nwatta Landscape Uses:Cascades, Container, Erosion control, Ground cover, Massing. Ivy is a very easily grown plant that dislikes waterlogged, very dry or very acid soils but otherwise succeeds in all soil types[1, 17, 238]. It grows well in heavy clay soils. Prefers some lime in the soil. Tolerates very dense shade[24, 31], though it may not flower in such a position[K]. The plant is very hardy and tolerant of atmospheric pollution[4]. Established plants are drought tolerant[190]. A very ornamental and hardy plant[190], it tolerates temperatures down to about -25°c[184]. There are many named varieties[190], the variegated forms are less hardy than the species and also require more light[238]. Ivy is a rampant climbing plant, clinging by means of aerial roots and often trailing on the ground in woods and hedges[186]. It is of benefit rather than harm when growing on a wall because it keeps the wall dry and acts as an insulation[11, 24]. It does not damage the structure of a wall. Similarly, it does not harm large trees when climbing into them, though it can shade out smaller and ailing trees[200]. It is not a parasitic plant, but instead obtains all its nutrient from the sun and the soil[186]. A very good plant for wild-life, it provides dense shelter for birds, spiders etc, an abundant late supply of nectar for insects and a supply of seeds for winter food[4, 24, 186]. It is a food plant for the larvae of many species of butterfly[24, 30]. A very variable plant, there are many named varieties. This species is notably resistant to honey fungus[200]. Special Features: Attractive foliage, Not North

American native, Naturalizing, All or parts of this plant are poisonous, Inconspicuous flowers or blooms. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

### 6.2.626 *Acer caesium*

5 tin 9 cyuc 0 kcak 0 tcan 1 dwat 15 m hkuc hmimhttu cyutli tcup hwicli hrasljutnyikfrip hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta *Acer caesium* is a deciduous Tree growing to 15 m (49ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in April. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcakta Preservative WoodThe leaves are packed around apples, rootcrops etc to help preserve them[18, 20]. Wood - close grained, soft to moderately hard. Occasionally used for carving, bowls, cups etc[146, 158].

dwatta AstringentThe juice of the bark is used externally in Nepal to treat muscular swellings, boils and pimples[272].

propta Seed - best sown as soon as it is ripe in a cold frame, it usually germinates in the following spring. Pre-soak stored seed for 24 hours and then stratify for 2 - 4 months at 1 - 8°c. It can be slow to germinate. The seed can be harvested 'green' (when it has fully developed but before it has dried and produced any germination inhibitors) and sown immediately. It should germinate in late winter. If the seed is harvested too soon it will produce very weak plants or no plants at all[80, 113]. When large enough to handle, prick the seedlings out into individual pots and grow them on until they are 20cm or more tall before planting them out in their permanent positions. Layering, which takes about 12 months, is successful with most species in this genus. Cuttings of young shoots in June or July. The cuttings should have 2 - 3 pairs of leaves, plus one pair of buds at the base. Remove a very thin slice of bark at the base of the cutting, rooting is improved if a rooting hormone is used. The rooted cuttings must show new growth during the summer before being potted up otherwise they are unlikely to survive the winter.

nwatta Of easy cultivation, it prefers a good moist well-drained soil in a sunny position but tolerates some shade. Grows well in heavy clay soils. Chlorosis can sometimes develop as a result of iron deficiency when the plants are grown in alkaline soils, but in general maples are not fussy as to soil pH. Most maples are bad companion plants, inhibiting the growth of nearby plants[18, 20]. This species is closely related to *A. giralduii*[11].

### 6.2.627 *Catalpa bungei*

5 tin 9 cyuc 0 kcak 0 tcan 2 dwat 10 m hkuc hmimhttu cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Catalpa bungei* is a deciduous Tree growing to 10 m (32ft 10in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from July to August, and the seeds ripen from September to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. It can tolerate atmospheric pollution.

kcakta None known

tcakta WoodWood - hard, excellent quality. Used for printing blocks, chess tables etc[174, 178].

dwatta Anthelmintic Poulrice StomachicThe stem bark is made into a lotion for cancer[218]. It is also anthelmintic

and stomachic[178, 218]. The leaf, stem bark and the seeds are all used as dressings for sores, boils etc[218].

propta Seed - best sown outdoors, or in a cold frame, as soon as it is ripe[200]. Stratify stored seed for 3 weeks at 1°c and sow in spring[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Softwood cuttings, 10cm long, in a frame. They should be taken in late spring to early summer before the leaves are fully developed[200]. Root cuttings in winter[200].

nwatta Prefers a good moist loamy soil and a sunny position that is not exposed[1, 11]. Tolerates heavy clay soils. Very resistant to atmospheric pollution[188]. Plants are hardy to about -15°c, probably more in continental climates[200], they grow best in areas with hot summers[188]. Protect plants from late frosts when they are young[200]. Transplants easily[200]. There are some named varieties selected for their ornamental value[188]. Plants in this genus are notably resistant to honey fungus[200].

## 6.2.628 Fraxinus longicuspis

5 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 8 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Fraxinus longicuspis is a deciduous Tree growing to 8 m (26ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta None known  
tcanta InkA bluish indelible dye is produced by steeping the bark in water[178].

dwatta Astringent Tonic UrinaryAstringent. A tonic for the genito-urinary system[178].

propta The seed is best harvested green - as soon as it is fully developed but before it has fully dried on the tree - and can then be sown immediately in a cold frame[80]. It usually germinates in the spring[80]. Stored seed requires a period of cold stratification and is best sown as soon as possible in a cold frame[200]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant them out into their permanent positions or a nursery bed in late spring or early summer of the following year. If you have sufficient seed then it is possible to sow it directly into an outdoor seedbed, preferably in the autumn. Grow the seedlings on in the seedbed for 2 years before transplanting either to their permanent positions or to nursery beds.

nwatta Prefers a deep loamy soil, even if it is on the heavy side[1, 200]. Most members of this genus are gross feeders and require a rich soil[11, 200]. Plants succeed when growing in exposed positions[200] and also in alkaline soils[11]. They tolerate atmospheric pollution[200]. This species is closely related to *F. chinensis*[11]. There is some confusion over the correct name for this species. The information was gathered under the name *F. pubinervis* which, according to [11] is a synonym for *F. longicuspis* Sieb. and Zucc. However, [200] says that *F. pubinervis* a synonym for *F. sieboldiana* and that *F. longicuspis* Hort. is also a synonym of *F. sieboldiana*. This species might be dioecious, in which case male and female plants must be grown if seed is required.

## 6.2.629 Clematis connata

5 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 7 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Clematis connata is a deciduous Climber growing to 7 m (23ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for: light

(sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known  
tcanta MiscellanyNone known  
dwatta MiscellanyThe juice of the plant is inhaled to relieve sinusitis[272].

propta Seed - best sown as soon as it is ripe in a cold frame[164, 200]. Sow stored seed as soon as it is obtained in a cold frame. Pre-soak the seed for 12 hours in warm water and remove as much of the tail and outer coat as possible[164]. A period of cold stratification is beneficial[164]. The seed germinates in 1 - 9 months or more at 20°c[164]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for the first winter. Plant out in late spring or early summer, after the last expected frosts. Internodal cuttings of soft to semi-ripe wood, late spring in sandy soil in a frame[200]. Layering of old stems in late winter or early spring[200]. Layering of current seasons growth in early summer[200].

nwatta Requires a warm, sheltered sunny position and plenty of water during the growing season[273]. Prefers a deep moist soil with its roots in the shade[11, 200]. Dislikes poorly-drained heavy clay soils, but grows well in clay if grit is added for drainage[11, 200]. Dislikes light sandy soils[11]. Succeeds in acid as well as alkaline soils[200]. When planting out, in order to avoid the disease ‘clematis wilt’, it is best to plant the rootball about 8cm deeper in the soil. This will also serve to build up a good root crown of growth buds[200]. A very vigorous plant, with new shoots extending up to 6 metres in a season. It can be rather invasive[273]. A twining plant[182]. The leafstalks wrap themselves around twigs and branches for support. When a side of the stalk touches an object, the growth on that side slows down whilst the other side grows at its normal rate - this causes the leaf stalk to entwine the object it is touching[212]. Plants flower on the current seasons growth. They often require no pruning, especially if left to clamber into large shrubs and trees. Weak or dead stems can be removed in the winter and, where pruning may be required to reduce the size of the plant, shoots can be cut back by up to two thirds in the winter[273]. Plants in this genus are notably resistant to honey fungus[200]. Plants seem to be immune to the predations of rabbits[233]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

## 6.2.630 Cotoneaster bacillaris

5 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 5 m hkuc hmimhtut cyutli kyucutop hwicli hyishrasjlutnyikfrip hpa7tli flatprikliwslip hpa7tmwatli xre7t hjonli

drutta Cotoneaster bacillaris is a deciduous Shrub growing to 5 m (16ft 5in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in June. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies, midges. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil. It can tolerate atmospheric pollution.

kcakta None known  
tcanta Dye WoodA rose-tan dye is obtained from the fruit[168]. Wood - very hard, elastic, close and even grained but splits and warps easily. Too small for many purposes but the branches are used for making walking sticks, agricultural implements etc[11, 146, 158].

dwatta AstringentThe stolons are said to be astringent[240].

propta Seed. Members of this genus hybridize freely so, if you require seed that breeds true, it is important to obtain it from a known wild source or from a controlled fertilization of garden plants. The seed is best sown as soon as it is ripe in the autumn in a cold frame, when it will usually germinate in the spring[11, 200]. Stored seed germinates faster if given 3 months warm stratification at 15°c and then 3 months cold stratification at 4°c[164]. The seed usually germinates within 1 - 18 months at 15°c but it can take 2 years[164]. Pot

## 6.2.687 Coptis chinensis

Huang Lian  
5 tlin 9 cyuc 0 kcaak 0 tcan 3 dwat 0.3 m hkuc hmimhtut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flat hpa7tmwatli xre7t hjonli

drutta Coptis chinensis is an evergreen Perennial growing to 0.3 m (1ft) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from February to March, and the seeds ripen from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta None known  
tcanta DyeA bright yellow pigment found in the roots can be used for dyeing[238]. Can be grown as a ground cover plant in the peat garden[200].

dwatta Anaesthetic Analgesic Antibacterial Antidote Antipyretic Antispasmodic Bitter Blood tonic Carminative Cholagogue Digestive Dysentery Sedative Skin Stomachic Tonic VasodilatorHuang Lian is commonly used in Chinese herbalism, where it is considered to be one of the 50 fundamental herbs[218]. The root is a pungent, very bitter, cooling herb that controls bacterial and viral infections, relaxes spasms, lowers fevers and stimulates the circulation[238]. It is one of the most frequently used herbs in prescriptions for the treatment of diabetes mellitus[218]. The root is analgesic, locally anaesthetic, antibacterial, antidote, antipyretic, bitter, blood tonic, carminative, cholagogue, digestive, sedative, stomachic, tonic and vasodilator[46, 61, 147, 176]. It is particularly helpful in the treatment of diarrhoea, acute enteritis and dysentery, whilst it is also used in the treatment of insomnia, fidget, delirium due to high fever, leukaemia and otitis media[176]. Externally it is used to treat various skin problems such as acne, boils, abscesses and burns whilst it is also used as a gargle for mouth and tongue ulcers, swollen gums and toothache[254]. As an eyewash it is used to treat conjunctivitis[254]. The root is harvested in the autumn and used fresh or dried[238].

propta Seed - best sown in a greenhouse as soon as it is ripe in an ericaceous compost[164]. Seal the pot in a polythene bag until germination takes place, which is usually within 1 - 6 months at 10°c[164]. Stored seed should be sown as early in the year as possible. Four weeks cold stratification may be beneficial[164]. Prick out the seedlings into individual pots when they are large enough to handle and grow on in a shady part of the greenhouse for at least their first winter. Plant them out in mid-autumn or in spring. Division in spring[200].

nwatta Succeeds in a light moist humid-rich slightly acidic soil with a northerly aspect or light shade[1, 200]. Plants are hardy to at least -15°c[238].

## 6.2.688 Ageratina occidentalis

Western Snakeroot  
5 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 0.7 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli fyixre7t hjonli

drutta Ageratina occidentalis is a PERENNIAL growing to 0.7 m (2ft 4in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known  
tcanta None known  
dwatta AntirheumaticThe plant is used externally in the treatment of rheumatism and swellings[254, 257].

propta Seed - sow spring in a cold frame, only just covering the seed. When large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring.

nwatta Succeeds in an ordinary well-drained but moist-retentive garden soil in sun or part shade[200].

## 6.2.689 Delphinium semibarbatum

Zalil  
5 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 0.5 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Delphinium semibarbatum is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to July, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta None known  
tcanta None known  
dwatta Anodyne Detergent Diuretic PoulticeThe plant is considered to be anodyne, detergent and diuretic[240]. It is used in the treatment of jaundice, dropsy and troubles of the spleen[240]. It is used externally as a poultice for swellings[240].

propta Seed - sow March/April in a cold frame or May outdoors[111]. Keep moist and in a shady position until germination takes place[175]. The seed has a limited viability so it should be stored in a sealed container at about 3°c[200]. Temperatures above 15°c inhibit germination[175]. The seed usually germinates in 2 - 9 weeks at 15°c[175]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out into their permanent positions in the summer. Cuttings of basal shoots in April/May, taken before they become hollow at the base, and planted in a cold frame[111]. Division in spring[111] or early autumn[200].

nwatta Prefers a rich well-drained soil that stays moist in the summer[111, 187]. Dislikes water-logged soils[200], it is liable to die out in heavy soils over winter[111]. Requires an open sunny position[188]. This species is not reliably hardy in cool temperate zones[200]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

## 6.2.690 Gentiana puberulenta

Downy gentian  
5 tlin 9 cyuc 0 kcaak 0 tcan 3 dwat 0.4 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Gentiana puberulenta is a PERENNIAL growing to 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bumblebees, butterflies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known  
tcanta None known  
dwatta Antidote Appetizer Bitter Digestive Stomachic TonicThe root is said to be an antidote to snakebites[61]. This *N. American* species has medicinal properties practically identical with the European gentians[4]. The following notes are based on the general uses of *G. lutea* which is the most commonly used species in the West[*K*]. Gentian root has a long history of use as a herbal bitter in the treatment of digestive disorders and is an ingredient of many proprietary medicines. It contains some of the most bitter compounds known and is used as a scientific basis for measuring bitterness[238]. It is especially useful in states of exhaustion from chronic disease and in all cases of debility, weakness of the digestive system and lack of appetite[4]. It is one of the best strengtheners of the human system, stimulating the liver, gall bladder and digestive system[238], and is an excellent tonic to combine with a purgative in order to prevent its debilitating effects[4]. The root is antihelmintic, anti-inflammatory, antiseptic, bitter tonic, cholagogue, emmenagogue, febrifuge, refrigerant, stomachic[4, 7, 9, 14, 21, 165, 238]. It is taken internally in the treatment of liver complaints, indigestion, gastric infections and anorexia[238]. It should not be prescribed for patients with gastric or duodenal ulcers[238]. The root is harvested in the autumn and dried for later use[4]. It is quite likely that the roots of plants

propta Seed - sow autumn in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. If you have sufficient quantity the seed can be sown outdoors in situ in the autumn or the spring. Division in autumn or spring[200]. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the summer or the following spring.

nwatta Easily grown in a moderately fertile moisture retentive well drained soil[200]. Prefers cool summers[200]. Prefers a sunny position[188].

## 6.2.684 *Salvia multiorrhiza*

Dan Shen

5 tlin 9 cyuc 0 kcaak 0 tcan 3 dwat m hkuc htut cyutil kyuctcup hwicli hrasljut hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Salvia multiorrhiza* is a PERENNIAL growing to 0.6 m (2ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: SeedEdible Uses: None known tcanta None known

dwatta Adaptogen Alterative Anticholesterolemic Antirheumatic Antiseptic Antispasmodic Astringent Cancer Emmenagogue Hepatic Sedative Tonic VulneraryDan Shen has long been used in Chinese medicine and recent research has confirmed the validity of its use in the treatment of heart and circulatory problems[254]. The root is adaptogen, alterative, anticholesterolemic, antirheumatic, antiseptic, antispasmodic, astringent, emmenagogue, hepatic, sedative, tonic and vulnerary[147, 176, 178, 218]. It acts mainly on the heart energy, removing excess heat and clearing stagnation[238]. Its use improves the micro-circulation, increases blood flow to the coronary artery, improves myocardial contraction and adjusts the heart rate[176]. It has an antibacterial action, inhibiting the growth of *Pseudomonas*, *E. coli*, *Vibrio Proteus*, *Bacillus typhi*, *Shigella dysenteriae*, *Shigella flexneri*, *Staphylococcus aureus* etc[176]. It is used internally in the treatment of coronary heart disease, poor circulation, palpitations, irritability, insomnia, breast abscesses, mastitis, ulcers, boils, sores, bruises, menstrual problems and post-natal pains[238]. 'Praised for its alleged medicinal qualities, including a cure for cancer'[187]. The roots are harvested in the autumn and early winter and are dried for later use[238].

propta Seed - sow March/April in a greenhouse[200]. Germination usually takes place within 2 weeks. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in early summer. In areas where the plant is towards the limits of its hardiness, it is best to grow the plants on in a greenhouse for their first winter and plant them out in late spring of the following year. Cuttings of half-ripe wood succeed at almost any time in the growing season[200].

nwatta Requires a very well-drained light sandy soil in a sunny position[200]. Prefers a rich soil[1]. Plants can be killed by excessive winter wet[200]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 6.2.685 *Salix miyabeana*

5 tlin 9 cyuc 0 kcaak 3 tcan 2 dwat m hkuc htut cyutil tcuphja7n hwicli hrasljutnykrip hpa7tli flatprik hpa7tmwatli nyanhjen hjonli

drutta *Salix miyabeana* is a deciduous Shrub growing to 5 m (16ft 5in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy

clay soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers moist or wet soil.

kcakta None known

tcanta Basketry FodderThe stems are very flexible and are occasionally used in basket making[199]. The plant is usually coppiced annually when grown for basket making, though it is possible to coppice it every two years if thick poles are required as uprights. Dynamic accumulator.

dwatta Anodyne FebrifugeThe fresh bark of all members of this genus contains salicin[226], which probably decomposes into salicylic acid (closely related to aspirin) in the human body[213]. This is used as an anodyne and febrifuge[226].

propta Seed - must be surface sown as soon as it is ripe in late spring. It has a very short viability, perhaps as little as a few days. Cuttings of mature wood of the current year's growth, November to February in a sheltered outdoor bed or planted straight into their permanent position and given a good weed-suppressing mulch. Very easy. Plant into their permanent positions in the autumn. Cuttings of half-ripe wood, June to August in a frame. Very easy.

nwatta Fodder: Bank Industrial Crop: Biomass Manage Coppice Other Systems: SRC Regional CropSucceeds in most soils, including wet, ill-drained or intermittently flooded soils[1, 11], but prefers a damp, heavy soil in a sunny position[200]. Rarely thrives on chalk[200]. Hybridizes freely with other members of this genus[200]. Although the flowers are produced in catkins early in the year, they are pollinated by bees and other insects rather than by the wind[11]. This species is very closely related to *S. purpurea*[11, 199]. Plants in this genus are notably susceptible to honey fungus[200]. Dioecious. Male and female plants must be grown if seed is required.

## 6.2.686 *Atractylodes macrocephala*

Bai Zhu

5 tlin 9 cyuc 0 kcaak 0 tcan 3 dwat m hkuc hmimhtut cyutil tcup hwicli hrasljutnyk hpa7tli flatprikliw hpa7tmwatli nyanhjen hjonli

drutta *Atractylodes macrocephala* is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August, and the seeds ripen from August to September. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). . Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta None known

dwatta Antibacterial Diuretic Sedative Stomachic TonicBai Zhu is widely used in traditional Chinese medicine[238]. The root contains an essential oil, glucoside and inulin[283]. It is a bitter-sweet tonic herb that acts mainly upon the digestive system and strengthens the spleen[238, 254]. The root is antibacterial, diuretic, hypoglycaemic, sedative, stomachic and tonic[176, 238]. It is used in the treatment of poor appetite, dyspepsia, abdominal distension, chronic diarrhoea, oedema and spontaneous sweating[176]. It is often used in conjunction with other herbs such as *Codonopsis tangshen* and *Glycyrrhiza uralensis*[238]. Combined with *Baical skullcap* (*Scutellaria baicalensis*) it is used to prevent miscarriage[254]. The roots are harvested in the autumn and baked for use in tonics[238].

propta Seed - sow spring in a cold frame and only just cover the seed. Prick out the seedlings when they are large enough to handle and plant them out into their permanent positions in the following spring or early summer.

nwatta Succeeds in any well-drained soil in sun or partial shade[238]. This species is probably hardy in most of Britain, it tolerates temperatures down to at least -15°C[238]. Widely cultivated in China for its use as a medicinal herb[238, 266]. This species is dioecious. Both male and female plants need to be grown if seed is required[266].

the seedlings up as soon as they are large enough to handle and plant them out into nursery beds or into their permanent positions when they are more than 10cm tall. Cuttings of half-ripe wood with a heel, July/August in a frame[11, 200].

nwatta A vigorous and easily grown plant[1], it prefers a good soil but also does well in poor soils[1, 11, 200]. It thrives in lime and is also happy in peaty soils[1]. It succeeds in any soil that is not marshy or waterlogged[11, 200]. Succeeds in dry soils[188]. Grows well in heavy clay soils. Succeeds in full sun or semi-shade but does not fruit so freely in a shady position[11, 200]. Tolerates atmospheric pollution[200]. Hybridizes freely with other members of this genus[200]. The flowers, when inhaled near to, have an unpleasant smell like decaying fish[245]. They are very attractive to bees whilst the fruit is a good winter food source for many species of birds[200]. A very ornamental plant[1]. Trees are notably susceptible to honey fungus[200].

## 6.2.631 *Weigela japonica*

5 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 5 m hkuc hmimhtut cyutil tcup hwicli hrasljutnyk hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Weigela japonica* is a deciduous Shrub growing to 5 m (16ft 5in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to June, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. It can tolerate atmospheric pollution.

kcakta None known

tcanta Hedge HedgePlants can be grown as a hedge[178].

dwatta SalveSalve. Used as a wash for virulent sores[178].

propta Seed - we have no information for this species but suggest sowing the seed in a cold frame as soon as it is ripe if this is possible, otherwise in late winter or early spring. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant them out in late spring or early summer. Softwood basal cuttings, 10 - 12cm long, in a sandy soil in a cold frame in early summer[200]. Cuttings of half-ripe wood, 8 - 10 cm with a heel, July/August in a frame[200]. Cuttings of mature wood of the current seasons growth. 20 cm long, November in a sheltered outdoor nursery bed[200].

nwatta An easily grown plant, succeeding in most fertile soils[11, 200]. Prefers a moist well-drained soil in sun or partial shade[200]. Tolerates atmospheric pollution[200]. Plants are very floriferous and can exhaust themselves, literally flowering themselves to death. The flowers are borne in the leaf nodes of the previous years growth and any pruning is therefore best done as soon as the plant has finished flowering[182]. There are some named forms selected for their ornamental value[200]. Plants in this genus are notably resistant to honey fungus[200].

## 6.2.632 *Clematis tibetana*

5 tlin 9 cyuc 0 kcaak 0 tcan 2 dwat 4 m hkuc hmimhtut cyutil tcup hwicli hrasljutnyk hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Clematis tibetana* is a deciduous Climber growing to 4 m (13ft 1in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta None known

dwatta Antipruritic AntitumorThe stem and flowers are used in Tibetan medicine, they are considered to have and acrid and sweet taste with a heating potency[241]. They promote stomach heat and destroy 'cold tumours'[241]. They

are used in the treatment of skin irritations and itches, and tumours[241].

propta Seed - best sown as soon as it is ripe in a cold frame[164, 200]. Sow stored seed as soon as it is obtained in a cold frame. Pre-soak the seed for 12 hours in warm water and remove as much of the tail and outer coat as possible[164]. A period of cold stratification is beneficial[164]. The seed germinates in 1 - 9 months or more at 20°C[164]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant out in late spring or early summer, after the last expected frosts. Internodal cuttings of soft to semi-ripe wood, late spring in sandy soil in a frame[200]. Layering of old stems in late winter or early spring[200]. Layering of current seasons growth in early summer[200].

nwatta Prefers a deep moist soil with its roots in the shade[11, 200]. Dislikes poorly-drained heavy clay soils, but grows well in clay if grit is added for drainage[11, 200]. Dislikes light sandy soils[11]. Does well on chalk[1]. Succeeds in acid as well as alkaline soils[200]. Plants are hardy to about -15°C[184]. A twining plant[182]. The leafstalks wrap themselves around twigs and branches for support. When a side of the stalk touches an object, the growth on that side slows down whilst the other side grows at its normal rate - this causes the leaf stalk to entwine the object it is touching[212]. When planting out, in order to avoid the disease 'clematis wilt', it is best to plant the rootball about 8cm deeper in the soil. This will also serve to build up a good root crown of growth buds[200]. Flowers are produced on the current season's growth, any pruning is best carried out in spring[219]. Plants in this genus are notably resistant to honey fungus[200]. Plants seem to be immune to the predations of rabbits[233]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

## 6.2.633 *Salix eriocephala*

Missouri Willow, Missouri River willow

5 tlin 9 cyuc 0 kcaak 3 tcan 2 dwat 4 m hkuc htut cyutil tcuphja7n hwicli hyihshasljutnykrip hpa7tli flatprik hpa7tmwatli nyanhjen hjonli

drutta *Salix eriocephala* is a deciduous Shrub growing to 4 m (13ft 1in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in April. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers moist or wet soil. The plant can tolerate strong winds but not maritime exposure.

kcakta None known

tcanta Basketry Fodder Shelterbelt Soil stabilizationThe stems are tough and very flexible, they are used in basket making[199, 257]. The plant is usually coppiced annually when grown for basket making, though it is possible to coppice it every two years if thick poles are required as uprights. The cultivar 'Green USA' is ideal as a windbreak, it tolerates very poor light soils[199]. The plants extensive root system make it effective at binding the soil along the sides of streams[229]. Wood - more durable that that of most willows, it is used for fence posts[82, 229]. Dynamic accumulator.

dwatta Anodyne FebrifugeThe fresh bark of all members of this genus contains salicin[226], which probably decomposes into salicylic acid (closely related to aspirin) in the human body[213]. This is used as an anodyne and febrifuge[226].

propta Seed - must be surface sown as soon as it is ripe in late spring. It has a very short viability, perhaps as little as a few days. Cuttings of mature wood of the current year's growth, November to February in a sheltered outdoor bed or planted straight into their permanent position and given a good weed-suppressing mulch. Very easy. Plant into their permanent positions in the autumn. Cuttings of half-ripe wood, June to August in a frame. Very easy.

nwatta Fodder: Bank Industrial Crop: Biomass Manage Coppice Other Systems: SRC Regional CropSucceeds in most soils, including wet, ill-drained or intermittently flooded

soils[1, 11], but prefers a damp, heavy soil in a sunny position[200]. Rarely thrives on chalk[200]. A fast-growing and relatively long lived species[229]. Hybridizes freely with other members of this genus[200]. Although the flowers are produced in catkins early in the year, they are pollinated by bees and other insects rather than by the wind[11]. Closely related to *S. mackenziaana* and *S. lutea*[11]. There are some named varieties[199]. Plants in this genus are notably susceptible to honey fungus[200]. Dioecious. Male and female plants must be grown if seed is required.

### 6.2.634 Ilex yunnanensis

5 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 4 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikkwis hpa7tmwatli nyanhjen hjonli

drutta *Ilex yunnanensis* is an evergreen Shrub growing to 4 m (13ft 1in). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from May to June, and the seeds ripen from September to November. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known  
tcanta None known  
dwatta FebrifugeA tea made from the leaves is used as a febrifuge[218].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. It can take 18 months to germinate. Stored seed generally requires two winters and a summer before it will germinate and should be sown as soon as possible in a cold frame. Scarification, followed by a warm stratification and then a cold stratification may speed up the germination time[78, 80]. The seedlings are rather slow-growing. Pot them up into individual pots when they are large enough to handle and grow them on in light shade in a cold frame for their first year. It is possible to plant them out into a nursery bed in late spring of the following year, but they should not be left here for more than two years since they do not like being transplanted. Alternatively, grow them on in their pots for a second season and then plant them out into their permanent positions in late spring or early summer. Give them a good mulch and some protection for their first winter outdoors. Cuttings of almost ripe wood with a heel, August in a shaded position in a cold frame. Leave for 12 months before potting up. Layering in October. Takes 2 years[78].

nwatta Succeeds in most soils so long as they are not water-logged[200]. This species is related to *I. crenata*[11]. Resents root disturbance, especially as the plants get older[11]. It is best to place the plants into their permanent positions as soon as possible, perhaps giving some winter protection for their first year or two[K]. Plants are very tolerant of pruning and can be cut right back into old wood if required[188]. Dioecious. Male and female plants must be grown if seed is required.

### 6.2.635 Clematis orientalis

Oriental virginibower

5 tlin 9 cyuc 0 kcaak 1 tcan 1 dwat 4 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

drutta *Clematis orientalis* is a deciduous Climber growing to 4 m (13ft 1in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known  
tcanta Plants can be used as ground cover[208]. They grow rapidly to give a tangled mass of growth in sun or moderate shade[197].

dwatta Antiseptic RefrigerantThe plant is antiseptic and refrigerant. It is used as a gargle for ulcerated throats and also to treat dog bites[178].

propta Seed - best sown as soon as it is ripe in a cold frame[164, 200]. Sow stored seed as soon as it is obtained in a cold frame. Pre-soak the seed for 12 hours in warm water and remove as much of the tail and outer coat as possible[164]. A period of cold stratification is beneficial[164]. The seed germinates in 1 - 9 months or more at 20°C[164]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant out in late spring or early summer, after the last expected frosts. Internodal cuttings of soft to semi-ripe wood, late spring in sandy soil in a frame[200]. Layering of old stems in late winter or early spring[200]. Layering of current seasons growth in early summer[200].

nwatta Prefers a deep moist soil with its roots in the shade[11, 200]. Dislikes poorly-drained heavy clay soils, but grows well in clay if grit is added for drainage[11, 200]. Dislikes light sandy soils[11]. Does well on chalk[11]. Succeeds in acid as well as alkaline soils[200]. Plants are hardy to about -15°C[184]. A twining plant[182]. The leafstalks wrap themselves around twigs and branches for support. When a side of the stalk touches an object, the growth on that side slows down whilst the other side grows at its normal rate - this causes the leaf stalk to entwine the object it is touching[212]. When planting out, in order to avoid the disease 'clematis wilt', it is best to plant the rootball about 8cm deeper in the soil. This will also serve to build up a good root crown of growth buds[200]. Flowers are produced on the current season's growth, any pruning is best carried out in spring[219]. Plants in this genus are notably resistant to honey fungus[200]. Plants seem to be immune to the predations of rabbits[233]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54]. The flowers have a delicate perfume similar to cowslips[245].

### 6.2.636 Euonymus fortunei

Winter Creeper, Wintercreeper Euonymus

5 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 4.5 m hkuc pcmhmimhtut cyutli kyuctcup hwicli hrasjlutnyikfrp hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

drutta *Euonymus fortunei* is an evergreen Climber growing to 4.5 m (14ft) by 10 m (32ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf all year, in flower in July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta None known  
tcanta Hedge HedgeA good evergreen ground cover plant[184, 200]. The sub species *E. fortunei* radicans and *E. fortunei* carrieri are particularly useful, other forms to use include 'Emerald and Gold', 'Emerald Gaiety', 'Coloratus', 'Dart's Carpet' and 'Kewensis'[182, 188, 197]. Plants can be grown as a low hedge[29], the varieties 'Emerald and Gold' and 'Variegatus' are normally used. They are very tolerant of clipping[200].

dwatta Cancer Women's complaintsPlants contain the anticancer compound dicitol[218]. The plant is used in gynaecological applications[218].

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed requires 8 - 12 weeks warm followed by 8 - 16 weeks cold stratification and can then be sown in a cold frame[78, 98]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 8cm long taken at a node or with a heel, July/August in a frame. Very easy[200].

nwatta Landscape Uses:Container, Erosion control, Ground cover, Massing. Thrives in almost any soil, including chalk, and is particularly suited to dry shaded areas[200]. Grows well in heavy clay soils. Prefers a well-drained loamy soil. Thrives in sunny positions and in deep shade[11, 182], though it does not fruit so well in the shade. Plants are hardy

This oil should not be used internally, except under professional supervision[254].

propta Seed - requires about 3 weeks cold stratification. Germination is best at a temperature around 13 - 16°C[238]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse for their first winter. Plant out in late spring or early summer[200]. Cuttings of softwood in the spring[200, 238].

nwatta Landscape Uses:Alpine garden, Rock garden. Requires a well-drained soil in full sun[200]. Plants are intolerant of excessive wet, especially in the winter, and will do better if covered by a pane of glass in the winter[200]. This species is hardy to at least -5°C, probably more if the ground is very well-drained[200]. Special Features:Not North American native, Extended bloom season in Zones 9A and above.

### 6.2.681 Chrysogonum virginianum

Golden-knee, Green and Gold, or Goldenstar

5 tlin 9 cyuc 0 kcaak 3 tcan 0 dwat 0.2 m hkuc pcmhmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli frusflatprik hpa7tmwatli hjonli

drutta *Chrysogonum virginianum* is an evergreen Perennial growing to 0.2 m (0ft 8in) by 0.4 m (1ft 4in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta  
tcanta *C. virginianum* spreads slowly via stolons to form a groundcover. Wildlife Habitat: A host wildlife such as reptiles, mammals, and songbirds. Insectary: The flowers provide nectar to pollinators. Ornamental Green and Gold is often planted ornamentally for its light green triangular foliage and golden star-shaped flowers. There are a number of named cultivars selected for ornamental properties[318-1].

dwatta None known  
propta Easily grown from seed and may self-seed in the garden.

nwatta A low growing herbaceous perennial with starry golden daisy-like flowers native to the USA. Easily grown in average, medium moisture, well-drained soils in part shade to full shade. Prefers moist, acidic, organically rich soils in sun-dappled part shade. Tolerates full sun only if grown in consistently moist soils. Spreads by rhizomes to form an attractive ground cover, but is easily controlled[368-1]. Growth Rate: Moderate to Fast. Stand Persistence: Long. Form: Spreading. Texture: Medium. Sun: Full Sun, Partial Shade. Soil Type: Sandy, Loamy, Silty, Clay. Soil Moisture: Moderate. Root Type: Stolon, Fibrous Shallow. Bacteria-Fungal Ratio: 10:1-100:1. Seasonal Interest: Spring-Fall. In the US it grows more upright in northern climates and more prostrate in southern climates. Recommended to naturalize in rain gardens. Best in well-drained soils. Blooms sparsely during the heat of summer. Fruit Type: Achene. Flower Color: Yellow. Soil pH preference: 6.0 - 6.8. Drought: Moderate. Flood: Tolerant. Salt: Intolerant. Soil Compaction: Intolerant. Cold Injury: Moderate. Wind Storm Damage: Infrequent. Disease Issues: Minor. Insect/Pest Damage: Minor. Animal Damage: Deer, Rabbits. Growing Season: Bloom Time: Spring - Fall. Fruit Time: Spring - Fall [318-1]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. An evergreen. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2]. Used in the Beach Plum Tree Guild: (Polycultures: Permaculture Activist Magazine February 2013, Eric Toensmeier.) Beach Plum (*Prunus maritima*) This fruiting shrub can grow to over 12 feet (4 meters) and produces small, delicious plums. Niche: deciduous shrub. Habitat: average water needs, Full to partial sun, Preferred soil types UNKNOWN (assume loamy soil is good?). Notable Products: Edible fruit, Green and Gold (*Chrysogonum virginianum*) This is a beautiful groundcover that attracts beneficial insects and can grow in partial shade and moist soils. Niche: Ground cover. Habitat: Requires consistently moist

soil that drain. Full sun to partial shade, Notable Products: Nectar. Dwarf Coreopsis (*Coreopsis auriculata nana*) This is another beautiful groundcover that attracts beneficial insects. Niche: Herbaceous perennial. Habitat: Full sun, medium water needs, said to be native to open woods in South Eastern US, so it probably can survive in a variety of soil types. Notable Products: Nectar, pollen. Ramps (*Allium tricoccum*) a.k.a. Wild Leeks, are early Spring vegetables and grows well in the shade. Niche: Herbaceous perennial. Habitat: Shaded woodlands, average water needs, prefers wet and acid soils. Tolerats juglone. Notable Products: Edible leaves and bulbs. Camas (*Camassia quamash*) has edible bulbs and has flowers that attract beneficial insects. Niche: Small Herbaceous plant. Habitat: Full sun to light shade, prefers moist soil, pH: 5.1-7.5 (tolerates a wide range of soil conditions). Notable Products:Nectar, pollen, edible bulb. Notes: This is a polyculture with flowering plumb and ground cover, edible Spring vegetables, and edible Camas bulbs.

### 6.2.682 Achillea erba

Musk Milfoil

5 tlin 9 cyuc 0 kcaak 0 tcan 2 dwat m hkuc htut cyutli kyuctcup hwicli hyishrasjlutnyik hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

drutta *Achillea erba-rotta moschata* is a PERENNIAL growing to 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in June, and the seeds ripen in July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcakta None known  
tcanta None known  
dwatta Appetizer Diaphoretic Digestive Diuretic Stomachic TonicThe leaves and flowering stems are appetizer, diaphoretic, digestive, diuretic, stomachic and tonic[9, 46, 61]. An infusion is used in the treatment of liver and kidney disorders, as a tonic to the digestive system, exhaustion, nervous headaches etc[9]. The plant is harvested in the summer and can be dried for later use[9].

propta Seed - sow spring or early autumn in a cold frame[133]. The seed usually germinates in 1 - 3 months[133]. When large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring or autumn. Very easy, the divisions can be planted direct into their permanent positions. Basal cuttings of new shoots in spring. Very easy, collect the shoots when they are about 10cm tall, potting them up individually in pots and keeping them in a warm but lightly shaded position. They should root within 3 weeks and will be ready to plant out in the summer.

nwatta Succeeds in most soils but prefers a well-drained soil in a sunny position[1]. Lives longer in a poor soil[200]. Hybridizes freely with other members of this genus[200]. Plants succeed in maritime gardens[233].

### 6.2.683 Veronicastrum sibiricum

Blackroot

5 tlin 9 cyuc 0 kcaak 0 tcan 2 dwat 0.8 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

drutta *Veronicastrum sibiricum* is a PERENNIAL growing to 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known  
tcanta None known  
dwatta The root is antimicrobial and hepatic[279]. It is used in Korea in the treatment of the common cold and as a liver tonic[279].

late winter because the plants come into growth very early in the year[233].

nwatta Thrives in most soils and in the light shade of trees[1]. Grows well in heavy clay soils. Prefers a moist soil in sun or semi-shade[200]. Prefers a calcareous soil. Grows well in open woodlands[1, 4]. Members of this genus seem to be immune to the predations of rabbits and deer[233]. A greedy plant, inhibiting the growth of nearby species, especially legumes[54].

### 6.2.677 Verbascum blattaria

Moth Mullein

5 tlin 9 cyuc 0 ckac 2 tcan 0 dwat 1 m hkuc htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Verbascum blattaria is a BIENNIAL/PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to October, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta None known

tcanta RepellentThe plant repels insects, it is used indoors to repel moths and cockroaches[124]. Dynamic accumulator.

dwatta None known

propta Seed - sow late spring to early summer in a cold frame and only just cover the seed[200]. Germination usually takes place within 2 - 3 weeks. When they are large enough to handle, prick out the seedlings into individual pots and plant them out in late summer. The seed has a long viability[200].

nwatta An easily grown plant, it succeeds in most well-drained soils, including dry ones, and prefers a sunny position[187, 200]. Dislikes shade[200]. Plants are hardy to about -20°c[187]. Hybridizes with other members of this genus, though the progeny are usually sterile[200].

Tutsan, Sweet-amber, St. Johnswort

5 tlin 10 cyuc 0 ckac 0 tcan 1 dwat 1 m hkuc hmimhtut cyutli hgatykyuctcup hwicli hrasjlutnyik hpa7tli frusflatpriklwisslip hpa7tmwatli fyifxre7t hjonli

drutta Hypericum androsaemum is a deciduous Shrub growing to 1 m (3ft 3in) by 1 m (3ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerates strong winds but not maritime exposure.

kcakta None known

tcanta A good ground cover plant[208]. Although it is clump forming rather than spreading it increases freely by self-sowing[186, 200]. Plants are best spaced about 90cm apart each way[208].

dwatta Antiseptic Diuretic Stomachic VulneraryThe leaves are diuretic, stomachic and vulnerary[61, 186]. They have antiseptic properties and have been used to cover open wounds[245].

propta Seed - sow spring in a greenhouse and only just cover the seed. The seed usually germinates in 1 - 3 months at 10°c. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood 10 - 12 cm with a heel, July/August in a frame. Plant out in the following spring[200] Careful division of old suckering shrubs in the dormant season.

nwatta Landscape Uses:Border, Erosion control, Ground cover, Massing, Rock garden. Easily grown in any reasonably good well-drained but moisture retentive soil[1]. Tolerates a wide range of pH[186]. Succeeds in sun or semi-shade[1] but flowers better in a sunny position[200]. Succeeds in dry shade and is drought tolerant when established[190]. Hardy to about -20°c, but if cut back by cold weather plants can re-sprout from the base[184]. Plants often self-sow freely[208]. A number of named forms have been developed for their ornamental value[182]. Plants in this genus are notably resistant to honey fungus[200]. The leaves are covered in pellucid dots which, when touched, release a resinous smell somewhat like goats[245]. Special Features: Attractive foliage, Naturalizing, Attracts butterflies, Attractive flowers or blooms

### 6.2.679 Primula macrophylla

5 tlin 9 cyuc 0 ckac 0 tcan 2 dwat m hkuc

htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Primula macrophylla is a PERENNIAL growing to 0.3 m (1ft) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta None known

tcanta None known

dwatta Antiinflammatory FebrifugeThe entire plant is used in Tibetan medicine, it is said to have a bitter taste and a cooling potency[241]. Antidiarrhetic, anti-inflammatory and febrifuge, it is used in the treatment of diarrhoea, inflammation of the liver, gall bladder, stomach and intestines[241]. It is especially used for children with high fever and diarrhoea[241].

propta Seed - best sown as soon as it is ripe in a cold frame[133]. Sow stored seed in early spring in a cold frame[1]. Germination is inhibited by temperatures above 20°c[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in autumn. This is best done every other year[200].

nwatta A plant of high alpine areas, it is of difficult cultivation in Britain[200]. In the wild it experiences wet summers, relatively dry autumns and long winters under a blanket of snow that protects the bulb-like resting bud[200]. It is best to give the plants a deep, well-drained soil in a sunny position with the added protection of a pane of glass[200].

### 6.2.680 Anacyclus pyrethrum

Mount Atlas Daisy, Chamomile Spanish, Pellitory

5 tlin 7 cyuc 0 ckac 0 tcan 2 dwat 0.3 m hkuc htut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Anacyclus pyrethrum is a PERENNIAL growing to 0.3 m (1ft) by 0.3 m (1ft in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta None known

tcanta None known

dwatta Acrid Antirheumatic Epilepsy OdontalgicThe root is a pungent acrid herb that stimulates the salivary glands and irritates the tissues, thereby increasing blood flow to the area[238]. It is used externally to treat toothache, facial neuralgia and chronic catarrh[238]. A gargle is used to soothe sore throats[254]. The root is harvested in the autumn and dried for later use[238]. In Ayurvedic medicine the root is considered to be tonic and is used in the treatment of paralysis and epilepsy[254]. The diluted essential oil in the root is used in mouthwashes and to treat toothaches[254].

to about -18°c[202]. A shrubby somewhat creeping plant that can also climb by means of aerial roots[184], if placed by a support, a wall, tree or fence, the plant will start to climb it and will be self-attaching to a large degree[182, 219]. Plants do not normally require pruning[219]. Plants have two forms of growth, a juvenile form and a mature form when the plants come into flower[219]. Plants in Britain often retain the juvenile form and never flower[219]. A polymorphic species[58], there are a number of named varieties selected for their ornamental value[182, 202]. Special Features:Not North American native, Invasive, Inconspicuous flowers or blooms.

### 6.2.637 Abelia triflora

Indian Abelia

5 tlin 9 cyuc 0 ckac 1 tcan 0 dwat 3.5 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlut hpa7tli priklwisslip hpa7tmwatli xre7t hjonli

drutta Abelia triflora is a deciduous Shrub growing to 3.5 m (11ft) by 3 m (9ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta None known
tcanta Wood - hard, close and even-grained. Used for walking sticks[146, 158].

dwatta None known

propta Seed - we have no specific information for this plant, but suggest sowing the seed in early spring in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm with a slight heel, July in pots of sandy soil in a frame[11]. Takes 3 - 4 weeks. Very easy, a good percentage of the cuttings root[78]. Cuttings of mature wood, 7 - 10cm with a heel if possible, November in a cold frame. High percentage[78]. Layering young shoots[245].

nwatta Requires a well-drained open loamy soil[11] in a warm, sheltered sunny position[200, 245]. Plants are best grown in semi-shade[219]. They are intolerant of water-logging[200] and of dry soils[219]. Succeeds in any soil but new growth is less vigorous in dry soils[202]. One report says that the plant likes a soil with a high chalk content[245], though another says that chlorosis occurs on very alkaline soils[202]. This species is hardy to about -15°c[184], it grows well in the open at Kew[11]. A fairly slow-growing plant, it is shy to flower in British gardens unless placed against a sunny wall[219]. It flowers on wood that is 2 - 3 years old or older[182]. Another report says that the plant flowers on the new wood[219], whilst another says that it flowers on terminal clusters[245]. Any pruning is best done immediately after flowering by thinning out the old wood[182, 219]. Plants in this genus are notably resistant to honey fungus[200], closely related to A buddleioides and A. umbelata[182]. The flowers are wonderfully scented[182], with the fragrance of vanilla[245].

### 6.2.638 Forsythia x intermedia

Golden Bell, Border Forsythia

5 tlin 8 cyuc 0 ckac 3 tcan 0 dwat 2.5 m hkuc pcmimhmhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwisslip hpa7tmwatli xre7t hjonli

drutta Forsythia x intermedia is a deciduous Shrub growing to 2.5 m (8ft) by 2.5 m (8ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from March to April. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta Hedge HedgeCan be grown as a tall hedge, the var. 'Lynwood' is frequently used[29]. Var. 'Spectabilis' also makes a good hedge[200] as does 'Beatrix Farrand'[188]. Landscape Uses: Border, Erosion control, Espalier, Pest tolerant, Hedge, Massing, Screen, Specimen.

dwatta None known

propta Seed - sow spring in a cold frame. The seed usually germinates within 2 months[K]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. This is a hybrid species and seed will not come true to type. Cuttings of half-ripe wood 10 - 15cm taken at a node, July/August in a frame. Plant out in autumn or spring. A very high percentage, they root within 3 weeks[78]. Cuttings of mature wood in a sheltered outdoor bed. Good percentage[78].

nwatta An easily grown plant, it succeeds in a well drained ordinary garden soil but prefers a rich soil[1]. Succeeds in limy soils[11]. Prefers a sunny position but succeeds in semi shade[200]. Plants are tolerant of deep shade[219]. A very ornamental plant[1], there are several named varieties. Any pruning out of weak shoots, plus any trimming of hedges, is best done after the plant has flowered[188]. Birds may destroy the flower buds in cold areas[200]. This species is notably susceptible to honey fungus[200]. Special Features:Not North American native, Blooms are very showy. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is fleshy. Thick or swollen - fibrous or tap root [2-1].

#### 6.2.639 Forsythia viridissima

Golden Bells, Greenstem forsythia, Forsythia
5 tlin 8 cyuc 0 ckac 3 tcan 2 dwat 2.5 m hkuc pcmimhmhtut cyutli tcup hwicli hrasjlutnyikrip hpa7tli flatpriklwisslip hpa7tmwatli dytxre7t hjonli

drutta Forsythia viridissima is a deciduous Shrub growing to 2.5 m (8ft 2in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in April, and the seeds ripen from August to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta Landscape Uses: Border, Erosion control, Ground cover, Massing.

dwatta Antibacterial Antifungal Antispasmodic EmmenagogueThe fruit is antibacterial, antifungal, antispasmdic and emmenagogue[279]. It is used in Korea to treat carbuncles, mastitis, inflammation, suppuration, lymphadenitis and suppressed menstruation[279].

propta Seed - sow spring in a cold frame. The seed usually germinates within 2 months[K]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood 10 - 15cm taken at a node, July/August in a frame. Plant out in autumn or spring. A very high percentage, they root within 3 weeks[78]. Cuttings of mature wood in a sheltered outdoor bed. Good percentage[78]. Layering in spring or summer. Plants often self-layer[K].

nwatta An easily grown plant, it succeeds in all soil types[202] but prefers a rich soil. Succeeds in limey soils. Grows well in heavy clay soils. It prefers a sunny position but succeeds in semi shade though it is apt to get leggy if grown in the shade of trees[182]. Succeeds against a north-facing wall[219]. Plants are hardy to about -25°c[184]. Plants are medium to fast growing[202]. Flowers are produced on wood that is more than one year old[202]. Any pruning is best done immediately after the plant has finished flowering[182,

200]. There are some named varieties, selected for their ornamental value[11, 200]. This species is notably susceptible to honey fungus[200]. Special Features: Attractive foliage, Not North American native, Blooms are very showy. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is fleshy. Thick or swollen - fibrous or tap root [2-1].

## 6.2.640 Euonymus americanus

Strawberry Bush, Bursting-heart
5 tlin 9 cyuc 0 kcaak 0 tcan 2 dwat 2.5 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Euonymus americanus is a deciduous Shrub growing to 2.5 m (8ft 2in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta None known
tcanta None known
dwatta Cathartic Diuretic Emmenagogue Expectorant Laxative Malaria TonicThe seed is strongly laxative[222]. A tea made from the roots is used in cases of uterine prolapse, vomiting of blood, painful urination and stomach aches[222, 257]. The bark is diuretic, expectorant, laxative and tonic[222]. It was used as a tea in the treatment of malaria, liver congestion, constipation etc[222, 257]. The powdered bark, applied to the scalp, was believed to eliminate dandruff[222]. An infusion of the plant has been used to stimulate menstruation and so should not be used by pregnant women[257].

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed requires 8 - 12 weeks warm followed by 8 - 16 weeks cold stratification and can then be sown in a cold frame[78, 98]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 8cm long taken at a node or with a heel, July/August in a frame. Very easy[200].

nwatta Thrives in almost any soil, including chalk, it is particularly suited to dry shaded areas[200]. Prefers a well-drained loamy soil[1]. Requires shade from the midday sun[1, 11].

## 6.2.641 Asclepias subulata

Rush Milkweed
5 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 2 m hkuc hmimhtut cyutli kyuctcup hwicli hyishras hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Asclepias subulata is a PERENNIAL growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 6. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects, Lepidoptera (Moths and Butterflies). Suitable for: light (sandy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta None known
tcanta LatexRubber can be made from latex contained in the leaves and the stems[61, 112, 171]. The dogbane-milkweed family Asclepias, Apocynum, Calotropis, and Trachomitum spp) has been used for fiber industrial crops for millennia with a number in cultivation as regional crops. All of these crops are dual-purpose fibres, offering bast fibres from the stem and seed finer or 'floss' in the fruit pods. Many have also been identified as potential hydrocarbon crops due to high latex content. Could be integrated into various agro-forestry systems rather than as monocultures [1-1].

dwatta Emetic Ophthalmic Purgative StomachicThe plant is emetic, ophthalmic, purgative and stomachic[61, 257]. The reports do not specify which part of the plant is used.

propta Seed - best sown in a greenhouse as soon as it is ripe in the autumn or in late winter[134, 169]. We have also had good results from sowing the seed in the greenhouse in early spring[K], though stored seed might need 2 - 3 weeks cold stratification[134]. Germination usually takes place in 1 - 3 months at 18°c[134]. As soon as the seedlings are large enough to handle, prick them out into individual pots and grow them on in the greenhouse for their first winter. Plant out when they are in active growth in late spring or early summer and give them some protection from slugs until they are growing away strongly. Division in spring. With great care since the plant resents root disturbance. Pot the divisions up and place them in a lightly shaded position in the greenhouse until they are growing away strongly, then plant them out in the summer, giving them some protection from slugs until they are established.. Basal cuttings in late spring. Use shoots about 10cm long with as much of their white underground stem as possible. Pot them up individually and place them in a lightly shaded position in a greenhouse until they are rooting and growing actively. If the plants grow sufficiently, they can be put into their permanent positions in the summer, otherwise keep them in the greenhouse until the following spring and when they are in active growth plant them out into their permanent positions. Give them some protection from slugs until they are established.

nwatta Experimental Crop Industrial Crop: Hydrocarbon Management: HayPrefers a well-drained light rich or peaty soil in a sunny position[1, 200]. Succeeds in poor soils. Many members of this genus seem to be particularly prone to damage by slugs. The young growth in spring is especially vulnerable, but older growth is also attacked and even well-established plants have been destroyed in wet years[K]. Plants resent root disturbance and are best planted into their final positions whilst small[134]. A xerophytic plant, it looks like a species of Ephedra[200]. The flower of many members of this genus can trap insects between its anther cells, the struggles of the insect in escaping ensure the pollination of the plant[207].

