogonum jamesii

Antelope Sage, James' buckwheat

4 tlin 8 cyuc 0 kcak 0 tcan 2 dwat 0.3 m hkuc htut cyutli kyucctup hwicli hyishrasjlut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Eriogonum jamesii is a PERENNIAL growing to 0.3 m (1ft) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from August to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta None known
tcanta None known

dwatta Analgesic Cardiac Contraceptive Ophthalmic StomachicSome native North American Indian tribes used this plant as a contraceptive. The women would drink one cup of a decoction of the root during menstruation[213]. A decoction of the whole plant has been drunk to ease the pain of childbirth[257]. The root has been chewed as a cardiac medicine and as a treatment for stomach aches[257]. An infusion of the roots has been used to treat despondency[257]. The infusion has also been used as a wash for sore eyes[257]. The plant has been chewed to sweeten the saliva[257].

propta Seed - best sown as soon as it is ripe in the autumn in a sandy compost in a greenhouse. Sow stored seed in early spring in a warm greenhouse[1]. As soon as they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant out in late spring or early summer, after the last expected frosts. Division in early spring[1]. This has to be done with care because the plant resents root disturbance[200]. Try to obtain divisions from around the edges of the plants without digging up the whole clump. Tease the divisions out with as much root on them as possible and pot them up. Grow them on in light shade in the greenhouse until they are rooting well and plant them out in the summer. Cuttings of greenwood with a heel in the summer[200].

nwatta Requires a loose lean gritty well-drained soil in a very sunny position[200]. Succeeds in dry soils. Tolerates exposed positions[200]. Requires some protection from winter wet[1]. Established plants deeply resent root disturbance[200].

### 5.2.1017 Chondrilla ambigua

Chondrilla, Sha di fen bao ju

4 tlin 9 cyuc 0 kcak 3 tcan 0 dwat 0.5 m hkuc htut cyutli kyucctup hwicli hyishrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta Chondrilla ambigua is an evergreen Perennial growing to 0.5 m (1ft 8in) by 0.5 m (1ft 8in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta None Known

tcanta Possibly a hydrocarbon latex crop. The species was experimentally cultivated in the USSR during the years

1929–1937 as a source of rubber. Carbon Farming Solutions - Industrial Crop: hydrocarbon (Crops grown for non-food uses. Industrial crops provide resources in three main categories: materials, chemicals, and energy. Traditional materials include lumber and thatch, paper and cardboard, and textiles) [1-1].

dwatta None Known
propta Seed

nwatta Experimental Crop
Industrial Crop: Hydrocarbon Management: HayClimate: cold to warm temperate. Humidity: semi-arid to humid. A woody, broomlike perennial herb usually growing to 0.5m but can reach 1m high. It has a taproot which can be very deep and highly branched. Usually found in Sand dunes, gravel and loess (a type of silt which forms fertile topsoil - The soil has few clay particles to hold it together) areas; Grows at 300-800m in the wild. Needs a well drained dry to moist soil. This genus is closely related to the dandelions of genus Taraxacum. Plants of both genera undergo apomixis, producing fertile seeds via asexual reproduction. Carbon Farming Solutions - Cultivation: experimental. Management: hay (Describes the non-destructive management systems that are used in cultivation) [1-1].

### 5.2.1018 Liatris squarrosa

Scaly blazing star, Alabama blazing star

4 tlin 8 cyuc 0 kcak 0 tcan 1 dwat 0.9 m hkuc hmimhtut cyutli kyucctup hwicli hyishrasjlut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Liatris squarrosa is a PERENNIAL growing to 0.9 m (3ft). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from August to September, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta None known

tcanta RepellentThe plant is used as an insect repellent in the clothes cupboard[4].

dwatta Diuretic Poultrice TonicThe root is diuretic and tonic[4, 61, 238]. A poultice made from the roots is applied to snake bites[238].

propta Seed - best sown as soon as it is ripe in autumn in a greenhouse[200]. Sow stored seed as soon as possible in the year in a greenhouse. Prick out the seedlings into individual pots when they are large enough to handle and grow the plants on in the greenhouse for their first year. Plant them out into their permanent positions in early summer. Division in spring[1]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring. Basal cuttings taken in spring as growth commences. Harvest the shoots when they are about 10cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Grows well in a moderately good light soil[200].Tolerates poor soils[200]. Plants are prone to rot overwinter in wet soils[200]. A good bee plant. Rodents are very fond of the tubers so the plants may require some protection[200].

### 5.2.1019 Cypripedium calceolus pubescens

Nerve Root

4 tlin 8 cyuc 0 kcak 0 tcan 3 dwat 0.6 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwisslip hpa7tmwatli xre7t hjonli

drutta Cypripedium calceolus pubescens is a PERENNIAL growing to 0.6 m (2ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can

pcimhmimhtut cyutli kyucctup hwicli hrasjlutnyik hpa7tli frusflatprikliwis hpa7tmwatli xre7t hjonli

drutta Apocynum androsaemifolium is a PERENNIAL growing to 0.6 m (2ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower in July. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta None known

tcanta Fibre LatexThe bark yields a good quality fibre that is used for making twine, bags, linen etc[4, 99, 155, 257]. It is inferior to A. cannabinum[99]. The fibre is finer and stronger than cotton[207]. It can be harvested after the leaves fall in the autumn but is probably at its best as the seed pods are forming[169]. The plant yields a latex, which is a possible source of rubber[46, 61]. It is obtained by making incisions on the stem and resembles indiarubber when dry[4].

dwatta Cardiotonic Cathartic Contraceptive Diaphoretic Diuretic Emetic Expectorant Urinary VDSpreading dogbane is an unpleasantly bitter stimulant irritant herb that acts on the heart, respiratory and urinary systems, and also on the uterus[238]. It was widely employed by the native North American Indians who used it to treat a wide variety of complaints including headaches, convulsions, earache, heart palpitations, colds, insanity and dizziness[257]. It should be used with great caution, and only under the supervision of a qualified practitioner if taking this plant internally[21, 238]. The root contains cymarin, a cardioactive glycoside that is toxic to ruminants[222]. The root is cardiotonic, cathartic, diaphoretic, diuretic, emetic and expectorant[1, 4, 21, 61, 222]. It has a powerful action in slowing the pulse and also has a very strong action on the vaso-motor system, it is rather an irritant to the mucous membranes though, so some people cannot tolerate it[4]. The juice of the fresh root has been used in the treatment of syphilis[207]. The sap of the plant has been applied externally to get rid of warts[257]. The roots were boiled in water and the water drunk once a week in order to prevent conception[213]. The green fruits were boiled and the decoction used in the treatment of heart and kidney problems and for the treatment of dropsy[213]. This preparation can irritate the intestines and cause unpleasant side-effects[213].

propta Seed - best sown as soon as it is ripe in late summer and overwintered outdoors. The seed requires a period of cold stratification if it is to germinate well[238]. Prick out the seedlings when large enough to handle and grow them on in a cold frame for their first winter, planting out in late spring of the following year[K]. Division in spring just before active growth begins[200]. Plants can also be divided in the autumn[238].

nwatta Prefers an acid peaty soil[1] but it succeeds in sun or shade in most well-drained soils and climates[169, 200]. A very ornamental plant[1], but it can be invasive[200]. The flowers the flowers secrete a sweet liquid that is very attractive to flies[4]. The flies are then imprisoned by their proboscis which becomes trapped between the short filaments of the stamens[207].

#### 5.2.955 Primula involucrata

4 tlin 8 cyuc 0 kcak 0 tcan 2 dwat 0.3 m hkuc hmim cyutli tcuphja7n hwicli hrasjlutnyikfrip hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Primula involucrata is a PERENNIAL growing to 0.3 m (1ft) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist or wet soil.

kcakta None known

tcanta None known

dwatta DysenteryThe entire plant is used in Tibetan medicine, it is said to have a sweet and bitter taste and a cooling potency[200]. Antidysenteric, anti-inflammatory and febrifuge, it is used in the treatment of contagious diseases and dysentery[241].

propta Seed - best sown as soon as it is ripe in a cold frame[133]. Sow stored seed in early spring in a cold frame[1]. Germination is inhibited by temperatures above 20°C[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in autumn. This is best done every other year[200].

nwatta Prefers a moist position in partial shade, such as along the edge of a stream or in a woodland garden[200]. In such a position the plant is usually long-lived[200]. If conditions are too dry the plant may become dormant by late summer[200]. Grows well in heavy clay soils. The flowers have a delicious sweet honey perfume[245].

### 5.2.956 Aplectrum hyemale

Putty Root, Adam and eve

4 tlin 8 cyuc 0 kcak 0 tcan 1 dwat 0.5 m hkuc pcimhmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Aplectrum hyemale is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf from October to May, in flower from May to June, and the seeds ripen from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta None known

tcanta AdhesiveA glue can be obtained from the tubers. The roots are bruised with a small addition of water, this gives a strong cement that is used for repairing broken pots, glass etc[207, 230].

dwatta Analgesic Pectoral PoultriceThe roots are macerated to a paste and applied to boils or used to treat head pains[207, 222, 257]. A tea made from the roots has been used in the treatment of bronchial troubles[222]. The roots were given to children by some tribes of native North American Indians in order to endow the children with the gift of eloquence and to make them fat[257].

propta Seed - surface sow, preferably as soon as it is ripe, in the greenhouse and do not allow the compost to dry out. The seed of this species is extremely simple, it has a minute embryo surrounded by a single layer of protective cells. It contains very little food reserves and depends upon a symbiotic relationship with a species of soil-dwelling fungus. The fungal hyphae invade the seed and enter the cells of the embryo. The orchid soon begins to digest the fungal tissue and this acts as a food supply for the plant until it is able to obtain nutrients from decaying material in the soil[200]. It is best to use some of the soil that is growing around established plants in order to introduce the fungus, or to sow the seed around a plant of the same species and allow the seedlings to grow on until they are large enough to move. Division of the tubers as the flowers fade[230]. This species produces a new tuber towards the end of its growing season. If this is removed from the plant as its flowers are fading, the shock to the plant can stimulate new tubers to be formed. The tuber should be treated as being dormant, whilst the remaining plant should be encouraged to continue in growth in order to give it time to produce new tubers[230]. Division can also be carried out when the plant has a fully developed rosette of leaves but before it comes into flower[230]. The entire new growth is removed from the old tuber from which it has arisen and is potted up, the cut being made towards the bottom of the stem but leaving one or two roots still attached to the old tuber. This can often be done without digging up the plant. The old tuber should develop one or two new growths, whilst the new rosette should continue in growth and flower normally[230].

nwatta Needs to be grown in the shade and humus-rich soil of a woodland garden[230]. Orchids are, in gen-

eral, shallow-rooting plants of well-drained low-fertility soils. Their symbiotic relationship with a fungus in the soil allows them to obtain sufficient nutrients and be able to compete successfully with other plants. They are very sensitive to the addition of fertilizers or fungicides since these can harm the symbiotic fungus and thus kill the orchid[230]. Plants have proved to be amenable to cultivation[230].

### 5.2.957 Gentiana saponaria

Harvestbells

4 tlin 8 cyuc 0 kcak 0 tcan 3 dwat 0.8 m hkuc hmimhtut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Gentiana saponaria is a PERENNIAL growing to 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bumblebees, butterflies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta None known
tcanta None known

dwatta Antidote Appetizer Bitter Digestive Stomachic TonicThe root is said to be an antidote to snakebites[61]. This N. American species has medicinal properties practically identical with the European gentians[4]. The following notes are based on the general uses of *G. lutea* which is the most commonly used species in the West[K]. Gentian root has a long history of use as a herbal bitter in the treatment of digestive disorders and is an ingredient of many proprietary medicines. It contains some of the most bitter compounds known and is used as a scientific basis for measuring bitterness[238]. It is especially useful in states of exhaustion from chronic disease and in all cases of debility, weakness of the digestive system and lack of appetite[4]. It is one of the best strengtheners of the human system, stimulating the liver, gall bladder and digestive system[238], and is an excellent tonic to combine with a purgative in order to prevent its debilitating effects[4]. The root is anthelmintic, anti-inflammatory, antiseptic, bitter tonic, cholagogue, emmenagogue, febrifuge, refrigerant, stomachic[4, 7, 9, 14, 21, 165, 238]. It is taken internally in the treatment of liver complaints, indigestion, gastric infections and anorexia[238]. It should not be prescribed for patients with gastric or duodenal ulcers[238]. The root is harvested in the autumn and dried for later use[4]. It is quite likely that the roots of plants that have not flowered are the richest in medicinal properties[4].

propta Seed - best sown as soon as it is ripe in a light position in a cold frame[200]. The compost must be rich in organic matter and should not be allowed to become dry[239]. The seed can also be sown in late winter or early spring but the seed germinates best if given a period of cold stratification and quickly loses viability when stored, with older seed germinating slowly and erratically[200, 239]. It is advantageous to keep the seed at about 10°C for a few days after sowing, to enable the seed to imbibe moisture[239]. Following this with a period of at least 5 - 6 weeks with temperatures falling to between 0 and -5°C will usually produce reasonable germination[239]. It is best to use clay pots, since plastic ones do not drain so freely and the moister conditions encourage the growth of moss, which will prevent germination of the seed[239]. The seed should be surface-sown, or only covered with a very light dressing of compost. The seed requires dark for germination, so the pots should be covered with something like newspaper or be kept in the dark[239]. Pot up the seedlings into individual pots as soon as they are large enough to handle and grow on in light shade in the greenhouse for at least their first winter. The seedlings grow on very slowly, taking 2 - 7 years to reach flowering size[239]. When the plants are of sufficient size, place them out into their permanent positions in late spring or early summer. Division in March[111]. Most members of this genus have either a single tap-root, or a compact root system united in a single root head, and are thus unsuitable for division[239]. Cuttings of basal shoots in late spring[238].

nwatta In general, gentians require a moist well-drained soil in a sheltered position, a certain minimum of atmospheric

humidity, high light intensity but a site where temperatures are not too high[239]. They are therefore more difficult to grow in areas with hot summers and in such a region they appreciate some protection from the strongest sunlight[200, 239]. Most species will grow well in the rock garden[200]. This species grows well in the woodland garden[200], it requires a lime-free soil[239]. Plants are intolerant of root disturbance[200]. A moisture loving plant, preferring to grow with full exposure to the sun but with plenty of underground moisture in the summer; it grows better in the north and west of Britain[1].

### 5.2.958 Salvia lyrata

Cancer Weed, Lyreleaf Sage

4 tlin 9 cyuc 0 kcak 0 tcan 2 dwat 0.6 m hkuc htut cyutli kyuctup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Salvia lyrata is a PERENNIAL growing to 0.6 m (2ft) by 0.5 m (1ft 8in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta None known
tcanta None known

dwatta Diaphoretic Laxative Salve WartsThe plant is diaphoretic and mildly laxative[222]. It can be used in the treatment of diarrhoea, coughs and colds[257]. The fresh leaves are applied to remove warts[207]. The plant is also a folk remedy for cancer[222]. The leaves and seeds are made into an ointment to cure wounds and sores[207]. The root can be used to make a salve for sores[222, 257].

propta Seed - sow March/April in a greenhouse[200]. Germination usually takes place within 2 weeks. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in early summer. In areas where the plant is towards the limits of its hardiness, it is best to grow the plants on in a greenhouse for their first winter and plant them out in late spring of the following year. Cuttings of half-ripe wood succeed at almost any time in the growing season[200].

nwatta Landscape Uses:Seashore. Requires a very well-drained light sandy soil in a sunny position[200]. Prefers a rich soil[1]. Plants can be killed by excessive winter wet[200]. Members of this genus are rarely if ever troubled by browsing deer[233]. Special Features:Attractive foliage, North American native, Attracts butterflies, Suitable for cut flowers.

### 5.2.959 Erica vagans

Cornish Heath, Cornish heath

4 tlin 8 cyuc 0 kcak 3 tcan 0 dwat 0.8 m hkuc htut cyutli kyuctcup hwicli hyihshrasjlut hpa7tli frusfatprik hpa7tmwatli fyfxre7t hjonli

drutta Erica vagans is an evergreen Shrub growing to 0.8 m (2ft 7in) by 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf all year, in flower from July to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta None known

tcanta Brush Dye Fuel ThatchingA dye is obtained from the flowers. No further details. The twigs are used for making brushes, thatching, bedding etc and also as a fuel. A good ground cover plant, though it might need weeding for the first year[197]. It can be clipped in spring to give denser growth[197, 208]. Space the plants about 60cm apart each way[208].

dwatta None known

arborecens[238]. The roots contain more than 13,000 parts per million of rosmarinic acid, the same anti-oxidant that is found in rosemary[222]. The fresh leaves are strongly emetic[222]. Some caution is advised, see notes above on toxicity[222]. A poultice of the leaves or roots is applied to burns, bruises, sores, sprains etc[4, 222, 254].

propta Seed - best sown as soon as it is ripe in a cold frame. The seed can also be sown in the spring, though it might be slower to germinate. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in a greenhouse or cold frame. Plant them out in spring or early summer of their second year. Division in spring[1].

nwatta Prefers a sandy peat in a moist situation but it is easily grown in ordinary garden soils[1] so long as they are not dry[200]. Prefers dappled shade[200]. The whole plant has a strong disagreeable odour and a pungent spicy taste[4]. Another report says that the foliage is strongly aromatic, with a lemon scent[238].

## 5.2.1013 Taenidia integerrima

Yellow pimperlnel

4 tlin 6 cyuc 0 kcak 2 tcan 1 dwat 0.6 m hkuc hmimhtut cyutli hgatkyuctcup hwicli hyishshrasjlut hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Taenidia integerrima is a PERENNIAL growing to 0.6 m (2ft) by 0.4 m (1ft 4in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta None Known

tcanta Garden Uses: Woodland gardens. Native US plant gardens. Not commonly found in cultivation. Invertebrates shelter: beneficial for insects and other arthropods. Nectary: provides nectar or pollen for beneficial insects [1-2]. The flowers attract small bees, wasps (including parasitic wasps), flies, and beetles. These insects seek nectar primarily, although some bees may collect pollen and some flies and beetles may feed on pollen. Some of the fly visitors include Syrphid flies, Tachinid flies, Chloropid flies, March flies, and Blow flies, while bee visitors include Nomadine bees, Little Carpenter bees, Halictid bees, Carder bees, and Andrenid bees. The caterpillars of the butterflies Papilio polyxenes asterias (Black Swallowtail) and Papilio joanae (Ozark Swallowtail) feed on the foliage of this plant; the latter insect has not been observed in Illinois, although it has been found in Missouri and western Kentucky. Little information is available about this plant's relationships to birds and mammals as a possible food source [1-6].

dwatta Native American ethnobotany. The Menominee take an infusion of root taken for pulmonary troubles, chew the steeped root for 'bronchial affections', and use it as a seasoener for other remedies because of the good smell. The Ojibwe smoke the seeds in a pipe before hunting for good luck.

propta Seed. Easy.

nwatta An herbaceous perennial plant in the parsley family. The preference is partial to full sun and dry to medium conditions. Tolerates close to full shade. Poor soil is preferred, consisting of clay, rocky material, or some sand, as this reduces the competition from other plants. This plant adapts well to slopes, although it may not remain very erect. Drought resistance is very good. Bloom Time: May to July. Bloom Description: Yellow. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is a tap root similar to a carrot going directly down [1-2].

## 5.2.1014 Narcissus poeticus

Poet's Narcissus

4 tlin 8 cyuc 0 kcak 0 tcan 1 dwat 0.3 m hkuc

htut cyutli tcup hwicli hrasjlutnyikprik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Narcissus poeticus is a BULB growing to 0.3 m (1ft) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from April to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta None known

tcanta EssentialAn essential oil is obtained from the flowers. 500kg of the flowers yields 1kg concrete, 300gr absolute of the essential oil[46, 61].

dwatta Emetic Homeopathy IrritantThe bulb is powerfully emetic and irritant[4]. A homeopathic remedy is made from the bulb[4].

propta Seed - best sown as soon as it is ripe in a cold frame. A short stratification will improve the germination of stored seed. Sow the seed thinly so that the seedlings can be left undisturbed in the pot for their first two years of growth. Give them an occasional liquid feed in the growing season to ensure they do not become nutrient deficient. When the plants become dormant in the summer, pot up the small bulbs placing 2 - 3 bulbs in each pot. Grow them on for another one or two years in the greenhouse before planting them out when they are dormant in late summer. Division of bulbs after the leaves die down in early summer[1]. Larger bulbs can be replanted immediately into their permanent positions, or can be stored in a cool place and then be planted out in the autumn. It is best to pot up the smaller bulbs and grow them on for a year before planting them out when dormant in the autumn.

nwatta Prefers a deep rather stiff soil but succeeds in moist soils and situations[1]. Grows well in heavy clay soils. Easily grown in a moist soil, doing well in grass[90] but it is slow to establish[188]. The dormant bulbs are fairly hardy and will withstand soil temperatures down to at least -5°C[214]. A very ornamental plant[1], but it is sometimes shy to flower[90]. The flowers are powerfully scented[245].

## 5.2.1015 Gentiana decumbens

4 tlin 8 cyuc 0 kcak 0 tcan 1 dwat 0.3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Gentiana decumbens is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bumblebees, butterflies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known
tcanta None known

dwatta StomachicA tincture of the plant is used as a stomachic[240].

propta Seed - best sown as soon as it is ripe in a light position in a cold frame[200]. It can also be sown in late winter or early spring but the seed germinates best if given a period of cold stratification and quickly loses viability when stored, with older seed germinating slowly and erratically[200, 239]. It is advantageous to keep the seed at about 10°C for a few days after sowing, to enable the seed to imbibe moisture[239]. Following this with a period of at least 5 - 6 weeks with temperatures falling to between 0 and -5°C will usually produce reasonable germination[239]. It is best to use clay pots, since plastic ones do not drain so freely and the moister conditions encourage the growth of moss, which will prevent germination of the seed[239]. The seed should be surface-sown, or only covered with a very light dressing of compost. The seed requires dark for germination, so the pots should be covered with something like newspaper or be kept in the dark[239]. Pot up the seedlings into individual pots as soon as they are large enough to handle and grow on in light shade in the greenhouse for at least their first winter. The seedlings grow on very slowly, taking 2 - 7 years to reach

drutta *Coreopsis rosea* is a PERENNIAL growing to 0.6 m (2ft) by 0.6 m (2ft in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry moist or wet soil.

kcakta None Known

tcanta A good ground cover with medium to high density growing at a fast rate. Plants will spread in the garden by rhizomes and self-seeding to form a dense ground cover, sometimes to the point of being considered aggressive [368-1]. Ornamental: Long summer bloom and airy foliage provide good accent in borders or rock gardens. Good small area ground cover. Also effective as an edger for borders, foundations and walks/paths. Naturalized areas, native plant gardens or cottage gardens [368-1]. Wildlife Food: Attracts birds that eat the seeds. Insectory: Provides for food for pollinators [1-2]. A good cut flower.

dwatta None known

propta Sow seeds at 55° to 61°F in mid- or late winter, or divide plants in early spring. Basal cuttings can be rooted in spring.

nwatta An herbaceous perennial for temperate areas. USDA Hardiness Zones: 4 - 9. Soil pH: 6.6 - 7.8. Growth Rate: Moderate. Life Span: Long-Lived Perennial. Stand Persistence: Long. Form: Creeping. Texture: Fine. Sun: Full Sun, Partial Shade. Soil Type: Sandy, Loamy, Silty. Soil Moisture: Wet, Moderate. Root Type: Rhizome. Seasonal Interest: Summer-Fall. Spreads via rhizome and seeds, can be aggressive. Seeds resemble ticks, hence the name tickseed. Fruit is a cypsela. Flower Color: Pink, Yellow. Drought: Sensitive. Flood: Sensitive. Salt: Moderate [318-1]. Bloom Time: Early Summer - Early Fall. Fruit Time: Summer - Fall. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2]. The root pattern is fibrous dividing into a large number of fine roots [1-2]. The root pattern is stoloniferous rooting from creeping stems above the ground [1-2].

## 5.2.1010 *Anthemis arvensis*

Corn Chamomile

4 tlin 8 cyuc 0 kcak 2 tcan 2 dwat 0.4 m hkuc htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatprik-wisslip hpa7tmwatli fyfjxre7t hjonli

drutta *Anthemis arvensis* is a ANNUAL growing to 0.4 m (1ft 4in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to July, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies, beetles. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta None known

tcanta Can be used as an ornamental plant.

dwatta Febrifuge This species is considered to be one of the best febrifuge species indigenous to France[4]. The flowers and leaves are used[4].

propta Seed - best sown outdoors as soon as it is ripe. Most of the seed germinates in the autumn.

nwatta Prefers a sunny position and a well-drained soil that is neutral to slightly acid[1, 200]. Succeeds in heavy clay soils.

## 5.2.1011 *Arnica fulgens*

Hillside Arnica, Foothill arnica

4 tlin 8 cyuc 0 kcak 0 tcan 2 dwat 0.6 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta *Arnica fulgens* is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 4. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers

well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta None known

dwatta Antiechymotic Antiphlogistic Irritant Nervine Sternutory Tonic VulneraryThe whole plant, but especially the flowers and the root, is antiechymotic, antiphlogistic, irritant, nervine, sternutory, tonic and vulnerary[61, 172]. This plant is used in North America in much the same way as *A. montana* is used in Europe[254]. These uses are as follows:- Arnica has a long history of herbal use, especially as an external treatment for bruises and sprains[232, 238] - it is an ingredient of a number of proprietary preparations[238]. Internally, it has been used in the treatment of heart complaints and as a booster for the immune system[238]. Arnica increases local blood supply and accelerates healing, it is anti-inflammatory and increases the rate of absorption of internal bleeding[254]. Generally the plant is nowadays only recommended for internal use as a homeopathic medicine, principally for treating shock, injury and pain[254]. If used as a decoction or tincture it stimulates the circulation and is valuable in the treatment of angina and a weak or failing heart, but it can be toxic even at quite low doses and so is rarely used this way[254]. The flowers are the part most commonly used[4, 232], they are harvested when fully open and dried - the receptacles are sometimes removed since these are liable to be attacked by insects[4]. The root is also used, it is harvested after the leaves have died down in the autumn and dried for later use[4]. The whole plant is antiechymotic, antiphlogistic, nervine, sternutory, vulnerary[4, 7, 9, 46, 165]. Although a very valuable remedy, it should be used with caution. It has been known to cause contact dermatitis when used externally and collapse when taken internally[238]. Only take it internally under the supervision of a qualified practitioner. The freshly crushed flowers cause sneezing if inhaled[232]. The leaves have also been smoked as a tobacco[232], though it is unclear whether this was for medicinal reasons The whole plant, harvested when in flower, is used in homeopathic remedies[232]. It is especially useful in the treatment of traumatic injuries, sores and bruises[232].

propta Seed - sow early spring in a cold frame[200]. Only just cover the seed and make sure that the compost does not dry out. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse or cold frame for their first winter. Plant out in late spring or early summer. Division in spring[200].

nwatta Prefers a moist, well-drained humus rich soil, preferably lime-free[200]. Prefers a mixture of sand, loam and peat[1].

## 5.2.1012 *Collinsonia canadensis*

Stone Root - Horse Balm, Richweed

4 tlin 8 cyuc 0 kcak 0 tcan 3 dwat 0.8 m hkuc hmim cyutli tcuphja7n hwicli hrasjlut hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

drutta *Collinsonia canadensis* is a PERENNIAL growing to 0.8 m (2ft 7in) by 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower in August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist or wet soil.

kcakta None known

tcanta None known

dwatta Alterative Antispasmodic Diaphoretic Diuretic Sedative Tonic Urinary Vasodilator VulneraryThe whole plant, but especially the fresh root, is alterative, antispasmodic, diaphoretic, diuretic, sedative, tonic, vasodilator and vulnerary[4, 21, 46, 102, 165]. A tea made from the roots is strongly diuretic, it is valuable in the treatment of all complaints of the urinary system and the rectum and is used in the treatment of piles, indigestion, diarrhoea, kidney complaints etc[4, 222]. It has proved of benefit in the treatment of irritable bowel syndrome, mucous colitis and varicose veins[254]. The root is seldom used on its own but is contained in remedies with other herbs, especially *Aphanes arvensis*, *Eupatorium purpureum* and *Hydrangea*

propta Seed - surface sow in an acid sandy compost in a cold frame in spring. Keep moist. Prick out the plants as soon as they are large enough to handle and plant them in their permanent positions when they are 5 - 8cm tall[11]. Cuttings of half-ripe wood, 3cm long taken from twiggy lateral growths near the base of the plant, July/August in a frame. Remove the leaves from the bottom part of the stem without causing any damage to the bark. The cuttings root in a few weeks if they are given some bottom heat. Plant out in spring[11]. Layering in spring or autumn. Plants can be 'dropped' and then dug up and divided about 6 - 12 months later. Dropping involves digging up the plant and then replanting it about 15 - 20cm deeper in the soil to encourage roots to form along the stems[78].

nwatta A calcifuge plant, it requires a light lime-free loam[11]. Grows well on sunny slopes, thriving in any soil that is not heavy or alkaline[11]. Plants can succeed in a slightly alkaline soil if it is rich in humus according to some reports[182, 188]. Grows best in a poor soil[11]. Resents dry soils. Prefers an open situation. A very ornamental plant[1], there are many named varieties[182]. A food plant for the caterpillars of many species of butterflies and moths as well as providing a food source for the moths and butterflies[30]. Plants in this genus are notably resistant to honey fungus[200]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

## 5.2.960 *Gentiana dahurica*

4 tlin 8 cyuc 0 kcak 0 tcan 3 dwat 0.3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

drutta *Gentiana dahurica* is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower in August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bumblebees, butterflies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta None known

dwatta Analgesic Antiinflammatory Antipyretic Antirheumatic Diuretic HypotensiveThe roots of gentian species contain some of the most bitter compounds known and make an excellent tonic for the whole digestive system, working especially on the stomach, liver and gall bladder[238]. The root is analgesic, anti-inflammatory, antipyretic, antirheumatic, diuretic, febrifuge, hypoglycaemic and hypotensive[176, 218, 238]. The root is used internally in the treatment of arthritis, allergic inflammations, low-grade fever in chronic diseases, jaundice and hepatitis[176, 218, 238]. The root is harvested in the autumn and dried for later use.

propta Seed - best sown as soon as it is ripe in a light position in a cold frame[200]. It can also be sown in late winter or early spring but the seed germinates best if given a period of cold stratification and quickly loses viability when stored, with older seed germinating slowly and erratically[200, 239]. It is advantageous to keep the seed at about 10°C for a few days after sowing, to enable the seed to imbibe moisture[239]. Following this with a period of at least 5 - 6 weeks with temperatures falling to between 0 and -5°C will usually produce reasonable germination[239]. It is best to use clay pots, since plastic ones do not drain so freely and the moister conditions encourage the growth of moss, which will prevent germination of the seed[239]. The seed should be surface-sown, or only covered with a very light dressing of compost. The seed requires dark for germination, so the pots should be covered with something like newspaper or be kept in the dark[239]. Pot up the seedlings into individual pots as soon as they are large enough to handle and grow on in light shade in the greenhouse for at least their first winter. The seedlings grow on very slowly, taking 2 - 7 years to reach flowering size[239]. When the plants are of sufficient size, place them out into their permanent positions in late spring

or early summer. Division in March[111]. Most members of this genus have either a single tap-root, or a compact root system united in a single root head, and are thus unsuitable for division[239]. Cuttings of basal shoots in late spring[238].

nwatta In general, gentians require a moist well-drained soil in a sheltered position, a certain minimum of atmospheric humidity, high light intensity but a site where temperatures are not too high[239]. They are therefore more difficult to grow in areas with hot summers and in such a region they appreciate some protection from the strongest sunlight[200, 239]. Most species will grow well in the rock garden[200]. This species prefers an alkaline soil, but can succeed in neutral to slightly acid conditions[239]. A moisture loving plant, preferring to grow with full exposure to the sun but with plenty of underground moisture in the summer, it grows better in the north and west of Britain[1]. Many of the plants and seeds offered under this name are wrongly identified, usually being *G. gracilipes*, *G. cruciata* or *G. decumbens*[239]. Plants are intolerant of root disturbance[200].

## 5.2.961 *Anthemis tinctoria*

Yellow Camomile, Golden chamomile, Dyers' Chamomile, Golden Marguerite

4 tin 6 cyuc 0 kcak 0 tcan 1 dwat 0.8 m hkuc htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli prikwlisslip hpa7tmwatli fyfjxre7t hjonli

drutta *Anthemis tinctoria* is an evergreen Perennial growing to 0.8 m (2ft 7in) by 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in leaf all year, in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies), flies, beetles. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcakta None known

tcanta DyeA distinctive yellow dye is obtained from the flowers[14, 17, 46, 61, 89, 169, 244].

dwatta Antispasmodic Emmenagogue VesicantThe whole plant is antispasmodic, diaphoretic, emetic, emmenagogue and vesicant[4]. It is used internally as a tea, which can be made either from the flowers or the whole plant[4]. Applied externally, it is used as a poultice on piles and can also be applied to the bath water[4]. The leaves are rubbed onto insect stings[222].

propta Seed - surface sow March/April in a greenhouse[134]. Do not allow the soil to dry out. Light aids germination. The seed usually germinates in 2 weeks at 20°C[134]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out into their permanent positions in the summer. Cuttings of soft wood early summer in a frame. Very easy[K]. Division in spring or autumn[200].

nwatta Landscape Uses:Border, Container, Massing, Seashore. Prefers a well-drained sweet soil and a sunny position[1]. Grows well on chalk[187]. Plants succeed in maritime gardens[233]. Hardy to about -15°C[200]. Another report says that it is hardy to about -25°C[187]. This species has formerly been cultivated as a dye plant[61], the var. 'Kel-away' is said to be the best form[169]. Plants are apt to over-flower and exhaust themselves. It is best to remove the flowering stems as soon as they stop flowering in order to stimulate the production of basal shoots for the following year[233]. Special Features:Attractive foliage, Fragrant foliage, Attracts butterflies, Suitable for cut flowers, Suitable for dried flowers, Extended bloom season in Zones 9A and above, Fragrant flowers, Attractive flowers or blooms.