## 6.2.642 Ageratina herbacea

Fragrant Snakeroot
5 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 2 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Ageratina herbacea is a PERENNIAL growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known
tcanta None known
dwatta A cold infusion of the plant is drunk and also used as a lotion in the treatment of headaches and fevers[257].

propta Seed - sow spring in a cold frame, only just covering the seed. When large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring.

nwatta Succeeds in an ordinary well-drained but moisture retentive garden soil in sun or part shade[200].

## 6.2.643 Myricaria germanica

5 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 2 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwisslip hpa7tmwatli xre7t hjonli

drutta Myricaria germanica is a deciduous Shrub growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid,

resents root disturbance[200]. Root cuttings in autumn or winter[200].

nwatta Requires a well-drained soil and a sunny position[1]. Prefers a light sandy soil but tolerates most soil types including lime and poor gravels[200]. Plants should be put in their final position whilst small since they resent root disturbance[200]. Plants labelled in nurseries as *E. aquaticum* are often *E. yuccifolium*[200].

## 6.2.673 Xanthorhiza simplicissima

Yellowroot
5 tlin 9 cyuc 0 kcaak 0 tcan 2 dwat 1 m hkuc pcmhminhtut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flat hpa7tmwatli xre7t hjonli

drutta Xanthorhiza simplicissima is a deciduous Shrub growing to 1 m (3ft 3in) by 3 m (9ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from March to April. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta None known
tcanta DyeA yellow dye is obtained from the root[46, 61]. The entire plant can be crushed to yield a yellow dye[257]. A good ground cover for damp semi-shaded positions[11, 200]. Plants should be spaced about 1.2 metres apart each way[208].

dwatta Antihæmorrhoidal Astringent Stomachic TonicThe root is astringent and a blood tonic[222]. A tea made from the roots is used to treat mouth ulcers[213], stomach ulcers, colds, jaundice etc[222, 257]. An infusion of the roots has also been used to treat piles, though the report does not specify if it is used internally or externally[257]. Some caution is advised in the use of this plant, see the notes above on toxicity. The root contains the alkaloid 'berberine' which is used for its tonic properties and for digestive disorders[213]. Berberine is anti-inflammatory, astringent, haemostatic, antispasmodic, immuno-stimulant, uterine tonic and antimicrobial[222]. It stimulates the secretion of bile and bilirubin and may be helpful in correcting high tyramine levels in people with liver cirrhosis[222].

propta Seed - best sown in a cold frame as soon as it is ripe in the autumn[200]. Sow stored seed in a cold frame in late winter. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in the autumn or late winter[11].

nwatta Requires a moist acid soil in sun or part shade[184]. Prefers shade or semi-shade[188]. Succeeds in any moist fertile soil according to other reports[1, 182, 200]. Hardy to about -20°c[184]. Plants can spread considerably by means of suckers[182], especially when they are growing in a light soil[208]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

## 6.2.674 Solidago gigantea

Giant Goldenrod
5 tlin 9 cyuc 0 kcaak 0 tcan 2 dwat 1.2 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Solidago gigantea is a PERENNIAL growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known
tcanta BasketryThe stems can be made into rough baskets[257].

dwatta Astringent Cathartic Diuretic Febrifuge StypticThe leaves and blossoms are astringent, cathartic and styptic[4]. They are a valuable remedy in the treatment of all

kinds of hæmorrhages[4]. An infusion of the blossoms has been used to treat various fevers[257]. An oil obtained from the plant (is this an essential oil?) is diuretic[4].

propta Seed - sow spring in a cold frame. Only just cover the seed and do not allow the compost to become dry. Prick out the seedlings into individual pots when they are large enough to handle, and grow them on for their first winter in pots. Plant them out into their permanent positions in spring or early summer. Division in spring or autumn. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Succeeds in any moderately fertile moisture retentive soil in sun or semi-shade[200]. Grows well in heavy clay soils. A rather greedy plant, it is apt to impoverish the soil[1]. This species has become a weed in its native range, increasing freely by seed and at the root[200]. The plant attracts various beneficial insects such as ladybirds, lacewings and hoverflies to the garden, these insects will help to control insect pests in the garden[201, 238].

## 6.2.675 Lithospermum caroliniense

Hairy Puccoon, Carolina puccoon
5 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 1 m hkuc htut cyutli kyuctcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Lithospermum caroliniense is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta None known
tcanta DyeA red dye is obtained from the dried or pulverized root[61, 257].

dwatta VulneryThe powdered root has been used in the treatment of chest wounds[257].

propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings. Division.

nwatta Requires a warm sunny position in a moderately fertile well-drained lime-free sandy soil[1, 200].

## 6.2.676 Aconitum orientale

5 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 1.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikrip hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Aconitum orientale is a PERENNIAL growing to 1.5 m (5ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known
tcanta None known
dwatta Anodyne Diaphoretic DiureticThe dried root is anodyne, diaphoretic and diuretic[4]. It should be harvested in the autumn as soon as the plant dies down[4]. This is a very poisonous plant and should only be used with extreme caution and under the supervision of a qualified practitioner.

propta Seed - best sown as soon as it is ripe in a cold frame[111]. The seed can be stratified and sown in spring but will then be slow to germinate[133]. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for their first winter. Plant them out in late spring or early summer. Division - best done in spring but it can also be done in autumn[1, 111]. Another report says that division is best carried out in the autumn or

and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta None known

tcanta A yellow dye is obtained from the stems[257]. Onion skins are sometimes added when making the dye[257]. Sometimes grown as an ornamental plant (but can be weedy).

dwatta Astringent SalveA decoction of the roots is used in the treatment of backaches[222]. A tea made from the leaves is used in the treatment of diarrhoea[222]. Externally, it is used as a wash for frostbite, sores, itching, piles and poison ivy rash[222, 257].

propta Seed - surface sow in early spring in a greenhouse. When large enough to handle, prick the seedlings out into individual pots and grow them on for the first winter in a cold greenhouse. Plant out in late spring or early summer, after the last expected frosts. Division in spring.

nwatta Requires a light porous sandy soil in full sun[200]. Plants are often found in very acid soils in the wild[236]. This plant was inadvertently introduced to the Hawaii Islands in 1932 and has spread widely there. It is considered to be one of the most threatening of exotic species, invading native habitats and altering the fire and hydrology regimes[274].

### 6.2.670 Verbascum phlomoides

Woolly Mullein, Orange mullein

5 tlin 9 cyuc 0 kcak 2 tcan 3 dwat 1.2 m hkuc

htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatprikwisslip hpa7tmwatli fyifxre7t hjonli

drutta Verbascum phlomoides is a BIENNIAL/PERENNIAL growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta None known

tcanta RepellentThe whole plant is used to repel mice and rats[46, 61]. Dynamic accumulator.

dwatta Anodyne Antiseptic Demulcent Diuretic Expecto- rant Pectoral VermifugeThe seed is used to expel tape- worms from the body[4]. No other details are given, but the seeds probably contain saponins and so should be used with caution[K]. The flowers and leaves are anodyne, anti- septic, astringent, demulcent, emollient, expecto- rant, pectoral and vulnerary[21, 238]. An infusion is used internally in the treatment of various respiratory complaints including coughs, bronchitis, asthma and throat irritations[238]. An infusion of the fresh or dried flowers in olive oil is used to treat earaches, sores, wounds, boils etc[238]. The plant is harvested when in flower and should be dried quickly and with care or it will lose its medicinal qualities[238].

propta Seed - sow late spring to early summer in a cold frame and only just cover the seed[200]. Germination usually takes place within 2 - 3 weeks. When they are large enough to handle, prick out the seedlings into individual pots and plant them out in late summer. The seed has a long viability[200].

nwatta An easily grown plant, it succeeds in most well- drained soils, including dry ones, and prefers a sunny position[200]. Dislikes shade and wet soils[200]. Thrives on chalk[200]. Prefers a light soil[200]. This species is hardy to at least -15°C[200]. Hybridizes with other members of this genus, though the progeny are usually sterile[200]. Plants can perennate when growing in light well-drained soils[111].

### 6.2.671 Hypericum hypericoides

St. Andrews Cross

5 tlin 9 cyuc 0 kcak 0 tcan 2 dwat 1.2 m hkuc

hmimhtut cyutli kyuctcup hwicli hrasjlut hpa7tli flatprikwisslip hpa7tmwatli fyifxre7t hjonli

drutta Hypericum hypericoides is a deciduous Shrub growing to 1.2 m (4ft). See above for USDA hardiness. It

is hardy to UK zone 6. It is in flower from July to Septem- ber. The species is hermaphrodite (has both male and fe- male organs) and is pollinated by Insects. The plant is self- fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neu- tral and basic (mildly alkaline) soils. It can grow in semi- shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta None known

tcanta None known

dwatta Antidote Kidney LithontripicLithontripic[61]. The root was chewed as an antidote to rattlesnake bites[207, 222]. A tea made from the roots is used in the treatment of colic, fevers, pain, diarrhoea etc[222]. It is applied externally to ulcerated breasts[222]. A tea made from the leaves is used in the treatment of kidney and bladder ailments, skin prob- lems and children's diarrhoea[61, 222]. A milky substance obtained from the plant has been rubbed on sores[257].

propta Seed - sow spring in a greenhouse and only just cover the seed. Germination usually takes place within 1 - 3 months at 10°C. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, af- ter the last expected frosts. Cuttings of half-ripe wood 10 - 12 cm with a heel, July/August in a frame. Plant out in the following spring[200]. Cuttings of mature wood, 12 - 17cm with a heel, October/November in a sheltered position out- doors. Plants root by the spring. Good percentage[78]. Di- vision in spring as new growth commences[78]. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Easily grown in any reasonably good well- drained but moisture retentive soil[1]. Succeeds in sun or semi-shade but flowers better in a sunny position[1]. Prefers a light loamy soil[11]. One report says that the plant requires frame protection in the winter[1] whilst another says that plants are hardy but short-lived at Kew[11]. It possibly suf- fers more from wet soils than from the cold, see the plant's native habitat above. Plants in this genus are notably resis- tant to honey fungus[200].

### 6.2.672 Eryngium aquaticum

Button Snakeroot, Rattlesnakemaster

5 tlin 9 cyuc 0 kcak 0 tcan 2 dwat 1.2 m hkuc

htut cyutli kyuctcup hwicli hyishrasjlut hpa7tli flatprikwisslip hpa7tmwatli fyifxre7t hjonli

drutta Eryngium aquaticum is an evergreen Perennial growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutri- tionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcakta None known

tcanta None known

dwatta Antidote Diaphoretic Diuretic Emetic Expecto- rant HomeopathyThe plant is diaphoretic, diuretic, expecto- rant and in large doses emetic[207]. It is used mainly in the treatment of disorders of the kidneys and sexual organs[238, 257]. It has been used as an antidote to snake poison[207, 257]. The pounded roots are used as a diuretic[213]. An in- fusion of them is used to reduce fevers[213]. The plant is used as an antidote to snakebites. The roots are chewed and ap- plied to the bite[213]. A homeopathic remedy is made from the fresh or dried root[4].

propta Seed - best sown as soon as it is ripe in early autumn on the surface of a well-drained compost in a cold frame[200]. The seed can also be sown in spring. It usu- ally germinates in 5 - 90 days at 20°C. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first win- ter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Di- vision in early spring or autumn. Take care since the plant

neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers moist soil.

kcakta None known

tcanta FuelThe wood is used as a fuel[146].

dwatta AperientA decoction of the bark is aperient[240]. It is used in Spain in the treatment of jaundice[240].

propta Seed - sow early spring in a cold frame and only just cover the seed. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half- ripe wood, July/August in a frame[200]. Cuttings of mature wood of the current seasons growth, November to January in a sandy propagating mix in an open frame[11, 200].

nwatta Prefers a fertile well-drained soil in full sun with shelter from cold drying winds[200]. Tolerates chalk soils[200]. An easily grown plant, preferring a damp sandy soil[182]. Closely related and very similar to Tamarisk spp[182].

### 6.2.644 Ageratina altissima

White Snakeroot, Richweed

5 tlin 9 cyuc 0 kcak 0 tcan 2 dwat 2 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwisslip hpa7tmwatli fyifxre7t hjonli

drutta Ageratina altissima is a PERENNIAL growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta None known

dwatta Diaphoretic Diuretic Febrifuge Odontalgic Stim- ulant Tonic UrinaryThe root is diaphoretic, diuretic, febrifuge, stimulant and tonic[257]. It has been used in the treatment of diarrhoea, gravel and urinary diseases[257]. It has also been used in herbal sweat baths to encourage sweating[257]. A decoction or infusion of the root has been taken to treat a fallen or inflamed womb[257]. The root has been chewed and held in the mouth as a treatment for toothache[257].

propta Seed - sow spring in a cold frame, only just covering the seed. When large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring.

nwatta Succeeds in an ordinary well-drained but mois- ture retentive garden soil in sun or part shade[200]. There is some difference of opinion over the correct name for this species with some authorities using Eupatorium rugosum[K].

### 6.2.645 Knautia arvensis

Field Scabious, Field scabiosa

5 tlin 9 cyuc 0 kcak 0 tcan 2 dwat 1 m hkuc

hmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatprikwisslip hpa7tmwatli fyifxre7t hjonli

drutta Knautia arvensis is a PERENNIAL growing to 1 m (3ft 3in) by 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to September. The species is hermaphrodite (has both male and female or- gans) and is pollinated by Bees, Lepidoptera (Moths and But- terflies). It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta None known

tcanta None known

dwatta Antipruritic Astringent Diuretic Eczema Homeo- pathyThe whole plant is astringent and mildly diuretic[9]. An infusion is used internally as a blood purifier and ex- ternally for treating cuts, burns and bruises[9]. The fresh

or dried flowering plant can be used, with or without the roots[9]. A homeopathic remedy is made from the plant[9]. It is used as a blood purifier and as a treatment for eczema and other skin disorders[9].

propta Seed - sow spring or autumn in a cold frame.

When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. If you have enough seed it would be worthwhile trying a sowing in situ outdoors in the spring. The seed germinates in the spring in the wild. Division in the spring. Basal cuttings in late spring. Harvest the shoots when they are about 10 - 15cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Succeeds in any well-drained soil[187]. Prefers a dry soil[9, 17]. Grows well on chalky soils[4]. Prefers a sunny position[188]. A very cold-hardy plant, tolerating tempera- tures down to at least -25°C[187]. Grows well in the summer meadow[24, 187]. The plant is an important source of nectar and pollen for bees and lepidoptera[24, 108]. The plants are sometimes dioecious, if this is the case then male and female plants will need to be grown if seed is required.

### 6.2.646 Leucothoe grayana

5 tlin 9 cyuc 0 kcak 0 tcan 1 dwat 1.2 m hkuc

hmim cyutli tcup hwicli hrasjlut hpa7tli frusflatprik hpa7tmwatli xre7t hjonli

drutta Leucothoe grayana is an evergreen Shrub grow- ing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from June to July. The species is hermaphrodite (has both male and female or- gans). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta None known

tcanta ParasiticideA parasiticide is obtained from the plant (No details are given as to which part). It is also used in the treatment of itch and ringworm[178].

dwatta Antipruritic ParasiticideAntipruritic[178].

propta Seed - sow late winter in a shady part of the greenhouse and only just cover the seed. Do not allow the compost to dry out. Germination is variable. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least their first winter. Plant them out into their perma- nent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 10cm with a heel, August in a frame. Fair to good percentage[78]. Layer- ing in autumn. Takes 12 months. Very high percentage[78].

nwatta Requires a lime-free well-drained humus-rich soil and some shade[1, 182]. Requires a moist peaty soil or a sandy loam with added leafmold[11]. Plants are tolerant of transplanting, which is best carried out in the autumn[200]. The flowers are produced on the current years growth[182]. A number of named forms have been developed in Japan for their ornamental value[182]. Plants in this genus are notably resistant to honey fungus[200].

### 6.2.647 Peucedanum cervaria

5 tlin 9 cyuc 0 kcak 0 tcan 1 dwat 1.5 m hkuc

htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwisslip hpa7tmwatli fyifxre7t hjonli

drutta Peucedanum cervaria is a PERENNIAL growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 6. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta None known

tcanta None known

dwatta Diuretic Emmenagogue Febrifuge StomachicDi- uretic, emmenagogue, febrifuge, stomachic[61].

propta Seed - we have no information on this species but suggest sowing the seed in a cold frame as soon as it is ripe

if this is possible otherwise in early spring. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer.

nwatta An easily grown plant, it succeeds in any moisture-retentive soil in a sunny position[200]. Suitable for group plantings in the wild garden[200]. This species was formerly cultivated as a medicinal plant[61].

## 6.2.648 *Aconitum uncinatum*

Wild Monkshood, Southern blue monkshood

5 tlin 9 cyuc 0 kcak 0 tcan 1 dwat 1 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyikfrp hpa7tli flatprikliw hpa7tmwatli hjonli

drutta *Aconitum uncinatum* is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August. The flowers are pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known  
tcanta None known  
dwatta Alterative Anaesthetic Antiarthritic Deobstruent Diaphoretic Diuretic Sedative StimulantThe dried root is alterative, anaesthetic, antiarthritic, deobstruent, diaphoretic, diuretic, sedative, stimulant[178]. It is harvested as soon as the plant dies down in the autumn. This is a very poisonous plant and should only be used with extreme caution and under the supervision of a qualified practitioner. A tincture is used as an external anaesthetic[207].

propta Seed - best sown as soon as it is ripe in a cold frame[111]. The seed can be stratified and sown in spring but will then be slow to germinate[133]. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for their first winter. Plant them out in late spring or early summer. Division - best done in spring but it can also be done in autumn[1, 111]. Another report says that division is best carried out in the autumn or late winter because the plants come into growth very early in the year[233].

nwatta Thrives in most soils and in the light shade of trees[1]. Grows well in heavy clay soils. Prefers a moist soil in sun or semi-shade[200]. Prefers a calcareous soil. Members of this genus seem to be immune to the predations of rabbits and deer[233]. Grows well in open woodlands[1, 4]. A greedy plant, inhibiting the growth of nearby species, especially legumes[54].

## 6.2.649 *Verbascum lychnitis*

White Mullein

5 tlin 9 cyuc 0 kcak 2 tcan 0 dwat 1 m hkuc htut cyutli kyuctcup hwicli hrasljutnyik hpa7tli flatprikliw hpa7tmwatli fyifxre7t hjonli

drutta *Verbascum lychnitis* is a BIENNIAL growing to 1 m (3ft 3in) by 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta None known  
tcanta RepellentFlower heads are used as a mouse and rat repellent in fruit stores etc[46, 61]. Dynamic accumulator.

dwatta None known  
propta Seed - sow late spring to early summer in a cold frame and only just cover the seed[200]. Germination usually takes place within 2 - 3 weeks. When they are large enough to handle, prick out the seedlings into individual pots and plant them out in late summer. The seed has a long viability[200].

nwatta An easily grown plant, it succeeds in most well-drained soils, including dry ones, preferring a sunny position[200]. Dislikes shade and wet soils[200]. Thrives on

chalk[200]. Prefers a light soil[200]. Hybridizes with other members of this genus, though the progeny are usually sterile[200].

## 6.2.650 *Reseda luteola*

Weld, Dyer's Rocket

5 tlin 9 cyuc 0 kcak 3 tcan 1 dwat 1.5 m hkuc htut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliw hpa7tmwatli fyifxre7t hjonli

drutta *Reseda luteola* is a BIENNIAL growing to 1.5 m (5ft) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from June to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: OilEdible Uses: OilNone known  
tcanta Dye OilA deep yellow dye is obtained from the plant, it is of very good quality[17, 46, 74]. The plant is harvested as the last flowers fade[115]. Most of the dye is found in the seed[115]. An oil is obtained from the seed, used in lighting[100].

dwatta NarcoticNarcotic (mild).  
propta Seed - sow in situ in the spring and only just cover the seed. An autumn sowing usually succeeds in areas where winter temperatures do not fall below about -10°C[200]. The seed germinates in the autumn in the wild.

nwatta Easily grown in any well-drained neutral to slightly alkaline soil in a sunny position or in some shade if the summers are long and hot[200]. At one time this plant was commonly cultivated for the dye obtained from the leaves and seed but with the advent of chemical dyes it has fallen into disuse[1, 17, 46]. A good plant for bees and butterflies[200]. Plants dislike root disturbance, they can be transplanted but care must be taken not to break the tap root[169].

## 6.2.651 *Geranium pratense*

Meadow Crane's Bill, Meadow geranium, Geranium

5 tlin 9 cyuc 0 kcak 0 tcan 2 dwat 1.2 m hkuc htut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Geranium pratense* is a PERENNIAL growing to 1.2 m (4ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from June to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta None known  
tcanta None known  
dwatta Analgesic Antiinflammatory Febrifuge VulneraryThe plant is used as a vulnerary[240]. The root is used in Tibetan medicine where it is said to have an acrid, sweet flavour plus a cooling potency[241]. Analgesic, anti-inflammatory and febrifuge, it is used in the treatment of fevers from influenza, inflammation of the lungs, pain and swellings of the limbs[241].

propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring or autumn. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Landscape Uses:Alpine garden, Border. Succeeds in any moderately fertile retentive soil in a sunny position[200]. Tolerates a wide range of soil types[200]. There are many named varieties, selected for their ornamental value[200]. Plants can be naturalized in meadows[200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. Special Features: Attractive foliage, Not North American native, Naturalizing, Suitable for cut flowers.

htut cyutli hgattcup hwicli hrasljutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Hebe 'Great Orme' is an evergreen Shrub growing to 1.5 m (5ft) by 1.2 m (4ft in). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from August to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil and can tolerate drought. The plant can tolerate maritime exposure. It can tolerate atmospheric pollution.

kcakta None known  
tcanta Hedge HedgeCan be used as a hedge in maritime areas, it is very resistant to salt winds[200]. Attractive flowers.

dwatta None known  
propta Seed - we have no information on this species but suggest sowing the seed in a greenhouse in spring. Only just cover the seed and do not allow the compost to dry out. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. This species is a hybrid and will not breed true from seed. Cuttings of half ripe wood, 3 - 5cm with a heel, July/August in a frame. Cuttings of mature wood, late autumn or winter in a frame.

nwatta Prefers a position in full sun, succeeding in most well-drained soils with some shelter from cold winds[200]. Dislikes very dry soils and water-logged soils, but is somewhat drought tolerant when established[190]. Tolerant of atmospheric pollution and maritime exposure[200]. Plants are hardy to about -10°C. They grow well in a dry border in an Essex garden[190]. Hybridizes freely with other members of this genus[200]. Tolerant of pruning, plants can be cut back into old wood if required[188]. Closely related to *H. 'Carnea'* [200]. This species is very easy to transplant and, with care, it can even be moved when in flower. Plants in this genus are notably resistant to honey fungus[200]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is clumping, giving the plant a 'clumping' habit. The predictable growth behaviour makes it easier to maintain without having to apply containment methods[2-1].

## 6.2.667 *Rubia tinctorum*

Madder, Dyer's madder

5 tlin 9 cyuc 0 kcak 0 tcan 2 dwat 1 m hkuc hmimhtut cyutli kyuctcup hwicli hrasljut hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Rubia tinctorum* is an evergreen Perennial growing to 1 m (3ft 3in) by 1 m (3ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower in June, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcakta None known  
tcanta Dye PolishA very good quality red dye is obtained from the roots. Some reports say that 2 year old roots are used in the spring and autumn[61, 200, 238] whilst others say that 3 year old roots are used[169, 171]. The roots can be dried for later use[169]. The dye can also be extracted from the leaves[169]. This dye is also used medicinally[200]. The leaves and stem are prickly, the whorls of leaves having spines along the midrib on the underside[4]. This feature enables them to be used for polishing metalwork[4, 148].

dwatta Aperient Astringent Cholagogue Diuretic EmmenagogueThe root is aperient, astringent, cholagogue, diuretic and emmenagogue[4, 7, 21]. It is taken internally in the treatment of kidney and bladder stones[238]. The root is seldom used in herbal medicine but is said to be effective in the treatment of amenorrhoea, dropsy and jaundice[4]. The roots are harvested in the autumn from plants that are at

least 3 years old. They are peeled and then dried[238]. When taken internally the root imparts a red colour to the milk, urine and bones, especially the bones of young animals, and it is used in osteopathic investigations[4, 200].

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed can be very slow to germinate[200]. Prick out the seedlings when they are large enough to handle and grow them on in light shade in the greenhouse for the first year. Plant them out into their permanent positions in early summer. Division in spring or at any time in the growing season if the divisions are kept well watered until established[200]. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Prefers a light sandy soil in full sun[14]. Plants grown in fertile well-limed soils produce more pigment in the root[169]. This plant was at one time widely cultivated for the red dye obtained from its roots, this dye is now manufactured chemically[200]. However, it is still cultivated in Europe as a medicinal dye plant. The plant produces many side roots that can travel just under the surface of the soil for some distance before sending up new shoots[4]. This species is closely related to *R. peregrina*[4].

## 6.2.668 *Inula conyza*

Ploughman's Spikenard

5 tlin 9 cyuc 0 kcak 0 tcan 1 dwat 1.2 m hkuc htut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliw hpa7tmwatli fyifxre7t hjonli

drutta *Inula conyza* is a BIENNIAL/PERENNIAL growing to 1.2 m (4ft) by 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers moist soil.

kcakta None known  
tcanta Insecticide ParasiticideThe leaves are burnt and used as an insecticide and parasiticide, especially against fleas[4, 100]. Even the smell of the plant is said to drive fleas away[4]. The root used to be burnt upon a fire in order to scent a room[245].

dwatta Antiscrofulatic Emmenagogue Parasiticide VulneraryThe herb is antiscrofulatic, emmenagogue and vulnerary[4]. The plant was considered to be a good wound herb and it was frequently taken in decoction for bruises, ruptures, internal wounds etc[4]. It was applied externally to treat itchy skin[4].

propta Seed - sow spring or autumn in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. If you have sufficient seed, it is worthwhile trying a sowing in situ in the spring or the autumn.

nwatta Succeeds in an ordinary garden soil in a sunny position[1]. The basal leaves of this species are often mistaken for the foxglove, *Digitalis purpurea*[17]. The basal leaves form a rosette that covers the ground for 30cm or more, destroying the grass underneath[245]. All parts of the plant are refreshingly aromatic[245].

## 6.2.669 *Andropogon virginicus*

Broomsedge Bluestem

5 tlin 9 cyuc 0 kcak 1 tcan 1 dwat 1.2 m hkuc htut cyutli kyuctcup hwicli hras hpa7tli frusflatprikliw hpa7tmwatli xre7t hjonli

drutta *Andropogon virginicus* is a PERENNIAL growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy) soils

(loamy) soils. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers moist soil.

kcakta None known

tcanta WoodWood - heavy, hard, close-grained, not strong[82].

dwatta Astringent StypticThe spongy bark at the base of the trunk is pliable, absorbent and astringent. It has been recommended as a styptic[82].

propta Seed - best sown as soon as it is ripe in a greenhouse[200]. As soon as they are large enough to handle, prick out the seedlings into individual pots. Grow them on in the greenhouse for at least their first winter, planting them out in early summer when there is no danger of frost. Give them some protection from the cold for their first winter outdoors. Cuttings of softwood, spring in a frame[200]. Cuttings of half-ripe wood, July/August in a frame[200]. Root cuttings in the spring[200].

nwatta Landscape Uses:Hedge, Standard, Woodland garden. Requires a sunny position and a humus-rich soil[200]. Thrives in a mixture of peat and loam[11]. Prefers a circum-neutral or slightly acid, moisture-retentive soil[200]. This species has a wide distribution in the wild, extending southwards from South-eastern North America to Brazil. An evergreen small tree in the warmer parts of its range, only those forms from the most northerly part of its range can be grown outdoors in Britain. These northerly forms are deciduous, though may remain evergreen in mild winters[11, 200]. They usually take the form of a small shrub, but can sometimes become a small tree. They succeed outdoors in the south of Britain, though can be damaged or killed in severe winters[11]. The flowers are produced at the base of the current years growth[11, 200]. Special Features:Attractive foliage, North American native, Naturalizing, Wetlands plant, Fragrant flowers, Attractive flowers or blooms

## 6.2.663 Aconitum kusnezoffii

Bei Wu Tou

5 tlin 9 cyuc 0 kcak 0 tcan 1 dwat 1.5 m hkcw hmimhtut cyutli tcup hwicli hrasjlutnyikfrp hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Aconitum kusnezoffii is a PERENNIAL growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to September. The flowers are pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta None known

dwatta Alterative Anaesthetic Antiarthritic Deobstruent Diaphoretic Diuretic Sedative StimulantThe root is alterative, anaesthetic, antiarthritic, deobstruent, diaphoretic, diuretic, sedative and stimulant[178]. This is a very poisonous plant and should only be used with extreme caution and under the supervision of a qualified practitioner.

propta Seed - best sown as soon as it is ripe in a cold frame[111]. The seed can be stratified and sown in spring but will then be slow to germinate[133]. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for their first winter. Plant them out in late spring or early summer. Division - best done in spring but it can also be done in autumn[1, 111]. Another report says that division is best carried out in the autumn or late winter because the plants come into growth very early in the year[233].

nwatta Thrives in most soils and in the light shade of trees[11]. Grows well in heavy clay soils. Prefers a moist soil in sun or semi-shade[200]. Prefers a calcareous soil. Grows well in open woodlands[1, 4]. Members of this genus seem to be immune to the predations of rabbits and deer[233]. This species is closely related to *A. yezoense*[1]. A greedy plant, inhibiting the growth of nearby species, especially legumes[54].

## 6.2.664 Plumbago europaea

Plumbago

5 tlin 9 cyuc 0 kcak 0 tcan 2 dwat 1 m hkcw htut cyutli kyuctcup hwicli hras hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Plumbago europaea is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta None known

tcanta None known

dwatta Acrid Emetic Odontalgic Sialagogue VesicantThe whole plant, but especially the root, is acrid, emetic, odontalgic, sialagogue and vesicant[4, 61, 100, 103]. Chewing the root produces copious salivation and is said to be of benefit in treating toothache[4].

propta Seed - sow spring in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of basal shoots as new growth emerges in the spring. Harvest the shoots with plenty of underground stem when they are about 8 - 10cm above the ground. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Requires a well-drained sandy or gritty soil in full sun[200]. One report says that the plant is not very hardy in Britain and is usually grown in a greenhouse[4].

## 6.2.665 Scrophularia ningpoensis

5 tlin 9 cyuc 0 kcak 0 tcan 3 dwat 1 m hkcw hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Scrophularia ningpoensis is a PERENNIAL growing to 1 m (3ft 3in) by 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to October, and the seeds ripen from September to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta None known

dwatta Antibacterial Antifungal Antiphlogistic Antipyretic Cardiac Diuretic Febrifuge Haemolytic Hypoglycaemic Restorative Sialagogue Tonic VasodilatorThis species has been used in Chinese herbal medicine for over 2,000 years[238]. The root is antibacterial, antifungal, antipyretic, antiphlogistic, cardiac, diuretic, febrifuge, haemolytic, hypoglycaemic, restorative, sialagogue, tonic and vasodilator[147, 176, 218]. Small doses act as a heart tonic, whilst large doses depress cardiac function[176, 238]. The root is used internally in the treatment of feverish illnesses with symptoms such as rashes, delirium and insomnia, dry cough, throat infections, abscesses and carbuncles[238]. The root is harvested in the autumn and dried for later use[238].

propta Seed - sow spring or autumn in a cold frame[238].

When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Succeeds in most moist to wet soils in full sun or partial shade[200, 238]. This species is hardy to at least -15°c[238].

## 6.2.666 Hebe 'Great Orme'

Great Orme Hebe

5 tlin 9 cyuc 0 kcak 3 tcan 0 dwat 1.5 m hkcw

## 6.2.652 Leucothoe axillaris

Coastal Doghobble

5 tlin 9 cyuc 0 kcak 0 tcan 1 dwat 1.8 m hkcw hmim cyutli tcup hwicli hrasjlutnyik hpa7tli frusflatprik hpa7tmwatli xre7t hjonli

drutta Leucothoe axillaris is an evergreen Shrub growing to 1.8 m (6ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from April to May. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta None known

tcanta None known

dwatta Antipruritic Expectorant PoulticePromotes the discharge of mucus from the nose[61]. An infusion of the leaf is taken internally and also used as a wash in the treatment of rheumatism[257]. A infusion of the leaves and stems has been used to bathe itchy skin[257].

propta Seed - sow late winter in a shady part of the greenhouse and only just cover the seed. Do not allow the compost to dry out. Germination is variable. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 10cm with a heel, August in a frame. Fair to good percentage[78]. Layering in autumn. Takes 12 months. Very high percentage[78].

nwatta Requires a lime-free well-drained humus-rich soil and some shade[11, 182, 200]. Plants are not very successful in Britain[11]. One report says they are not very hardy in Britain, succeeding outdoors only in the milder areas of the country, whilst another says that they are hardy to zone 6, which means tolerating temperatures down to -15° or lower[200]. The flowers are strongly fragrant[245]. This species is often confused with *L. fontanesiana*[182]. Plants in this genus are notably resistant to honey fungus[200].

## 6.2.653 Hebe rakaiensis

5 tlin 9 cyuc 0 kcak 3 tcan 0 dwat 1 m hkcw htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Hebe rakaiensis is an evergreen Shrub growing to 1 m (3ft 3in) by 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerate maritime exposure. It can tolerate atmospheric pollution.

kcakta None known

tcanta Hedge HedgeAn excellent ground cover plant[182], though it takes about 2 years to form an effective cover[197]. Plants should be spaced about 60cm apart each way[208]. It can also be grown as a dwarf hedge, tolerating gentle clipping[182]. Attractive flowers.

dwatta None known

propta Seed - we have no information on this species but suggest sowing the seed in a greenhouse in spring. Only just cover the seed and do not allow the compost to dry out. Prick out the seedlings into individual pots when they are large enough to handle. Grow on the young plants for at least their first winter in a greenhouse and plant out in late spring or early summer after the last expected frosts. It would probably be worthwhile giving some protection to the plant for its first winter outdoors. Cuttings of half-ripe wood, 3 - 5cm with a heel, July/August in a frame. Pot up when roots are forming and keep in a frame or greenhouse for its first winter before planting out in late spring. Cuttings of mature wood, late autumn or winter in a frame.

nwatta Prefers a position in full sun, succeeding in most well-drained soils with some shelter from cold winds[200]. Dislikes very dry soils and water-logged soils. Tolerant of atmospheric pollution and maritime exposure[200]. Plants are hardy to about -15°c[184]. Hybridizes freely with other

members of this genus[200]. Plants of this species are often grown under the names of *H. buxifolia* or *H. subalpina* in British gardens[200]. This species is very easy to transplant and, with care, it can even be moved when in flower[200]. Plants in this genus are notably resistant to honey fungus[200]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is clumping, giving the plant a clumping habit. The predictable growth behaviour makes it easier to maintain without having to apply containment methods[2-1].

## 6.2.654 Opopanax chironium

Opopanax

5 tlin 9 cyuc 0 kcak 0 tcan 1 dwat 1.8 m hkcw htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyfkrxre7t hjonli

drutta Opopanax chironium is a PERENNIAL growing to 1.8 m (6ft). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in leaf from October to August, in flower from June to July, and the seeds ripen in August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Edible Uses: GumNone known

tcanta GumA gum is obtained through incisions in the roots at the base of the stems[4]. It is used in perfumery[1, 46, 61] and also in medicines[171]. The gum is inflammable, burning brightly[4].

dwatta Antispasmodic DeobstruentThe gum (an oleo resin according to one report) that is obtained from the base of the stems is antispasmodic and deobstruent[4]. It is nowadays considered to be a medium of feeble powers though it was at one time widely used in the treatment of menstrual disorders, asthma, chronic visceral afflictions etc[4].

propta Seed - sow spring in situ. If seed is in short supply then it is best to sow it in a pot in the greenhouse in early spring. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in early summer.

nwatta An easily grown plant, it succeeds in any good garden soil[1]. It can tolerate very considerable neglect, some plants we were growing were left to fend for themselves in very dense weed growth and survived well for 8 years before being moved to another site[K]. We are not sure how hardy this plant is, but the foliage has withstood short periods of temperatures down to -6°c with us[K]. A warm climate is necessary in order to produce good quality gum[4]. Plants seem to be very tolerant of root disturbance, specimens that had been growing for 4 years in one site grew away very well when transplanted as they came into growth in late autumn[K].

## 6.2.655 Aconitum chinense

5 tlin 9 cyuc 0 kcak 0 tcan 1 dwat 1.2 m hkcw hmimhtut cyutli tcup hwicli hrasjlutnyikfrp hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Aconitum chinense is a PERENNIAL growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta None known

dwatta Analgesic Anodyne Carminative Diaphoretic Diuretic Irritant SedativeThe root is analgesic, anodyne, carminative, diaphoretic, diuretic, irritant, sedative[4, 7, 9, 145, 165]. This is a very poisonous plant and should only be used with extreme caution and under the supervision of a qualified practitioner.

propta Seed - best sown as soon as it is ripe in a cold frame[111]. The seed can be stratified and sown in spring but will then be slow to germinate[133]. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for their first winter. Plant them out in late spring or early summer. Division - best done in spring but it can also be done in autumn[1, 111]. Another report says that division is best carried out in the autumn or late winter because the plants come into growth very early in the year[233].

nwatta Thrives in most soils and in the light shade of trees[1]. Grows well in heavy clay soils. Prefers a moist soil in sun or semi-shade[200]. Prefers a calcareous soil. Grows well in open woodlands[1, 4]. Members of this genus seem to be immune to the predations of rabbits and deer[233]. A greedy plant, inhibiting the growth of nearby species, especially legumes[54].

## 6.2.656 Aconitum ferox

Indian aconite

5 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 1 m hkuc

drutta Aconitum ferox is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from August to September. The flowers are pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta None known  
tcanta None known  
dwatta Alternative Anaesthetic Antiarthritic Cholera Deobstruent Diaphoretic Diuretic Leprosy Sedative Stimulant-The dried root is alterative, anaesthetic, antiarthritic, deobstruent, diaphoretic, diuretic, sedative, stimulant[178]. It is best harvested in the autumn as soon as the plant dies down. This is a very poisonous plant and should only be used with extreme caution and under the supervision of a qualified practitioner. It has been used in India and Nepal in the treatment of neuralgia, leprosy, fevers, cholera and rheumatism[240, 272]. When the roots are soaked in cow's urine, they become soft and lose their depressant action on the heart, becoming a stimulant instead[240].

propta Seed - best sown as soon as it is ripe in a cold frame[111]. The seed can be stratified and sown in spring but will then be slow to germinate[133]. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for their first winter. Plant them out in late spring or early summer. Division - best done in spring but it can also be done in autumn[1, 111]. Another report says that division is best carried out in the autumn or late winter because the plants come into growth very early in the year[233].

nwatta Thrives in most soils and in the light shade of trees[1]. Grows well in heavy clay soils. Prefers a moist soil in sun or semi-shade[200]. Prefers a calcareous soil. Grows well in open woodlands[1, 4]. The root of this plant is widely collected from the wild for medicinal use and is becoming much rarer in much of its range[272]. Members of this genus seem to be immune to the predations of rabbits and deer[233]. A greedy plant, inhibiting the growth of nearby species, especially legumes[54]. Closely related to *A. napellus*[1].

## 6.2.657 Lobelia siphilitica

Great Blue Lobelia, Blue Cardinal Flower, Big Blue Lobelia, Great Lobelia

5 tlin 9 cyuc 0 kcaak 0 tcan 2 dwat 1 m hkuc  
hmimhtut cyuti tucphja7n hwicli hrasljutnyik hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta Lobelia siphilitica is a PERENNIAL growing to 1 m (3ft 3in) by 0.3 m (1ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from August to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly

acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcaakta None known  
tcanta None known  
dwatta Analgesic Cathartic Diaphoretic Dysentery Emetic Homeopathy Poulitice VDThe root is cathartic, diaphoretic and emetic[4, 46, 103]. It is used in the treatment of dropsy, diarrhoea, stomach complaints, syphilis and dysentery[4, 257]. A poultice of the root has been applied to sores that are hard to heal[257]. The leaves are analgesic and febrifuge[257]. An infusion has been used in the treatment of colds and fevers[257]. A poultice of the crushed leaves has been applied to the head to relieve the pain of headaches[257]. At one time in N. America the root of this plant was believed to be effective in the treatment of VD[103, 222]. When used in Europe, however, it was found to be ineffective[213]. This might have been because the N. American Indians used the fresh root (which still contained the volatile oils) and also used it in conjunction with *Podophyllum peltatum* and *Prunus virginiana*, and then dusted the ulcers with the bark of *Ceanothus americanus*[213]. It was believed by some native North American Indian tribes that if the finely ground roots were secretly added to the food of an arguing couple then this would avert a divorce and they would love each other again[213]. A homeopathic remedy is made from the roots[4].

propta Seed - best sown as soon as it is ripe in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring[200]. Basal cuttings in spring[1]. Harvest the shoots when they are about 10cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer. Layering in moist sand, it forms roots at the nodes[200].

nwatta Landscape Uses:Border, Massing, Woodland garden. Requires a moist soil, succeeding in full sun or partial shade[111, 187, 200]. A very ornamental plant[1], but it is short-lived unless divided frequently[233]. Special Features:Attracts birds, North American native, Naturalizing, All or parts of this plant are poisonous, Wetlands plant, Attracts butterflies, Suitable for cut flowers.

## 6.2.658 Hypericum bellum

5 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 1 m hkuc  
hmimhtut cyuti tcup hwicli hrasljutnyik hpa7tli flatprikwisslip hpa7tmwatli fyifxre7t hjonli

drutta Hypericum bellum is an evergreen Shrub growing to 1 m (3ft 3in) by 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from July to August, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta None known  
tcanta MiscellanyA good ground cover[11].  
dwatta Dysentery Febrifuge Miscellany Vermifuge-Febrifuge, vermifuge. Also used in the treatment of hepatitis, colds, dysentery and dermatitis[91].

propta Seed - sow spring in a greenhouse and only just cover the seed. Germination usually takes place within 1 - 3 months at 10°C. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood 10 - 12 cm with a heel, July/August in a frame. Plant in the following spring[200] Careful division of old suckering shrubs in the dormant season.

nwatta Easily grown in any reasonably good well-drained but moisture retentive soil[11]. Succeeds in sun or

semi-shade but flowers better in a sunny position[200]. Tolerates chalk. A very ornamental plant[11], it is hardy to about -10°C[184]. Plants in this genus are notably resistant to honey fungus[200].

## 6.2.659 Phoradendron leucarpum

False Mistletoe, Oak mistletoe

5 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 1 m hkuc  
hmimhtut cyuti tcup hwicli hrasljutnyik hpa7tli flatprikwis hpa7tmwatli nyanhjen hjonli

drutta Phoradendron leucarpum is an evergreen Shrub growing to 1 m (3ft 3in) by 1 m (3ft 3in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from February to April, and the seeds ripen from November to December. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta None known  
tcanta None known  
dwatta Abortifacient Contraceptive OxytoxicA tea made from the leaves is said to procure abortions and also to prevent conception[213]. It causes an increase in uterine contractions and helps to stop bleeding after parturition[213]. When injected into the blood it increases blood pressure[213].

propta This is a parasitic plant that grows entirely on the host tree. To grow it you need to obtain berries and squash them onto the branches of host trees in late autumn and early winter[11]. This is best done on the lower side of the branch[1]. It is then simply a matter of waiting and hoping.

nwatta A parasitic plant, growing on the branches of several deciduous species of trees. It has a wide range of hosts, though it is usually only found on one species in any given area[200]. The host tree must be at least 20 years old[200]. This species is seldom cultivated since it can severely weaken its host[200].

## 6.2.660 Ligusticum sinense

Chuang Xiong

5 tlin 9 cyuc 0 kcaak 0 tcan 3 dwat 1 m hkuc  
htut cyuti tcup hwicli hrasljutnyik hpa7tli flatprikwis hpa7tmwatli fyifxre7t hjonli

drutta Ligusticum sinense is a PERENNIAL growing to 1 m (3ft 3in) by 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcaakta None known  
tcanta None known  
dwatta Analgesic Antifungal Antirheumatic Antispasmodic Diaphoretic Emmenagogue SedativeThe root is anodyne, antibacterial, antifungal, antirheumatic, antispasmodic, emmenagogue, diaphoretic, hypotensive and sedative[176, 218, 238]. It is taken internally in the treatment of menstrual disorders, post-partum bleeding, coronary heart disease, poor circulation, headaches etc[238]. It is soaked in alcohol for 2 weeks and then used in the treatment of gout[218]. The root is harvested in the autumn and dried for later use[238].

propta The seed is best sown as soon as it is ripe in a cold frame in the autumn. Stored seed should be sown as early in the year as possible in a greenhouse or cold frame. Prick out the seedlings into individual pots when they are large enough to handle and plant them out into their permanent positions in the summer if they have grown large enough. Otherwise, keep them in a cold frame for the first winter and plant them out in early summer. Division in spring.

nwatta Succeeds in any well-drained soil in a sunny position[1, 200]. Tolerates moister conditions than many other members of the genus[238]. Plants are hardy to at least -15°C[238].

## 6.2.661 Veratrum nigrum

Black Hellebore

5 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 1.5 m hkuc  
hmimhtut cyuti tcup hwicli hrasljutnyik hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta Veratrum nigrum is a PERENNIAL growing to 1.5 m (5ft) by 0.6 m (2ft in). See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta None known  
tcanta InsecticideThe dried and powdered root is used as an insecticide and a parasiticide[172]. It is also effective against caterpillars and mammals so great caution is advised[1, 19, 20].

dwatta Analgesic Anthelmintic Emetic Errhine Expectorant Laxative VermifugeThe root is anthelmintic, emetic, errhine, expectorant, laxative and vermifuge[178, 218]. This herb is highly toxic and should not be used internally, or even externally, without expert guidance[K]. The whole plant is analgesic[218].

propta Unless stored in damp sand at around 4°C the seed has a short viability[200]. Where possible it is best to sow the seed in a lightly shaded position in the greenhouse as soon as it is ripe[200]. Stored seed needs to be stratified but can be very slow to germinate. Germination can be erratic even for seed sown when it was fresh, it usually takes place within 3 - 12 months at 15°C but can be much longer[200]. The plant produces just one seedleaf in its first year, this forms an over-wintering bulb. It takes up to 10 years for the plant to reach maturity[200]. Sow the seed thinly so there is no need to thin or transplant them, and grow the seedlings on undisturbed in the pot for their first two years of growth. Apply a liquid feed at intervals through the growing season to ensure the plants do not become nutrient deficient. At the end of the second year plant out the dormant plants into individual pots and grow them on in light shade in the greenhouse for a further year or two before planting them out into their permanent positions in late spring or early summer. Division in March/April or in October. Establish the plants in pots in a shaded frame before planting them out[200]. Division is best carried out in the autumn because the plants come into growth very early in the spring[233]. Root cuttings, 6mm long with a bud, rooted in a sandy soil in a cold frame[200].

nwatta Requires a deep fertile moisture retentive humus-rich soil[200]. Succeeds in full sun if the soil does not dry out but prefers a position in semi-shade[200]. Dislikes dry soils[42]. Grows best in a cool woodland garden or a north facing border[42]. Plants are hardy to about -25°C[187], especially if they are given a protective mulch in the winter. The flowers smell of rotten fruit and are visited by flies[187]. Members of this genus are rarely if ever troubled by browsing deer[233]. Plants are long-lived and can be left in the same position for years without attention[233].

## 6.2.662 Cyrilla racemiflora

Leatherwood, Swamp titi, Black Titi, Swamp, Myrtle, Titi Swamp, Leatherwood

5 tlin 10 cyuc 0 kcaak 0 tcan 1 dwat 1.2 m hkuc  
htut cyuti tcup hwicli hrasljut hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Cyrilla racemiflora is a deciduous Shrub growing to 1.2 m (4ft) by 2 m (6ft 7in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf from April to October, in flower from August to October, and the seeds ripen from September to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium

used to make a good quality paper[269]. This plant is currently (1995) under investigation at Rosewarne in Cornwall as a potential commercial paper crop for small-scale industries in SW England[K]. Because of rather high yields from natural stands, the plant has been suggested as a source of biomass for energy production[7, 269]. Dry cane yields of ca 10, 15, and 20 tonnes per hectare were reported respectively from infertile, partly fertile and fertile soils[269]. According to the phytomass files annual productivity ranges from 10 to 59 tonnes per hectare, the latter figure from Westlake's (1963) estimate of 57 - 59 tonnes[269]. In addendum, Westlake cites evidence that *Arundo donax* can produce 40-75 MT/ha/yr. in warm temperate and tropical regions. Early vegetative growth has ME (metabolizable energy) of 2.22 megacalories/kg DM, while hay has an ME of only 1.37 (Gohl, 1981). Such annual productivity, if sustainable, makes this a notable energy candidate, especially when one considers the energy as a by-product, with leaf protein and potential pharmaceutical as primary products[269]. A particular type of cellulose is obtained from the plant[7]. In Italy, the plant is used in the manufacture of rayon[269]. Bio-fuel crop.

**dwatta Diaphoretic Diuretic Emollient Galactofuge Hypotensive**The root is diaphoretic, diuretic, emollient and galactofuge[7]. An infusion is said to stimulate menstrual discharge and diminish milk flow[240, 272]. A paste of the root is applied to the forehead to treat headaches[272]. Isolated alkaloids have been experimentally shown to raise the blood pressure and contract the intestine and uterus[240]. The rhizome or rootstock is used in the treatment of dropsy. Boiled in wine with honey, the root or rhizome has been used for treating cancer[269]. The plant contains the alkaloid gramine. This is said to be a vasopressor, raising the blood pressure in dogs after small doses, causing a fall in larger doses[269]. The stems have been used as splints for broken limbs[257].

**propta Seed** - surface sow in a greenhouse in February to April. Stand the pots in about 3cm of water to keep the soil moist until the seed germinates. It usually germinates in 1 - 3 months at 15°C[134]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Once they are 20cm or more tall, plant them out into their permanent positions in late spring or early summer. Division in spring[1]. Whilst large divisions can be planted out direct into their permanent positions, we have found that it is best to pot the divisions up and keep them in light shade in a greenhouse until they are rooting away well. Stem cuttings, planted in water, root easily[1].

**nwatta Fodder:** Bank Industrial Crop: Biomass Management Hay Minor Global CropLandscape Uses:Container, Screen, Specimen, Winter interest. Prefers a moist fertile soil in a sunny sheltered position, preferably by water[1, 134, 200]. Tolerates a pH in the range 5.5 to 8.3. Plants can be grown as a specimen in lawns etc, succeeding in quite coarse grass[233]. Plants are succeeding in a site that is very exposed to maritime winds at Rosewarne in Cornwall[K]. Adapted to tropical, subtropical and warm temperate climates of the World, Giant reed is often found on sand dunes near seashores. It tolerates some salt. It grows best along river banks and in other wet places, and is best developed in poor sandy soil and in sunny situations. Said to tolerate all types of soils, from heavy clays to loose sands and gravelly soils. Ranging from Cool Temperate Wet through Tropical Dry to Wet Forest Life Zones, giant reed is reported to tolerate annual precipitation of 30 to 400cm, an average annual temperature range of 9 to 28.5°C and a pH in the range of 5.0 to 8.7[269]. One report says that this plant is only hardy in the milder areas of Britain[1] whilst another report says that it is hardy to between -5 and -10°C[200]. This contradicts with the hardness zone rating of 6 which would make the plant hardy in most areas of Britain[200]. Plants thrive outdoors at Oxford Botanical Gardens[233] as well as at Hilliers Arboretum in Hampshire and the RHS Gardens in Surrey[K]. Extensively cultivated in S. Europe for basket making etc[50]. Plants rarely if ever flower in British gardens[233]. Members of this genus are rarely if ever troubled by browsing deer[233]. **Special Features:** Attracts birds, Attractive foliage, Not North American native, Naturalizing, Wetlands plant, Suitable for cut flowers, Suitable for dried flowers, Attractive flowers or blooms.