## 5.2.962 *Centaurea scabiosa*

Greater Knapweed

4 tin 8 cyuc 0 kcak 0 tcan 2 dwat 0.9 m hkuc htut cyutli hgatkyuctcup hwicli hysihrasjlutnyik hpa7tli flatprikwlisslip hpa7tmwatli fyfjxre7t hjonli

drutta *Centaurea scabiosa* is a PERENNIAL growing to 0.9 m (3ft). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from July to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta None known
tcanta None known

dwatta Diaphoretic Diuretic Tonic VulneraryThe roots and seeds are diaphoretic, diuretic, tonic and vulnerary[4]. The plant once had a very high reputation as an ingredient of the Medieval 'salve', an ointment applied to heal wounds and treat skin infections[4, 254].

propta Seed - sow early spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out into their permanent positions in the summer. Division in autumn. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the summer or following spring. This should be done at least once every three years in order to maintain the vigour of the plant. Basal cuttings in spring. Harvest the shoots when they are about 10 - 15cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Succeeds in ordinary garden soil[1, 200]. Prefers a well-drained fertile soil and a sunny position[200]. Tolerates dry, low fertility and alkaline soils[200]. Does well in the summer meadow[24]. An important nectar plant for bees and butterflies[24]. Members of this genus are rarely if ever troubled by browsing deer[233].

### 5.2.963 Phlox stolonifera

Creeping phlox

4 tlin 9 cyuc 0 kcak 3 tcan 0 dwat 0.3 m hkuc

drutta Phlox stolonifera is an evergreen Perennial growing to 0.3 m (1ft) by 0.5 m (1ft 8in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil and can tolerate drought.

kcakta None Known

tcanta A good medium to high density groundcover that can be grown in semi-shade. Good for woodland gardening.
dwatta None known
propta Seed, division or by cuttings.

nwatta A long blooming mat forming perennial wildflower with showy flowers. Prefers bright shade with moist rich well drained soil. Plants tolerate acid or alkaline pH, drought, part sun and dry shade. Species self-seeds in optimum growing conditions. Spreads by stolons to form large colonies in the wild. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2]. The root pattern is fibrous dividing into a large number of fine roots [1-2]. The root pattern is stoloniferous rooting from creeping stems above the ground [1-2].

### 5.2.964 Carex pensylvanica

Pennsylvania sedge

4 tlin 8 cyuc 0 kcak 3 tcan 0 dwat 0.3 m hkuc
pcimhmimhtut cyutli hgatkyuctcup hwicli hrasjlutnyik hpa7tli frusflatprik hpa7tmwatli hjonli

drutta *Carex pensylvanica* is an evergreen Perennial growing to 0.3 m (1ft) by 0.5 m (1ft 8in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 3. The flowers are pollinated by Wind, Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta None Known

tcanta Soil stabilizationCapable of colonizing disturbed sites [277]. Groundcover for dry shade. Underplanting for shade perennials. Lawn substitute for dry soils in shady areas (forms a turf that never needs mowing or mow 2-3 times per year to 2" tall). [368-1]. Provides cover for migratory fowl, sandhill cranes, and ducks (who also use the leaves for nesting material). It is also used by sharptail grouse and prairie chickens for nesting, cover, and dancing grounds [277]. Erosion Control. Ornamental: The leaves are soft and fine textured with an arching habit. It can be used as a lawn substitute [368-1]. Tolerant of mowing. Moderate salt tolerance.

dwatta None known

propta Plants spread by rhizomes. Plants may self-seed in optimum growing conditions. This species often does not grow well from seed.[368-1].

nwatta Easily grown in average, dry to medium, well-drained soils in part shade to full shade. Prefers loose loams in dry soils in sun-dappled part shade. Most sedges prefer moist to wet soils, but not this one. Plants spread by rhizomes. Plants may self-seed in optimum growing conditions[368-1]. Soil pH: 4.0 - 8.0. Drought: Tolerant. Flood: Moderate. Salt: Moderate. Soil Compaction: Intolerant. Mowing: Tolerant. Does not compete well with larger plants in full sun. Competes well in moderate to deep shade. Can form dense mats. Makes one of the earliest spring appearances of the Carices. Life Span:Long-Lived Perennial. Stand Persistence:Long. Form: Clump. [368-1]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. An evergreen. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is clumping, giving the plant a clumping habit. The predictable growth behaviour makes it easier to maintain without having to apply containment methods[2-1].

### 5.2.965 Pyrola asarifolia

Bog Wintergreen, Liverleaf wintergreen, Pink wintergreen
4 tlin 8 cyuc 0 kcak 0 tcan 1 dwat 0.3 m hkuc
pcimhmimhtut cyutli tcup hwicli hrasjlut hpa7tli frusflatprik hpa7tmwatli fyifxre7t hjonli

drutta *Pyrola asarifolia* is an evergreen Perennial growing to 0.3 m (1ft) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 4. It is in leaf all year; in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta Plants can be used as a ground cover when spaced about 30cm apart each way[208]. They are somewhat slow to settle down though, and only form a good cover when they are growing luxuriantly[208].

dwatta Antirheumatic Haemostatic Hepatic Ophthalmic-This plant was considered to be an effective remedy in the treatment of rheumatism[207]. A decoction of the leaves, or the leaves and roots, has been used as an eyewash for sore eyes[257]. A decoction of the plant has been used to treat the coughing up of blood[257]. A decoction of the root has been used to treat liver complaints[257].

propta Seed - the only information we have on this species is that it is difficult from seed and germinates infre-

kcakta None known

tcanta A useful ground cover plant, though rather slow to spread[197]. Plants form clumps[208].

dwatta Antiseptic Astringent Styptic TonicThe root is astringent, styptic, tonic[61, 91, 218]. A safe and effective treatment for chronic bronchitis[218]. It is also used in the treatment of giddiness and general physical feebleness[61, 91]. Extracts of the plant are antiseptic[218]. The plant is a source of the drug bergenin[266].

propta Seed - surface sow in a greenhouse. Make sure that the compost does not dry out. Two weeks cold stratification can speed up germination which usually takes 1 - 6 months at 15°c[134]. Fresh seed, sown as soon as it is ripe in late spring is liable to germinate better than stored seed. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in late spring after flowering[188] or in autumn[200]. Very easy, larger divisions can be planted straight into their permanent positions whilst smaller clumps are best potted up and kept in a cold frame until they are growing away well.

nwatta Succeeds in full sun or light shade in most soils[134, 200] but prefers a deep fertile soil that does not dry out fully[134]. Grows well in heavy clay soils. Plants are at their best in a medium-heavy soil[208]. Requires a position sheltered from cold drying winds and from the early morning sun. The leaf colour is best when plants are grown in a poor soil in a sunny position[188]. Plants are hardy to about -20°c[187]. The young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. Plants seem to be immune to the predations of rabbits[233]. The different species of this genus will hybridise freely when grown near each other[233].

### 5.2.1007 Phlox divaricata

Wild blue phlox

4 tlin 9 cyuc 0 kcak 3 tcan 0 dwat 0.5 m hkuc
pcimhmimhtut cyutli hgattcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli hjonli

drutta Phlox divaricata is an evergreen Perennial growing to 0.5 m (1ft 8in) by 1 m (3ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil and can tolerate drought.

kcakta None Known

tcanta Soil conditioner Soil stabilizationA medium density groundcover for shady areas especially with acid soils. Good for woodland gardening. Attractive to butterflies, clearing moths, and hummingbirds. As a long-lived perennial with fibrous roots it may be good for soil building and erosion control [318-1].

dwatta None known

propta Propagate by division in fall or spring. Propagate by basal cuttings in spring or propagate by root cuttings in early fall or winter.

nwatta Herbaceous perennial ephemeral wildflower with showy fragrant flowers. USDA Hardiness Zones: 4 - 9. Soil pH: 5.5 - 7.1. Growth Rate: Moderate. Life Span: Long-Lived Perennial. Stand Persistence: Medium. Form: Upright. Texture: Fine. Sun: bright shade, partial shade, shade. Soil Type: Loamy, Silty. Soil Moisture: Moderate. Minimum Root Depth: 14 inches (0.3m). Root Type: Fibrous Deep. Seasonal Interest: Spring. Flower Color: Blue, Pink, Purple, White. Flood: Sensitive. Salt: Intolerant. Soil Compaction: Moderate. Mowing: Intolerant. Fire Damage: Intolerant. Cold Injury: Infrequent. Disease Issues: Minor. Insect/Pest Damage: Minor. Bloom Time: Spring - Early Summer. Plants tolerate clay loam, sand, acid or alkaline pH, heat, drought, part sun and dry shade. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. Evergreen. The root pattern is fibrous dividing into a

large number of fine roots [1-2]. Royal Horticultural Society Award of Garden Merit

### 5.2.1008 Pulsatilla vulgaris

Pasque Flower, European pasqueflower

4 tlin 8 cyuc 0 kcak 0 tcan 3 dwat 0.2 m hkuc
htut cyutli hgatkyuctcup hwicli hrasjlut hpa7tli flatprik-wisslip hpa7tmwatli fyifxre7t hjonli

drutta *Pulsatilla vulgaris* is a PERENNIAL growing to 0.2 m (0ft 8in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from April to May, and the seeds ripen from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta None known

tcanta DyeA green dye is obtained from the flowers[238]. Plants can be grown to form a ground cover; they are best spaced about 30cm apart each way[208].

dwatta Alterative Antispasmodic Diaphoretic Diuretic Emmenagogue Expectorant Homeopathy Nervine Ophthalmic SedativePasque flower is considered by herbalists to be of highly valuable modern curative use as a herbal simple[4]. The plant contains the glycoside ranunculin, this is converted to anemonine when the plant is dried and is the medicinally active principle in the plant[268]. The whole plant is alterative, antispasmodic, diaphoretic, diuretic, emmenagogue, expectorant, nervine and sedative[4, 46, 165]. It is taken internally in the treatment of pre-menstrual syndrome, inflammations of the reproductive organs, tension headaches, neuralgia, insomnia, hyperactivity, bacterial skin infections, septicæmia, spasmodic coughs in asthma, whooping cough and bronchitis[238]. Externally, it is used to treat eye conditions such as diseases of the retina, senile cataract and glaucoma[244]. This remedy should be used with caution[165], excessive doses cause diarrhoea and vomiting[238]. It should not be prescribed to patients with colds[238]. See also the notes above on toxicity[165]. The plant is harvested soon after flowering, it is more poisonous when fresh and so should be carefully preserved by drying[4, 268]. It should not be stored for longer than 12 months before being used[4]. In homeopathy, the plant is considered to be specific in the treatment of measles[244]. It is also used for treating nettle rash, toothache, earache and bilious indigestion[244].

propta Seed - best sown as soon as it is ripe in early summer in a cold frame. The seed usually germinates in about 2 - 3 weeks. Sow stored seed in late winter in a cold frame. Germination takes about 1 - 6 months at 15°c. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in the spring. Root cuttings, 4cm long taken in early winter, potted up in a mixture of peat and sand[175]. They can also be taken in July/August, planted vertically in pots in a greenhouse or frame. Some care is needed since the plant resents root disturbance[200].

nwatta Requires a well-drained humus rich gritty soil in a sunny position[200]. Lime tolerant[1]. Prefers lime[187]. Grows best in a well-drained chalky soil in a dry warm situation[268]. Established plants are fairly drought tolerant[190]. A very hardy plant, tolerating temperatures down to about -20°c[187]. A very ornamental plant[1], there are many named varieties[187]. The plant has become rare in its natural environment, due partly to over-collecting and partly to habitat loss[238]. Large plants transplant badly[200]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

### 5.2.1009 Coreopsis rosea

Pink tickseed

4 tlin 9 cyuc 0 kcak 3 tcan 0 dwat 0.6 m hkuc
hmimhtut cyutli kyuctcuphja7n hwicli hrasjlut hpa7tli flatprik hpa7tmwatli hjonli

## 5.2.1002 Actaea spicata

Herb Christopher, Baneberry

4 1in 8 cyuc 0 kcaak 0 tcan 1 dwat 0.5 m hkuc  
pcimhhm cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikhwis  
hpa7tmwatli xre7t hjonli

drutta Actaea spicata is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from May to June, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Beetles, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

ckakta None known

tcanta Dye RepellentThe smell of the plant is reputed to drive away vermin[4]. A black dye is obtained from the berries when alum is used as a mordant[4, 13, 74, 100]. The seeds contain tannin[240].

dwatta Antidote Antispasmodic Cytostatic NervineThe root is antispasmodic, cytostatic, emetic, nervine and purgative[4, 17, 65, 240]. In Canada the root is used in the treatment of snakebite[211]. It is also considered useful in the treatment of nervous disorders and rheumatic fever[211]. In India it is used in the treatment of rheumatism, goitre and asthma[240]. This remedy should be used with some caution, see the notes above on toxicity.

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame or outdoors in a moist shaded seedbed[200]. The seed has a limited viability[200], it can also be sown in spring in a cold frame but germination rates may be poor. When they are large enough to handle, prick the seedlings out into individual pots and plant them out into their permanent positions in late spring or early summer of the following year. Division in March or October.

nwatta Succeeds in most conditions[233], but prefers a humus-rich moist soil in light shade doing well amongst shrubs and in light woods[1, 200]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

## 5.2.1003 Waldsteinia ternata

Barren Strawberry

4 1in 8 cyuc 0 kcaak 3 tcan 0 dwat 0.2 m hkuc  
hmimhtut cyutli hgtaccup hwicli hrasjlutnyik hpa7tli flatprikhwis hpa7tmwatli hjonli

drutta Waldsteinia ternata is an evergreen Perennial growing to 0.2 m (0ft 6in) by 0.5 m (1ft 8in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil and can tolerate drought. It cannot tolerate atmospheric pollution.

ckakta None Known

tcanta Ground Cover. Food Forest, Accent: Good Texture/Form, Containers, Edging, Rabbit Resistant.

dwatta None Known

propta Propagate by division in early spring.

nwatta Herbaceous rhizomatous perennial. A dense mat of shiny dark green leaves similar to a strawberry plant. Saucer-shaped, bright yellow flowers. A very good low maintenance ground cover. Evergreen in mild winter regions. Tolerates light foot traffic. Easily divided in spring or early fall. Combines well with spring-blooming bulbs. Drought tolerant once established. Light: Partial Shade or Full Shade. Soil Type: Normal, Sandy or Clay. Soil pH: Neutral to Acid. Soil Moisture: Average or Moist. Dislikes heat and humidity. Growth Rate: Fast. Bloom Time: Early spring to summer.

## 5.2.1004 Waldsteinia fragarioides

Appalachian barren strawberry

4 1in 7 cyuc 0 kcaak 3 tcan 2 dwat 0.2 m hkuc  
pcimhhmhtut cyutli hgtakuyctucup hwicli hrasjlutnyikfrip  
hpa7tli flatprikhsom hpa7tmwatli hjonli

drutta Waldsteinia fragarioides is an evergreen Perennial growing to 0.2 m (0ft 6in) by 3 m (9ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. The

flowers are pollinated by Bees, Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid and neutral soils and can grow in saline soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

ckakta None Known

tcanta Groundcover. A good medium to high density groundcover that will work in a dry or shady spot. Edging or Groundcover for the Perennial Border or Rock Garden. Woodland gardens. Andrenid bees (*Andrena* spp.) have been observed to visit the flowers for nectar and/or pollen; it is likely that other small bees and other small insects visit the flowers as well. It has been reported that White-tailed Deer avoid browsing on the foliage [1-6].

dwatta Native American ethnobotany: The Iroquois take a compound decoction of the plants as a blood remedy, and apply a poultice of the smashed plants to snakebites (Herick, JW, 1977, Iroquois Medical Botany, State University of New York, Albany, PhD Thesis).

propta Clump Division , Seeds.

nwatta An evergreen strawberry-like mat forming perennial wildflower. The fruit is neither fleshy nor edible at maturity. Prefers partial sunlight to light shade, more or less mesic (requiring a moderate amount of moisture) conditions, and soil containing rocky material, clay, loam, or humus. Will tolerate almost any well drained soil. The soil pH should be moderately acidic to neutral (5.5-7.0). This plant dislikes hot summer weather. Bloom Color: Yellow. Bloom Time: Apr to Jun. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

## 5.2.1005 Cirsium acaulon

Stemless Thistle

4 1in 8 cyuc 0 kcaak 0 tcan 1 dwat 0.3 m hkuc  
htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikhwis hpa7tmwatli fyifxre7t hjonli

drutta Cirsium acaulon is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from July to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies), beetles. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

ckakta None known

tcanta The seed of all species of thistles yields a good oil by expression[4]. No details of potential yields etc are given[K].

dwatta OdontalgicAt one time the root used to be chewed as a remedy for toothache[4].

propta Seed - sow early spring or autumn in situ. Germination usually takes place within 2 - 8 weeks at 20°C.

nwatta An easily grown plant, succeeding in any ordinary garden soil in a sunny position[200]. This plant is very injurious in grassland, killing all plants that grow below it[4].

## 5.2.1006 Bergenia purpurascens

4 1in 8 cyuc 0 kcaak 0 tcan 2 dwat 0.5 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprikhwis hpa7tmwatli xre7t hjonli

drutta Bergenia purpurascens is an evergreen Perennial growing to 0.5 m (1ft 8in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in leaf all year, in flower from March to May. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

quently[200]. We would suggest sowing the seed as soon as it is ripe if this is possible. Sow it into soil collected from around an established plant, only just covering the seed, and put the pot in a shady part of a cold frame. Pot up any young seedlings as soon as they are large enough to handle, once again using soil from around an established plant. Plant out into their permanent positions when the plants are large enough. You should not need to use soil from around an established plant to do this since the soil in the pot will contain the necessary mycorrhiza. Division with great care in the spring[1, 111]. Pot up the divisions using some soil from around an established plant, grow on in a lightly shaded part of a greenhouse or frame and do not plant out until the plants are growing away vigorously[200].

nwatta Prefers a moist sandy woodland soil[111, 200] in a cool position with partial shade[1, 11, 200]. Requires a peaty or leafy acid soil that remains moist in the summer[200]. This is a very difficult plant to grow. It requires a mycorrhizal relationship in the soil and therefore needs to be grown initially in soil collected from around an established plant[200]. It is also very difficult from seed as well as being intolerant of root disturbance which makes division difficult[1]. This species is extremely rare and endangered in the wild[200].

## 5.2.966 Veronica arvensis

Corn Speedwell

4 1in 8 cyuc 0 kcaak 0 tcan 1 dwat 0.2 m hkuc  
htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatprikhwis hpa7tmwatli fyifxre7t hjonli

drutta Veronica arvensis is a ANNUAL growing to 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from March to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

ckakta None known

tcanta None known

dwatta Alterative Antiscorbatic DiureticThe herb is alterative, antiscorbatic and diuretic[240]. It is used in the treatment of scurvy, impurities of the blood etc[240]. It is also used as a remedy for scrofulous affections, especially of the skin, and is bruised and applied externally for healing burns, ulcers, whitlows and the mitigation of painful piles[240].

propta Seed - sow spring or autumn in situ.

nwatta Easily grown in a moderately fertile moisture retentive or dry well drained soil[200]. Prefers cool summers[200].

## 5.2.967 Limonium vulgare

Sea Lavender, Mediterranean sea lavender, Common Privet  
4 1in 7 cyuc 0 kcaak 0 tcan 1 dwat 0.3 m hkuc  
hmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatprikhwishsom hpa7tmwatli fyifxre7t hjonli

drutta Limonium vulgare is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies, bees, wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in saline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

ckakta None known

tcanta Repellent TanninThe plant repels moths[66]. The root is a source of tannin[46].

dwatta Decongestant DepurativeThe roots are decongestant and depurative[66]. They are used in the treatment of consumption with haemorrhage[257].

propta Seed - sow spring in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in

late spring or early summer, after the last expected frosts. Division in spring. Very difficult[200]. Root cuttings in late autumn or winter[200].

nwatta Landscape Uses:Border, Hedge, Screen, Superior hedge. Succeeds in light dry soils[1]. Tolerates maritime exposure[200]. A good bee plant[108]. Special Features: Not North American native, Invasive, Naturalizing, Attractive flowers or blooms.

## 5.2.968 Cypripedium calceolus parviflorum

Nerve Root

4 1in 8 cyuc 0 kcaak 0 tcan 3 dwat 0.6 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikhwis hpa7tmwatli xre7t hjonli

drutta Cypripedium calceolus parviflorum is a PERENNIAL growing to 0.6 m (2ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from May to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

ckakta None known

tcanta None known

dwatta Antidiarrhoeal Antispasmodic Diaphoretic Hypnotic Nervine Sedative TonicNerve root has a high reputation for its effect on the nervous system[238]. The root is a pungent bitter-sweet herb with an unpleasant odour, it is antispasmodic, diaphoretic, hypnotic, nervine, sedative, tonic[21, 46, 165, 192, 222, 238]. It is taken internally in the treatment of anxiety, nervous tension, insomnia, depression and tension headaches[238]. The active ingredients are not water soluble and so the root is best taken in the form of a tincture[222]. The plant is said to be the equivalent of Valerian (*Valeriana officinalis*) in its effect as a nervine and sedative, though it is less powerful[1, 4]. The roots are harvested in the autumn and are dried for later use[238]. In the interests of conservation, it is best not to use this herb unless you can be certain it was obtained from a cultivated source - see the notes above under cultivation details[K].

propta Seed - surface sow, preferably as soon as it is ripe, in the greenhouse and do not allow the compost to dry out. The seed of this species is extremely simple, it has a minute embryo surrounded by a single layer of protective cells. It contains very little food reserves and depends upon a symbiotic relationship with a species of soil-dwelling fungus. The fungal hyphae invade the seed and enter the cells of the embryo. The orchid soon begins to digest the fungal tissue and this acts as a food supply for the plant until it is able to obtain nutrients from decaying material in the soil[200]. It is best to use some of the soil that is growing around established plants in order to introduce the fungus, or to sow the seed around a plant of the same species and allow the seedlings to grow on until they are large enough to move. Division with care in early spring, the plants resent disturbance[200]. Remove part of the original rootball with the soil intact[200]. Division is best carried out towards the end of the growing season, since food reserves are fairly evenly distributed through the rhizome[230]. Small divisions of a lead and two buds, or divisions from the back (older) part of the rhizome without any developed buds, establish quickly using this method[230]. Replant immediately in situ[230].

nwatta Succeeds in shade or full sun so long as there is adequate moisture[42]. Grows well in a woodland garden[230]. Plants are best grown on a north or north-west aspect in order to slow down early growth[1]. Requires a humus rich soil with plenty of moisture in the growing season[42], it also succeeds in chalky soils[200]. Must not be planted too deeply[42]. A very ornamental plant[1] it is long-lived when once established, though it is very difficult to establish a plant[233]. The flowers have a soft, rose-like perfume[245]. Plants are growing very well at the Savill Gardens in Windsor[233]. This plant is becoming very rare in the wild due to overcollecting for medicinal usage[238]. Reports that the plant is cultivated for its medicinal uses are largely spurious and, unless you can be certain that the root has come from a cultivated source, it is best not to use this plant

medicinally but to use suitable substitutes such as *Scutellaria laterifolia* and *Lavendula angustifolia*[238]. Orchids are, in general, shallow-rooting plants of well-drained low-fertility soils. Their symbiotic relationship with a fungus in the soil allows them to obtain sufficient nutrients and be able to compete successfully with other plants. They are very sensitive to the addition of fertilizers or fungicides since these can harm the symbiotic fungus and thus kill the orchid[230].

## 5.2.969 Anemone cylindrica

Candle Anemone

4 tlin 8 cyuc 0 kcaak 0 tcan 2 dwat 0.5 m hkuc hmim cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta *Anemone cylindrica* is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta None known

tcanta MiscellanyNone known

dwatta Antiseptic Miscellany Ophthalmic PoulticeThe root of this plant was one of the most highly esteemed medicines of the Omaha and Ponca Indians[213]. A wash of the pounded boiled root was applied externally to wounds[213]. The root contains anemoin, which is said to be a potent antiseptic[213]. A poultice made from the leaves is used to treat burns[207, 257]. A tea of the roots was used in the treatment of headaches and dizziness[213, 257]. A decoction of the stem and fruit is used as a wash for sore eyes[257].

propta Seed - best sown in a cold frame as soon as it is ripe in the summer[1]. Surface sow or only just cover the seed and keep the soil moist. Sow stored seed as soon as possible in late winter or early spring. The seed usually germinates in 1 - 6 months at 15°c[133]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least their first year. When the plants are large enough, plant them out in the spring. Division in late summer after the plant dies down.

nwatta Succeeds in ordinary garden soil but prefers a well-drained woodland soil and some shade[200]. Plants succeed in maritime gardens[233]. Hardy to at least -20°c[187]. Plants seem to be immune to the predations of rabbits[233]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54]. A good woodland plant[1, 187].

## 5.2.970 Pyrola rotundifolia

Round-Leaved Wintergreen

drutta *Pyrola rotundifolia* is an evergreen Perennial growing to 0.3 m (1ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 4. It is in leaf all year, in flower from June to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta Plants can be used as a ground cover when spaced about 30cm apart each way[208]. They are somewhat slow to settle down though, and only form a good cover when they are growing luxuriantly[208].

dwatta Antirheumatic Antiseptic Antispasmodic Astringent Cardiotonic Contraceptive Diuretic Epilepsy Ophthalmic Skin Tonic UrinaryThe leaves are antirheumatic, antiseptic, antispasmodic, astringent, cardiotonic, contraceptive, diuretic, poultice, sedative and tonic[4, 9, 46, 172, 176,

218, 222]. A decoction is used in the treatment of skin diseases, as a gargle and a wash for the eyes[4]. It is used internally in the treatment of epilepsy and other nervous afflictions[4]. The leaves are harvested in mid to late summer and can be used fresh or dried[9]. The plant contains arbutin, a proven diuretic and antibacterial agent that is used as a urinary antiseptic, this hydrolyzes in the body into the toxic hydroquinone[222].

propta Seed - the only information we have on this species is that it is difficult from seed and germinates infrequently[200]. We would suggest sowing the seed as soon as it is ripe if this is possible. Sow it into soil collected from around an established plant, only just covering the seed, and put the pot in a shady part of a cold frame. Put up any young seedlings as soon as they are large enough to handle, once again using soil from around an established plant. Plant out into their permanent positions when the plants are large enough. You should not need to use soil from around an established plant to do this since the soil in the pot will contain the necessary mycorrhiza. Division with great care in the spring[1, 111]. Put up the divisions using some soil from around an established plant, grow on in a lightly shaded part of a greenhouse or frame and do not plant out until the plants are growing away vigorously[200].

nwatta Prefers a moist sandy woodland soil[111, 200] in a cool position with partial shade[1, 11, 200]. Requires a peaty or leafy but not very acid soil that remains moist in the summer[31, 187]. Plants are hardy to at least -20°c[187]. This is a very ornamental[1] but difficult plant to grow. It requires a mycorrhizal relationship in the soil and therefore needs to be grown initially in soil collected from around an established plant[200]. It is also very difficult from seed as well as being intolerant of root disturbance which makes division difficult[1]. The flowers have a delicious almond-like fragrance[245].

## 5.2.971 Asarum europaeum

Asarabacca, European Wild Ginger

4 tlin 8 cyuc 0 kcaak 0 tcan 2 dwat 0.1 m hkuc pcmhmim cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta *Asarum europaeum* is an evergreen Perennial growing to 0.1 m (0ft 4in) by 0.5 m (1ft 8in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in leaf all year, in flower from May to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta None known

tcanta DyeA vibrant apple-green dye is obtained from plant[7, 244]. A useful ground cover for a shady position so long as it is not dry[197], spreading by its roots[208].

dwatta Cathartic Diaphoretic Emetic Errhine Sternutatory Stimulant TonicAsarabacca has a long history of herbal use dating back at least to the time of the ancient Greeks, though it is little used in modern herbalism[268]. The root, leaves and stems are cathartic, diaphoretic, emetic, errhine, sternutatory, stimulant and tonic[4, 7, 9, 13, 21, 46, 240]. The plant has a strong peppery taste and smell[244]. It is used in the treatment of affections of the brain, eyes, throat and mouth[4, 19]. When taken as a snuff, it produces a copious flow of mucous[268]. The root is harvested in the spring and dried for later use[7]. Use with caution[21], see the notes above on toxicity. An essential oil in the root contains 50% asarone and is 65% more toxic than peppermint oil[240]. This essential oil is the emetic and expectorant principle of the plant and is of value in the treatment of digestive tract lesions, silicosis, dry pharyngeal and laryngeal catarrh etc[240].

propta Seed - best sown in a cold frame as soon as it is ripe in the summer[134]. Stored seed will require 3 weeks cold stratification and should be sown in late winter[134]. The seed usually germinates in the spring in 1 - 4 or more weeks at 18°c[134]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least their first winter. Plant them out when large enough in late spring. Division in spring

## 5.2.999 Fritillaria sewerzowii

4 tlin 8 cyuc 0 kcaak 0 tcan 1 dwat 0.3 m hkuc hmimhtut cyutli hgatkyuctup hwicli hrasljut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Fritillaria sewerzowii* is a BULB growing to 0.3 m (1ft) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from March to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta None known

tcanta None known

dwatta AnaestheticAnaesthetic[123]. The plant contains an alkaloid that is a good local anaesthetic.

propta Seed - best sown as soon as ripe in a cold frame, it should germinate in the spring[1]. Protect from frost[134]. Stored seed should be sown as soon as possible and can take a year or more to germinate[134]. Sow the seed quite thinly to avoid the need to prick out the seedlings. Once they have germinated, give them an occasional liquid feed to ensure that they do not suffer mineral deficiency. Once they die down at the end of their second growing season, divide up the small bulbs, planting 2 - 3 to an 8cm deep pot. Grow them on for at least another year in light shade in the greenhouse before planting them out whilst dormant. Division of offsets in August[1]. The larger bulbs can be planted out direct into their permanent positions, but it is best to pot up the smaller bulbs and grow them on in a cold frame for a year before planting them out in the autumn. Bulb scales[163].

nwatta Prefers a well-drained loam that is kept dry in the summer[1, 90]. The soil must be kept quite firm[1]. Established plants are drought tolerant[190]. This species is best grown in a bulb frame, the light being left off (except in severe weather) whilst growth is in progress but then put on in the summer when growth dies down to ensure that the ground is baked[1]. Do not disturb the plants and only hand weed them[1].

## 5.2.1000 Gentiana straminea

4 tlin 8 cyuc 0 kcaak 0 tcan 3 dwat 0.3 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Gentiana straminea* is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bumblebees, butterflies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta None known

dwatta Analgesic Antiinflammatory Antipyretic Antirheumatic HypotensiveThe roots of gentian species contain some of the most bitter compounds known and make an excellent tonic for the whole digestive system, working especially on the stomach, liver and gall bladder[238]. The root is analgesic, anti-inflammatory, antipyretic, antirheumatic, diuretic, febrifuge, hypoglycaemic and hypotensive[176, 238]. The root is used internally in the treatment of arthritis, allergic inflammations, low-grade fever in chronic diseases, jaundice and hepatitis[176, 238]. The root is harvested in the autumn and dried for later use.

propta Seed - best sown as soon as it is ripe in a light position in a cold frame[200]. It can also be sown in late winter or early spring but the seed germinates best if given a period of cold stratification and quickly loses viability when stored, with older seed germinating slowly and erratically[200, 239]. It is advantageous to keep the seed at about 10°c for a few days after sowing, to enable the seed to imbibe moisture[239]. Following this with a period of at least 5 - 6 weeks with temperatures falling to between 0 and -5°c will usually produce reasonable germination[239]. It is best to use clay pots, since plastic ones do not drain so freely and the moister conditions encourage the growth of moss, which will

prevent germination of the seed[239]. The seed should be surface-sown, or only covered with a very light dressing of compost. The seed requires dark for germination, so the pots should be covered with something like newspaper or be kept in the dark[239]. Pot up the seedlings into individual pots as soon as they are large enough to handle and grow on in light shade in the greenhouse for at least their first winter. The seedlings grow on very slowly, taking 2 - 7 years to reach flowering size[239]. When the plants are of sufficient size, place them out into their permanent positions in late spring or early summer. Division in March[111]. Most members of this genus have either a single tap-root, or a compact root system united in a single root head, and are thus unsuitable for division[239]. Cuttings of basal shoots in late spring[238].

nwatta In general, gentians require a moist well-drained soil in a sheltered position, a certain minimum of atmospheric humidity, high light intensity but a site where temperatures are not too high[239]. They are therefore more difficult to grow in areas with hot summers and in such a region they appreciate some protection from the strongest sunlight[200, 239]. Most species will grow well in the rock garden[200]. This is an easily grown species[239]. A moisture loving plant, preferring to grow with full exposure to the sun but with plenty of underground moisture in the summer, it grows better in the north and west of Britain[1]. Plants are intolerant of root disturbance[200].