## 7.2.99 Brassica napus

Colza, Rape

6 tlin 9 cyuc 3 kcaok 0 tcan 2 dwat 1.2 m hkuc hminhtut cyutili tcup hwicli hrasjlutnykfrif hpa7tli frusflat-prikliwsslip hpa7tmwatli fyfixre7t hjonli

**drutta Brassica napus** is a ANNUAL/BIENNIAL growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from May to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**kcakta Edible Parts:** Leaves Oil Oil Seed Stem**Edible Uses:** Condiment Oil OilLeaves - raw or cooked[4, 34, 37]. Added to salads or used as a potherb[183, 272]. The leaves are also fermented for later use[272]. Immature flowering stems - cooked in much the same way as broccoli[183]. An edible oil is obtained from the seed, it is used mainly for cooking purposes, but can also be used raw in salad dressings[4, 13, 34, 46, 183]. Some caution is advised, however, see the notes above on toxicity. The sprouted seed is often used as the mustard part of mustard and cress. Eaten in salads[4, 34, 37, 183]. The seed is used as a mustard flavouring[183].

**tcanta Green manure Oil Oil**The seed contains up to 45% of an edible semi-drying oil, it is used as a luminant, lubricant, in soap making etc[13, 21, 57, 142]. Rapeseed oil has potential market in detergent lubrication oils, emulsifying agents, polyamide fibres, and resins, and as a vegetable wax substitute. According to the Chemical Marketing Reporter (April 26, 1982) "the most common use for the oil is still in the production of erucic acid, a fatty acid used in turn in the manufacture of other chemicals[269]. The seed husks are used in plastering house walls[272]. A good green manure, the deep taproot improves drainage and loosens heavy soils[18, 20, 87].

**dwatta Diuretic Emollient**The root is emollient and diuretic[240]. The juice of the roots is used in the treatment of chronic coughs and bronchial catarrh[240, 269]. The seed, powdered, with salt is said to be a folk remedy for cancer[269]. Rape oil is used in massage and oil baths, it is believed to strengthen the skin and keep it cool and healthy. With camphor it is applied as a remedy for rheumatism and stiff joints[269]. It is dropped into the ear to relieve ear-aches[272].

**propta Seed** - sow in situ in early spring to mid-August for a green manure crop.

**nwatta** Succeeds in full sun in a well-drained fertile preferably alkaline soil[200]. Succeeds in any reasonable soil[52]. Prefers a heavy soil and cool moist conditions[16, 20]. Sunny days and cool nights are favourable for plant growth whilst dry weather at harvest time is essential[269]. Colza is reported to tolerate an annual precipitation of 30 to 280cm, an annual average temperature range of 5 to 27°C and a pH in the range of 4.2 to 8.2[269]. Very young plants are susceptible to cold damage, -4°C either killing or injuring seedlings, whereas -2°C has no effect when the plants are more than one month old[269]. *Brassica napus* is an aggregate species, probably derived through cultivation. It is thought that crosses of *Brassica oleracea* subsp. *oleracea* with *B. rapa* gave rise to the subsp. *B. napus pabularia*, from which subsp. *napus* and subsp. *rapifera* and other cvs were derived[269]. The aggregate species includes forms with swollen edible roots (*B. napus napobrassica*, the garden swede), forms grown for their oil-rich seeds (*B. napus napus*, the oilseed rape), forms grown for their edible leaves (*B. napus pabularia*, the rape kales) whilst the form grown as a green manure is *B. napus arvensis*. All these forms are treated separately here. The oil obtained from the seed is high in erucic acid and glucosinolates, both of which have anti-nutritional properties. Cultivars have been developed that have a low content of these items and are therefore suitable for food. Colza is 70% self-pollinating and 30% cross-pollinated. Even if wind and insects are absent, seed are still produced. Yield increases with honeybees[269]. The growth of this plant is inhibited by field mustard and hedge mustard growing nearby[18, 20]. This species is closely related to *B. rapa*[200].

soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline and saline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure.

**kcakta Edible Parts:** Flowers Leaves**Edible Uses:** Gum TeaYoung leaves - cooked. An aromatic flavour[2, 106, 178, 179]. They are used as a potherb[183]. Flowers - cooked. Eaten as a vegetable[183]. The dried leaves are a tea substitute[177, 183].

**tcanta Fodder Gum Plaster PlasterA** gummy extract of the plant is used as a plaster[178]. No more details are given. Wood - dense, hard, strong, takes a good polish. Used for furniture, industrial applications, firewood etc[74, 158, 272].

**dwatta Analgesic Anthelmintic Carminative Digestive Diuretic Oxytotic Plaster Plaster Sedative Stimulant Tonic Vulnerary**The flower heads are carminative, digestive, sedative and tonic[176, 218, 238]. They are used internally in the treatment of insomnia, irritability, breathlessness and poor memory[176, 238]. The flowers are harvested as they open and are dried for later use[238]. The stem bark is anodyne, anthelmintic, carminative, discutient, diuretic, oxytotic, sedative, stimulant, tonic, vermifuge and vulnerary[176, 178, 218]. It is used internally in the treatment of insomnia, irritability, boils and carbuncles[238]. Externally, it is applied to injuries and swellings[238]. The bark is harvested in spring or late summer and is dried for later use[238]. A gummy extract obtained from the plant is used as a plaster for abscesses, boils etc and also as a retentive in fractures and sprains[218].

**propta Seed** - pre-soak 24 hours in hot water and sow March/April in a greenhouse or sow as soon as it is ripe in a cold frame[113]. Germinates in 2 - 3 months at 19°C. Scarification helps[133]. There are about 11,000 seeds to a pound, about 25 - 33% of which germinate[227]. Prick out the seedlings into individual pots of fairly rich soil when they are large enough to handle and grow them on in the greenhouse for at least their first winter. Plant out in late spring or early summer and consider giving them some protection from the cold for their first winter or two outdoors[K]. Root cuttings, late winter in a greenhouse[113, 200]. Cuttings of half-ripe wood, July/August in a frame[200]. Suckers planted out in late winter[200].

**nwatta Agroforestry Services:** Alley crop Agroforestry Services: Contour hedgerow Agroforestry Services: Crop shade Agroforestry Services: Nitrogen Fodder: Bank Fodder: Insect Industrial Crop: Biomass Management: Coppice Management: Standard Regional Crop**Requires** a well-drained moisture retentive soil and a very sunny position[200]. Succeeds in dry soils. Highly fertile soils can promote soft sappy growth which is frost tender[200]. Trees tolerate a high pH, saline soils, high winds and drought[200, 238]. They also succeed in poor soils[238]. Trees prefer a more continental climate than Britain[11] and when dormant are hardy to about -20°C in such a zone[200]. They are only hardy to about -10°C in the maritime climate of this country[200]. The young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. They succeed on a sunny wall at Kew[11], and also in a more open but sunny sheltered position there[K], but only rarely succeed outdoors in the mildest areas of Britain[1]. If killed back to the ground by a severe winter, plants can often resprout from the base[200]. The form 'Rosea' is hardier and more compact, succeeding even in the drier parts of Britain if given some protection[11]. Plants are quite tolerant of pruning and can be fan-trained for growing on a wall. Any pruning is best done in late winter or early spring[202]. Often grown as a summer bedding plant[1]. Quite tolerant of being transplanted[200]. Plants often produce suckers[200]. Plants in this genus are notably resistant to honey fungus[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. **Special Features:**Attracts birds, Attractive foliage, Not North American native, Invasive, Fragrant flowers, Blooms are very showy.

## 7.1.8 Alhagi maurorum

Camel Thorn

tfo2n 6 tlin 10 cyuc 2 kcaok 0 tcan 2 dwat m hkuc htut cyutili kyucup hwicli hrasjlut hpa7tli flatprikliwshsom hpa7tmwatli xre7t hjonli

**drutta Alhagi maurorum** is a deciduous Shrub growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in July. The species is hermaphrodite (has both male and female organs). It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in saline soils. It cannot grow in the shade. It prefers dry or moist soil.

**kcakta Edible Parts:** Manna**Edible Uses:** A sweet-tasting manna is exuded from the twigs at flowering time[2, 22, 105, 177]. It is exuded during hot weather according to one report[1]. It contains about 47% melizitose, 26% sucrose, 12% invert sugar[114]. Another manna is obtained from the pods - it is sweet and laxative[61]. Root - cooked. A famine food, it is only used in times of need[46, 61, 177].

**tcanta None known**

**dwatta Diaphoretic Diuretic Expectorant Laxative**The whole plant is diaphoretic, diuretic, expectorant and laxative[46, 114]. An oil from the leaves is used in the treatment of rheumatism[238]. The flowers are used in the treatment of piles[238].

**propta Seed** - pre-soak the seed for 12 hours in warm water and sow March/April in a warm greenhouse. When large enough to handle, prick the seedlings out into individual pots and grow them on in a greenhouse for at least the first winter. Plant out into their permanent positions in the summer. Cuttings of young shoots in a frame[1].

**nwatta** Requires a sunny position in a well-drained light or medium soil. Plants are not very hardy in Britain, they can be grown outdoors in the summer but require protection in the winter[1]. The stems of the plant are covered in sharp spines[245]. Like the closely related gorse (*Ulex europaea*) the flowers have a pineapple scent[245]. (A slightly strange report because the gorse flowers have a strong coconut fragrance[K]). This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

## 7.1.9 Acacia decurrens

Green Wattle

tfo2n 6 tlin 9 cyuc 2 kcaok 3 tcan 1 dwat 12 m hkuc htut cyutili kyucup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli xre7t hjonli

**drutta Acacia decurrens** is an evergreen Tree growing to 12 m (39ft 4in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower in April. The species is hermaphrodite (has both male and female organs). It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers dry or moist soil.

**kcakta Edible Parts:** Flowers**Edible Uses:** Gum**Flowers** - cooked[144]. Rich in pollen, they are often used in fritters. A gum that exudes naturally from the trunk is edible and is used as a substitute for Gum Arabic in making jellies etc[46, 105, 177]. It is insoluble in water[153] and is of low quality[64]. Larger quantities can be obtained by tapping the trunk[64]. Some species produce a gum that is dark and is liable to be astringent and distasteful, but others produce a light gum and this is sweet and pleasant. It can be sucked like candy or soaked in water to make a jelly[193]. The gum can be warmed when it becomes soft and chewable[193].

**tcanta Dye Gum Hedge Hedge Soil stabilization Tannin**A yellow dye is obtained from the flowers[168]. A green dye is obtained from the seed pods[168]. The extensive root system of this plant helps to prevent soil erosion[200]. Often grown as a screen in Australia[157]. The bark contains about 40% tannin[61, 171]. On a 10% moisture basis, the bark contains 36.6% tannin[223].

**dwatta Astringent**The bark is astringent[4, 153]. It should be stored for 12 months before being used[4]. Its

main use is in the treatment of diarrhoea[4].

propta Seed - best sown as soon as it is ripe in a sunny position in a warm greenhouse[1]. Stored seed should be scarified, pre-soaked for 12 hours in warm water and then sown in a warm greenhouse in March. The seed germinates in 3 - 4 weeks at 25°C[133]. As soon as the seedlings are large enough to handle, prick them out into individual pots and grow them on in a sunny position in the greenhouse for their first winter. Plant them out in late spring or early summer, after the last expected frosts, and consider giving them some protection from the cold for their first winter outdoors. Cuttings of half-ripe wood with a heel, July/August in individual pots in a frame[78]. Overwinter in a greenhouse for the first winter and plant out in their permanent positions in late spring or early summer. Fair percentage[78].

nwatta Prefers a light sandy loam and a very sunny position sheltered from strong winds[1, 49, 89]. Succeeds in any good garden soil that is not excessively limey[11], it also succeeds in dry soils. Most species in this genus become chlorotic on limey soils[200]. Plants tolerate temperatures down to about -5°C[260]. This species is one of the hardiest members of the genus, it succeeds outdoors in the milder areas of the country, but even in Cornwall it can be killed back to the ground in excessively harsh winters[11]. It will, however, usually resprout from the base. Plants require hot, sunny summers if they are to ripen their wood fully and flower freely. In Britain they tend to do best when grown in coastal gardens in a sunny, sheltered position that is protected from the wind[11]. A fast-growing and very ornamental tree[1, 260], it is closely related to *A. dealbata*[11]. The cultivar 'Mollis' is notably resistant to honey fungus[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

## 7.1.10 Ceanothus integerrimus

Deer Brush

tfo2n 6 tlin 9 cyuc 2 ckak 0 tcan 1 dwat 4 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlut hpa7tli flatprikliws hpa7tmwatli xre7t hjonli

drutta *Ceanothus integerrimus* is a deciduous Shrub growing to 4 m (13ft 1in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in June, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: SeedEdible Uses: Seed - raw or cooked. Used as pineole[105, 161, 177, 257].

tcanta Basketry Dye Miscellany SoapA green dye is obtained from the flowers[168]. Young flexible shoots can be used for the circular withes of baskets[257]. All parts of the plant are rich in saponins - when crushed and mixed with water they produce a good lather which is an effective and gentle soap[168, 169]. This soap is very good at removing dirt, though it does not remove oils very well. This means that when used on the skin it will not remove the natural body oils, but nor will it remove engine oil etc[K]. The flowers are a very good source, when used as a body soap they leave behind a pleasant perfume on the skin[K]. The developing seed cases are also a very good source of saponins[K].

dwatta MiscellanyThe plant has been used by some native North American Indian tribes to treat women who have suffered injury in childbirth[257].

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed should be pre-soaked for 12 hours in warm water and then given 1 - 3 months stratification at 1°C[138, 200]. Germination usually takes place within 1 - 2 months at 20°C[138]. Another report says that the seed is best given boiling water treatment, or heated in 4 times its volume of sand at 90 - 120°C for 4 - 5 minutes and then soaked in warm water for 12 hours before sowing it[214]. It then requires a period of chilling below 5°C for up to 84 days before it will germinate[214]. The seed exhibits considerable longevity, when stored for 15 years in an air-tight dry

container at 1 - 5°C it has shown little deterioration in viability[214]. The seed is ejected from its capsule with some force when fully ripe, timing the collection of seed can be difficult because unless collected just prior to dehiscence the seed is difficult to extract and rarely germinates satisfactorily[214]. Prick out the seedlings into individual pots as soon as they are large enough to handle. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in late spring or early summer. Cuttings of half-ripe wood, taken at a node[200], July/August in a frame[11]. Cuttings of mature wood of the current year's growth, 7 - 12 cm with a heel, October in a cold frame[78]. The roots are quite brittle and it is best to pot up the callused cuttings in spring, just before the roots break[78]. Good percentage.

nwatta Prefers a warm sunny position but tolerates light shade[11, 200]. Tolerates some lime, but will not succeed on shallow chalk[200]. Requires a well-drained soil. This species is hardy to about -10°C[184, 200] according to some reports whilst another says that it requires a sheltered position or the protection of a wall when grown outdoors in Britain[1]. Plants dislike root disturbance, they should be planted out into their permanent positions whilst still small[182]. Dislikes heavy pruning, it is best not to cut out any wood thicker than a pencil[182]. Any pruning is best carried out in the spring[219]. Fast growing but short lived, it flowers well when young, often in its second year from seed[11]. Hybridizes freely with other members of this genus[200]. Some members of this genus have a symbiotic relationship with certain soil micro-organisms, these form nodules on the roots of the plants and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200, 212].

## 7.1.11 Phaseolus polystachios

Thicket Bean. Wild bean

tfo2n 6 tlin 10 cyuc 2 ckak 3 tcan 0 dwat 3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliws hpa7tmwatli hjonli

drutta *Phaseolus polystachios* is a CLIMBER growing to 3 m (9ft) by 0.2 m (0ft 8in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. The flowers are pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Seed SeedpodEdible Uses: Edible Portion: The seeds are eaten, fresh or dried. Seeds - cooked[1438 ]. The elongate seedpod can be 70mm long and 12 mm wide, containing black, squarish seeds around 6mm long, 6 - 7mm wide and 4mm thick[1555 ]. Carbon farming - Staple Crop: protein.

tcanta Carbon farming - Agroforestry Services: nitrogen.

dwatta None Known

propta Like many species within the family Fabaceae, once they have ripened and dried the seeds of this species may benefit from scarification before sowing in order to speed up and improve germination. This can usually be done by pouring a small amount of nearly boiling water on the seeds (being careful not to cook them!) and then soaking them for 12 - 24 hours in warm water. By this time they should have imbibed moisture and swollen - if they have not, then carefully make a nick in the seedcoat (being careful not to damage the embryo) and soak for a further 12 hours before sowing[ K ].

nwatta Agroforestry Services: Nitrogen Historic Crop Management: Standard Staple Crop: ProteinClimate: cold temperate to tropical. Humidity: humid. Found in the wild on a range of soils from clays to sands[1555 ]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[755 ]. Carbon Farming - Cultivation: historic crop. Management: standard. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root

soil. Succeeds in most soils. Although given a hardiness rating of 9 in [200] (which means that a plant is not very frost-tolerant), this species is thriving in a sunny bed at Kew Botanical Gardens and so should be hardy to at least zone 7[K]. Another report says that it withstands temperatures down to about -40°C when dormant. Yet another report says that it should succeed outdoors in the milder and drier counties, but that it is not very long-lived[233]. The flowers are very attractive to bees. The flowers are pink or red.

## 7.2.96 Asarum caudatum

Wild Ginger. British Columbia wildginger

6 tlin 10 cyuc 3 ckak 0 tcan 2 dwat 0.1 m hkuc pcmhmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta *Asarum caudatum* is an evergreen Perennial growing to 0.1 m (0ft 4in) by 0.3 m (1ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: Edible Uses: Condiment TeaThe root can be used as a ginger substitute[183]. The root has a pungent, aromatic smell like mild pepper and ginger mixed, but more strongly aromatic. It can be harvested all year round, but is best in the autumn[K]. It can also be dried for later use[K]. Leaves are a tea substitute[177, 183].

tcanta A useful ground-cover plant for deep shade[187], spreading by its roots[208].

dwatta Analgesic Antirheumatic Appetizer Laxative Poulitce Stomachic TonicThe root is laxative, stomachic and tonic[61, 257]. A tea made from the root is used in the treatment of colds, colic, indigestion and stomach pains[213, 257]. The root is harvested in the autumn and dried for later use[238]. The whole plant is analgesic, antirheumatic, appetizer and tonic[257]. A decoction is used externally to treat headaches, intestinal pain and knee pains[257]. A poultice made from the heated leaves is applied to boils, skin infections and toothaches, whilst a decoction of the leaves is used as a wash on sores[257].

propta Seed - best sown in a cold frame as soon as it is ripe in the summer[134]. Stored seed will require 3 weeks cold stratification and should be sown in late winter[134]. The seed usually germinates in the spring in 1 - 4 or more weeks at 18°C[134]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least their first winter. Plant them out when large enough in late spring. Division in spring or autumn. Plants are slow to increase[200]. It is best to pot the divisions up and keep them in light shade in the greenhouse until they are growing away strongly.

nwatta Landscape Uses:Ground cover, Woodland garden. Prefers a rich moist neutral to acid soil in woodland or a shady position in the rock garden[1, 200]. Plants are hardy to at least -15°C[200]. The flowers are malodorous and are pollinated by flies[200]. Plants often self-sow when growing in a suitable position[200]. Special Features:Attractive foliage, North American native, Fragrant foliage, Inconspicuous flowers or blooms.

## 7.2.97 Allium drummondii

Prairie Onion, Drummond's onion

6 tlin 9 cyuc 3 ckak 0 tcan 2 dwat 0.3 m hkuc htut cyutli tcup hwicli hrasjlut hpa7tli flatprikliws hpa7tmwatli xre7t hjonli

drutta *Allium drummondii* is a BULB growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from April to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Bulb - raw or cooked[161, 177, 257]. Used mainly as a condiment[177], the bulb is also eaten as a vegetable[183]. The bulb is rather small, up to 25mm tall and 15mm in diameter[235]. Leaves - raw or cooked. Flowers - raw. Used as a garnish on salads.

tcanta RepellentThe juice of the plant is used as a moth repellent. The whole plant is said to repel insects and moles[20].

dwatta Although no specific mention of medicinal uses has been seen for this species, members of this genus are in general very healthy additions to the diet. They contain sulphur compounds (which give them their onion flavour) and when added to the diet on a regular basis they help reduce blood cholesterol levels, act as a tonic to the digestive system and also tonify the circulatory system[K].

propta Seed - sow spring in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle - if you want to produce clumps more quickly then put three plants in each pot. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in spring once they are growing vigorously and are large enough. Division in spring. The plants divide successfully at any time in the growing season, pot up the divisions in a cold frame or greenhouse until they are growing well and then plant them out into their permanent positions.

nwatta Prefers a sunny position in a light well-drained soil[1]. Succeeds in the rock garden, though in cold wet areas it is best grown in a bulb frame or cold greenhouse[203]. The bulbs should be planted fairly deeply[1]. Most members of this genus are intolerant of competition from other growing plants[203]. The plants are much liked by grazing animals and have become rare or absent on pasture land[203]. Grows well with most plants, especially roses, carrots, beet and chamomile, but it inhibits the growth of legumes[18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 7.2.98 Arundo donax

Giant Reed, Giant Reed Grass

6 tlin 10 cyuc 3 ckak 4 tcan 2 dwat 6 m hkuc htut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flatprikliwsslip hpa7tmwatli xre7t hjonli

drutta *Arundo donax* is a PERENNIAL growing to 6 m (19ft) by 4 m (13ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in September, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers moist or wet soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: Leaves RootEdible Uses: Rhizome - raw or cooked[84]. The rhizome can be dried and ground into a powder to make bread, usually in conjunction with cereal flours[7, K]. It can also be roasted or boiled[84]. Leaves - cooked as a potherb[84]. They are very bitter[177]. The young shoots are used[177].

tcanta Basketry Biomass Broom Dye Fodder Hedge Hedge Musical Paper Pipes Plant support Shelterbelt Soil stabilization Thatching WeavingBrooms are made from the terminal panicles[7]. Plants are grown alongside irrigation canals to check soil erosion[169]. The plant can be grown as a windbreak screen[1, 169]. If cut down, the culms branch and in this form the plants can be used as a hedge[236]. The leaves can be woven into mats etc, whilst the split and flattened stems are used to make screens, walls of houses etc[46, 50, 61, 84]. A yellow dye is obtained from the pollen[257]. The stems of the plant have a multitude of applications. They are used as plant supports for vines and other climbing plants[7, 169, 269] and to make clarinets, bag-pipes etc[46, 61, 103]. They are also used as pipe stems[84], for roofing[46], to make screens, walking sticks and in basketry[100, 195]. They are used to make the reeds of clarinets and organ pipes[236]. The stems can be harvested as desired at any time of the year[269]. The fibre from the stems can be

81]. Soaking the seed for 3 - 6 seconds in boiling water may speed up the germination process[11]. The seed is best sown as soon as it is ripe in a cold frame. Some might germinate in the following spring, though most will take another year. Another possibility is to harvest the seed 'green' (when the embryo has fully formed but before the seedcoat has hardened). The seedlings can be potted up into individual pots when they are large enough to handle. Grow on in pots until large enough, then plant out in early summer. When stored dry, the seed can remain viable for several years[1]. Cuttings of mature wood, 5 - 10cm with a heel, September/October in a cold frame. Plant out in the following autumn[1, 78]. Layering in September/October. Takes 12 months[78].

nwatta Succeeds in dry soils, tolerating drought once it is established[185]. Succeeds in most soils if they are well drained, preferring a neutral or slightly alkaline soil[11]. Prefers a limestone soil, growing well on chalk, but it also succeeds in very acid soils[200]. Grows well on dry banks[200]. A very ornamental plant[1] that is fairly fast growing for a juniper[81, 185]. A tree at Westonbirt Arboretum was 7 metres tall after 23 years[81, 185]. This species is resistant to honey fungus[88]. Cones are rarely if ever produced in Britain, could this be due to a lack of female trees?[1] Only male trees have been seen in cultivation in Britain[185]. Seed takes 2 years to mature[200]. Dioecious. Male and female plants must be grown if seed is required.

### 7.2.93 Allium giganteum

Giant Onion, Ornamental Onion

6 tin 10 cyuc 3 kcaak 0 tcan 2 dwat 2 m hkuc

htut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Allium giganteum is a BULB growing to 2 m (6ft) by 0.2 m (0ft 8in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Bulb - raw or cooked[K]. We have seen no reports of edibility, but the bulb is certainly not poisonous and has a pleasant mild onion flavour[K]. The fairly large bulbs are 4 - 6cm in diameter[200]. Leaves - raw or cooked. Flowers - raw. Used as a garnish on salads.

tcanta RepellentThe juice of the plant is used as a moth repellent. The whole plant is said to repel insects and moles[20].

dwatta Although no specific mention of medicinal uses has been seen for this species, members of this genus are in general very healthy additions to the diet. They contain sulphur compounds (which give them their onion flavour) and when added to the diet on a regular basis they help reduce blood cholesterol levels, act as a tonic to the digestive system and also tonify the circulatory system[K].

propta Seed - sow spring in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle - if you want to produce clumps more quickly then put three plants in each pot. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in spring once they are growing vigorously and are large enough. Division in spring. The plants divide successfully at any time in the growing season, pot up the divisions in a cold frame or greenhouse until they are growing well and then plant them out into their permanent positions.

nwatta Landscape Uses:Container, Foundation, Massing, Rock garden, Specimen. Prefers a hot, sunny position in a light well-drained soil[1], it grows well in the light shade of thinly-clad shrubs that also like hot dry conditions[200]. The bulbs tend to rot when grown in cool wet climates, even if they are given sharp drainage[203]. One report says that this species is only hardy to zone 8, which only covers the mildest areas of Britain[200], whilst another says that it is much harder and will succeed in zone 4[203]. It is being grown successfully about 60 kilometres west of London, and so should be hardy at least in the south of Britain[242]. The bulbs should be planted fairly deeply[1]. Most members of this genus are intolerant of competition from other growing plants[203]. Grows well with most plants, especially roses,

carrots, beet and chamomile, but it inhibits the growth of legumes[18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. Members of this genus are rarely if ever troubled by browsing deer[233]. Special Features: Attractive foliage, Fragrant foliage, Not North American native, Attracts butterflies, Suitable for cut flowers, Suitable for dried flowers.

### 7.2.94 Lallelantia iberica

6 tin 9 cyuc 3 kcaak 0 tcan 0 dwat 0.5 m hkuc

htut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Lallelantia iberica is a ANNUAL/BIENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Leaves Oil Oil SeedEdible Uses: Oil OilLeaves - cooked and used as a potherb[46, 61, 105, 177, 183]. Seed - raw or cooked. It is rich in oil[2]. An edible oil is obtained from the seed[2, 6, 105, 177, 183].

tcanta Oil OilThe seed contains up to 30% of a drying oil[61]. It is used for lighting, as a varnish, in paints and as a lubricant[46, 57, 74]. It is a linseed substitute[114]. Linseed oil has a very wide range of applications including use as a wood preservative, an ingredient of oil-based paints, furniture polishes, printer's inks, soap making etc[46, 57, 244]. It is also used in the manufacture of linoleum[169].

dwatta None known

propta Seed - sow April in situ[1]. Very fast germination[K].

nwatta Requires a light well-drained soil in a sunny position[200]. Prefers a cool situation[1]. Often grown in the ornamental garden[50]. The flowers are very attractive to bees[74].

### 7.2.95 Agastache mexicana

Mexican Giant Hyssop

6 tin 10 cyuc 3 kcaak 2 tcan 0 dwat m hkuc

htut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Agastache mexicana is a PERENNIAL growing to 0.8 m (2ft 7in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in August, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: LeavesEdible Uses: TeaThe highly aromatic young leaves are used as a flavouring in salads and cooked foods[183]. The young leaves are used to make a herbal tea[183].

tcanta Attracts wildlife. The flowers are very attractive to bees.

dwatta None known

propta Seed - sow spring in a greenhouse and only just cover the seed. The seed usually germinates in 1 - 3 months at 13°C[133]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse for their first year. Plant out in late spring or early summer[K]. Division in spring. Fairly simple, if large divisions are used it is possible to plant them straight out into their permanent positions. Basal cuttings of young shoots in spring[111]. Harvest the young shoots when they are about 10 - 15cm tall and pot them up in a lightly shaded position in a greenhouse. They should root within 3 weeks and can be planted out in the summer or following spring.

nwatta A perennial plant. It can be grown as an annual. Prefers a warm sunny sheltered position and a well-drained

pattern is also useful and given here if available. Growth habit is a single or multiple shooting vine from a crown [1-2]. Herbaceous.

#### 7.1.12 Ceanothus cuneatus

Buckbrush, Sedgeleaf buckbrush, Monterey ceanothus

tfo2n 6 tin 9 cyuc 2 kcaak 0 tcan 1 dwat 1.8 m hkuc

hmimhtut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Ceanothus cuneatus is an evergreen Shrub growing to 1.8 m (6ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower in May, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: SeedEdible Uses: TeaSeed[94]. No more details are given. The leaves and flowers make an excellent tea when steeped in boiling water for about 5 minutes[183].

tcanta Dye SoapA green dye is obtained from the flowers[168]. A red dye is obtained from the root[94]. The stems have been used as rods in basket making[257]. All parts of the plant are rich in saponins - when crushed and mixed with water they produce a good lather which is an effective and gentle soap[94, 168, 169]. This soap is very good at removing dirt, though it does not remove oils very well. This means that when used on the skin it will not remove the natural body oils, but nor will it remove engine oil etc[K] The flowers are a very good source, when used as a body soap they leave behind a pleasant perfume on the skin[K]. The developing seed cases are also a very good source of saponins[K].

dwatta Astringent Digestive Hepatic Pectoral TonicAstringent, digestive, pectoral, tonic. A liver tonic[94].

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed should be pre-soaked for 12 hours in warm water and then given 1 - 3 months stratification at 1°C[138, 200]. Germination usually takes place in 1 - 2 months at 20°C[138]. One report says that the seed is best given boiling water treatment, or heated in 4 times its volume of sand at 90 - 120°C for 4 - 5 minutes and then soaked in warm water for 12 hours before sowing it[214]. The seed exhibits considerable longevity, when stored for 15 years in an air-tight dry container at 1 - 5°C it has shown little deterioration in viability[214]. The seed is ejected from its capsule with some force when fully ripe, timing the collection of seed can be difficult because unless collected just prior to dehiscence the seed is difficult to extract and rarely germinates satisfactorily[214]. Prick out the seedlings into individual pots as soon as they are large enough to handle. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in late spring or early summer. Cuttings of half-ripe wood, taken at a node[200], July/August in a frame[11]. Cuttings of mature wood of the current year's growth, 7 - 12 cm with a heel, October in a cold frame[78]. The roots are quite brittle and it is best to pot up the callused cuttings in spring, just before the roots break[78]. Good percentage.

nwatta Prefers a warm sunny position but tolerates light shade[11, 200]. Prefers a light soil with a low lime content[108]. Tolerates some lime, but will not succeed on shallow chalk[200]. Plants dislike root disturbance, they should be planted out into their permanent positions whilst still small[182]. Dislikes heavy pruning, it is best not to cut out any wood thicker than a pencil[182]. Plants flower on the previous year's growth, if any pruning is necessary it is best carried out immediately after flowering[200, 219]. Constant pruning to keep a plant small can shorten its life[200]. A fast-growing plant, it flowers well when young, often in its second year from seed[11]. Hybridizes freely with other members of this genus[200]. Some members of this genus have a symbiotic relationship with certain soil micro-organisms, these form nodules on the roots of the plants and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200, 212].

### 7.1.13 Lupinus littoralis

Seashore Lupine

tfo2n 6 tin 9 cyuc 2 kcaak 3 tcan 0 dwat 0.5 m hkuc

htut cyutli hgattcup hwicli hyishrasjlutnyik hpa7tli frusflat-prik hpa7tmwatli xre7t hjonli

drutta Lupinus littoralis is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to October, and the seeds ripen from July to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It cannot grow in the shade. It prefers moist soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: RootEdible Uses: Root - raw or cooked[257]. The root can be dried and roasted[2, 44, 61, 161]. A sweet flavour; almost like sugar[256]. The tough and fibrous roots are rich in starch[2]. The root is roasted and then pounded to loosen the edible fibres from the stem[118]. The roasted, dried and powdered root can be stored for winter use[256]. The roots can be up to 1 metre long[256]. Lupine roots are best not eaten raw since they contain alkaloids that could be poisonous - North American Indians would fall into a drunken sleep if they ate them raw, though they are perfectly safe when cooked[256].

tcanta Green manureA good green manure plant for poor soils[61]. It is quite fast growing and fixes atmospheric nitrogen.

dwatta None known

propta Pre-soak the seed for 24 hours in warm water and then sow in early spring in a greenhouse[1, 200]. Germination should take place within a couple of weeks. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. It should also be possible to sow the seed in situ in mid spring. It might be necessary to protect the sowing from mice. Division in March. Difficult. Basal cuttings, April in a cold frame. Harvest the shoots when they are about 10cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta An easily grown plant, succeeding in any moderately good soil in a sunny position[1, 200]. It strongly dislikes excessive winter wet[1]. Requires an acid to neutral soil[200]. Succeeds in poor soils[60]. Plants dislike root disturbance. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

### 7.1.14 Cercis chinensis

Chinese Redbud

tfo2n 6 tin 8 cyuc 1 kcaak 0 tcan 2 dwat 15 m hkuc

htut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Cercis chinensis is a deciduous Tree growing to 15 m (49ft 3in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It can fix Nitrogen. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Although no records of edibility have been seen for the seed, on a zero moisture basis it contains 16.6% protein, 9.2% fat and 2.8% ash[218].

tcanta None known

dwatta Anthelmintic Diuretic Women's complaintsTreats bladder diseases, post-partum discharges, bleeding piles and internal parasites[178]. The wood and the bark have been used to treat abscesses, bladder ailments and head troubles[218].

propta Seed - best sown as soon as it is ripe in a cold frame[200]. Pre-soak stored seed for 24 hours in warm wa-

ter then cold stratify for 3 months[113]. Sow spring in the greenhouse[78]. As soon as they are large enough to handle, prick the seedlings out into individual pots and grow them on in a greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Plants resent root disturbance and are best planted out in their permanent positions as soon as possible[11]. Cuttings of half-ripe wood, July/August in a frame[200].

nwatta Landscape Uses:Border, Massing, Specimen. Succeeds in most soils and pH types, but dislikes growing in wet soils, especially when these are of clay[200]. Prefers a deep damp sandy loam and a very sunny position[11, 182]. Dislikes drought[200]. Repays generous treatment[11]. Although the dormant plant is cold-hardy, the young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. This species does not flower very freely in Britain. Plants do not thrive at Kew, they prefer a hotter climate[11]. The flowers are produced on the branches of the previous or earlier years, and also on the trunk of the plant[82]. Plants are susceptible to coral spot fungus, especially in areas with cooler summers where the wood is not fully ripened[11]. Plants in this genus are notably resistant to honey fungus[200]. Resents root disturbance, plants should be planted into their permanent positions as soon as possible, preferably in May, and should be kept well watered until established[11]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. Special Features:Not North American native, Blooms are very showy.

### 7.1.15 Gleditsia caspica

Caspian Locust

tfo2n 6 tlin 8 cyuc 1 kcak 0 tcan 0 dwat 12 m hkuc htut cyutli hgatkyuctcup hwicli hrasjlutnyik hpa7tli flatprik-wis hpa7tmwatli xre7t hjonli

drutta Gleditsia caspica is a deciduous Tree growing to 12 m (39ft 4in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from April to May, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. It can tolerate atmospheric pollution.

kcakta Edible Parts: SeedEdible Uses: The seed of several species can be eaten raw or cooked. This species often crops well in this country and so some research into its potential edibility would be desirable[K].

tcanta SoapThe closely related *G. sinensis* has a saponaceous pulp inside the seed pod that can be used as a soap substitute[11]. It is quite probable that this species can be similarly used[K]. Wood - strong, durable, coarse-grained[82].

dwatta None known

propta Seed - pre-soak for 24 hours in warm water and then sow in spring in a greenhouse[78]. The seed should have swollen up, in which case it can be sown, if it has not swollen then soak it for another 24 hours in warm water. If this does not work then file away some of the seed coat but be careful not to damage the embryo[78]. Further soaking should then cause the seed to swell. One it has swollen, the seed should germinate within 2 - 4 weeks at 20°C. As soon as they are large enough to handle, prick the seedlings out into individual deep pots and plant them out into their permanent positions in the summer. Give the plants some protection from the cold for their first few winters outdoors.

nwatta Landscape Uses:Rock garden, Specimen. Easily grown in a loamy soil, requiring a sunny position[11]. Succeeds in most soils[200] including sandy ones[188]. Established plants tolerate drought[1] and atmospheric pollution[200]. This species is often confused in cultivation with the closely related *G. sinensis*, many of the trees grown under that name are this species[11]. This tree is remarkable for the number and length of the spines growing on its

trunk, which makes it the most formidably armed of temperate trees[11]. Trees have a light canopy, they come into leaf late in the spring and drop their leaves in early autumn[200] making them an excellent top storey tree in a woodland garden. Plants in this genus are notably resistant to honey fungus[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. Special Features:Not North American native, Fragrant flowers, Inconspicuous flowers or blooms.

### 7.1.16 Indigofera heterantha

Indigo Bush

tfo2n 6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 3 m hkuc htut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwisslip hpa7tmwatli xre7t hjonli

drutta Indigofera heterantha is a deciduous Shrub growing to 3 m (9ft) by 2.5 m (8ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf from May to November, in flower from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: FlowersEdible Uses: The flowers are boiled and pickled[272].

tcanta Basketry FuelThe branches are used in basket making and in making twig bridges[146, 158]. They are also used as a fuel[145, 158].

dwatta None known

propta Pre-soak the seed for 12 hours in warm water and sow February in a warm greenhouse. The germination can be variable. Prick out the seedlings when large enough to handle and overwinter the young plants in a greenhouse for the first winter, planting out in late spring or early summer after the last expected frosts[78]. Cuttings of half-ripe wood, 5 - 8cm with a heel if possible, July/August in individual pots in a frame. Good percentage[78]. Overwinter the young plants in a greenhouse for the first winter and plant out in late spring or early summer[11]. Root cuttings 3cm long in December. Good percentage[78]. Suckers. Remove them in the dormant season, preferably towards the end of winter, and plant out into their permanent positions.

nwatta Requires a light or medium well-drained soil and a sunny position[11, 200]. Succeeds on chalk[11]. Succeeds in full sun in most well-drained soils[184], including dry ones[182, 202]. Tolerates light shade[202]. The root-stock is hardy to about -15°C[184, 200] and plants resprout from the base if they are cut back by winter cold. Plants are cut back to the ground in most winters at Kew though they are all right in the milder areas of the country[11]. They flower on the current years growth[184] and flower more freely if they are pruned to the ground during the winter or early spring[219]. They do not come into new growth until quite late in the spring[219]. A very ornamental plant[1]. Fast-growing when young, but slowing with age[200]. The flowers have a vanilla scent[245]. Plants in this genus are notably resistant to honey fungus[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

### 7.1.17 Indigofera pseudotinctoria

Indigo

tfo2n 6 tlin 10 cyuc 1 kcak 0 tcan 0 dwat 1 m hkuc htut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwisslip hpa7tmwatli xre7t hjonli

drutta Indigofera pseudotinctoria is a deciduous Shrub growing to 1 m (3ft 3in) by 2 m (6ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suit-

### 7.2.90 Viburnum grandiflorum

Cranberry bush,

6 tlin 9 cyuc 3 kcak 0 tcan 0 dwat 2 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli dyatxre7t hjonli

drutta Viburnum grandiflorum is a deciduous Shrub growing to 2 m (6ft) by 2 m (6ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from January to March. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[11, 51, 105, 272]. A sweet flavour[K]. The ovoid fruit is about 20mm long and contains a single large seed[200].

tcanta None known

dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe. Germination can be slow, sometimes taking more than 18 months. If the seed is harvested 'green' (when it has fully developed but before it has fully ripened) and sown immediately in a cold frame, it should germinate in the spring[80]. Stored seed will require 2 months warm then 3 months cold stratification and can still take 18 months to germinate[113]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame or greenhouse. Plant out into their permanent positions in late spring or early summer of the following year. Cuttings of soft-wood, early summer in a frame[200]. Pot up into individual pots once they start to root and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, 5 - 8 cm long with a heel if possible, July/August in a frame[78, 113]. Plant them into individual pots as soon as they start to root. These cuttings can be difficult to overwinter, it is best to keep them in a greenhouse or cold frame until the following spring before planting them out[113]. Cuttings of mature wood, winter in a frame. They should root in early spring - pot them up when large enough to handle and plant them out in the summer if sufficient new growth is made, otherwise keep them in a cold frame for the next winter and then plant them out in the spring. Layering of current seasons growth in July/August. Takes 15 months[78].

nwatta An easily grown plant, it succeeds in most soils but is ill-adapted for poor soils and for dry situations[1]. It prefers a deep rich loamy soil in sun or semi-shade[11, 200]. Best if given shade from the early morning sun in spring[200]. Requires shelter from north and east winds[200]. A very ornamental plant[1], the deliciously scented flowers are produced in the winter and the flowers are said to withstand temperatures down to -12°C without damage[11, 200]. However fruit is not often produced in this country[K]. This may be due to the plant being self-incompatible and so growing 2 or more different cultivars together may improve fruit set[11, 200]. Hand pollination may also be beneficial as well as sitting the plants so that they get the maximum of protection from severe winter weather[K]. A position against an east-facing wall, or on the edge of a woodland, would be ideal for this[K]. Closely allied to *V. farrieri*. The very closely related species *V. foetens*, which is often included as part of this genus, has a more westerly range, shorter stems and white flowers.

### 7.2.91 Oxalis oregana

Redwood Sorrel

6 tlin 9 cyuc 3 kcak 3 tcan 1 dwat 0.2 m hkuc pcmhmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Oxalis oregana is an evergreen Perennial growing to 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year; in flower from May to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers

moist soil.

kcakta Edible Parts: Flowers LeavesEdible Uses: Leaves - raw or cooked[118, 183, 257]. A acid, flavour, it is especially adored by children and makes an excellent addition to mixed salads[K]. The leaves can be harvested all year round[K]. A mass of the leaves and stems can be allowed to ferment slightly when they make a tasty dessert[183]. A sort of rhubarb pie can be made from the leaf stalks[183]. The leaf stalks are very thin - you would need an awful lot for a pie[K]. Use in moderation, see notes above on toxicity. Flow-ers - raw[K]. A pleasant acid flavour[K].

tcanta A good ground cover plant for a woodland garden[197, 208], though it can be invasive[60]. It needs weeding for the first year or so[197].

dwatta Antirheumatic Ophthalmic PoulticeA decoction of the whole plant has been used as a wash in the treatment of rheumatism[257]. The fresh juice of the plant has been used as eye drops to ease sore eyes[257]. A poultice of the wilted leaves has been used as a dressing on boils, sores and on swollen areas of the skin[257].

propta Seed - best sown as soon as ripe in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in late spring or early summer. Division in spring. Larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Easily grown in a moisture-retentive humus-rich soil in shade or dappled sunlight[200]. Succeeds in dense shade[187]. Grows well in a wild or woodland garden[200]. Plants can be very invasive when in suitable conditions[60]. Plant is growing very vigorously in quite dense shade under an *Elaeagnus* shrub in Cornwall - it stays green all year round and is fairly productive[K]. The plant is heat tolerant in zones 9 through 7. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

### 7.2.92 Juniperus drupacea

Syrian Juniper

6 tlin 9 cyuc 3 kcak 0 tcan 0 dwat 15 m hkuc htut cyutli hgatkyuctcup hwicli hrasjlutnyik hpa7tli frusflat-priklwisslip hpa7tmwatli nyanhjen hjonli

drutta Juniperus drupacea is an evergreen Tree growing to 15 m (49ft) by 2 m (6ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, and the seeds ripen in October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. Large and sweet[2, 61, 105].The cones are about 20 - 25mm in diameter and take 2 years to mature[200].

tcanta None known

dwatta None known

propta The seed requires a period of cold stratification. The seed has a hard seedcoat and can be very slow to germinate, requiring a cold period followed by a warm period and then another cold spell, each of 2 - 3 months duration[78,

cyanate) is used in commercial cat and dog repellent mixtures[269].

dwatta Antirheumatic Appetizer Digestive Diuretic Emetic Epilepsy Rubefacient StimulantMustard seed is often used in herbal medicine, especially as a rubefacient poultice[4]. The seed is ground and made into a paste then applied to the skin[4, 21, 46, 213] in the treatment of rheumatism, as a means of reducing congestion in internal organs[4, 222]. Applied externally, mustard relieves congestion by drawing the blood to the surface as in head afflictions, neuralgia and spasms. Hot water poured on bruised seeds makes a stimulant foot bath, good for colds and headaches. Old herbals suggested mustard for treating alopecia, epilepsy, snakebite, and toothache[269]. Care must be taken not to overdo it, since poultices can sometimes cause quite severe irritation to the skin[K]. The seed is also used internally, when it is appetizer, digestive, diuretic, emetic and tonic[4, 21, 46]. Swallowed whole when mixed with molasses, it acts as a laxative[213]. A decoction of the seeds is used in the treatment of indurations of the liver and spleen. It is also used to treat carcinoma, throat tumours, and imposthumes[269]. A liquid prepared from the seed, when gargled, is said to help tumours of the "sinax." [269]. The seed is eaten as a tonic and appetite stimulant[4, 21, 46, 222]. Hot water poured onto bruised mustard seeds makes a stimulating foot bath and can also be used as an inhaler when it acts to throw off a cold or dispel a headache[4]. Mustard Oil is said to stimulate hair growth. Mustard is also recommended as an aperient ingredient of tea, useful in hiccup. Mustard flour is considered antiseptic[269].

propta Seed - sow in situ from early spring until late summer in order to obtain a succession of crops. The main crop for seed is sown in April.

nwatta An easily grown plant, black mustard is suited to many types of soils except very heavy clays, it grows best on light sandy loams, or deep rich fertile soils[269]. Succeeds in full sun in a well-drained fertile preferably alkaline soil[200]. Prefers a heavy soil in an open position[16]. Another report says that it prefers a light well-drained soil and some shade in the summer[52]. The plant tolerates an annual precipitation of 30 to 170cm, an annual average temperature range of 6 to 27°C and a pH in the range of 4.9 to 8.2[269]. Black mustard is adapted to a wide variety of climatic conditions, it is often grown in the temperate zone though it is mainly suited to tropical areas, and grown chiefly as a rainfed crop in areas of low or moderate rainfall[269]. Black mustard is often cultivated for its edible seed, though it is going out of favour because it rapidly sheds its seeds once they are ripe and this makes it harder to harvest mechanically than the less pungent brown mustard (*Brassica juncea*). This is used especially as a food flavouring, though it is also sown with the seeds of garden cress (*Lepidium sativum*) to provide mustard and cress, a salading eaten when the seedlings are about one week old. Black mustard is also grown as a medicinal plant. It germinates freely and quickly grows rapidly and makes a very useful green manure. The plants are not very winter hardy so the seed is best sown in the spring when grown for its seed whilst it can be sown as late as late summer as a green manure crop. The flowers have a pleasing perfume, though this is only noticed if several flowers are inhaled at the same time[245].

## 7.2.89 Origanum majorana

Sweet Marjoram

6 tin 9 cyuc 3 kcaak 3 tcan 3 dwat m hkuc hmimhtut cyutli kyucctup hwicli hrasjlutnyik hpa7tli flat-prikliwis hpa7tmwatli xre7t hjonli

drutta Origanum majorana is a PERENNIAL growing to 0.6 m (2ft) by 0.6 m (2ft in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to September, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: LeavesEdible Uses: Condi-ment TeaLeaves - raw or cooked[2, 52]. Sweet marjoram is widely used as a flavouring for salad dressings, vegetables,

legumes and oils[7, 14, 27, 61, 171, 238]. It has a more delicate flavour than the closely related oregano (*Origanum vulgare*), and is best when used fresh and only added towards the end of cooking[238]. The aromatic seeds are used as a flavouring in sweets, drinks etc[183]. A herb tea is made from the fresh or dried leaves[21, 183]. The flavour resembles a blend of thyme, rosemary and sage[183].

tcanta Disinfectant Dye EssentialThe leaves and flowers yield 0.3 - 0.4% essential oil by steam distillation[240]. Called 'Oil of Sweet Marjoram', it is used as a food flavouring and in perfumery, soaps, hair products etc[57, 61, 171, 238]. The plant is often used to disinfect bee hives[7].

dwatta Antidepressant Antiseptic Antispasmodic Aromatherapy Carminative Chologogue Diaphoretic Disinfectant Emmenagogue Expectorant Stimulant Stomachic TonicSweet marjoram is mainly used as a culinary herb, but is also medicinally valuable due to its stimulant and antispasmodic properties[254]. It is a good general tonic, treating various disorders of the digestive and respiratory systems. It has a stronger affect on the nervous system than the related oregano (*O. vulgare*) and is also thought to lower the sex drive[254]. Because it can promote menstruation, it should not be used medicinally by pregnant women though small quantities used for culinary purposes are safe[254]. The herb is antiseptic, antispasmodic, carminative, chologogue, diaphoretic, diuretic, emmenagogue, expectorant, stimulant, stomachic and mildly tonic[4, 7, 21, 240]. It is taken internally in the treatment of bronchial complaints, tension headaches, insomnia, anxiety, minor digestive upsets and painful menstruation[238]. It should not be prescribed for pregnant women[238]. Externally, it is used to treat muscular pain, bronchial complaints, arthritis, sprains and stiff joints[238]. The plant is harvested as flowering begins and can be used fresh or dried. Marjoram is often used medicinally in the form of the essential oil, about 400 grams being obtained from 70 kilos of the fresh herb[4]. The oil is used as an external application for sprains, bruises etc[4, 240]. The essential oil is used in aromatherapy. Its keyword is 'Muscle relaxant'[210].

propta Seed - sow early spring at 10 - 13°C and only just cover the seed. Germination usually takes place within 2 - 4 weeks. Prick out the seedlings into individual pots when they are large enough to handle and plant them out into their permanent positions in early summer. The seed can also be sown in situ in April or early May, and, although it can be slow to germinate, usually does well[4]. Division in March or October. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer. Basal cuttings of young barren shoots in June. Very easy. Harvest the shoots with plenty of underground stem when they are about 8 - 10cm above the ground. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Requires a rather dry, warm, well-drained soil, but is not fussy as to soil type[18], thriving on chalk[1, 37]. Prefers slightly alkaline conditions[200]. Sweet marjoram is often cultivated as a culinary herb, there are some named varieties[46, 183]. Plants do not normally survive the winter outdoors in Britain so they are usually grown as an annual[1, 4, 14, 37]. Another report says that it is possible to overwinter plants in areas with cold winters so long as you apply a thick mulch to the roots[200]. Container growing is preferred in areas with cold, wet winters or humid, wet summers. Plants do not often set seed in Britain[K]. A good companion plant, improving the flavour of nearby plants[14, 18, 20]. The flowers are very attractive to bees[108]. The bruised leaves emit a fragrance somewhat resembling thyme, but somewhat sweeter with balsamic undertones[245]. This is a sacred plant in India[171]. Members of this genus are rarely if ever troubled by browsing deer[233]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [2-1].

able for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Flowers LeavesEdible Uses: The leaves and flowers are boiled and eaten[177, 183].

tcanta None known

dwatta None known

propta Pre-soak the seed for 12 hours in warm water and sow February in a warm greenhouse. The germination can be variable. Prick out the seedlings when large enough to handle and overwinter the young plants in a greenhouse for the first winter; planting out in late spring or early summer after the last expected frosts[78]. Cuttings of half-ripe wood, 5 - 8cm with a heel if possible, July/August in well-drained individual pots in a frame. Good percentage[78]. Overwinter the young plants in a greenhouse for the first winter and plant out in late spring or early summer[11]. Root cuttings 3cm long in December. Good percentage[78]. Suckers. Remove them in the dormant season, preferably towards the end of winter, and plant out into their permanent positions.

nwatta Landscape Uses:Border, Container, Massing, Specimen. Requires a light or medium well-drained soil and a sunny position[11, 200]. Succeeds on chalk[11]. Most members of this genus have their top-growth cut back by winter cold in this country. The roots are much hardier, however, and the plants usually resprout freely from the base in late spring, growing away quickly and flowering freely in late summer[K]. Plants in this genus are notably resistant to honey fungus[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. Special Features:Not North American native, Attracts butterflies, Attractive flowers or blooms.

## 7.1.18 Anthyllis vulneraria

Kidney Vetch

tf02n 6 tin 9 cyuc 1 kcaak 0 tcan 2 dwat 0.2 m hkuc htut cyutli hgatkuyuctup hwicli hyhshrasjlut hpa7tli prkiliwssip hpa7tmwatli xre7t hjonli

drutta Anthyllis vulneraria is a PERENNIAL growing to 0.2 m (0ft 8in) by 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from June to September, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). It can fix Nitrogen. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

kcakta Edible Parts: Edible Uses: TeaThe dried flower heads are a tea substitute[9].

tcanta None known

dwatta Antiemetic Antitussive Astringent Laxative VulneraryThe roots leaves and flowers are antitussive, astringent, laxative and vulnerary[7, 9, 13, 21]. This plant is an ancient remedy for skin eruptions, slow-healing wounds, minor wounds, cuts and bruises, it is applied externally[9]. Internally, it is used as a treatment for constipation and as a spring tonic[9]. The plant can be used fresh in the growing season, or harvested when in flower and dried for later use[9].

propta Seed - sow spring or autumn in a cold frame. If there is sufficient seed it can be sown outdoors in situ. Pre-soak the seed for about 12 hrs or scarify the seed[134]. It usually germinates in 1 -2 months at 10°C[134]. When large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring or autumn[200].

nwatta Prefers a sunny position[200] and an alkaline soil[7, 13, 17, 21]. Tolerates a pH in the range 4.8 to 8. Prefers a sandy loam[1, 7]. Thrives in poor soils[200]. A rich food source for bees, butterflies and caterpillars[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix

atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

## 7.1.19 Cercocarpus montanus

Mountain Mahogany, Alderleaf mountain mahogany, Silver mountain mahogany, Island mountain mahogany, tfo2n 6 tin 7 cyuc 0 kcaak 3 tcan 1 dwat m hkuc htut cyutli hgatkuyuctup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Cercocarpus montanus is an evergreen Shrub growing to 4 m (13ft 1in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf all year; in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

kcakta None known

tcanta Broom Dye Fuel Hedge WoodBunches of the tied stems have been used as rough brooms[257]. A red to brown dye can be obtained from the root bark[257]. The bark is often mixed with alder and wild plum root barks when making the dye[257]. Tolerant of maritime exposure and amenable to training, this species can be grown as a hedge in seaside gardens[K]. The wood is heavy, hard and brittle[82]. It makes a valuable fuel and is occasionally used in the manufacture of small articles for domestic and industrial use[82].

dwatta Laxative Stomachic TonicAn infusion of the leaves has been used as a general strengthened to the system[257]. The roots and the bark have been used in the treatment of stomach complaints[257]. A cold infusion of the plant or leaves has been used as a laxative[257].

propta Seed - sow autumn or late winter in a cold frame. Seed of the more tender forms is best sown in the late winter whilst harder forms are best sown in the autumn. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame.

nwatta Landscape Uses:Erosion control, Hedge, Screen. Requires a perfectly drained soil in a sunny position[200]. Tolerant of salt spray[200]. Succeeds in a hot dry position. This species has many sub-species. Whilst some forms are hardy to about -17°C when in a suitable soil and position, other forms are frost tender. The hardiest forms, succeeding in zone 5, are *C. montanus argenteus* (Rydb.)F.L.Martin and *C. montanus glaber* (S.Wats.)F.L.Martin. Less hardy are *C. montanus paucidentatus* (S.Wats.)F.L.Martin which succeeds in zone 7, *C. montanus blanchae* (C.Schneid.)F.L.Martin and *C. montanus multiflorus* (Abrams.)F.L.Martin are hardy in zone 8 whilst *C. montanus traskiae* (Eastw.)F.L.Martin. is the least hardy, to zone 9[200]. Some members of this genus have a symbiotic relationship with certain soil micro-organisms, these form nodules on the roots of the plants and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200, 212]. Special Features:North American native, Inconspicuous flowers or blooms. The plant is heat tolerant in zones 9 through 6. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is multistemmed with multiple stems from the crown [1-2].

## 7.1.20 Lathyrus sylvestris

Flat pea, Wood pea

tfo2n 6 tlin 9 cyuc 0 kcak 3 tcan 0 dwat 1.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta Lathyrus sylvestris is a deciduous Perennial Climber growing to 1.5 m (5ft) by 0.2 m (0ft 8in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. The flowers are pollinated by insects. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. It cannot tolerate atmospheric pollution.

kcakta None Known

tcanta Agroforestry Uses: The plant is used as a green manure and soil cover for preventing erosion and for rehabilitating degraded land[1309]. It is grown as an ornamental in gardens, there are some named varieties. Nitrogen Fixer: dwatta None Known

propta Pre-soak the seed for 24 hours in warm water and then sow in early spring in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer.

nwatta Lathyrus sylvestris is a moderately cold-hardy plant, able to tolerate temperatures down to around -20°C when fully dormant[200]. Grows well in full sun and in light, dappled shade, succeeding in most moderately fertile, well-drained soils[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[1309]. Suggested planting locations and garden types: Forest garden, Flower borders and beds Wall-side Borders Cottage and Informal Garden City and Courtyard Gardens. May be attacked by aphids, slugs and snails.

## 7.1.21 Ulex parviflorus

tfo2n 6 tlin 9 cyuc 0 kcak 0 tcan 0 dwat 1.5 m hkuc

htut cyutli hgatkuyctcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Ulex parviflorus is an evergreen Shrub growing to 1.5 m (5ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

kcakta None known

tcanta Hedge Hedge ShelterbeltPlants make an impenetrable barrier, especially in exposed maritime areas. They are a useful windbreak by the coast.

dwatta None known

propta Seed - pre-soak 24 hours in hot water and sow in individual pots in a greenhouse in late winter to early spring. Germination should take place within 2 weeks. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Plants are very intolerant of root disturbance and so should be planted into their permanent positions as soon as possible, though not until after the last expected frosts[78]. Cuttings of half-ripe wood, 7cm with a heel, July/August in a frame. Pot up in spring as soon as rooting commences and plant out into their permanent positions as soon as possible[78].

nwatta Requires a poor soil and a sunny position, doing well on dry sunny banks or poor gravelly soils[11]. Succeeds on land that is too dry and barren for most plants[200]. Intolerant of shade, nor does it do well on rich soils[11, 182]. Prefers a neutral to slightly acid soil[200], disliking alkaline soils[17]. Plants are very intolerant of root disturbance[11]. Very tolerant of maritime exposure and, once established, drought[75, 186]. Hardy to about -15°C[200]. Hybridizes

freely with other members of this genus[200]. Plants in this genus are notably resistant to honey fungus[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

## 7.1.22 Clitoria mariana

Atlantic Pigeonwings, Butterfly Pea

tfo2n 6 tlin 9 cyuc 0 kcak 3 tcan 0 dwat m hkuc hmimhtut cyutli kyuctcup hwicli hyishrasjlut hpa7tli prik hpa7tmwatli hjonli

drutta Clitoria mariana is a PERENNIAL CLIMBER growing to 0.8 m (2ft 7in) by 0.8 m (2ft 7in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta None Known

tcanta Nitrogen fixer.

dwatta AphrodisiacThe roots and seeds have been used medicinally, including as an aphrodisiac according to the ancient but unscientific doctrine of signatures.’ but we have not been able to confirm this - Missouriplants.com

propta Seed

nwatta A temperate perennial forb. Stems are erect to reclining or trailing, to 1.2m, glabrous to sparsely pubescent with short, fine, curved hairs. It is a twining vine and not a climbing vine so is often found growing along the ground. In southern China it grows in forests between 100-2,000m above sea level. It grows in hardiness zones 6-9. Light Requirement: Sun, Part Shade. Preferred soil: Dry and Sandy. Bloom Color: Pink , Blue. Bloom Time: Jun to Aug. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. Herbaceous. Growth habit is a single or multiple shooting vine from a crown [1-2].

## 7.1.23 Colutea istria

Bladder-senna

tfo2n 6 tlin 9 cyuc 0 kcak 0 tcan 0 dwat 3 m hkuc hmimhtut cyutli kyuctcup hwicli hyishrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Colutea istria is a deciduous Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcakta None known

tcanta Hedge Hedge Soil reclamationUsed in land reclamation projects in the Negev desert, consolidating soil and plant debris from flood waters[200]. Plants can be grown as a hedge[200].

dwatta None known

propta Seed - pre-soak for 24 hours in hot water and sow late winter in a greenhouse[113]. Scarification can help speed up the germination process[164]. Germination can be slow and erratic[200], though treated seed usually germinates in 1 - 3 months at 20°C[164]. As soon as they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in a frame[78]. Cuttings are not very long-lived[78].

nwatta Requires a well-drained soil in full sun[200]. Grows well on dry sunny banks and in poor soils[1, 182]. Dislikes strong winds, though another entry in the same book

drutta Tritelleia laxa is a BULB growing to 0.5 m (1ft 8in) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower in June, and the seeds ripen in August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: RootEdible Uses: Bulb - raw or cooked[105, 177, 257]. Tasty[161]. A sweet flavour[207]. Rich in starch, the bulb can be used like potatoes[257].

tcanta None known

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame. Alternatively, the seed can be sown in spring in a cold frame. Germination usually takes place within 1 - 3 months at 15°C. Sow the seed thinly so that there is no need to prick them out and grow the seedlings on in the pot for their first year. Give an occasional liquid feed to ensure that they do not become mineral deficient. Seedlings are prone to damping off so be careful not to overwater them and keep them well ventilated. When they become dormant, pot up the small bulbs placing about 3 in each pot. Grow them on in the greenhouse for another year or two until the bulbs are about 20mm in diameter and then plant them out into their permanent positions when they are dormant in the autumn. Division of flowering size bulbs in autumn. Dig up the clumps of bulbs, replanting the larger ones direct into their permanent positions. It is best to pot up the smaller ones and grow them on in a greenhouse for a year before planting them out when they are dormant in early autumn.

nwatta Succeeds outdoors in a warm position[90], requiring a rich well-drained sandy loam[1]. Likes plenty of moisture whilst in growth followed by a warm dry period in late summer and autumn[200]. A polymorphic species[71].

## 7.2.87 Brassica juncea napiformis

Root Mustard

6 tlin 9 cyuc 4 kcak 0 tcan 2 dwat 0.8 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Brassica juncea napiformis is a ANNUAL growing to 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from June to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves Oil RootEdible Uses: Condiment OilLeaves - raw or cooked[206]. A peppery flavour that can range from mild to hot, they make a good cooked vegetable[206]. The leaves can also be finely shredded and added to mixed salads[206]. The protein extracted from the leaves mixes well with banana pulp and is well adapted as a pie filling[183]. Flowers and young flowering stems - raw or cooked[52]. Sweet and succulent[133]. An edible semi-drying oil is obtained from the seed[1, 2, 17, 57, 183]. The seed contains 25 - 30% oil[74]. The seed is used as a mustard flavouring[171]. It is the source of 'brown mustard'[183], a prepared mustard that is milder than that produced from other species[238]. Pungency of mustard develops when cold water is added to the ground-up seed - an enzyme (myrosin) acts on a glycoside (sinigrin) to produce a sulphur compound. The reaction takes 10 - 15 minutes. Mixing with hot water or vinegar, or adding salt, inhibits the enzyme and produces a mild bitter mustard[238]. Black mustard comes from *B. nigra* and white mustard from *Sinapis alba*. The seed is also used whole in curries and pickles[238]. They are often heated in oil to destroy their pungency and give them a nutty flavour[238]. Sprouted seeds can be added to salads. Root - raw or cooked[183]. Usually sliced and made into pickles[206].

tcanta Green manure Oil RepellentThere is some evidence that if this plant is grown as a green manure it is effective in reducing soil-borne root rots in pea crops[206]. This

is attributed to chemicals that are given off as the plants decay[206].

dwatta Anodyne Aperient Diuretic Emetic Galactagogue Rubefacient StimulantReported to be anodyne, aperitif, diuretic, emetic, rubefacient, and stimulant, the plant is a folk remedy for arthritis, foot ache, lumbago, and rheumatism[269]. The seed is used in the treatment of tumours in China[269]. In Korea, the seeds are used in the treatment of abscesses, colds, lumbago, rheumatism, and stomach disorders[269]. The root is used as a galactagogue in Africa[269]. Ingestion may impart a body odour repellent to mosquitoes[269]. Mustard oil is used in the treatment of skin eruptions and ulcers[269]. Believed to be aperient and tonic, the volatile oil is used as a counterirritant and stimulant[269]. In Java the plant is used as an antisyphilitic emmenagogue[269]. Leaves applied to the forehead are said to relieve headache[269]. The Chinese eat the leaves in soups for bladder, inflammation or haemorrhage[269].

propta Seed - sow in situ from June to October. Spring-sown crops tend to run quickly to seed, though they can be eaten whilst still small[206]. It is best not to sow the seed in very hot weather[206]. There are about 5,660 - 6,000 per 0.01 kg (1/3 oz)[269].

nwatta Succeeds in full sun in most well-drained moisture-retentive fertile soils[16, 200, 206]. Prefers a heavy soil and some shade[16]. Dislikes very hot weather[33]. Plants tolerate high rainfall and, although fairly deep rooted, are not very drought resistant[206]. A form of *B. juncea* that has been selected in the Orient for its edible root[206]. It is fairly hardy, surviving temperatures down to at least -4°C[269]. Plants have a rooting depth of between 90 - 120 cm[269]. A good bee plant[74].

## 7.2.88 Brassica nigra

Black Mustard

6 tlin 9 cyuc 3 kcak 2 tcan 3 dwat 1.2 m hkuc

hmimhtut cyutli tcup hwicli hrasjlut hpa7tli frusflatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Brassica nigra is a ANNUAL growing to 1.2 m (4ft) by 0.6 m (2ft in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from June to August, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: Leaves Oil Oil Seed StemEdible Uses: Oil OilLeaves - raw or cooked[2, 85, 100]. A hot flavour; they can be finely chopped and added to salads or cooked as a potherb[183]. The seedlings can also be used as a salading when about one week old, adding a hot pungency to a salad[2, 27, 183, K]. Immature flowering stems - cooked and eaten like broccoli[183]. Mustard seed is commonly ground into a powder and used as a food flavouring and relish[4, 5, 17, 27, 34]. This is the black mustard of commerce, it is widely used as a food relish and as an ingredient of curry[183]. Pungency of mustard develops when cold water is added to the ground-up seed - an enzyme (myrosin) acts on a glycoside (sinigrin) to produce a sulphur compound. The reaction takes 10 - 15 minutes. Mixing with hot water or vinegar, or adding salt, inhibits the enzyme and produces a mild bitter mustard[238]. The seed can also be used whole to season pickles, curries, sauerkraut etc[183, 238]. Black mustard has a stronger more pungent flavour than white mustard (*Sinapis alba*) and brown mustard (*B. juncea*) [238]. An edible oil is obtained from the seed[2, 21, 171].

tcanta Green manure Oil Oil RepellentA semi-drying oil is obtained from the seed, as well as being edible it is also used as a lubricant, illuminant and in making soap[17, 21, 46, 100]. The plant is often grown as a green manure, it is very fast, producing a bulk suitable for digging into the soil in about 8 weeks[100]. Not very winter hardy, it is generally used in spring and summer. It does harbour the pests and diseases of the cabbage family so is probably best avoided where these plants are grown in a short rotation and especially if club root is a problem. Mustard oil (allyl isothio-

can turn bitter especially in the summer and if the plant is growing in a hot dry position[K]. Although individual leaves are fairly small, they are produced in abundance and are easily picked[K]. Stalks and flowers - raw[52]. A nice addition to the salad bowl[K]. Bulb - raw[5, 53, 62]. Although very small and labour-intensive to harvest, the boiled and peeled root has the flavour of chestnuts[244]. Another report says that the plant has a fibrous root system[62] so this report seems to be erroneous[K].

tcanta Although only an annual, this species makes an excellent ground cover in a cool acid soil under trees. In such a position it usually self-sows freely[208] and grows all year round[K].

dwatta Antirheumatic Laxative Vitamin CThe leaves are gently laxative[94]. Apart from its value as a nourishing vegetable that is rich in vitamin C, it can also be taken as an invigorating spring tonic and an effective diuretic[254]. A poultice of the mashed plants has been applied to rheumatic joints[257].

propta Seed - sow spring or autumn in situ. The seed usually germinates rapidly.

nwatta Prefers a moist peaty soil[1, 60]. It is often found growing wild on sandy soils[264]. An easily grown plant, it can succeed on very poor and dry soils[52, 60]. Plants grow well the dappled shade of trees, producing a better quality crop in such a situation[52, 60, 264]. Although only an annual[208], it usually self-sows when well sited. A very hardy plant, tolerating temperatures down to at least -15°C. Miner's lettuce is occasionally cultivated as a salad plant[1, 46]. It's main value is as a reliable producer of leaves in the winter, though it can provide leaves all year round[141, 200, 264]. It can be grown as a cut and come again crop[183]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. A self-seeding annual [1-2]. A clumping mat former. Forming a dense prostrate carpet spreading indefinitely [1-2]. The root pattern is fibrous dividing into a large number of fine roots [1-2].

### 7.2.85 Elymus hispidus

Wild triga, Pubescent wheatgrass, 6 tlin 9 cyuc 4 kcak 4 tcan 0 dwat 0.8 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwshom hpa7tmwatli fyif hjonli

drutta Elymus hispidus is a PERENNIAL growing to 0.8 m (2ft 7in) by 0.4 m (1ft 4in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. The flowers are pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in saline soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: Edible Portion: Seeds, Grain, Cereal. Seed - raw or cooked[646 ]. A sweet, mild, nutty flavout[646 ]. Usually ground into a powder and used as a flour, it can also be eaten raw when sprouted or can be cooked whole in a similar manner to rice, or be added to steaks etc[646 , K ]. The grain has higher levels of protein (20.8%), fat (3.21%) and ash (2.64%) than wheat[646 ]. The protein is nutritionally limiting in lysine as is wheat, but the grain has higher levels than wheat of all the other essential amino acids[646 ]. No functional gluten was found in samples of the grain tested by USDA. However no tests have been conducted to determine if individuals with wheat or gluten allergies can tolerate this grain and, since it is closely related to wheat, there is a possibility that this may cause similar problems[646 ]. Most of the grain will have the hulls still attached after harvesting. Dehulling can be accomplished with any piece of equipment that will rub the grain vigorously. A brush machine in which brushes rotate rapidly inside a cylindrical screen is an effective dehuller[646 ]. Carbon Farming Solutions - Staple Crop: balanced carb (The term staple crop typically refers to a food that is eaten routinely and accounts for a dominant part of people's diets in a particular region of the world) [1-1].

tcanta Widely planted and naturalized in western North America, used for forage and erosion control. An excellent food source for grazing and browsing animals. Left unharvested, the vegetation is a good nesting habitat for some

birds and waterfowl. Generally, it is not an invasive plant and coexists well with native plant species. Erosion control and land rehabilitation are additional uses for this plant. This species is well adapted to the stabilization of disturbed soils. It can be used in critical and urban areas where irrigation water is limited; and to stabilize ditchbanks, dykes, roadsides and airport landing strips[277 , 646 ]. The plant can also be use to build soils because of its heavy root production. Levels as high as 7,500 kilos (dry weight) per hectare of root production in the upper 20cm of soil have been measured in five-year-old stands[277 ]. It can be used as a reclamation grass for mine sites[646 ]. It establishes quickly to form a protective mat of roots and rhizomes, even when planted on soils degraded by earth moving or mining. Within five years, stands have produced up to 7000 pounds of the dry root mass per acre in the top 8 inches of soil. Heavy root production holds the soil in place and restores its natural fertility by increasing the soil carbon. Attractive to pets who often chew on it to aid their digestion.

dwatta None Known

propta Seed - if sufficient moisture is available, the seed can be sown shallowly in situ in late summer. It germinates within a few days and grows rapidly before becoming dormant for the winter. New growth in spring is rapid, the plant flowering in early summer and maturing the seed in mid to late summer[646 ]. In drier soils the seed is better sown in the spring, but will generally only give a light crop or no crop of seed in its first year[277 ]. If seed is in short supply then it can be sown in containers in a greenhouse, pricked out into individual pots when large enough to handle and then planted out when 15cm or more tall. Division of the rhizomes is easy.

nwatta Management: Standard Staple Crop: Balanced carb Under DevelopmentClimate: cold to warm temperate. Humidity: semi-arid to humid. When grown at higher elevations (from 1,000 - 2,700 metres) Thinopyrum intermedium can tolerate a minimum annual rainfall of around 300mm, though rainfall requirements are greater at lower elevations[277 ]. The plant can tolerate up to 1,160mm per annum[418 ]. Plants can withstand considerable cold, with temperatures down to around -25°C, so long as this is not accompanied by heavy rain[277, 418 ]. Requires a sunny position. It prefers well-drained loamy to clayey textured soils; the pubescent form performs best on loamy to sandy to shallow soils[277 ]. It can tolerate slightly acidic to mildly saline conditions[277 ]. Plants, especially the pubescent form, can tolerate low fertility[277 ]. Plants are tolerant of moderate, short-lasting seasonal inundation of the soil in spring[277 ]. Plants are very tolerant of fire - top growth is killed but the plant usually resprouts freely from the roots[277 ]. Seed production when the plant has ample moisture in the growing season can reach 500 - 600 kilos per hectare in the first year of harvest, though this diminishes in subsequent years unless the plant is fertilized and preferably also divided[277, 646 ]. During the seed conditioning process, some of the seeds lose their hulls, producing naked hull-less grain. The hull-less seeds tend to lose viability more quickly and are therefore not sold for planting hay and forage crops. This grain is now being sold as Wild Triga, the first commercially available perennial grain[646 ]. There are two main forms of this species and at one time the two were treated as distinct (as Agropyron intermedium (Host) P.Beauv., with leaves and flower spikes mainly smooth; and Agropyron trichophorum (Link) K.Richt., which is densely hairy). The two interbreed freely and the commercial seed will often produce a mix of the two forms. The hairy form is considered to be slightly more drought tolerant and winter hardy[277].

Carbon Farming Solutions - Cultivation: under development. Researchers estimate that Elymus hispidus could be yielding as well as wheat within 20 years. However, seed size will be smaller. Gluten quality is not as good as wheat. Management: standard (Describes the non-destructive management systems that are used in cultivation) [1-1].

#### 7.2.86 Tritileia laxa

Grassnut, Ithuriel's spear

6 tlin 9 cyuc 4 kcak 0 tcan 0 dwat 0.5 m hkuc htut cyutli kyucctup hwicli hrasjlutnyik hpa7tli flatprikliws hpa7tmwatli xre7t hjonli

says that it tolerates salt-laden winds[200]. This species is not very hardy in Britain, tolerating temperatures down to about -5°C[200], but it should succeed outdoors in the milder areas of the country[182]. Even there it is probably best grown on a south or south-west facing wall[200]. According to the International Legume Database, this species may actually be *Colutea abyssinica* Kunth and Bouch., a species found in N. Africa where it grows in montane grassland and shrubland. Flowers are produced on the current year's growth[200]. Plants in this genus are notably resistant to honey fungus[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

#### 7.1.24 Ceanothus prostratus

Squaw Carpet, Prostrate ceanothus

to2n 6 tlin 9 cyuc 0 kcak 3 tcan 0 dwat 0.1 m hkuc hmimhtut cyutli kyucctup hwicli hrasjlut hpa7tli flatprikliws hpa7tmwatli xre7t hjonli

drutta Ceanothus prostratus is an evergreen Shrub growing to 0.1 m (0ft 4in) by 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta None known

tcanta Dye SoapaA green dye is obtained from the flowers[168]. All parts of the plant are rich in saponins - when crushed and mixed with water they produce a good lather which is an effective and gentle soap[168, 169]. This soap is very good at removing dirt, though it does not remove oils very well. This means that when used on the skin it will not remove the natural body oils, but nor will it remove engine oil etc[K] The flowers are a very good source, when used as a body soap they leave behind a pleasant perfume on the skin[K]. The developing seed cases are also a very good source of saponins[K]. A useful ground cover plant, especially on warm sunny slopes[200].

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed should be pre-soaked for 12 hours in warm water and then given 1 - 3 months stratification at 1°C[138, 200]. Germination usually takes place within 1 - 2 months at 20°C[138]. one report says that the seed is best given boiling water treatment, or heated in 4 times its volume of sand at 90 - 120°C for 4 - 5 minutes and then soaked in warm water for 12 hours before sowing it[214]. It then requires a period of chilling below 5°C for up to 84 days before it will germinate[214]. The seed exhibits considerable longevity, when stored for 15 years in an air-tight dry container at 1 - 5°C it has shown little deterioration in viability[214]. The seed is ejected from its capsule with some force when fully ripe, timing the collection of seed can be difficult because unless collected just prior to dehiscence the seed is difficult to extract and rarely germinates satisfactorily[214]. Prick out the seedlings into individual pots as soon as they are large enough to handle. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in late spring or early summer. Cuttings of half-ripe wood, taken at a node[200], July/August in a frame[11]. Cuttings of mature wood of the current year's growth, 7 - 12 cm with a heel, October in a cold frame[78]. The roots are quite brittle and it is best to pot up the callused cuttings in spring, just before the roots break[78]. Good percentage.

nwatta Prefers a warm sunny position but tolerates light shade[11, 200]. Tolerates some lime, but will not succeed on shallow chalk[200]. A difficult plant to cultivate, it might do well in a lime-free soil in full sun and occasionally does well on heavier soils[208]. This species is particularly susceptible to damage by frost when it is young[200], though it should be hardy as it grows older[11]. The sub-species *C. prostratus* *occidentalis*. McMinn. is a form growing by the coast in N. California - it may be a more suitable form for maritime areas[K]. Plants dislike root disturbance, they

should be planted out to their permanent positions whilst still small[182]. Dislikes heavy pruning, it is best not to cut out any wood thicker than a pencil[182]. Plants flower on the previous year's growth, if any pruning is necessary it is best carried out immediately after the plant has finished flowering[200]. Constant pruning to keep a plant small can shorten its life[200, 219]. Fast growing, it flowers well when young, often in its second year from seed[11]. The branches are prostrate and often form roots where they touch the soil[11]. Hybridizes freely with other members of this genus[200]. Some members of this genus have a symbiotic relationship with certain soil micro-organisms, these form nodules on the roots of the plants and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200, 212]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. An evergreen. A clumping mat former. Forming a dense prostrate carpet with a limited spread [1-2]. The root pattern is flat with shallow roots forming a plate near the soil surface [1-2].

#### 7.1.25 Genista pilosa procumbens

Creeping broom, Creeping hairy broom

to2n 6 tlin 8 cyuc 0 kcak 3 tcan 0 dwat 0.1 m hkuc hmimhtut cyutli hgtakyuactup hwicli hyishrasjlut hpa7tli flatprikliwsslip hpa7tmwatli hjonli

drutta Genista pilosa procumbens is an evergreen Shrub growing to 0.1 m (0ft 4in) by 0.3 m (1ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6. It can fix Nitrogen. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta None Known

tcanta A good high density groundcover. Nitrogen Fixer. Location: Border, Ground Cover, Mass Planting, Rock Garden, Wildlife Garden, Woodland Garden. Invertebrates shelter: beneficial for insects and other arthropods. Nectary: provides nectar or pollen for beneficial insects [1-2].

dwatta None known

propta Seed: Easy. Cover seed and germinate at 55-65F/13-18C. Chipping and soaking may aid germination. Do not/transplant. Cuttings taken in summer, or by simple layering. Tip cuttings about 3-6 cm may be taken in mid-summer and rooted in a mist chamber or shaded frame.

nwatta Evergreen prostrate shrub. Flowers, golden-yellow, cover the plants in late spring to early summer. Poor, dry, sandy, and stony soils. Full sun or part shade and well drained soil. Soil pH: Acid/Neutral/Alkaline. Foot Traffic: Light. Drought tolerant. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. A clumping mat former. Forming a dense prostrate carpet with a limited spread [1-2].

## 7.2 mran

### 7.2.1 Quercus ilex ballota

Holm Oak

6 tin 9 cyuc 5 kcak 3 tcan 2 dwat 25 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprikliws hpa7tmwatli hjonli

drutta Quercus ilex ballota is an evergreen Tree growing to 25 m (82ft) by 20 m (65ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from May to June, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade

(light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: Oil SeedEdible Uses: Coffee OilSeed - raw or cooked[1, 2, 46, 63, 200]. The seed of this variety is normally sweet. The seed is up to 3cm long[200], it can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread. The seed from some trees contains bitter tannins, these can be leached out by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute. An edible oil is obtained from the seed[183].

tcanta Fuel Hedge Hedge Oil Repellent Shelterbelt Tannin WoodA much of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth[20]. Oak galls are excrescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4]. Very tolerant of maritime exposure and of trimming, it can be grown as a shelterbelt tree or hedge in maritime areas[11, 29, 49, 75]. Wood - strong, hard, durable. Used for furniture[46, 61, 89]. It makes a good charcoal[89] and a good fuel, burning well even if green[146]. The bark is a source of tannin[146].

dwatta Astringent DysenteryAny galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4].

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but its best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Prefers a good deep fertile loam which can be on the stiff side[11]. Thrives on shallow chalky soils[188]. Succeeds in all soils except those that are cold and poorly drained[98]. Grows well in sandy soils[188]. Young plants tolerate reasonable levels of side shade[200]. Very resistant to maritime exposure[11, 49, 75]. A very ornamental[1] though quite slow-growing tree[75]. Transplants badly unless moved regularly and this should be done as growth commences in late May or in September[11]. This plant is treated as a distinct species, *Q. rotundifolia*. Lam. by some botanists[50]. Cultivated for its edible seed in Spain[11, 63]. The tree grows well in Britain but is said to fruit poorly here[11], however a tree at Kew was bearing a very good crop at the end of the hot summer of 1989 and again in 1991[K]. The seed ripens in its first year[200]. Hybridizes freely with other members of the genus[200]. This species is notably resistant to honey fungus[88, 200].

## 7.2.2 Torreya nucifera

Kaya, Japanese torreya

6 tlin 8 cyuc 5 kcak 0 tcan 2 dwat 20 m hkuc pcmhmimt cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyif hjonli

drutta Torreya nucifera is an evergreen Tree growing to 20 m (65ft) by 10 m (32ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, and the seeds ripen from September to November. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly

acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: Oil SeedEdible Uses: OilSeed - raw, cooked or used in confectionery[1, 63, 105, 183]. An agreeable sweet slightly resinous flavour[11]. An aromatic flavour[46], it is much relished and is eaten in quantity[178] though it is said to be laxative if eaten in excess[2]. An edible oil is obtained from the seed[1, 2, 1, 63, 178, 183]. Used in cooking[183].

tcanta OilNone known

dwatta Anodyne Anthelmintic Carminative Digestive Laxative PectoralThe seeds are anthelmintic[63, 147, 178, 218]. They are used in the treatment of several parasitic conditions including hookworm, tapeworms, pinworms and roundworms[279]. The plant is anodyne, carminative, digestive, laxative and pectoral[63, 147, 178, 218].

propta Seed - best sown as soon as it is ripe in a cold frame. Some of the seed should germinate in the following spring though much of it might take another 12 months. Stored seed requires a period of cold stratification and can take 18 months or more to germinate. Prick out the seedlings into individual pots as soon as growth is observed and grow them on in light shade in the greenhouse for at least the next couple of winters, making sure to pot them on into larger pots as and when required. Plant them out into their permanent positions in early summer when the plants are at least 20cm tall. Cuttings of half-ripe shoots in late summer[1]. Cuttings do not grow well[11]. Layering.

nwatta Management: Standard Regional Crop Staple Crop: Protein-oilSucceeds in ordinary garden soil, tolerating some lime[1]. Prefers an acid soil[200]. Dislikes wind exposure[200]. Requires a sheltered position and either high humidity or a moist riverside soil[200]. Tolerates woodland shade very well[200]. Requires hot, very humid summers for best growth[200]. Trees are probably not hardy in all parts of Britain, but should succeed quite far north. A tree at Wakehurst Place was 11 metres tall in 1970[185]. A shrub growing in the shade of coniferous trees at Kew was about 2.5 metres tall and 4 metres wide in September 1993[K], it was carrying a very heavy crop of fruit[K]. No fruit was formed in 1994[K]. A specimen at Cambridge Botanical Gardens was 6 metres tall and 6 metres wide, it was carrying an enormous crop of seed in the late summer of 1996[K]. This plant has an excellent potential as a nut crop in Britain[K]. Sometimes cultivated for its edible seed in Japan, the variety ‘Shibunashigaya’ is considered to be the best for seed production[46]. The seed takes two summers to mature[229]. Plants are dioecious so both male and female plants are required if seed is to be produced. Occasional trees are monoecious with dioecious branches. Solitary trees have been seen on a number of occasions with heavy crops of fertile seed, so it would appear that the tree is not dioecious[K].

## 7.2.3 Vitis vinifera

Grape, Wine grape, Purpleleaf Grape, Common Grape

6 tlin 10 cyuc 5 kcak 2 tcan 2 dwat 15 m hkuc hmimhut cyutli kyuctup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Vitis vinifera is a deciduous Climber growing to 15 m (49ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from May to July, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Flowers Fruit Leaves Oil ShootsI Uses: OilFruit - raw or dried for winter use[1, 2, 11, 46]. The dried fruits are the raisins, sultanas and currants of commerce, different varieties producing the different types of dried fruit. A fully ripened fresh fruit is sweet, juicy and delicious[K]. The fruit juice can be concentrated and used as a sweetener[183]. This fruit is widely used in making wine[183]. Leaves - cooked[55]. Young leaves are wrapped around other foods and then baked, they impart a pleasant flavour[183]. Young tendrils - raw or cooked[85]. The flower clusters are used as a vegetable[183]. An edible oil similar to

this is probably the wild species that *P. ixocarpa* was derived from in cultivation[170].

### 7.2.82 Brassica juncea foliosa

Leaf Mustard

6 tlin 9 cyuc 4 kcak 0 tcan 2 dwat 0.3 m hkuc hmimhut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Brassica juncea foliosa is a ANNUAL growing to 0.3 m (1ft) by 0.3 m (1ft in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from June to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves OilEdible Uses: Condiment OilLeaves - raw or cooked[22, 33, 46, 52, 61]. A peppery flavour that can range from mild to hot, this is one of the most highly prized cooked vegetables in the Orient[206]. The leaves can also be finely shredded and added to mixed salads[206]. The protein extracted from the leaves mixes well with banana pulp and is well adapted as a pie filling[183]. Flowers and young flowering stems - raw or cooked[52]. Sweet and succulent[133]. An edible semi-drying oil is obtained from the seed[1, 2, 17, 57, 183]. The seed contains 25 - 30% oil[74]. The seed is used as a mustard flavouring[171]. It is the source of ‘brown mustard’[183], a prepared mustard that is milder than that produced from other species[238]. Pungency of mustard develops when cold water is added to the ground-up seed - an enzyme (myrosin) acts on a glycoside (sinigrin) to produce a sulphur compound. The reaction takes 10 - 15 minutes. Mixing with hot water or vinegar, or adding salt, inhibits the enzyme and produces a mild bitter mustard[238]. Black mustard comes from *B. nigra* and white mustard from *Sinapis alba*. The seed is also used whole in curries and pickles[238]. They are often heated in oil to destroy their pungency and give them a nutty flavour[238]. Sprouted seeds can be added to salads.

tcanta Green manure Oil RepellentThere is some evidence that if this plant is grown as a green manure it is effective in reducing soil-borne root rots in pea crops[206]. This is attributed to chemicals that are given off as the plants decay[206].

dwatta Anodyne Aperient Diuretic Emetic Galactogogue Rubefacient StimulantReported to be anodyne, aperitif, diuretic, emetic, rubefacient, and stimulant, the plant is a folk remedy for arthritis, foot ache, lumbago, and rheumatism[269]. The seed is used in the treatment of tumours in China[269]. In Korea, the seeds are used in the treatment of abscesses, colds, lumbago, rheumatism, and stomach disorders[269]. The root is used as a galactagogue in Africa[269]. Ingestion may impart a body odour repellent to mosquitoes[269]. Mustard oil is used in the treatment of skin eruptions and ulcers[269]. Believed to be aperient and tonic, the volatile oil is used as a counterirritant and stimulant[269]. In Java the plant is used as an antisyphilitic emenagogue[269]. Leaves applied to the forehead are said to relieve headache[269]. The Chinese eat the leaves in soups for bladder, inflammation or haemorrhage[269].

propta Seed - sown in situ from August to October. Spring and early summer-sown crops tend to run quickly to seed, though they can be eaten whilst still small[206]. It is best not to sow the seed in very hot weather[206]. There are about 5,660 - 6,000 per 0.01 kg (1/3 oz)[269].

nwatta Succeeds in full sun in most well-drained moisture-retentive fertile soils[16, 200, 206]. Prefers a heavy soil and some shade[16]. Dislikes very hot weather[33]. Plants tolerate high rainfall and, although fairly deep rooted, are not very drought resistant[206]. A form of *B. juncea* with entire leaves that has been selected in the Orient for its edibility. There are many named varieties[206]. A very fast growing variety, usually maturing within 40 days of sowing[206]. The plants in this group are fairly cold-tolerant[206]. Plants have a rooting depth of between 90 - 120 cm[269]. A good bee plant[74].

## 7.2.83 Brassica napus napobrassica

Swede

6 tlin 9 cyuc 4 kcak 0 tcan 2 dwat 0.8 m hkuc hmimhut cyutli tcup hwicli hrasjlutnyikrip hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Brassica napus napobrassica is a BIENNIAL growing to 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from May to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Leaves - cooked as a potherb[183]. A mild, cabbage-like flavour[K]. Root - raw or cooked[1, 16, 46, 171, 183]. A richer flavour than turnips, it makes a good cooked vegetable and, when finely grated, is acceptable in mixed salads[183, K]. The root can be 30cm or more in diameter, though it is usually eaten smaller since it then is more tender[K]. It is available from early autumn, and can either be left in the ground over winter to be harvested as required, or can be harvested and stored in a cool, frost-free place where it will keep for 6 months[K].

tcanta The seed contains up to 45% of an edible semi-drying oil, it is used as a luminaant, lubricant, in soap making etc[13, 21, 57, 142].

dwatta Diuretic EmollientThe root is emollient and diuretic[240]. The juice of the roots is used in the treatment of chronic coughs and bronchial catarrh[240, 269]. The seed, powdered, with salt is said to be a folk remedy for cancer[269]. Rape oil is used in massage and oil baths, it is believed to strengthen the skin and keep it cool and healthy. With camphor it is applied as a remedy for rheumatism and stiff joints[269].

propta Seed - sow April to June in situ.

nwatta Succeeds in full sun in a well-drained fertile preferably alkaline soil[16, 200]. Prefers a stiff moist soil and a fairly high rainfall[16, 20, 26]. Another report says that it prefers a light but rich soil and an open sunny position[264]. Succeeds in any reasonable soil[52]. Sunny days and cool nights are favourable for plant growth whilst dry weather at harvest time is essential[269]. Swede is reported to tolerate an annual precipitation of 30 to 280cm, an annual average temperature range of 5 to 27°C and a pH in the range of 4.2 to 8.2[269]. Very young plants are susceptible to cold damage, -4°C either killing or injuring seedlings, whereas -2°C has no affect when the plants are more than one month old[269]. The garden swede is often cultivated for its edible root, there are several named varieties[183]. The plant is somewhat hardier than turnips and in most parts f Britain it can usually be left outdoors all winter and harvested as required. Plants take 4 - 6 weeks longer to mature than turnips[183]. Swede is 70% self-pollinating and 30% cross-pollinated. Even if wind and insects are absent, seed are still produced. Yield increases with honeybees[269]. A good companion plant for peas but it dislikes growing with hedge mustard and knotweed[18].

## 7.2.84 Claytonia perfoliata

Miner’s Lettuce

6 tlin 10 cyuc 4 kcak 2 tcan 1 dwat 0.2 m hkuc pcmhmimhut cyutli kyuctup hwicli hvishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Claytonia perfoliata is a ANNUAL growing to 0.2 m (0ft 8in). It is not frost tender. It is in leaf all year, in flower from May to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Leaves - raw or cooked[2, 5, 12, 27, 52, 62]. A fairly bland flavour with a mucilaginous texture, it is quite nice in a salad[183, K]. The young leaves are best[85], older leaves

propta Seed - sow in situ from early spring to early autumn in order to obtain a succession of edible leaves. Most varieties of Oriental vegetables belonging to this species are best sown from late June to early September otherwise they may bolt[206]. There are about 5,660 - 6,000 per 0.01 kg (1/3 oz)[269].

nwatta Succeeds in full sun in most well-drained moisture-retentive fertile soils[16, 200, 206]. Prefers a heavy soil and some shade[16]. Dislikes very hot weather[33]. Plants tolerate high rainfall and, although fairly deep rooted, are not very drought resistant[206]. Tolerates a pH in the range 4.3 to 8.3. Brown mustards is widely cultivated for its edible seed which is used to make the condiment 'brown mustard' and is also sprouted as the mustard of mustard and cress[50, 200]. It has only 70% of the pungency of black mustard (*B. nigra*) but can be harvested mechanically so is more viable commercially[238]. This species has also been cultivated in the Orient for many hundreds of years and a wide diversity of forms has been developed with edible leaves, stems, roots and seeds. These forms have been classified by the botanists as follows and separate entries have been made for each of them. *B. juncea crispifolia*. The curled or cutleaf mustards, this group has attractively curled edible leaves. *B. juncea foliosa*. The leaf mustards have quite large smooth-edged edible leaves. *B. juncea japonica*. Rather similar to *B. juncea crispifolia* and combined with that group by some botanists. *B. juncea multiceps*. The multishoot mustard group. *B. juncea napiformis*. A form with a swollen edible root. *B. juncea rugosa*. Large somewhat cabbage-like edible leaves. *B. juncea strumata*. A form with large edible leaf stalks. *B. juncea tumida*. A form with swollen edible stems. Plants take from 2 - 5 months from sowing to maturity, depending on the season and the cultivar[206]. They prefer a fairly high stable temperature and are well adapted to short day length[200]. Many are best grown in warmer climates than Britain but there are several cultivars that grow well in this country[206]. Plants have a rooting depth of between 90 - 120 cm[269]. A good bee plant[74].

## 7.2.80 Brassica juncea rugosa

Head Mustard

6 tin 9 cyuc 4 kcak 0 tcan 2 dwat 0.6 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyfxre7t hjonli

drutta Brassica juncea rugosa is a ANNUAL growing to 0.6 m (2ft) by 0.4 m (1ft 4in). See above for USDA hardness. It is hardy to UK zone 7 and is not frost tender. It is in flower from June to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves Oil Seed ShootsEdible Uses: Condiment OilLeaves and stems - raw or cooked[22, 33, 46, 52, 61]. A peppery flavour that can range from mild to hot, this is one of the most highly prized cooked vegetables in the Orient[206]. The leaves are more peppery than the stems[206]. The leaves can also be finely shredded and added to mixed salads[206]. The leaves can be harvested at any stage from seedling to maturity, becoming hotter with age[206].The protein extracted from the leaves mixes well with banana pulp and is well adapted as a pie filling[183]. Flowers and young flowering stems - raw or cooked[52]. Sweet and succulent[133]. An edible semi-drying oil is obtained from the seed[1, 2, 17, 57, 183]. The seed contains 25 - 30% oil[74]. The seed is used as a mustard flavouring[171]. It is the source of 'brown mustard' [183], a prepared mustard that is milder than that produced from other species[238]. Pungency of mustard develops when cold water is added to the ground-up seed - an enzyme (myrosin) acts on a glycoside (sinigrin) to produce a sulphur compound. The reaction takes 10 - 15 minutes. Mixing with hot water or vinegar, or adding salt, inhibits the enzyme and produces a mild bitter mustard[238]. Black mustard comes from *B. nigra* and white mustard from *Sinapis alba*. The seed is also used whole in curries and pickles[238]. They are often heated in oil to

destroy their pungency and give them a nutty flavour[238]. Sprouted seeds can be added to salads.

tcanta Green manure Oil RepellentThere is some evidence that if this plant is grown as a green manure it is effective in reducing soil-borne root rots in pea crops[206]. This is attributed to chemicals that are given off as the plants decay[206].

dwatta Anodyne Aperient Diuretic Emetic Galactagogue Rubefacient StimulantReported to be anodyne, aperitif, diuretic, emetic, rubefacient, and stimulant, the plant is a folk remedy for arthritis, foot ache, lumbago, and rheumatism[269]. The seed is used in the treatment of tumours in China[269]. In Korea, the seeds are used in the treatment of abscesses, colds, lumbago, rheumatism, and stomach disorders[269]. The root is used as a galactagogue in Africa[269]. Ingestion may impart a body odour repellent to mosquitoes[269]. Mustard oil is used in the treatment of skin eruptions and ulcers[269]. Believed to be aperient and tonic, the volatile oil is used as a counterirritant and stimulant[269]. In Java the plant is used as an antisyphilitic emenagogue[269]. Leaves applied to the forehead are said to relieve headache[269]. The Chinese eat the leaves in soups for bladder inflammation or haemorrhage[269].

propta Seed - sow in situ from August to October[206]. Seed can also be sown in the spring but plants are very likely to run to seed[206]. There are about 5,660 - 6,000 per 0.01 kg (1/3 oz)[269].

nwatta Succeeds in full sun in most well-drained moisture-retentive fertile soils[16, 200, 206]. Prefers a heavy soil and some shade[16]. Dislikes very hot weather[33]. Plants tolerate high rainfall and, although fairly deep rooted, are not very drought resistant[206]. A form of *B. juncea* that has been selected in the Orient for its large edible leaves, there are many named varieties[206]. Plants are very hardy and stand the winter well in temperate areas, they can be harvested lightly in the winter but the main cropping time is in spring[206]. Plants take 3 - 4 months to reach maturity[206]. They prefer a fairly high stable temperature and are well adapted to short day length[200]. Plants have a rooting depth of between 90 - 120 cm[269]. A good bee plant[74].

## 7.2.81 Physalis philadelphica

Wild Tomatillo, Mexican groundcherry

6 tin 9 cyuc 4 kcak 0 tcan 1 dwat 0.6 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Physalis philadelphica is a ANNUAL growing to 0.6 m (2ft). See above for USDA hardness. It is hardy to UK zone 7 and is not frost tender. It is in flower from July to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[2, 50, 105]. A delicious flavouring when used like a tomato and added to soups, stews etc[K]. The plant conveniently wraps up each fruit in its own 'paper bag' (botanically, the calyx) to protect it from pests and the elements. This calyx is toxic and should not be eaten. The fruit can be stored for up to a year if picked before they are fully ripe and left inside their calyx. tcanta None known dwatta OphthalmicThe juice from the berries has been used as an eyewash[257].

propta Seed - sow March/April in a greenhouse only just covering the seed. Germination usually takes place quickly and freely. Prick out the seedlings into individual pots of fairly rich soil when they are large enough to handle and plant them out after the last expected frosts. Consider giving them some protection such as a cloche until they are growing away well. Diurnal temperature fluctuations assist germination[170].

nwatta Succeeds in any well-drained soil in full sun or light shade[200]. Cultivated for its edible fruit in the Ukraine[50]. There are some named varieties[183, 200]. 'Purple de Milpa' has small purple-tinged fruits with a sharp flavour, they keep well[200]. Closely related to *P. ixocarpa*,

sunflower oil is obtained from the seed[7, 183]. It needs to be refined before it can be eaten[46]. A polyunsaturated oil, it is suitable for mayonnaise and cooking, especially frying[238]. Sap - raw. Used as a drink, it has a sweet taste. The sap can be harvested in spring and early summer, though it should not be taken in quantity or it will weaken the plant. The roasted seed is a coffee substitute[7]. Cream of tartar, also known as potassium bitartrate, a crystalline salt, is extracted from the residue of pressed grapes, and from the sediment of wine barrels. It is used in making baking powder[238].

tcanta Dye Miscellany OilA yellow dye is obtained from the fresh or dried leaves[168]. An oil from the seed is used for lighting and as an ingredient in soaps, paints etc[46, 61]. Cream of tartar, extracted from the residue of pressed grapes, is used in making fluxes for soldering[238]. Especially when growing in hotter countries than Britain, the stems of very old vines attain a good size and have been used to supply a very durable timber[4].

dwatta Analgesic Antiinflammatory Astringent Bach Cholera Demulcent Diuretic Hepatic Laxative Lithotropic Miscellany Skin StomachicGrapes are a nourishing and slightly laxative fruit that can support the body through illness, especially of the gastro-intestinal tract and liver[254]. Because the nutrient content of grapes is close to that of blood plasma, grape fasts are recommended for detoxification[254]. Analgesic[178]. The fresh fruit is antilithic, constructive, cooling, diuretic and strengthening[4, 218]. A period of time on a diet based entirely on the fruit is especially recommended in the treatment of torpid liver or sluggish biliary function[7]. The fruit is also helpful in the treatment of varicose veins, haemorrhoids and capillary fragility[254]. The dried fruit is demulcent, cooling, mildly expectorant, laxative and stomachic[218]. It has a slight effect in easing coughs[254]. The leaves, especially red leaves, are anti-inflammatory and astringent[4, 7, 218, 254]. A decoction is used in the treatment of threatened abortion, internal and external bleeding, cholera, dropsy, diarrhoea and nausea[4, 218, 254]. It is also used as a wash for mouth ulcers and as douche for treating vaginal discharge[254]. Red grape leaves are also helpful in the treatment of varicose veins, haemorrhoids and capillary fragility[254]. The leaves are harvested in early summer and used fresh or dried[238]. The seed is anti-inflammatory and astringent[4, 7, 218]. The sap of young branches is diuretic[7]. It is used as a remedy for skin diseases[218, 240] and is also an excellent lotion for the eyes[4, 7, 254]. The tendrils are astringent and a decoction is used in the treatment of diarrhoea[7]. The plant is used in Bach flower remedies - the keywords for prescribing it are 'Dominating', 'Inflexible' and 'Ambitious'[209].

propta Seed - best sown in a cold frame as soon as it is ripe[K]. Six weeks cold stratification improves the germination rate, and so stored seed is best sown in a cold frame as soon as it is obtained. Germination should take place in the first spring, but sometimes takes another 12 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant out in early summer. Cuttings of mature wood of the current seasons growth, December/January in a frame. These cuttings can be of wood 15 - 30cm long or they can be of short sections of the stem about 5cm long with just one bud at the top of the section. In this case a thin, narrow strip of the bark about 3cm long is removed from the bottom half of the side of the stem. This will encourage callusing and the formation of roots. Due to the size of these cuttings they need to be kept in a more protected environment than the longer cuttings. Layering.

nwatta Landscape Uses:Arbor. Prefers a deep rich moist well-drained moderately fertile loam[1, 200]. Grows best in a calcareous soil, but dislikes excessively chalky soils[200]. Prefers a pH in the range 6.5 to 7[200] but tolerates a range from 4.3 to 8.6. Succeeds in sun or partial shade though a warm sunny sheltered position is required for the fruit to ripen[200]. Very commonly grown in the temperate zones of the world for its edible fruit, there are many named varieties, some of which have been developed for their use as a dried fruit, others for dessert use and others for wine[132, 183]. Good and regular crops are a bit problematical in Britain, grapes are on the northern most limits of their range in this country and the British summer often does not provide enough heat to properly ripen the fruit. Late frosts can also damage young growth in spring, though dormant shoots are very hardy, tolerating temperatures down to about -20°c[11].