## 5.2.1001 Narcissus pseudonarcissus

Wild Daffodil, Daffodil

4 tlin 8 cyuc 0 kcaak 0 tcan 2 dwat 0.5 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyikfrip hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Narcissus pseudonarcissus* is a BULB growing to 0.5 m (1ft 8in) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from March to April. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta DyeA yellow to gold dye is obtained from the flowers[168].

dwatta Astringent Dysentery Emetic EpilepsyThe bulbs, leaves and flowers are astringent and powerfully emetic[4]. The bulb, especially, is narcotic and depresses the nervous system[4]. It has been used in the treatment of hysterical affections and even epilepsy with some effect[4]. The bulb is harvested in the winter and dried for later use[4]. The flowers are harvested in dry weather when they are fully open and should be dried quickly[4]. They are less powerful than the bulbs but are also considered to be antispasmodic and are useful in relieving the congestive bronchial catarrh of children and also useful in cases of epidemic dysentery[4].

propta Seed - best sown as soon as it is ripe in a cold frame. A short stratification will improve the germination of stored seed. Sow the seed thinly so that the seedlings can be left undisturbed in the pot for their first two years of growth. Give them an occasional liquid feed in the growing season to ensure they do not become nutrient deficient. When the plants become dormant in the summer, pot up the small bulbs placing 2 - 3 bulbs in each pot. Grow them on for another one or two years in the greenhouse before planting them out when they are dormant in late summer. Division of bulbs after the leaves die down in early summer[1]. Larger bulbs can be replanted immediately into their permanent positions, or can be stored in a cool place and then be planted out in the autumn. It is best to pot up the smaller bulbs and grow them on for a year before planting them out when dormant in the autumn.

nwatta Prefers a deep rather stiff soil but succeeds in most soils[1]. Grows well in heavy clay soils. Succeeds in sun or shade[31]. Grows well on woodland edges[24]. The flowers have the sweet woodland perfume of the primrose[245]. This is not very discernible when only a few plants are grown, but is quite noticeable in a group of plants[245].

dwatta Cardiotonic Diuretic HypotensiveThe leaves or the whole herb is cardiotonic, diuretic and hypotensive[176, 218]. It is used in the treatment of hypertensive headache, dizziness, insomnia, irritability, oliguria and nephritic oedema[176]. It increases the renal blood flow and can be used for renal and cardiac oedema and ascites of liver cirrhosis[176].

propta Seed - best sown as soon as it is ripe in late summer and overwintered outdoors. The seed requires a period of cold stratification if it is to germinate well[238]. Prick out the seedlings when large enough to handle and grow them on in a cold frame for their first winter, planting out in late spring of the following year[K]. Division in spring just before active growth begins[200]. Plants can also be divided in the autumn[238].

nwatta Industrial Crop: Fiber Management: Hay Regional CropSucceeds in sun or shade in most well-drained but moisture-retentive soils[1, 200]. Plants can be invasive[200]. The flowers are attractive to bees.

## 5.2.996 Scutellaria galericulata

Common Skullcap, Marsh skullcap

4 tlin 8 cyuc 0 kcaak 0 tcan 3 dwat 0.5 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Scutellaria galericulata is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to September, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcaakta None known tcanta None known

dwatta Antiinflammatory Antispasmodic Astrigent Epilepsy Febrifuge Nerve TonicThe herb is anti-inflammatory, antispasmodic, slightly astringent, febrifuge, nerve and strongly tonic[4, 9, 165]. In the home an infusion is sometimes used in the treatment of throat infections[9]. The plant is harvested in the summer as it comes into flower and can be dried for later use[9]. This plant is rarely if ever used in herbal medicine[9], though it is said to have the same applications as *S. lateriflora*[238]. These applications are:- Skullcap was traditionally used in the treatment of a wide-range of nervous conditions including epilepsy, insomnia, anxiety, delirium tremens, withdrawal from barbiturates and tranquilisers, and neuralgia[222, 238]. An infusion of the plant has been used to promote suppressed menstruation[213], it should not be given to pregnant women since it can induce a miscarriage[238]. This plant should be used with some caution since in excess it causes giddiness, stupor, confusion and twitching[238].

propta Seed - sow in situ outdoors in late spring. If there is only a small quantity of seed it is better to sow it in a pot in a cold frame in early spring. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the spring. Division in spring just before new growth begins. Very easy, larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer. Basal cuttings in early summer in a frame. Very easy. Harvest the shoots with plenty of underground stem when they are about 8 - 10cm above the ground. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Succeeds in a sunny position in any ordinary garden soil that does not dry out during the growing season[200].

## 5.2.997 Fritillaria roylei

4 tlin 8 cyuc 0 kcaak 0 tcan 2 dwat 0.6 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Fritillaria roylei* is a BULB growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta None known tcanta None known

dwatta Antiasthmatic Antirheumatic Febrifuge Galactagogue Haemostatic Ophthalmic OxytoxicThe bulb is antiasthmatic, antirheumatic, febrifuge, galactagogue, haemostatic, ophthalmic and oxytoxic[46, 61, 178]. It is boiled with orange peel and used in the treatment of TB and asthma[240].

propta Seed - best sown as soon as ripe in a cold frame, it should germinate in the spring[1]. Protect from frost[134]. Stored seed should be sown as soon as possible and can take a year or more to germinate[134]. Sow the seed quite thinly to avoid the need to prick out the seedlings. Once they have germinated, give them an occasional liquid feed to ensure that they do not suffer mineral deficiency. Once they die down at the end of their second growing season, divide up the small bulbs, planting 2 - 3 to an 8cm deep pot. Grow them on for at least another year in light shade in the greenhouse before planting them out whilst dormant. Division of offsets in August[1]. The larger bulbs can be planted out direct into their permanent positions, but it is best to pot up the smaller bulbs and grow them on in a cold frame for a year before planting them out in the autumn. Bulb scales[163].

nwatta This species is easily grown in a cold greenhouse but is difficult to grow outdoors in Britain[42]. In the wild it is under snow for 6 months of the year and is barked by the sun for the rest of the year[42]. Very closely related to and merging into *F. cirrhosa* in the eastern part of its range[90]. Famous in Chinese medicine, where it is called Pé-mou, it is sold as a medicinal herb in local markets there[42, 61]. Flowers are produced in 3 - 5 years from seed.

## 5.2.998 Verbena urticifolia

White Vervain

4 tlin 8 cyuc 0 kcaak 0 tcan 1 dwat 0.3 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli fyfjxre7t hjonli

drutta *Verbena urticifolia* is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcaakta None known tcanta MiscellanyNone known

dwatta Miscellany Restorative Women's complaintsA decoction of the root is given to babies to break out the hives[207]. The sweetened root decoction is drunk as an aid for flu[207]. An infusion of the root has been used in the treatment of profuse menstruation[257]. The root has been eaten to revive a patient and restore them to health[257].

propta Seed - sow early spring in a greenhouse or cold frame[1]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the summer or the following spring. Basal cuttings in early summer. Harvest the shoots with plenty of underground stem when they are about 8 - 10cm above the ground. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Succeeds in any moderately fertile well-drained but moisture retentive soil in a sunny position[1, 200]. Hardy to about -15°c[200].

or autumn. Plants are slow to increase[200]. It is best to pot the divisions up and keep them in light shade in the greenhouse until they are growing away strongly.

nwatta Landscape Uses:Border, Ground cover, Massing, Rock garden, Woodland garden. Prefers a rich moist neutral to acid soil in woodland or a shady position in the rock garden[1, 200]. Other reports say that this plant prefers a calcareous soil[13, 19, 268]. Plants are hardy to at least -15°c[200]. The flowers are malodorous and are pollinated by flies[200]. The root has a pungent, aromatic smell like mild pepper and ginger mixed, but more strongly aromatic. Plants often self-sow when growing in a suitable position[200]. This plant was at one time commonly cultivated as a medicinal herb[17]. Special Features: Attractive foliage, Not North American native, Naturalizing, Inconspicuous flowers or blooms.

## 5.2.972 Jeffersonia dubia

4 tlin 8 cyuc 0 kcaak 0 tcan 2 dwat 0.3 m hkuc pcmhmim cyutli tcup hwicli hrasjlut hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Jeffersonia dubia* is a PERENNIAL growing to 0.3 m (1ft) by 0.2 m (0ft 8in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from May to June. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcaakta None known tcanta None known dwatta Cancer Febrifuge StomachicThe root is febrifuge and stomachic[218]. It also contains the anti-tumour compound berberine[218].

propta Seed - best sown as soon as it is ripe in a cold frame[200]. Sow stored seed as soon as possible in late winter or the spring. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in early spring[200].

nwatta Prefers a light sandy, peaty or humus-rich woodland soil and a rather shady situation[1, 130, 280]. Suitable for a choice position in a cool leafy soil[187]. This species is hardy to at least -20°c[187]. Plants have an extensive root system and resent disturbance[188]. They should be pot-grown and planted into their permanent positions as soon as possible. They should be pot-grown and planted into their permanent positions as soon as possible

## 5.2.973 Ranunculus flammula

Lesser Spearwort, Greater creeping spearwort

4 tlin 8 cyuc 0 kcaak 0 tcan 1 dwat 0.6 m hkuc hmimhtut cyutli tcuphja7nhs6s hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli fyfjxre7t hjonli

drutta *Ranunculus flammula* is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from May to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies, bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can grow in water.

kcaakta None known tcanta None known dwatta The whole plant is strongly rubefacient[4]. A tincture of the plant is used to cure ulcers[4].

propta Seed - sow spring in situ. This plant does not really need any encouragement. Division in spring. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta A plant of boggy soils and shallow water; it prefers a loamy soil and a sunny position. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

## 5.2.974 Phlox subulata

Mass phlox

4 tlin 9 cyuc 0 kcaak 3 tcan 0 dwat 0.1 m hkuc htut cyutli hgatkuyctcup hwicli hyishrasjlut hpa7tli flatprikliw hpa7tmwatli hjonli

drutta *Phlox subulata* is an evergreen Perennial growing to 0.1 m (0ft 4in) by 0.4 m (1ft 4in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcaakta None known tcanta Soil conditioner Soil stabilizationA great high density groundcover. As a long-lived perennial with fibrous roots it may be good for soil building and erosion control [318-1].

dwatta None known propta Seed, division or by cuttings.

nwatta Herbaceous mat forming perennial wildflower. A very colourful, vigorous groundcover for full sun or partial shade. Poor soil tolerant. USDA Hardiness Zones: 4 - 9. Very hardy, tolerating temperatures down to -20 °C (-4 °F). Soil pH: 5.0 - 8.0. Soil Type: Sandy, Loamy. Soil Moisture: Moderate, Dry. Growth Rate: Moderate. Life Span: Long-Lived Perennial. Stand Persistence: Long. Form: Prostrate. Texture: Fine. Minimum Root Depth: 14 inches. Drought: Tolerant. Flood: Intolerant. Salt: Intolerant. Soil Compaction: Moderate. Fire Damage: Tolerant. Cold Injury: Infrequent. Wind Storm Damage: Infrequent. Disease Issues: Minor. Insect/Pest Damage: Minor. Root Type: Fibrous Deep. Seasonal Interest: Spring. Used in borders, edgings, foundations and walls. Semi evergreen. Fruit Type: Capsule. Flower Color: Blue, Pink, purple, Red, White. Bloom Time: Spring - Late Spring. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. Evergreen. The root pattern is fibrous dividing into a large number of fine roots [1-2].

## 5.2.975 Hyacinthoides nonscripta

Bluebell

4 tlin 8 cyuc 0 kcaak 0 tcan 1 dwat 0.3 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlutnyikrip hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Hyacinthoides nonscripta* is a BULB growing to 0.3 m (1ft) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from May to June, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies, beetles. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcaakta None known tcanta Adhesive StarchA glue is obtained from the sap in the bulb and stem[4, 6, 66]. Simply cut open a bulb and apply the sap to whatever needs to be joined[K]. It makes an excellent paper glue, the join is stronger than the surrounding paper[6]. It would not work on non-absorbent materials such as plastics and glass[K]. A starch from the bulb has been used in laundering[4], it is very harsh on the skin[6].

dwatta Diuretic StypticThe bulb has diuretic and styptic properties[4]. It is used as a remedy for leucorrhoea[4].

propta Seed - sow early spring or as soon as ripe in a cold frame. It usually requires stratification. If you have plenty of seed it can be sown in situ, but it is usually more economical to sow it in a frame. If sown thinly, the seedlings can be left in their pots for the first year, though give them regular

liquid feeds to make sure that they get sufficient nutrient. Prick out the seedlings about 3 to a pot and grow on for 1 - 2 more years before planting out into their permanent positions when they are dormant[K]. Division of the bulbs in summer after the leaves die down. Larger bulbs can be replanted direct into their permanent positions, but it is best to pot up smaller bulbs and grow them on for a year in a cold frame before planting them out when dormant in late summer.

nwatta Easily grown in a soil rich in leafmold[90], preferring semi-shade[28, 31] but tolerating full sun. Succeeds in most soils but prefers a heavy one[200]. Succeeds in the dry shade of trees[188, 233]. Bulbs like to be quite deep in the soil[200]. The flowers diffuse a balsam-like scent in the sunshine[245].

## 5.2.976 *Antennaria dioica*

Catsfoot, Stoloniferous pussytoes

4 tin 8 cyuc 0 kcaak 2 tcan 2 dwat 0.1 m hkuc htut cyutli hgatyuctcup hwicli hyishras hpa7tli flatprikwiv hpa7tmwatli fyifnyanhjen hjonli

drutta *Antennaria dioica* is an evergreen Perennial growing to 0.1 m (0ft 4in) by 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in leaf all year; in flower from June to July. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Apomictic (reproduce by seeds formed without sexual fusion). The plant is self-fertile. Suitable for: light (sandy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcaakta None known

tcanta A good ground cover plant for sunny positions. Rather slow to spread, however, and it requires weeding for at least the first year[197]. Plants form a carpet and root as they spread[208].

dwatta Antitussive Astringent Chologogue Diuretic EmollientCatsfoot has been little used in herbal medicine though it was once used in mixtures for the treatment of bronchitis and bilious conditions[268]. The whole plant is antitussive, astringent, chologogue, discutient, diuretic and emollient[4, 7, 9, 21]. The plant is very rich in mucilage which makes it very valuable in the treatment of chest complaints[7]. It is also used in the treatment of liver and gall bladder complaints, hepatitis and diarrhoea[238]. Externally it is used as a gargle for treating tonsillitis and as a douche for vaginitis[238]. The herb is gathered in May before it comes into flower and can be dried for later use[7].

propta Seed - sow spring in cold frame and only just cover the seed. Do not allow the soil to dry out. The seed germinates in 1 -2 months at 15°C. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in late spring of the following year[K]. Division in spring or autumn. Fairly easy, the divisions can be planted out direct into their permanent positions if required.

nwatta Prefers a light well-drained soil in full sun, succeeding in poor soils[1, 133, 200]. Established plants are drought tolerant[190]. This species is very susceptible to slug damage, the young growth in spring is particularly at risk[K]. Tolerates light treading[200]. The flowers are sometimes cut and used as 'everlasting flowers' since they dry well and keep their colour[7]. Plants are usually dioecious, male and female plants must be grown if seed is required. Some male plants have a few hermaphrodite flowers, though these are usually sterile. Apomictic flowers are also produced[17], these produce seed without sexual fertilization, each seedling being a clone of the parent plant. The plant is heat tolerant in zones 9 through 4. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree,

shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. An evergreen. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is stoloniferous rooting from creeping stems above the ground [1-2].

## 5.2.977 *Zizia aptera*

Meadow zizia, Golden alexanders

4 tin 8 cyuc 0 kcaak 2 tcan 1 dwat 0.6 m hkuc hmimhtut cyutli hgatyuctcup hwicli hrasjlutnyik hpa7tli flatprikwiv hpa7tmwatli hjonli

drutta *Zizia aptera* is an evergreen Perennial growing to 0.6 m (2ft) by 0.6 m (2ft in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. The flowers are pollinated by Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcaakta None known

tcanta Nectary: provides nectar or pollen for beneficial insects [1-2]. The flowers attract butterflies and seed heads attract birds. Various kinds of insects visit the flowers primarily for nectar, especially small bees (Halictid, Andrenid, Nomadine) and flies (Chloropid, Tachinid, Muscid, Syrphid, etc.), as well as occasional beetles and plant bugs. The bees collect pollen as well, while some flies and beetles may feed on pollen. The caterpillars of *Papilio polyxenes asterias* (Black Swallowtail butterfly) feed on the foliage of this and other members of the Carrot family [1-6]. Suitable for the wild garden and other informal plantings as well as collections of native wild flowers[200]. Cut Flower. Water Purifier: Used in raingarden plantings [318-1].

dwatta The presence of secondary compounds such as apterin may contribute to the potential medicinal value of *Zizia* species. *Zizia aurea* roots have been used by Native Americans as a tea to cure fevers, and the plant has been referred to as a vulnerary (wound-healing) agent [318-1].

propta Seed - we have no information for this species but it is probably best sown in spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts.

nwatta An upright short-lived tap-rooted perennial wildflower in the Carrot (Apiaceae) family. Prefers sun or part sun with moist or dry soil. Plants tolerate clay loam, rocky or gravelly soil, alkaline pH and controlled burns. Drought Tolerant. Bloom Time: May to July. Bloom Description: Showy, Yellow. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is fibrous dividing into a large number of fine roots [1-2].

## 5.2.978 *Chamaelirium luteum*

Blazing Star - Unicorn Root - Devil's Bit, Fairywand

4 tin 8 cyuc 0 kcaak 0 tcan 3 dwat 0.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli nyanhjen hjonli

drutta *Chamaelirium luteum* is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from May to June. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). . The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta None known

tcanta None known

dwatta Adaptogen Diuretic Emetic Tonic Uterine tonic VermifugeBlazing star is a traditional remedy of the North American Indians where it was used mainly as a woman's herb[254]. It is widely used in Western herbal medicine

dwatta Miscellany ParasiticideOne report says that the roots are used medicinally, but gives no further details[240].

propta Seed - sow March/April in a cold frame or May outdoors[111]. Keep moist and in a shady position until germination takes place[175]. The seed has a limited viability so it should be stored in a sealed container at about 3°C[200]. Temperatures above 15°C inhibit germination[175]. The seed usually germinates in 2 - 9 weeks at 15°C[175]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out into their permanent positions in the summer. Cuttings of basal shoots in April/May, taken before they become hollow at the base, and planted in a cold frame[111]. Division in spring[111] or early autumn[200].

nwatta Prefers a rich well-drained soil that stays moist in the summer[111, 187]. Dislikes water-logged soils[200], it is liable to die out in heavy soils over winter[111]. Requires an open sunny position[188]. Plants are generally hardy to about -20°C[187]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54]. Grows well in the rock garden[188]. This species is closely related to *C. brunonianum*[200].

## 5.2.993 *Gentiana triflora*

4 tin 8 cyuc 0 kcaak 0 tcan 2 dwat 0.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta *Gentiana triflora* is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bumblebees, butterflies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta None known

tcanta None known

dwatta Antibacterial Eczema Stomachic UrinaryGentian roots contain some of the most bitter compounds known and make an excellent tonic for the digestive system, working especially on the stomach, liver and gall bladder[238]. The root is antibacterial and stomachic[176]. It is used in the treatment of jaundice, leucorrhoea, eczema, conjunctivitis, sore throat, acute infection of the urinary system, hypertension with dizziness and tinnitus[176]. The root is harvested in the autumn and dried for later use.

propta Seed - best sown as soon as it is ripe in a light position in a cold frame[200]. It can also be sown in late winter or early spring but the seed germinates best if given a period of cold stratification and quickly loses viability when stored, with older seed germinating slowly and erratically[200, 239]. It is advantageous to keep the seed at about 10°C for a few days after sowing, to enable the seed to imbibe moisture[239]. Following this with a period of at least 5 - 6 weeks with temperatures falling to between 0 and -5°C will usually produce reasonable germination[239]. It is best to use clay pots, since plastic ones do not drain so freely and the moister conditions encourage the growth of moss, which will prevent germination of the seed[239]. The seed should be surface-sown, or only covered with a very light dressing of compost. The seed requires dark for germination, so the pots should be covered with something like newspaper or be kept in the dark[239]. Pot up the seedlings into individual pots as soon as they are large enough to handle and grow on in light shade in the greenhouse for at least their first winter. The seedlings grow on very slowly, taking 2 - 7 years to reach flowering size[239]. When the plants are of sufficient size, place them out into their permanent positions in late spring or early summer. Division in March[111]. Most members of this genus have either a single tap-root, or a compact root system united in a single root head, and are thus unsuitable for division[239]. Cuttings of basal shoots in late spring[238].

nwatta In general, gentians require a moist well-drained soil in a sheltered position, a certain minimum of atmospheric humidity, high light intensity but a site where temperatures are not too high[239]. They are therefore more difficult to grow in areas with hot summers and in such a region they appreciate some protection from the strongest sunlight[200, 239]. Most species will grow well in the rock garden[200]. This species requires a lime-free, peaty, moist

but well-drained soil in sun or partial shade[187, 239]. Plants are hardy to about -20°C[187].

## 5.2.994 *Pyrola chlorantha*

Green-Flowered Wintergreen

4 tin 8 cyuc 0 kcaak 0 tcan 1 dwat 0.3 m hkuc pimhmimhtut cyutli tcup hwicli hrasjlut hpa7tli frusflatprik hpa7tmwatli fyifxre7t hjonli

drutta *Pyrola chlorantha* is an evergreen Perennial growing to 0.3 m (1ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf all year; in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta None known

tcanta None known

dwatta AstringentThe plant is astringent. It has been used in the treatment of menorrhagia, diarrhoea and haemorrhages[155]. It has also been used to treat bloody diarrhoea in children[257].

propta Seed - the only information we have on this species is that it is difficult from seed and germinates infrequently[200]. We would suggest sowing the seed as soon as it is ripe if this is possible. Sow it into soil collected from around an established plant, only just covering the seed, and put the pot in a shady part of a cold frame. Pot up any young seedlings as soon as they are large enough to handle, once again using soil from around an established plant. Plant out into their permanent positions when the plants are large enough. You should not need to use soil from around an established plant to do this since the soil in the pot will contain the necessary micorrhiza. Division with great care in the spring[1, 111]. Pot up the divisions using some soil from around an established plant, grow on in a lightly shaded part of a greenhouse or frame and do not plant out until the plants are growing away vigorously[200].

nwatta Prefers a moist sandy woodland soil[111, 200] in a cool position with partial shade[1, 11, 200]. Requires a peaty or leafy acid soil that remains moist in the summer[200]. This is a very difficult plant to grow. It requires a mycorrhizal relationship in the soil and therefore needs to be grown initially in soil collected from around an established plant[200]. It is also very difficult from seed as well as being intolerant of root disturbance which makes division difficult[1]. This species is extremely rare and endangered in the wild[200].

## 5.2.995 *Apocynum venetum*

4 tin 8 cyuc 0 kcaak 0 tcan 2 dwat 0.3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwiv hpa7tmwatli xre7t hjonli

drutta *Apocynum venetum* is a PERENNIAL growing to 0.3 m (1ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower in August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta None known

tcanta FibreThe bark yields a fibre that is used for making twine, bags, linen etc[46, 61]. It can be harvested after the leaves fall in autumn but is probably at its best as the seed pods are forming[169]. The dogbane-milkweed family *Asclepias*, *Apocynum*, *Calotropis*, and *Trachomitum* spp) has been used for fiber industrial crops for millennia with a number in cultivation as regional crops. All of these crops are dual-purpose fibres, offering bast fibres from the stem and seed fiber or 'floss' in the fruit pods. Many have also been identified as potential hydrocarbon crops due to high latex content. Could be integrated into various agroforestry systems rather than as monocultures [1-1].

## 5.2.989 *Uvularia grandiflora*

Fairybells, Merry Bells, Bellwort, Largeflower bellwort  
4 tin 9 cyuc 0 kcaak 0 tcan 3 dwat 0.3 m hkuc  
pcimhmim cyutli tcup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Uvularia grandiflora* is a PERENNIAL growing to 0.3 m (1ft) by 0.3 m (1ft in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 3. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta None known

tcanta None known

dwatta Analgesic Poultice SalveThe root is analgesic[257]. It is used as a poultice or salve in the treatment of toothaches, boils, swellings, wounds and ulcers[222, 257]. As I was typing this report (29/01/95), Geoffrey Smith on Radio 4's 'Gardeners Question Time' spoke about it and said that it was the best poultice for boils that he knew of[K]. An infusion of the root has been used to treat backaches and, mixed with oil, has been used as a salve on sore muscles[257]. A tea made from the roots is used as a wash in the treatment of rheumatic pains[222].

propta Seed - best sown in a cold frame as soon as it is ripe in the summer[200]. Sow stored seed in late winter in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division after the plants die down in late summer. It is best carried out in early spring before the plants flower[188]. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the following spring.

nwatta Landscape Uses:Container, Foundation, Specimen, Woodland garden. An easily grown plant, it requires a cool moist shady position and a light sandy soil[1, 42, 111]. Likes plenty of humus in the soil[111]. Grows well in a woodland garden and in the rock garden[200]. Plants grow much taller in rich soils and then succeed in the herbaceous border[222]. A very hardy plant, tolerating temperatures down to about -20°c[187]. A very ornamental species, there are some named varieties[233]. Special Features:North American native, Naturalizing, Attracts butterflies.

## 5.2.990 *Tephrosia virginiana*

Catgut, Virginia tephrosia

4 tin 8 cyuc 0 kcaak 0 tcan 2 dwat 0.6 m hkuc

htut cyutli hgatkyuctcup hwicli hyishrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Tephrosia virginiana* is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from May to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta None known

tcanta Hair InsecticideThe root is a source of the insecticide 'rotenone'[207, 213]. This is especially effective against flying insects but appears to be relatively harmless to animals[213]. A decoction of the roots has been used as a hair shampoo by women in order to prevent hair loss[257].

dwatta Anthelmintic Cancer Diaphoretic Diuretic Pectoral Tonic Women's complaintsThe root is anthelmintic, diaphoretic, diuretic, pectoral and tonic[207, 222, 257]. A tea made from the roots is said to make children muscular and strong[222, 257]. A cold tea is used to improve male potency and also to treat TB, bladder problems, coughs, irregular menstruation and other women's complaints[222, 257]. Experimentally, the root has shown both anticancer and cancer-

causing activity[222]. The leaves have been placed in the shoes in order to treat fevers and rheumatism[257].

propta Pre-soak the seed for 12 hours in warm water and then sow in a greenhouse in spring. Prick out the seedlings into individual pots when they are large enough to handle and grow on in the greenhouse for their first winter, planting out in the following spring or early summer.

nwatta Industrial Crop: Pesticide Management: Hay Wild CropA deep rooted plant, requiring a dry to moist light or medium very well-drained soil in a sunny position[200]. Plants are hardy to about -25° when given a suitable position[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

## 5.2.991 *Delphinium nuttallianum*

4 tin 8 cyuc 0 kcaak 2 tcan 0 dwat 0.3 m hkuc

htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Delphinium nuttallianum* is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from May to July. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta None known

tcanta Dye Ink ParasiticideA blue dye is obtained from the flowers[207, 257]. An ink can be made from the dye[207]. A parasiticide is obtained from the leaves[172]. It is quite toxic and so is for external use only.

dwatta ParasiticideNone known

propta Seed - sow March/April in a cold frame or May outdoors[111]. Keep moist and in a shady position until germination takes place[175]. The seed has a limited viability so it should be stored in a sealed container at about 3°c[200]. Temperatures above 15°c inhibit germination[175]. The seed usually germinates in 2 - 9 weeks at 15°c[175]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out into their permanent positions in the summer. Cuttings of basal shoots in April/May, taken before they become hollow at the base, and planted in a cold frame[111]. Division in spring[111] or early autumn[200].

nwatta Prefers a rich well-drained soil[111, 200]. Dislikes water-logged soils[200]. Requires an open sunny position[188]. A very variable species, there are several subspecies[61]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54]. Slugs and snails are very attracted to this plant[200].

## 5.2.992 *Delphinium cashmerianum*

4 tin 8 cyuc 0 kcaak 0 tcan 1 dwat 0.5 m hkuc

htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Delphinium cashmerianum* is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from June to July, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: OilEdible Uses: OilNone known

tcanta Miscellany Oil ParasiticideThe following uses are for the closely related *D. brunonianum*. They probably also apply for this species:- A parasiticide is obtained from the leaves[51, 61]. It is quite toxic and so is for external use only. In the Himalayas it is only used to destroy ticks on animals[51, 240]. The seed contains 30% of an oil that has industrial uses[91]. The seed is very small, however, and it would require a large area of plants to obtain reasonable yields.

where it is seen as a balancing herb for the female reproductive system and has proved to be a beneficial remedy for menstrual problems and ovarian cysts - it can also be of help in the menopause[254]. The root is adaptogen, diuretic, emetic, uterine tonic and vermifuge[4, 46, 61, 105, 238]. Small doses of the dried and powdered root are used[222]. It is employed in the treatment of amenorrhoea, dysmenorrhoea and leucorrhoea[207] and also for a variety of ailments associated with the male and female reproductive organs[222]. It should be used with caution since an excess causes vomiting[238]. The root is harvested in the autumn and dried for later use[238].

propta Seed - sow as soon as it is ripe just below the surface of a peat/sand mix in pots in a cold frame[164]. Keep cool and moist. Germination usually takes place within 1 - 6 months at 10°c[164]. When large enough to handle, prick the seedlings out into individual pots and grow them on in pots plunged in a nursery bed for 1 - 2 years, giving protection from severe weather. Plant out in spring when the plants are large enough[164]. Division.

nwatta Requires a moist fertile humus-rich acidic soil in sun or light dappled shade[1, 200]. Prefers a cool peaty soil[233]. Plants are dioecious, male and female plants must be grown if seed is required[270].

## 5.2.979 *Erigeron pulchellus*

Robin's plantain, blue spring daisy, hairy fleabane

4 tin 8 cyuc 0 kcaak 3 tcan 0 dwat 0.6 m hkuc

pcimhmim cyutli tcup hwicli hyishrasjlutnyik hpa7tli flatprik hpa7tmwatli hjonli

drutta *Erigeron pulchellus* is a PERENNIAL growing to 0.6 m (2ft) by 0.6 m (2ft in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. The flowers are pollinated by Bees, Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None Known

tcanta Ground Cover. Invertebrates shelter: beneficial for insects and other arthropods. Nectary: provides nectar or pollen for beneficial insects [1-2]. Locations: Cottage gardens, butterfly gardens, native plant/wildflower gardens, meadows or naturalized areas. May be used in borders and rock gardens [368-1].

dwatta None known

propta Propagate by seed, division or cuttings. Seeds: sow outside in late fall or the following spring without any cold treatment. Poor germination. Seeds require light for germination. Division - very good. Will naturalize in optimum growing conditions by self-seeding and stoloniferous spread.

nwatta A perennial herbaceous wildflower. Dry to medium, well-drained soils in full sun. Tolerates light shade, heat and humidity. Good drainage is very important. Best in poor to modest soils which have not been fertilized. Plants usually perform poorly in rich soils. [368-1]. Will naturalize in optimum growing conditions by self-seeding and stoloniferous spread. Flowers: Showy. Flower Color: White. Flower Time: Late spring or early summer. No serious insect or disease problems. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growing habit is a clumper with limited spread [1-2]. The root pattern is stoloniferous rooting from creeping stems above the ground [1-2].

## 5.2.980 *Helichrysum arenarium*

Everlasting Flower

4 tin 8 cyuc 0 kcaak 0 tcan 2 dwat 0.3 m hkuc

htut cyutli kyuctcup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Helichrysum arenarium* is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower in August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH:

mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta None known

tcanta None known

dwatta Chologogue Diuretic Homeopathy Skin StomachicThe fresh or dried flowers, or the entire flowering herb, are chologogue, diuretic, skin and stomachic[9, 46, 61]. An infusion is used in the treatment of gall bladder disorders and as a diuretic in treating rheumatism, cystitis etc[9]. A homeopathic remedy is made from the flowering plant[9]. It is used in the treatment of gall bladder disorders and lumbago[9].

propta Seed - sow February/March in a greenhouse. The seed usually germinates in 2 - 3 weeks at 20°c. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts.

nwatta Requires a well-drained, sunny sheltered position[1, 200]. Often cultivated for its flowers which are extensively used as a decoration and in wreaths etc[1]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 5.2.981 *Asplenium scolopendrium*

Hart's Tongue Fern

4 tin 8 cyuc 0 kcaak 0 tcan 2 dwat 0.6 m hkuc

pcimhmim cyutli kyuctcup hwicli hrasjlutnyikfrp hpa7tli flatprikliwsslip hpa7tmwatli hjonli

drutta *Asplenium scolopendrium* is an evergreen Fern growing to 0.6 m (2ft) by 0.5 m (1ft 8in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in leaf all year, and the seeds ripen from July to August. Suitable for: light (sandy) and medium (loamy) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers dry or moist soil.

kcakta None known

tcanta CosmeticA good ground cover plant for shady positions[28, 200], so long as it is planted no more than 30cm apart each way[208]. Plants form a slowly spreading clump[208]. A decoction of the fronds is used cosmetically as a hair wash to counteract greasy skin and also as a face pack for delicate skin[7].

dwatta Astringent Chologogue Diaphoretic Diuretic Dysentery Expectoant VulneryThe fronds are astringent, chologogue, diaphoretic, diuretic, expectoant, vulnery[4, 7, 9, 165]. Externally it is used as an ointment in the treatment of piles, burns and scalds[4]. An infusion is taken internally for the treatment of diarrhoea, dysentery, gravelly deposits of the bladder and for removing obstructions of the liver and spleen[4]. The fronds are harvested during the summer and can be dried for later use[7].

propta Spores - best sown as soon as they are ripe on the surface of a humus-rich sterilized soil. Keep the compost moist, preferably by putting a plastic bag over the pot. The spores usually germinate in the spring[1]. Spring sown spores germinate in 1 - 3 months at 15°c[134]. Pot on small clumps of plantlets as soon as they are large enough to handle and grow them on in light shade in a greenhouse. Keep the plants humid until they are well established. Once the plants are 15cm or more tall, plant them out into their permanent positions in the spring. Division in spring. Leaf bases - dig up the plant and wash off the soil until the old caudex covered with 'dead' leaf bases can be clearly seen. Strip off these bases individually by peeling them down the caudex. At the point of attachment they will be green. Young plants can be raised by planting these leaf bases, green tip up, in a pot of loam-based compost and enclosing the pot in a plastic bag. Within one month green swellings will appear around the original point of attachment to the caudex, each of these will develop quite quickly into a young fern. It takes 3 months in summer but longer in winter[200].

nwatta Easily grown in a shady position in a soil that is rich in leaf-mould[187]. Prefers a light sandy soil[1]. Succeeds on chalk[28]. Plants can be grown on drystone walls[219]. Grows well in heavy clay soils. Prefers a shady

position with no more than 3 hours sunlight a day, greater exposure will cause yellowing and burning of the leaves[187]. One report says that it succeeds in dry shade[188]. Requires a pH of 6 or more in order to flourish. Plants are hardy to about -30°c[187], they grow very well in SW England[31]. A very adaptable plant[28]. There are many named forms, selected for their ornamental value[187, 200]. Members of this genus are rarely if ever troubled by browsing deer[233].

### 5.2.982 Linaria canadensis

Blue Toadflax

4 tin 8 cyuc 0 kcak 0 tcan 1 dwat 0.6 m hkcuc htuc cyutli hgatkuyctcup hwicli hyishrasljut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Linaria canadensis is a ANNUAL/BIENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 4. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.
kcakta None known
tcanta None known
dwatta Antiahaemorrhoidal Diuretic LaxativeThe leaves are antiaemorrhoidal, diuretic and laxative[61, 254]. They are applied externally in the treatment of haemorrhoids[254].

propta Seed - sow spring in situ[200]. An autumn sowing can also be made in areas with mild winters[200]. This sowing will produce larger plants.

nwatta A very drought resistant plant once established, it thrives in a poor gravelly soil[200]. Nitrogen-rich soils produce excessive leaf growth at the expense of flowering[200]. Prefers a sunny position[200].

### 5.2.983 Limonium carolinianum

Sea Lavender; Lavender thrift

4 tin 8 cyuc 0 kcak 0 tcan 1 dwat 0.6 m hkcuc htuc cyutli kyuctcup hwicli hrasljutnyik hpa7tli flatpriklwish-som hpa7tmwatli fyifxre7t hjonli

drutta Limonium carolinianum is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in saline soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcakta None known
tcanta None known
dwatta Astringent DysenteryThe roots contain tannin and are powerfully astringent[4, 207]. A decoction of the root has long been used as a popular domestic remedy for diarrhoea, dysentery etc and are also used to treat sore mouths, cankers etc[4, 207]. The dried and powdered root is applied to old ulcers or piles[4].

propta Seed - sow spring in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring. Very difficult[200].

nwatta Requires a well drained soil and a sunny position[200]. Plants are well-suited to coastal gardens and dry soils[200]. Hardy to about -20°c[200].

### 5.2.984 Anemone virginiana

Tall Thimbleweed

4 tin 8 cyuc 0 kcak 0 tcan 1 dwat 0.6 m hkcuc pcmhmmim cyutli hgattcup hwicli hrasljutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Anemone virginiana is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower in July. The species is hermaphrodite

(has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil and can tolerate drought.

kcakta None known
tcanta None known
dwatta Astringent Emetic Expectoant PoutliceThe root and seeds are astringent, emetic and expectoant[222]. A decoction of the roots was used in the treatment of TB, whooping cough and diarrhoea[222, 257]. The root is pulverised and used as a wet poultice in the treatment of boils[213, 222, 257].

propta Seed - best sown in a cold frame as soon as it is ripe in the summer[1]. Surface sow or only just cover the seed and keep the soil moist. Sow stored seed as soon as possible in late winter or early spring. The seed usually germinates in 1 - 6 months at 20°c[133]. When large enough to handle, prick the seedlings out into individual pots and grow them on for at least their first year in a lightly shaded place in a greenhouse. When large enough, plant them out into their permanent positions in the spring. Division in late summer after the plant dies down.

nwatta Succeeds in ordinary garden soil but prefers a moist well-drained woodland soil[1, 200]. Prefers a moist peaty soil in some shade[187]. Tolerates drought during its summer dormancy[200]. Plants seem to be immune to the predations of rabbits[233]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

### 5.2.985 Paeonia caucasica

4 tinl 8 cyuc 0 kcak 0 tcan 1 dwat 0.6 m hkcuc hmimhtut cyutli tcup hwicli hrasljutnyikfrip hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Paeonia caucasica is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: OilEdible Uses: OilNone known
tcanta Beads Dye OilA red dye is obtained from the flowers[74]. It has been used to dye cloth and paper[250]. A fatty oil is obtained from the seed[74, 250]. No uses of the oil are given[K]. The seeds are used as beads in necklaces etc[74, 250].

dwatta AntitussiveA tea made from the dried crushed petals of various peony species has been used as a cough remedy, and as a treatment for haemorrhoids and varicose veins[250].

propta Seed - best sown as soon as it is ripe in a cold frame[250]. When sown fresh, the seed produces a root about 6 weeks after sowing with shoots formed in the spring[200]. Stored seed is much slower; it should be sown as soon as possible in a cold frame but may take 18 months or more to germinate[200]. The roots are very sensitive to disturbance, so many growers allow the seedlings to remain in their pots for 2 growing seasons before potting them up. This allows a better root system to develop that is more resilient to disturbance[250]. If following this practice, make sure you sow the seed thinly, and give regular liquid feeds in the growing season to ensure the plants are well fed. We usually prick out the seedlings into individual pots as soon as they are large enough to handle, and then grow them on in a cold frame for at least two growing seasons before planting them out when they are in growth in the spring[K]. Division with great care in spring or autumn. Each portion must have a leaf bud. If the lifted root is stood in shade for several hours it becomes less brittle and easier to divide[200]. Divisions that have several buds will usually flower in the second year, but those that only have one or two buds will take a number of years before they have grown sufficiently to flower[250].

nwatta Requires a deep rich soil, preferably neutral or slightly alkaline[1], doing quite well in sun or light shade[1, 200]. Plants are tolerant of a wide range of soil conditions, but will not survive if the soil becomes waterlogged or is too

dry[250]. This species is lime tolerant[200]. Plants grown on sandy soils tend to produce more leaves and less flowers, whilst those growing on clay take longer to become established but produce better blooms[250]. This species is not recognized by many botanists, who view it as no more than a synonym of *P. mascula*[250]. A long-lived plant, specimens can survive in the garden for at least 50 years[200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. A very greedy plant inhibiting the growth of nearby plants, especially legumes[54]. Strongly resents root disturbance, taking some time to recover after being divided[1]. Peony species are usually self-fertile, though they will also hybridise with other species if these flower nearby at the same time[250]. Plants take 4 - 5 years to flower from seed[200]. They generally breed true from seed[1].

### 5.2.986 Dryopteris cristata

Crested Wood Fern

4 tin 8 cyuc 0 kcak 0 tcan 4 dwat 0.5 m hkcuc hmim cyutli hgattcup hwicli hrasljutnyik hpa7tli flatprik hpa7tmwatli hjonli

drutta Dryopteris cristata is an evergreen Fern growing to 0.5 m (1ft 8in) by 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 4. It is in leaf all year. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland). It prefers moist soil and can tolerate drought.

kcakta None known
tcanta None known
dwatta Diaphoretic Expectoant Febrifuge VermifugeThe male fern is one of the most popular and effective treatments for tapeworms. The root stalks are anodyne, antibacterial, anti-inflammatory, antiviral, astringent, expectoant, febrifuge, sudorific, vermifuge and vulnerary[218, 222, 238]. The root contains 'filicin', a substance that paralyses tapeworms and other internal parasites and has been used as a worm expellent[238]. It is one of the most effective treatments known for tapeworms - its use should be immediately followed by a non-oily purgative such as magnesium sulphate in order to expel the worms from the body[238]. An oily purge, such as castor oil, increases the absorption of the fern root and can be dangerous[238]. The root is also taken internally in the treatment of internal haemorrhage, uterine bleeding, mumps and feverish illnesses[238]. The root is harvested in the autumn and can be dried for later use, it should not be stored for longer than 12 months[238]. This remedy should be used with caution and only under the supervision of a qualified practitioner[238]. The root is toxic and the dosage is critical[238]. See also the notes above on toxicity. Externally, the root is used in the treatment of abscesses, boils, carbuncles and sores[238].

propta Spores - can be sown at any time of the year in a greenhouse. Surface sow on a sterilised compost and keep moist, possibly by placing the pot in a plastic bag. Germinates in 1 - 3 months at 20°c. Pot up small clumps of the plants when they are large enough to handle and grow on in a shady part of the greenhouse until large enough to plant out. Division in spring. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Prefers an acid to neutral soil, succeeding in ordinary fertile soil in a shady position. Succeeds in full sun but grows best in a shady position with only 2 - 3 hours sun per day[200]. Tolerates a pH range from 4.5 to 7[200]. Dislikes heavy clay. Prefers a good supply of water at its roots but succeeds in dry shade and tolerates drought when it is established. A very hardy plant, tolerating temperatures down to about -30°c[200]. Members of this genus are rarely if ever troubled by browsing deer[233]. Hybridizes in the wild with several other species[187].

### 5.2.987 Polemonium reptans

Abcess Root, Greek valerian

4 tin 8 cyuc 0 kcak 0 tcan 2 dwat 0.3 m hkcuc hmimhtut cyutli tcup hwicli hrasljut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Polemonium reptans is a PERENNIAL growing to 0.3 m (1ft) by 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta HairA decoction of the whole plant is used as a hair rinse[213].

dwatta Alternative Astringent Diaphoretic Expectoant PectoralThe dried roots have a slightly bitter and acrid taste[4]. They are alternative, astringent, diaphoretic, expectoant and pectoral[4, 61, 222, 238]. They can be used in an infusion with water or as a tincture with alcohol[4]. They are used internally in the treatment of coughs, colds, bronchitis, laryngitis, tuberculosis, feverish and inflammatory diseases, including skin conditions and poisonous bites[238]. The root is rarely used in modern herbalism[238]. It is harvested in the autumn and dried for later use[238].

propta Seed - sow spring in a cold frame[14]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in early spring or early autumn[111]. Larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Prefers a moist well-drained fertile soil in sun or semi-shade[200]. Plants are best grown in a soil approaching that of a moraine and they must not be allowed to dry out in the summer[1]. Plants are hardy to about -20°c[187]. A number of named varieties have been selected for their ornamental value[187]. Plants have a creeping root and can multiply very quickly[4]. They can also self-sow to the point of nuisance[200]. The plants have a smell that attracts cats. The cats roll in the plants with evident pleasure and can cause considerable damage to young plants and ones that have recently been moved[238, K].

## 5.2.988 Woodwardia areolata

Netted chain fern

4 tin 9 cyuc 0 kcak 3 tcan 0 dwat 0.3 m hkcuc hmim cyutli tcuphja7n hwicli hrasljutnyik hpa7tli flatprik hpa7tmwatli hjonli

drutta Woodwardia areolata is a deciduous Fern growing to 0.3 m (1ft) by 0.3 m (1ft in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. The flowers are pollinated by Wind. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland). It prefers moist or wet soil.

kcakta None Known

tcanta Groundcover. A medium to high density ground-cover that will work in a wet and shady spot. Garden Uses: Shade gardens, native plant gardens, woodland gardens or naturalized areas. Also effective along streams and ponds [368-1]. Provides shelter for frogs, toads, newts.

dwatta None known

propta Propagate by spores or rhizome division.

nwatta A deciduous, perennial, colony-forming, waxy green, deciduous fern. Prefers organically rich, medium to wet, well-drained soils in part shade to full shade. Does well in average garden soils and will take considerable sun as long as soils are kept consistently moist[368-1]. Soil pH: Acidic (pH<6.8). Typically occurs in woodland swamps and bogs. Bloom Time: Non-flowering. Bloom Description: Non-flowering. Can be mistaken for Onoclea sensibilis. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

hardy to UK zone 6 and is not frost tender. It is in flower from May to June, and the seeds ripen in November. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Bees, insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. The ovoid fruit is very small, about 10mm x 7mm, and hairless when fully ripe[198, 200, 266]. It contains a number of small seeds, but these are easily eaten with the fruit[K].

tcanta None known

dwatta None known

propta Seed - sow spring in a greenhouse[133]. It is probably best if the seed is given 3 months stratification[113], either sow it in a cold frame as soon as it is ripe in November or as soon as it is received. Fresh seed germinates in 2 - 3 months at 10°c, stored seed can take longer[133]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least their first winter. When the plants are 30cm or more tall, plant them out into their permanent positions in late spring or early summer, after the last expected frosts[K]. Most seedlings are male[126]. The seedlings are subject to damping off, they must be kept well ventilated[113]. Cuttings of softwood as soon as ready in spring in a frame[K]. Cuttings of half-ripe wood, July/August in a frame. Very high percentage[113]. Cuttings of ripe wood, October/November in a frame.

nwatta Prefers a sound loamy neutral soil[1, 200]. Succeeds in semi-shade but full sun is best for fruit production[200]. Prefers a sheltered position[200]. Young spring growth is susceptible to frost damage[160]. Fruits are formed on second year wood and also on fruit spurs on older wood[126], any pruning is best carried out in the winter[219]. This is a climbing plant, supporting itself by twining around branches etc[200]. Plants in this genus are notably resistant to honey fungus[200]. Dioecious. Male and female plants must be grown if seed is required.

## 6.2.101 Celtis australis

Nettle Tree, European hackberry

5 tlin 9 cyuc 3 kcaak 0 tcan 2 dwat 20 m hkuc

htut cyutli hgatkuyctcup hwicli hyishrasjlut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Celtis australis is a deciduous Tree growing to 20 m (65ft) by 10 m (32ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in April, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Fruit Oil Oil SeedEdible Uses: Oil OilFruit - raw[3, 7, 100]. A mealy pleasant taste[74]. Small and insipidly sweet[2, 183]. Of little value[177]. The fruit is about 10mm in diameter[200] with a single large seed[K]. Seed - raw or cooked[7, 46, 61, 105]. An oil is obtained from the seed[7, 105].

tcanta Dye Fuel Oil Oil WoodA yellow dye is obtained from the bark[100]. A fatty oil is obtained from the seed[243]. No more information is given. Wood - very tough, pliable, durable[46, 61, 158]. Widely used by turners[7]. Used for the handles of agricultural implements[272]. The flexible thin shoots are used as walking sticks[61]. An excellent fuel[146].

dwatta Astringent Dysentery Lenitive StomachicThe leaves and fruit are astringent, lenitive and stomachic[7, 254]. The leaves are gathered in early summer and dried for later use[7]. The fruit, particularly before it is fully ripe, is considered to be more effective medicinally[254]. A decoction of both leaves and fruit is used in the treatment of amenorrhoea, heavy menstrual and intermenstrual bleeding and colic[218, 240]. The decoction can also be used to as-

tringe the mucous membranes in the treatment of diarrhoea, dysentery and peptic ulcers[254].

propta Seed - best sown as soon as it is ripe in a cold frame[200]. Stored seed is best given 2 - 3 months cold stratification and then sown February/March in a greenhouse[78, 200]. Germination rates are usually good, though the stored seed might take 12 months or more to germinate. The seed can be stored for up to 5 years[113]. As soon as they are large enough to handle, prick the seedlings out into individual pots. The leaves of seedlings often have a lot of white patches without chlorophyll, this is normal and older plants produce normal green leaves. Grow the seedlings on in a cold frame for their first winter, and plant them out in the following late spring or early summer[K]. Give them some protection from the cold for their first winter outdoors. Cuttings

nwatta Succeeds in any reasonably good soil, preferring a good fertile well-drained loamy soil[1, 11, 200]. Succeeds on dry gravels and on sandy soils[200]. The trees have deep spreading roots[7] and are very drought resistant once established[74, 200]. This species requires mild winters if it is to succeed[3]. Trees prefer hotter summers and more sunlight than are normally experienced in Britain, they often do not fully ripen their wood when growing in this country and they are then very subject to die-back in winter[1, 11, 200]. A hardier form, from seed collected in the Caucasus, is in cultivation in Britain[11]. The fruit and the seed are sometimes sold in local markets in the Balkans[46, 183]. This plant is said to be the lotus fruit of the ancients[183]. It is mentioned in the story of Odysseus returning from Troy and the story relates that if a person should eat the fruit they will never leave that area. Coppices well[146]. A good shade tree[200]. Trees can be very long-lived, perhaps to 1000 years[200]. Plants in this genus are notably resistant to honey fungus[200].

## 6.2.102 Sorbus thibetica

Tibetan whitebeam

5 tlin 9 cyuc 3 kcaak 0 tcan 0 dwat 20 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Sorbus thibetica is a deciduous Tree growing to 20 m (65ft) by 15 m (49ft). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in May, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. Very nice raw when it is fully ripe, preferably picked after a frost[K]. At this stage it has a mealy texture and a mild-flavoured slightly sweet fruit. The fruit can also be bletted. This involves storing the fruit in a cool dry place until it is almost but not quite going rotten. At this stage the fruit has a delicious taste, somewhat like a luscious tropical fruit. The fruit is up to 15mm across[200].

tcanta None known

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame[78, 80]. If you have sufficient seed it can be sown in an outdoor seedbed[78, 80]. Stored seed germinates better if given 2 weeks warm then 14 - 16 weeks cold stratification[98], so sow it as early in the year as possible. Prick out the seedlings into individual pots when they are large enough to handle. Seedlings are very slow to put on top-growth for their first year or two[11], but they are busy building up a good root system. It is best to keep them in pots in a cold frame for their first winter and then plant them out into their permanent positions in late spring.

nwatta Succeeds in most reasonably good soils in an open sunny position[11]. Tolerates light shade[188], though it fruits better in a sunny position[K]. Plants are susceptible to fireblight[188]. Closely related to *S. cuspidata*[11]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants

mixed with water they produce a good lather which is an effective and gentle soap[168, 169]. This soap is very good at removing dirt, though it does not remove oils very well. This means that when used on the skin it will not remove the natural body oils, but nor will it remove engine oil etc[K] The flowers are a very good source, when used as a body soap they leave behind a pleasant perfume on the skin[K]. The developing seed cases are also a very good source of saponins[K].

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed should be pre-soaked for 12 hours in warm water and then given 1 - 3 months stratification at 1°c[138, 200]. Germination usually takes place in 1 - 2 months at 20°c[138]. One report says that the seed is best given boiling water treatment, or heated in 4 times its volume of sand at 90 - 120°c for 4 - 5 minutes and then soaked in warm water for 12 hours before sowing it[214]. The seed exhibits considerable longevity, when stored for 15 years in an air-tight dry container at 1 - 5°c it has shown little deterioration in viability[214]. The seed is ejected from its capsule with some force when fully ripe, timing the collection of seed can be difficult because unless collected just prior to dehiscence the seed is difficult to extract and rarely germinates satisfactorily[214]. Prick out the seedlings into individual pots as soon as they are large enough to handle. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in late spring or early summer. This is a garden hybrid and it will not breed true from seed. Cuttings of half-ripe wood, taken at a node[200], July/August in a frame[11]. Cuttings of mature wood of the current year's growth, 7 - 12 cm with a heel, October in a cold frame[78]. The roots are quite brittle and it is best to pot up the callused cuttings in spring, just before the roots break[78]. Good percentage.

nwatta Prefers a warm sunny position but tolerates light shade[11, 200]. Tolerates some lime, but will not succeed on shallow chalk[200]. Some of the cultivars included here are tolerant of clay soils[260]. Plants dislike root disturbance, they should be planted out into their permanent positions whilst still small[182]. Dislikes heavy pruning, it is best not to cut out any wood thicker than a pencil[182]. Hybridizes freely with other members of this genus[200]. Some members of this genus have a symbiotic relationship with certain soil micro-organisms, these form nodules on the roots of the plants and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200, 212].

## 6.1.37 Lespedeza formosa

Oriental lespedeza

tfo2n 5 tlin 9 cyuc 0 kcaak 3 tcan 0 dwat 2 m hkuc

htut cyutli hgatkuy hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Lespedeza formosa is a deciduous Shrub growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in September, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta None known

tcanta BroomThe twigs are used in making brooms[151].

dwatta None known

propta Pre-soak the seed for 24 hours in warm water and then sow it in spring in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in individual pots in a frame. It can be difficult to get the cuttings through their first winter, it is best to plunge the pots in a bed of ashes in a sheltered border outdoors[78].

nwatta Easily grown in a light loam in full sun[1]. The top growth is not very cold tolerant, although the rootstock is considerably hardier. Plants are usually cut back to the

ground in all but very mild winters, though they generally sprout well from the base in the following spring and flower in late summer[182]. A very ornamental plant[1]. This species is extremely variable in the shape of leaflets, size of flowers and split-length of calyx. However, these characters are continuous and overlapping, without a clearly defined concept and cannot be used to distinguish different species or infraspecies[266]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

## 6.1.38 Gleditsia macracantha

tfo2n 5 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat m hkuc htut cyutli hgatkuyctcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Gleditsia macracantha is a deciduous Tree growing to 18 m (59ft 1in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from April to May, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. It can tolerate atmospheric pollution.

kcakta None known

tcanta SoapA soap substitute is obtained from the seedpods[46, 61, 109]. Wood - strong, durable, coarse-grained[82].

dwatta AnaestheticThe twigs and the leaves contain the alkaloids gleditsichine and stencarpine[4]. Stencarpine has been used as a local anaesthetic whilst gleditsichine causes stupor and loss of reflex activity[4].

propta Seed - pre-soak for 24 hours in warm water and then sow in spring in a greenhouse[78]. The seed should have swollen up, in which case it can be sown, if it has not swollen then soak it for another 24 hours in warm water. If this does not work then file away some of the seed coat but be careful not to damage the embryo[78]. Further soaking should then cause the seed to swell. One it has swollen, the seed should germinate within 2 - 4 weeks at 20°c. As soon as they are large enough to handle, prick the seedlings out into individual deep pots and plant them out into their permanent positions in the summer. Give the plants some protection from the cold for their first few winters outdoors.

nwatta Easily grown in a loamy soil, requiring a sunny position[11]. Succeeds in most soils[200] including sandy ones[188]. Tolerates drought once established[1] and atmospheric pollution[200]. Rather tender when young, it grows best in S. Britain[11]. Trees have a light canopy, they come into leaf late in the spring and drop their leaves in early autumn[200] making them an excellent top storey tree in a woodland garden. The flowers have a delightful vanilla fragrance[245]. Plants in this genus are notably resistant to honey fungus[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

## 6.1.39 Coronilla emerus

Scorpion Senna

tfo2n 5 tlin 9 cyuc 0 kcaak 0 tcan 2 dwat 2.7 m hkuc

htut cyutli hgatkuyctcup hwicli hyishrasjlut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Coronilla emerus is an evergreen Shrub growing to 2.7 m (8ft 10in). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from May to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta None known  
tcanta None known  
dwatta Cardiac DiureticThe plant is cardiac and diuretic[61].

propta Seed - scarify and then pre-soak the seed for 1 - 2 hours in warm water[164]. A period of cold stratification is also said to be helpful[200]. Sow the seed in spring in a greenhouse. Germination usually takes place in 4 - 6 weeks at 15°c[164]. Pot up the seedlings as soon as possible into individual pots and plant them out in the following spring[164]. Cuttings of greenwood, June in a frame with bottom heat[11]. Cuttings of half-ripe wood, July/August in a frame[11]. Cuttings of nearly mature side shoots, firm at the base and 7 - 10cm long with a heel, October/November in a frame. Plants are well rooted after 12 months. Good percentage[78].

nwatta Succeeds in a sunny position in most well-drained soils[184], preferring a moderately rich loamy soil[11, 182, 200]. An easily grown plant[11], it is hardy to about -20°c[184] if it is sheltered from cold winds[200]. Plants can be pruned almost back to the base if required, they usually resprout freely[200]. The flowers are sweetly scented[245]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. Plants in this genus are notably resistant to honey fungus[200].

### 6.1.40 Colutea x media

tfo2n 5 tlin 9 cyuc 0 kcak 0 tcan 0 dwat 5 m hkuc  
hmimhtut cyutli hqatkyuctcup hwicli hyishrasjltutnyik hpa7tli flat-prikliwis hpa7tmwatli xre7t hjonli

drutta Colutea x media is a deciduous Shrub growing to 3 m (9ft) by 3 m (9ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August. The species is hermaphrodite (has both male and female organs). It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcakta None known  
tcanta Hedge Hedge Soil stabilizationThis species has an extensive root system and is useful for planting on dry sunny banks for stabilizing the soil[200]. Plants can be grown as a hedge[200].

dwatta None known  
propta Seed - pre-soak for 24 hours in hot water and sow late winter in a greenhouse[113]. Scarification can help speed up the germination process[164]. Germination can be slow and erratic[200], though treated seed usually germinates in 1 - 3 months at 20°c[164]. As soon as they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out in late spring or early summer, after the last expected frosts. This species is a hybrid and so is unlikely to breed true from seed. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in a frame[78]. Cuttings are not very long-lived[78].

nwatta Requires a well-drained soil and a sunny sheltered position[182, 200]. Succeeds in poor and in dry soils, growing well on sunny banks[182]. Tolerates atmospheric pollution and salt-laden winds[200]. Plants are hardy to about -20°c[200]. Flowers are produced on the current year's growth[200]. Plants in this genus are notably resistant to honey fungus[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

### 6.1.41 Centrosema virginianum

Butterfly Pea, Spurred butterfly pea  
tfo2n 5 tlin 9 cyuc 0 kcak 0 tcan 0 dwat 2 m hkuc  
htut cyutli hqatkyuctcup hwicli hyishrasjltut hpa7tli frusflat-prikliwis hpa7tmwatli xre7t hjonli

drutta Centrosema virginianum is a PERENNIAL growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta None known  
tcanta Green manure Soil stabilizationThe plant can be allowed to grow without supports and it will then sprawl over the ground as an effective ground cover[200]. Plants have been grown as a green manure[200]. The plants extensive root system makes it useful for stabilizing soils and controlling erosion[200].

dwatta None known  
propta Seed - pre-soak for 12 hours in warm water and sow in a greenhouse in the spring. Prick out the seedlings into individual pots once they are large enough to handle and plant out in the summer.

nwatta Succeeds in any sandy or loamy soil in a sunny position[200]. Tolerant of poor acid soils, dry soils and drought[200]. A climbing plant, supporting itself by twining around other plants[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

### 6.1.42 Indigofera kirilowii

Kirilow's indigo, Indigo  
tfo2n 5 tlin 7 cyuc 0 kcak 0 tcan 1 dwat 1.5 m hkuc  
htut cyutli tcup hwicli hrasjltut hpa7tli flatprikliwsslip hpa7tmwatli xre7t hjonli

drutta Indigofera kirilowii is a deciduous Shrub growing to 1.5 m (5ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers moist soil.

kcakta None known  
tcanta None known  
dwatta OphthalmicOphthalmic[151].

propta Pre-soak the seed for 12 hours in warm water and sow February in a warm greenhouse. The germination can be variable. Prick out the seedlings when large enough to handle and overwinter the young plants in a greenhouse for the first winter, planting out in late spring or early summer after the last expected frosts[78]. Cuttings of half-ripe wood, 5 - 8cm with a heel if possible, July/August in individual pots in a frame. Good percentage[78]. Overwinter the young plants in a greenhouse for the first winter and plant out in late spring or early summer[11]. Root cuttings 3cm long in December. Good percentage[78]. Suckers. Remove them in the dormant season, preferably towards the end of winter, and plant out into their permanent positions.

nwatta Landscape Uses:Border, Erosion control, Ground cover, Massing, Rock garden, Specimen. Requires a light or medium well-drained soil and a sunny position[11, 200]. Succeeds on chalk[11]. The rootstock is hardy to about -20°c[200] and plants resprout from the base if they are cut back by winter cold. Plants are only sometimes cut to the ground in the winter[11]. They flower on the current years growth[184] and flower more freely if they are pruned to the ground during the winter. Plants in this genus are notably resistant to honey fungus[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. Special Features:Not North American native, Attracts butterflies, Attractive flowers or blooms.

drutta Vitis monticola is a deciduous Climber growing to 10 m (32ft 10in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to July, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Fruit LeavesEdible Uses: Fruit - raw or dried for winter use[1, 2, 105]. Large, thin-skinned with a tender juicy sweet pulp[183]. Small and sweet according to another report[182]. The fruit is about 12mm in diameter[200] and is borne in bunches. Leaves - cooked[55]. Young leaves are wrapped around other foods and then baked, they impart a pleasant flavour. Young tendrils - raw or cooked[55, 85].

tcanta DyeA yellow dye is obtained from the fresh or dried leaves[168].

dwatta None known  
propta Seed - best sown in a cold frame as soon as it is ripe[K]. Six weeks cold stratification improves the germination rate, and so stored seed is best sown in a cold frame as soon as it is obtained. Germination should take place in the first spring, but sometimes takes another 12 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant out in early summer. Cuttings of mature wood of the current seasons growth, December/January in a frame. These cuttings can be of wood 15 - 30cm long or they can be of short sections of the stem about 5cm long with just one bud at the top of the section. In this case a thin, narrow strip of the bark about 3cm long is removed from the bottom half of the side of the stem. This will encourage callusing and the formation of roots. Due to the size of these cuttings they need to be kept in a more protected environment than the longer cuttings. Layering.

nwatta Prefers a deep rich moist well-drained moderately fertile loam[1, 200]. Grows best in a calcareous soil[200]. Succeeds in sun or partial shade though a warm sunny position is required for the fruit to ripen[200]. Plants climb by means of tendrils[182]. They grow especially well up elm trees[18]. Any pruning should be carried out in winter when the plants are dormant otherwise they bleed profusely[182, 200]. Plants in this genus are notably susceptible to honey fungus[200].

### 6.2.98 Vaccinium hirsutum

Hairy Huckleberry  
5 tlin 9 cyuc 3 kcak 0 tcan 0 dwat m hkuc  
hmimhtut cyutli tcup hwicli hrasjltut hpa7tli frusflat hpa7tmwatli dyatxre7t hjonli

drutta Vaccinium hirsutum is a deciduous Shrub. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105, 177]. A sweet and pleasant taste according to some reports[3, 182], though others say that it is gritty and insipid[200]. The fruit is about 6mm in diameter[200].

tcanta None known  
dwatta None known

propta Seed - sow late winter in a greenhouse in a lime-free potting mix and only just cover the seed[78]. Stored seed might require a period of up to 3 months cold stratification[113]. Another report says that it is best to sow the seed in a greenhouse as soon as it is ripe[200]. Once they are about 5cm tall, prick the seedlings out into individual pots and grow them on in a lightly shaded position in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 8cm with a heel, August in a frame[78]. Slow and difficult. Layering in late summer or early autumn[78]. Another report says that

spring is the best time to layer[200]. Takes 18 months[78]. Division of suckers in spring or early autumn[113].

nwatta Requires a moist but freely-draining lime free soil, preferring one that is rich in peat or a light loamy soil with added leaf-mould[11, 200]. Prefers a very acid soil with a pH in the range of 4.5 to 6, plants soon become chlorotic when lime is present. Succeeds in full sun or light shade though it fruits better in a sunny position[200]. Requires shelter from strong winds[200]. Plants are self-sterile, at least two plants from different sources must be grown if seed is required. Dislikes root disturbance, plants are best grown in pots until being planted out in their permanent positions[200]. A freely suckering shrub when well-grown in a moist soil[182]. Plants in this genus are notably resistant to honey fungus[200].

### 6.2.99 Castanea henryi

5 tlin 9 cyuc 3 kcak 0 tcan 0 dwat 25 m hkuc  
hmimhtut cyutli hqatkyuctcup hwicli hyishrasjltutnyik hpa7tli frusflatprik hpa7tmwatli hjonli

drutta Castanea henryi is a deciduous Tree growing to 25 m (82ft 0in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in July, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: SeedEdible Uses: Seed - raw or cooked[105, 177]. Small[61, 63]. Said to be of excellent eating quality[183]. Eaten raw, there is a distinct astringency, especially if the fleshy inner skin beneath the outer shell of the seed is not removed[K]. When cooked, however, and especially when baked, the seed becomes much sweeter and has a floury texture[K]. It then makes an excellent food and can be used as a staple food in much the same way as potatoes or cereals[K].

tcanta Tannin WoodThe bark, leaves, wood and seed husks all contain tannin. Wood - valued locally for construction[61].

dwatta None known  
propta Seed - where possible sow the seed as soon as it is ripe in a cold frame or in a seed bed outdoors[78]. The seed must be protected from mice and squirrels. The seed has a short viability and must not be allowed to become dry. It can be stored in a cool place, such as the salad compartment of a fridge, for a few months if it is kept moist, but check regularly for signs of germination. The seed should germinate in late winter or early spring. If sown in an outdoor seedbed, the plants can be left in situ for 1 - 2 years before planting them out in their permanent positions. If grown in pots, the plants can be put out into their permanent positions in the summer or autumn, making sure to give them some protection from the cold in their first winter[K].

nwatta Prefers a good well-drained slightly acid loam but succeeds in dry soils[1, 11, 200]. Once established, it is very drought tolerant[1, 11, 200]. Very tolerant of highly acid, infertile dry sands[200]. Averse to calcareous soils but succeeds on harder limestones[11, 200]. Although it is very winter-hardy, this species only really thrives in areas with hot summers[200]. It is very slow growing and small in Britain[11, 200]. A shrub at Kew was 3 metres tall in 1990[K]. Resists endothia blight[105]. Plants in this genus are notably resistant to honey fungus[200]. An excellent soil-enriching understorey in pine forests[200]. Flowers are produced on wood of the current year's growth[229]. Plants are fairly self-sterile[200]. They hybridize freely with other members of this genus[200].

### 6.2.100 Actinidia lanceolata

5 tlin 9 cyuc 3 kcak 0 tcan 0 dwat 20 m hkuc  
hmimhtut cyutli tcup hwicli hrasjltutnyik hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

drutta Actinidia lanceolata is a deciduous Climber growing to 20 m (65ft 7in). See above for USDA hardiness. It is

that this species prefers shade[74]. Succeeds in acid and alkaline soils[38]. Likes a mulch of pine or spruce leaves[18, 24]. At one time this species was widely cultivated for its edible fruit, but it is fairly low yielding and has now been almost totally superseded by cultivars of *F. x. ananassa*[17]. There are some named varieties[183]. The flowers are usually unisexual[200]. (This report does not say if the plants are dioecious or monoecious.) This species produces few or no stolons[200]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. An evergreen. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2]. The root pattern is fibrous dividing into a large number of fine roots [1-2]. The root pattern is stoloniferous rooting from creeping stems above the ground [1-2].

## 6.2.94 *Sidalcea malviflora*

Checkerbloom, Dwarf checkerbloom, California checkerbloom, Siskiyou checkerbloom  
5 tin 9 cyuc 3 kcaak 0 tcan 0 dwat m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Sidalcea malviflora* is a PERENNIAL growing to 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 6. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked. The leaves have a very mild flavour and a slightly mucilaginous texture, they make a very acceptable salad[K]. The leaves can be cooked as greens[257]. The dried mashed leaves have been used as a flavouring with black manzanita berries (*Arctostaphylos* spp)[257].

tcanta None known  
dwatta None known

propta Seed - sow spring in a greenhouse. When the seedlings are large enough to handle, prick them out into individual pots and plant them out in the summer. Division in the spring.

nwatta Prefers a deep fertile well-drained but moisture-retentive soil in full sun or with some shade at the hottest part of the day[200]. This species thrives in climates with a relatively cool summer and mild winters and tolerates temperatures down to about -15°c[200]. However, where prolonged cold temperatures are experienced without snow cover, it is best to mulch the plants well in winter with material such as bracken litter[200]. If the plants are cut back immediately after flowering they will usually produce a second flush of bloom in late summer[200]. The flowers last well when they are cut for indoor use[200]. There are many named varieties, selected for their ornamental value[200].