Nonetheless, there are a number of commercial vineyards in Britain (usually producing wine grapes) and, given a suitably sunny and sheltered position, good dessert grapes can also be grown. In general it is best to grow the dessert varieties against the shelter of a south or west facing wall[219]. There are a number of varieties that have been bred to cope with cooler summers. Grapes are very susceptible to attacks by phylloxera, this disease is especially prevalent in some areas of Europe and it almost destroyed the grape industry. However, American species of grapes that are resistant to phylloxera are now used as rootstocks and this allows grapes to be grown in areas where the disease is common. Britain is free of the disease at the present (1989) and grapes are usually grown on their own roots. Plants in this genus are notably susceptible to honey fungus[200]. The flowers are intensely fragrant[245]. Grapes grow well in the company of hyssop, chives, basil and charlock[201]. They grow badly with radishes, both the grapes and the radishes developing an off taste[201]. Plants climb by means of tendrils[182]. Any pruning should be carried out in winter when the plants are dormant otherwise they bleed profusely[182]. The cultivated grape is thought to have been derived from *V. vinifera sylvestris*. (Gmel.)Hegi. This form has dioecious flowers and produces small black grapes. Special Features:Attractive foliage, Inconspicuous flowers or blooms. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. Woody. Growth habit is a single or multiple shooting vine from a crown [1-2].

## 7.2.4 Sorbus domestica

Service Tree

6 tin 10 cyuc 5 kcak 2 tcan 0 dwat 15 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Sorbus domestica is a deciduous Tree growing to 15 m (49ft 3in) at a medium rate. See above for USDA hardness. It is hardy to UK zone 6 and is not frost tender. It is in flower in May, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. The fruit is usually bletted if it is going to be eaten raw[1, 2, 3, 11, 115, 183]. This involves storing the fruit in a cool dry place until it is almost but not quite going rotten. At this stage the fruit has a delicious taste, somewhat like a luscious tropical fruit[K]. The fruit will often begin its bletting process whilst still on the tree and we have eaten delicious fruits straight from the tree in mid-September[K]. The fruit can also be dried and used like prunes. The fruit is up to 3cm across[200].

tcanta Tannin WoodThe bark is a source of tannin[61]. Wood - fine grained, very heavy, hard to split. Used for furniture, screws, wine presses etc[11, 46, 61, 74, 115].

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame[78, 80]. If you have sufficient seed it can be sown in an outdoor seedbed[78, 80]. Stored seed germinates better if given 2 weeks warm then 14 - 16 weeks cold stratification[98], so sow it as early in the year as possible. Prick out the seedlings into individual pots when they are large enough to handle. Seedlings are very slow to put on top-growth for their first year or two[11], but they are busy building up a good root system. It is best to keep them in pots in a cold frame for their first winter and then plant them out into their permanent positions in late spring.

nwatta Succeeds in most reasonably good soils in an open sunny position[11]. Tolerates light shade[188], though it fruits better in a sunny position[K]. The service tree is occasionally cultivated for its edible fruit[3, 45, 132]. There are 2 distinct forms, *S. domestica pomifera*. (Hayne.)Rehd. with apple shaped fruits (which ripen from September) and *S. domestica pyriformis*. (Hayne.)Rehd. with pear shaped fruits

which ripen from October[11, 132]. Plants are susceptible to fireblight[188] and to canker (which is especially prevalent in areas with high rainfall)[K]. They grow best in the drier areas of Britain, which in general means the eastern half of the country[121]. The plant is heat tolerant in zones 8 through 6. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

## 7.2.5 Crataegus tanacetifolia

Tansy-Leaved Thorn

6 tlin 8 cyuc 5 kcaak 3 tcan 2 dwat 10 m hkuc hmimhtut cyutli hgtatkyuctcuphja7n hwicli hrasljutnyikfrjp hpa7tli flatprikwisslip hpa7tmwatli xre7t hjonli

drutta Crataegus tanacetifolia is a deciduous Tree growing to 10 m (32ft) by 8 m (26ft). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in June, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Midges. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry moist or wet soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[2, 3, 105]. A good size with a soft juicy texture and an acid/sweet apple-like flavour that is very nice raw when fully ripe[11, 183, K]. The fruit can also be used in making pies, preserves, etc, and can be dried for later use. The fruit is up to 25mm in diameter[200]. There are up to five fairly large seeds in the centre of the fruit, these often stick together and so the effect is of eating a cherry-like fruit with a single seed[K].

tcanta WoodWood - heavy, hard, tough, close-grained. Useful for making tool handles, mallets and other small items[74, 82].

dwatta Cardiotonic HypotensiveAlthough no specific mention has been seen for this species, the fruits and flowers of many hawthorns are well-known in herbal folk medicine as a heart tonic and modern research has borne out this use. The fruits and flowers have a hypotensive effect as well as acting as a direct and mild heart tonic[222]. They are especially indicated in the treatment of weak heart combined with high blood pressure[222]. Prolonged use is necessary for it to be efficacious[222]. It is normally used either as a tea or a tincture[222].

propta Seed - this is best sown as soon as it is ripe in the autumn in a cold frame, some of the seed will germinate in the spring, though most will probably take another year. Stored seed can be very slow and erratic to germinate, it should be warm stratified for 3 months at 15°C and then cold stratified for another 3 months at 4°C[164]. It may still take another 18 months to germinate[78]. Scarifying the seed before stratifying it might reduce this time[80]. Fermenting the seed for a few days in its own pulp may also speed up the germination process[K]. Another possibility is to harvest the seed 'green' (as soon as the embryo has fully developed but before the seedcoat hardens) and sow it immediately in a cold frame. If timed well, it can germinate in the spring[80]. If you are only growing small quantities of plants, it is best to

pot up the seedlings as soon as they are large enough to handle and grow them on in individual pots for their first year, planting them out in late spring into nursery beds or their final positions. When growing larger quantities, it might be best to sow them directly outdoors in a seedbed, but with protection from mice and other seed-eating creatures. Grow them on in the seedbed until large enough to plant out, but undercut the roots if they are to be left undisturbed for more than two years.

nwatta A very easily grown plant, it prefers a well-drained moisture retentive loamy soil but is not at all fussy[11, 200]. Once established, it succeeds in excessively moist soils and also tolerates drought[200]. It grows well on a chalk soil and also in heavy clay soils[200]. A position in full sun is best when plants are being grown for their fruit, they also succeed in semi-shade though fruit yields and quality will be lower in such a position[11, 200]. Most members of this genus succeed in exposed positions, they also tolerate atmospheric pollution[200]. Hybridizes freely with other members of this genus[200]. Seedling trees take from 5 - 8 years before they start bearing fruit, though grafted trees will often flower heavily in their third year[K]. Unlike most members of this genus, the flowers are sweetly scented and free from the smell of decaying fish[245]. Seedlings should not be left in a seedbed for more than 2 years without being transplanted[11]. This species has an excellent potential as a fruit crop in Britain. The fruit is of a reasonable size, it is usually very freely borne and the quality is very acceptable for dessert[K]. The tree is very easily grown and is little troubled by pests or diseases. It also requires very little attention, once the trees are established virtually the only work needed is to harvest the fruit each year[K]. A tree at Cambridge Botanical Gardens was about 6 metres tall and 4 metres wide in September 1993. It usually carries a very good crop of fruit[K]. A very ornamental plant[1], it is closely related to *C. laciniata*[11].

## 7.2.6 Actinidia deliciosa

Kiwi Fruit

6 tlin 9 cyuc 5 kcaak 1 tcan 1 dwat 9 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flat hpa7tmwatli nyanhjen hjonli

drutta Actinidia deliciosa is a deciduous Climber growing to 9 m (29ft 6in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from July to August, and the seeds ripen from October to December. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Bees, insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Fruit Leaves SeedEdible Uses: Fruit - raw or cooked. A delicious flavour[1, 2, 3, 11, 105], the fruit can be up to 8cm long, it is very juicy when fully ripe and has a refreshing, acid flavour[K]. It contains a number of small seeds, but these are easily eaten with the fruit[K]. Rich in vitamin C[183]. Fresh fruits contain 100 - 420mg vitamin C per 100g and 8 - 14% carbohydrate[218]. Acidity is 1 - 2%, mainly citric acid[218]. The fruit ripens in November and can store for 3 - 4 months[132]. Yields of 8 - 30 tonnes per hectare are possible[218]. Leaves are a famine food[179].

tcanta Paper PencilPaper is made from the bark[178]. If the bark is removed in one piece from near the root and placed in hot ashes, it becomes very hard and can be used as a tube for a pencil[178].

dwatta Diuretic Febrifuge Sedative Urinary Vitamin CThe fruits, stems and roots are diuretic, febrifuge and sedative[147]. They are used in the treatment of stones in the urinary tract, rheumatoid arthralgia, cancers of the liver and oesophagus[147].

propta Seed - sow spring in a greenhouse[133]. It is probably best if the seed is given 3 months stratification[113], either sow it in a cold frame as soon as it is ripe in November or as soon as it is received. Fresh seed germinates in 2 - 3 months at 10°C, stored seed can take longer[133]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in light shade

rant[176]. It is used in the treatment of stiffness sensation and pain in the chest, angina pectoris, pleurisy, bronchitis, diarrhoea and tenesmus in cases of dysentery[176]. Although no other specific mention of medicinal uses has been seen for this species, members of this genus are in general very healthy additions to the diet. They contain sulphur compounds (which give them their onion flavour) and when added to the diet on a regular basis they help reduce blood cholesterol levels, act as a tonic to the digestive system and also tonify the circulatory system[K].

propta Seed - sow spring in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle - if you want to produce clumps more quickly then put three plants in each pot. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in spring once they are growing vigorously and are large enough. Division in spring. Very easy, the plants divide successfully at any time in the growing season and the divisions can be planted straight out into their permanent positions if required.

nwatta Prefers a sunny position in a light well-drained soil[1]. Tolerates poor soils[206]. Plants often die-back in hot weather mid-summer, coming back into growth in late summer and flowering in the autumn[206]. The flowers seldom set seed in Britain[206]. The bulbs should be planted fairly deeply[1]. Most members of this genus are intolerant of competition from other growing plants[203]. Grows well with most plants, especially roses, carrots, beet and chamomile, but it inhibits the growth of legumes[18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. This species is widely cultivated for its edible bulb and leaves, mainly in the tropical and sub-tropical areas of Japan, China and many other parts of eastern Asia[58, 183, 266]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 7.2.78 Bunias orientalis

Turkish Rocket, Turkish wartycabbage

6 tlin 9 cyuc 4 kcaak 0 tcan 0 dwat 0.9 m hkuc htut cyutli tcup hwicli hrasljutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Bunias orientalis is a PERENNIAL growing to 0.9 m (3ft) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from May to August, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves StemEdible Uses: Leaves and young stems - raw or cooked[17, 61, 105, 177, 183]. The young leaves have a mild cabbage flavour that goes very well in a mixed salad, though some people find them indigestible[K]. The leaves are a bit hairy so we find them less than wonderful when eaten raw on their own[K]. The cooked leaves make an excellent vegetable[K]. The leaves are available early in the year, usually towards the end of winter, and the plant will continue to produce leaves until late autumn, with a bit of a gap when the plant is in flower[27, K]. Flower buds and flowering stems - raw or cooked[264]. A pleasant mild flavour with a delicate sweetness and cabbage-like flavour, they make an excellent broccoli substitute though they are rather smaller[K].

tcanta None known

dwatta None known

propta Seed - sow April in a cold frame. Germination is usually very quick and good. Prick out the seedlings into pots as soon as they are large enough to handle and plant them out in early summer. The seed can also be sown in situ in the spring, though the seedlings are rather prone to slug damage[K]. Division in spring. Quick and easy. Root cuttings 2 - 5cm in length succeed at any time during the growing season, though early spring as the plant comes into growth is best[K]. If the top 7 - 10cm of the plant is removed to supply root cuttings and divisions, the roots remaining in the soil usually regrow very quickly[K].

nwatta A very easily grown plant, it succeeds in any soil in a sunny position[1, 200]. Plants have also been seen

growing exceedingly well in the dappled shade of a woodland garden[K]. Plants are quite tolerant of neglect, growing well amongst long grass on our Cornish trial ground[K]. The young spring growth can be quite badly damaged by slugs, though more mature plants grow away so quickly that this does not seem to be a problem[K]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2].

## 7.2.79 Brassica juncea

Brown Mustard

6 tlin 9 cyuc 4 kcaak 2 tcan 2 dwat 0.8 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli frusflatprikwisslip hpa7tmwatli fyifxre7t hjonli

drutta Brassica juncea is a ANNUAL growing to 0.8 m (2ft 7in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from June to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves Oil Root SeedEd Uses: Condiment OilLeaves - raw or cooked[22, 33, 46, 52, 61]. A peppery flavour that can range from mild to hot, this is one of the most highly prized cooked vegetables in the Orient[206]. The leaves can also be eaten raw, when finely shredded they make a very acceptable addition to mixed salads[206]. The protein extracted from the leaves mixes well with banana pulp and is well adapted as a pie filling[183]. Flowers and young flowering stems - raw or cooked[52]. Sweet and succulent[133]. An edible semi-drying oil is obtained from the seed[1, 2, 17, 57, 183]. The seed contains 25 - 30% oil[74]. The seed is used as a mustard flavouring[171]. It is the source of 'brown mustard'[183], a prepared mustard that is milder than that produced from other species[238]. Pungency of mustard develops when cold water is added to the ground-up seed - an enzyme (myrosin) acts on a glycoside (sinigrin) to produce a sulphur compound. The reaction takes 10 - 15 minutes. Mixing with hot water or vinegar, or adding salt, inhibits the enzyme and produces a mild bitter mustard[238]. Black mustard comes from *B. nigra* and white mustard from *Sinapis alba*. The seed is also used whole in curries and pickles[238]. They are often heated in oil to destroy their pungency and give them a nutty flavour[238]. The root of some forms of this species is edible[183]. Sprouted seeds can be added to salads.

tcanta Green manure Oil RepellentThere is some evidence that if this plant is grown as a green manure it is effective in reducing soil-borne root rots in pea crops[206]. This is attributed to chemicals that are given off as the plants decay[206]. Brassica juncea is used in phytoremediation to remove heavy metals, such as lead, from the soil in hazardous waste sites because it has a higher tolerance for these substances and stores the heavy metals in its cells. In particular, Schneider et al. found that Brassica juncea was particularly effective at removing cadmium from soil.

dwatta Anodyne Antibiotic Aperient Diuretic Emetic Galactogogue Rubefacient StimulantAlthough not usually used medicinally, the seed is a warming stimulant herb with antibiotic effects[238]. Reported to be anodyne, aperitif, diuretic, emetic, rubefacient, and stimulant, Brown Mustard is a folk remedy for arthritis, foot ache, lumbago, and rheumatism[269]. The seed is used in the treatment of tumours in China[269]. In Korea, the seeds are used in the treatment of abscesses, colds, lumbago, rheumatism, and stomach disorders[269]. The root is used as a galactogogue in Africa[269]. Ingestion may impart a body odour repellent to mosquitoes[269]. Mustard oil is used in the treatment of skin eruptions and ulcers[269]. Believed to be aperient and tonic, the volatile oil is used as a counterirritant and stimulant[269]. In Java the plant is used as an antisyphilitic emmenagogue[269]. Leaves applied to the forehead are said to relieve headache[269]. The Chinese eat the leaves in soups for bladder, inflammation or haemorrhage[269].

drutta Brassica rapa nipposinica is a BIENNIAL growing to 0.3 m (1ft) by 0.5 m (1ft 8in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from May to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers LeavesEdible Uses: Leaves - raw or cooked[206]. They can be eaten at any stage from seedling to mature plant though older leaves become fibrous[206]. A very good salad, the leaves can also be cooked as greens or in soups etc[206]. The leaf stalks can also be eaten but require more cooking than the leaves[206]. It can be used as a cut and come again crop. regrowing rapidly after being harvested[206]. Immature flowering stems - cooked like broccoli[206]. A sweet flavour[206].

tcanta None known
dwatta None known

propta Seed - sow in situ or in a seed bed from April to September. Thinnings can be transplanted[206]. Some varieties can also be sown in a cold greenhouse in late autumn or early spring to provide leaves overwinter and in late spring.

nwatta Succeeds in full sun in most well-drained fertile soils[200]. Summer crops tolerate light shade[206]. Prefers a pH of 5.5 to 7[200]. Prefers a cool moist reasonably fertile soil[52]. The plant is shallow rooted and intolerant of drought, it needs to be grown in a moist fertile soil for the best quality leaves[206]. Fairly hardy, tolerating quite hard frosts, though plants are likely to die if this is coupled with wet weather[206]. Plants are also tolerant of summer heat[206]. Mizuna is widely cultivated in China for its edible leaves, there are many named varieties[206]. This plant is one of the most resistant to bolting of the oriental brassicas and can be sown in spring. It can also be planted in the summer for an autumn and winter crop[264]. Mizuna can also be transplanted successfully[206]. A fast growing plant, it can be cropped on a cut and come again basis just 2 - 3 weeks after sowing and has been known to continue cropping for 10 months before going to seed[206]. A very ornamental plant[206].

### 7.2.76 Brassica juncea tsatsai tumida

Swollen-Stem Mustard

6 tin 10 cyuc 4 kcaak 2 tcan 2 dwat 0.8 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprikliwis hpa7tmwatli fyif hjonli

drutta Brassica juncea tsatsai tumida is a ANNUAL growing to 0.8 m (2ft 7in) by 0.4 m (1ft 4in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. The flowers are pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves Oil Oil Seed Shoots Other Edible Uses: Condiment Oil OilEdible portion: Flowers, Leaves, Oil, Stem, Vegetable. Leaves and leaf stems - raw or cooked[ 22 , 33 , 46 , 52 , 61 ]. A peppery flavour that can range from mild to hot, this is one of the most highly prized cooked vegetables in the Orient[ 206 ]. The leaves can also be finely shredded and added to mixed salads[ 206 ]. The protein extracted from the leaves mixes well with banana pulp and is well adapted as a pie filling[ 183 ]. Flowers and young flowering stems - raw or cooked[ 52 ]. Sweet and succulent[ 133 ]. The stem is trimmed then washed, halved, withered slightly and preserved with salt, cayenne pepper and zanthoxylum pericarps under pressure then marketed. An edible semi-drying oil is obtained from the seed[ 1 , 2 , 17 , 57 , 183 ]. The seed contains 25 - 30% oil[ 74 ]. The seed is used as a mustard flavouring[ 171 ]. It is the source of 'brown mustard'[ 183 ], a prepared mustard that is milder than that produced from other species[ 238 ]. Pungency of mustard develops when cold water is added to the ground-up seed - an enzyme (myrosin) acts on a glycoside (sinigrin) to

produce a sulphur compound. The reaction takes 10 - 15 minutes. Mixing with hot water or vinegar, or adding salt, inhibits the enzyme and produces a mild bitter mustard[ 238 ]. Black mustard comes from B. nigra and white mustard from Sinapis alba. The seed is also used whole in curries and pickles[ 238 ]. They are often heated in oil to destroy their pungency and give them a nutty flavour[ 238 ]. Sprouted seeds can be added to salads. Plants produce swellings on the stem, these can be cooked or pickled[ 206 ].

tcanta Green manure Oil Oil Repellent Soil reclamationOther uses rating: Low (2/5). Agroforestry Uses: There is some evidence that if this plant is grown as a green manure it is effective in reducing soil-borne root rots in pea crops[ 206 ]. This is attributed to chemicals that are given off as the plants decay[ 206 ]. Other Uses None known

dwatta Anodyne Antiarthritic Antinflammatory Antirheumatic Antitumor Diuretic Emetic Emmenagogue Foot care Galactogogue Laxative Rubefacient Stimulant TonicReported to be anodyne, aperitif, diuretic, emetic, rubefacient, and stimulant, the plant is a folk remedy for arthritis, foot ache, lumbago, and rheumatism[ 269 ]. The seed is used in the treatment of tumours in China[ 269 ]. In Korea, the seeds are used in the treatment of abscesses, colds, lumbago, rheumatism, and stomach disorders[ 269 ]. The root is used as a galactagogue in Africa[ 269 ]. Ingestion may impart a body odour repellent to mosquitoes[ 269 ]. Mustard oil is used in the treatment of skin eruptions and ulcers[ 269 ]. Believed to be aperient and tonic, the volatile oil is used as a counterirritant and stimulant[ 269 ]. In Java the plant is used as an antisyphilitic emmenagogue[ 269 ]. Leaves applied to the forehead are said to relieve headache[ 269 ]. The Chinese eat the leaves in soups for bladder, inflammation or haemorrhage[ 269 ].

propta Seed - sow in situ from August to October. Spring and early summer-sown crops tend to run quickly to seed, though they can be eaten whilst still small[ 206 ]. It is best not to sow the seed in very hot weather[ 206 ]. There are about 5,660 - 6,000 per 0.01 kg (1/3 oz)[ 269 ].

nwatta Originating from the central Asian Himalayas to China, the plant has long been cultivated and many forms have been developed that can be grown from the temperate to the tropical zones. Succeeds in full sun in most well-drained moisture-retentive fertile soils[ 16 , 200 , 206 ]. Prefers a heavy soil and some shade[ 16 ]. Dislikes very hot weather[ 33 ]. Plants tolerate high rainfall and, although fairly deep rooted, are not very drought resistant[ 206 ]. A form of B. Juncea that has been selected in the Orient for its edible swollen stem, there are many named varieties[ 206 ]. Plants are reasonably cold-tolerant[ 206 ]. They prefer a fairly high stable temperature and are well adapted to short day length[ 200 ]. Plants have a rooting depth of between 90 - 120 cm[ 269 ]. A good bee plant[ 74 ].

### 7.2.77 Allium chinense

Rakkyo

6 tin 9 cyuc 4 kcaak 0 tcan 2 dwat 0.3 m hkuc htut cyutli tcup hwicli hyishrasjltu hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Allium chinense is an evergreen Bulb growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves Root SeedpodEdi Uses: Bulb - raw or cooked[116, 177]. The bulb has an excellent crisp texture with a strong onion flavour[183], it can be 4 - 5cm in diameter, though it does not reach this size until the second or third year[206]. It contains about 3.1% protein, 0.12% fat, 18.3% soluble carbohydrate, 0.7% ash[179]. Leaves - raw or cooked[179]. Flowers and young seedpods - raw[179]. Used as a garnish on salads.

tcanta RepellentThe juice of the plant is used as a moth repellent. The whole plant is said to repel insects and moles[20].

dwatta Astringent Carminative Dysentery Expectorant-The whole plant is astringent, carminative and expecto-

in the greenhouse for at least their first winter. When the plants are 30cm or more tall, plant them out into their permanent positions in late spring or early summer, after the last expected frosts[K]. Most seedlings are male[126]. The seedlings are subject to damping off, they must be kept well ventilated[113]. Cuttings of softwood as soon as ready in spring in a frame[K]. Cuttings of half-ripe wood, July/August in a frame. Very high percentage[113]. Cuttings of ripe wood, October/November in a frame.

nwatta Prefers a sound loamy acid soil, it dislikes alkaline soils and becomes chlorotic at pH 6 or higher[11]. Tolerates a pH in the range 5.5 to 7.3. Succeeds in semi-shade but full sun is best for fruit production[3, 126, 200]. Prefers a sheltered position[200]. Does well when grown into trees[K]. Plants requires a 6 - 8 month frost-free growing season[160, 200]. They are hardy to about -12°c when fully dormant but young growth is very subject to damage by late frosts, being killed back at -2°c[160, 200]. Plants also require a winter chilling of 600 - 1100 hours below 7°c and a long warm summer to ripen the fruit[200]. Plants fruit on second year wood or on fruit spurs produced on older wood[126], any pruning is best carried out in the winter[219]. The flowers are sweetly scented[245]. A very ornamental plant[1], it is widely cultivated in warm temperate zones for its edible fruit, there are many named varieties[183, 200]. The fruit can store for up to 9 months at 0°c with a relative humidity of 90%, but under domestic conditions 4 - 6 weeks is optimal[200]. This is a rampant climbing plant, supporting itself by twining around branches etc[200]. Plants have been seen with very good crops of fruit at the Hillier Arboretum in Hampshire in several autumns. These plants had outgrown their planned supports and had climbed 15 metres into neighbouring trees. The main problem with them would be how to harvest the fruit[K]. The female 'Heywood' is the most commonly cultivated form in Britain (1993), its fruits store well but it tends to flower late and there can be problems with pollination[126]. The cultivar 'Blake' is said to be fast cropping and self-fertile[200]. The male 'Tomuri' is free-flowering and disease-resistant[202]. Plants in this genus are notably resistant to honey fungus[200]. Plants are usually dioecious, but hermaphrodite forms are known. However, the fruit quality and yield of these hermaphrodite forms is usually inferior[11]. Male and female plants must usually be grown if seed is required, one male to five or six females is normally adequate. The plant is heat tolerant in zones 9 through 7. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. Woody. Growth habit is a single or multiple shooting vine from a crown [1-2].

### 7.2.7 Semiarundinaria fastuosa

Narihiradake, Narihira bamboo

6 tin 9 cyuc 5 kcaak 2 tcan 0 dwat 7.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Semiarundinaria fastuosa is an evergreen Bamboo growing to 7.5 m (24ft) by 3 m (9ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: Shoots StemEdible Uses: Young shoots - cooked[25, 61, 177]. The shoots are almost free of any acidity[183]. Although small, they are of good quality when cooked[183]. A plant at Trebah gardens in Cornwall was producing a good amount of new shoots about 35mm in diameter in early April 1995[K]. They are best harvested as

they come through the soil in spring[183]. Do not take too many from any plant since this will weaken the clump.

tcanta Hedge Plant supportThe plant is fairly resistant to maritime exposure and makes a good shelter hedge[K]. A hedge seen in 1987 in an exposed position at Rosewarne in N. Cornwall was looking good even after the severe winter of that year[K]. It needs to be planted fairly closely if a thick hedge is wanted quickly since it is a slow spreader. 60 - 75cm is a good distance. The canes can be used as plant supports[25].

dwatta None known

propta Seed - surface sow as soon as it is ripe in a greenhouse at about 20°c. Do not allow the compost to dry out. Germination usually takes place fairly quickly so long as the seed is of good quality, though it can take 3 - 6 months. Prick out the seedlings into individual pots as soon as they are large enough to handle. Grow them on in a lightly shaded place in the greenhouse until large enough to plant out, which could be 2 - 3 years. The plants only flower at intervals of many years and so seed is rarely available. Division as the plants come into growth in spring. Take divisions with at least three canes in the clump, trying to cause as little root disturbance to the main plant as possible. Grow them on in light shade in a greenhouse in pots of a high fertility sandy medium. Mist the foliage regularly until plants are established. Plant them out into their permanent positions when a good root system has developed, which can take a year or more[200]. Basal cane cuttings. Rhizome cuttings.

nwatta Prefers a damp humus-rich soil in sun or semi-shade[200]. Dislikes drought[1]. A slow growing plant, it prefers a position sheltered from cold north and east winds[25] but is fairly tolerant of maritime exposure[K]. A very ornamental and hardy bamboo[195], tolerating temperatures down to about -22°c[25, 200]. Most leaves are produced at the tops of the stems[200]. This species is notably resistant to honey fungus[200]. The plant has a running root-stock but is slow moving and generally well behaved in the British climate. New shoots are produced from late April[25]. Plants only flower at intervals of many years. When they do come into flower most of the plants energies are directed into producing seed and consequently the plant is severely weakened. They sometimes die after flowering, but if left alone they will usually recover though they will look very poorly for a few years. If fed with artificial NPK fertilizers at this time the plants are more likely to die[122]. The plant is heat tolerant in zones 9 through 6. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. An evergreen. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

### 7.2.8 Phyllostachys nidularia

Big-Node Bamboo, Broom bamboo

6 tin 9 cyuc 5 kcaak 4 tcan 0 dwat 6 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Phyllostachys nidularia is an evergreen Bamboo growing to 6 m (19ft) by 6 m (19ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Shoots StemEdible Uses: Young shoots - cooked. Highly prized in China, both for their earliness and their delicate flavour[195], they taste somewhat

like hominy corn[183]. Neither acrid nor bitter, even in the raw state. The shoots, which are about 4cm in diameter[266] are harvested in the spring when they are about 8cm above the ground, cutting them about 5cm below soil level.

tcanta Hedge Hedge Plant support Soil stabilization WoodThe plant has been suggested as being useful for soil and water stabilization on hills and levees[195]. The canes are strong and useful in their whole state, but do not split well[195]. They can be used for plant supports etc.

dwatta None known

propta Seed - surface sow as soon as it is ripe in a greenhouse at about 20°c. Do not allow the compost to dry out. Germination usually takes place fairly quickly so long as the seed is of good quality, though it can take 3 - 6 months. Grow on in a lightly shaded place in the greenhouse until large enough to plant out. Seed is rarely available. Division in spring as new growth commences. Divisions from the open ground do not transplant well, so will need careful treatment and nurturing under cover in pots until at least late spring[238]. Division is best carried out in wet weather and small divisions will establish better than large clumps[238]. Another report says that you can take large divisions from established clumps and transfer them straight to their permanent positions, misting or drenching them frequently until they are established[200]. Basal cane cuttings in spring.

nwatta Requires a rich damp soil in a sheltered position. Dislikes prolonged exposure to hard frosts. New growth begins in early spring. This is a good companion species to grow in a woodland because the plants are shallow rooted and do not compete with deep rooted trees[195]. This species is notably resistant to honey fungus[200]. Plants only flower at intervals of many years. When they do come into flower most of the plants energies are directed into producing seed and consequently the plant is severely weakened. They sometimes die after flowering, but if left alone they will usually recover though they will look very poorly for a few years. If fed with artificial NPK fertilizers at this time the plants are more likely to die[122].

## 7.2.9 Cephalotaxus fortunei

Chinese Plum Yew

6 tlin 9 cyuc 5 kcaak 3 tcan 1 dwat 6 m hkuc pcmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

drutta Cephalotaxus fortunei is an evergreen Shrub growing to 6 m (19ft 8in) at a slow rate. See above for USDA hardness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower from April to May, and the seeds ripen from October to November. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Fruit SeedEdible Uses: Fruit[2]. Fairly large, it is about 30mm x 15mm[200]. We have no further details, though it is closely related to C. harringtonia, the fruit of which is edible raw if fully ripe[K]. The fruit does not always ripen in Britain, before full ripeness it has a disgusting resinous flavour that coats the mouth and refuses to go away for hours[K]. It is quite possible that the seed of this species is also edible[K].

tcanta Hedge HedgeSome forms of this species are procumbent in habit and can be used as ground cover in shady places[200]. Very tolerant of pruning, this plant makes a very good hedge in shady positions[200].

dwatta CancerSubstances from the plant have shown anticancer activity[218].

propta Seed - best sown as soon as it is ripe in a cold frame[113], it should then germinate in the following spring[K]. A hard seedcoat can delay germination, especially in if the seed is not sown as soon as it is ripe[81, K]. Stored seed should be cold-stratified and sown in a cold frame in the spring[200]. Germination can take 18 months or more. Prick out the seedlings as soon as they are large enough to handle and grow them on for at least their first winter under cover. Plant out in late spring after the last expected frosts.

Greenwood cuttings of terminal shoots, August/September in a humid cold frame[1, 200]. Difficult[113].

nwatta Prefers a moist well-drained sandy soil but succeeds in most soils though it dislikes dry gravelly or chalky soils[1, 200]. Prefers a position in semi-shade but tolerates full shade[11, 81] and it also succeeds but does not usually thrive in full sun[200]. It grows very well in the mild wet coastal region of W.Scotland where it succeeds even in full sun[200]. Requires a humid sheltered site[200], strongly disliking very exposed positions[1]. Although the dormant plant is very cold-hardy, the young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. The Chinese plum yew is a very slow growing shrub or small tree[185] that has excellent potential as a nut crop in Britain. It usually fruits regularly and well in most parts of the country[K] and does well in Cornwall[59]. Trees growing in the shade of other conifers fruit regularly and heavily at Kew Botanical gardens and, unlike most nut trees there, the seeds do not get eaten by the squirrels[K]. Although we have seen no records of edibility for the seed of this species, the closely related C. harringtonia does have edible seed[K]. There are some named forms selected for their ornamental value[200]. ‘Grandis’ is a long leaved female form[200]. ‘Longifolia’ is male but otherwise similar to ‘Grandis’[200]. ‘Prostrata’ (syn ‘Prostrate Spreader’) is a procumbent ground-covering plant that arose as cuttings from a side-shoot of a normal plant[200], a plant of this cultivar was seen with a very heavy crop of immature fruit in mid September 1994 at Hillier Arboretum[K]. Plants are dioecious, but female plants sometimes produce fruits and infertile seeds in the absence of any male plants[11]. However, at least one male plant for every five females should be grown if you are growing the plants for fruit and seed. Plants have also been known to change sex[81]. Male cones are produced in the axils of the previous year’s leaves, whilst female cones are borne at the base of branchlets[200].

## 7.2.10 Phyllostachys aurea

Golden Bamboo, Fishpole Bamboo

6 tlin 11 cyuc 5 kcaak 0 tcan 0 dwat 6 m hkuc hmim cyutli hgattuc hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Phyllostachys aurea is an evergreen Bamboo growing to 6 m (19ft) by 6 m (19ft) at a fast rate. See above for USDA hardness. It is hardy to UK zone 6. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil and can tolerate drought.

kcakta Edible Parts: Seed StemEdible Uses: Young shoots - cooked[61, 105, 177]. They can also be eaten raw and have very little bitterness[183]. They are said to be the sweetest of the genus[25]. The canes are about 15mm in diameter[K]. In China, the new canes are 2 - 5cm in diameter[266]. The shoots are harvested in the spring when about 8cm above the ground, cutting them about 5cm below soil level. Seed - raw or cooked. The seed is only produced at intervals of several years, it can be eaten in all the ways that rice s used and can also be ground into a flour and used as a cereal[183].

tcanta Paper Plant support WoodThe canes make excellent plant supports and are also used for making items such as umbrella handles, walking sticks, fan handles and pipe stems[25, 162, 195]. The canes are very hard but super-flexible[195]. A fibre from the stems is used for making paper[189]. The stems are harvested at any time of the year and crushed with a hammer. They are then cooked for 2 hours or more with lye and beaten in a ball mill for 4 hours. The fibre makes a yellow/gold to cream paper[189].

dwatta None known

propta Seed - surface sow as soon as it is ripe in a greenhouse at about 20°c. Do not allow the compost to dry out. Germination usually takes place fairly quickly so long as the seed is of good quality, though it can take 3 - 6 months. Grow on in a lightly shaded place in the greenhouse until large enough to plant out. Seed is rarely available. Division in spring as new growth commences. Divisions from the open

Plant them out in the following spring.

nwatta Agroforestry Services: Living fence Historic Crop Industrial Crop: Fiber Management: StandardLandscape Uses:Border, Massing, Specimen. Thrives in any soil but prefers a sandy loam and full exposure to the south[11]. Plants are hardier when grown on poor sandy soils[200]. Prefers a hot dry position[166], disliking heavy rain[3]. Established plants are very drought resistant[11]. Only hardy in the milder areas of Britain[3, 200]. Another report says that plants are hardy to at least -30°c[164]. A plant at Kew (1992) has survived the last 3 winters outdoors[K]. This plant is still thriving in 1999, though it has not grown much and has not flowered[K]. Another plant is thriving in an open sunny position at Cambridge Botanical Gardens and must have experienced temperatures of at least -10°c, probably somewhat lower[K]. In the plants native environment, its flowers can only be pollinated by a certain species of moth. This moth cannot live in Britain and, if fruit and seed is required, hand pollination is necessary. This can be quite easily and successfully done using something like a small paint brush. Individual crowns are monocarpic, dying after flowering[233]. However, the crown will usually produce a number of sideshoots before it dies and these will grow on to flower in later years[233]. Plants in this genus are notably resistant to honey fungus[200]. Members of this genus seem to be immune to the predations of rabbits[233]. Special Features: North American native, Fragrant flowers, Attractive flowers or blooms. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is multistemmed with multiple stems from the crown [1-2]. An evergreen. The root pattern is a tap root similar to a carrot going directly down [1-2].

## 7.2.73 Sasa nipponica

Miyako-Zasa

6 tlin 9 cyuc 4 kcaak 0 tcan 0 dwat 0.8 m hkuc hmim cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Sasa nipponica is an evergreen Bamboo growing to 0.8 m (2ft 7in). See above for USDA hardness. It is hardy to UK zone 7. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: Young shoots - cooked. They are so popular in Japan that a license is required in order to collect them. Seed - used as a cereal[177]. The seed is only produced at intervals of many years.

tcanta None known

dwatta None known

propta Seed - if possible, surface sow the seed as soon as it is ripe in a greenhouse at about 20°c. Stored seed is best sown as soon as it is received. Do not allow the compost to dry out. Germination usually takes place fairly quickly so long as the seed is of good quality, though it can take 3 - 6 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a lightly shaded place in the greenhouse until large enough to plant out, which could be a few years. Plants only flower at intervals of several years and so seed is rarely available. Division in late spring as new growth commences. Take large divisions, trying to cause as little root disturbance to the main clump as possible. Grow them on in light shade in a greenhouse in pots of a high fertility sandy medium. Mist the foliage regularly until plants are established. Plant them out into their permanent positions when a good root system has developed, which can take a year or more[200]. Divisions of less than 5 - 6 culms rarely succeed[200].

nwatta Prefers a damp humus rich soil in partial shade[200]. This species is notably resistant to honey fungus[200]. Plants only flower at intervals of many years. When they do come into flower most of the plants energies are directed into producing seed and consequently the plant is severely weakened. They sometimes die after flowering, but if left alone they will usually recover though they will look very poorly for a few years. If fed with artificial NPK

fertilizers at this time the plants are more likely to die[122]. The rootstock can be rampant and invasive[200]. Plants are sometimes confused with Sasaella ramosa[200].

## 7.2.74 Brassica juncea strumata

Large Petiole Mustard

6 tlin 9 cyuc 4 kcaak 0 tcan 2 dwat 0.8 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli fyfxfre7t hjonli

drutta Brassica juncea strumata is a ANNUAL growing to 0.8 m (2ft 7in). See above for USDA hardness. It is hardy to UK zone 7 and is not frost tender. It is in flower from June to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves Oil StemEdible Uses: Oil- Leaves and leaf stems - raw or cooked. Flowers and young flowering stems - raw or cooked[52]. Sweet and succulent[133]. An edible semi-drying oil is obtained from the seed[1, 2, 17, 57, 183]. The seed contains 25 - 30% oil[74]. The seed is used as a mustard flavouring[171]. It is the source of ‘brown mustard’[183], a prepared mustard that is milder than that produced from other species[238]. Pungency of mustard develops when cold water is added to the ground-up seed - an enzyme (myrosin) acts on a glycoside (sinigrin) to produce a sulphur compound. The reaction takes 10 - 15 minutes. Mixing with hot water or vinegar, or adding salt, inhibits the enzyme and produces a mild bitter mustard[238]. Black mustard comes from B. nigra and white mustard from Sinapis alba. The seed is also used whole in curries and pickles[238]. They are often heated in oil to destroy their pungency and give them a nutty flavour[238]. Sprouted seeds can be added to salads.

tcanta OilNone known

dwatta Anodyne Aperient Diuretic Emetic Galactogogue Rubefacient StimulantReported to be anodyne, aperitif, diuretic, emetic, rubefacient, and stimulant, the plant is a folk remedy for arthritis, foot ache, lumbago, and rheumatism[269]. The seed is used in the treatment of tumours in China[269]. In Korea, the seeds are used in the treatment of abscesses, colds, lumbago, rheumatism, and stomach disorders[269]. The root is used as a galactagogue in Africa[269]. Ingestion may impart a body odour repellent to mosquitoes[269]. Mustard oil is used in the treatment of skin eruptions and ulcers[269]. Believed to be aperient and tonic, the volatile oil is used as a counterirritant and stimulant[269]. In Java the plant is used as an antisymphilitic emmenagogue[269]. Leaves applied to the forehead are said to relieve headache[269]. The Chinese eat the leaves in soups for bladder, inflammation or haemorrhage[269].

propta Seed - sow in situ from August to October. Spring and early summer-sown crops tend to run quickly to seed, though they can be eaten whilst still small[206]. It is best not to sow the seed in very hot weather[206]. There are about 5,660 - 6,000 per 0.01 kg (1/3 oz)[269].

nwatta Succeeds in full sun in most well-drained moisture-retentive fertile soils[16, 200, 206]. Prefers a heavy soil and some shade[16]. Dislikes very hot weather[33]. Plants tolerate high rainfall and, although fairly deep rooted, are not very drought resistant[206]. A form of B. juncea that has been selected in the Orient for its edible swollen stem, there are many named varieties[206]. Plants are reasonably cold-tolerant[206]. They prefer a fairly high stable temperature and are well adapted to short day length[200]. Many are best grown in warmer climates than Britain but there are several cultivars that grow well in this country[206]. Plants have a rooting depth of between 90 - 120 cm[269]. A good bee plant[74].

## 7.2.75 Brassica rapa nipposinica

Mizuna

6 tlin 9 cyuc 4 kcaak 0 tcan 0 dwat 0.3 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli fyfxfre7t hjonli

propta Seed - sow outdoors in spring in situ. Germination is usually very quick and free. In order to obtain a continuous supply of edible leaves, successional sowings can be made every few weeks until mid August[33]. A late summer/early autumn sowing can provide leaves in winter, though the plants might require some protection in very cold winters[200].

nwatta A very easily grown and fast-maturing plant, it succeeds in most soils and conditions, though it prefers some shade in summer[52]. Once established, plants are quite drought resistant[160]. Rocket is occasionally cultivated for its edible leaves and flowers, it can be ready for harvest within 40 days of sowing the seed[1, 46, 89, 264], there are some named varieties. 'Rocket Improved' is less prone to bolting, though it still grows best in cooler weather[183]. Plants usually self-sow freely if the ground is disturbed in some way, such as by hoeing[K]. This species is normally untroubled by pests or diseases[160].

### 7.2.71 Brassica rapa parachinensis

False Pak Choi
6 tlin 9 cyuc 4 kcak 0 tcan 0 dwat 0.3 m hkuc
hminhhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliw hpa7tmwatli fyifxre7t hjonli

drutta Brassica rapa parachinensis is a BIENNIAL growing to 0.3 m (1ft). See above for USDA hardness. It is hardy to UK zone 7 and is not frost tender. It is in flower from May to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers LeavesEdible Uses: Leaves - raw or cooked[206]. They can be eaten at any stage from seedling to mature plant[206]. The leaves are tougher and stronger flavoured than standard Pak choi[206]. The flavour is enhanced after a touch of frost[206]. The leaves are said to be very nutritious, with up to twice the mineral content of Pak choi[206]. Immature flowering stems - cooked like broccoli[206]. A sweet flavour[206]. An edible oil is obtained from the seed.

tcanta None known
dwatta None known

propta Seed - sow in situ July/August. Spring sown crops are prone to run quickly to seed if there is a spell of cold weather[206]. Some varieties can also be sown in a cold greenhouse in autumn or early spring to provide leaves over-winter and in late spring.

nwatta Succeeds in full sun in a well-drained fertile preferably alkaline soil[200]. Prefers a pH of 5.5 to 7[200]. Prefers a cool moist reasonably fertile soil[52]. The plant is shallow rooted and intolerant of drought, it responds well to a moist fertile soil but succeeds in poorer soils than standard Pak choi[206]. Hardy to about -10°C, the plants stand up well to snow but are less likely to stand up to prolonged winter wet[206]. The prostrate forms are hardier than semi-prostrate forms[206]. The rosette pak choi is widely cultivated in China for its edible leaves, there are several named varieties[206]. It is slower-growing than standard Pak choi, B. rapa chinensis[206].

### 7.2.72 Yucca baccata

Spanish Bayonet, Banana yucca, Blue Yucca, Spanish Yucca
6 tlin 11 cyuc 4 kcak 5 tcan 1 dwat 0.9 m hkuc
htut cyutli hgatyuctcup hwicli hysihrasljutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Yucca baccata is an evergreen Shrub growing to 0.9 m (3ft) at a slow rate. See above for USDA hardness. It is hardy to UK zone 7. It is in leaf all year, in flower in August. The species is hermaphrodite (has both male and female organs) and is pollinated by Hand. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and

can tolerate drought. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: Flowers Fruit Leaves Seed Stem Uses: Fully ripe fruit - raw, cooked or dried for winter use[1, 2, 3, 62, 92, 94, 257]. A staple food for several native North American Indian tribes, the fruits are large, fleshy, sweet and palatable[85, 92, 95, 183]. The ovoid fruit is about 17cm long and 7cm wide[200]. Considered to be a luxury by the native North American Indians[207], the fruits were often baked in ovens[216]. The cooked fruit can be formed into cakes and then dried for later use[257]. Large quantities of the fruit has caused diarrhoea in people who are not used to it[85]. The dried fruit can be dissolved in water to make a drink[257]. Flower buds - cooked[2, 62, 95, 183]. A soapy taste[85]. The older flowers are best[85], they are rich in sugar[94]. The flowers, harvested before the summer rains (which turn them bitter), have been used as a vegetable[257]. Flowering stems - cooked[257]. Harvested before the flowers open then roasted[257]. Seed - cooked. It can be roasted and then ground into a powder and boiled[62, 85]. The tender crowns of the plants have been roasted and eaten in times of food shortage[257]. The young leaves have been cooked as a flavouring in soups[257].

tcanta Basketry Brush Fibre Hair Needles Soap String Waterproofing WeavingA fibre obtained from the leaves is used for making ropes, baskets and mats[21, 46, 57, 85, 92, 94, 95]. The fibre can be braided into a good quality rope[257]. The leaves can be reduced into fibre and then made into cloth[257]. To obtain the fibre, the terminal spine and a section of the back of the leaf are removed and pounded to free the fibre from the fleshy portion of the leaf[257]. Another method of obtaining the fibre was to fold the leaves into sections about 10cm long. The leaves were then boiled with a small quantity of cedar ashes. When sufficiently cooked, the leaves were placed in a bowl or basket and cooled, then youths and young women would peel off the epidermis and chew the leaves, starting at one end and finishing at the other. After chewing the leaves, the fibres were separated, straightened out and hung to dry. When required for weaving, they would first be soaked in water to soften them[257]. The whole leaf is sometimes split into sections and then tied together by square knots to make a rope[92, 257]. The leaf can be used as a paint brush[92]. Leaf slivers are used, the end being pounded to reveal the fibres[257]. The leaves have also been used to make small brushes for pottery decoration[257]. The leaf is used in basket making[216, 257]. Small roots have been used in making baskets[257]. They have been used to produce a red pattern in baskets[257]. The leaves can be split and then woven into mats[257]. The leaves can be split and used as a temporary string[257]. The leaf fibre has been braided into ropes[257]. The terminal spines have been used as needles[257]. The dried leaves have been boiled with gum, hardened, ground into a powder then mixed with water and used to make baskets waterproof[257]. The roots are rich in saponins and can be used crushed and then soaked in water to release the suds for use as a soap[21, 85, 95, 216, 257]. It makes a good hair wash[85, 94, 257] and can also be used on the body and for washing clothes[257]. A soap can also be obtained from the leaves and stems[257].

dwatta Antiemetic LaxativeAn infusion of the pulverized leaves has been used as an antiemetic to prevent vomiting[257]. The fruits have been eaten raw as a laxative[257].

propta Seed - sow spring in a greenhouse. Pre-soaking the seed for 24 hours in warm water may reduce the germination time. It usually germinates within 1 - 12 months if kept at a temperature of 20°C. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse or cold frame for at least their first two winters. Plant them out into their permanent positions in early summer and consider giving them some winter protection for at least their first winter outdoors - a simple pane of glass is usually sufficient[K]. Seed is not produced in Britain unless the flowers are hand pollinated. Root cuttings in late winter or early spring. Lift in April/May and remove small buds from base of stem and rhizomes. Dip in dry wood ashes to stop any bleeding and plant in a sandy soil in pots in a greenhouse until established[78]. Division of suckers in late spring[3]. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well.

ground do not transplant well, so will need careful treatment and nurturing under cover in pots until at least late spring[238]. Division is best carried out in wet weather and small divisions will establish better than large clumps[238]. Another report says that you can take large divisions from established clumps and transfer them straight to their permanent positions, misting or drenching them frequently until they are established[200]. Basal cane cuttings in spring.

nwatta Landscape Uses:Container, Screen, Specimen. Requires a rich damp soil in a sheltered position[200]. Dislikes prolonged exposure to hard frosts[200]. Established plants are drought resistant[74]. A very hardy bamboo, it succeeds in most parts of Britain[25] but suffers leaf and culm damage at temperatures below about -15°C. Plants only flower at intervals of many years. When they do come into flower most of the plants energies are directed into producing seed and consequently the plant is severely weakened. They sometimes die after flowering, but if left alone they will usually recover though they will look very poorly for a few years. If fed with artificial NPK fertilizers at this time the plants are more likely to die[122]. Although called the 'Golden Bamboo', the leaves of this plant only turn golden if plants are grown in full sun[195], especially if the plants are half-starved. This species is considered by some botanists to be a part of P. bambusoides[25]. Cultivated for its edible shoots in China[25, 162], it has the sweetest taste of the genus[25]. It has been widely planted as an ornamental in the Mediterranean and seems to be naturalizing there[50]. This species is notably resistant to honey fungus[200]. The rootstock is running[25], but not aggressively so, the plant forming fairly tight clumps[195]. New shoots are produced from late May[25]. This is a good companion species to grow in a woodland because the plants have shallow root systems that do not compete with deep tree roots[195]. Special Features:Not North American native, Naturalizing, Inconspicuous flowers or blooms.

### 7.2.11 Cephalotaxus harringtonia drupacea

Japanese Plum Yew
6 tlin 9 cyuc 5 kcak 3 tcan 0 dwat 5 m hkuc
pcimhmim cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliw hpa7tmwatli nyanhjen hjonli

drutta Cephalotaxus harringtonia drupacea is an evergreen Shrub growing to 5 m (16ft) by 3 m (9ft) at a slow rate. See above for USDA hardness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower from April to May, and the seeds ripen from October to November. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: Fruit Oil Oil SeedEdible Uses: Oil OilFruit. - raw or cooked[177]. The fruit closely resembles a plum in its structure, the flesh is thick, juicy and very sweet with a hint of pine in its flavour[2, 183]. The fruit is about 2 - 3cm long[200]. The fruit does not always ripen in Britain, before full ripeness it has a disgusting resinous flavour that coats the mouth and refuses to go away for hours[K]. Seed - raw or cooked[81, 105]. Oily[1]. The seed has a firm texture and a slightly resinous flavour[K].

tcanta Hedge Hedge Oil OilAn oil obtained from the seed is used as an illuminant[105]. Very tolerant of pruning, this plant makes a very good hedge in shady positions[200].

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame[113], it should then germinate in the following spring[K]. A hard seedcoat can delay germination, especially if in the seed is not sown as soon as it is ripe[81, K]. Stored seed should be cold-stratified and sown in a cold frame in the spring[200]. Germination can take 18 months or more. Prick out the seedlings as soon as they are large enough to handle and grow them on for at least their first winter under cover. Plant out in late spring after the last expected frosts. Greenwood cuttings of terminal shoots, August/September in

a humid cold frame[1, 200]. Difficult[113].

nwatta Landscape Uses:Border, Foundation, Hedge, Massing, Screen, Woodland garden. Prefers a moist well-drained sandy soil but succeeds in most soils though it dislikes dry gravelly or chalky soils[1, 200]. Prefers a position in semi-shade but tolerates full shade[11, 81] and it also succeeds but does not usually thrive in full sun[200]. It grows very well in the mild wet coastal region of W. Scotland where it succeeds even in full sun[200]. Requires a humid sheltered site[200], strongly disliking very exposed positions[1]. Although the dormant plant is very cold-hardy, the young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. The Japanese plum yew is a very slow growing tree[185] with an excellent potential as a food crop in Britain. This subspecies is growing very well in the shade of other conifers at Kew botanical gardens, where it fruits regularly and heavily. Both the fruit and the seed are edible, these are often eaten in Japan. In addition, the seeds seem to be immune to the predations of squirrels. The seed on trees growing at Kew Botanical gardens are untouched even though virtually every other nut tree there has its crop destroyed[K]. Plants are dioecious, but female plants sometimes produce fruits and infertile seeds in the absence of any male plants[11]. However, at least one male plant for every five females should be grown if you are growing the plants for fruit and seed. Plants have also been known to change sex[81]. Male cones are produced in the axils of the previous year's leaves, whilst female cones are borne at the base of branchlets[200]. There has been some confusion in the naming of this plant. Some botanists have separated it off as a separate species, C. drupacea, though most nowadays include it as a subspecies of C. harringtonia, differing from the species in its shortly pedunculate male catkins[81]. In cultivation it is often known as the variety 'Fastigiata'[81]. Special Features:Not North American native, Inconspicuous flowers or blooms.