## 6.2.95 *Plantago maritima*

Sea Plantain, Goose tongue, California goose tongue  
5 tin 9 cyuc 3 kcaak 2 tcan 2 dwat m hkuc  
htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwishsom hpa7tmwatli fyifxre7t hjonli

drutta *Plantago maritima* is a PERENNIAL growing to 0.2 m (0ft 8in) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from June to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in saline soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: Leaves SeedEdible Uses: Young leaves - raw or cooked[2, 61, 105, 183]. A delicious flavour[172]. This is one of the nicer-tasting members of the genus, the leaves are fairly low in fibres and make an acceptable addition to a mixed salad[K]. The leaves are canned

for winter use in Alaska[183]. Seed - raw or cooked. The seed can be ground into a powder and used as a flour extender[172]. The seed is very small and tedious to harvest[172].

tcanta An important food plant for the caterpillars of many species of butterflies[30]. Dynamic accumulator.

dwatta LaxativePlantain seeds contain up to 30% mucilage which swells up in the gut, acting as a bulk laxative and soothing irritated membranes[238]. Sometimes the seed husks are used without the seeds[238].

propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in early summer. A sowing can be made outdoors in situ in mid to late spring if you have enough seeds.

nwatta Succeeds in any moderately fertile soil in a sunny position[200].

## 6.2.96 *Passiflora mollissima*

Banana Passion Fruit

5 tin 9 cyuc 3 kcaak 0 tcan 0 dwat m hkuc  
htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Passiflora mollissima* is an evergreen Climber growing to 5 m (16ft 5in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in leaf all year, in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[46, 105]. An agreeable flavour[2]. An aromatic taste, it can be eaten out of hand or used as a flavouring in ice creams, fruit salads, puddings etc[183]. A juice made from the fruit is highly prized in S. America[183]. Individual fruits are up to 15cm long and weigh 50 - 150g[196].

tcanta None known  
dwatta None known

propta Pre-soak the seed for 12 hours in warm water and then sow late winter or early spring in a warm greenhouse. If sown in January and grown on fast it can flower and fruit in its first year[88]. The seed germinates in 1 - 12 months at 20°c. Prick out the seedlings into individual pots when they are large enough to handle. It you are intending to grow the plants outdoors, it is probably best to keep them in the greenhouse for their first winter and plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Mulch the roots well in late autumn to protect them from the cold. Cuttings of young shoots, 15cm with a heel, in spring[1]. Leaf bud cuttings in spring. Cuttings of fully mature wood in early summer. Takes 3 months. High percentage[3].

nwatta Requires a well-drained soil with plenty of moisture in the growing season, otherwise it is not fussy[1]. One report says that this plant is hardy to climatic zone 6 (tolerating frosts of -20°c)[200] but this is surely a misprint. The top growth is said to tolerate slight air frosts[88] and plants are said to be hardy on a wall in the mild areas of Britain, being commonly grown around Penzance[49, 59]. In S. America plants can tolerate occasional lows to -5°c[196]. Outdoor grown plants should have their roots restricted in order to reduce vegetative growth and encourage fruiting[1]. Plants do not generally fruit well in Britain[88]. In order to improve the chances of producing fruit it is best to hand pollinate using pollen from a flower that has been open for 12 hours to pollinate a newly opened flower before midday[88]. Cultivated for its edible fruit in S. America[46, 196]. Yields of 300 fruits per vine and 30 tonnes per hectare are recorded in S. America[196]. A climbing plant, attaching itself to other plants by means of tendrils that are produced at the leaf axils. Plants in this genus are notably resistant to honey fungus[200].

## 6.2.97 *Vitis monticola*

Sweet Mountain Grape

5 tin 9 cyuc 3 kcaak 0 tcan 0 dwat m hkuc

## 6.1.43 *Sophora flavescens*

Ku Shen, Shrubby sophora

tfo2n 5 tin 9 cyuc 0 kcaak 0 tcan 3 dwat 1.5 m hkuc  
htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Sophora flavescens* is an evergreen Shrub growing to 1.5 m (5ft) by 1 m (3ft 3in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from July to August, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta None known

tcanta Insecticide Parasiticide ParasiticideThe plant is a source of an insecticide and parasiticide[74, 176]. No further details.

dwatta Anthelmintic Antibacterial Antifungal Antipruritic Astringent Bitter Carminative Diuretic Dysentery Eczema Fehrigue Leprosy Parasiticide Parasiticide Pectoral Stomachic Tonic UrinaryThe root is anthelmintic, antibacterial, antifungal, antipruritic, astringent, bitter, carminative, diuretic, febrifuge, parasiticide, pectoral, stomachic and tonic[61, 147, 174, 176, 178, 218, 279]. It is used internally in the treatment of jaundice, dysentery, diarrhoea and urinary infections[238]. It is used both internally and externally in the treatment of vaginitis, eczema, pruritis, ringworm, leprosy, syphilis, scabies and itching allergic reactions[238]. The root is harvested in the autumn and dried for later use[238]. The plant is anthelmintic and diuretic[218]. It also has antibacterial activity, inhibiting the growth of *Mycobacterium tuberculosis* and *Trichomonas vaginitis*[176, 218].

propta Seed - best sown as soon as it is ripe in a greenhouse[200]. Pre-soak stored seed for 12 hours in hot (not boiling) water and sow in late winter in a greenhouse[78]. Prick out the seedlings as soon as they are large enough to handle into individual pots in the greenhouse, and grow them on for 2 years under protected conditions. Plant them out into their permanent positions in early summer of their third year. Cuttings of young shoots with a heel, July/August in a frame[11]. Air-layering[200].

nwatta Succeeds in a well-drained moderately fertile soil in full sun[200]. Requires the protection of a sunny wall if it is to flower[182], and succeeds only in the mildest areas of the country. It grows best in the warmer areas of the country where the wood will be more readily ripened and better able to withstand winter cold[219]. Although hardy to at least -15°c[238], this species does not do very well in the relatively cool summers of Britain, the plant gradually weakens and eventually succumbs[11]. It can be grown in the milder areas of the country and be treated like a herbaceous perennial, growing afresh from the base each spring[233]. An important medicinal herb in China[61]. Plants should be container-grown and planted out whilst young, older plants do not transplant well[219]. A polymorphic species[58]. The flowers are produced on the current years growth[182]. Plants in this genus are notably resistant to honey fungus[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

## 6.1.44 *Desmodium elegans*

tfo2n 5 tin 9 cyuc 0 kcaak 0 tcan 2 dwat 1.5 m hkuc  
htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Desmodium elegans* is a deciduous Shrub growing to 1.5 m (5ft) by 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from August to October, and the seeds ripen from September to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the

shade. It prefers moist soil.

kcakta None known

tcanta Fibre FuelA fibre from the bark is used for ropes and paper making[146, 158]. The wood is a good fuel[146, 158].

dwatta Carminative Cholera Diuretic TonicThe roots are carminative, diuretic and tonic[240, 272]. They are used in the treatment of bilious complaints[240, 243].The juice of the root, sometimes combined with the bark juice of *Bauhinia malabarica*, is used in the treatment of cholera[272]. The juice of the bark is used in the treatment of peptic ulcers[272].

propta Seed - best sown as soon as it is ripe in a greenhouse. Scarify and pre-soak stored seed for 5 hours in warm water then sow March in a greenhouse. The seed usually germinates within 1 - 4 months at 25°c. Prick out the seedlings into individual pots once they are large enough to handle and grow them on in the greenhouse for their first winter. Plant them out in late spring or early summer and consider giving them some protection from frost in their first winter outdoors. Cuttings of half-ripe wood with a heel, July/August in a frame. Division as the plant comes into growth in the spring. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring. Root cuttings in winter.

nwatta Succeeds in most soils so long as they are well-drained[182, 200]. Requires a sunny sheltered position[175, 182]. Plants are hardy to about -15°c[184]. Requires long hot summers to be at its best, the flowers are produced on the current years growth and do not open in cold wet seasons[11]. Plants send up new shoots 1 - 1.5m long annually from a woody base[11]. If the plant is not cut back to the ground by winter cold then it is best to prune it hard in late winter in order to encourage better flowering[182]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

## 6.1.45 *Lotus uliginosus*

Greater Bird's Foot Trefoil

tfo2n 5 tin 9 cyuc 0 kcaak 3 tcan 0 dwat 0.4 m hkuc  
htut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli frusflatprikliwis hpa7tmwatli xre7t hjonli

drutta *Lotus uliginosus* is a PERENNIAL growing to 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It can fix Nitrogen. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It cannot grow in the shade. It prefers moist or wet soil.

kcakta None known

tcanta Insecticide Soil reclamationAn insecticide is obtained from the plant[153]. No more details are given. This species is used as a pioneer plant in the reclamation of peat and pumice soils and on other wet acid soils that are unsuitable for the more commonly used *Trifolium* spp[200]. Nitrogen Fixer.

dwatta None known

propta Pre-soak the seed for 24 hours in warm water and then sow in situ in the spring or autumn. The seed usually germinates in 2 - 4 weeks at 15°c. If seed is in short supply, it can be sown in pots in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in late spring or early summer.

nwatta Succeeds in wet acid soils[200]. Dislikes shade[200]. Does well on poor soils[61]. Suitable for naturalistic and conservation plantings in situations that approximate to its natural habitat[200]. A good bee plant[74]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

## 6.1.46 Genista pilosa

Hairy greenweed, silkyleaf broom

tfo2n 5 tlin 8 cyuc 0 kcak 3 tcan 0 dwat 0.3 m hkuc hmimhtut cyutli hgatkuyctcup hwicli hyishrasjlut hpa7tli flatprikhwisslip hpa7tmwatli hjonli

drutta Genista pilosa is an evergreen Shrub growing to 0.3 m (1ft) by 0.6 m (2ft in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6. It can fix Nitrogen. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta None Known

tcanta A good high density groundcover. Nitrogen Fixer. Location: Border, Ground Cover, Mass Planting, Rock Garden, Wildlife Garden, Woodland Garden. Invertebrates shelter: beneficial for insects and other arthropods. Nectary: provides nectar or pollen for beneficial insects [1-2].

dwatta None known

propta Seed: Easy. Cover seed and germinate at 55-65F/13-18C. Chipping and soaking may aid germination. Do not transplant. Cuttings taken in summer, or by simple layering. Tip cuttings about 3-6 cm may be taken in mid-summer and rooted in a mist chamber or shaded frame.

nwatta Evergreen prostrate perennial (mostly) to erect shrub. Flowers, golden-yellow, cover the plants in late spring to early summer. Poor, dry, sandy, and stony soils. Full sun or part shade and well drained soil. Soil pH: Acid/Neutral/Alkaline. Foot Traffic: Light. Drought tolerant. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is miststemmed with multiple stems from the crown [1-2]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is suckering with new plants from runners away from the plant [2-1].

## 6.1.47 Genista hispanica

Spanish Gorse

tfo2n 5 tlin 9 cyuc 0 kcak 0 tcan 1 dwat 0.8 m hkuc htut cyutli hgatkuyctcup hwicli hyishrasjlut hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta Genista hispanica is a deciduous Shrub growing to 0.8 m (2ft 7in) by 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta None known

tcanta Hedge HedgePlants can be grown as a low hedge[29]. A good ground cover for sunny positions[190]. Plants take about 2 years to form an effective cover[197]. They should be spaced about 60cm apart each way and can be pruned back hard if they become open or straggly with age[208].

dwatta DiureticThe flowers have been used in the treatment of dropsy[4].

propta The seed requires a period of cold stratification and is best sown autumn in a cold frame. Pre-soak stored seed for 24 hours in warm water and sow February in a cold frame. Good germination[78]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Cuttings of half-ripe wood, 5 - 10 cm with a heel, July/August in a frame. Roots are formed in the spring[11]. Cuttings of ripe wood, 5 - 10 cm with a heel, September/October in a frame. Good percentage. Plant out the following autumn[78].

nwatta Easily grown in a light well-drained soil in a sunny position[1]. Prefers a rather dry stony or sandy soil

and does better in one on the poor side[11]. Established plants are drought tolerant[190]. Plants are hardy to about -20°c[184]. Resents root disturbance and should be planted into its permanent position whilst small[11]. A very ornamental plant[1], it grows well on the top of walls and on hot dry banks, covering them with a dense mass of prickly greenery[182]. The flowers have a sweet refreshing perfume, like ripe apples or pineapples[245]. Plants occasionally die back in the centre of the clump, especially after cold wet winters. Cut out the dead growth and layer living shoots into the gap[200]. Closely related to *G. tournefortii*. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

## 6.1.48 Cytisus decumbens

Prostrate Broom

tfo2n 5 tlin 8 cyuc 0 kcak 4 tcan 0 dwat 0.2 m hkuc htut cyutli hgatkuyctcup hwicli hyishrasjlut hpa7tli flatprikhwisslip hpa7tmwatli hjonli

drutta Cytisus decumbens is an evergreen Shrub growing to 0.2 m (0ft 8in) by 1 m (3ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6. It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta None Known

tcanta Soil stabilizationNitrogen fixer. Groundcover. A reasonable groundcover shrub with a medium density. Invertebrates shelter: beneficial for insects and other arthropods. Nectary: provides nectar or pollen for beneficial insects [1-2]. Container gardening. Erosion control.

dwatta None known

propta

nwatta A flowering deciduous shrub with branching stems that are wiry and hairy leaves. Sun: Full Sun, Partial Shade. Soil Type: Sandy, Loamy. Soil Moisture: Dry, Moderate. Soil pH: 5.0 - 8.0. Drought: Tolerant. Root Type: Fibrous ShallowGrowth Rate: Moderate. Life Span: Short. Form: Prostrate. Texture: Medium. Fungal Types: Endomycorrhizal. Seasonal Interest: Spring-Summer. Notes: This plant needs good drainage but is tolerant of nutrient-poor soils. Fruit Type: Pod. Flower Color: Yellow. USDA Hardiness Zones: 5 - 8. Flood: Sensitive.Salt: Intolerant. Soil Compaction: Intolerant. Cold Injury: Infrequent. Wind Storm Damage: Infrequent. Disease Issues: Minor. Insect/Pest Damage: Minor. Animal Damage: Deer. Bloom Time: Late Spring - Early Summer [318-1]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. A clumping mat former. Forming a dense prostrate carpet with a limited spread [1-2].

## 6.2 mran

### 6.2.1 Castanea sativa

Sweet Chestnut, European chestnut

5 tlin 7 cyuc 5 kcak 5 tcan 2 dwat 30 m hkuc htut cyutli hgatkuyctcup hwicli hyishrasjlutnyik hpa7tli frusflatprik hpa7tmwatli hjonli

drutta Castanea sativa is a deciduous Tree growing to 30 m (98ft) by 15 m (49ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in July, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

and polymorphic species[200], there are many named varieties[184]. This species was named for a sterile (or 'mop head') cultivar so that the true species should really be referred to as *H. macrophylla normalis*[182]. Plants are cultivated for their leaves in China and Japan. Plants are very tolerant of pruning and can be cut back into old wood if required[188]. This species is notably susceptible to honey fungus[200]. Special Features:Not North American native, All or parts of this plant are poisonous, Suitable for cut flowers, Suitable for dried flowers, Blooms are very showy.

### 6.2.91 Corylus sieboldiana mand-schurica

Hairy hazel, Japanese hazelnut,

5 tlin 9 cyuc 3 kcak 1 tcan 0 dwat m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikhwisslip hpa7tmwatli fyif hjonli

drutta Corylus sieboldiana mandschurica is a deciduous Shrub growing to 4.5 m (14ft 9in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from April to May, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: Oil SeedEdible Uses: OilSeed - raw or cooked[63, 74, 105]. Rich in oil. The seed ripens in mid to late autumn and will probably need to be protected from squirrels[K]. When kept in a cool place, and not shelled, the seed should store for at least 12 months[K]. An edible oil is obtained from the seed[105].

tcanta OilNone known

dwatta None known

propta Seed - best sown as soon as it is harvested in autumn in a cold frame[164]. Germinates in late winter or spring. Stored seed should be pre-soaked in warm water for 48 hours and then given 2 weeks warm followed by 3 - 4 months cold stratification[164]. Germinates in 1 - 6 months at 20°c[164]. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame or sheltered place outdoors for their first winter. Plant them out into their permanent positions in late spring or early summer[K]. Layering in autumn. Easy, it takes about 6 months[78, 200]. Division of suckers in early spring. Very easy, they can be planted out straight into their permanent positions.

nwatta An easily grown plant, it succeeds in most soils, but is in general more productive of seeds when grown on soils of moderate fertility[11, 200]. It does less well in rich heavy soils or poor ones[11, 63]. Does well in a loamy soil[11]. Very suitable for an alkaline soil[1, 11], but it dislikes very acid soils[17]. Plants are fairly well tolerant[1, 11]. This species is closely allied to *C. cornuta*, and often bears good crops of seeds in Britain[11]. Members of this genus bear transplanting well and can be easily moved even when relatively large[11].

### 6.2.92 Vaccinium membranaceum

Mountain Huckleberry, Thinleaf huckleberry

5 tlin 9 cyuc 3 kcak 0 tcan 1 dwat m hkuc hmimhtut cyutli hgattcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta Vaccinium membranaceum is a deciduous Shrub growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil and can tolerate drought.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[1, 159, 172, 257]. A sweet but rather acid

flavour[11]. Sour but delicious according to other reports[177, 200]. A reasonable source of vitamin C[257]. This fruit is amongst the largest and best flavoured of all the wild blueberries[183]. The native North Americans would often dry the fruit for use in the winter[256].

tcanta None known

dwatta Antiarthritic Antiseptic Astringent Cardiac Carminative Hypoglycaemic Vitamin CAntiseptic, astringent, carminative, hypoglycaemic[172]. An infusion of the roots and stems has been used in the treatment of heart troubles, arthritis and rheumatism[257].

propta Seed - sow late winter in a greenhouse in a lime-free potting mix and only just cover the seed[78]. Stored seed might require a period of up to 3 months cold stratification[113]. Another report says that it is best to sow the seed in a greenhouse as soon as it is ripe[200]. Once they are about 5cm tall, prick the seedlings out into individual pots and grow them on in a lightly shaded position in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 8cm with a heel, August in a frame[78]. Slow and difficult. Layering in late summer or early autumn[78]. Another report says that spring is the best time to layer[200]. Takes 18 months[78]. Division of suckers in spring or early autumn[113].

nwatta Requires a moist but freely-draining lime free soil, preferring one that is rich in peat or a light loamy soil with added leaf-mould[11, 200]. Prefers a very acid soil with a pH in the range of 4.5 to 6, plants soon become chlorotic when lime is present. Succeeds in full sun or light shade though it fruits better in a sunny position[200]. Requires shelter from strong winds[200]. Established plants are extremely drought resistant[183]. Plants are very hardy, tolerating temperatures down to about -40°c in N. America[160]. Dislikes root disturbance, plants are best grown in pots until being planted out in their permanent positions[200]. Plants in this genus are notably resistant to honey fungus[200].

### 6.2.93 Fragaria moschata

Hautbois Strawberry

5 tlin 9 cyuc 3 kcak 2 tcan 0 dwat m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

drutta Fragaria moschata is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from April to July, and the seeds ripen from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw. Sweet and succulent. The fruit is small but has an excellent flavour and is very aromatic[61, 142, 183, K]. It is greatly superior to the cultivated strawberries, but is not very freely produced[K].

tcanta An excellent ground cover plant, spreading vigorously by means of surface stolons and forming a dense carpet of growth[K]. It grows well amongst shrubs but is likely to suffocate smaller plants[K]. A dynamic accumulator gathering minerals or nutrients from the soil and storing them in a more bioavailable form - used as fertilizer or to improve mulch.

dwatta None known

propta Seed - sow early spring in a greenhouse. The seed can take 4 weeks or more to germinate. The seedlings are very small and slow-growing at first, but then grow rapidly. Prick them out into individual pots when they are large enough to handle and plant them out during the summer. Division of runners, preferably done in July/August in order to allow the plants to become established for the following years crop[200]. They can also be moved in the following spring if required, though should not then be allowed to fruit in their first year. The runners can be planted out direct into their permanent positions.

nwatta Prefers a fertile, well-drained, moisture retentive soil in a sunny position[200]. Tolerates semi-shade though fruit production will be reduced[38]. Another report says

dwatta TB TonicAn infusion of the bark has been used in the treatment of TB[257]. The raw sap has been used as a tonic[257].

propta Seed - best sown as soon as it is ripe in a cold frame, it usually germinates in the following spring. Pre-soak stored seed for 24 hours and then stratify for 2 - 4 months at 1 - 8°C. It can be slow to germinate. The seed can be harvested 'green' (when it has fully developed but before it has dried and produced any germination inhibitors) and sown immediately. It should germinate in late winter. If the seed is harvested too soon it will produce very weak plants or no plants at all[80, 113]. When large enough to handle, prick the seedlings out into individual pots and grow them on until they are 20cm or more tall before planting them out in their permanent positions. Layering, which takes about 12 months, is successful with most species in this genus. Cuttings of young shoots in June or July. The cuttings should have 2 - 3 pairs of leaves, plus one pair of buds at the base. Remove a very thin slice of bark at the base of the cutting, rooting is improved if a rooting hormone is used. The rooted cuttings must show new growth during the summer before being potted up otherwise they are unlikely to survive the winter.

nwatta Landscape Uses:Aggressive surface roots possible, Pollard, Specimen, Street tree. Of easy cultivation, it prefers a good moist well-drained soil[1] and a position that is at least moderately sunny[11, 200]. Grows well in heavy clay soils. Chlorosis can sometimes develop as a result of iron deficiency when the plants are grown in alkaline soils, but in general maples are not fussy as to soil pH. Growth of young plants is rapid in the wild, slowing down after 40 -50 years with a maximum life span of about 275 years[229]. This species thrives in Britain but it can be cut back in a severe winter if that follows a mild autumn[11]. A very ornamental plant[1]. Most maples are bad companion plants, inhibiting the growth of nearby plants[18, 20]. Special Features:North American native, Fragrant flowers, Inconspicuous flowers or blooms.

## 6.2.89 Aesculus chinensis

Chinese Horse Chestnut

5 tin 9 cyuc 3 kcaak 0 tcan 1 dwat 25 m hkuc hmimhtut cyutli tcup hwicli hrasjltunyk hpa7tli flatprikwi hpa7tmwatli xre7t hjonli

drutta Aesculus chinensis is a deciduous Tree growing to 25 m (82ft) by 10 m (32ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in July, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: SeedEdible Uses: Seed - cooked. It can be dried and ground into a powder and used as a gruel. The seed is quite large, it can be 3cm in diameter, and is easily harvested. Unfortunately it is also rich in saponins, these must be removed before it can be used as a food and this process also removes many of the minerals and vitamins, leaving behind mainly starch. See also the notes above on toxicity. The following notes apply to A. californica, but are probably also relevant here:- The seed needs to be leached of toxins before it becomes safe to eat - the Indians would do this by slow-roasting the nuts (which would have rendered the saponins harmless) and then cutting them into thin slices, putting them into a cloth bag and rinsing them in a stream for 2 - 5 days[213].

tcanta Soap WoodSaponins in the seed are used as a soap substitute[169]. The saponins can be easily obtained by chopping the seed into small pieces and infusing them in hot water. This water can then be used for washing the body, clothes etc. Its main drawback is a lingering odour of horse chestnuts[K].

dwatta Antirheumatic EmeticThe seed is antirheumatic and emetic[178, 218]. The sweet tasting seed is said to be used in the treatment of contracted limbs that are due to palsy or rheumatism[178, 218]. It is also used in the treatment of stomach aches[218].

propta Seed - best sown outdoors or in a cold frame as soon as it is ripe[11, 80]. The seed germinates almost immediately and must be given protection from severe weather[130]. The seed has a very limited viability and must not be allowed to dry out. Stored seed should be soaked for 24 hours prior to sowing and even after this may still not be viable[80, 113]. It is best to sow the seed with its 'scar' downwards[130]. If sowing the seed in a cold frame, pot up the seedlings in early spring and plant them out into their permanent positions in the summer.

nwatta Prefers a deep loamy well-drained soil but is not too fussy[11]. Plants grow best in eastern and south-eastern areas of England, probably needing a continental climate in order to thrive[11, 200]. Although the trees are very hardy when dormant, the new growth can be damaged by late spring frosts[11]. Most members of this genus transplant easily, even when fairly large[111].

## 6.2.90 Hydrangea macrophylla

French hydrangea , Florist's Hydrangea, Bigleaf Hydrangea 5 tin 9 cyuc 3 kcaak 3 tcan 2 dwat m hkuc hmimhtut cyutli tcup hwicli hrasjltunyk hpa7tli frusflatprikwi hpa7tmwatli xre7t hjonli

drutta Hydrangea macrophylla is a deciduous Shrub growing to 3 m (9ft) by 3 m (9ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure.

kcaakta Edible Parts: LeavesEdible Uses: SweetenerThe young leaves, when dried and rubbed between the hands, become very sweet and are used to make a sweet tea called 'tea of heaven', it is used in Buddhist ceremonies[183]. The leaves contain phellodulin (its chemical formula is C16 H14 O), a very sweet substance that can be used as a sugar substitute[116, 183]. One small leaf is sufficient to sweeten a cup of tea[218]. The older leaves can be dried, powdered and used as a flavouring on foods[105, 177]. The young leaves and shoots are also eaten cooked[105, 177]. Young leaves contain the toxin hydrocyanic acid, this reduces as the leaves grow older, often to zero levels[218].

tcanta Hedge HedgeA useful hedging plant because of its vigorous growth. The Hortensias or mop-head cultivars are recommended[200].

dwatta Antiperiodic Antitussive Diuretic MalariaThe leaves, roots and flowers are antimalarial, antitussive and diuretic[218, 240]. They are said to be a more potent antimalarial than quinine, due to the presence of an alkaloid[240].

propta Seed - surface sow in a greenhouse in spring[113]. Cover the pot with paper until the seed germinates[78]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 8cm long, July/August in a frame. Overwinter in a greenhouse and plant out in late spring[78]. Cuttings of mature wood in late autumn in a frame[200]. Mound layering in spring. Takes 12 months[78]. Leaf-bud cuttings of the current seasons growth in a frame[200].

nwatta Landscape Uses:Container, Seashore, Specimen. Tolerates most soil[200], thriving in a well-drained loamy soil[1], but resenting dryness at the roots[11, 200]. Succeeds in full sun or semi-shade[200], but if it is grown in a low rainfall area then it requires shade at the hottest part of the day[11]. Prefers a shady position[1]. Does well on very acid soils with a pH around 4.5[200]. Plants also tolerate alkaline soils, though they become chlorotic on shallow soils over chalk[200]. The colour of the flowers reflects the pH of the soil the plant is growing in, the flowers are pink in a neutral to alkaline soil and blue in an acid soil[200]. A very wind resistant plant when grown in mild areas[166]. Dormant plants are hardy to about -10°C[184], though the young growth in spring is frost-tender[K]. A very ornamental plant

kcaakta Edible Parts: SeedEdible Uses: Cof-fee SweetenerSeed - raw or cooked[2, 4, 5, 9, 12, 34]. A somewhat astringent taste raw, it improves considerably when cooked and is delicious baked with a floury texture and a flavour rather like sweet potatoes[K]. The seed is rich in carbohydrates, it can be dried, then ground and used as a flour in breads, puddings, as a thickener in soups etc[7, 63, 132, 183]. The roasted seed can be used as a coffee substitute[183]. A sugar can be extracted from the seed[183].

tcanta Basketry Fuel Hair Starch Tannin WoodTannin is obtained from the bark[46, 223]. The wood, leaves and seed husks also contain tannin[223]. The husks contain 10 - 13% tannin[223]. On a 10% moisture basis, the bark contains 6.8% tannin and the wood 13.4%[223]. The meal of the seed has been used as a source of starch and also for whitening linen cloth[4]. A hair shampoo is made from the leaves and the skins of the fruits[7]. It imparts a golden gleam to the hair[7]. Wood - hard, strong, light. The young growing wood is very durable, though older wood becomes brittle and liable to crack[4]. It is used for carpentry, turnery, props, basketry, fence posts etc[4, 6, 7, 23, 46, 100]. A very good fuel[6].

dwatta Antiarrhoeal Antiinflammatory Astringent Bach ExpectantAlthough more commonly thought of as a food crop, sweet chestnut leaves and bark are a good source of tannins and these have an astringent action useful in the treatment of bleeding, diarrhoea etc. The leaves and bark are anti-inflammatory, astringent, expectorant and tonic[4, 7, 165]. They are harvested in June or July and can be used fresh or dried[4]. An infusion has been used in the treatment of fevers and ague, but are mainly employed for their efficacy in treating convulsive coughs such as whooping cough and in other irritable conditions of the respiratory system[4, 7]. The leaves can also be used in the treatment of rheumatism, to ease lower back pains and to relieve stiff muscles and joints[254]. A decoction is a useful gargle for treating sore throats[254]. The plant is used in Bach flower remedies - the keywords for prescribing it are 'Extreme mental anguish', 'Hopelessness' and 'Despair'[209].

propta Seed - where possible sow the seed as soon as it is ripe in a cold frame or in a seed bed outdoors[78]. The seed must be protected from mice and squirrels. The seed has a short viability and must not be allowed to become dry. It can be stored in a cool place, such as the salad compartment of a fridge, for a few months if it is kept moist, but check regularly for signs of germination. The seed should germinate in late winter or early spring. If sown in an outdoor seedbed, the plants can be left in situ for 1 - 2 years before planting them out in their permanent positions. If grown in pots, the plants can be put out into their permanent positions in the summer or autumn, making sure to give them some protection from the cold in their first winter[K].

nwatta Global Crop Industrial Crop: Biomass Industrial Crop: Tannin Management: Standard Staple Crop: Balanced carbPrefers a good well-drained slightly acid loam in a sunny position but it also succeeds in dry soils[1, 11, 200, 238]. Once established, it is very drought tolerant[1, 11, 200, 238]. Plants are very tolerant of highly acid, infertile dry sands[200]. Averse to calcareous soils but succeeds on harder limestones[11, 200]. Tolerates maritime exposure though it is slower growing in such a position[75]. The dormant plant is very cold-hardy in Britain, though the young growth in spring, even on mature plants, is frost-tender[K]. The sweet chestnut is often cultivated for its edible seed in warm temperate zones, there are several named varieties[46, 183]. Both 'Marron de Lyon' and 'Paragon' produce fruits with a single large kernel (rather than 2 - 4 smaller kernels) and so are preferred for commercial production[238]. Castanea sativa x crenata: The hybrid sweet chestnut 'Marigoule' is a good choice if you only want to grow one tree as Marigoule is a partly self-fertile cultivar. Sweet chestnuts require a warm dry summer in order to ripen their fruit properly in Britain[63] and even then these seeds are generally inferior in size and quality to seeds grown in continental climates[4]. Most species in this genus are not very well adapted for the cooler maritime climate of Britain, preferring hotter summers, but this species grows well here[11, 200]. An excellent soil-enriching understorey in pine forests[200]. Flowers are produced on wood of the current year's growth[229] and they are very attractive to bees[7]. Plants are fairly self-sterile[200]. They hybridize freely with other members of this genus[200]. At one time this tree was widely grown in coppiced woodlands for its

wood, but the practise of coppicing has fallen into virtual disuse[111]. Trees regrow very quickly after being cut down, producing utilizable timber every 10 years. This species is not often seen in Cornwall though it grows very well there[59]. Trees take 30 years from seed to come into bearing[98]. Plants in this genus are notably resistant to honey fungus[200]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is fleshy. Thick or swollen - fibrous or tap root [2-1].