### 7.2.12 Cephalotaxus harringtonia

Japanese Plum Yew
6 tlin 9 cyuc 5 kcak 3 tcan 0 dwat 5 m hkuc
pcimhmim cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliw hpa7tmwatli nyanhjen hjonli

drutta Cephalotaxus harringtonia is an evergreen Shrub growing to 5 m (16ft) by 3 m (9ft) at a slow rate. See above for USDA hardness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower from April to May, and the seeds ripen from October to November. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: Fruit Oil Oil SeedEdible Uses: Oil OilFruit. - raw or cooked. About 2 - 3cm long[200]. The fruit of this plant is said to be astringent and inedible even when fully ripe[200]. However, several of its sub-species produce a very nice sweet fruit - see cultivation details for more information. Seed - raw or cooked[81, 105]. Oily[1] with a slightly resinous flavour[K]. The seed is up to 15mm long.

tcanta Hedge Hedge Oil OilAn oil obtained from the seed is used as an illuminant[105]. Very tolerant of pruning, this plant makes a very good hedge in shady positions[200].

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame[113], it should then germinate in the following spring[K]. A hard seedcoat can delay germination, especially if in the seed is not sown as soon as it is ripe[81, K]. Stored seed should be cold-stratified and sown in a cold frame in the spring[200]. Germination can take 18 months or more. Prick out the seedlings as soon as they are large enough to handle and grow them on for at least their first winter under cover. Plant out in late spring after the last expected frosts. Greenwood cuttings of terminal shoots, August/September in a humid cold frame[1, 200]. Difficult[113].

nwatta Prefers a moist well-drained sandy soil but succeeds in most soils though it dislikes dry gravelly or chalky

soils[1, 200]. Prefers a position in semi-shade but tolerates full shade[11, 81] and it also succeeds but does not usually thrive in full sun[200]. It grows very well in the mild wet coastal region of W. Scotland where it succeeds even in full sun[200]. Requires a humid sheltered site[200], strongly disliking very exposed positions[1]. The Japanese plum yew is a very slow growing tree[185] with an excellent potential as a food crop in Britain. It generally has a large crop of fruit and seeds, these are often eaten in Japan. In addition, the seeds seem to be immune to the predations of squirrels, the seed on trees growing at Kew Botanical gardens being untouched even though virtually every other nut tree there has its crop destroyed[K]. There has been some confusion in the naming of this species. Some botanists have separated off *C. drupacea* as a separate species, though most nowadays include it as a subspecies of this plant as *C. harringtonia* drupacea. (Sieb. and Zucc.)Koidzumi, differing from the species in its shortly pedunculate male catkins[81]. In cultivation it is often known as the variety 'Fastigiata'[81]. Another subspecies, *C. harringtonia* nana. (Nakai)Rehd. is a small spreading shrub to 2 metres, spreading by means of suckers[81, 200]. This form is said to have the best fruit of this genus[200], it is a very hardy plant, succeeding as far north as S. Sweden and Nova Scotia[200]. Plants are dioecious, but female plants sometimes produce fruits and infertile seeds in the absence of any male plants[11]. However, at least one male plant for every five females should be grown if you are growing the plants for fruit and seed. Plants have also been known to change sex[81]. Male cones are produced in the axils of the previous year's leaves, whilst female cones are borne at the base of branchlets[200]. The plant is heat tolerant in zones 9 through 3. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is mistletemmed with multiple stems from the crown [1-2]. An evergreen.

### 7.2.13 *Crataegus festiva*

6 tlin 9 cyuc 5 kcaak 2 tcan 2 dwat 3 m hkuc hmimhtut cyutli hgattcuphja7n hwicli hrasjlutnykfrip hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Crataegus festiva* is a deciduous Shrub growing to 3 m (9ft) by 3 m (9ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. The seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Midges. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. About 15mm in diameter with a delicious sweet flavour and juicy though slightly mealy texture[K]. This is a very acceptable dessert fruit that makes very enjoyable eating[K]. The fruit can also be used in making pies, preserves, etc, and can be dried for later use. There are up to five fairly large seeds in the centre of the fruit, these often stick together and so the effect is of eating a cherry-like fruit with a single seed[K].

tcanta Wood - heavy, hard, tough, close-grained. Useful for making tool handles, mallets and other small items[82].

dwatta Cardiotonic HypotensiveAlthough no specific mention has been seen for this species, the fruits and flowers of many hawthorns are well-known in herbal folk medicine

as a heart tonic and modern research has borne out this use. The fruits and flowers have a hypotensive effect as well as acting as a direct and mild heart tonic[222]. They are especially indicated in the treatment of weak heart combined with high blood pressure[222]. Prolonged use is necessary for it to be efficacious[222]. It is normally used either as a tea or a tincture[222].

propta Seed - this is best sown as soon as it is ripe in the autumn in a cold frame, some of the seed will germinate in the spring, though most will probably take another year. Stored seed can be very slow and erratic to germinate, it should be warm stratified for 3 months at 15°C and then cold stratified for another 3 months at 4°C[164]. It may still take another 18 months to germinate[78]. Scarifying the seed before stratifying it might reduce this time[80]. Fermenting the seed for a few days in its own pulp may also speed up the germination process[K]. Another possibility is to harvest the seed 'green' (as soon as the embryo has fully developed but before the seedcoat hardens) and sow it immediately in a cold frame. If timed well, it can germinate in the spring[80]. If you are only growing small quantities of plants, it is best to pot up the seedlings as soon as they are large enough to handle and grow them on in individual pots for their first year, planting them out in late spring into nursery beds or their final positions. When growing larger quantities, it might be best to sow them directly outdoors in a seedbed, but with protection from mice and other seed-eating creatures. Grow them on in the seedbed until large enough to plant out, but undercut the roots if they are to be left undisturbed for more than two years.

nwatta We have very little information on this species and do not know how hardy it will be in Britain. However, a tree growing in an open sunny position at Kew Botanical Gardens is healthy and bears a very good crop of fruit every year[K]. A very easily grown plant, it prefers a well-drained moisture retentive loamy soil but is not at all fussy[11, 200]. Once established, it succeeds in excessively moist soils and also tolerates drought[200]. It grows well on a chalk soil and also in heavy clay soils[200]. A position in full sun is best when plants are being grown for their fruit, they also succeed in semi-shade though fruit yields and quality will be lower in such a position[11, 200]. Most members of this genus succeed in exposed positions, they also tolerate atmospheric pollution[200]. Hybridizes freely with other members of this genus[200]. Seedling trees take from 5 - 8 years before they start bearing fruit, though grafted trees will often flower heavily in their third year[K]. The flowers have a foetid smell somewhat like decaying fish. This attracts midges which are the main means of fertilization. When freshly open, the flowers have more pleasant scent with balsamic undertones[245]. Seedlings should not be left in a seedbed for more than 2 years without being transplanted[11].

### 7.2.14 *Helianthus annuus*

Sunflower, Common sunflower

6 tlin 9 cyuc 5 kcaak 5 tcan 2 dwat 3 m hkuc hmimhtut cyutli hgatkuyctcup hwicli hrasjlutnyk hpa7tli flatprikliw hpa7tmwatli dyatxre7t hjonli

drutta *Helianthus annuus* is a ANNUAL growing to 3 m (9ft) by 0.3 m (1ft in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from July to September, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is not self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Flowers Oil Seed StemEdible Uses: Coffee OilSeed - raw or cooked[4, 14, 94, 101, 183]. A delicious nut-like flavour, but very fiddly to extract due to the small size of the seed. Commercially there are machines designed to do this. Rich in fats, the seed can be ground into a powder[95], made into sunflower butter or used to make seed yoghurt. When mixed with cereal flours, it makes a nutritious bread[244]. Cultivars with up to 50% oil have been developed in Russia[218]. The oil contains between 44 - 72% linoleic acid[218]. The germinated seed is said to be best

with banana pulp and is well adapted as a pie filling[ 183 ]. Flowers and young flowering stems - raw or cooked[ 52 ]. Sweet and succulent[ 133 ]. An edible semi-drying oil is obtained from the seed[ 1 , 2 , 17 , 57 , 183]. The seed contains 25 - 30% oil[ 74 ]. The seed is used as a mustard flavouring[ 171 ]. It is the source of 'brown mustard'[ 183 ], a prepared mustard that is milder than that produced from other species[ 238 ]. Pungency of mustard develops when cold water is added to the ground-up seed - an enzyme (myrosin) acts on a glycoside (sinigrin) to produce a sulphur compound. The reaction takes 10 - 15 minutes. Mixing with hot water or vinegar, or adding salt, inhibits the enzyme and produces a mild bitter mustard[ 238 ]. Black mustard comes from *B. nigra* and white mustard from *Sinapis alba*. The seed is also used whole in curries and pickles[ 238 ]. They are often heated in oil to destroy their pungency and give them a nutty flavour[ 238 ]. Sprouted seeds can be added to salads.

tcanta Green manure Oil Repellent Soil reclamationOther uses rating: Low (2/5). Agroforestry Uses: There is some evidence that if this plant is grown as a green manure it is effective in reducing soil-borne root rots in pea crops[ 206 ]. This is attributed to chemicals that are given off as the plants decay[ 206 ].

dwatta Anodyne Antiarthritic Antiinflammatory Antirheumatic Antitumor Diuretic Emetic Emmenagogue Foot care Galactagogue Laxative Rubefacient Stimulant TonicReported to be anodyne, aperitif, diuretic, emetic, rubefacient, and stimulant, the plant is a folk remedy for arthritis, foot ache, lumbago, and rheumatism[ 269 ]. The seed is used in the treatment of tumours in China[ 269 ]. In Korea, the seeds are used in the treatment of abscesses, colds, lumbago, rheumatism, and stomach disorders[ 269 ]. The root is used as a galactagogue in Africa[ 269 ]. Ingestion may impart a body odour repellent to mosquitoes[ 269 ]. Mustard oil is used in the treatment of skin eruptions and ulcers[ 269 ]. Believed to be aperient and tonic, the volatile oil is used as a counterirritant and stimulant[ 269 ]. In Java the plant is used as an antisyphilitic emmenagogue[ 269 ]. Leaves applied to the forehead are said to relieve headache[ 269 ]. The Chinese eat the leaves in soups for bladder, inflammation or haemorrhage[ 269 ].

propta Seed - sow in situ from August to October[ 206 ]. Seed can also be sown in the spring but plants are very likely to run to seed[ 206 ]. There are about 5,660 - 6,000 per 0.01 kg (1/3 oz)[ 269 ].

nwatta Originating from the central Asian Himalayas to China, the plant has long been cultivated and many forms have been developed that can be grown from the temperate to the tropical zones. Succeeds in full sun in most well-drained moisture-retentive fertile soils[ 16 , 200 , 206 ]. Prefers a heavy soil and some shade[ 16 ]. Dislikes very hot weather[ 33 ]. Plants tolerate high rainfall and, although fairly deep rooted, are not very drought resistant[ 206 ]. A form of *B. juncea* that has been selected in the Orient for its large edible leaves, there are many named varieties[ 206 ]. Plants take 3 - 4 months to reach maturity[ 206 ]. They prefer a fairly high stable temperature and are well adapted to short day length[ 200 ]. Plants have a rooting depth of between 90 - 120 cm[ 269 ]. A good bee plant[ 74 ].

### 7.2.69 *Brassica rapa chinensis*

Pak Choi

6 tlin 9 cyuc 4 kcaak 0 tcan 1 dwat 0.9 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyk hpa7tli flatprikliw hpa7tmwatli fyfixre7t hjonli

drutta *Brassica rapa chinensis* is a BIENNIAL growing to 0.9 m (3ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from May to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves Oil StemEdible Uses: Oil - Leaves - raw or cooked[46, 52, 61, 116]. They can be eaten at any stage from seedling to mature plant[206]. Well-flavoured, they are sweet with a hint of mustard[206]. The leaves are also dried for winter use[206]. The leaves have

pronounced stems and these can also be eaten, they tend to have a mild, almost bland flavour[206]. A nutritional analysis is available[218]. Immature flowering stems - cooked like broccoli[206]. A sweet flavour[206]. An edible oil is obtained from the seed.

tcanta OilNone known dwatta Antirheumatic Antiscorbutic ResolventThe leaf is antiarthritic, antiscorbutic and resolvent[218].

propta Seed - sow in situ May to August. Spring sown crops are prone to run quickly to seed if there is a spell of cold weather[206]. Some varieties can also be sown in a cold greenhouse in autumn or early spring to provide leaves overwinter and in late spring.

nwatta Succeeds in full sun in a well-drained fertile preferably alkaline soil[200]. Prefers a pH of 5.5 to 7[200]. Tolerates a pH in the range 4.3 to 7.5. Prefers a cool moist reasonably fertile soil[52]. The plant is shallow rooted and intolerant of drought, it needs to be grown in a moist fertile soil for the best quality leaves[206]. Plants are not tremendously cold-hardy, though they will withstand light frosts[133]. Pak choi is widely cultivated, especially in China, for its edible leaves which are produced mainly in the summer and autumn. A fast-growing plant, there are many named varieties and some can be ready in as little as five weeks from sowing the seed[88, 206, 264]. Forms with green stems tend to stand up better to adverse conditions than white-stemmed forms[206].

### 7.2.70 *Eruca vesicaria sativa*

Rocket

6 tlin 9 cyuc 4 kcaak 0 tcan 1 dwat 0.6 m hkuc hmimhtut cyutli hgatkuyctcup hwicli hrasjlutnyk hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Eruca vesicaria sativa* is a ANNUAL growing to 0.6 m (2ft) by 0.3 m (1ft in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower from May to August, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: Flowers Leaves Oil OilEdible Uses: Condiment Oil OilYoung leaves - raw or cooked[2, 27, 33, 34, 74]. A distinct strongly spicy flavour[183], the taste is best from fast, well-grown plants[200]. A few leaves added to a salad are acceptable though the flavour is too strong for many tastes[K]. Some people really like these leaves though most are not very keen[K]. Older leaves that have become too hot to eat on their own can be pureed and added to soups etc[183]. In the milder areas of Britain it is possible to produce edible leaves all year round from successional sowings, especially if the winter crop is given some protection[K]. Flowers - raw[52]. A similar taste to the leaves, they make a nice garnish on the salad bowl[183]. The seed yields a semi-drying oil[1, 2, 74] which is edible if stored 6 months[61, 114] and is a substitute for rapeseed oil[34]. It contains 32% fat, 27% protein[114]. It is known as 'jamba oil'[183]. A mustard is obtained from the seed[46, 74, 183], the strong flavour comes from an essential oil that is contained within the oil of the seed[114]. The pungency of mustard develops when cold water is added to the ground-up seed - an enzyme (myrosin) acts on a glycoside (sinigrin) to produce a sulphur compound. The reaction takes 10 - 15 minutes. Mixing with hot water or vinegar, or adding salt, inhibits the enzyme and produces a mild bitter mustard[238].

tcanta Oil OilThe seed yields a semi-drying oil which is a substitute for rapeseed oil[46]. It can also be used for lighting, burning with very little soot[114].

dwatta Antibacterial Antiscorbutic Aphrodisiac Diuretic Rubefacient Stimulant StomachicRocket was at one time used medicinally, though it is now used only as a salad herb[238]. The leaves are antiscorbutic, diuretic, stimulant and stomachic[4, 46]. The seed is rubefacient and stimulant[4, 46]. The powdered seed possesses antibacterial activity, but no alkaloids have been isolated[240]. The oil from the seed is said to have aphrodisiac properties[264].

seed should be cold-stratified and sown in a cold frame in the spring[200]. Germination can take 18 months or more. Prick out the seedlings as soon as they are large enough to handle and grow them on for at least their first winter under cover. Plant out in late spring after the last expected frosts. Greenwood cuttings of terminal shoots, August/September in a humid cold frame[1, 200]. Difficult[113]. Division of self-layered stems and suckers in early autumn or mid-spring.

nwatta Prefers a moist well-drained sandy soil but succeeds in most soils though it dislikes dry gravelly or chalky soils[1, 200]. Prefers a position in semi-shade but tolerates full shade[11, 81] and it also succeeds but does not usually thrive in full sun[200]. It grows very well in the mild wet coastal region of W. Scotland where it succeeds even in full sun[200]. Requires a humid sheltered site[200], strongly disliking very exposed positions[1]. The dwarf Japanese plum yew is a very slow growing plant[185] with an excellent potential as a food crop in Britain. The fruit and the seed are often eaten in Japan. In addition, the seeds seem to be immune to the predations of squirrels, the seed on trees growing at Kew Botanical gardens being untouched even though virtually every other nut tree there has its crop destroyed[K]. This sub-species is a small spreading shrub to 2 metres, spreading by means of suckers[81, 200]. It is said to have the best fruit of this genus[200]. It is also a very frost-resistant plant, succeeding as far north as S. Sweden and Nova Scotia[200]. Plants are dioecious, but female plants sometimes produce fruits and infertile seeds in the absence of any male plants[11]. However, at least one male plant for every five females should be grown if you are growing the plants for fruit and seed. Plants have also been known to change sex[81]. Male cones are produced in the axils of the previous year's leaves, whilst female cones are borne at the base of branchlets[200].

## 7.2.16 Gaultheria shallon

Shallon, Salal

6 tin 9 cyuc 5 kcaak 3 tcan 2 dwat 1.2 m hkuc pcmhmimhtut cyutli hgatyuctcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta Gaultheria shallon is an evergreen Shrub growing to 1.2 m (4ft) by 1 m (3ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf all year, in flower from May to June, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: FruitEdible Uses: TeaFruit - raw, cooked or dried for later use[2, 3, 4, 183]. Sweet and juicy with a pleasant flavour[11, 95, 101], it makes good raw eating[K]. The fruit can also be made into preserves, pies, drinks etc or be dried and used like raisins[183]. The fruit is about 10mm in diameter[200] and is produced over a period of several weeks in late summer[K]. A pleasant tea is made from the leaves[101].

tcanta DyeA purple dye is obtained from the fruit[99]. It is dark green[168]. A greenish-yellow dye is obtained from the infused leaves[257]. A ground cover plant for a shady position under trees, spreading slowly by means of suckers[188]. It should be spaced about 90cm apart each way[208].

dwatta Astrigent Poulitce StomachicA poultice of the toasted, pulverized leaves has been applied to cuts[257]. A poultice of the chewed leaves has been applied to burns and sores[257]. The leaves have been chewed to dry the mouth[257]. An infusion of the leaves have been used as a stomach tonic and a treatment for diarrhoea, coughs, TB etc[257].

propta The seed requires a period of cold stratification. Pre-chill for 4 - 10 weeks and then surface sow in a lime-free compost in a shady part of the greenhouse and keep the compost moist[78]. The seed usually germinates well, usually within 1 - 2 months at 20°C, but the seedlings are liable to damp off. It is important to water them with care and to ensure that they get plenty of ventilation. Watering them with a garlic infusion can also help to prevent damping

off[K]. Prick out the seedlings into individual pots when they are about 25mm tall and grow them on in light shade in the greenhouse for at least their first winter[K]. Plant them out in late spring or early summer. The seedlings are susceptible to spring frosts so might need some protection for their first few years outdoors. The leaves remain very small for the first few years[11]. Cuttings of half-ripe wood 3 - 6cm long, July/August in a frame in a shady position. They form roots in late summer or spring[78]. A good percentage usually take. Division in spring when new growth is about 7cm tall. Divided plants can be rather slow to get established[182]. We have found that it is best to pot up the clumps and grow them on in a shady position in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Landscape Uses:Erping control, Ground cover, Hedge, Massing. Prefers a moist but not boggy humus rich soil in shade or semi-shade[11, 182], but it can also succeed in full sun. A peat and moisture loving species, it requires a lime-free soil[11, 182]. One report says that it can succeed in dry shade[188] and another that it can withstand considerable drought once it is established[208]. Plants are hardy to about -20°C[184]. A vigorous suckering plant, it can be invasive when growing in good conditions, but responds to cutting back[1, 28]. It also succeeds when planted under trees[28, 49]. Plants in this genus are notably resistant to honey fungus[200]. Special Features: North American native. The plant is heat tolerant in zones 8 through 6. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. An evergreen. The plant growth habit is a running thicket former forming a colony from shoots away from the crown spreading indefinitely [1-2]. The root pattern is flat with shallow roots forming a plate near the soil surface [1-2]. The root pattern is stoloniferous rooting from creeping stems above the ground [1-2].

## 7.2.17 Cephalotaxus harringtonia koreana

Korean Plum Yew

6 tin 9 cyuc 5 kcaak 3 tcan 0 dwat 1.5 m hkuc pcmhmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

drutta Cephalotaxus harringtonia koreana is an evergreen Shrub growing to 1.5 m (5ft) by 3 m (9ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower from April to May, and the seeds ripen from October to November. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: Fruit Oil Oil SeedEdible Uses: Oil OilFruit. - raw or cooked. Fairly large, about 3cm long[200]. We have no information on this sub-species but assume that the fruit and seed will be edible[K]. The fruit does not always ripen in Britain, before full ripeness it has a disgusting resinous flavour that coats the mouth and refuses to go away for hours[K]. Seed - raw or cooked. Oily.

tcanta Hedge Hedge Oil OilAn oil obtained from the seed is used as an illuminant[105]. Very tolerant of pruning, this plant makes a very good hedge in shady positions[200].

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame[113], it should then germinate in the following spring[K]. A hard seedcoat can delay germination, especially

little resistance to drought[206]. They require about 5 gallons of water from sowing to maturity[206]. Plants are not fully winter hardy in Britain, though mature plants withstand light frosts to about -3°C[160, 206]. Plants prefer coolish weather during their growing season, a temperature range of 13 - 20°C is ideal[206]. The Chinese cabbage is widely cultivated, especially in China and Japan, for its edible leaves[88]. It looks like a large cos lettuce or cabbage and has a crisp, watery texture with a mustard-like taste[264]. There are many named varieties[88, 206]. Those forms with loose heads were developed for areas with hotter summers, whilst compact-headed forms were developed for cooler areas[206]. The loose-headed forms are less prone to bolt, are more resistant to cold and are more disease-resistant[206]. An annual to biennial species, it is normally grown as an annual[206]. Plants take from 55 - 100 days from sowing to maturity, depending on variety, the loose-headed forms are usually 2 - 3 weeks faster than compact-headed forms[206]. Plants do not like root disturbance so should not be transplanted unless grown in individual pots[206]. Plants are highly resistant to fungus attacks and the cabbage moth[160], they are also slow to bolt in hot weather[160]. Some cultivars are more resistant to bolting when sown in spring than other forms[206]. There is some evidence that interplanting this species with dill and garlic can lessen the attacks of caterpillars[206]. A good bee plant[108].

## 7.2.64 Brassica juncea integrifolia strumata

Large Petiole Mustard

6 tin 10 cyuc 4 kcaak 2 tcan 2 dwat 0.8 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprikliwis hpa7tmwatli fyif hjonli

drutta Brassica juncea integrifolia strumata is a ANNUAL growing to 0.8 m (2ft 7in) by 0.8 m (2ft 7in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. The flowers are pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves Oil Seed Sheds, Stems, Foliage Uses: Condiment OilLeaves and leaf stems - raw or cooked. Flowers and young flowering stems - raw or cooked[ 52 ]. Sweet and succulent[ 133 ]. An edible semi-drying oil is obtained from the seed[ 1, 2, 17, 57, 183 ]. The seed contains 25 - 30% oil[ 74 ]. The seed is used as a mustard flavouring[ 171 ]. It is the source of 'brown mustard'[ 183 ], a prepared mustard that is milder than that produced from other species[ 238 ]. Pungency of mustard develops when cold water is added to the ground-up seed - an enzyme (myrosin) acts on a glycoside (sinigrin) to produce a sulphur compound. The reaction takes 10 - 15 minutes. Mixing with hot water or vinegar, or adding salt, inhibits the enzyme and produces a mild bitter mustard[ 238 ]. Black mustard comes from B. nigra and white mustard from Sinapis alba. The seed is also used whole in curries and pickles[ 238 ]. They are often heated in oil to destroy their pungency and give them a nutty flavour[ 238 ]. Sprouted seeds can be added to salads.

tcanta Green manure Oil Repellent Oil reclamationOther uses rating: Low (2/5). Agroforestry Uses: There is some evidence that if this plant is grown as a green manure it is effective in reducing soil-borne root rots in pea crops[ 206 ]. This is attributed to chemicals that are given off as the plants decay[ 206 ].

dwatta Anodyne Antiarthritic Antinflammatory Antirheumatic Antitumor Diuretic Emetic Emmenagogue Foot care Galactogogue Laxative Rubefacient Stimulant TonicReported to be anodyne, aperitif, diuretic, emetic, rubefacient, and stimulant, the plant is a folk remedy for arthritis, foot ache, lumbago, and rheumatism[ 269 ]. The seed is used in the treatment of tumours in China[ 269 ]. In Korea, the seeds are used in the treatment of abscesses, colds, lumbago, rheumatism, and stomach disorders[ 269 ]. The root is used as a galactagogue in Africa[ 269 ]. Ingestion may impart a body odour repellent to mosquitoes[ 269 ]. Mustard oil is used in the treatment of skin eruptions and ulcers[ 269 ]. Believed to be aperient and tonic, the volatile oil is used

as a counterirritant and stimulant[ 269 ]. In Java the plant is used as an antispilhitic emmenagogue[ 269 ]. Leaves applied to the forehead are said to relieve headache[ 269 ]. The Chinese eat the leaves in soups for bladder, inflammation or haemorrhage[ 269 ].

propta Seed - sow in situ from August to October. Spring and early summer-sown crops tend to run quickly to seed, though they can be eaten whilst still small[ 206 ]. It is best not to sow the seed in very hot weather[ 206 ]. There are about 5,660 - 6,000 per 0.01 kg (1/3 oz)[ 269 ].

nwatta Originating from the central Asian Himalayas to China, the plant has long been cultivated and many forms have been developed that can be grown from the temperate to the tropical zones. Succeeds in full sun in most well-drained moisture-retentive fertile soils[ 16, 200, 206 ]. Prefers a heavy soil and some shade[ 16 ]. Dislikes very hot weather[ 33 ]. Plants tolerate high rainfall and, although fairly deep rooted, are not very drought resistant[ 206 ]. A form of B. Juncea that has been selected in the Orient for its edible swollen stem, there are many named varieties[ 206 ]. Plants are reasonably cold-tolerant[ 206 ]. They prefer a fairly high stable temperature and are well adapted to short day length[ 200 ]. Plants have a rooting depth of between 90 - 120 cm[ 269 ]. A good bee plant[ 74 ].

## 7.2.65 Allium scorodoprasum

Rocambole, Sand leek

6 tin 9 cyuc 4 kcaak 0 tcan 2 dwat 0.6 m hkuc htut cyutli kyuctcup hwicli hyishrasjlut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Allium scorodoprasum is a BULB growing to 0.6 m (2ft) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from May to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Bulb - raw or cooked[5, 46]. A garlic substitute[22, 27, 37, 38]. It is used as a flavouring in salads, soups etc[238]. The bulbs are smaller than garlic and have a milder flavour, they are produced at the points of the stem as well as at the base[2]. The bulbs are 10 - 20mm in diameter[200]. Leaves - raw or cooked[238]. Used as a flavouring in salads etc[238]. Flowers - raw. Used as a garnish on salads.

tcanta RepellentThe juice of the plant is used as a moth repellent. The whole plant is said to repel insects and moles[20].

dwatta Cholera Depurative Digestive DysenteryThe plant is digestive and depurative[178]. The bulb is used in the treatment of abscesses, amoebic dysentery, bronchitis, cholera, dysentery, influenza, skin diseases and TB[218].

propta Seed - sow spring in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle - if you want to produce clumps more quickly then put three plants in each pot. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in spring once they are growing vigorously and are large enough. Division in spring. Very easy, the plants divide successfully at any time in the growing season and the divisions can be planted straight out into their permanent positions if required.

nwatta Prefers a sunny position in a light well-drained soil[1]. Thrives in poor dry soils[238]. The bulbs should be planted fairly deeply[1]. Many forms of this species produce numerous bulbils in the flowering head[203]. The plants can become very invasive by means of these bulbils[203]. The sub-species A. scorodoprasum jajlae and A. scorodoprasum rotundum do not produce bulbils[203]. Grows well with most plants, especially roses, carrots, beet and chamomile, but it inhibits the growth of legumes[18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. Occasionally cultivated, especially in Russia, for its edible bulb[183]. Members of this genus are rarely if ever troubled by browsing deer[233].

folk remedy for arthritis, foot ache, lumbago, and rheumatism[269]. The seed is used in the treatment of tumours in China[269]. In Korea, the seeds are used in the treatment of abscesses, colds, lumbago, rheumatism, and stomach disorders[269]. The root is used as a galactagogue in Africa[269]. Ingestion may impart a body odour repellent to mosquitoes[269]. Mustard oil is used in the treatment of skin eruptions and ulcers[269]. Believed to be aperient and tonic, the volatile oil is used as a counterirritant and stimulant[269]. In Java the plant is used as an antisyphilitic emmenagogue[269]. Leaves applied to the forehead are said to relieve headache[269]. The Chinese eat the leaves in soups for bladder, inflammation or haemorrhage[269].

propta Seed - sow in situ from June to October. Spring-sown crops tend to run quickly to seed, though they can be eaten whilst still small[206]. It is best not to sow the seed in very hot weather[206]. There are about 5,660 - 6,000 per 0.01 kg (1/3 oz)[269].

nwatta Succeeds in full sun in most well-drained moisture-retentive fertile soils[16, 200, 206]. Prefers a heavy soil and some shade[16]. Dislikes very hot weather[33]. Plants tolerate high rainfall and, although fairly deep rooted, are not very drought resistant[206]. A form of *B. juncea* that has been selected for its edible leaves, there are many named varieties[206]. They prefer a fairly high stable temperature and are well adapted to short day length[200]. Many are best grown in warmer climates than Britain but there are several cultivars that grow well in this country[206]. Plants have a rooting depth of between 90 - 120 cm[269]. A good bee plant[74].

### 7.2.62 Brassica juncea integrifolia subintegrifolia

Leaf Mustard

6 tlin 10 cyuc 4 kcaak 2 tcan 2 dwat 0.3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprikliwis hpa7tmwatli fyif hjonli

drutta Brassica juncea integrifolia subintegrifolia is a ANNUAL growing to 0.3 m (1ft) by 0.3 m (1ft in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. The flowers are pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves Oil Seed Shoots Uses: Condiment OilLeaves - raw or cooked[ 22, 33, 46, 52 , 61 ]. A peppery flavour that can range from mild to hot, this is one of the most highly prized cooked vegetables in the Orient[ 206 ]. The leaves can also be finely shredded and added to mixed salads[ 206 ]. The protein extracted from the leaves mixes well with banana pulp and is well adapted as a pie filling[ 183 ]. Flowers and young flowering stems - raw or cooked[ 52 ]. Sweet and succulent[ 133 ]. An edible semi-drying oil is obtained from the seed[ 1 , 2 , 17 , 57 , 183 ]. The seed contains 25 - 30% oil[ 74 ]. The seed is used as a mustard flavouring[ 171 ]. It is the source of 'brown mustard'[ 183 ], a prepared mustard that is milder than that produced from other species[ 238 ]. Pungency of mustard develops when cold water is added to the ground-up seed - an enzyme (myrosin) acts on a glycoside (sinigrin) to produce a sulphur compound. The reaction takes 10 - 15 minutes. Mixing with hot water or vinegar, or adding salt, inhibits the enzyme and produces a mild bitter mustard[ 238 ]. Black mustard comes from *B. nigra* and white mustard from *Sinapis alba*. The seed is also used whole in curries and pickles[ 238 ]. They are often heated in oil to destroy their pungency and give them a nutty flavour[ 238 ]. Sprouted seeds can be added to salads.

tcanta Green manure Oil Repellent Soil reclamationOther uses rating: Low (2/5). Agroforestry Uses: There is some evidence that if this plant is grown as a green manure it is effective in reducing soil-borne root rots in pea crops[ 206 ]. This is attributed to chemicals that are given off as the plants decay[ 206 ]. Other Uses None known

dwatta Anodyne Antiarthritic Antinflammatory Antirheumatic Antitumor Diuretic Emetic Emmenagogue Foot care Galactogogue Laxative Rubefacient Stimulant TonicRe-

ported to be anodyne, aperitif, diuretic, emetic, rubefacient, and stimulant, the plant is a folk remedy for arthritis, foot ache, lumbago, and rheumatism[ 269 ]. The seed is used in the treatment of tumours in China[ 269 ]. In Korea, the seeds are used in the treatment of abscesses, colds, lumbago, rheumatism, and stomach disorders[ 269 ]. The root is used as a galactagogue in Africa[ 269 ]. Ingestion may impart a body odour repellent to mosquitoes[ 269 ]. Mustard oil is used in the treatment of skin eruptions and ulcers[ 269 ]. Believed to be aperient and tonic, the volatile oil is used as a counterirritant and stimulant[ 269 ]. In Java the plant is used as an antisyphilitic emmenagogue[ 269 ]. Leaves applied to the forehead are said to relieve headache[ 269 ]. The Chinese eat the leaves in soups for bladder, inflammation or haemorrhage[ 269 ].

propta Seed - sow in situ from August to October. Spring and early summer-sown crops tend to run quickly to seed, though they can be eaten whilst still small[ 206 ]. It is best not to sow the seed in very hot weather[ 206 ]. There are about 5,660 - 6,000 per 0.01 kg (1/3 oz)[ 269 ].

nwatta Originating from the central Asian Himalayas to China, the plant has long been cultivated and many forms have been developed that can be grown from the temperate to the tropical zones. Succeeds in full sun in most well-drained moisture-retentive fertile soils[ 16 , 200 , 206 ]. Prefers a heavy soil and some shade[ 16 ]. Dislikes very hot weather[ 33 ]. Plants tolerate high rainfall and, although fairly deep rooted, are not very drought resistant[ 206 ]. A form of *B. juncea* with entire leaves that has been selected in the Orient for its edibility. There are many named varieties[ 206 ]. A very fast growing variety, usually maturing within 40 days of sowing[ 206 ]. The plants in this group are fairly cold-tolerant[ 206 ]. Plants have a rooting depth of between 90 - 120 cm[ 269 ]. A good bee plant[ 74 ].

### 7.2.63 Brassica rapa pekinensis

Chinese Cabbage

6 tlin 9 cyuc 4 kcaak 2 tcan 1 dwat 0.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli frusflatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Brassica rapa pekinensis is a ANNUAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers LeavesEdible Uses: Leaves - raw or cooked[116, 160, 171]. A crisp, watery texture with a naturally sweet taste, it is best eaten raw in salads[116, 206]. The plant can be eaten as a young seedling, or left to grow into a mature plant[206]. The flavour is quickly ruined by prolonged cooking[206]. Leaves can also be dried for winter use[206]. The heads of mature plants can be 50cm long and weigh up to 4.5 kg[200, 206]. Fresh leaves do not store well and are best used within a day or two of harvesting[206]. A nutritional analysis is available[218]. Flowering shoots - raw or cooked[206]. Sweet and tender[133].

tcanta Dynamic accumulator.

dwatta DepurativeThe leaves are depurative[218].

propta Seed - it can be sown from late May to September in situ[206]. The spring sown crops often run to seed very quickly but 'barrel' types can be sown at this time. If seedlings are germinated at a temperature of 18 - 20°C and then grown on at this temperature for their first few weeks, they are then less likely to bolt[206]. Seed usually germinates within 3 - 4 days[206]. A late summer sowing under protection can provide leaves in the winter[206]. Seedlings can be transplanted when about 3 - 4 weeks old[206].

nwatta Succeeds in a well-drained fertile preferably alkaline soil[16, 52, 200]. Succeeds in acid and alkaline soils[166, 200]. Prefers a pH in the range 6.5 to 7[206]. Tolerates a pH in the range 4.3 to 6.8. Prefers a heavy soil[16] and grows badly in sandy ones[200]. Prefers full sun[200, 206] and a sheltered position[206]. Likes some shade[16]. Drought resistant according to one report[160], whilst another says that the plants are shallow-rooted and have very

in if the seed is not sown as soon as it is ripe[81, K]. Stored seed should be cold-stratified and sown in a cold frame in the spring[200]. Germination can take 18 months or more. Prick out the seedlings as soon as they are large enough to handle and grow them on for at least their first winter under cover. Plant out in late spring after the last expected frosts. Greenwood cuttings of terminal shoots, August/September in a humid cold frame[1, 200]. Difficult[113].

nwatta Prefers a moist well-drained sandy soil but succeeds in most soils though it dislikes dry gravelly or chalky soils[1, 200]. Prefers a position in semi-shade but tolerates full shade[11, 81] and it also succeeds but does not usually thrive in full sun[200]. It grows very well in the mild wet coastal region of W. Scotland where it succeeds even in full sun[200]. Requires a humid sheltered site[200], strongly disliking very exposed positions[1]. A very slow growing plant[185], a 20 year old specimen at Kew was only 1.3 metres tall[K]. Plants are dioecious, but female plants sometimes produce fruits and infertile seeds in the absence of any male plants[11]. However, at least one male plant for every five females should be grown if you are growing the plants for fruit and seed. Plants have also been known to change sex[81]. Male cones are produced in the axils of the previous year's leaves, whilst female cones are borne at the base of branchlets[200]. This sub-species is more frost hardy than the type species, it succeeds as far north as S. Sweden and Nova Scotia if given a sheltered position[200].

### 7.2.18 Malva verticillata

Chinese Mallow, Cluster mallow

6 tlin 12 cyuc 5 kcaak 2 tcan 2 dwat 1.7 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Malva verticillata is a ANNUAL/BIENNIAL growing to 1.7 m (5ft 7in). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from July to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves SeedEdible Uses: Leaves - raw or cooked[2, 51, 61, 100, 183]. The leaves of well-grown plants can be 15cm or more across. They have a mild and very pleasant flavour that makes an excellent addition to salads[K]. We use them as a tasty alternative to the lettuce[K]. Young seeds - raw or cooked. Used when green and immature[85]. A pleasant nutty taste but the seed is too small and fiddly for most people to want to harvest[K].

tcanta DyeCream, yellow and green dyes can be obtained from the plant and the seed heads[168 ]. An extract of the leaves, flowers and stems is used as an ingredient in commercial cosmetic preparations as a skin conditioner[1243 ]. An essential oil obtained from the seeds is used as an ingredient in commercial cosmetic preparations as an emollient and skin conditioner[1243 ]. The following were listed under *Malva meluca* and *mohileviensis* (both now considered to be synonyms of this species) The seed contains up to 10 - 20% of a greenish oil with an iodine number 116.9[74 ]. It is used for making soap[74 ]. The fibre obtained from the stem is a useful substitute for jute in cordage production. The fibre is strong, but somewhat coarse and brittle. It is inferior in quality to kenaf and hemp. The fibre has a breaking strength of 14 kilos without a knot and 9 - 10 kilos with a knot[74 ].

dwatta Demulcent Digestive Diuretic Emollient Galactogogue LaxativeThe seed contains mucilage, polysaccharides and flavonoids[279]. It is demulcent, diuretic, emollient, galactogogue and laxative[147, 176, 218]. The seeds are used in Tibetan medicine, where they are considered to have a sweet and astringent taste plus a heating potency[241]. They are used in the treatment of renal disorders, the retention of fluids, frequent thirst and diarrhoea[241]. The root is used to cause vomiting in the treatment of whooping cough[240]. The leaves and stems are said to be digested[240]. They are given to women in the advanced stages of pregnancy[240].

propta Seed - sow early spring in situ. Germination should take place within 2 weeks.

nwatta A very easily grown plant, succeeding in ordinary garden soil[1], though it prefers a reasonably well-drained and moderately fertile soil in a sunny position[200]. This species is cultivated as a salad crop in parts of Europe[17, 50, 51]. There is at least one named variety- 'Crispa' has more tender leaves than the species with curled leaf edges that make it look more attractive in salads. This species was one of the earliest domesticated crops in China, it has been in cultivation for well over 2,500 years[183]. Plants seem to be immune to the predations of rabbits[233]. Plants are prone to infestation by rust fungus[200]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is clumping, giving the plant a clumping habit. The predictable growth behaviour makes it easier to maintain without having to apply containment methods[2-1].

### 7.2.19 Oxalis tuberosa

Oca

6 tlin 9 cyuc 5 kcaak 0 tcan 0 dwat 0.5 m hkuc htut cyutli tcup hwicli hrasjut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Oxalis tuberosa is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Tubers - raw or cooked[2, 103, 183]. An acid lemon flavour when first harvested, if left out in the sun the tubers turn sweet[183], so sweet in some varieties that they are said to resemble dried figs and are sold as fruits in local markets in S. America[34, 37, 97, 196]. The cooked root is delicious whether in its sweet or acid state, it can be boiled, baked etc in similar ways to potatoes[K]. The tubers tend to be rather smaller than potatoes, with good sized specimens reaching 8cm or more in length. The slightly waxy skin makes cleaning them very easy[K]. They contain about 70 - 80% moisture, 11 - 22% carbohydrate, 1% fat, 1% fibre and 1% ash[196]. The carbohydrate is rich in sugar and easy to digest[196]. Acid types are rich in oxalic acid (up to 500ppm) but sweet forms have much less oxalic acid than is found in potatoes[196]. Edible young leaves and flowers - raw or cooked[34, 37, 103]. Poor quality[33]. Use in moderation, see notes at top of sheet,

tcanta None known dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in late spring or early summer. Seed is not usually produced in Britain. Harvest the tubers in late autumn after the frosts have killed off top growth. Store in a cool dry frost free place and plant out in April. Basal cuttings in spring[196]. Harvest the shoots with plenty of underground stem when they are about 8 - 10cm above the ground. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Prefers a light rich soil in a warm sunny position[1, 37, 196]. Tolerates a pH range from 5.3 to 7.8[196]. Plants succeed in areas with an average rainfall ranging from 570 - 2150mm per year[196]. Oka is widely cultivated in the Andes for its edible tubers, there are many named varieties[33, 97]. This species has an excellent potential as a major root crop in temperate zones, it has the potential to yield as highly as potatoes but does not have the susceptibility to pests and diseases that are a bughane for potato growers[K]. Plants are slightly more hardy than the potato, tolerating light frosts but the top-growth being severely damaged or killed by temperatures much below freezing. The main drawback is that development of the tubers is initiated by the number of hours of daylight in a day. In Britain this means that tubers do not begin to form until after the 21st of September and, if there are early frosts in the autumn, yields

will be low[37]. There are possibly some forms in southern Chile that are not sensitive to daylength, these will be more suitable to higher latitudes such as Britain[196]. It is said that the varieties with white tubers are bitter because they contain calcium oxylate crystals whilst those with tubers that are of other colours are sweet[97]. However, we are growing one variety with white tubers and it most certainly is not bitter[K]. Yields tend to average about 7 - 10 tonnes per hectare but experimentally yields of 40 tonnes per hectare have been achieved[196]. Earthing up the growing stems as they start to form tubers can increase yields significantly[196].

## 7.2.20 Pinus armandii

Chinese White Pine, Armand pine

6 tlin 9 cyuc 4 kcak 2 tcan 2 dwat 15 m hkuc htut cyutli hgtakuyctcup hwicli hyhshrasjlt hpa7tli flatprik hpa7tmwathi dyat hjonli

drutta Pinus armandii is an evergreen Tree growing to 15 m (49ft) by 8 m (26ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower in June, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: SeedEdible Uses: CondimentSeed - raw or cooked[63]. Esteemed as a great delicacy[105, 177, 183], the oil-rich seed has a slightly resinous flavour. Up to 13mm x 11mm[200]. A vanillin flavouring is obtained as a by-product of other resins that are released from the pulp-wood[200].

tcanta Dye Herbicide WoodA tan or green dye is obtained from the needles[168]. The needles contain a substance called terpene, this is released when rain washes over the needles and it has a negative effect on the germination of some plants, including wheat[201]. Oleo-resins are present in the tissues of all species of pines, but these are often not present in sufficient quantity to make their extraction economically worthwhile[64]. The resins are obtained by tapping the trunk, or by destructive distillation of the wood[4, 64]. In general, trees from warmer areas of distribution give the higher yields[64]. Turpentine consists of an average of 20% of the oleo-resin[64] and is separated by distillation[4, 64]. Turpentine has a wide range of uses including as a solvent for waxes etc, for making varnish, medicinal etc[4]. Rosin is the substance left after turpentine is removed. This is used by violinists on their bows and also in making sealing wax, varnish etc[4]. Pitch can also be obtained from the resin and is used for waterproofing, as a wood preservative etc. Wood - soft. The timber is used for construction, railway sleepers, furniture, and wood fibre[46, 61, 266].

dwatta The turpentine obtained from the resin of all pine trees is antiseptic, diuretic, rubefacient and vermifuge[4]. It is a valuable remedy used internally in the treatment of kidney and bladder complaints and is used both internally and as a rub and steam bath in the treatment of rheumatic affections[4]. It is also very beneficial to the respiratory system and so is useful in treating diseases of the mucous membranes and respiratory complaints such as coughs, colds, influenza and TB[4]. Externally it is a very beneficial treatment for a variety of skin complaints, wounds, sores, burns, boils etc and is used in the form of liniment plasters, poultices, herbal steam baths and inhalers[4].

propta It is best to sow the seed in individual pots in a cold frame as soon as it is ripe if this is possible otherwise in late winter. A short stratification of 6 weeks at 4°C can improve the germination of stored seed[80]. Plant seedlings out into their permanent positions as soon as possible and protect them for their first winter or two[11]. Plants have a very sparse root system and the sooner they are planted into their permanent positions the better they will grow[K]. Trees should be planted into their permanent positions when they are quite small, between 30 and 90cm[200]. We actually plant them out when they are about 5 - 10cm tall. So long as they are given a very good weed-excluding mulch they establish very well[K]. Larger trees will check badly and hardly put on any growth for several years. This also badly affects

root development and wind resistance[200]. Cuttings. This method only works when taken from very young trees less than 10 years old. Use single leaf fascicles with the base of the short shoot. Disbudding the shoots some weeks before taking the cuttings can help. Cuttings are normally slow to grow away[81].

nwatta Thrives in a light well-drained sandy or gravelly loam[1]. Dislikes poorly drained moorland soils[1]. Established plants tolerate drought[200]. This species grows well in Britain[120]. The best growth in this country is found in Sussex, trees also grow well in Ireland. Annual increases in height are normally moderate but the best trees have been increasing by 60cm a year. Increase in girth can be as high as 5cm a year[185]. A plant at Kew, accession no 000-69.10663, was bearing a good crop of cones in 2000[K]. Plants are strongly outbreeding, self-fertilized seed usually grows poorly[200]. They hybridize freely with other members of this genus[200]. Leaf secretions inhibit the germination of seeds, thereby inhibiting the growth of other plants below the tree[18]. Plants in this genus are notably susceptible to honey fungus[200]. The plant is heat tolerant in zones 8 through 6. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2]. An evergreen. The root pattern is a tap root similar to a carrot going directly down [1-2].

## 7.2.21 Broussonetia papyrifera

Paper Mulberry

6 tlin 11 cyuc 4 kcak 3 tcan 2 dwat 9 m hkuc htut cyutli hgtakuyctcup hwicli hyhshrasjltunyk hpa7tli frusflatprikwis hpa7tmwathi nyanhjen hjonli

drutta Broussonetia papyrifera is a deciduous Tree growing to 9 m (29ft) by 9 m (29ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in flower from August to September, and the seeds ripen from September to November. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required) . The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. It can tolerate atmospheric pollution.

kcakta Edible Parts: Flowers Fruit LeavesEdible Uses: Fruit - raw[2, 105, 177, 179]. The fruit comprises a ball about 1.5cm in diameter with numerous small edible fruits protruding - there is not much edible flesh but it has a lovely flavour[K]. Prolonged ingestion is said to weaken the bones[179]. Leaves - cooked[105]. The dried leaf contains 1% calcium carbonate[179](this report does not mention edibility). Flowers[179]. No more details.

tcanta Fibre Fodder Leather Paper WoodA fibre from the bark is used in making paper, cloth, rope etc[46, 61, 114, 171]. The fibre can be produced by beating strips of bark on a flat surface with a wooden mallet. A very fine cloth can be made in this way, the more the bark is beaten the finer the cloth becomes. Larger sizes can be made by overlapping 2 pieces of bark and beating them together. A leather substitute can also be made from the bark[171]. When used for making paper branches are harvested after the leaves have fallen in the autumn, they are steamed and the fibres stripped off. In humid areas this can be done without steaming the branches. The inner and outer bark are then separated by scraping (or simply peeling in humid areas) and the fibres are cooked for 2 hours with lye before being hand pounded

male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Fruit LeavesEdible Uses: TeaFruit - raw or cooked[183]. Aromatic and delicious[2, 62, 106] with a flavour of wintergreen. Often used in preserves[183]. The fruit is about 6mm in diameter[200]. Leaves - raw[62]. Used as a wayside nibble[85]. The young tender leaves are especially suited for use as greens[183]. They have a delicate flavour of wintergreen. A tea is made from the fresh or dried leaves[62, 85, 183].

tcanta DyeA ground cover plant for positions in the sun or light shade. A black dye has been made from the plant[257].

dwatta None known

propta The seed requires a period of cold stratification. Pre-chill for 4 - 10 weeks and then surface sow in a lime-free compost in a shady part of the greenhouse and keep the compost moist[78]. The seed usually germinates well, usually within 1 - 2 months at 20°C, but the seedlings are liable to damp off. It is important to water them with care and to ensure that they get plenty of ventilation. Watering them with a garlic infusion can also help to prevent damping off[K]. Prick out the seedlings into individual pots when they are about 25mm tall and grow them on in light shade in the greenhouse for at least their first winter[K]. Plant them out in late spring or early summer. The seedlings are susceptible to spring frosts so might need some protection for their first few years outdoors. The leaves remain very small for the first few years[11]. Cuttings of half-ripe wood 3 - 6cm long, July/August in a frame in a shady position. They form roots in late summer or spring[78]. A good percentage usually take. Division in spring just before new growth begins[200]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring. Layering.

nwatta Prefers a moist but not boggy humus rich soil in sun or semi-shade[11]. This species requires a lot of shade[1]. A peat and moisture loving species, it requires a lime-free soil[11]. The plant can make a good nesting place for mice, these mice then eat the bark of the stems in winter causing die-back. Grows well in a rock garden[11]. This species is closely allied to *G. ovatifolia*[1]. Plants in this genus are notably resistant to honey fungus[200].

## 7.2.60 Lomatium nudicaule

Pestle Parsnip, Barestem biscuitroot

6 tlin 8 cyuc 4 kcak 2 tcan 2 dwat 0.6 m hkuc htut cyutli kyuctcup hwicli hrasjltunyk hpa7tli flatprikwis hpa7tmwathi fyfxxre7t hjonli

drutta Lomatium nudicaule is a PERENNIAL growing to 0.6 m (2ft) by 0.6 m (2ft in). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Leaves Root StemEdible Uses: TeaRoot - raw or cooked[207]. The taste is rather like a hot spicy parsnip[207]. The root can be roasted and used as a vegetable, or can be dried and ground into a powder then used as a flavouring in soups etc[105, 161]. Leaves and young shoots - eaten as a vegetable or used as a celery-like flavouring in soups etc[177, 183, 257]. The leaves, stems and flowers are infused and used as a beverage[161, 183, 257]. Seed - raw or cooked[257]. The immature seed is chewed as a refreshing snack and can be used as a flavouring in soups etc[257]. The vitamin C content of young plants is remarkably high, one cup providing more than the recommended daily allowance[183]. (the part of the plant is not referred to, it is probably the leaves)

tcanta Incense RepellentThe seed is spicy and aromatic, it is used as a house fumigant and deodorant. It also repels mosquitoes[99].

dwatta Analgesic Diaphoretic Febrifuge Laxative Pectoral Poultice Vitamin CThe seeds are analgesic, diaphoretic, febrifuge, laxative and pectoral[257]. They have been chewed in the treatment of fevers, colds and sore throats[257]. An infusion has been used by pregnant women to ensure an easy delivery[257]. A poultice of the crushed seeds has been applied to the head to relieve the pain of headaches[257]. The poultice has also been applied to sore places, pains and itches[257].

propta Seed - best sown as soon as it is ripe in a cold frame[188]. Stored seed can be rather slow to germinate, when sown in the spring it usually takes at least 12 months to germinate. Giving it a period of cold stratification might reduce this time. The seedlings need to be pricked out into individual pots as soon as they are large enough to handle, and should be planted out into their permanent positions in the summer. Fresh seed can be sown immediately in situ[188]. Division may be possible in spring or autumn.

nwatta Requires a sunny position in a fertile well-drained soil[188]. Plants are frost hardy[188]. This is a taxonomically very difficult genus, many of the species now included in it have at times been included in other genera[60]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is a tap root similar to a carrot going directly down [1-2].