## 6.2.2 Sassafras albidum

Sassafras, Common Sassafras

5 tin 9 cyuc 5 kcaak 3 tcan 3 dwat 25 m hkuc hmimhtut cyutli tcup hwicli hrasjltunyk hpa7tli flatprik hpa7tmwatli nyanhjen hjonli

drutta Sassafras albidum is a deciduous Tree growing to 25 m (82ft) by 15 m (49ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in leaf from April to October, in flower from May to June, and the seeds ripen from September to October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). . The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: LeavesEdible Uses: Condi-ment TeaLeaves - raw or cooked. The young leaves can be added to salads whilst both old and young leaves can be used as a flavouring and as a thickening agent in soups etc[2, 20, 55, 62, 82, 102, 183]. They have a mild aromatic flavour[K]. The leaves are often dried and ground into powder for later use[82, 159, 183]. The young shoots have been used to make a kind of beer[4]. The dried root bark can be boiled with sugar and water until it forms a thick paste[183]. It is then used as a condiment[183]. The root and the berries can also be used as flavourings[55, 142]. Winter buds and young leaves - raw[62, 183]. A tea is made from the root bark, it is considered to be a tonic[18, 20, 55, 62]. The tea can also be made by brewing the root in maple syrup, this can be concentrated into a jelly[183]. A tea can also be made from the leaves and the roots. It is best in spring. A tea can be made from the flowers[2].

tcanta Companion Dye Essential Repellent WoodAn essential oil is obtained from the bark of the root[61] and also from the fruits[4]. One hundred kilos of root chips yield one litre of essential oil under steam pressure - this oil comprises about 90% safrol[245]. The oil is medicinal and is also used in soaps, the coarser kinds of perfumery, toothpastes, soft drinks etc[4, 46, 57, 82]. It is also used as an antiseptic in dentistry[61]. A yellow dye is obtained from the wood and the bark[4, 168]. It is brown to orange[168]. The plant repels mosquitoes and other insects[18, 20]. Wood - coarse-grained, soft, weak, fragrant, brittle, very durable in the soil. It weighs 31lb per cubic foot and is used for fence posts and items requiring lightness[46, 82, 171, 227].

dwatta Alterative Anodyne Antirheumatic Antiseptic Aromatic Carminative Diaphoretic Diuretic Stimulant VasodilatorSassafras has a long history of herbal use. It was widely employed by many native North American Indian tribes who used it to treat a wide range of complaints, valuing it especially for its tonic effect upon the body[257]. It is still commonly used in herbalism and as a domestic remedy. The root bark and root pith are alterative, anodyne, antiseptic, aromatic, carminative, diaphoretic, diuretic, stimulant and vasodilator[4, 21, 46, 165]. A tea made from the root bark is particularly renowned as a spring tonic and blood purifier as well as a household cure for a wide range of ailments such as gastrointestinal complaints, colds, kidney ailments, rheumatism and skin eruptions[222, 238, 257]. The muclaginous pith from the twigs has been used as a poultice or wash for eye ailments and is also taken internally as a tea for chest, liver and kidney complaints[222]. An essential oil from the root bark is used as an antiseptic in dentistry and also as an anodyne[213]. The oil contains safrole, which is said to have carcinogenic activity and has been banned from use in

American foods - though it is less likely to cause cancer than alcohol[222]. In large doses the oil is poisonous, causing dilated pupils, vomiting, stupor, collapse and kidney and liver damage[4, 238]. The oil has been applied externally to control lice and treat insect bites, though it can cause skin irritation[238].

propta Seed - best sown as soon as ripe in a cold frame[200]. Stored seed requires 4 months cold stratification at 4°C[113]. It is best sown as early in the year as possible. Prick out the seedlings into individual pots as soon as possible and grow them on in the greenhouse. One report says to harden off the plants as soon as possible[78], but young plants are frost-tender[11] and so we recommend growing them on in the greenhouse for their first winter and then planting them out in early summer. Give the young trees some protection for at least their first winter outdoors[K]. Root cuttings, taken from suckers, 1 - 2cm long taken in December. Plant horizontally in pots in a greenhouse[78]. Suckers in late winter. Plant straight out into their permanent positions[200].

nwatta Landscape Uses:Pest tolerant, Massing, Specimen, Woodland garden. Requires a deep, fertile, well-drained, lime-free, near neutral soil in sun or light shade[11, 200]. Does well in a woodland garden[166], especially in a sheltered position along the edge[200]. The plant is tender when young, the young shoots of older trees can also be damaged by late spring frosts[11, 238]. A very ornamental plant[1] with a wide range of uses, it is occasionally cultivated and often gathered from the wild[61]. All parts of the tree contain essential oils and give off a pleasant spicy aroma when crushed[229]. The stem bark is highly aromatic, more so than the wood. The root stem bark is the most pleasant of all[245]. The flowers have a spicy perfume[245]. Trees are long-lived, moderately fast-growing and disease-free in the wild[227, 229]. They can begin flowering when only 10 years old and good seed crops are usually produced every 2 - 3 years[229]. The trees spread by root suckers and can form thickets[229]. Although some flowers appear to be hermaphrodite, they are functionally either male or female and most trees are dioecious[229]. Both male and female plants must be grown if seed is required. Special Features:North American native, Attracts butterflies, Fragrant flowers, Attractive flowers or blooms. The plant is heat tolerant in zones 8 through 3. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. A sprouting standard sending up shoots from the base [1-2]. The root pattern is a tap root similar to a carrot going directly down [1-2]. The root pattern is suckering with new plants from underground runners away from the plant [1-2].

## 6.2.3 Cornus kousa

Japanese Dogwood, Kousa dogwood, Chinese Dogwood, 5 tlin 8 cyuc 5 kcaak 2 tcan 0 dwat 10 m hkuc hmimhtut cyuti tcup hwicli hrasljutnyikfrip hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Cornus kousa is a deciduous Tree growing to 10 m (32ft) by 6 m (19ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in June, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kckahta Edible Parts: Fruit LeavesEdible Uses: Fruit - raw or cooked[61, 177]. Sweet and juicy[11, 183], it is very nice in small quantities[K]. Very seedy[105]. The skin is rather tough and unpleasant, but the pulp is delicious with a

custard-like texture, it is one of our favourite late summer fruits[K]. The fruit is about 2cm in diameter[200]. Young leaves - cooked[105, 177, 183].

tcanta WoodWood - very hard and heavy. Used for mallets etc[151].

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame or in an outdoors seedbed if there is sufficient seed[80, 113]. The seed must be separated from the fruit flesh since this contains germination inhibitors[80, 164]. Stored seed should be cold stratified for 3 - 4 months and sown as early as possible in the year[164]. Scarification may also help as may a period of warm stratification before the cold stratification[80, 164]. Germination, especially of stored seed, can be very slow, taking 18 months or more[164]. Prick out the seedlings of cold-frame sown seeds into individual pots as soon as they are large enough to handle and grow the plants on for their first winter in a greenhouse, planting out in the spring after the last expected frosts. Cuttings of half-ripe side shoots, July/August in a frame[188]. Cuttings of mature wood of the current year's growth, taken with a heel if possible, autumn in a cold frame. High percentage[78]. Layering of new growth in June/July. Takes 9 months[78].

nwatta Landscape Uses:Pest tolerant, Specimen, Woodland garden. An easily grown plant, it succeeds in any soil of good or moderate fertility, from acid to slightly alkaline but dislikes shallow chalky soils[184, 188]. Grows well in heavy clay soils. Prefers a rich well-drained loamy soil and a position that is at least partially sunny[11]. A very ornamental plant[1], it is hardy to about -20°C[184]. A number of named forms have been developed for their ornamental value[182]. Plants are slow-growing when young, they speed up somewhat after a few years but then soon slow down again[202]. The sub-species of *C. kousa chinensis* grows more freely, flowering and fruiting better in Britain though it barely differs in appearance from the species[11]. This species has been known to hybridize with *C. capitata*[182]. The cultivar 'Norman Hadden' could be such a hybrid[182]. Plants in this genus are notably resistant to honey fungus[200]. Special Features:Attracts birds, Not North American native, Blooms are very showy. The plant is heat tolerant in zones 8 through 5. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2].

## 6.2.4 Morus nigra

Black Mulberry 5 tlin 9 cyuc 5 kcaak 3 tcan 3 dwat 10 m hkuc hmimhtut cyuti tcup hwicli hrasljutnyik hpa7tli flatprikliw hpa7tmwatli fyif hjonli

drutta Morus nigra is a deciduous Tree growing to 10 m (32ft) by 15 m (49ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from May to June, and the seeds ripen from August to September. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. It can tolerate atmospheric pollution.

kckahta Edible Parts: FruitEdible Uses: Fruit - raw, cooked or used in preserves[1, 2, 3, 4, 7, 9, 183]. A delicious slightly acid flavour, it makes an excellent dessert fruit and can be eaten in quantity[K]. The fruit is juicy and refreshing, though it must be used as soon as it is ripe (from mid-August to September) otherwise it will start to rot[200]. The fruit falls from the tree as soon as it is fully ripe. It is best, therefore, to grow the tree in short grass to cushion the fall of

is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in saline soils. It cannot grow in the shade. It prefers moist or wet soil and can grow in water. The plant can tolerate maritime exposure.

kckahta Edible Parts: Root SeedEdible Uses: Root - raw or cooked. Rich in starch, it is usually dried and ground into a powder[2, 55, 74, 144]. The roots form tubers at intervals along their length and new plants are formed from these tubers. When first formed, the tubers are white and starchy with a sweet coconut-milk flavour, they become black and woody with age[193]. Tubers can be up to 2.5cm in diameter[193]. Seed - cooked[257]. They can be ground into a powder and used as a mush[257].

tcanta Basketry WeavingThe leaves are used in weaving and basketry[74, 257]. The leaves have been used to secure the edges of woven mats, as the warp for sandals, as the warps and twining wefts for clothing, to secure the edges of skirts etc[257]. They have been used to make twined mats for the insides of houses[257].

dwatta Astringent DiureticThe root is astringent and diuretic[240]. It is used in the treatment of amenorrhoea, dysmenorrhoea, abdominal pain or tumours for post-partum females, abdominal distension and indigestion[176].

propta Seed - sow in a cold frame as soon as it is ripe in a pot standing in 3cm of water. Only just cover the seed with soil[200]. The seed usually germinates fairly quickly. Prick out the plants when large enough to handle and plant out in their permanent positions in early summer. Division in spring. Very easy, larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Succeeds in any wet to moisture retentive ground, pond margins and shallow water in full sun or shade[200].

## 6.2.87 Helianthus maximiliani

Maximilian Sunflower, Maximilian Daisy 5 tlin 10 cyuc 3 kcaak 0 tcan 0 dwat m hkuc htut cyuti tcup hwicli hrasljutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Helianthus maximiliani is a PERENNIAL growing to 2.4 m (7ft 10in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from September to October, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kckahta Edible Parts: RootEdible Uses: Tubers - raw or cooked[22, 46, 61, 257]. Similar in flavour to Jerusalem artichokes, but lower yielding. Seed - raw or cooked[183]. An edible oil is obtained from the seed[183].

tcanta None known

dwatta None known

propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring or autumn. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring. Basal cuttings in spring. Harvest the shoots when they are about 10 - 15cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Management: Standard Staple Crop: Protein-oilLandscape Uses:Border, Container, Specimen. Succeeds in most soils in a sunny position[1]. Requires a rich soil[1]. Dislikes shade[1]. The young growth is extremely attractive to slugs, plants can be totally destroyed by them[K]. At least

one named form has been developed. Called 'Prairie Gold', it is being investigated by the Land Institute in Salina, Kansas for its oil-seed potential in a non-tillage permaculture system[183]. The yield of edible tubers is not very high. This species is closely related to *H. giganteus*[1]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. Plants have a running root system and can be invasive[1]. Special Features:Attracts birds, North American native, Naturalizing, Attracts butterflies, Suitable for cut flowers, Suitable for dried flowers. The plant is heat tolerant in zones 9 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2]. The root pattern is tuberous with swollen potato-like roots [1-2].

## 6.2.88 Acer macrophyllum

Oregon Maple, Bigleaf maple, Oregon Maple 5 tlin 9 cyuc 3 kcaak 0 tcan 1 dwat m hkuc hmimhtut cyuti tcup hwicli hrasljutnyikfrip hpa7tli flatprikliw hpa7tmwatli hjonli

drutta Acer macrophyllum is a deciduous Tree growing to 30 m (98ft) by 12 m (39ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in April, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kckahta Edible Parts: Flowers Inner bark Leaves Sap S Uses: SweetenerThe sap contains a certain amount of sugar and can either be used as a drink, or can be concentrated into a syrup by boiling off the water[105, 177, 183]. The syrup is used as a sweetener on many foods. The concentration of sugar is somewhat lower than in the sugar maples (*A. saccharum*). The tree trunk is tapped in the early spring, the sap flowing better on warm sunny days following a frost. The best sap production comes from cold-winter areas with continental climates. Inner bark[177]. Eaten in small quantities with oil[257]. No more details are given but inner bark is often dried, ground into a powder and then used as a thickening in soups etc or mixed with cereals when making bread. The leaves, when wrapped round food during baking, impart a nice flavour to the food[99, 118]. Yellow flower clusters - raw. They are sweet with nectar[183]. Seeds - sprouted and then boiled[226]. The sprouted seeds are generally bitter, but the young shoots are quite sweet and juicy[257]. The seeds are about 6mm long and are produced in small clusters[82].

tcanta Basketry Companion Fibre Fuel Hair Preservative Scourer WoodThe leaves are packed around apples, rootcrops etc to help preserve them[18, 20]. A sticky gum obtained from the buds in spring has been mixed with oil and used as a hair tonic[257]. A fibre obtained from the inner bark is used for making scouring pads, rope and crude dresses[99, 118, 257]. It was harvested in the spring and was also used in making baskets[257]. Young stems are used as coarse twine warp and weft in the manufacture of baskets[257]. Wood - light, soft, not strong, close grained. It is highly valued for timber, furniture and indoor use and is also used for carving bowls, veneer etc[46, 61, 82, 99, 118, 229]. It makes an excellent fuel, producing a hot smokeless flame[226].

of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Landscape Uses:Aggressive surface roots possible, Specimen, Street tree. Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Young plants tolerate reasonable levels of side shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. Prefers warmer summers than are usually experienced in Britain, trees are not well suited to the British climate and usually grow poorly here. They fail to properly ripen their wood which results in frost damage overwinter[200]. A slow-growing but long-lived tree[227], it takes 25 - 30 years before it starts to produce seeds[229]. The tree flowers on new growth produced in spring, the seed ripening in its first year[200, 229]. Large crops are produced every 3 - 4 years with low production in the intervening years[229]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. Hybridizes freely with other members of the genus[200]. Plants in this genus are notably resistant to honey fungus[200]. Special Features:Attracts birds, North American native, Inconspicuous flowers or blooms.

## 6.2.85 Pinus jeffreyi

Jeffrey Pine

5 tlin 8 cyuc 3 kcaak 3 tcan 2 dwat 25 m hkuc htut cyutli hgtakuyuctcp hwicli hyishrasjlut hpa7tli flatprik hpa7tmwatli dyat hjonli

drutta Pinus jeffreyi is an evergreen Tree growing to 25 m (82ft) by 6 m (19ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, and the seeds ripen from January to February. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Sap SeedEdible Uses: ConditmentSeed - raw or cooked[105, 177]. Large[183]. The oil-rich seed has a resinous flavour and is about 10 - 12mm long[82, 200]. The crystallised sap has been gathered and eaten like candy[257]. A vanillin flavouring is obtained as a by-product of other resins that are released from the pulp-wood[200].

tcanta Dye Herbicide Resin WoodLandscape Uses: Aggressive surface roots possible, Specimen. A tan or green dye is obtained from the needles[168]. The needles contain a substance called terpene, this is released when rain washes over the needles and it has a negative effect on the germination of some plants, including wheat[201]. Oleo-resins are present in the tissues of all species of pines, but these are often not present in sufficient quantity to make their extraction economically worthwhile[64]. The resins are obtained by tapping the trunk, or by destructive distillation of the wood[4, 64]. In general, trees from warmer areas of distribution give the higher yields[64]. Turpentine consists of an average of 20% of the oleo-resin[64] and is separated by distillation[4, 64]. Turpentine has a wide range of uses including as a solvent for waxes etc, for making varnish, medicinal etc[4]. Rosin is the substance left after turpentine is removed. This is used by violinists on their bows and also in making sealing wax, varnish etc[4]. Pitch can also be obtained from the resin and is used for waterproofing, as a wood preservative etc. The resin contained in this plant is very unusual in that it contains the hydrocarbon n-heptane. This is unmixed with other isomers of heptane and is formed by a very complex and little understood biochemical process. Its purity lead it to be used as the zero-point in the octane rating for petrol[200]. Wood - light, strong and fine-grained, it can vary from soft to hard[229]. It is used for making furniture, boxes, toys etc[229]. Special Features: Attractive foliage, North American native, Inconspicuous flowers or blooms.

dwatta The turpentine obtained from the resin of all pine trees is antiseptic, diuretic, rubefacient and vermifuge[4]. It

is a valuable remedy used internally in the treatment of kidney and bladder complaints and is used both internally and as a rub and steam bath in the treatment of rheumatic affections[4]. It is also very beneficial to the respiratory system and so is useful in treating diseases of the mucous membranes and respiratory complaints such as coughs, colds, influenza and TB[4]. Externally it is a very beneficial treatment for a variety of skin complaints, wounds, sores, burns, boils etc and is used in the form of liniment plasters, poultices, herbal steam baths and inhalers[4].

propta It is best to sow the seed in individual pots in a cold frame as soon as it is ripe if this is possible otherwise in late winter. A short stratification of 6 weeks at 4°C can improve the germination of stored seed[80]. Plant seedlings out into their permanent positions as soon as possible and protect them for their first winter or two[11]. Plants have a very sparse root system and the sooner they are planted into their permanent positions the better they will grow[K]. Trees should be planted into their permanent positions when they are quite small, between 30 and 90cm[200]. We actually plant them out when they are about 5 - 10cm tall. So long as they are given a very good weed-excluding mulch they establish very well[K]. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200]. Cuttings. This method only works when taken from very young trees less than 10 years old. Use single leaf fascicles with the base of the short shoot. Disbudding the shoots some weeks before taking the cuttings can help. Cuttings are normally slow to grow away[81].

nwatta Industrial Crop: Hydrocarbon Management: Standard Regional TimberSucceeds in most soils[129], but prefers a light well-drained sandy or gravelly loam[1, 11]. Dislikes poorly drained moorland soils[1]. Established plants tolerate drought[200]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°C[200]. A very ornamental plant[120]. It is often short-lived in Britain but is moderately fast growing with some trees reaching a height of 15 metres in 29 years[185]. A long-lived tree in the wild, specimens 500 years old are known[229]. It commences bearing seeds when about 10 - 15 years old, though good production does not commence until twice that age[229]. Leaf secretions inhibit the germination of seeds, thereby inhibiting the growth of other plants below the tree[18]. Plants are strongly outbreeding, self-fertilized seed usually grows poorly[200]. They hybridize freely with other members of this genus[200]. Closely related to *P. ponderosa*[1], and hybridizes with it in the wild[71]. Some of the earlier plantings under this name in Britain have turned out to be *P. ponderosa*[185]. The cones are 12 - 35cm long, they open and shed their seed whilst still attached to the tree[82, 226]. The resin from broken shoots has a very strong lemon scent[185]. Plants in this genus are notably susceptible to honey fungus[200]. The plant is heat tolerant in zones 8 through 6. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2]. An evergreen. The root pattern is a tap root similar to a carrot going directly down [1-2].

## 6.2.86 Scirpus maritimus

Seaside Bulrush. Cosmopolitan Bulrush

5 tlin 9 cyuc 3 kcaak 0 tcan 1 dwat m hkuc htut cyutli tcuphja7nhs6b hwicli hrasjlutnyik hpa7tli flatprik-wishsom hpa7tmwatli hjonli

drutta Scirpus maritimus is a PERENNIAL growing to 1 m (3ft 3in) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August, and the seeds ripen from August to September. The species

the fruit but to still make it possible to find and harvest[K]. The fruit can also be dried and ground into a powder[183]. The fruit is up to 25mm in diameter[200, 227]. White Mulberry (*Morus alba*) has edible young leaves and shoots eaten cooked[105, 183] but we have found no information for this plant.

tcanta Dye Fibre WoodA fibre used in weaving is obtained from the bark[7]. A red-violet to dark purple dye is obtained from the fruit[168]. A yellow-green dye is obtained from the leaves[168]. Wood - used in joinery[100].

dwatta Anthelmintic Astringent Homeopathy Hypoglycaemic Laxative Odontalgic Purgative UrinaryThe mulberry has a long history of medicinal use in Chinese medicine, almost all parts of the plant are used in one way or another[238]. The white mulberry (*M. alba*) is normally used, but this species has the same properties[238]. Recent research has shown improvements in elephantiasis when treated with leaf extract injections and in tetanus following oral doses of the sap mixed with sugar[238]. Analgesic, emollient, sedative[7, 176]. The leaves are antibacterial, astringent, diaphoretic, hypoglycaemic, odontalgic and ophthalmic[218, 238]. They are taken internally in the treatment of colds, influenza, eye infections and nosebleeds[238]. The leaves are collected after the first frosts of autumn and can be used fresh but are generally dried[238]. The stems are antirheumatic, diuretic, hypotensive and pectoral[218, 238]. A tincture of the bark is used to relieve toothache[7]. The branches are harvested in late spring or early summer and are dried for later use[238]. The fruit has a tonic effect on kidney energy[218, 238]. It is used in the treatment of urinary incontinence, tinnitus, premature greying of the hair and constipation in the elderly[238]. Its main use in herbal medicine is as a colouring and flavouring in other medicines[4]. The root bark is antitussive, diuretic, expectorant and hypotensive[238]. It is used internally in the treatment of asthma, coughs, bronchitis, oedema, hypertension and diabetes[238]. The roots are harvested in the winter and dried for later use[238]. The bark is anthelmintic and purgative, it is used to expel tape worms[4, 240]. Extracts of the plant have antibacterial and fungicidal activity[218]. A homeopathic remedy is made from the leaves[9]. It is used in the treatment of diabetes[9].

propta The seed germinates best if given 2 - 3 months cold stratification[80, 98]. Sow the seed as soon as it is ripe if possible, otherwise in February in a cold frame. The seed usually germinates in the first spring, though it sometimes takes another 12 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the cold frame for their first winter. Plant them out in late spring or early summer after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in a frame. Plant out in spring. A good percentage take, though they sometimes fail to thrive[78, 113]. Cuttings of mature wood of the current season's growth, 25 - 30cm with a heel of 2 year old wood, autumn or early spring in a cold frame or a shady bed outside[78, 113, 200]. Bury the cuttings to threequarters of their depth. It is said that cuttings of older wood up to 2.5 metres long can be readily made to strike[4]. The cuttings are taken in February and planted 30cm deep in a shady sheltered position outdoors. The stem is wrapped in moss to prevent water loss by transpiration, with only the top few buds not being covered[4]. Layering in autumn[200].

nwatta Prefers a warm moist but well-drained loamy soil in a sheltered sunny position[1, 11]. Prefers a light soil[37]. Plants are very tolerant of atmospheric pollution[4]. Trees are hardy as far north as southern Sweden[4]. A slow growing[200] but very ornamental tree[1], the mulberry is sometimes cultivated in gardens for its delicious edible fruit[183]. The tree is not grown on a commercial scale because the fruit is too soft and easily damaged to allow it to be transported to market, and is therefore best eaten straight from the tree. There are some named varieties[183]. The mulberry takes many years to settle down and produce good crops of fruit, about 15 years being the norm[4]. Trees fruit well in southern and south-western Britain[59, 200] but they require the protection of a wall further north if the fruit is to ripen[200]. This is a good tree for growing grapes into[20]. It means that the grapes are difficult to pick, but they always seem to be healthier and free from fungal diseases[201]. Plants are late coming into leaf and also lose their leaves at the first autumn frosts though the tree in leaf casts quite a dense

shade[200]. Mulberries have brittle roots and so need to be handled with care when planting them out[238]. Any pruning should only be carried out in the winter when the plant is fully dormant because mulberries bleed badly when cut[238]. Ideally prune only badly placed branches and dead wood[238]. Once considered to be a very long-lived tree, doubts are now being cast on this assumption, it is probably fairly short-lived[11]. Plants in this genus are notably resistant to honey fungus[200]. The plant is heat tolerant in zones 9 through 5. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2].

## 6.2.5 Cornus kousa chinensis

Japanese Dogwood

5 tlin 8 cyuc 5 kcaak 2 tcan 0 dwat 10 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprik-wis hpa7tmwatli xre7t hjonli

drutta Cornus kousa chinensis is a deciduous Tree growing to 10 m (32ft) by 6 m (19ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in June, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Fruit LeavesEdible Uses: Fruit - raw or cooked[61, 177]. Sweet and juicy[11, 183], it is very nice in small quantities[K]. Very seedy[105]. The skin is rather tough and unpleasant, but the pulp is delicious with a custard-like texture[K]. This fruit gained very high marks from a group of 7 people in a fruit-tasting visit to various gardens[K]. The fruit is about 2cm in diameter[200]. Young leaves - cooked[105, 177, 183].

tcanta WoodWood - very hard and heavy. Used for materials etc[151].

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame or in an outdoors seedbed if there is sufficient seed[80, 113]. The seed must be separated from the fruit flesh since this contains germination inhibitors[80, 164]. Stored seed should be cold stratified for 3 - 4 months and sown as early as possible in the year[164]. Scarification may also help as may a period of warm stratification before the cold stratification[80, 164]. Germination, especially of stored seed, can be very slow, taking 18 months or more[164]. Prick out the seedlings of cold-frame sown seeds into individual pots as soon as they are large enough to handle and grow the plants on for their first winter in a greenhouse, planting out in the spring after the last expected frosts. Cuttings of half-ripe side shoots, July/August in a frame[188]. Cuttings of mature wood of the current year's growth, taken with a heel if possible, autumn in a cold frame. High percentage[78]. Layering of new growth in June/July. Takes 9 months[78].

nwatta An easily grown plant, it succeeds in any soil of good or moderate fertility[1], ranging from acid to shallow chalk[200]. Does not like chalky soils according to other reports[184, 188]. Grows well in heavy clay soils. Prefers a rich well-drained loamy soil and a position that is at least partially sunny[11]. A very ornamental plant[1], it is hardy to about -20°C[184]. A number of named forms have been developed for their ornamental value[182]. Plants are slow-growing when young, they speed up somewhat after a few years but then soon slow down again[202]. This sub-species of *C. kousa* grows more freely, flowering and fruiting better in Britain though it barely differs in appearance from

the species[11]. Plants in this genus are notably resistant to honey fungus[200].

### 6.2.6 Amelanchier laevis

Allegheny Shadberry, Allegheny serviceberry, Smooth Serviceberry

5 tlin 8 cyuc 5 kcak 2 tcan 1 dwat 9 m hkcuc hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli frusflat-prik hpa7tmwatli fyfxre7t hjonli

drutta Amelanchier laevis is a deciduous Shrub growing to 9 m (29ft) by 6 m (19ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from April to May, and the seeds ripen from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kckata Edible Parts: FruitEdible Uses: Edible fruit - raw or cooked[2, 11, 105, 159]. Succulent and sweet[82, 183]. This is one of the nicest fruits in the genus, it can be eaten and enjoyed in quantity[K]. The fruit can also be dried for winter use[183]. Up to 18mm in diameter[200]. The fruit is rich in iron and copper[226].

tcanta Miscellany WoodWood - heavy, exceedingly hard, strong, close grained. Used for tool handles etc[82].

dwatta MiscellanyAn infusion of the bark was used by expectant mothers[257].

propta Seed - it is best harvested ‘green’, when the seed is fully formed but before the seed coat has hardened, and then sown immediately in pots outdoors or in a cold frame. If stored seed is obtained early enough in the autumn, it can be given 4 weeks warm stratification before being left out in the winter and it should then germinate in the spring. Otherwise seed can be very slow to germinate, perhaps taking 18 months or more. When large enough to handle, prick the seedlings out into individual pots and grow them on in a sheltered outdoor position, planting them out once they are 20cm or more tall. If there is sufficient seed it is best to sow it thinly in an outdoor seedbed[78, 80]. Grow the seedlings on for two years in the seedbed before planting them out into their permanent positions during the winter. Layering in spring - takes 18 months[78]. Division of suckers in late winter. The suckers need to have been growing for 2 years before you dig them up, otherwise they will not have formed roots. They can be planted out straight into their permanent positions if required.

nwatta Landscape Uses:Firewood, Specimen, Woodland garden. Prefers a rich loamy soil in a sunny position or semi-shade[1, 200] but thrives in any soil that is not too dry or water-logged[11]. Grows well in heavy clay soils. Found in the wild on light acidic soils[17]. All members of this genus have edible fruits and, whilst this is dry and uninteresting in some species, in many others it is sweet and juicy. Many of the species have potential for use in the garden as edible ornamentals, this species is worthy of especial attention because of the quality of its fruit. The main draw-back to this genus is that birds adore the fruit and will often completely strip a tree before it is fully ripe[K]. Trees come into bearing in about 12 years from seed[98]. Considerable confusion has existed between this species and A. arborea, A. canadensis and A. lamarcii, see [11] for the latest (1991) classification. It hybridizes with A. sanguinea, A. huronensis, A. wiegandii, A. stolonifera, A. canadensis, A. arborea and A. bartramiana. Grafting onto seedlings of A. lamarcii or Sorbus aucuparia is sometimes practised in order to avoid the potential problem of hybridizing[1]. Special Features:Attracts birds, North American native, Attracts butterflies, Blooms are very showy.

### 6.2.7 Crataegus pennsylvanica

5 tlin 9 cyuc 5 kcak 0 tcan 2 dwat 9 m hkcuc hmimhtut cyutli hgattcuphja7n hwicli hrasjlutnyikfrip hpa7tli flatprikwlisslp hpa7tmwatli xre7t hjonli

drutta Crataegus pennsylvanica is a deciduous Tree growing to 9 m (29ft 6in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in

flower in May, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Midges. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kckata Fruit - raw or cooked. A very good size fruit, up to 25mm in diameter, with a lovely semi-sweet flavour even when semi-ripe, it makes a delicious dessert[K]. It is also sometimes made into jellies[82] and can be dried for later use. The fruit is borne in clusters of 4- 12 and is very easily harvested[82, K]. There are up to five fairly large seeds in the centre of each fruit, these often stick together and so the effect is of eating a cherry-like fruit with a single seed[K].

tcanta Wood - heavy, hard, tough, close-grained. Useful for making tool handles, mallets and other small items[82].

dwatta Although no specific mention has been seen for this species, the fruits and flowers of many hawthorns are well-known in herbal folk medicine as a heart tonic and modern research has borne out this use. The fruits and flowers have a hypotensive effect as well as acting as a direct and mild heart tonic[222]. They are especially indicated in the treatment of weak heart combined with high blood pressure[222]. Prolonged use is necessary for it to be efficacious[222]. It is normally used either as a tea or a tincture[222].

propta Seed - this is best sown as soon as it is ripe in the autumn in a cold frame, some of the seed will germinate in the spring, though most will probably take another year. Stored seed can be very slow and erratic to germinate, it should be warm stratified for 3 months at 15°c and then cold stratified for another 3 months at 4°c[164]. It may still take another 18 months to germinate[78]. Scarifying the seed before stratifying it might reduce this time[80]. Fermenting the seed for a few days in its own pulp may also speed up the germination process[K]. Another possibility is to harvest the seed ‘green’ (as soon as the embryo has fully developed but before the seedcoat hardens) and sow it immediately in a cold frame. If timed well, it can germinate in the spring[80]. If you are only growing small quantities of plants, it is best to pot up the seedlings as soon as they are large enough to handle and grow them on in individual pots for their first year, planting them out in late spring into nursery beds or their final positions. When growing larger quantities, it might be best to sow them directly outdoors in a seedbed, but with protection from mice and other seed-eating creatures. Grow them on in the seedbed until large enough to plant out, but undercut the roots if they are to be left undisturbed for more than two years.

nwatta A very easily grown plant, it prefers a well-drained moisture retentive loamy soil but is not at all fussy[11, 200]. Once established, it succeeds in excessively moist soils and also tolerates drought[200]. It grows well on a chalk soil and also in heavy clay soils[200]. A position in full sun is best when plants are being grown for their fruit, they also succeed in semi-shade though fruit yields and quality will be lower in such a position[11, 200]. Most members of this genus succeed in exposed positions, they also tolerate atmospheric pollution[200]. This species has a good potential as a fruit crop in Britain. It regularly produces heavy crops of high quality, the tree is very easily grown and is little troubled by pests or diseases. It also requires very little attention, once the trees are established virtually the only work needed is to harvest the fruit each year[K]. A tree about 5 metres tall and wide at Kew fruits regularly and very heavily[K]. Hybridizes freely with other members of this genus[200]. Seedling trees take from 5 - 8 years before they start bearing fruit, though grafted trees will often flower heavily in their third year[K]. The flowers have a foetid smell somewhat like decaying fish. This attracts midges which are the main means of fertilization. When freshly open, the flowers have more pleasant scent with balsamic undertones[245]. Seedlings should not be left in a seedbed for more than 2 years without being transplanted[11].

most appropriate provenances should be sought[137]. Most trees growing in Britain at present tend to only produce good seed after hot summers[137]. Trees are self-fertile but larger crops of better quality seeds are produced if cross-pollination takes place[229].

### 6.2.83 Carya laciniosa

Shellbark Hickory

5 tlin 9 cyuc 3 kcak 3 tcan 1 dwat 30 m hkcuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyf hjonli

drutta Carya laciniosa is a deciduous Tree growing to 30 m (98ft 5in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf from June to October, in flower from April to May, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kckaata Edible Parts: Sap SeedEdible Uses: SweetenerSeed - raw or cooked in pies, cakes etc[183]. Sweet, with a very fine flavour[183], it has the largest seeds of the hickories[227], up to 5cm long[229]. Probably the finest flavoured hickory[117]. The shell is hard and thick[101, 117] and the cracking quality is poor compared to C. ovata[183]. The seed ripens in late autumn and, when stored in its shell in a cool place, will keep for at least 6 months[K]. Sap - a sweet flavour[62]. Tapped in spring, it can be boiled down to a syrup or sugar and be used in similar ways to maple syrup[101, 183].

tcanta Fuel WoodWood - close-grained, tough, hard, heavy, elastic, very flexible. It weighs 50 lb. per cubic foot. An excellent wood, it is used for tool handles, baskets, fuel etc[46, 61, 63, 82, 226, 227]. A dynamic accumulator gathering minerals or nutrients from the soil and storing them in a more bioavailable form - used as fertilizer or to improve mulch.

dwatta Astringent DetergentThe inner bark is astringent and detergent[257]. It has been used as a dressing for cuts and has been chewed to treat sore mouths[257].

propta Seed - requires a period of cold stratification. It is best sown in a cold frame as soon as it is ripe[78]. Stored seed should be kept moist (but not wet) prior to sowing and should be sown in a cold frame as soon as possible[78]. Where possible, sow 1 or 2 seeds only in each deep pot and thin to the best seedling. If you need to transplant the seedlings, then do this as soon as they are large enough to handle, once more using deep pots to accommodate the tap root. Put the plants into their permanent positions as soon as possible, preferably in their first summer, and give them some protection from the cold for at least the first winter[78, K]. Seed can also be sown in situ so long as protection is given from mice etc and the seed is given some protection from cold[200] (a plastic bottle with the top and bottom removed and a wire mesh top fitted to keep the mice out is ideal)

nwatta Management: Standard Regional Crop Staple Crop: OilLandscape Uses:Pest tolerant, Aggressive surface roots possible. Prefers a deep moisture-retentive loam in a sunny sheltered position, requiring a good summer for best development[1, 63, 137, 200]. A very ornamental but slow growing tree[1], it is sometimes cultivated for its edible seed, and is also sold in local markets in N. America[82]. There are some named varieties[183] though some of these are likely to be hybrids. ‘Fayette’ is a thin shelled form[200]. ‘Henry’ has a very large nut[200]. Trees have been planted on an experimental scale in Germany for their wood[50]. Hybridizes in the wild with C. ovata[227]. Trees take up to 15 years from seed to bear fruit[117]. Plants are strongly taprooted and should be planted in their permanent positions as soon as possible[1, 137]. Sowing in situ would be the best method so long as the seed could be protected from mice[1, 200]. Trees are late coming into leaf (usually late May to June) and lose their leaves early in the autumn (usually in October)[137]. During this time they cast a heavy shade. These factors combine to make the trees eminently suitable for a mixed woodland planting with shrubs and other trees

beneath them[137]. Plants in this genus are notably resistant to honey fungus[200]. Most species in this genus have quite a wide range of distribution and, in order to find trees more suited to this country, seed from the most appropriate provenances should be sought[137]. Most trees growing in Britain at present tend to only produce good seed after hot summers[137]. Trees are self-fertile but larger crops of better quality seeds are produced if cross-pollination takes place[229]. Special Features:North American native, Wetlands plant, Inconspicuous flowers or blooms. The plant is heat tolerant in zones 9 through 4. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of ‘heat days’ experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2]. The root pattern is a tap root similar to a carrot going directly down [1-2].

### 6.2.84 Quercus lyrata

Overcup Oak

5 tlin 9 cyuc 3 kcak 0 tcan 2 dwat 30 m hkcuc hmimhtut cyutli tcup hwicli jlutnyikfrip hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta Quercus lyrata is a deciduous Tree growing to 30 m (98ft 5in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in April, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kckaata Edible Parts: SeedEdible Uses: CoffeeSeed - cooked. The seed is about 25mm long[200], it can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread. The seed is fairly sweet and does not contain many bitter tannins[159]. It does not require much leaching but any bitterness can be leached out by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute.

tcanta Repellent Tannin WoodA mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth[20]. Oak galls are excrescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4]. Wood - close-grained, hard, tough, strong, heavy, very durable in contact with the ground[82]. It weighs 51lb per cubic foot. Used for construction, tools, furniture etc[46, 82, 227].

dwatta Astringent DysenteryThe leaves and bark are astringent[46, 61]. Any galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4].

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities

so long as the seed could be protected from mice[1, 200]. Trees are late coming into leaf (usually late May to June) and lose their leaves early in the autumn (usually in October)[137]. During this time they cast a heavy shade. These factors combine to make the trees eminently suitable for a mixed woodland planting with shrubs and other trees beneath them[137]. Plants in this genus are notably resistant to honey fungus[200]. Most species in this genus have quite a wide range of distribution and, in order to find trees more suited to this country, seed from the most appropriate provenances should be sought[137]. Most trees growing in Britain at present tend to only produce good seed after hot summers[137]. Trees are self-fertile but larger crops of better quality seeds are produced if cross-pollination takes place[229]. The leaves are richly aromatic[245].

### 6.2.81 Ulmus glabra

Wych Elm, Table-top Scotch Elm, Scotch Elm
5 tlin 7 cyuc 3 kcaak 0 tcan 2 dwat 30 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyikfrip hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Ulmus glabra is a deciduous Tree growing to 30 m (98ft) by 25 m (82ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from February to March, and the seeds ripen from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: Fruit Inner bark LeavesEdible Uses: Leaves - raw or cooked[179, K]. They can be a little bit bitter, especially if not very young, and have a mucilaginous texture[K]. They make a nice addition to a mixed salad[K]. Immature fruits, used just after they are formed, can be eaten raw[132]. An aromatic, unusual flavour, leaving the mouth feeling fresh and the breath smelling pleasant[132]. They contain about 34.4% protein, 28.2% fat, 17% carbohydrate, 5% ash[179]. The fruit is about 2.5cm long[200]. Inner bark - mucilaginous[179]. No more details are given but inner bark is often dried, ground into a powder and then used as a thickening in soups etc or mixed with cereals when making bread[K].

tcanta Fibre WoodA fibre from the inner bark is used for mats and making ropes[100]. Wood - very durable under water, fairly hard, elastic, withstands abrasion and salt water. Used for water pipes, wheels, mallet heads, ships keels etc[46, 61, 67, 100].

dwatta Astringent Bach Demulcent Diuretic Eczema HomeopathyThe inner bark is astringent, demulcent and mildly diuretic[9]. It is used both internally and externally in the treatment of diarrhoea, rheumatism, wounds, piles etc and is also used as a mouthwash in the treatment of ulcers[4, 9, 66]. The inner bark is harvested from branches 3 - 4 years old and is dried for later use[9]. The plant is used in Bach flower remedies - the keywords for prescribing it are 'Occasional feelings of inadequacy', 'Dependancy' and 'Exhaustion from over-striving for perfection'[209]. A homeopathic remedy is made from the inner bark[9]. It is used in the treatment of eczema[9].

propta Seed - if sown in a cold frame as soon as it is ripe, it usually germinates within a few days[200]. Stored seed does not germinate so well and should be sown in early spring[200]. The seed can also be harvested 'green' (when it has fully developed but before it dries on the tree) and sown immediately in a cold frame. It should germinate very quickly and will produce a larger plant by the end of the growing season[80]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Plants should not be allowed to grow for more than two years in a nursery bed since they form a tap root and will then move badly. Layering of suckers or coppiced shoots[200].

nwatta Landscape Uses:Specimen. Easily grown in any soil of at least moderate quality so long as it is well drained[1]. Prefers a deep or heavy soil that is moist but not waterlogged and does not thrive if the soil is markedly acid[186]. Moderately shade tolerant[186]. Very wind resistant and tolerant of maritime exposure[186]. Trees cast a dense shade[186]. Rarely produces suckers but responds well to coppicing[186]. The wych elm is subject to 'Dutch elm disease' (though less so than *U. procera*), a disease that has destroyed the greater part of all the elm trees growing in Britain. Mature trees killed back by the disease will often regrow from suckers, but these too will succumb when they get larger. There is no effective cure (1992) for the problem, but most E. Asian, though not Himalayan, species are resistant to the disease so the potential exists to develop new resistant hybrids with the native species. The various species hybridize freely, the pollen stores well and can be kept for use with species that flower at different times. A very ornamental tree[1], it is a food plant for the caterpillars of many lepidoptera species[30]. A good tree for growing grapes into[18]. Special Features: Not North American native, Inconspicuous flowers or blooms.

### 6.2.82 Carya pallida

Sand Hickory
5 tlin 9 cyuc 3 kcaak 0 tcan 1 dwat 30 m hkuc htut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli fyif hjonli

drutta Carya pallida is a deciduous Tree growing to 30 m (98ft 5in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf from June to October, in flower from April to May. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: Seed - raw or cooked[105, 177]. Rather thin-shelled, the seed is small and sweet[82, 235]. The seed is up to 3cm long[229]. The seed ripens in late autumn and, when stored in its shell in a cool place, will keep for at least 6 months[K].

tcanta Fuel WoodWood - heavy, hard, tough. Used for tool handles etc[82]. A good fuel, burning well and giving off a good heat[229].

dwatta Astringent DetergentThe inner bark is astringent and detergent[257]. It has been used as a dressing for cuts and has been chewed to treat sore mouths[257].

propta Seed - requires a period of cold stratification. It is best sown in a cold frame as soon as it is ripe[78]. Stored seed should be kept moist (but not wet) prior to sowing and should be sown in a cold frame as soon as possible[78]. Where possible, sow 1 or 2 seeds only in each deep pot and thin to the best seedling. If you need to transplant the seedlings, then do this as soon as they are large enough to handle, once more using deep pots to accommodate the tap root. Put the plants into their permanent positions as soon as possible, preferably in their first summer, and give them some protection from the cold for at least the first winter[78, K]. Seed can also be sown in situ so long as protection is given from mice etc and the seed is given some protection from cold[200] (a plastic bottle with the top and bottom removed and a wire mesh top fitted to keep the mice out is ideal)

nwatta Prefers a deep moisture-retentive loam in a sunny sheltered position, requiring a good summer for best development[1, 63, 137, 200]. Slow growing[200]. Plants are strongly tap-rooted and should be planted in their permanent positions as soon as possible[1, 137]. Sowing in situ would be the best method so long as the seed could be protected from mice[1, 200]. Trees are late coming into leaf (usually late May to June) and lose their leaves early in the autumn (usually in October)[137]. During this time they cast a heavy shade. These factors combine to make the trees eminently suitable for a mixed woodland planting with shrubs and other trees beneath them[137]. Plants in this genus are notably resistant to honey fungus[200]. Most species in this genus have quite a wide range of distribution and, in order to find trees more suited to this country, seed from the

### 6.2.8 Crataegus arnoldiana

Arnold Hawthorn
5 tlin 9 cyuc 5 kcaak 0 tcan 2 dwat 7 m hkuc hmimhtut cyutli hgatkycutcuphja7n hwicli hrasljutnyikfrip hpa7tli flatprikliwisliip hpa7tmwatli xre7t hjonli

drutta Crataegus arnoldiana is a deciduous Tree growing to 7 m (23ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in May, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Midge. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry moist or wet soil and can tolerate drought. The plant can tolerates strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105, 177]. Sub-acid[82]. A delicious flavour, it is sweet with a soft juicy flesh and makes an excellent dessert fruit[K]. It can also be cooked and used in pies, preserves etc and can be dried for later use. The fruit ripens in early September in southern Britain[K]. The fruit is about 2cm in diameter[K]. There are up to five fairly large seeds in the centre of the fruit, these often stick together and so the effect is of eating a cherry-like fruit with a single seed[K].

tcanta Wood - heavy, hard, tough, close-grained. Useful for making tool handles, mallets and other small items[82].

dwatta Cardiotonic HypotensiveAlthough no specific mention has been seen for this species, the fruits and flowers of many hawthorns are well-known in herbal folk medicine as a heart tonic and modern research has borne out this use. The fruits and flowers have a hypotensive effect as well as acting as a direct and mild heart tonic[222]. They are especially indicated in the treatment of weak heart combined with high blood pressure[222]. Prolonged use is necessary for it to be efficacious[222]. It is normally used either as a tea or a tincture[222].

propta Seed - this is best sown as soon as it is ripe in the autumn in a cold frame, some of the seed will germinate in the spring, though most will probably take another year. Stored seed can be very slow and erratic to germinate, it should be warm stratified for 3 months at 15°C and then cold stratified for another 3 months at 4°C[164]. It may still take another 18 months to germinate[78]. Scarifying the seed before stratifying it might reduce this time[80]. Fermenting the seed for a few days in its own pulp may also speed up the germination process[K]. Another possibility is to harvest the seed 'green' (as soon as the embryo has fully developed but before the seedcoat hardens) and sow it immediately in a cold frame. If timed well, it can germinate in the spring[80]. If you are only growing small quantities of plants, it is best to pot up the seedlings as soon as they are large enough to handle and grow them out in individual pots for their first year, planting them out in late spring into nursery beds or their final positions. When growing larger quantities, it might be best to sow them directly outdoors in a seedbed, but with protection from mice and other seed-eating creatures. Grow them on in the seedbed until large enough to plant out, but undercut the roots if they are to be left undisturbed for more than two years.

nwatta A very easily grown plant, it prefers a well-drained moisture retentive loamy soil but is not at all fussy[11, 200]. Once established, it succeeds in excessively moist soils and also tolerates drought[200]. It grows well on a chalk soil and also in heavy clay soils[200]. A position in full sun is best when plants are being grown for their fruit, they also succeed in semi-shade though fruit yields and quality will be lower in such a position[11, 200]. Most members of this genus succeed in exposed positions, they also tolerate atmospheric pollution[200]. This is a tree with an excellent potential as a fruit crop in Britain. The fruit is of very good quality and is freely borne, whilst the tree is of very easy cultivation and rarely troubled by pests or diseases[K]. A tree at the Hillier Arboretum in September 1993 was about 3 metres tall and 1.5 metres wide. The growth looked somewhat weak and the tree was leaning due to wind rock but it was carrying a heavy crop of fruit[K]. Seedling trees take from 5 - 8 years before they start bearing fruit, though grafted trees will often flower heavily in their third year[K]. The flowers

have a foetid smell somewhat like decaying fish. This attracts midges which are the main means of fertilization. When freshly open, the flowers have more pleasant scent with balsamic undertones[245]. A very ornamental plant[1], it is very closely related to *C. mollis*, and considered to be part of that species by many botanists[229]. Hybridizes freely with other members of this genus[200]. Seedlings should not be left in a seedbed for more than 2 years without being transplanted[11].

### 6.2.9 Prunus persica

Peach, Flowering Peach, Ornamental Peach, Common Peach
5 tlin 9 cyuc 5 kcaak 3 tcan 3 dwat 6 m hkuc htut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli fyifkre7t hjonli

drutta Prunus persica is a deciduous Tree growing to 6 m (19ft) by 6 m (19ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in April, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Flowers Fruit Oil Oil SeedEdible Uses: Gum Oil Oil TeaFruit - raw, cooked or dried for later use[1, 2, 34, 46]. The fruit is often used in ice creams, pies, jams etc[183]. When fully ripe, the fruit of the best forms are very juicy with a rich delicious flavour[K]. Wild trees in the Himalayas yield about 36.5kg of fruit a year[194]. The fruit of the wild form contains about 5.2% sugars, 2% protein, 1.6% ash. Vitamin C content is 2.3mg per 100g[194]. The fruit is a good source of vitamin A[201]. Fruits of the wild peach are richer in nutrients than the cultivated forms[194]. The size of fruit varies widely between cultivars and the wild form, it can be up to 7cm in diameter and contains one seed[200]. Flowers - raw or cooked. Added to salads or used as a garnish[183]. They can also be brewed into a tea[183]. The distilled flowers yield a white liquid which can be used to impart a flavour resembling the seed[183]. Seed - raw or cooked. Do not eat if it is too bitter, seed can contain high concentrations of hydrocyanic acid. See the notes above on toxicity. A semi-drying oil is obtained from the seed[57]. Although the report does not mention edibility it can be assumed that it is edible. The seed contains up to 45% oil[218]. A gum is obtained from the stem. It can be used for chewing[64].

tcanta Adhesive Cleanser Dye Gum Oil OilA green dye can be obtained from the leaves[168]. Yellow according to another report[257]. A dark grey to green dye can be obtained from the fruit[168]. A semi-drying oil is obtained from the seed[57]. It is used as a substitute for almond oil in skin creams[238]. The bruised leaves, when rubbed within any container, will remove strong odours such as garlic or cloves so long as any grease has first been fully cleaned off[4]. A gum obtained from the stem is used as an adhesive[64].

dwatta Alternative Anthelmintic Antiasthmatic Antihalitosis Antitussive Astringent Demulcent Diuretic Emollient Expectorant Febrifuge Haemolytic Laxative Sedative Vitamin CAntihalitosis[194]. The leaves are astringent, demulcent, diuretic, expectorant, febrifuge, laxative, parasiticide and mildly sedative[21, 218]. They are used internally in the treatment of gastritis, whooping cough, coughs and bronchitis[238]. They also help to relieve vomiting and morning sickness during pregnancy, though the dose must be carefully monitored because of their diuretic action[21]. The dried and powdered leaves have sometimes been used to help heal sores and wounds[21]. The leaves are harvested in June and July then dried for later use[4]. The flowers are diuretic, sedative and vermifuge[4, 21, 176, 194, 218]. They are used internally in the treatment of constipation and oedema[238]. A gum from the stems is alternative, astringent, demulcent and sedative[4, 21, 176, 194, 218]. The seed is antiasthmatic, antitussive, emollient, haemolytic, laxative and sedative[4, 21, 176, 194, 218]. It is used internally in the treatment of constipation in the elderly, coughs, asthma and menstrual disorders[238]. The bark is demulcent, diuretic, expectorant and sedative[4]. It is used internally in the treatment of gastritis, whooping cough, coughs and bronchitis[238]. The root bark is used in the treatment of dropsy and jaundice[218].

The bark is harvested from young trees in the spring and is dried for later use[4]. The seed contains 'laetrial', a substance that has also been called vitamin B17[218]. This has been claimed to have a positive effect in the treatment of cancer, but there does not at present seem to be much evidence to support this[K]. The pure substance is almost harmless, but on hydrolysis it yields hydrocyanic acid, a very rapidly acting poison - it should thus be treated with caution[218]. In small amounts this exceedingly poisonous compound stimulates respiration, improves digestion and gives a sense of well-being[238].

propta Seed - requires 2 - 3 months cold stratification and is best sown in a cold frame as soon as it is ripe[200]. Sow stored seed in a cold frame as early in the year as possible[200]. The stored seed is best given 2 months warm followed by 3 months cold stratification[113]. Protect the seed from mice etc. The seed can be rather slow, sometimes taking 18 months to germinate[113]. Prick out the seedlings into individual pots when they are large enough to handle. Grow them on in a greenhouse or cold frame for their first winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood with a heel, July/August in a frame[11, 200]. A very low percentage[113]. Softwood cuttings from strongly growing plants in spring to early summer in a frame[200]. Layering in spring.

nwatta Landscape Uses:Container, Espalier, Firewood. Requires a well-drained moisture retentive soil[1, 11]. Thrives in a loamy soil, doing well on limestone[11]. Best not grown in acid soils. Prefers some chalk in the soil but it is apt to become chlorotic if too much is present[1]. Prefers a pH in the range 6 to 7[200]. Succeeds in light shade but fruits better in a sunny position[11]. Requires shelter from north and north-east winds[11] and also from spring frosts[200]. Widely cultivated for its edible fruit in warm temperate areas and continental climates, there are many named varieties[183]. There are numerous divisions of the varieties according to skin colour etc. Perhaps the most useful from the eaters point of view is whether it is free-stone (the flesh parts easily from the seed) or cling-stone (the flesh adheres to the seed)[200, K]. Trees are normally hardy in southern Britain[11], tolerating temperatures down to about -20°C when they are dormant[184], but they require some protection if cropping is to be at all reliable[11]. This is not due so much to lack of cold hardness, more to the cooler summers in Britain which do not fully ripen the wood and the fruit, plus the unpredictable winters and springs which, in a mild spell, can excite the tree into premature flowering and growth which is then very liable to damage in any following cold spell. Hand pollination at this time can improve fruit-set[200]. The cultivar 'Rochester' is more likely than most cultivars to succeed outdoors in Britain[200]. In general it is best to site peaches in a very warm sheltered sunny position, preferably against a south or west facing wall[200, 219]. Most cultivars are self-fertile[200]. Trees are often grafted onto plum or other rootstocks but are said to be better when grown on their own roots in southern Britain[11]. Trees are not generally long-lived[200], this is partly because of the need for the tree to produce a constant supply of new wood since most fruit is formed on one-year old wood (though some fruit spurs are formed)[200]. Garlic is a good companion for this plant, helping to prevent disease, especially peach leaf curl[20, 201]. Tansy grown below peach trees helps to keep them healthier[201]. Peach leaf curl can also be prevented by protecting the plants from winter and early spring rains, perhaps by covering them in plastic[200]. Plants grown or overwintered indoors do not suffer from leaf curl[260]. Most members of this genus are shallow-rooted and will produce suckers if the roots are damaged[238]. Plants in this genus are notably susceptible to honey fungus[200]. Special Features: Edible, Not North American native, All or parts of this plant are poisonous, Attractive flowers or blooms. The plant is heat tolerant in zones 8 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture

(form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is flat with shallow roots spreading near the soil surface. The root pattern is suckering with new plants from runners away from the plant [2-1].

## 6.2.10 Crataegus ellwangeriana

Scarlet Hawthorn

5 tin 7 cyuc 5 kcaak 2 tcan 2 dwat 6 m hkuc  
hmmihut cyutli hqattcuphia7n hwicli hrasjlutnyik frip hpa7tli flatprikwisslip hpa7tmwatli xre7t hjonli

drutta Crataegus ellwangeriana is a deciduous Tree growing to 6 m (19ft) by 6 m (19ft). See above for USDA hardness. It is hardy to UK zone 5 and is not frost tender. It is in flower in May, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Midgees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcaakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. Juicy and acid[82]. An excellent dessert fruit, it has an acid yet sweet flavour, is juicy but with a mealy texture, it makes very pleasant eating[K]. The fruit can also be used in making pies, preserves etc. and can be dried for later use. A reasonable size, it is about 15mm in diameter[200]. A specimen at Kew has fruits up to 25mm in diameter[K]. There are up to five fairly large seeds in the centre of the fruit, these often stick together and so the effect is of eating a cherry-like fruit with a single seed[K].

tcanta Wood - heavy, hard, tough, close-grained. Useful for making tool handles, mallets and other small items[82].

dwatta Cardiotonic HypotensiveAlthough no specific mention has been seen for this species, the fruits and flowers of many hawthorns are well-known in herbal folk medicine as a heart tonic and modern research has borne out this use. The fruits and flowers have a hypotensive effect as well as acting as a direct and mild heart tonic[222]. They are especially indicated in the treatment of weak heart combined with high blood pressure[222]. Prolonged use is necessary for it to be efficacious[222]. It is normally used either as a tea or a tincture[222].

propta Seed - this is best sown as soon as it is ripe in the autumn in a cold frame, some of the seed will germinate in the spring, though most will probably take another year. Stored seed can be very slow and erratic to germinate, it should be warm stratified for 3 months at 15°C and then cold stratified for another 3 months at 4°C[164]. It may still take another 18 months to germinate[78]. Scarifying the seed before stratifying it might reduce this time[80]. Fermenting the seed for a few days in its own pulp may also speed up the germination process[K]. Another possibility is to harvest the seed 'green' (as soon as the embryo has fully developed but before the seedcoat hardens) and sow it immediately in a cold frame. If timed well, it can germinate in the spring[80]. If you are only growing small quantities of plants, it is best to pot up the seedlings as soon as they are large enough to handle and grow them on in individual pots for their first year, planting them out in late spring into nursery beds or their final positions. When growing larger quantities, it might be best to sow them directly outdoors in a seedbed, but with protection from mice and other seed-eating creatures. Grow them on in the seedbed until large enough to plant out, but undercut the roots if they are to be left undisturbed for more than two years.

nwatta A very easily grown plant, it prefers a well-drained moisture retentive loamy soil but is not at all fussy[11, 200]. Once established, it succeeds in excessively moist soils and also tolerates drought[200]. It grows well on a chalk soil and also in heavy clay soils[200]. A position in full sun is best when plants are being grown for their fruit,

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Grows well on chalk[98], even when the soil is shallow[188]. Young plants tolerate reasonable levels of side shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. Grows well near the coast[98]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. A very ornamental tree[1], it grows very well in Britain and is the fastest growing of the oaks in cultivation in this country[1]. The seed ripens in its second year[200]. Trees transplant badly unless they are moved regularly[11]. Hybridizes freely with other members of the genus[200]. This species is notably resistant to honey fungus[88, 200].

## 6.2.79 Ulmus procera

English Elm

5 tin 9 cyuc 3 kcaak 0 tcan 2 dwat 35 m hkuc  
hmmihut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta Ulmus procera is a deciduous Tree growing to 35 m (114ft) by 15 m (49ft) at a fast rate. See above for USDA hardness. It is hardy to UK zone 6 and is not frost tender. It is in flower from February to March, and the seeds ripen from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure. It can tolerate atmospheric pollution.

kcaakta Edible Parts: Fruit Inner bark LeavesEdible Uses: TeaLeaves - raw or cooked[2, 179, K]. They can be a little bit bitter, especially if not very young, and have a mucilaginous texture[K]. They make a nice addition to a mixed salad[K]. Immature fruits, used just after they are formed - raw[2, 177]. An aromatic, unusual flavour, leaving the mouth feeling fresh and the breath smelling pleasant[132]. They contain about 34.4% protein, 28.2% fat, 17% carbohydrate, 5% ash[179]. Inner bark - cooked. A mucilaginous texture[179]. It can be dried, ground into a powder and then used as a thickening in soups etc or mixed with cereals when making bread[2, 177]. A tea is made from the leaves[177].

tcanta Dye Tannin WoodA fibre from the inner bark is very tough[4]. It is used for making mats and ropes[4]. Tannin and a dyestuff are obtained from the inner bark[7]. No details of the colour are given. Wood - close-grained, free from knots, very durable under water, fairly hard, elastic, withstands abrasion and salt water, but does not take a high polish. It is used for water pipes, wheels, mallet heads, ships keels etc[4, 7, 11] and is a good firewood[6].

dwatta Astringent Bach Demulcent Diuretic Eczema Homeopathy Mouthwash Resolvent Skin Tonic VulneraryThe dried inner bark is anti-inflammatory, astringent, demulcent, mildly diuretic, resolvent, tonic and vulnerary[4, 7, 9]. It is used both internally and externally in the treatment of diarrhoea, rheumatism, wounds, piles etc and is also used as a mouthwash in the treatment of ulcers[4, 9, 66]. The inner bark is harvested from branches 3 - 4 years old and is dried for later use[9]. The sap has been used in the treatment of baldness[7]. The leaves are astringent and have been powdered then used in the treatment of haemorrhoids[7]. A decoction is used to treat reddened and inflamed skin as well as to relieve various skin disorders[7]. The plant is used in Bach flower remedies - the keywords for prescribing it are 'Occasional feelings of inadequacy', 'Dependancy' and 'Exhaustion from over-striving for perfection'[209]. A homeopathic remedy is made from the inner bark[4]. It is used as an astringent[4] and as a treatment for eczema[9].

propta Seed - if sown in a cold frame or outdoor seedbed as soon as ripe it usually germinates in a few days. A high proportion of the seed is not viable but seed is normally freely produced and can be sown thickly to take into account the poor viability. Stored seed does not germinate so well and should be sown in early spring. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Plants should not be allowed to grow for more than two years in a nursery bed since they form a tap root and will then move badly. Layering of suckers or coppiced shoots.

nwatta Prefers a fertile soil in full sun[188], but is easily grown in any soil of at least moderate quality so long as it is well drained[1]. Tolerant of atmospheric pollution[4]. The English elm is susceptible to 'Dutch elm disease', a disease that has destroyed the greater part of all the elm trees growing in Britain. Mature trees killed back by the disease will often regrow from suckers, but these too will succumb when they get larger. There is no effective cure (1992) for the problem, but most E. Asian, though not Himalayan, species are resistant to the disease so the potential exists to develop new resistant hybrids with the native species[200]. The various species hybridize freely, the pollen stores well and can be kept for use with species that flower at different times[200]. A food plant for the caterpillars of many lepidoptera species[30], there are 80 species of insects associated with this tree[24]. A good tree for growing grapes into[18].

## 6.2.80 Carya ovalis

Sweet Pignut

5 tin 9 cyuc 3 kcaak 0 tcan 0 dwat 30 m hkuc  
htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwis hpa7tmwatli fyif hjonli

drutta Carya ovalis is a deciduous Tree growing to 30 m (98ft 5in) at a slow rate. See above for USDA hardness. It is hardy to UK zone 6. It is in leaf from June to October, in flower from April to May. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcaakta Edible Parts: Sap SeedEdible Uses: Seed - raw or cooked[1, 101, 105]. Small but sweet[11, 82] with a thin shell[159, 235]. The seed ripens in late autumn and, when stored in its shell in a cool place, will keep for at least 6 months[K]. Sap - raw. Tapped in the spring, it has a sweet flavour[101].

tcanta Fuel WoodWood - heavy, hard, tough and elastic. Used for making wagons, agricultural implements, tool handles etc[63, 82].

dwatta None known

propta Seed - requires a period of cold stratification. It is best sown in a cold frame as soon as it is ripe[78]. Stored seed should be kept moist (but not wet) prior to sowing and should be sown in a cold frame as soon as possible[78]. Where possible, sow 1 or 2 seeds only in each deep pot and thin to the best seedling. If you need to transplant the seedlings, then do this as soon as they are large enough to handle, once more using deep pots to accommodate the tap root. Put the plants into their permanent positions as soon as possible, preferably in their first summer, and give them some protection from the cold for at least the first winter[78, K]. Seed can also be sown in situ so long as protection is given from mice etc and the seed is given some protection from cold[200] (a plastic bottle with the top and bottom removed and a wire mesh top fitted to keep the mice out is ideal)

nwatta Prefers a deep moisture-retentive loam in a sunny sheltered position, requiring a good summer for best development[1, 63, 137, 200]. Slow growing[200]. Considered by some botanists to be no more than a form of *C. glabra*[101], this tree is more regular cropping than other species[159]. Plants are strongly tap-rooted and should be planted in their permanent positions as soon as possible[1, 137]. Sowing in situ would be the best method

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[3, 105]. Eaten in early September, the fruit was not quite ripe but had already developed a pleasantly sweet flavour and a mealy texture, it made a very acceptable dessert fruit[K]. The fruit is about 10mm in diameter and is produced in fairly large clusters that make harvesting quite simple[K]. It is usually bled if it is going to be eaten raw[K]. This involves storing the fruit in a cool dry place until it is almost but not quite going rotten. At this stage the fruit has a delicious taste, somewhat like a luscious tropical fruit[K]. The fruit is up to 8mm in diameter[200].

tcanta None known  
dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame[78, 80]. If you have sufficient seed it can be sown in an outdoor seedbed[78, 80]. Stored seed germinates better if given 2 weeks warm then 14 - 16 weeks cold stratification[98], so sow it as early in the year as possible. Prick out the seedlings into individual pots when they are large enough to handle. Seedlings are very slow to put on top-growth for their first year or two[11], but they are busy building up a good root system. It is best to keep them in pots in a cold frame for their first winter and then plant them out into their permanent positions in late spring.

nwatta Succeeds in most reasonably good soils in an open sunny position[11]. Tolerates light shade[188], though it fruits better in a sunny position[K]. Plants are susceptible to fireblight[188]. A tetraploid species, it is closely related to *S. intermedia* and *S. latifolia*[200]. Very similar to *S. anglica*[11]. The trees usually have apomictic flowers. They thus produce seed asexually, each seedling being a clone of the parent[11].

## 6.2.77 Apium graveolens rapaceum

Celeriac

5 tin 9 cyuc 4 kcaak 0 tcan 2 dwat 0.6 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnykfrp hpa7tli flatprikwisslip hpa7tmwatli fyfxre7t hjonli

drutta Apium graveolens rapaceum is a BIENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from June to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: Leaves Root SeedEdible Uses: CondimentLeaves - used as a flavouring in soups etc[200]. They can be eaten raw but have a very strong flavour[52]. Seed - a flavouring. An essential oil from the seed is also used as a flavouring. Root - raw or cooked[27, 33, 52]. It can be grated and added to salads, baked or added to soups, stews etc[183].

tcanta The growing plant is an insect repellent, it repels the cabbage white butterfly so is a good companion for brassicas[20].

dwatta Aperient Carminative Diuretic Emmenagogue Galactagogue Nerve Stimulant TonicAlthough not as medicinally active as wild celery, the cultivated forms of celery also have the same medicinal properties and, when used as an item of the diet, will have a similar effect upon the body. These medicinal uses are as follows:- Wild celery is an aromatic bitter tonic herb that reduces blood pressure, relieves indigestion, stimulates the uterus and is anti-inflammatory[238]. The ripe seeds, herb and root are aperient, carminative, diuretic, emmenagogue, galactagogue, nerve stimulant and tonic[4, 7, 21, 165]. Wild celery is said to be useful in cases of hysteria, promoting restfulness and sleep and diffusing through the system a mild sustaining influence[4]. The herb should not be prescribed for pregnant women[238]. Seeds purchased for cultivation purposes are often dressed with a fungicide, they should not be used for medicinal purposes[238]. The root is harvested in the autumn and can be used fresh or dried[238]. The whole plant is harvested when fruiting and is usually liquified to extract the juice[238]. The seeds are harvested as they ripen and are dried for later use[238]. An essential oil obtained from

the plant has a calming effect on the central nervous system. Some of its constituents have antispasmodic, sedative and anticonvulsant actions. It has been shown to be of value in treating high blood pressure[254]. A homeopathic remedy is made from the herb[9]. It is used in treating rheumatism and kidney complaints[9].

propta Seed - surface sow February in a greenhouse. The maincrop can be sown as late as mid-April. Germinates in 2 - 3 weeks at 15°C. Plant out in May. The seed can harbour certain diseases of celery, it is usually treated by seed companies before being sold but if you save your own seed you should make sure that only seed from healthy plants is used[1].

nwatta Prefers a rich moist soil and an open sunny situation[1, 27, 33, 52]. Requires abundant moisture in the growing season otherwise the root will be small and tough[1]. Tolerates a pH in the range 5.2 to 8.3. The root is hardy to about -12°C and can be left in the ground over winter, to be harvested as required[200]. Roots can also be stored in boxes of sand or other such material in a cool dry shed[200]. Celeriac is a form of *A. graveolens* that has been selected for its enlarged edible root. It is occasionally cultivated commercially but more often in the garden or allotment[46, 200], there are some named varieties[183]. Any side-shoots should be removed in order to encourage a larger root[200]. A good companion plant for leeks, tomatoes, French beans and brassicas[18].

## 6.2.78 Quercus cerris

Turkey Oak, European turkey oak

5 tin 9 cyuc 3 kcaak 0 tcan 2 dwat 35 m hkuc  
hmimhtut cyutli tcup hwicli jlutnykfrp hpa7tli flatprikwisslip hpa7tmwatli hjonli

drutta Quercus cerris is a deciduous Tree growing to 35 m (114ft) by 25 m (82ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in May, and the seeds ripen in September. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: Manna SeedEdible Uses: CoffeeSeed - cooked. Up to 2.5cm long. It can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread[183]. The seed contains bitter tannins, these can be leached out by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute. A sweet fluid exudes from insect damage on the stems and solidifies[2, 61, 105, 177]. This is edible and is sold as a manna in local markets in Iran[46]. It can be boiled down into a syrup and used for sweetening food[183].

tcanta Buttons Repellent Tannin WoodThe seed cups are used as buttons[95]. A mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit the growth of young plants[20]. Oak galls are excrescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4]. The leaves, bark and wood are used commercially as a source of tannins[223]. Wood. It is valued by wheelwrights, turners and cabinet makers[4]. Of little value[1, 11]. It does not weather well[100].

dwatta Astringent DysenteryAny galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4].

they also succeed in semi-shade though fruit yields and quality will be lower in such a position[11, 200]. Most members of this genus succeed in exposed positions, they also tolerate atmospheric pollution[200]. Hybridizes freely with other members of this genus[200]. This species is possibly of hybrid origin, involving *C. pedicellata*, though some botanists view it as no more than part of *C. pedicellata*[82]. Seedling trees take from 5 - 8 years before they start bearing fruit, though grafted trees will often flower heavily in their third year[K]. The flowers have a foetid smell somewhat like decaying fish. This attracts midges which are the main means of fertilization. When freshly open, the flowers have more pleasant scent with balsamic undertones[245]. Seedlings should not be left in a seedbed for more than 2 years without being transplanted[11]. A very ornamental plant[11].