## 7.2.61 Brassica juncea multiceps

Green In The Snow

6 tlin 9 cyuc 4 kcak 0 tcan 2 dwat m hkuc hpmihmtut cyutli tcup hwicli hrasjltunyk hpa7tli flatprikwis hpa7tmwathi fyfxxre7t hjonli

drutta Brassica juncea multiceps is an ANNUAL growing to 0.4 m (1ft 4in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from June to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves OilEdible Uses: Condiment OilLeaves - raw or cooked[22, 33, 46, 52, 61]. A peppery flavour that can range from mild to hot, this is one of the most highly prized cooked vegetables in the Orient[206]. The young raw leaves are pleasantly spicy but older leaves, particularly when the plant runs to seed, can become overpoweringly hot though they are still nice cooked at this stage[206]. The leaves can be finely shredded and added to mixed salads[206]. The protein extracted from the leaves mixes well with banana pulp and is well adapted as a pie filling[183]. Flowers and young flowering stems - raw or cooked[52]. Sweet and succulent[133]. An edible semi-drying oil is obtained from the seed[1, 2, 17, 57, 183]. The seed contains 25 - 30% oil[74]. The seed is used as a mustard flavouring[171]. It is the source of "brown mustard"[183], a prepared mustard that is milder than that produced from other species[238]. Pungency of mustard develops when cold water is added to the ground-up seed - an enzyme (myrosin) acts on a glycoside (sinigrin) to produce a sulphur compound. The reaction takes 10 - 15 minutes. Mixing with hot water or vinegar, or adding salt, inhibits the enzyme and produces a mild bitter mustard[238]. Black mustard comes from *B. nigra* and white mustard from *Sinapis alba*. The seed is also used whole in curries and pickles[238]. They are often heated in oil to destroy their pungency and give them a nutty flavour[238]. The root of some forms of this species is edible[183]. Sprouted seeds can be added to salads.

tcanta Green manure Oil RepellentThere is some evidence that if this plant is grown as a green manure it is effective in reducing soil-borne root rots in pea crops[206]. This is attributed to chemicals that are given off as the plants decay[206].

dwatta Anodyne Aperient Diuretic Emetic Galactagogue Rubefacient StimulantReported to be anodyne, aperitif, diuretic, emetic, rubefacient, and stimulant, the plant is a

full sun in most well-drained moisture-retentive fertile soils[ 16 , 200 , 206 ]. Prefers a heavy soil and some shade[ 16 ]. Dislikes very hot weather[ 33 ]. Plants tolerate high rainfall and, although fairly deep rooted, are not very drought resistant[ 206 ]. Plants have a rooting depth of between 90 - 120 cm[ 269 ]. A good bee plant[ 74 ].

### 7.2.57 Brassica juncea crispifolia

Curled Mustard

6 tin 9 cyuc 4 kcaak 0 tcan 2 dwat 0.3 m hkuc hmimhut cyutli kcuypc hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli fyfixre7t hjonli

drutta Brassica juncea crispifolia is an ANNUAL growing to 0.3 m (1ft) by 0.3 m (1ft in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from June to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves OilEdible Uses: Condiment OilLeaves - raw or cooked[22, 33, 46, 52, 61]. A peppery flavour that can range from mild to hot, this is one of the most highly prized cooked vegetables in the Orient[206]. The leaves can also be finely shredded and added to mixed salads[206]. The protein extracted from the leaves mixes well with banana pulp and is well adapted as a pie filling[183]. Flowers and young flowering stems - raw or cooked[52]. Sweet and succulent[133]. An edible semi-drying oil is obtained from the seed[1, 2, 17, 57, 183]. The seed contains 25 - 30% oil[74]. The seed is used as a mustard flavouring[171]. It is the source of 'brown mustard'[183], a prepared mustard that is milder than that produced from other species[238]. Pungency of mustard develops when cold water is added to the ground-up seed - an enzyme (myrosin) acts on a glycoside (sinigrin) to produce a sulphur compound. The reaction takes 10 - 15 minutes. Mixing with hot water or vinegar, or adding salt, inhibits the enzyme and produces a mild bitter mustard[238]. Black mustard comes from *B. nigra* and white mustard from *Sinapis alba*. The seed is also used whole in curries and pickles[238]. They are often heated in oil to destroy their pungency and give them a nutty flavour[238]. Sprouted seeds can be added to salads.

tcanta Green manure Oil RepellentThere is some evidence that if this plant is grown as a green manure it is effective in reducing soil-borne root rots in pea crops[206]. This is attributed to chemicals that are given off as the plants decay[206].

dwatta Anodyne Aperient Diuretic Emetic Galactogogue Rubefacient StimulantReported to be anodyne, aperitif, diuretic, emetic, rubefacient, and stimulant, the plant is a folk remedy for arthritis, foot ache, lumbago, and rheumatism[269]. The seed is used in the treatment of tumours in China[269]. In Korea, the seeds are used in the treatment of abscesses, colds, lumbago, rheumatism, and stomach disorders[269]. The root is used as a galactagogue in Africa[269]. Ingestion may impart a body odour repellent to mosquitoes[269]. Mustard oil is used in the treatment of skin eruptions and ulcers[269]. Believed to be aperient and tonic, the volatile oil is used as a counterirritant and stimulant[269]. In Java the plant is used as an antisyphilitic emmenagogue[269]. Leaves applied to the forehead are said to relieve headache[269]. The Chinese eat the leaves in soups for bladder, inflammation or haemorrhage[269].

propta Seed - sow in situ from August to October. Spring and early summer-sown crops tend to run quickly to seed, though they can be eaten whilst still small[206]. It is best not to sow the seed in very hot weather[206]. There are about 5,660 - 6,000 per 0.01 kg (1/3 oz)[269].

nwatta Succeeds in full sun in most well-drained moisture-retentive fertile soils[16, 200, 206]. Prefers a heavy soil and some shade[16]. Dislikes very hot weather[33]. Plants tolerate high rainfall and, although fairly deep rooted, are not very drought resistant[206]. A form of *B. juncea* with curled leaves that has been selected in the Orient for its edibility. There are some named varieties[206]. Plants in this group are fairly cold-tolerant and often stand the winter, they

are then slow to bolt and can supply a good crop of leaves in the spring[206]. Plants have a rooting depth of between 90 - 120 cm[269]. A good bee plant[74].

### 7.2.58 Quercus ithaburensis macrolej

Valonia Oak

6 tin 9 cyuc 4 kcaak 0 tcan 2 dwat m hkuc hmimhut cyutli kcuypc hwicli jlutnyik hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta Quercus ithaburensis macrolepis is a deciduous Tree growing to 15 m (49ft) by 13 m (42ft). See above for USDA hardiness. It is hardy to UK zone 7. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: Manna SeedEdible Uses: CoffeeSeed - raw or cooked[2, 63, 89, 100]. The seed is quite big, about 4cm x 3cm[200] and is very low in tannin[183]. Any bitter seeds can be leached by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. Roasted seed is a coffee substitute. A manna is obtained from the tree[183]. No further details.

tcanta Dye Ink Repellent Tannin WoodA mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth[20]. The acorn cups contain about 45% tannin[171, 223]. A black dye can be obtained from them[89] and it can be used as an ink[100]. Gall-like excretions on the plant are caused by damage from the insect *Cynips calicis*. These growths contain about 30% tannin[223].

dwatta Astringent DysenteryAny galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4].

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Lime tolerant[188]. Young plants tolerate reasonable levels of side shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. Prefers warmer summers than are usually experienced in Britain, but trees usually grow well in Britain[200]. The seed takes two years to ripen but is seldom produced in this country[11]. Hybridizes freely with other members of the genus[200]. This species is notably resistant to honey fungus[88, 200]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11].

### 7.2.59 Gaultheria humifusa

Alpine Wintergreen, Alpine spicwintergreen

6 tin 9 cyuc 4 kcaak 3 tcan 0 dwat 0.1 m hkuc hmimhut cyutli tucp hwicli hrasljut hpa7tli frusflatprik hpa7tmwatli xre7t hjonli

drutta Gaultheria humifusa is an evergreen Shrub growing to 0.1 m (0ft 4in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from July to August. The species is hermaphrodite (has both

with mallets. The paper varies in colour if the outer and inner barks are used together or separately[189]. Wood - coarse grained, soft, easily worked, light, not very durable. Used for cups, bows, furniture etc[149, 158, 178, 229, 266]. Its timber does not have high commercial value. Animal feed, fodder, forage: Fodder/animal feed, Invertebrate food for silkworms. Environmental Uses: Agroforestry. Erosion control or dune stabilization. Revegetation. Shade and shelter. Soil improvement. Windbreak. [1d].

dwatta Astringent Diaphoretic Diuretic Dysentery Galactogogue Haemostatic Laxative Ophthalmic Skin Stimulant Stomachic Tonic VulneryAstringent, diuretic, tonic, vulnery[178]. The leaf juice is diaphoretic and laxative - it is also used in the treatment of dysentery[218]. It is also poulticed onto various skin disorders, bites etc[218]. The stem bark is haemostatic[218]. The fruit is diuretic, ophthalmic, stimulant, stomachic and tonic[218]. The root is cooked with other foods as a galactogogue[218].

propta Seed - no pre-treatment is required. Sown in the autumn or spring in a greenhouse, germination usually takes place within 1 - 3 months at 15°C[138]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter, planting them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 8 - 12cm long with a heel, July/August in a frame. High percentage[11, 78]. Cuttings of mature wood of the current season's growth, November in a frame[200]. Root cuttings in winter[200]. Layering in spring[200].

nwatta Management: Coppice Regional CropEasily cultivated in a warm sunny position in any soil of reasonable quality[11]. A drought resistant species once established[149], thriving on poor sandy or gravelly soils[200, 229]. Another report says that it does not thrive on poor soils[146]. Tolerates atmospheric pollution[200]. A fast-growing tree according to one report[227], but whilst it might be fast in relation to other members of the genus, it is only of moderate growth compared to some species[K]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to about -10°C[200]. The young growing in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. There is a superb specimen of this tree at Cambridge Botanical gardens, in the late summer of 1996 it was about 12 metres tall and 16 metres wide and was bearing a huge crop of immature fruit[K]. The leaves on the same tree can vary widely in shape and size[K]. The paper mulberry is widely cultivated in E. Asia for the fibre in its bark, there are many named varieties[11, 200]. Trees are coppiced annually for this purpose[4], though the coppice interval in countries such as Britain would probably be 2 - 3 years. This is a very adaptable tree, it is found growing in tropical climates but its range also extends well into the temperate zone. Dioecious. Male and female plants must be grown if seed is required. Special Features:Not North American native, Invasive, Inconspicuous flowers or blooms.

### 7.2.22 Phyllostachys bambusoides

Madake, Japanese timber bamboo

6 tin 9 cyuc 4 kcaak 3 tcan 1 dwat 8 m hkuc hmim cyutli tucp hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Phyllostachys bambusoides is an evergreen Bamboo growing to 8 m (26ft) by 8 m (26ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: Shoots StemEdible Uses: Young shoots - cooked as a vegetable[25, 46, 105]. Large but somewhat acid when raw[61], they require boiling in a lot of water or in several changes of water[183]. The shoots are harvested in the spring when they are about 8cm above the ground, cutting them about 5cm below soil level. The shoots contain about 2.1% protein, 0.3% fat, 3.2% carbohydrate, 0.9% ash[179].

tcanta Soil stabilization WoodThe plant has an extensive root system and is used for erosion control. The stems are used for making furniture, plant supports etc[46, 61, 74]. Fairly thick walled, the canes are considered to be the most versatile of this genus and are used in construction and other industrial uses[195]. Splints made from the stems are good for weaving various bamboo articles[266]. Even the dead culms are durable[195].

dwatta AntipyreticThe leaves are antipyretic[218]. New shoots are used in the treatment of haematuria[218].

propta Seed - surface sow as soon as it is ripe in a greenhouse at about 20°C. Do not allow the compost to dry out. Germination usually takes place fairly quickly so long as the seed is of good quality, though it can take 3 - 6 months. Grow on in a lightly shaded place in the greenhouse until large enough to plant out. Seed is rarely available. Division in spring as new growth commences. Divisions from the open ground do not transplant well, so will need careful treatment and nurturing under cover in pots until at least late spring[238]. Division is best carried out in wet weather and small divisions will establish better than large clumps[238]. Another report says that you can take large divisions from established clumps and transfer them straight to their permanent positions, misting or drenching them frequently until they are established[200]. Basal cane cuttings in spring.

nwatta Industrial Crop: Biomass Management: Managed Multistem Minor Global Crop Other Systems: MultistrataRequires a rich loamy soil and plenty of moisture in the growing season[1] plus a sheltered position[200]. A very hardy plant[11, 25], tolerating temperatures down to about -18°C, but it dislikes prolonged exposure to hard frosts[200]. Plants can reach 25 metres in height in their native habitat, they are much smaller in Britain but, even so, a height of 12 metres has been recorded in Cornwall. Cultivated for its edible shoots in China[183], it is the most widely grown bamboo in Japan for its useful canes[195]. It has been widely planted for ornament in the Mediterranean and is becoming naturalized there[50]. There are some named forms selected for their ornamental value[200]. 'Castillon' has smaller culms than the species type, the edible shoots are less bitter[195]. A plant of this cultivar at Trebah gardens in Cornwall was growing well in woodland shade, it was 5 metres tall with canes 20mm in diameter[K]. This is a good companion species to grow in a woodland because the plants are shallow rooted and do not compete with deep rooted trees[195]. The rootstock is running but not aggressively so, especially in the cooler climate of Britain[25]. New shoots are produced from late May[25]. Individual stems can be long lived, staying leafy for up to 20 years[195]. This species is notably resistant to honey fungus[200]. Plants only flower at intervals of several years, viable seed is usually produced[122]. When they do come into flower most of the plants energies are directed into producing seed and consequently the plant is severely weakened. They usually die after flowering, but if left alone they will sometimes recover though they will look very poorly for a few years. If fed with artificial NPK fertilizers at this time the plants are more likely to die[122].

### 7.2.23 Phyllostachys edulis

Moso-Chiku, Tortoise shell bamboo

6 tin 10 cyuc 4 kcaak 0 tcan 1 dwat 8 m hkuc hmim cyutli tucp hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Phyllostachys edulis is an evergreen Bamboo growing to 8 m (26ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: Shoots StemEdible Uses: Young shoots - cooked[1, 11, 105]. Very palatable when cooked but acrid raw[25, 74, 183]. Not of the highest quality, but their large size makes them very popular[195]. Extensively eaten in China, they are usually cooked in one change of water[183]. The shoots are harvested in the spring when they are about 8cm above the ground, cutting them about 5cm below soil level. The dormant young shoots, harvested in the

winter before they emerge above the ground, are especially relished as a delicacy[183, 195].

tcanta Containers Fodder Pipes WoodThe canes make good water pipes[74], they are also used for household utensils etc[25]. The short internodes at the lower end of the cane are used as flasks, vases etc[74]. Although the wood is relatively soft, the canes are much used for heavy construction, weaving various types of handicrafts and paper making[195]. The rhizomes are used as walking sticks and umbrella handles. Carbon farming - Industrial Crop: biomass. Fodder: bank. Other Systems: multistrata.

dwatta Antiemetic AntirheumaticThe leaves are used in the treatment of arthritic inflammations[218]. The sheaths of the stem are used in the treatment of nausea and sour stomach[218].

propta Seed - surface sow as soon as it is ripe in a greenhouse at about 20°c. Do not allow the compost to dry out. Germination usually takes place fairly quickly so long as the seed is of good quality, though it can take 3 - 6 months. Grow on in a lightly shaded place in the greenhouse until large enough to plant out. Seed is rarely available. Division in spring as new growth commences. Divisions from the open ground do not transplant well, so will need careful treatment and nurturing under cover in pots until at least late spring[238]. Division is best carried out in wet weather and small divisions will establish better than large clumps[238]. Another report says that you can take large divisions from established clumps and transfer them straight to their permanent positions, misting or drenching them frequently until they are established[200]. Basal cane cuttings in spring.

nwatta Industrial Crop: Biomass Management: Managed Multistem Minor Global Crop Other Systems: MultistrataRequires a rich damp soil in a sheltered position[200] with plenty of moisture in the growing season[162]. Likes abundant sunshine[11]. A fairly cold-hardy plant, succeeding outdoors in many areas of Britain. It tolerates temperatures down to about -15°c according to one report, but the plants are slow to recover from damage caused by cold weather[11]. They also dislike prolonged exposure to hard frosts[200]. Plants grow well in Cornwall making a very good sized clump. The young shoots are very fast growing, up to 30cm per day[11], and are produced from late April[25]. The rootstock is running but it is practically static in cool climates[25]. This species is notably resistant to honey fungus[200]. Plants only flower at intervals of many years. When they do come into flower most of the plants energies are directed into producing seed and consequently the plant is severely weakened. They sometimes die after flowering, but if left alone they will usually recover though they will look very poorly for a few years. If fed with artificial NPK fertilizers at this time the plants are more likely to die[122]. Young plants can be difficult to establish, new plantings only grow slowly at first and often fail completely if soil and water conditions are less than the best[195]. This species, but especially its cultivar 'Pubescens'[266] is extensively cultivated for its edible young shoots and other uses in China and Japan[46, 183, 266], it is the most commonly cultivated bamboo in China and the second most common in Japan[195]. This is a good companion species to grow in a woodland because the plants are shallow rooted and do not compete with deep rooted trees[195]. Carbon Farming - Cultivation: minor global crop. Management: managed multistem.

## 7.2.24 Actinidia chinensis

Kiwi

6 tlin 9 cyuc 4 kcaak 2 tcan 2 dwat 7.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

drutta Actinidia chinensis is a deciduous Climber growing to 7.5 m (24ft 7in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from May to June, and the seeds ripen from October to December. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Bees, insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

ckakta Edible Parts: Fruit LeavesEdible Uses: Fruit - raw or cooked. A delicious flavour. The fruit is up to 3cm across[198]. Fresh fruits contain 100 - 420mg vitamin C per 100g and 8 - 14% carbohydrate[218]. Acidity is 1 - 2%, mainly citric acid[218]. The fruit contains a number of small seeds, but these are easily eaten with the fruit[K]. The leaves are eaten cooked in times of need as a famine food[179].

tcanta Insecticide Paper PencilPaper is made from the bark[178]. If the bark is removed in one piece from near the root and placed in hot ashes, it becomes very hard and can be used as a tube for a pencil[178]. The plant is said to have insecticidal properties (no more details)[218].

dwatta Diuretic Febrifuge Sedative Urinary Vitamin CThe fruits, stems and roots are diuretic, febrifuge and sedative[147]. They are used in the treatment of stones in the urinary tract, rheumatoid arthralgia, cancers of the liver and oesophagus[147]. A decoction of the leaves is used to treat mange in dogs[218]. The stem-juice is used in the treatment of gravel[218].

propta Seed - sow spring in a greenhouse[133]. It is probably best if the seed is given 3 months stratification[113], either sow it in a cold frame as soon as it is ripe in November or as soon as it is received. Fresh seed germinates in 2 - 3 months at 10°c, stored seed can take longer[133]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least their first winter. When the plants are 30cm or more tall, plant them out into their permanent positions in late spring or early summer, after the last expected frosts[K]. Most seedlings are male[126]. The seedlings are subject to damping off, they must be kept well ventilated[113]. Cuttings of softwood as soon as ready in spring in a frame[K]. Cuttings of half-ripe wood, July/August in a frame. Very high percentage[113]. Cuttings of ripe wood, October/November in a frame.

nwatta Prefers a sound loamy neutral soil[1, 200]. Succeeds in semi-shade but full sun is best for fruit production[200]. Prefers a sheltered position[200]. The dormant plant is hardy to about -15°c[184], though new growth in spring is very susceptible to frost damage[11]. This species is the parent of the cultivated Kiwi fruits, these cultivars are now included under the name *A. deliciosa*[200]. Fruits are formed on second year wood and also on fruit spurs on older wood[126], any pruning is best carried out in the winter[219]. The flowers are sweetly scented[245]. This is a climbing plant, supporting itself by twining around branches etc[200]. The ssp. *A. chinensis setosa* (newly named, no author as yet) is found in Taiwan from 1300 - 2600m[198]. Plants in this genus are notably resistant to honey fungus[200]. Dioecious. Male and female plants must be grown if seed is required.

## 7.2.25 Phyllostachys viridiglaucescen

Greenwax golden bamboo

6 tlin 9 cyuc 4 kcaak 1 tcan 0 dwat 6 m hkuc hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Phyllostachys viridiglaucescens is an evergreen Bamboo growing to 6 m (19ft) by 7 m (23ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

ckakta Edible Parts: Shoots StemEdible Uses: Young shoots - cooked[61, 105, 177]. Virtually free of acidity even when raw[195], they are eaten in salads or added to soups etc[183]. The shoots on mature clumps can be 40mm or more in diameter[K]. Another report says the shoots are acrid when raw. The shoots are harvested in the spring when they are about 8cm above the ground, cutting them about 5cm below soil level.

tcanta Plant supportThe canes are used as plant supports etc[61, 195].

dwatta None known

propta Seed - surface sow as soon as it is ripe in a greenhouse at about 20°c. Do not allow the compost to dry out. Germination usually takes place fairly quickly so long as the seed is of good quality, though it can take 3 - 6 months. Grow

Winter savory is often grown in the garden as a culinary herb, there are some named varieties[183]. The flavour is said to be more coarse than that of the annual savory (*S. hortensis*). The plants live for several years, but as they grow older they do not make so much new growth and so are best replaced every two years[4].

## 7.2.55 Brassica juncea tumida

Swollen-Stem Mustard

6 tlin 9 cyuc 4 kcaak 0 tcan 2 dwat 0.8 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Brassica juncea tumida is a ANNUAL growing to 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from June to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

ckakta Edible Parts: Flowers Leaves Oil StemEdible Uses: Condiment OilLeaves and leaf stems - raw or cooked[22, 33, 46, 52, 61]. A peppery flavour that can range from mild to hot, this is one of the most highly prized cooked vegetables in the Orient[206]. The leaves can also be finely shredded and added to mixed salads[206]. The protein extracted from the leaves mixes well with banana pulp and is well adapted as a pie filling[183]. Flowers and young flowering stems - raw or cooked[52]. Sweet and succulent[133]. An edible semi-drying oil is obtained from the seed[1, 2, 17, 57, 183]. The seed contains 25 - 30% oil[74]. The seed is used as a mustard flavouring[171]. It is the source of 'brown mustard'[183], a prepared mustard that is milder than that produced from other species[238]. Pungency of mustard develops when cold water is added to the ground-up seed - an enzyme (myrosin) acts on a glycoside (sinigrin) to produce a sulphur compound. The reaction takes 10 - 15 minutes. Mixing with hot water or vinegar, or adding salt, inhibits the enzyme and produces a mild bitter mustard[238]. Black mustard comes from *B. nigra* and white mustard from *Sinapis alba*. The seed is also used whole in curries and pickles[238]. They are often heated in oil to destroy their pungency and give them a nutty flavour[238]. Sprouted seeds can be added to salads. Plants produce swellings on the stem, these can be cooked or pickled[206].

tcanta Green manure Oil RepellentThere is some evidence that if this plant is grown as a green manure it is effective in reducing soil-borne root rots in pea crops[206]. This is attributed to chemicals that are given off as the plants decay[206].

dwatta Anodyne Aperient Diuretic Emetic Galactogogue Rubefacient StimulantReported to be anodyne, aperitif, diuretic, emetic, rubefacient, and stimulant, the plant is a folk remedy for arthritis, foot ache, lumbago, and rheumatism[269]. The seed is used in the treatment of tumours in China[269]. In Korea, the seeds are used in the treatment of abscesses, colds, lumbago, rheumatism, and stomach disorders[269]. The root is used as a galactagogue in Africa[269]. Ingestion may impart a body odour repellent to mosquitoes[269]. Mustard oil is used in the treatment of skin eruptions and ulcers[269]. Believed to be aperient and tonic, the volatile oil is used as a counterirritant and stimulant[269]. In Java the plant is used as an antisyphilitic emmenagogue[269]. Leaves applied to the forehead are said to relieve headache[269]. The Chinese eat the leaves in soups for bladder, inflammation or haemorrhage[269].

propta Seed - sow in situ from August to October. Spring and early summer-sown crops tend to run quickly to seed, though they can be eaten whilst still small[206]. It is best not to sow the seed in very hot weather[206]. There are about 5,660 - 6,000 per 0.01 kg (1/3 oz)[269].

nwatta Succeeds in full sun in most well-drained moisture-retentive fertile soils[16, 200, 206]. Prefers a heavy soil and some shade[16]. Dislikes very hot weather[33]. Plants tolerate high rainfall and, although fairly deep rooted, are not very drought resistant[206]. A form of *B. juncea* that has been selected in the Orient for its edible swollen stem, there are many named varieties[206]. Plants are reasonably

cold-tolerant[206]. They prefer a fairly high stable temperature and are well adapted to short day length[200]. Many are best grown in warmer climates than Britain but there are several cultivars that grow well in this country[206]. Plants have a rooting depth of between 90 - 120 cm[269]. A good bee plant[74].

## 7.2.56 Brassica juncea integrifolia crispifolia

Curled Mustard

6 tlin 10 cyuc 4 kcaak 2 tcan 2 dwat 0.3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikrip hpa7tli flatprikliwis hpa7tmwatli fyif hjonli

drutta Brassica juncea integrifolia crispifolia is a ANNUAL growing to 0.3 m (1ft) by 0.3 m (1ft in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. The flowers are pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

ckakta Edible Parts: Flowers Leaves Seed Shoots Stee Uses: CondimentLeaves - raw or cooked[ 22 , 33 , 46 , 52 , 61 ]. A peppery flavour that can range from mild to hot, this is one of the most highly prized cooked vegetables in the Orient[ 206 ]. The leaves can also be finely shredded and added to mixed salads[ 206 ]. The protein extracted from the leaves mixes well with banana pulp and is well adapted as a pie filling[ 183 ]. Flowers and young flowering stems - raw or cooked[ 52 ]. Sweet and succulent[ 133 ]. An edible semi-drying oil is obtained from the seed[ 1 , 2 , 17 , 57 , 183 ]. The seed contains 25 - 30% oil[ 74 ]. The seed is used as a mustard flavouring[ 171 ]. It is the source of 'brown mustard'[ 183 ], a prepared mustard that is milder than that produced from other species[ 238 ]. Pungency of mustard develops when cold water is added to the ground-up seed - an enzyme (myrosin) acts on a glycoside (sinigrin) to produce a sulphur compound. The reaction takes 10 - 15 minutes. Mixing with hot water or vinegar, or adding salt, inhibits the enzyme and produces a mild bitter mustard[ 238 ]. Black mustard comes from *B. nigra* and white mustard from *Sinapis alba*. The seed is also used whole in curries and pickles[ 238 ]. They are often heated in oil to destroy their pungency and give them a nutty flavour[ 238 ]. Sprouted seeds can be added to salads.

tcanta Green manure Repellent Soil reclamation TeethOther uses rating: Low (2/5). Agroforestry Uses: There is some evidence that if this plant is grown as a green manure it is effective in reducing soil-borne root rots in pea crops[ 206 ]. This is attributed to chemicals that are given off as the plants decay[ 206 ]. Other Uses None known

dwatta Anodyne Antiarthritic Antiinflammatory Antirheumatic Antitumor Aperient Diuretic Emetic Galactogogue Laxative Rubefacient Skin Stimulant TonicReported to be anodyne, aperitif, diuretic, emetic, rubefacient, and stimulant, the plant is a folk remedy for arthritis, foot ache, lumbago, and rheumatism[ 269 ]. The seed is used in the treatment of tumours in China[ 269 ]. In Korea, the seeds are used in the treatment of abscesses, colds, lumbago, rheumatism, and stomach disorders[ 269 ]. The root is used as a galactagogue in Africa[ 269 ]. Ingestion may impart a body odour repellent to mosquitoes[ 269 ]. Mustard oil is used in the treatment of skin eruptions and ulcers[ 269 ]. Believed to be aperient and tonic, the volatile oil is used as a counterirritant and stimulant[ 269 ]. In Java the plant is used as an antisyphilitic emmenagogue[ 269 ]. Leaves applied to the forehead are said to relieve headache[ 269 ]. The Chinese eat the leaves in soups for bladder, inflammation or haemorrhage[ 269 ].

propta Seed - sow in situ from August to October. Spring and early summer-sown crops tend to run quickly to seed, though they can be eaten whilst still small[ 206 ]. It is best not to sow the seed in very hot weather[ 206 ]. There are about 5,660 - 6,000 per 0.01 kg (1/3 oz)[ 269 ].

nwatta A form of *B. juncea* with curled leaves that has been selected in the Orient for its edibility. There are some named varieties[ 206 ]. Very hardy in cold weather, it is used more in temperate areas than in tropical ones. Succeeds in

smelting[82]. The wood has a high combustibility and burns well[257]. It gives off a pleasant aroma as it burns[257].

dwatta Antiseptic Contraceptive Diuretic Laxative Plaster Poultice Salve Skin VermifugeSingle leaf piñon was employed medicinally by several native North American Indian tribes who valued it especially for its antiseptic and vulnerary properties and also for its beneficial effect on the respiratory system[257]. It is little, if at all, used in modern herbalism. The turpentine obtained from the resin of all pine trees is antiseptic, diuretic, rubefacient and vermifuge[4]. It is a valuable remedy in the treatment of kidney and bladder complaints, and is used both internally and externally to treat rheumatic affections[4, 257]. It is also used in treating diseases of the mucous membranes, respiratory complaints, VD, TB, coughs, colds and influenza[4, 257]. A decoction is used to rid the body of tapeworms and other internal parasites[257]. Externally it is used in the form of liniment plasters and inhalers[4]. A poultice of the melted gum has been applied to cuts and sores[257]. The heated pitch has been applied to the face as a depilatory[257]. The pitch has also been used as a face cream to prevent sunburn[257]. The heated pitch has been used as a poultice to treat sciatic pains and muscular soreness[257]. The cooked pitch has been used by women to stop menstruation and thereby become infertile[257]. It has also been given to adolescent girls to help them keep youthful and live a long life[257]. The gum is used as a plaster on sores and cuts[216].

propta It is best to sow the seed in individual pots in a cold frame as soon as it is ripe if this is possible otherwise in late winter. A short stratification of 6 weeks at 4°C can improve the germination of stored seed[80]. Plant seedlings out into their permanent positions as soon as possible and protect them for their first winter or two[11]. Plants have a very sparse root system and the sooner they are planted into their permanent positions the better they will grow[K]. Trees should be planted into their permanent positions when they are quite small, between 30 and 90cm[200]. We actually plant them out when they are about 5 - 10cm tall. So long as they are given a very good weed-excluding mulch they establish very well[K]. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200]. Cuttings. This method only works when taken from very young trees less than 10 years old. Use single leaf fascicles with the base of the short shoot. Disbudding the shoots some weeks before taking the cuttings can help. Cuttings are normally slow to grow away[81].

nwatta Management: Standard Staple Crop: Protein-oil Wild Staple CropLandscape Uses:Specimen, Woodland garden. Thrives in a light well-drained sandy or gravelly ground[1, 11]. Succeeds in a hot dry position[200]. Dislikes poorly drained moorland soils[1]. Established plants tolerate drought[200]. A slow growing tree in the wild, taking 25 years from sowing until it produces a crop[117]. It then usually produces cones annually, with heavy crops very 2 - 3 years[229]. The tree is long-lived, taking 250 - 350 years to reach maturity[181]. It grows well in southern England[120] and in most of the drier parts of Britain[11]. The cones take 2 summers to mature[229], they open and shed their seed whilst still attached to the tree[226]. Closely related to *P. cembroides* and considered to be no more than a sub-species of it by some botanists[11]. The main difference is that this species has its leaves singly whilst *P. cembroides* has them in groups of two or three[200]. Plants are strongly outbreeding, self-fertilized seed usually grows poorly[200]. They hybridize freely with other members of this genus[200]. Leaf secretions inhibit the germination of seeds, thereby reducing the amount of plants that can grow beneath the tree[18]. Plants in this genus are notably susceptible to honey fungus[200]. Special Features: North American native, Inconspicuous flowers or blooms.

## 7.2.54 Satureja montana

Winter Savory

6 tin 11 cyuc 4 kcaak 4 tcan 3 dwat 6 hkuc htuc cyuti hgatkuyctcup hwicli hyishrasjut hpa7tli flatprikwisslip hpa7tmwatli xre7t hjonli

drutta Satureja montana is an evergreen Shrub growing to 0.4 m (1ft 4in) by 0.3 m (1ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6 and is

not frost tender. It is in leaf all year, in flower from July to October, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcaakta Edible Parts: LeavesEdible Uses: Condi-ment TeaLeaves - raw or cooked[2, 4, 9, 20, 34, 37, 52]. A peppery flavour, they are used mainly as a flavouring for cooked foods, especially beans, and also as a garnish for salads etc[183]. Plants are very hardy, tolerating temperatures down to about -20°C[195], but they dislike prolonged exposure to hard frosts[200]. Plants can reach 10 metres in height in the warmer parts of Britain. This species is notably resistant to honey fungus[200]. Plants only flower at intervals of many years. When they do come into flower most of the plants energies are directed into producing seed and consequently the plant is severely weakened. They sometimes die after flowering, but if left alone they will usually recover though they will look very poorly for a few years. If fed with artificial NPK fertilizers at this time the plants are more likely to die[122]. A very ornamental plant, it will in time form a clump 7 or more metres in diameter so it is best grown in an isolated position[11]. This is a good companion species to grow in a woodland because the plants are shallow rooted and do not compete with deep rooted trees[195]. The rootstock is running[25], it is not too invasive in the cooler British climate[200] but can wander a little. New shoots appear from early April[25]. The plant is heat tolerant in zones 12 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. An evergreen. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

tcanta Companion Essential RepellentThe growing plant repels insects[18, 20, 201]. An essential oil is obtained from the leaves. Plants can be grown as a ground cover when spaced about 45cm apart each way[208]. A good bee plant[200]. The leaves have an aromatic fragrance[245]. A good companion plant to grow in the garden, it does especially well with onions and beans and helps to repel insect pests[201]. The plant is said to inhibit the germination of certain seeds[18]. Winter savory seeds can prevent the germination of nearby seeds[201]. Members of this genus are rarely if ever troubled by browsing deer[233]. Special Features: Attractive foliage, Edible, Fragrant foliage, Not North American native. Dynamic accumulator.

dwatta Antiseptic Aromatic Carminative Digestive Expectorant Stings StomachicWinter savory is most often used as a culinary herb, but it also has marked medicinal benefits, especially upon the whole digestive system[254]. The plant has a stronger action than the closely related summer savory, *S. hortensis*[254]. The whole herb, and especially the flowering shoots, is mildly antiseptic, aromatic, carminative, digestive, mildly expectorant and stomachic[4, 7, 9, 14, 21]. Taken internally, it is said to be a sovereign remedy for colic and a cure for flatulence[4], whilst it is also used to treat gastro-enteritis, cystitis, nausea, diarrhoea, bronchial congestion, sore throat and menstrual disorders[9, 238]. It should not be prescribed for pregnant women[238]. A sprig of the plant, rubbed onto bee or wasp stings, brings instant relief[4, K]. The plant is harvested in the summer when in flower and can be used fresh or dried[238]. The essential oil forms an ingredient in lotions for the scalp in cases of incipient baldness[7]. An ointment made from the plant is used externally to relieve arthritic joints[7].

propta Seed - surface sow in April in a greenhouse. Do not allow the compost to dry out. Germination can be slow and erratic[1] but usually takes place within a month[K]. Prick out the seedlings into individual pots as soon as they are large enough to handle. It is usually possible to plant out into their permanent positions during the summer, but if the plants have not grown sufficiently, or if you live in an area of cold winters, it might be best to grow them in a cold frame for their first winter and plant them out in late spring or early summer of the following year[K]. Cuttings of half-ripe wood, 5 - 8cm taken at a node, July/August in a frame. Pot up in autumn and overwinter in a frame, planting out in late spring or early summer of the following year. A high percentage usually succeed[78]. Cuttings of young wood, preferably with a heel, April/May in a frame[1, 37]. Plant out in the summer if the plants grow well, otherwise overwinter them in a cold frame and plant out in late spring or early summer of the following year[K]. Division in early spring as growth commences[78, 200]. This works best if soil has been mounded up into the bottom 20cm of the plant early in the previous summer[78]. Pot up the divisions and grow them on in a cold frame until they are established. Plant them out in the summer.

nwatta Landscape Uses:Alpine garden, Border, Rock garden, Specimen. An easily grown plant when given suitable conditions, it prefers a well-drained poor stony soil[4, 14, 27, 52] and succeeds in a hot dry sunny position[200]. It prefers an alkaline soil[200] though it is not too fussy. It is very intolerant of soils that remain damp, especially in the winter, and dislikes shade[200]. Plants are less hardy when they are grown in rich soils and also in wet conditions[4, K].

on in a lightly shaded place in the greenhouse until large enough to plant out. Seed is rarely available. Division in spring as new growth commences. Divisions from the open ground do not transplant well, so will need careful treatment and nurturing under cover in pots until at least late spring[238]. Division is best carried out in wet weather and small divisions will establish better than large clumps[238]. Another report says that you can take large divisions from established clumps and transfer them straight to their permanent positions, misting or drenching them frequently until they are established[200]. Basal cane cuttings in spring.

nwatta Requires a rich damp soil in a sheltered position[200] and plenty of moisture in the growing season[200]. Plants are very hardy, tolerating temperatures down to about -20°C[195], but they dislike prolonged exposure to hard frosts[200]. Plants can reach 10 metres in height in the warmer parts of Britain. This species is notably resistant to honey fungus[200]. Plants only flower at intervals of many years. When they do come into flower most of the plants energies are directed into producing seed and consequently the plant is severely weakened. They sometimes die after flowering, but if left alone they will usually recover though they will look very poorly for a few years. If fed with artificial NPK fertilizers at this time the plants are more likely to die[122]. A very ornamental plant, it will in time form a clump 7 or more metres in diameter so it is best grown in an isolated position[11]. This is a good companion species to grow in a woodland because the plants are shallow rooted and do not compete with deep rooted trees[195]. The rootstock is running[25], it is not too invasive in the cooler British climate[200] but can wander a little. New shoots appear from early April[25]. The plant is heat tolerant in zones 12 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. An evergreen. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

## 7.2.26 Phyllostachys nigra punctata

Kurodake

6 tin 9 cyuc 4 kcaak 0 tcan 3 dwat 6 m hkuc hmim cyuti tcup hwicli hrasjutnyik hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta Phyllostachys nigra punctata is an evergreen Bamboo growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcaakta Edible Parts: StemEdible Uses: Young shoots - cooked. Somewhat acid, they are prepared for eating by boiling in one change of water, the water being changed after 8 - 10 minutes. A distinctive taste and aroma. The shoots are harvested in the spring when they are about 8cm above the ground, cutting them about 5cm below soil level.

tcanta Basketry Plant supportThe canes make good plant supports. The rhizome is used in making umbrella handles, wickerwork, canes etc.

dwatta Antiemetic Depurative Diuretic Expectorant Febrifuge SedativeThe leaves are antipyretic and diuretic[218]. They are used internally in the treatment of fevers (especially infantile convulsions), vomiting and nosebleeds[238]. The leave are harvested during the growing season and dried for later use[238]. The juice of the stems is antipyretic, antitussive, expectorant and sedative[147, 176, 218]. It is taken internally in the treatment of lung infections

with cough and phlegm[238]. The sap is pressed from young stems in the summer and then dried for later use[238]. The epidermis of the stem bark is antiemetic and sedative[147, 176, 218]. It is used internally in the treatment of vomiting, nosebleeds, coughs etc[238]. The epidermis is collected from young stems in the summer and is dried for later use[238]. The root is astringent, antipyretic, depurative, diuretic and stypitic[147, 176, 218]. It has been used in the treatment of rabies[147, 238]. A decoction is also used in the treatment of high fevers and nocturnal fretfulness in infants[147]. The roots are harvested in the winter and dried for later use[238].

propta Seed - surface sow as soon as it is ripe in a greenhouse at about 20°C. Do not allow the compost to dry out. Germination usually takes place fairly quickly so long as the seed is of good quality, though it can take 3 - 6 months. Grow on in a lightly shaded place in the greenhouse until large enough to plant out. Seed is rarely available. Division in spring as new growth commences. Divisions from the open ground do not transplant well, so will need careful treatment and nurturing under cover in pots until at least late spring[238]. Division is best carried out in wet weather and small divisions will establish better than large clumps[238]. Another report says that you can take large divisions from established clumps and transfer them straight to their permanent positions, misting or drenching them frequently until they are established[200]. Basal cane cuttings in spring.

nwatta Requires a rich damp soil in a sheltered position[200] and plenty of moisture in the growing season[1]. A very hardy plant, tolerating temperatures down to at least -7°C, but it dislikes prolonged exposure to hard frosts[200]. A very ornamental plant[1], this form of *P. nigra* is often grown for food and ornament. This species is notably resistant to honey fungus[200]. Plants only flower at intervals of many years. When they do come into flower most of the plants energies are directed into producing seed and consequently the plant is severely weakened. They sometimes die after flowering, but if left alone they will usually recover though they will look very poorly for a few years. If fed with artificial NPK fertilizers at this time the plants are more likely to die[122]. This is a good companion species to grow in a woodland because the plants are shallow rooted and do not compete with deep rooted trees[195]. The plant has a running rootstock, though not aggressively so in the cooler climate of Britain[200], and it produces new shoots from May[25]. Dead stems can be removed at any time of the year[238]. It is also possible to thin the clumps in spring, leaving only the strongest stems and thus creating an open grove-like effect[238]. Cultivated for its edible young shoots in China[61]. This species has been widely planted for ornament in the Mediterranean and is becoming established[50].

## 7.2.27 Phyllostachys nigra henonis

Ha-Chiku

6 tin 9 cyuc 4 kcaak 0 tcan 3 dwat 6 m hkuc hmim cyuti tcup hwicli hrasjutnyik hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta Phyllostachys nigra henonis is an evergreen Bamboo growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcaakta Edible Parts: StemEdible Uses: Young shoots - cooked[25, 46, 105, 177]. Somewhat acid when raw[61], they are prepared for eating by boiling in one change of water, the water being changed after 8 - 10 minutes[183]. A distinctive taste and aroma[183]. The shoots, which are about 5cm in diameter[266], are harvested in the spring when they are about 8cm above the ground, cutting them about 5cm below soil level.

tcanta Basketry Hedge Hedge Plant supportThe canes make good plant supports. Thin walled but durable, the canes are also used for cabinet work and for decorative panels and inlays[195]. The rhizome is used in making umbrella handles, wickerwork, canes, musical instruments and various kinds of handicrafts[25, 74].

dwatta Antiemetic Depurative Diuretic Expectorant Febrifuge SedativeThe leaves are antipyretic and di-

uretic[218]. They are used internally in the treatment of fevers (especially infantile convulsions), vomiting and nosebleeds[176, 238]. The leave are harvested during the growing season and dried for later use[238]. The juice of the stems is antipyretic, antitussive, expectorant and sedative[147, 176, 218]. It is taken internally in the treatment of lung infections with cough and phlegm[238]. The sap is pressed from young stems in the summer and then dried for later use[238]. The epidermis of the stem bark is antiemetic and sedative[147, 176, 218]. It is used internally in the treatment of vomiting, nosebleeds, coughs etc[238]. The epidermis is collected from young stems in the summer and is dried for later use[238]. The root is astringent, antipyretic, depurative, diuretic and styptic[147, 176, 218]. It has been used in the treatment of rabies[147, 238]. A decoction is also used in the treatment of high fevers and nocturnal fretfulness in infants[147]. The roots are harvested in the winter and dried for later use[238].

propta Seed - surface sow as soon as it is ripe in a greenhouse at about 20°c. Do not allow the compost to dry out. Germination usually takes place fairly quickly so long as the seed is of good quality, though it can take 3 - 6 months. Grow on in a lightly shaded place in the greenhouse until large enough to plant out. Seed is rarely available. Division in spring as new growth commences. Divisions from the open ground do not transplant well, so will need careful treatment and nurturing under cover in pots until at least late spring[238]. Division is best carried out in wet weather and small divisions will establish better than large clumps[238]. Another report says that you can take large divisions from established clumps and transfer them straight to their permanent positions, misting or drenching them frequently until they are established[200]. Basal cane cuttings in spring.

nwatta Requires a rich damp soil in a sheltered position[200] and plenty of moisture in the growing season[1]. A very hardy plant, tolerating temperatures down to at least -7°c, but it dislikes prolonged exposure to hard frosts[200]. Another report says that it tolerates temperatures down to about -20°c[195]. A very ornamental plant[1], this is the form of *P. nigra* that is most commonly met in the wild. It is believed that this form is the true wild form and that the species is in fact a garden cultivar. However, since that form was the first to be named botanical etiquette demands that this form is treated taxonomically as a cultivar[195]. It is this form 'Hennonis' that is used medicinally in China[176]. Plants only flower at intervals of many years. When they do come into flower most of the plants energies are directed into producing seed and consequently the plant is severely weakened. They sometimes die after flowering, but if left alone they will usually recover though they will look very poorly for a few years. If fed with artificial NPK fertilizers at this time the plants are more likely to die[122]. This is a good companion species to grow in a woodland because the plants are shallow rooted and do not compete with deep rooted trees[195]. This species is notably resistant to honey fungus[200]. The plant has a running rootstock, though not aggressively so in the cooler climate of Britain[200]. and it produces new shoots from May[25]. Dead stems can be removed at any time of the year[238]. It is also possible to thin the clumps in spring, leaving only the strongest stems and thus creating an open grove-like effect[238]. Cultivated for its edible young shoots in China[61]. This species has been widely planted for ornament in the Mediterranean and is becoming established[50].

## 7.2.28 Prunus laurocerasus

Cherry Laurel, English Laurel

6 tlin 8 cyuc 4 kcaak 5 tcan 3 dwat 6 m hkuc pcmihmhmtut cyutli tcup hwicli hrasljutnykfrip hpa7tli flatprkhwia hpa7tmwatli xre7t hjonli

drutta *Prunus laurocerasus* is an evergreen Shrub growing to 6 m (19ft) by 10 m (32ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from April to June, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-

shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcaakta Edible Parts: Fruit SeedEdible Uses: Condi- mentFruit - raw or cooked. Sweet and reasonably pleasant when fully ripe[65, 74, K]. The cultivar 'Camellifolia' bears huge quantities of fruit[K]. This is the size of a large cherry and, when fully ripe, has a reasonable flavour raw with a jelly-like texture and a slight astringency[K]. Some sources suggest the fruit is poisonous, this probably refers to the unripe fruit[7]. We have eaten this fruit in quite large quantities without the slightest ill effects (this also includes a 2 year old child) and so any toxicity is of a very low order[K]. However, any fruit that is bitter should not be eaten in quantity because the bitterness is caused by the presence of the toxic compounds - see the notes above on toxicity. The fruit is about 8mm in diameter and contains one large seed[200]. Water distilled from the leaves is used as an almond flavouring[2, 46, 61, 183]. It should only be uses in small quantities, it is poisonous in large amounts[183]. Seed - raw or cooked. Do not eat the seed if it is too bitter - see the notes above on toxicity.

tcanta Cleanser Dye Essential Hedge Hedge WoodVery tolerant of trimming, this plant makes an excellent hedge especially in shady areas[11, 29, 200]. Some forms of this plant, notably 'Cherry Brandy', 'Otto Luyken', 'Zabelina' and 'Schipkaensis' are low-growing and make very good ground cover plants for sun or shade[182, 197]. Water distilled from the leaves is used in perfumery[4]. The bruised leaves, when rubbed within any container, will remove strong odours such as garlic or cloves so long as any grease has first been fully cleaned off[4]. A green dye can be obtained from the leaves[168]. A dark grey to green dye can be obtained from the fruit[168]. Wood - pinkish grey. Used in turnery and lathe work[74].

dwatta Antispasmodic Narcotic Ophthalmic Seda- tiveThe fresh leaves are antispasmodic, narcotic and sedative[4, 7]. They are of value in the treatment of coughs, whooping cough, asthma, dyspepsia and indigestion[4, 238]. Externally, a cold infusion of the leaves is used as a wash for eye infections[238]. There are different opinions as to the best time to harvest the leaves, but they should only be used fresh because the active principles are destroyed if the leaves are dried[4]. Although no specific mention has been seen for this species, all members of the genus contain amygdalin and prunasin, substances which break down in water to form hydrocyanic acid (cyanide or prussic acid). In small amounts this exceedingly poisonous compound stimulates respiration, improves digestion and gives a sense of well-being[238].

propta Seed - requires 2 - 3 months cold stratification and is best sown in a cold frame as soon as it is ripe[200]. Sow stored seed in a cold frame as early in the year as possible[200]. Protect the seed from mice etc. The seed can be rather slow, sometimes taking 18 months to germinate[113]. Prick out the seedlings into individual pots when they are large enough to handle. Grow them on in a greenhouse or cold frame for their first winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood with a heel, July/August in a frame[11, 200]. Cuttings of mature wood, October in a sheltered north facing border outdoors[113]. Layering in spring.

nwatta Landscape Uses:Border, Screen, Specimen. Requires a well-drained moisture retentive soil[1, 11]. Grows well in heavy clay soils. Thrives in a loamy soil, doing well on limestone[11]. Prefers some chalk in the soil but it is apt to become chlorotic if too much is present, growing badly on shallow chalk[98, 200]. Extremely tolerant of shade, it succeeds in the dense shade of trees with almost no direct light and in their drip line[197, 200], though it fruits better in a more sunny position[200]. A very ornamental plant, there are many named varieties[200]. The cultivar 'Otto Luyken' is a low growing narrow-leaved form that flowers in spring and autumn. The tiny flowers are powerfully fragrant[245] but have a rather offensive odour[182]. This is a matter of opinion, some people find the smell sweet and delightful[K]. A greedy plant, inhibiting the growth of nearby plants[11], it should be introduced with care since it often self-sows in woodlands and can prevent the successful regeneration of native trees by shading out the seedlings[208]. Most members of this genus are shallow-rooted and will produce suckers if the roots are damaged[238]. The flowers attract butter-

has been used as a black pigment in dyes[269]. The stem has been used as a base for drilling fire[269].

dwatta Antibilious Aphrodisiac Dysentery Poul- ticePurgativeThe juice of the flowers, mixed with sugar and black pepper, is used in the treatment of biliousness with acidity[240]. The seeds are aphrodisiac[240]. They are added to the diet in order to promote weight increase[240]. Externally, they are used as a poultice on pains and bruises[240]. The leaves are purgative[240]. An infusion of the leaves is used in the treatment of coughs[269]. In Ayurvedic medicine, the leaves are used in the treatment of dysentery and bilious, blood and throat disorders. The powdered leaves are applied to Guinea worms in Africa[269]. The peelings from the stems have been used in the treatment of anaemia, fatigue, lassitude, etc[269].

propta Seed - sow early spring in a warm greenhouse. Germination is usually fairly rapid. Prick out the seedlings into individual pots when they are large enough to handle. If growing them as annuals, plant them out into their permanent positions in early summer and protect them with a frame or cloche until they are growing away well. If hoping to grow them as perennials, then it is better to grow them on in the greenhouse for their first year and to plant them out in early summer of the following year. Cuttings of half-ripe wood, July/August in a frame. Overwinter them in a warm greenhouse and plant out after the last expected frosts.

nwatta Prefers a well-drained humus rich fertile soil in full sun[200]. Tolerates most soils but prefers a light sandy soil[123]. Plants are adapted to a wide range of soils and climatic conditions[171]. Kenaf is reported to tolerate an annual precipitation in the range of 57 to 410cm, an annual temperature range of 11.1 to 27.5°c and a pH in the range of 4.3 to 8.2 (though it prefers neutral to slightly acid)[269]. The plant is frost sensitive and damaged by heavy rains with strong winds[269]. Kenaf is widely cultivated in tropical and sub-tropical areas of the world, where it is grown mainly as a fibre crop but also for its seeds and leaves[269]. It is very hardy outdoors in Britain, it really requires a frost free climate[123]. It can, however, probably be grown as an annual. A fast-growing plant, it can be harvested in 3 - 4 months from seed[50, 61]. The plant requires temperatures in the range of 15 - 25°c[169]. It succeeds as a crop as far north in N. America as Indiana, Iowa, Kansas and Nebraska[160]. Plants are daylight sensitive, they remain vegetative and do not flower until the daylength is less than 12.5 hr/day. Two weeks of very cloudy days will induce flowering as daylength approaches 12.5 hr[269]. The plant has a deep-penetrating taproot with deep-seated laterals[269]. Plants, including any varieties, are partially self-fertile[269].