## 6.2.11 Prunus insititia

Damson

5 tin 9 cyuc 5 kcaak 3 tcan 1 dwat 6 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnykfrp hpa7tli flatprikwisslip hpa7tmwatli xre7t hjonli

drutta Prunus insititia is a deciduous Tree growing to 6 m (19ft) by 5 m (16ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in April, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: Fruit SeedEdible Uses: Fruit - raw or cooked[1, 2, 46]. More acid than a plum but it is very acceptable raw when fully ripe, especially after being touched by frost[12, 34, K]. The fruit is about 3cm in diameter and contains one large seed[200]. Seed - raw or cooked. Do not eat the seed if it is too bitter - see the notes above on toxicity.

tcanta Dye Hedge Hedge ShelterbeltA green dye can be obtained from the leaves[168]. A dark grey to green dye can be obtained from the fruit[168]. Trees are fairly wind resistant and can be grown as a shelterbelt hedge[200].

dwatta Febrifuge Purgative StypticThe bark of the root and branches is febrifuge and considerably styptic[4]. An infusion of the flowers has been used as a mild purgative for children[4]. Although no specific mention has been seen for this species, all members of the genus contain amygdalin and prunasin, substances which break down in water to form hydrocyanic acid (cyanide or prussic acid). In small amounts this exceedingly poisonous compound stimulates respiration, improves digestion and gives a sense of well-being[238].

propta Seed - requires 2 - 3 months cold stratification and is best sown in a cold frame as soon as it is ripe[200]. Sow stored seed in a cold frame as early in the year as possible[200]. Protect the seed from mice etc. The seed can be rather slow, sometimes taking 18 months to germinate[113]. Prick out the seedlings into individual pots when they are large enough to handle. Grow them on in a greenhouse or cold frame for their first winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood with a heel, July/August in a frame[11, 200]. Softwood cuttings from strongly growing plants in spring to early summer in a frame[200]. Layering in spring.

nwatta Requires a well-drained moisture retentive soil[1, 11]. Succeeds in light shade but fruits better in a sunny position[11, 200]. Thrives in a loamy soil, doing well on limestone[11]. Grows well in heavy clay soils. Prefers some chalk in the soil but apt to become chlorotic if too much is present[1]. Occasionally cultivated for its edible fruit, there are some named varieties[200]. It has been derived in cultivation from the bullace, differing in having a sweeter fruit[200]. Damsons can be grown successfully against a north facing wall[219]. Most members of this genus are shallow-rooted and will produce suckers if the roots are damaged[238]. Plants in this genus are notably susceptible to honey fungus[200]. *Prunus insititia* L. is a synonym of *Prunus domestica* subsp. *insititia* (L.) Bonnier and Layens For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given

here if available. A sprouting standard sending up shoots from the base [1-2].

## 6.2.12 Crataegus schraderana

Blue hawthorn

5 tin 9 cyuc 5 kcaak 0 tcan 2 dwat 6 m hkuc  
hmimhtut cyutli hgattcuphja7n hwicli hrasjlutnykfrp hpa7tli flatprikwisslip hpa7tmwatli xre7t hjonli

drutta Crataegus schraderana is a deciduous Tree growing to 6 m (19ft 8in). It is not frost tender. It is in flower in June, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Midges. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta Fruit - raw or cooked[74]. A reasonable size, about 15 - 20mm in diameter[K]. This is one of the nicest tasting fruits of the genus I have tried to date. When fully ripe it is juicy with an extremely pleasant flavour and almost literally melts in the mouth[K]. I would far rather eat this fruit than a strawberry[K]. It ripens in late September and hangs on the tree in good condition for at least 4 weeks[K]. The ripe fruit is so soft that it is best eaten fresh from the tree[K]. The fruit can also be used in making pies, preserves etc, and can be dried for later use. There are up to five fairly large seeds in the centre of the fruit, these often stick together and so the effect is of eating a cherry-like fruit with a single seed[K].

tcanta Wood - heavy, hard, tough, close-grained. Useful for making tool handles, mallets and other small items[82].

dwatta Although no specific mention has been seen for this species, the fruits and flowers of many hawthorns are well-known in herbal folk medicine as a heart tonic and modern research has borne out this use. The fruits and flowers have a hypotensive effect as well as acting as a direct and mild heart tonic[222]. They are especially indicated in the treatment of weak heart combined with high blood pressure[222]. Prolonged use is necessary for it to be efficacious[222]. It is normally used either as a tea or a tincture[222].

propta Seed - this is best sown as soon as it is ripe in the autumn in a cold frame, some of the seed will germinate in the spring, though most will probably take another year. Stored seed can be very slow and erratic to germinate, it should be warm stratified for 3 months at 15°C and then cold stratified for another 3 months at 4°C[164]. It may still take another 18 months to germinate[78]. Scarifying the seed before stratifying it might reduce this time[80]. Fermenting the seed for a few days in its own pulp may also speed up the germination process[K]. Another possibility is to harvest the seed 'green' (as soon as the embryo has fully developed but before the seedcoat hardens) and sow it immediately in a cold frame. If timed well, it can germinate in the spring[80]. If you are only growing small quantities of plants, it is best to pot up the seedlings as soon as they are large enough to handle and grow them on in individual pots for their first year, planting them out in late spring into nursery beds or their final positions. When growing larger quantities, it might be best to sow them directly outdoors in a seedbed, but with protection from mice and other seed-eating creatures. Grow them on in the seedbed until large enough to plant out, but undercut the roots if they are to be left undisturbed for more than two years.

nwatta A very easily grown plant, it prefers a well-drained moisture retentive loamy soil but is not at all fussy[11, 200]. Once established, it succeeds in excessively moist soils and also tolerates drought[200]. It grows well on a chalk soil and also in heavy clay soils[200]. A position in full sun is best when plants are being grown for their fruit, they also succeed in semi-shade though fruit yields and quality will be lower in such a position[11, 200]. Most members of this genus succeed in exposed positions, they also tolerate atmospheric pollution[200]. This species has an excellent potential as a fruit crop in Britain. The fruit is about the size of a cherry, it is very freely borne and the best forms are of excellent dessert quality[K]. The tree is very easily grown

and is little troubled by pests or diseases. It also requires very little attention, once the trees are established virtually the only work needed is to harvest the fruit each year[K]. Grafted specimens can produce fruit in their third year[K]. A very ornamental plant[74], it grows well in Britain flowering and fruiting well at Kew and Wisley[K]. Seedling trees take from 5 - 8 years before they start bearing fruit, though grafted trees will often flower heavily in their third year[K]. The flowers have a foetid smell somewhat like decaying fish. This attracts midges which are the main means of fertilization. When freshly open, the flowers have more pleasant scent with balsamic undertones[245]. Hybridizes freely with other members of this genus[200]. Seedlings should not be left in a seedbed for more than 2 years without being transplanted[11].

## 6.2.13 Prunus domestica italica

Gages, Greengage  
5 tlin 8 cyuc 5 kcaak 2 tcan 2 dwat 5 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyikfrp hpa7tli flatprikliw  
wisslip hpa7tmwatli hjonli

drutta Prunus domestica italica is a deciduous Tree growing to 5 m (16ft) by 4 m (13ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6. The flowers are pollinated by Bees, Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers Fruit Oil SeedEdible Uses: OilFruit - raw or cooked. Often considered to be the finest of the dessert plums, they have a delicious flavour[K].The greengages. The usually green, globose fruit is usually 30 - 400mm in diameter. Seed - raw or cooked. Do not eat the seed if it is too bitter - see the notes above on toxicity. An edible gum is obtained from points of damage on the trunk[64]. The seed contains about 20% of an edible semi-drying oil[4, 57]. It has an agreeable almond smell and flavour[4]. The flowers are eaten. They are used as a garnish for salads and ice cream or brewed into a tea[183].

tcanta Adhesive Cosmetic Dye Oil WoodA green dye can be obtained from the leaves [168]. A dark grey to green dye can be obtained from the fruit [168]. A yellow dye is obtained from the bark [115]. A gum obtained from points of damage along the stem can be used as an adhesive [64]. The ground up seeds are used cosmetically in the production of face-masks for dry skin [7]. A semi-drying oil is obtained from the seed [64]. No details of its uses. The reddish-brown wood is very close-grained, hard, compact. Liable to warp and split. It is used for musical instruments [115, 146].

dwatta Digestive Febrifuge Laxative Purgative Stomachic StypticThe dried fruit, known as prunes, is a safe and effective laxative and is also stomachic [4, 7, 21, 238]. The bark is sometimes used as a febrifuge and is styptic [4, 7]. An infusion of the flowers has been used as a mild purgative for children [4]. Although no specific mention has been seen for this species, all members of the genus contain amygdalin and prunasin, substances which break down in water to form hydrocyanic acid (cyanide or prussic acid). In small amounts this exceedingly poisonous compound stimulates respiration, improves digestion and gives a sense of well-being [238].

propta Seed - requires 2 - 3 months cold stratification and is best sown in a cold frame as soon as it is ripe [200]. Sow stored seed in a cold frame as early in the year as possible [200]. Protect the seed from mice etc. The seed can be rather slow, sometimes taking 18 months to germinate [113]. Prick out the seedlings into individual pots when they are large enough to handle. Grow them on in a greenhouse or cold frame for their first winter and plant them out in late spring or early summer of the following year. The various cultivars of plum are unlikely to breed true (though the green forms of the gage generally do) - they will usually produce a range of plants from seed with differing characteristics from their parent, Cuttings of half-ripe wood with a heel, mid summer in a frame [11, 200]. Softwood cuttings from strongly growing plants in spring to early summer in a frame [200]. Layering in spring.

nwatta The greengages are a group of cultivars of the common European plum. Gages are often cultivated as a fruit crop, especially in western Europe. Of excellent quality, though their delicate skins makes it difficult to get them to market in good condition and so they are more likely to be grown on a garden scale or be used for canning etc. Prunus domestica subsp. italica requires a well-drained moisture retentive soil [1, 11]. Succeeds in light shade but fruits better in a sunny position [11, 200]. Thrives in a loamy soil, doing well on limestone [11]. Grows well in heavy clay soils. Prefers some chalk in the soil but apt to become chlorotic if too much is present [1]. The various gages are often cultivated for their edible fruits, especially on a garden scale. There are some named varieties [200]. The gage was first developed from the plum in the Middle East, later spreading via France into much of western Europe. Its cultivation has spread into most temperate regions, though it is often only grown on a small scale because of the difficulty of getting it to market in good condition. Most members of this genus are shallow-rooted and will produce suckers if the roots are damaged [238]. Plants in this genus are notably susceptible to honey fungus [200]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is flat with shallow roots spreading near the soil surface [2-1]. Prunus domestica italica is a deciduous shrub or a tree usually growing 2 - 6 metres tall, occasionally to 15 metres. We can infer from its cultivation that the species grows optimally in areas with cold winters and long warm summers as vernalisation is required for flowering. The species can tolerate frost, however, when this occurs after flowering the fruit quality is poor (Lim 2002). Widely grown cultivars include: Boddarts Reneklode (Germany), Bryanston (UK), Cambridge Gage (UK), Canerik (Turkey), Denniston's Superb (USA), Gojeh Sabz (Iran), Yasil Alca or Goy Alca (Azerbaijan), Golden Transparent (UK), Graf Althanns Reneklode (Germany), Green Vanilla (Mount Pelion, Greece), Große Grüne Reneklode (Germany) / Reine Claude Verte (France), Laxton's Gage (UK), Laxton's Supreme (UK), Meroldts Reneklode (Germany), Rainha Cláudia (Portugal), Regina Claudia (Italy), Reine Claude de Bavay (France), Reine Claude d'Oullins (France), Uhinks Reneklode (Germany), Washington (USA).

## 6.2.14 Rubus fruticosus

Blackberry, Shrubby blackberry  
5 tlin 9 cyuc 5 kcaak 2 tcan 3 dwat 3 m hkuc  
pcimhmimhtut cyutli hgattcup hwicli hyishrasjlutnyik hpa7tli  
frusflatprikliwsslip hpa7tmwatli fyfjxre7t hjonli

drutta Rubus fruticosus is a deciduous Shrub growing to 3 m (9ft) by 3 m (9ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in leaf from March to November, in flower from May to September, and the seeds ripen from July to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects, Apomictic (reproduce by seeds formed without sexual fusion). The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and very alkaline soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: Fruit Leaves Root ShootsEdible Uses: TeaFruit - raw or cooked[5, 7, 9, 12, 183]. The best forms have delicious fruits and, with a range of types, it is possible to obtain ripe fruits from late July to November[K]. The fruit is also made into syrups, jams and other preserves[238]. Some people find that if they eat the fruit before it is very ripe and quite soft then it can give them stomach upsets[K]. Root - cooked. The root should be neither to young nor too old and requires a lot of boiling[7]. A tea is made from the dried leaves[21] - the young leaves are best[61]. The leaves are often used in herbal tea blends[238]. Young shoots - raw. They are harvested as they emerge through the ground in the spring, peeled and then eaten in salads[244].

nectar and are very attractive to honey bees[200], the plant also attracts butterflies[4, 7, 24]. Special Features:Attractive foliage, Edible, Fragrant foliage, Not North American native, Suitable for dried flowers. Heat Zone 9-1.

## 6.2.75 Salvia officinalis

Sage, Kitchen sage, Small Leaf Sage, Garden Sage  
5 tlin 10 cyuc 4 kcaak 5 tcan 5 dwat 0.6 m hkuc  
htut cyutli hgatkyuctcup hwicli hrasjlut hpa7tli prikliwsslip  
hpa7tmwatli xre7t hjonli

drutta Salvia officinalis is an evergreen Shrub growing to 0.6 m (2ft) by 0.6 m (2ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in leaf all year, in flower from June to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Flowers LeavesEdible Uses: Condiment TeaLeaves and flowers - raw or cooked[2, 14, 27, 46, 52]. A very common herb, the strongly aromatic leaves are used as a flavouring in cooked foods[183]. They are an aid to digestion and so are often used with heavy, oily foods[244]. They impart a sausage-like flavour to savoury dishes. The young leaves and flowers can be eaten raw, boiled, pickled or used in sandwiches[183]. The flowers can also be sprinkled on salads to add colour and fragrance[183]. A herb tea is made from the fresh or dried leaves[183], it is said to improve the digestion[13, 21]. An essential oil obtained from the plant is used commercially to flavour ice cream, sweets, baked goods etc[61, 183].

tcanta Compost Essential Repellent Strewing TeethThe leaves make excellent tooth cleaners[14, 21], simply rub the top side of the leaf over the teeth and gums[K]. The purple-leafed form of sage has tougher leaves and is better for cleaning the teeth[K]. The leaves have antiseptic properties and can heal diseased gums[201]. An essential oil from the leaves is used in perfumery, hair shampoos (it is good for dark hair) and as a food flavouring[14, 57, 61]. It is a very effective 'fixer' in perfumes[7], and is also used to flavour toothpastes and is added to bio-activating cosmetics[238]. The plant (the flowers?) is an alternative ingredient of 'QR' herbal compost activator[32]. This is a dried and powdered mixture of several herbs that can be added to a compost heap in order to speed up bacterial activity and thus shorten the time needed to make the compost[K]. The growing or dried plant is said to repel insects, it is especially useful when grown amongst cabbages and carrots[14, 18, 20, 201]. It was formerly used as a stewing herb[201] and has been burnt in rooms to fumigate them[244]. A good dense ground cover plant for sunny positions, though it needs weeding for the first year or two[197]. They are best spaced about 60cm apart each way[208].

dwatta Anti diarrhoeal Antihydrotic Antiseptic Antispasmodic Appetizer Aromatherapy Astringent Carminative Cholagogue Galactofuge Stimulant Tonic VasodilatorSage has a very long history of effective medicinal use and is an important domestic herbal remedy for disorders of the digestive system. Its antiseptic qualities make it an effective gargle for the mouth where it can heal sore throats, ulcers etc[K]. The leaves applied to an aching tooth will often relieve the pain[4, K]. The whole herb is antihydrotic, antiseptic, antispasmodic, astringent, carminative, cholagogue, galactofuge, stimulant, tonic and vasodilator[4, 9, 13, 21, 165, 238]. Sage is also used internally in the treatment of excessive lactation, night sweats, excessive salivation (as in Parkinson's disease), profuse perspiration (as in TB), anxiety, depression, female sterility and menopausal problems[238]. Many herbalists believe that the purple-leafed forms of this species are more potent medicinally[238]. This remedy should not be prescribed to pregnant women or to people who have epileptic fits[238]. The plant is toxic in excess or when taken for extended periods[238] - though the toxic dose is very large. Externally, it is used to treat insect bites, skin, throat, mouth and gum infections and vaginal discharge[238]. The leaves are best harvested before the plant comes into flower and are dried for later use[4]. The essential oil from the plant is used in small doses to remove heavy collections of mu-

cous from the respiratory organs and mixed in embrocations for treating rheumatism[4]. In larger doses, however, it can cause epileptic fits, giddiness etc[4]. The essential oil is used in aromatherapy. Its keyword is 'Tonic'[210]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve *Salvia officinalis* Sage for loss of appetite, inflammation of the mouth, excessive perspiration (see [302] for critics of commission E).

propta Seed - sow March/April in a greenhouse[1]. Germination usually takes place within 2 weeks. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in early summer. In areas where the plant is towards the limits of its hardiness, it is best to grow the plants on in a greenhouse for their first winter and plant them out in late spring of the following year. Cuttings of heeled shoots, taken off the stem in May and planted out directly into the garden grow away well[182]. Cuttings of half-ripe wood, 5 - 10cm with a heel, June to August in a frame[78]. Easy. Cuttings of mature wood, 7 - 10cm with a heel, November/December in a cold frame[78]. Layering in spring or autumn. Mound soil up into the plants, the branches will root into this soil and they can be removed and planted out 6 - 12 months later.

nwatta Landscape Uses:Border, Container, Massing, Rock garden, Seashore, Specimen. Requires a very well-drained light sandy soil in a sunny position[200]. Prefers a calcareous soil[4, 14]. Dislikes heavy or acid soils[1, 16]. Succeeds in dry soils, tolerating drought once it is established[190]. Sage can be killed by excessive winter wet[200] and winter-planted bushes often die[208]. A very ornamental plant[1], sage is commonly grown in the herb garden for culinary and medicinal purposes. There are some named varieties[182, 183]. 'Albiflora' is said to be the best culinary sage[11]. 'Purpurea' has tougher leaves than the type and makes a better tooth cleaner[K]. Plants need to be trimmed in late spring in order to keep them compact[200]. They tend to degenerate after a few years and are best replaced after about 4 years[4]. The leaves emit a unique pungent aroma when pressed[245]. A good companion for many plants, including rosemary, cabbages and carrots[14, 18, 20, 54], the growing plant is said to repel insects. It is inhibited by wormwood growing nearby and dislikes growing with basil, rue or the cucumber and squash family[14, 18, 20, 54]. Special Features:Attractive foliage, Edible, Fragrant foliage, Not North American native, Suitable for cut flowers. The plant is heat tolerant in zones 8 through 5. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is multistemmed with multiple stems from the crown [1-2]. An evergreen. The root pattern is a heart root, dividing from the crown into several primary roots going down and out [1-2].

## 6.2.76 Sorbus mougeotii

5 tlin 9 cyuc 4 kcaak 0 tcan 0 dwat m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliw  
hpa7tmwatli fyfjxre7t hjonli

drutta Sorbus mougeotii is a deciduous Tree growing to 18 m (59ft 1in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in May, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Apomictic (reproduce by seeds formed without sexual fusion). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

When freshly open, the flowers have more pleasant scent with balsamic undertones[245]. Seedlings should not be left in a seedbed for more than 2 years without being transplanted[11]. A very ornamental plant, this sub-species is widely cultivated for its edible fruit in China[266], it is larger than the type species[46, 178, 200].

### 6.2.73 Actinidia melanandra

Red Kiwi

5 tlin 9 cyuc 4 kcaak 0 tcan 0 dwat m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliw hpa7tmwattli nyanhjen hjonli

drutta Actinidia melanandra is a deciduous Climber growing to 7 m (23ft). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from June to July, and the seeds ripen from October to November. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Bees, insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[126, 183]. The globose fruit is hairless when fully ripe and up to 45mm long[183, 198, 266]. It contains a number of small seeds, but these are easily eaten with the fruit[K].

tcanta None known  
dwatta None known

propta Seed - sow spring in a greenhouse[133]. It is probably best if the seed is given 3 months stratification[113], either sow it in a cold frame as soon as it is ripe in November or as soon as it is received. Fresh seed germinates in 2 - 3 months at 10°C, stored seed can take longer[133]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least their first winter. When the plants are 30cm or more tall, plant them out into their permanent positions in late spring or early summer, after the last expected frosts[K]. Most seedlings are male[126]. The seedlings are subject to damping off, they must be kept well ventilated[113]. Cuttings of softwood as soon as ready in spring in a frame[K]. Cuttings of half-ripe wood, July/August in a frame. Very high percentage[113]. Cuttings of ripe wood, October/November in a frame.

nwatta Prefers a sound loamy neutral soil[1, 200]. Succeeds in semi-shade but full sun is best for fruit production[200]. Prefers a sheltered position[200]. One report says that plants are not fully hardy in the colder parts of the country[219]. Young spring growth is susceptible to frost damage[160]. Fruits are formed on second year wood and also on fruit spurs on older wood[126], any pruning is best carried out in the winter[219]. The flowers have a soft, aromatic perfume[245]. This is a climbing plant, supporting itself by twining around branches etc[200]. At least one named variety has been developed for its edible fruit[183]. Plants have been seen in fruit at Kew[11]. This species is a good pollinator for *A. arguta cordifolia*[183]. Plants in this genus are notably resistant to honey fungus[200]. Dioecious. Male and female plants must be grown if seed is required. Another report says that both sexes are on one plant[182].

### 6.2.74 Thymus serpyllum

Wild Thyme

5 tlin 9 cyuc 4 kcaak 5 tcan 3 dwat 0.1 m hkuc htut cyutli kyuctup hwicli hrasljut hpa7tli flatprikliw hpa7tmwattli xre7t hjonli

drutta Thymus serpyllum is an evergreen Shrub growing to 0.1 m (0ft 4in) by 0.3 m (1ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in leaf all year; in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained

soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate strong winds but not maritime exposure.

kcaakta Edible Parts: LeavesEdible Uses: TeaLeaves - raw in salads or added as a flavouring to cooked foods[2, 11, 46, 61]. Thyme retains its flavour well in long slow cooking. If the leaves are to be dried, the plants should be harvested in early and late summer just before the flowers open and the leaves should be dried quickly[200]. An aromatic tea is made from the leaves[21].

tcanta Deodorant Disinfectant Disinfectant Essential Fungicide RepellentAn essential oil from the leaves and flowering tops is used in perfumery, soaps, medicinally etc. It has fungicidal and disinfectant properties[4, 7]. About 150 grams of oil are obtained from 100 kilos of plant material[4]. The dried flowers are used to repel moths from clothing[4]. The growing plant is said to repel cabbage root fly[18, 20]. A good ground cover for a sunny position[197]. It needs weeding for the first year or so[197]. Plants are best spaced about 45cm apart each way[208]. Plants are only satisfactory when young or growing luxuriantly - they are apt to become bare in patches otherwise[208]. Summer flowers bring bees. Perennial groundcover for zone 2 firebreaks. The US government has created a system of firebreaks for areas prone to wild-fires, these are separated into concentric zones surrounding buildings. Zone 2 is the second away from the house. These low-level groundcovers provide little fuel.

dwatta Anthelmintic Antirheumatic Antiseptic Antispasmodic Carminative Deodorant Diaphoretic Disinfectant Disinfectant Expectorant Sedative TonicWild thyme is a commonly used domestic remedy, being employed especially for its antiseptic properties and its beneficial effect on the digestive system. The whole plant is anthelmintic, strongly antiseptic, antispasmodic, carminative, deodorant, diaphoretic, disinfectant, expectorant, sedative and tonic[4, 165, 200, 238, 254]. It is taken internally in the treatment of bronchitis, catarrh, laryngitis, flatulent indigestion, painful menstruation, colic and hangovers[238]. It is said to be effective in treating alcoholism[238]. It should not be prescribed for pregnant women[238]. Externally, it is applied to minor injuries, mastitis, mouth, throat and gum infections etc[238]. The plant can be used fresh at any time of the year, or it can be harvested as it comes into flower and either be distilled for the oil or dried for later use[238]. The seeds are used as a vermifuge[240]. Wild thyme contains all the medicinal properties of the more commonly used garden thyme (*T. vulgaris*), though in a lesser degree[4]. An essential oil distilled from the leaves is used in the treatment of stress-related conditions, though it can cause allergic reactions[238].

propta Seed - sow spring in a cold frame. Seed can also be sown in autumn in a greenhouse. Surface sow or barely cover the seed. Germination can be erratic. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring or autumn[200]. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the summer or the following spring. Cuttings of young shoots, 5 - 8cm with a heel, May/June in a frame[200]. Cuttings of half-ripe wood, 5 - 8cm with a heel, July/August in a frame[200]. Layering.

nwatta Landscape Uses:Container, Ground cover, Rock garden, Seashore. Requires a light well-drained preferably calcareous soil in a sunny position[1, 200]. Succeeds in dry soils[4]. Grows well between stepping stones on paths, tolerating light treading[183, 200]. Succeeds on walls. Thymes dislike wet conditions, especially in the winter. A layer of gravel on the soil around them will help protect the foliage from wet soils[238]. Plants are hardy to about -15°C[200]. This is a very difficult genus taxonomically, the species hybridize freely with each other and often intergrade into each other[200]. This species is harvested commercially for its essential oil, known as 'wild thyme'[218]. Closely related to *T. praecox* arcticus, but this species is not so common in Britain[11]. It is a very polymorphic plant. A good companion for most other plants[54], it makes a very good carpeting plant for the rockery or between paving stones[1] and can also be grown in a short lawn[54]. The flowers are rich in

tcanta Dye Fibre PioneerA purple to dull blue dye is obtained from the fruit[168]. A fibre is obtained from the stem and used to make twine[66]. Plants are spread by seed deposited in the droppings of birds and mammals. They often spring up in burnt-over, logged or abandoned land and make an excellent pioneer species, creating the right conditions for woodland trees to move in. The trees will often grow in the middle of a clump of blackberries, the prickly stems protecting them from rabbits[K].

dwatta Antidiarrhoeal Astringent Depurative Diuretic Dysentery Tonic VulneraryThe root-bark and the leaves are strongly astringent, depurative, diuretic, tonic and vulnerary[4, 7, 9, 165, 254]. They make an excellent remedy for dysentery, diarrhoea, haemorrhoids, cystitis etc, the root is the more astringent[4, 238]. Externally, they are used as a gargle to treat sore throats, mouth ulcers and gum inflammations[238, 254]. A decoction of the leaves is useful as a gargle in treating thrush and also makes a good general mouthwash[7].

propta Seed - requires stratification and is best sown in early autumn in a cold frame. Stored seed requires one month stratification at about 3°C and is best sown as early as possible in the year. Prick out the seedlings when they are large enough to handle and grow on in a cold frame. Plant them out into their permanent positions in late spring of the following year. Cuttings of half-ripe wood, July/August in a frame[200]. Tip layering in July. Plant out in autumn. Division in early spring or just before leaf-fall in the autumn[200].

nwatta Easily grown in a good well-drained loamy soil[1, 11, 200]. Succeeds in acid and calcareous soils[186]. Tolerates poor soils[202]. Established plants are drought resistant[132]. Succeeds in sun or semi-shade[1, 11, 200], though it fruits less well in the shade[202]. Plants will also fruit when grown in fairly deep shade or against a north facing wall, though the fruit will ripen later[219]. Plants tolerate quite severe exposure[186]. Hardy to at least -18°C[202]. *R. fruticosus* is an aggregate species made up of several hundred slightly differing species. The reason for this is that most seed is produced by a non-sexual method (Apomixis) and is therefore genetically identical to the parent plant. On occasions when sexual production of seed takes place the offspring will all be slightly different from the parent plant and will then usually reproduce as a new species by means of apomixis. Modern treatment of this aggregate usually does not use the name *R. fruticosus* because of the confusion over which species it should apply to, the type species of the aggregate should be called *R. ulmifolius*[150]. The following members of the aggregate have been highly recommended for their fruit[150]. *R. badius*. *R. cyclophorus*. *R. gratus*. *R. nemoralis*. *R. oxyanchus*. *R. pyramidalis*. *R. separinus*. *R. winteri*. The following members are said to be nearly as good. *R. balfourianus*. *R. broensis*. *R. carpinifolius*. *R. foliosus*. *R. fuscoviridis*. *R. infestus*. *R. insericatus newbouldianus*. *R. koehleri*. *R. largificus*. *R. lindinensis*. *R. ludensis*. *R. macrophyllus*. *R. obscurus*. *R. pseudo-bifrons*. *R. rhombifolius*. *R. riddelsdellii*. *R. scaber*. *R. thyrsiflorus*. *R. vallisparvus*. *R. vestitus*. Plants form dense thickets and this makes excellent cover for birds[186]. They regenerate freely after being cut back[186]. This species is also a good plant for bees and butterflies[24]. This species has biennial stems, it produces a number of new stems each year from the perennial rootstock, these stems fruit in their second year and then die[200]. Plants in this genus are notably susceptible to honey fungus[200]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a running thicket former forming a colony from shoots away from the crown spreading indefinitely [1-2]. The root pattern is suckering with new plants from underground runners away from the plant [1-2].

### 6.2.15 Ribes x culverwellii

Jostaberry

5 tlin 9 cyuc 5 kcaak 0 tcan 0 dwat 1.8 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliw hpa7tmwattli xre7t hjonli

drutta Ribes x culverwellii is a deciduous Shrub growing to 1.8 m (6ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf from April to October, in flower from

April to May, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked in pies, jams etc[200]. Intermediate in size and flavour between gooseberries and blackcurrants, tasting more like a gooseberry when under-ripe and more like a blackcurrant when fully ripe[K]. The fruit is rich in vitamin C[183].

tcanta None known

dwatta Vitamin CNone known  
propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. Stored seed requires 3 months cold stratification at between 0 and 5°C and should be sown as early in the year as possible[113, 164]. Under normal storage conditions the seed can remain viable for 17 years or more. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter, planting them out in late spring of the following year. This plant is a cultivar and will not breed true from seed. Cuttings of half-ripe wood, 10 - 15cm with a heel, July/August in a frame[78, 113]. Cuttings of mature wood of the current year's growth, preferably with a heel of the previous year's growth, November to February in a cold frame or sheltered bed outdoors[78, 200].

nwatta Easily grown in a moisture retentive but well-drained loamy soil of at least moderate quality[11, 200]. Best grown on a deep sandy loam[1]. Dislikes very heavy clay, chalky soils and thin dry soils, but it can succeed on most soil types if plenty of organic matter is incorporated[1]. Quite tolerant of shade though not fruiting so well in such a position[11]. A group of cultivars of hybrid origin, basically a cross between blackcurrants and gooseberries. Very vigorous plants, producing prolific crops of fruit. They are being grown increasingly in gardens. In general they resist American gooseberry mildew, blackcurrant leaf spot and gall mite. Plants in this genus are notably susceptible to honey fungus[200]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is multi-stemmed with multiple stems from the crown [1-2]. The root pattern is suckering with new plants from underground runners away from the plant [1-2].

### 6.2.16 Allium ampeloprasum

Wild Leek, Broadleaf wild leek

5 tlin 9 cyuc 5 kcaak 2 tcan 3 dwat 1.8 m hkuc htut cyutli kyuctup hwicli hrasljutnyikrip hpa7tli flatprikliw hpa7tmwattli xre7t hjonli

drutta Allium ampeloprasum is a BULB growing to 1.8 m (6ft) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in leaf from October to August, in flower from July to August, and the seeds ripen in August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate strong winds but not maritime exposure.

kcaakta Edible Parts: Flowers Leaves RootEdible Uses: Bulb - raw or cooked[2, 27, 61, 105]. The small bulbs can vary considerably in size from 2 - 6cm[200], they have a fairly strong leek to garlic flavour and are nice as a flavouring in cooked foods[K]. The bulbs of selected cultivars are very large with a mild garlic flavour[183]. Leaves - raw or cooked[2]. A pleasant mild to strong garlic flavour, they are available from late autumn to the spring though they can become rather tough and fibrous as they get older[K]. Flowers - raw. A similar flavour to the leaves but they have a somewhat dry texture and are best used as a flavouring in cooked foods[K]. The bulbs have a mild garlic flavour and make a nice flavouring in salads and cooked foods. Although produced abundantly, they are quite fiddly to use because they

are small[K]. They can also be pickled[142].

**tcanta Repellent**The juice of the plant is used as a moth repellent. The whole plant is said to repel insects and moles[20].

**dwatta Anthelmintic Anticholagmatic Anticholesterolemic Antiseptic Antispasmodic Chologogue Diaphoretic Diuretic Expectorant Febrifuge Stimulant Stings Stomachic Tonic Vasodilator**This species has the same medicinal virtues as garlic, but in a much milder and less effective form[238]. These virtues are as follows:- Garlic has a very long folk history of use in a wide range of ailments, particularly ailments such as ringworm, Candida and vaginitis where its fungicidal, antiseptic, tonic and parasitidal properties have proved of benefit[218]. It is also said to have anticancer activity[218]. Daily use of garlic in the diet has been shown to have a very beneficial effect on the body, especially the blood system and the heart. For example, demographic studies suggest that garlic is responsible for the low incidence of arteriosclerosis in areas of Italy and Spain where consumption of the bulb is heavy[222]. The bulb is said to be anthelmintic, antiasthmatic, anticholesterolemic, antiseptic, antispasmodic, chologogue, diaphoretic, diuretic, expectorant, febrifuge, stimulant, stomachic, tonic, vasodilator[4, 9, 14, 21, 46, 165]. The crushed bulb may be applied as a poultice to ease the pain of bites, stings etc[4, 9, 14, 21].