## 7.2.52 Allium ramosum

Chinese Chives

6 tlin 9 cyuc 4 kcaak 0 tcan 2 dwat 0.5 m hkuc htut cyutli kyuctuc hwicli hrasljut hpa7tli flatprikhwis hpa7tmwatli xre7t hjonli

drutta *Allium ramosum* is a BULB growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcaakta Edible Parts: Flowers Leaves RootEdible Uses: Bulb - raw or cooked. The small bulbs are about 10mm in diameter[200]. Leaves - raw or cooked. The flavour is somewhat between that of garlic and chives[183]. An excellent taste, the leaves have a pleasant sweetness mixed with a strong onion flavour[K]. Flowers - raw. Used as a garnish on salads.

tcanta RepellentThe juice of the plant is used as a moth repellent. The whole plant is said to repel insects and moles[20].

dwatta DysenteryThe leaves and bulbs contain sulphur compounds (which give them their onion flavour), saponins and bitter substances[283]. They possess antibacterial properties and are used in Vietnam in the treatment of haemoptysis, epistaxis, cough, sore throat, asthma, dysentery, dyspepsia etc[283]. When added to the diet on a regular basis

they help reduce blood cholesterol levels, act as a tonic to the digestive system and also tonify the circulatory system[K]. The seed contains alkaloids and saponins[283]. It is used in the treatment of spermatorrhoea, haematuria, incontinence, lumbago etc[283].

propta Seed - sow spring in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle - if you want to produce clumps more quickly then put three plants in each pot. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in spring once they are growing vigorously and are large enough. Division in spring. Very easy, the plants divide successfully at any time in the growing season and the divisions can be planted straight out into their permanent positions if required.

nwatta An easily grown plant[203], it prefers a sunny position in a light well-drained soil[1, 42]. The bulbs should be planted fairly deeply[1]. A very ornamental plant, the flowers are especially attractive. Very closely related to *A. tuberosum*[42, 90, 203]. Grows well with most plants, especially roses, carrots, beet and chamomile, but it inhibits the growth of legumes[18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 7.2.53 Pinus monophylla

Single Leaf Piñon, Single Leaf PinyonPine, Stone Pine, Pine Pinyon

6 tlin 8 cyuc 4 kcaak 5 tcan 2 dwat m hkuc htut cyutli hgatkyuctuc hwicli hyishrasljut hpa7tli flatprik hpa7tmwatli dyat hjonli

drutta *Pinus monophylla* is an evergreen Tree growing to 10 m (32ft 10in) at a slow rate.It is in leaf all year, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcaakta Edible Parts: SeedEdible Uses: CondimentSeed - raw or cooked[1, 82, 161, 257]. Oily, with an agreeable almond-like flavour[2, 229]. They are often used in sweetmeats, pastries, etc. They are the lowest in protein and fats and the highest in starch of the piñons[183, 200]. The seeds are an important food source for the local Indians of Nevada and California[82]. A good size, the seed is up to 20mm long[200] and has a thin shell[229]. The pitch obtained from the trunk is allowed to harden and is then used as a chewing gum[257]. A vanillin flavouring is obtained as a by-product of other resins that are released from the pulpwood[200].

tcanta Adhesive Dye Fuel Herbicide Pitch Plaster Roof- ing WoodA tan or green dye is obtained from the needles[168]. The needles contain a substance called terpene, this is released when rain washes over the needles and it has a negative effect on the germination of some plants, including wheat[201]. Oleo-resins are present in the tissues of all species of pines, but these are often not present in sufficient quantity to make their extraction economically worthwhile[64]. The resins are obtained by tapping the trunk, or by destructive distillation of the wood[4, 64]. In general, trees from warmer areas of distribution give the higher yields[64]. Turpentine consists of an average of 20% of the oleo-resin[64] and is separated by distillation[4, 64]. Turpentine has a wide range of uses including as a solvent for waxes etc, for making varnish, medicinal etc[4]. Rosin is the substance left after turpentine is removed. This is used by violinists on their bows and also in making sealing wax, varnish etc[4]. Pitch can also be obtained from the resin and is used for waterproofing, as a wood preservative etc. The gum (this almost certainly means the resin[K]) is used in water-proofing canoes, baskets, water containers etc, for repairing pottery vessels and in making turquoise mosaic[216]. It is also used as an adhesive for mending pottery[257]. The bark has been used as a roofing material in houses[257]. Wood - light, soft, weak and brittle[82]. Used primarily for fuel and fence posts[229]. It is also made into charcoal and used for

days after emergence, depending on cultivar and ecological conditions[141

, 183  
, 299  
, 418

] The seed is harvested when most of it (at least 75%) is mature, and most leaves have yellowed and dropped. The crop is harvested by mowing, after which the stems are bundled and put in heaps to dry. Farmers prefer to harvest early in the morning or late in the afternoon, or even at night, when the plants are slightly damp from dew, to reduce grain shattering[299

] The average seed yield in the United States is 0.9 - 1 tonne per hectare; in Kenya, it is 1 tonne, and in Russia 1 - 1.3 tonnes; but up to 4 tonnes can be obtained[418

] The seed ripens irregularly over a period of several weeks, so it is difficult to harvest[141

] Plants have poor frost resistance, but they are disease and insect resistant[166

] They inhibit the growth of winter wheat[118

, 20  
, 201

] There are some named varieties[183

] The flowers have a pleasant sweet honey scent[245

] and are extremely attractive to bees and hoverflies[4

, 171  
, 1

## 7.2.50 Asphodeline lutea

King's Spear, Yellow Asphodel, Jacob's Rod

6 tin 9 cyuc 4 kcaak 2 tcan 0 dwat 1 m hkc

hmimhtut cyutli kyuctcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Asphodeline lutea is a PERENNIAL growing to 1 m (3ft 3in) by 1 m (3ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from June to July, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Root - roasted. This food was highly valued by the ancient Greeks, who roasted the roots like potatoes and ate them with salt and oil or mashed them with figs[2, 183]. The roots are not very thick but are abundantly produced and have a nice nutty flavour[K]. They can be harvested at any time of the year, but are best used when the plant is dormant in late summer and early autumn[K]. They do not store well and should be used within a few weeks of harvest[K]. Young shoots - cooked[K]. They smell less than pleasant whilst cooking but have a fairly bland flavour[K]. Some people find that they have a very pleasant flavour[K]. The plant comes into growth in late summer and the autumn, the young shoots can be harvested in moderation all through the winter[K]. Flowers - raw. A delightful sweetness, they are a very decorative and tasty addition to the salad bowl but should be used as soon as possible after harvesting because they soon start to decompose[K]. The flowers are very short-lived and are best picked in the late afternoon - thus you can enjoy them visually during the day and gastronomically in the evening[K]. There is also said to be a double-flowered form[245], which will have twice the quantity of petals, though we do not know its name[K].

tcanta Scented plant. Attractive edible flowers.

dwatta None known

propta Seed - sow March/April in a greenhouse and only just cover the seed. Germination usually takes place in 1 - 3 months at 15°C[134]. Once the seedlings are large enough to handle, prick them out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring. Division in spring or autumn, with care since the roots are easily damaged[1]. Ensure each division has at least one growing bud[200]. Large divisions can be planted out straight into their permanent positions, smaller ones are best potted up until they are growing away strongly and can then be panted out. We have found

that this plant can be successfully divided throughout the growing season so long as it is watered in dry weather[K].

nwatta Landscape Uses:Container, Foundation, Massing. An easily grown plant, it succeeds in ordinary garden soil[1, K], tolerating partial shade[200]. Requires a well-drained soil[42, 134], doing well in sandy soils[188]. Prefers a deep rich soil[111]. Prefers a soil that is not too rich and a warm sunny position[200]. Plants are hardy to about -15°C[187]. A very ornamental plant[1], though it looks very untidy in late summer when it dies down after flowering[K]. It seems to be very wind resistant, tolerating maritime exposure on an exposed site in Cornwall[K]. The flowers are sweetly scented[245]. Plants seem to be immune to the predations of rabbits[233]. Special Features:Attractive foliage, Naturalizing, Suitable for dried flowers, Fragrant flowers. The plant is heat tolerant in zones 9 through 6. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is tuberous with swollen potato-like roots [1-2].

## 7.2.51 Hibiscus cannabinus

Kenaf, Brown Indianhemp

6 tin 12 cyuc 4 kcaak 3 tcan 2 dwat 1.8 m hkc

htut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli fyixre7t hjonli

drutta Hibiscus cannabinus is a ANNUAL/PERENNIAL growing to 1.8 m (6ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 10 and is frost tender. It is in flower from August to September, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves Oil Root See Uses: Condiment Oil OilYoung leaves - cooked[74, 105, 177]. Used as a potherb or added to soups[183]. The leaves have an acid flavour like sorrel[2]. Seed - roasted or ground into a flour and made into a kind of cake[105, 177, 183]. Root - it is edible but very fibrous[144]. Mucilaginous, without very much flavour[144]. An edible oil is obtained from the seed[61, 183]. The yield varies from 2 - 10 tonnes per hectare[74] (or is it per acre?).

tcanta Dye Fibre Friction sticks Oil Oil Paper Plant support Soap making Soil reclamation StringAgroforestry Uses: Kenaf plants accumulate minerals such as selenium and boron, and can be used as a bioremedial tool for removing these metals from contaminated soil[299, 1519]. Yields a fibre from the stem[1, 123], a very good jute substitute though it is a bit coarser[61]. The fibre strands, which are 1.5 - 3 metres long, are used for making rope, cordage, canvas, sackings, carpet backing, nets, table cloths etc[74, 123, 269]. For the best quality fibre, the stems should be harvested shortly after the flowers open[171, 269]. The best fibre is at the base of the stems, so hand pulling is often recommended over machine harvesting[269]. Yields of about 1.25 tonnes of fibre per hectare are average, though 2.7 tonnes has been achieved in Cuba[74, 269]. The pulp from the stems has been used in making paper[269]. The seed contains between 18 and 35% of an edible semi-drying oil[61, 74]. It is rather similar to groundnut oil, obtained from *Arachis hypogaea*[240]. The oil is also used for burning, as a lubricant and in making soap, linoleum, paints and varnishes[46, 61, 74, 269]. The seed yield varies from 2 to 10 tonnes per acre[74] (or is it per hectare?). The stems have been used as plant supports for growing runner beans etc[269]. The soot from the stems

flies and moths[30]. This species is notably resistant to honey fungus[88, 200]. Subject to bacterial canker which can kill large branches[124]. Trim (preferably with secateurs) in spring or late summer[200]. Old plants can be cut back hard into the old wood in spring and will soon recover[200]. Special Features:Not North American native, All or parts of this plant are poisonous, Fragrant flowers, Attractive flowers or blooms.

## 7.2.29 Ficus carica

Fig, Edible fig, Fig Common

6 tin 10 cyuc 4 kcaak 2 tcan 2 dwat 6 m hkc

htut cyutli hgtakuyctcup hwicli hyishrasljutnyikfrip hpa7tli flatprikliwis hpa7tmwatli fyif hjonli

drutta Ficus carica is a deciduous Tree growing to 6 m (19ft) by 6 m (19ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from June to September, and the seeds ripen from August to September. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Fruit SapEdible Uses: Curdling agentFruit - raw or cooked[1, 3, 3, 4, 46]. Sweet and succulent, a fully ripe specimen is an exquisite fruit that almost literally melts in the mouth[K]. The fruit is often dried for later use[183] and this dried fruit is a major item of commerce. Figs are usually pear-shaped and up to 5cm in diameter[200]. A nutritional analysis is available[218]. The latex from the sap can be used to coagulate plant milks[183].

tcanta Landscape Uses: Container, Espalier, Specimen. Wood - pliable but porous and of little value[4, 89]. It is used for hoops, garlands, ornaments etc[89]. When saturated with oil and covered with emery is used as a substitute for a hone[4].

dwatta Cancer Demulcent Digestive Emollient Galactagogue Laxative Pectoral Stings Stomachic Tonic WartsA decoction of the leaves is stomachic[218]. The leaves are also added to boiling water and used as a steam bath for painful or swollen piles[218]. The latex from the stems is used to treat corns, warts and piles[4, 89, 218]. It also has an analgesic effect against insect stings and bites[7]. The fruit is mildly laxative, demulcent, digestive and pectoral[4, 7, 218]. The unripe green fruits are cooked with other foods as a galactagogue and tonic[218]. The roasted fruit is emollient and used as a poultice in the treatment of gumbolls, dental abscesses etc[4]. Syrup of figs, made from the fruit, is a well-known and effective gentle laxative that is also suitable for the young and very old[254, K]. A decoction of the young branches is an excellent pectoral[7]. The plant has anticancer properties[218].

propta Seed - sow spring in a warm greenhouse. Prick out the seedlings as soon as they are large enough to handle and overwinter the young plants in a greenhouse for at least their first year. Plant out in late spring after the last expected frosts and give some protection for their first winter outdoors. Cuttings of mature wood 10 - 12cm with a heel, winter in a frame. Fairly easy, but the cuttings must be kept frost free. It is probably best if the cuttings are put in individual pots[78]. Layering.

nwatta Figs are plants of temperate and subtropical climates. They do not generally grow well in the wet tropics, but can be grown at higher elevations in the drier to moist tropics[418

] The fruits develop best when plants are grown in relatively dry climates where a cool-season alternates with a hot season[335

] They grow best in areas where annual daytime temperatures are within the range of 16 - 26°C, but can tolerate 4 - 38°C[418

] Dormant plants are hardy to about -15°C[202

] The top growth is susceptible to frost damage and can be killed back to the base in severe winters, though plants usually recover well[3

] They prefer a mean annual rainfall in the range 700 - 1,500mm, but tolerate 300 - 2,700mm[418

] Prefers a very sunny position but tolerates part-day shade when grown on a warm wall[202

] Requires a well-drained medium to light loam and some lime rubble incorporated into the soil[1

] Succeeds in dry soils. A heavy wet soil tends to encourage excessive plant growth at the expense of fruit production[1

] Prefers a pH in the range 6 - 7, but tolerates 4.3 - 8.6[418

] Seedling trees can commence cropping when only 3 - 4 years old, whilst cuttings can start fruiting in only 1 - 2 years[335

] Up to three crops of fruit a year can be obtained in some countries[46

] Trees have been known to live for as long as 200 years[418

] There are many named varieties[183

, 301

] There are two primary types of fig:- the Adriatic fig which produces fruit without pollination; and the Symrna fig that require the presents of a fig wasp for pollination[418

] It is a good idea to restrict the roots of fig trees on most soil types in order to discourage excessive vegetative growth at the expense of fruit production[3

] This can be done by root pruning, but it is easier to place some kind of permanent restriction around the roots - planting into a large tub that is then buried into the ground is one method. It is important to make sure that the tree still gets ample moisture, especially when the fruits are ripening. Fig trees have a unique form of fertilization, each species relying on a single, highly specialized species of wasp that is itself totally dependant upon that fig species in order to breed. The trees produce three types of flowers; a male, a long-styled female and a short-styled female flower, often called the gall flower. All three types of flowers are contained within the structure we usually think of as the fruit. The female fig wasp enters a fig and lays its eggs on the short styled female flowers while pollinating the long-styled female flowers. Wingless male fig wasps emerge first, inseminate the emerging females and then bore exit tunnels out of the fig for the winged females. Females emerge, collect pollen from the male flowers and fly off in search of figs whose female flowers are receptive. In order to support a population of its pollinator, individuals of a *Ficus* spp. must flower asynchronously. A population must exceed a critical minimum size to ensure that at any time of the year at least some plants have an overlap of emission and reception of fig wasps. Without this temporal overlap, the short-lived pollinator wasps will go locally extinct[413

] When grown outdoors in Britain only one crop is usually obtained, though in exceptionally hot years two crops are sometimes produced. The fruit usually takes about 12 months to mature in Britain, baby fruits no larger than about 15mm long in the autumn usually overwinter to form the following year's crop of fruit. If plants are grown in pots in a conservatory or cold greenhouse, two crops of fruit can be obtained, one in early summer and one in late summer to autumn[260]. Pinch back the new shoots to about six leaves in order to encourage the second crop[260]. Special Features: Attractive foliage, Not North American native, Invasive, Inconspicuous flowers or blooms. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is suckering with new plants from underground runners away from the plant [2-1].

## 7.2.30 Prunus brigantia

Briançon Apricot

6 tin 9 cyuc 4 kcaak 0 tcan 1 dwat 6 m hkc

hmimhtut cyutli kyuctcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Prunus brigantia is a deciduous Tree growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in May, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in

semi-shade (light woodland) or no shade. It prefers dry or moist soil.

**kcakta Edible Parts:** Fruit Oil Seed**Edible Uses:** Oil-Fruit - raw or cooked. A yellow plum about 3cm in diameter with a single large seed[K]. Scarcely edible according to one report[177], but we found it to have a pleasant mealy texture and a sweet flavour[K]. We have found it bearing quite freely, even on young trees no more than 6 years old[K]. An edible oil called 'huile des marmottes' is obtained from the seed[1, 2, 11, 46]. It is used as an olive oil substitute in France[105, 183]. Seed - raw or cooked. Do not eat the seed if it is too bitter - see the notes above on toxicity.

**tcanta Dye Oil**The oil obtained from the seed is also used for lighting[11]. It is aromatic[61]. A green dye can be obtained from the leaves[168]. A dark grey to green dye can be obtained from the fruit[168].

**dwatta** Although no specific mention has been seen for this species, all members of the genus contain amygdalin and prunasin, substances which break down in water to form hydrocyanic acid (cyanide or prussic acid). In small amounts this exceedingly poisonous compound stimulates respiration, improves digestion and gives a sense of well-being[238].

**propta Seed** - requires 2 - 3 months cold stratification and is best sown in a cold frame as soon as it is ripe[200]. Sow stored seed in a cold frame as early in the year as possible[200]. Protect the seed from mice etc. The seed can be rather slow, sometimes taking 18 months to germinate[113]. Prick out the seedlings into individual pots when they are large enough to handle. Grow them on in a greenhouse or cold frame for their first winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood with a heel, July/August in a frame[11, 200]. Softwood cuttings from strongly growing plants in spring to early summer in a frame[200]. Layering in spring.

**nwatta** Thrives in a well-drained moisture-retentive loamy soil, growing well on limestone[11, 200]. Prefers some lime in the soil but is likely to become chlorotic if too much lime is present[1]. Succeeds in sun or partial shade though it fruits better in a sunny position[11, 200]. Three shrubs at Kew in September 1993 were about 1.5 metres tall and still had a few fruits on them, though there was evidence that they had carried a large crop[K]. They fruited well again in 1994[K]. Most members of this genus are shallow-rooted and will produce suckers if the roots are damaged[238]. Plants in this genus are notably susceptible to honey fungus[200].

## 7.2.31 Prunus dulcis

Almond, Sweet almond

6 tlin 9 cyuc 4 kcak 3 tcan 3 dwat 6 m hku  
htut cyutli tcup hwicli hrasjnutnyik hpa7tli flatprikliwis hpa7tmwatli fyfxre7t hjonli

**drutta** Prunus dulcis is a deciduous Tree growing to 6 m (19ft) by 6 m (19ft). See above for USDA hardness. It is hardy to UK zone 7. It is in flower from March to April, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

**kcakta Edible Parts:** Oil Oil Seed**Edible Uses:** Gum Gum Milk Oil OilSeed - raw, cooked or dried and ground into a powder for use in confections etc[7, 183]. The whole seed can also be roasted, sprouted or used in cakes, confectionery and pastry[183]. The sweet-flavoured forms have a delicious flavour but bitter forms should not be eaten in any quantity - see the notes above on toxicity. The seed is somewhat difficult to digest and so needs to be thoroughly masticated[4]. It can be blended with water to make almond milk[183]. An edible oil is obtained from the seed[183]. It is used mainly as a food flavouring and in cooking[57, 105]. An edible gum is obtained from points of damage on the stems[64].

**tcanta Adhesive Cleanser Cosmetic Dye Gum Gum** Miscellany Oil Oil Soap makingAn oil expressed from the seeds is an excellent lubricant in delicate mechanisms such as watches[4]. It is often used in soaps and cosmetics because it has a softening effect on the skin[4, 7]. A green dye can be obtained from the leaves[168]. A dark grey to green dye

can be obtained from the fruit[168]. A yellow dye is obtained from the roots and leaves[148]. The bruised leaves, when rubbed within any container, will remove strong odours such as garlic or cloves so long as any grease has first been fully cleaned off[4]. A gum from the stems is used as an adhesive[64]. The burnt shell yields a valuable absorbent for coal gas[74]. The burnt pericarp is rich in potassium, it is used in soap making[74]. The seed contains amygdalin, under the influence of water and in the presence of emulsion it can be hydrolyzed to produce benzaldehyde (the almond aroma, formula C6 H5 CHO) and prussic acid (the toxic principle)[74]. **Espalier:** tree or other plants that is trained to grow flat against a support (such as a trellis or wall).

**dwatta** Antiemetic Antitumor Demulcent Emollient Miscellany Nutritive PectoralAs well as being a tasty addition to the diet, almonds are also beneficial to the overall health of the body, being used especially in the treatment of kidney stones, gallstones and constipation[238]. Externally, the oil is applied to dry skins and is also often used as a carrier oil in aromatherapy[238, K]. The seed is demulcent, emollient, laxative, nutritive and pectoral[4, 7, 21]. When used medicinally, the fixed oil from the seed is normally employed[4]. The seed contains 'laetrile', a substance that has also been called vitamin B17[218]. This has been claimed to have a positive effect in the treatment of cancer, but there does not at present seem to be much evidence to support this[K]. The pure substance is almost harmless, but on hydrolysis it yields hydrocyanic acid, a very rapidly acting poison - it should thus be treated with caution[218]. In small amounts this exceedingly poisonous compound stimulates respiration, improves digestion and gives a sense of well-being[238]. The leaves are used in the treatment of diabetes[218]. The plant contains the antitumor compound taxifolin[218].

**propta Seed** - requires 2 - 3 months cold stratification and is best sown in a cold frame as soon as it is ripe[200]. Sow stored seed in a cold frame as early in the year as possible[200]. Protect the seed from mice etc. The seed can be rather slow, sometimes taking 18 months to germinate[113]. Prick out the seedlings into individual pots when they are large enough to handle. Grow them on in a greenhouse or cold frame for their first winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood with a heel, July/August in a frame[11, 200]. Difficult. Softwood cuttings from strongly growing plants in spring to early summer in a frame[200]. Cuttings of mature wood, late autumn in a frame. Layering in spring.

**nwatta** Global Crop Management: Standard Staple Crop: Protein-oilThrives in a well-drained moisture-retentive loamy soil[11, 200]. Prefers some lime in the soil but is likely to become chlorotic if too much lime is present[1]. Succeeds in sun or partial shade though it fruits better in a sunny position[11, 200]. The almond is often cultivated in the temperate zone for its edible seeds, there are many named varieties[63, 200]. It prefers a Mediterranean climate with a clear distinction between winter and spring, in milder maritime areas it can be induced into flower too early in the season and is then very liable to be damaged by frosts[200]. There is also likely to be a shortage of pollinating insects around when the tree is in flower so hand pollination may improve the crop. Although partially self-fertile, better crops are obtained if at least 2 cultivars are grown[200]. There are two basic forms of almonds, one with bitter seeds and one with 'sweet' seeds. The bitterness is caused by the presence of hydrogen cyanide (see notes above). Although the bitter forms are used in making marzipan and as a food flavouring, the seeds themselves should not be eaten. Even the sweet forms should not be eaten in very large quantities. (Approximately 900 seeds at one time is considered to be a toxic dose for the average adult). Trees are harder than grown on a plum rootstock[11]. Almond seedlings are the preferred rootstock when plants are grown on hot dry soils, peach rootstocks are better for heavier soils[200]. Trees are at least partially self-sterile. Most members of this genus are shallow-rooted and will produce suckers if the roots are damaged[238]. Plants in this genus are notably susceptible to honey fungus[200]. The plant is heat tolerant in zones 8 through 5. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin

flowers attract bees and hoverflies[24]. Fennel is a poor companion plant in the garden, it inhibits the growth of nearby plants, especially beans, tomatoes and kohlrabi[14, 18]. It is itself inhibited by wormwood and coriander[14, 18].

## 7.2.49 Fagopyrum esculentum

Buckwheat

6 tlin 12 cyuc 4 kcak 4 tcan 3 dwat 1.5 m hku  
htut cyutli hgatkyuctcup hwicli hyshrasjnutnyikfrip hpa7tli frusflatprikliwis hpa7tmwatli hjonli

**drutta** Fagopyrum esculentum is an ANNUAL growing to 1.5 m (5ft) by 0.3 m (1ft in) at a fast rate. It is frost tender. It is in flower from July to September, and the seeds ripen from August to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Bees, flies. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

**kcakta Edible Parts:** Leaves Seed**Edible Uses:** Rutin-Leaves - raw or cooked like spinach[4]

, 183  
, K  
]. Not that wonderful raw, they improve somewhat with cooking[K]

]. The leaves are rich in rutin[171  
] (see below for more details) and so are a very healthy addition to the diet[K]

].  
Seed - raw or cooked. A nutty flavour, though it has a somewhat gritty texture that is not universally liked[K]

]. It can be cooked like rice[299  
]. The seed can be soaked overnight in warm water then sprouted for a few days and added to salads[183

]. It can also be ground into a powder and used as a cereal[2

, 4  
, 9

], when it can be made into pancakes, noodles, bread etc or be used as a thickening agent in soups etc[46

, 183  
]. It is popular for use in mixtures with wheat, barley or rye flour to improve the taste and nutritional value of bread and other foodstuffs. Up to 30% of buckwheat flour may be mixed in the wheat dough for baking bread[299

]. Due to the absence of gluten, buckwheat is suitable for the diet of people with coeliac disease[299

]. Rich in vitamin B6[160  
]. Excellent beer can be brewed from the grain[244

].  
Fresh leaves and inflorescences are used for the industrial extraction of rutin, which is applied to strengthen the inner lining of blood vessels (however, it is rather the related species Fagopyrum tataricum (L.) Gaertn., which is commonly grown for rutin production). Rutin is also industrially used as a natural pigment, antioxidant, stabilizer, food preserving and absorber of UV light.

**tcanta Dye Green manure Soil reclamation**A very good green manure plant, it can be used to reclaim badly degraded soils and subsoils[1, 18, 20, 201]. A blue dye is obtained from the stems[57, 106]. A brown dye is obtained from the flowers[4]. Livestock forage and feed: Buckwheat has historically been used as feed for cattle, pigs and chickens (Myers and Meinke, 1994). Green manure and cover crop:Buckwheat grows in the shortest time period of all cover crops (Bjorkman and Shail, 2010) flowering within 3 to 6 weeks and completely maturing within 11 to 12 weeks (Bjorkman et al., 2008). Weed suppressor: because buckwheat grows quickly, it is an excellent suppressor of weeds, and it has been used for this purpose in North America for several centuries. Cover crop: Buckwheat can also be grown as a cover crop to prevent erosion, improve soil aggregate stability, scavenge nutrients such as phosphorus and calcium, and mineralize rock phosphate (Clark, 2007; Bjorkman and Shail, 2010). Pollinator and beneficial insect habitat: Buckwheat is an excellent plant for bee pasture and insectary gardens(Mader et al., 2011; Lee-Mader et al., 2014).

About one acre of buckwheat can provide enough forage for a hive of honey bees, producing about 150 pounds of honey in one season (Oplinger et al., 1989; Myers and Meinke, 1994). The flowers also attract beneficial insects such as parasitic wasps, minute pirate bugs, insidious flower bugs, tachinid flies, ladybeetles and hoverflies, which may prey on insect pests of neighboring crops (Clark, 2007; Bjorkman and Shail, 2010). Wildlife habitat:Buckwheat is sometimes an ingredient in birdseed mixes and planted with other crops for wildlife food plots(Oplinger et al., 1989). USDA.gov.

**dwatta** Acid Astringent Eczema Galactogogue VasodilatorBuckwheat is a bitter but pleasant tasting herb that is frequently used medicinally because the leaves are a good source of rutin[238]. Rutin is useful in the treatment of a wide range of circulatory problems, it dilates the blood vessels, reduces capillary permeability and lowers blood pressure[238, 254]. The leaves and shoots of flowering plants are acid, astringent and vasodilator[4, 141, 165]. It is used internally in the treatment of high blood pressure, gout, varicose veins, chilblains, radiation damage etc[4, 141, 165]. It is best used in conjunction with vitamin C since this aids absorption[254]. Often combined with lime flowers (Tilia species), it is a specific treatment for haemorrhage into the retina[254]. The leaves and flowering stems are harvested as the plant begins to flower and are dried for later use[238]. They should be stored in the dark because the active ingredients rapidly degrade in the light[238]. Some caution should be exercised in the use of this herb because it has been known to cause light-sensitive dermatitis[238]. A poultice made from the seeds has been used for restoring the flow of milk in nursing mothers[4]. An infusion of the herb has been used in the treatment of erysipelas (an acute infectious skin disease)[4, 244]. A homeopathic remedy has been made from the leaves[9]. It is used in the treatment of eczema and liver disorders[9].

**propta Seed** - sow from the middle of spring to early summer in situ. The seed usually germinates in 5 days[115]. The earlier sowings are for a seed or leaf crop whilst the later sowings are used mainly for leaf crops or green manure.

**nwatta** Fagopyrum esculentum is a plant of the temperate and subtropical zones, though it can also be grown at higher elevations, generally above 1,500 metres, in the tropics[299

]. It grows best in areas where annual daytime temperatures are within the range 17 - 27°C, but can tolerate 7 - 40°C[418

]. It is very sensitive to frost[299  
]. It prefers a mean annual rainfall in the range 700 - 1,000mm, but tolerates 400 - 1,300mm[418

]. A very easily grown plant, it prefers dry sandy soils but succeeds in most conditions, including poor[57

, 141  
, 171  
]. heavy[18

] or acid soils[141  
] and even sub-soils[160  
]. It prefers a pH in the range 5 - 6.5, tolerating 4.4 - 7.5[418

]. It prefers a cool moist climate, but it also succeeds in dry and arid regions[171

]. Hot drying temperatures and drying weather at blooming time blast the flowers and prevent seed formation[418

]. The plant has a poorly developed root system that makes it rather sensitive to drought[299

]. Fagopyrum esculentum is cultivated in many parts of the world for its edible seed. It is a prolific producer of seeds, and these are often spread by animal activity. It easily escapes from cultivation and can become established as a weed of cultivated and waste ground, though it is easy to control and does not usually become a pest. Buckwheat is a fast-growing plant that can reach its full height within 4 - 6 weeks. Flower formation starts 20 days after emergence, the plant continuing to flower until complete senescence and death of the whole plant. After the onset of flowering, the leaves and stems continue to grow while the fruits develop; hence seed ripening is very uneven, making harvesting difficult. From the middle of the flowering period onwards, when the leaf area has reached its maximum, further growth of the vegetative parts is slow, and producing ripe seed becomes the main focus of the plant. The seed is ready for harvesting 70 - 130

and basic (mildly alkaline) soils and can grow in very alkaline and saline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Leaves SeedEdible Uses: Leaves - cooked[105, 177] and used as greens[216, 257]. The water in which the leaves is cooked is used in making corn pudding[161, 183]. Seed - used in piñole or ground into a meal and used as a thickener in making bread or mixed with flour in making bread[95, 105, 161, 183].

tcanta None known

dwatta Antispasmodic Epilepsy PoulticeThe plant has been burnt and the smoke inhaled as a treatment for epilepsy[257]. The boiled leaves have been used as a liniment for sore muscles and aches[257]. A poultice of the mashed leaves have been applied to the chest and a decoction of the leaves drunk to treat colds[257].

propta Seed - sow April/May in a cold frame in a compost of peat and sand. Germinates in 1 - 3 weeks at 13°c[134]. Pot up the seedlings when still small into individual pots, grow on in a greenhouse for the first winter and plant out in late spring or early summer after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame. Very easy. Pot up as soon as they start to root (about 3 weeks) and plant out in their permanent positions late in the following spring[K]. Cuttings of mature wood of the current season's growth, November/December in a frame. Very easy. Pot up in early spring and plant out in their permanent position in early summer[K].

nwatta Requires a light or medium well-drained but not too fertile soil in a sunny position[11, 200]. Tolerates saline and very alkaline soils[200]. Succeeds in a hot dry position. Plants resent root disturbance when they are large[134]. Plants are apt to succumb to winter wet when grown on heavy or rich soils. Shadscale forms hybrids with *Atriplex canescens*, *A. garrettii*, *A. corrugata*, and *A. gardneri* varieties. It is, however, closely allied to *A. parryi* and *A. spinifera*[270]. Dioecious. Male and female plants must be grown if seed is required.

## 7.2.47 Rhynchosinapis wrightii

Lundy Cabbage

6 tlin 9 cyuc 4 kcak 0 tcan 0 dwat 1 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Rhynchosinapis wrightii is an evergreen Perennial growing to 1 m (3ft 3in) by 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year; in flower from May to June, and the seeds ripen from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: Flowers LeavesEdible Uses: Leaves - raw or cooked[105]. A flavour somewhere between a cabbage and a radish[K]. At its best for harvesting in the winter months, when it makes an acceptable addition to the salad bowl[K]. It is also a reasonable cabbage substitute when cooked[K]. Flowers and young flowering stems - raw or cooked[K]. The flowers make a decorative addition to the salad bowl, whilst the young flowering stems can be used like broccoli. A cabbage-like flavour but with a distinct bitterness[K].

tcanta None known

dwatta None known

propta Seed - sow spring in a cold frame or outdoor seedbed. The seed usually germinates within a week. Prick out the pot-sown seedlings into individual pots as soon as they are large enough to handle and plant them out in the summer. Those in the outdoor seedbed can be thinned as required (the thinnings can be transplanted or eaten) and be moved to their permanent positions when they are 15 - 25cm tall.

nwatta A very rare plant, it is only found growing wild on Lundy Island in the Bristol channel[17]. It requires a sunny position in a well-drained soil[K]. The plant is fairly hardy and should succeed outdoors in most parts of the country, though

it tends to droop somewhat in very cold weather. It can provide edible leaves all year round, though there are scant pickings as the plant comes into flower and for a month or so afterwards[K]. Plants are generally quite short-lived perennials, though they usually self-sow freely when well-sited[K].

## 7.2.48 Foeniculum vulgare dulce

Sweet Fennel

6 tlin 9 cyuc 4 kcak 4 tcan 3 dwat 1.5 m hkuc

htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Foeniculum vulgare dulce is a PERENNIAL growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from August to October, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: Leaves Root Seed StemEdible Uses: Leaves - raw or cooked[52]. A delicious aniseed flavour[183], the young leaves are best since older ones soon become tough. They are often used as a garnish on raw or cooked dishes or added to salads[183]. The leaves are difficult to store dried[200]. Leaf stalks and flower heads - raw or cooked[14, 37, 52, 183]. An aniseed flavour[K]. The aromatic seeds are used as a flavouring in cakes, bread, stuffings etc[2, 4, 5, 21, 27, 183]. The sprouted seeds can be added to salads[183]. An essential oil from the seed is used as a food flavouring in similar ways to the whole seed[1, 46, 183]. Root - cooked[53]. The flavour is somewhat parsnip-like. The leaves or the seeds can be used to make a herb tea[16, 183].

tcanta Dye Essential Repellent StrewingThe seed yields up to 5% of an essential oil[1, 4, 46]. This is used medicinally, as a food flavouring, in toothpastes, soaps, perfumery, air fresheners etc[1, 46, 238]. The flavour of fennel oil depends upon its two main constituents. 'Fenphone' is a bitter tasting element whilst 'anethole' has a sweet anise-like flavour[238]. The proportions of these two ingredients varies according to strain and region. Plants growing in the Mediterranean and southern Europe usually have a sweet oil whilst plants growing in central and northern Europe usually produce a more bitter oil[238]. The quality of the oil also depends upon how well the seed has been dried - the oil from fully ripened and dried seeds being much sweeter and more fragrant[245]. The dried plant is an insect repellent[14, 53], the crushed leaves are effective for keeping dogs free of fleas[201]. The plant was formerly used as a strewing herb[201]. Yellow and brown dyes are obtained from the flowers and leaves combined[168].

dwatta Analgesic Antiinflammatory Antispasmodic Aromatic Carminative Diuretic Emmenagogue Expectorant Galactogogue Hallucinogenic Stimulant Stomachic UrinaryFennel is a commonly used household remedy, being useful in the treatment of a variety of complaints, especially those of the digestive system. The seeds, leaves and roots can be used, but the seeds are most active medicinally and are the part normally used[4]. An essential oil is often extracted from the seed for medicinal use, though it should not be given to pregnant women[4, 238]. The plant is analgesic, anti-inflammatory, antispasmodic, aromatic, carminative, diuretic, emmenagogue, expectorant, galactogogue, hallucinogenic, laxative, stimulant and stomachic[4, 7, 9, 21, 147, 165, 176, 192, 238]. Fennel is often added to purgatives in order to allay their tendency to cause gripe, and also to improve the flavour[4]. An infusion of the root is used to treat urinary disorders[238]. An essential oil obtained from the seed is used in aromatherapy. Its keyword is 'Normalising'[210]. The essential oil is bactericidal, carminative and stimulant[218]. Some caution is advised, see notes above on toxicity[222].

propta Seed - best sown in early spring in situ[1]. Division in March as the new growth appears[16, 200].

nwatta Succeeds in most soils[1] but prefers a sunny dry position[200]. A cultivar of *F. vulgare*, this is not the genuine Florence fennel since it does not have swollen leaf stems[200]. It is used in much the same way as fennel. See *F. vulgare azoricum* for the genuine Florence fennel[K]. The

to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2].

## 7.2.32 Castanea pumila ashei

Chinquapin

6 tlin 9 cyuc 4 kcak 2 tcan 1 dwat 5 m hkuc

htut cyutli hgatkyuctcup hwicli hyishrasjlutnyik hpa7tli flatprik hpa7tmwatli hjonli

drutta Castanea pumila ashei is a deciduous Shrub growing to 5 m (16ft 5in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower in July, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: SeedEdible Uses: Seed - raw or cooked[2, 61, 105]. Sweet with a nice nutty flavour[46, 82, 183], it is very acceptable raw[142, 161, K]. When baked it becomes even sweeter and develops a floury texture, it makes an excellent potato or cereal substitute[K]. The seed is quite small, about half the size of *C. dentata*[183]. Sold in local markets in America[82].

tcanta Tannin WoodThe bark, leaves, wood and seed husks all contain tannin. Wood - hard, strong, light. Used for fence posts etc[46, 61].

dwatta Antiperiodic Astringent TonicThe leaves contain tannin and are antiperiodic, astringent and tonic[46, 61, 213]. An infusion of the leaves has been used as an external wash for the feverish condition common to colds[213, 257].

propta Seed - where possible sow the seed as soon as it is ripe in a cold frame or in a seed bed outdoors[78]. The seed must be protected from mice and squirrels. The seed has a short viability and must not be allowed to become dry. It can be stored in a cool place, such as the salad compartment of a fridge, for a few months if it is kept moist, but check regularly for signs of germination. The seed should germinate in late winter or early spring. If sown in an outdoor seedbed, the plants can be left in situ for 1 - 2 years before planting them out in their permanent positions. If grown in pots, the plants can be put out into their permanent positions in the summer or autumn, making sure to give them some protection from the cold in their first winter[K]. Division of suckers in winter[200]. They can be planted straight out into their permanent positions.

nwatta Prefers a good well-drained slightly acid loam but succeeds in dry soils[1, 11, 200]. Once established, it is very drought tolerant[1, 11, 200]. Very tolerant of highly acid, infertile dry sands[200]. Averse to calcareous soils but succeeds on harder limestones[11, 200]. Although it is winter-hardy in most areas of Britain, this species only really thrives in areas with hot summers[200]. The young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. Produces suckers, eventually forming a thicket[182]. An excellent soil-enriching understorey in pine forests[200]. Flowers are produced on wood of the current year's growth[229]. Plants are fairly self-sterile[200]. They hybridize freely with other members of this genus[200]. Fruits are produced within 2 - 3 years from seed[117]. One report dealing with the type species states that it never fruits in Britain[11]. However, a bush at Wisley fruits well in most years[K]. Therefore it is hoped that this sub-species will also fruit in Britain[K]. There are a few plants at Hilliers Arboretum, but we have never seen them produce fertilized fruits[K]. Plants in this genus are notably resistant to honey fungus[200].

## 7.2.33 Cephalotaxus sinensis

Chinese Plum Yew

6 tlin 9 cyuc 4 kcak 3 tcan 1 dwat 5 m hkuc

pcimhhim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

drutta Cephalotaxus sinensis is an evergreen Shrub growing to 5 m (16ft 5in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year; in flower from April to May, and the seeds ripen from October to November. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: Fruit SeedEdible Uses: Fruit[81]. Fairly large, about 25mm x 17mm[200]. No more details, though it is closely related to *C. harringtonia*, the fruit of which is edible raw if fully ripe[K]. The fruit does not always ripen in Britain, before full ripeness it has a disgusting resinous flavour that coats the mouth and refuses to go away for hours[K]. It is quite likely that the seed of this species is also edible. More research is required[K].

tcanta Hedge Hedge WoodVery tolerant of pruning, this plant makes a very good hedge in shady positions[200]. The wood is used to make furniture, farm implements, crafts, and utensils[266].

dwatta CancerExtracts from the plant have shown anticancer activity[218]. The branches, roots, leaves, and seeds are a source of many alkaloids, which are used to treat leukaemia and lymphosarcoma[266].

propta Seed - best sown as soon as it is ripe in a cold frame[113], it should then germinate in the following spring[K]. A hard seedcoat can delay germination, especially in if the seed is not sown as soon as it is ripe[81, K]. Stored seed should be cold-stratified and sown in a cold frame in the spring[200]. Germination can take 18 months or more. Prick out the seedlings as soon as they are large enough to handle and grow them on for at least their first winter under cover. Plant out in late spring after the last expected frosts. Greenwood cuttings of terminal shoots, August/September in a humid cold frame[1, 200]. Difficult[113].

nwatta Landscape Uses:Specimen, Woodland garden. Prefers a moist well-drained sandy soil but succeeds in most soils though it dislikes dry gravelly or chalky soils[1, 200]. Prefers a position in semi-shade but tolerates full shade[11, 81] and it also succeeds but does not usually thrive in full sun[200]. It grows very well in the mild wet coastal region of W. Scotland where it succeeds even in full sun[200]. Requires a humid sheltered site[200], strongly disliking very exposed positions[1]. Although the dormant plant is cold-hardy, the young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. Closely related to *C. harringtonia*[11, 200]. Plants are dioecious, but female plants sometimes produce fruits and infertile seeds in the absence of any male plants[11]. However, at least one male plant for every five females should be grown if you are growing the plants for fruit and seed. Plants have also been known to change sex[81]. Male cones are produced in the axils of the previous year's leaves, whilst female cones are borne at the base of branchlets[200]. Special Features:Not North American native, Inconspicuous flowers or blooms.

## 7.2.34 Phyllostachys sulphurea viridis

Kou-Chiku

6 tlin 9 cyuc 4 kcak 3 tcan 0 dwat 4 m hkuc

hmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Phyllostachys sulphurea viridis is an evergreen Bamboo growing to 4 m (13ft 1in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly

acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

**kaakta Edible Parts:** Shoots **StemEdible Uses:** Young shoots - raw or cooked. Virtually free of acidity even when raw[195], they can be thinly sliced and eaten raw in salads but are usually boiled first[183]. The shoots are harvested in the spring when they are about 8cm above the ground, cutting them about 5cm below soil level.

**tcanta Wood**The canes are used in construction. They are said to have excellent technological properties[195].

**dwatta None known**

**propta Seed - surface sow** as soon as it is ripe in a greenhouse at about 20°C. Do not allow the compost to dry out. Germination usually takes place fairly quickly so long as the seed is of good quality, though it can take 3 - 6 months. Grow on in a lightly shaded place in the greenhouse until large enough to plant out. Seed is rarely available. Division in spring as new growth commences. Divisions from the open ground do not transplant well, so will need careful treatment and nurturing under cover in pots until at least late spring[238]. Division is best carried out in wet weather and small divisions will establish better than large clumps[238]. Another report says that you can take large divisions from established clumps and transfer them straight to their permanent positions, misting or drenching them frequently until they are established[200]. Basal cane cuttings in spring.

**nwatta Requires** a rich damp soil in a sheltered position and plenty of moisture in the growing season. Tolerates dry conditions. This is generally a very hardy species, tolerating temperatures down to about -20°C, but persistent cold springs make the plant lazy in sending up new canes. It dislikes prolonged exposure to hard frosts. In warm parts of Britain this plant can reach 6 metres or more in height. This species is notably resistant to honey fungus[200]. Plants only flower at intervals of many years. When they do come into flower most of the plants energies are directed into producing seed and consequently the plant is severely weakened. They sometimes die after flowering, but if left alone they will usually recover though they will look very poorly for a few years. If fed with artificial NPK fertilizers at this time the plants are more likely to die[122]. This is a good companion species to grow in a woodland because the plants are shallow rooted and do not compete with deep rooted trees[195]. A running rootstock, the plant does not produce enough new shoots to be invasive but it still wanders about a bit. New shoots appear in late May. Although classed as a sub-species, this is in fact the true wild form of the species (the cultivated variegated form was the first to be named and is thus treated as the species type!). It does not reach a good size in cooler climes.

## 7.2.35 *Crataegus caesa*

6 tlin 9 cyuc 4 kcaak 2 tcan 2 dwat 3 m hkuc  
hmimhtut cyutli hgattcuphja7n hwicli hrasljutnyikfrjp hpa7tli flatprikliwis hpa7tmwatlii xre7t hjonli

**drutta Crataegus caesa** is a deciduous Shrub growing to 3 m (9ft) by 3 m (9ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from April to May, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Midges. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

**kaakta Edible Parts:** Fruit**Edible Uses:** Fruit - raw or cooked. A good size fruit, about 20mm in diameter, with a sweet taste and a fair fruit to seed ratio, it has a mealy texture, is fairly juicy and makes very pleasant eating[K]. It ripens in mid to late September and can hang on the tree for several weeks[K]. The fruit can be used in making pies, preserves, etc, and can also be dried for later use. There are up to five fairly large seeds in the centre of the fruit, these often stick together and so the effect is of eating a cherry-like fruit with a single seed[K].

**tcanta Wood** - heavy, hard, tough, close-grained. Useful for making tool handles, mallets and other small items[82].

**dwatta Cardiotoxic Hypotensive**Although no specific mention has been seen for this species, the fruits and flowers of many hawthorns are well-known in herbal folk medicine as a heart tonic and modern research has borne out this use. The fruits and flowers have a hypotensive effect as well as acting as a direct and mild heart tonic[222]. They are especially indicated in the treatment of weak heart combined with high blood pressure[222]. Prolonged use is necessary for it to be efficacious[222]. It is normally used either as a tea or a tincture[222].

**propta Seed - this is best sown** as soon as it is ripe in the autumn in a cold frame, some of the seed will germinate in the spring, though most will probably take another year. Stored seed can be very slow and erratic to germinate, it should be warm stratified for 3 months at 15°C and then cold stratified for another 3 months at 4°C[164]. It may still take another 18 months to germinate[78]. Scarifying the seed before stratifying it might reduce this time[80]. Fermenting the seed for a few days in its own pulp may also speed up the germination process[K]. Another possibility is to harvest the seed 'green' (as soon as the embryo has fully developed but before the seedcoat hardens) and sow it immediately in a cold frame. If timed well, it can germinate in the spring[80]. If you are only growing small quantities of plants, it is best to pot up the seedlings as soon as they are large enough to handle and grow them on in individual pots for their first year, planting them out in late spring into nursery beds or their final positions. When growing larger quantities, it might be best to sow them directly outdoors in a seedbed, but with protection from mice and other seed-eating creatures. Grow them on in the seedbed until large enough to plant out, but undercut the roots if they are to be left undisturbed for more than two years.

**nwatta We** have very little information on this species, and do not know how hardy it will be in this country, or even its country of origin. However, a specimen growing in an open position at Kew Botanical Gardens is about 3 metres tall and wide and regularly carries a heavy crop of fruit[K]. A very easily grown plant, it prefers a well-drained moisture retentive loamy soil but is not at all fussy[11, 200]. Once established, it succeeds in excessively moist soils and also tolerates drought[200]. It grows well on a chalk soil[200]. A position in full sun is best when plants are being grown for their fruit, they also succeed in semi-shade though fruit yields and quality will be lower in such a position[11, 200]. Most members of this genus succeed in exposed positions, they also tolerate atmospheric pollution[200]. Seedling trees take from 5 - 8 years before they start bearing fruit, though grafted trees will often flower heavily in their third year[K]. The flowers have a foetid smell somewhat like decaying fish. This attracts midges which are the main means of fertilization. When freshly open, the flowers have more pleasant scent with balsamic undertones[245]. Hybridizes freely with other members of this genus[200]. Seedlings should not be left in a seedbed for more than 2 years without being transplanted[11].

## 7.2.36 *Syzygium australe*

**Brush Cherry**

6 tlin 12 cyuc 4 kcaak 3 tcan 0 dwat 3 m hkuc  
hmimhtut cyutli tucp hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatlii xre7t hjonli

**drutta Syzygium australe** is an evergreen Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**kaakta Fruit** - raw or made into jellies[46, 397]. Crisp and juicy, it ranges in flavour from delicious to mediocre[440]. The reddish-pink to red, obovoid fruit is about 15 - 25 mm long and 15 mm in diameter, with a large seed[365].

**tcanta Agroforestry Uses:** The plant has a very dense habit of growth and responds well to trimming. It is often grown as a hedge, especially the cultivar 'Brilliant'[K]. The reddish or yellowish wood is light, elastic and seasons well[46]. It is used for making oars, boat building etc, and was traditionally used for making boomerangs and

samic[207]. The root can be dried and ground into a powder and then be mixed with cereal flours or added as a flavouring to soups etc. The roots have been boiled to make a refreshing and nutritious drink[257]. Young seed sprouts - raw[105, 177, 257]. Seed[106, 257]. No more details are given, though it is most likely used as an aromatic flavouring in cooked foods[K].

**tcanta Disinfectant Incense**The pulverized root has been burnt as an incense[257].

**dwatta Antidandruff Disinfectant Ophthalmic Pectoral Poultrice Salve Stomachic Tonic**Fernleaf biscuitroot was widely employed medicinally by many native North American Indian tribes who considered it to be a universal panacea and used it especially in treating chest problems and skin complaints[207, 257]. It is little, if at all, used in modern herbalism, but probably warrants investigation. The whole plant, but especially the root, is disinfectant, pectoral, salve, stomachic and tonic[257]. The dried root was used in the treatment of rheumatism, stomach complaints, coughs, colds, hay fever, bronchitis, influenza, pneumonia and tuberculosis[207, 257]. The root was burnt and the smoke inhaled in the treatment of asthma and other chest complaints[257], it was also used as a herbal steam bath for treating chest complaints[257]. The root was used to make a drink that was taken as a tonic to help people in a weakened condition gain weight[257]. A poultice of the peeled and crushed roots has been applied to open cuts, sores, boils, bruises and rheumatic joints[257]. The root has been soaked in water and then used as an antidandruff wash for the hair[257]. An infusion of the leaves and stems has been used as a tonic[257]. The root oil has been applied as a salve to sores and also used as an eye wash in the treatment of trachoma[257]. Some people may experience a one-time uncomfortable detox rash (please research more on this plant before taking it).

**propta Seed - best sown** as soon as it is ripe in a cold frame. Stored seed can be rather slow to germinate, when sown in the spring it usually takes at least 12 months to germinate. Giving it a period of cold stratification might reduce this time. The seedlings need to be pricked out into individual pots as soon as they are large enough to handle, and should be planted out into their permanent positions in the summer. Fresh seed can be sown immediately in situ. Division may be possible in spring or autumn.

**nwatta We** have almost no information on this species and do not know if it will be hardy in Britain, though judging by its native range it should succeed outdoors in much of the country. It can be assumed that plants will require a dry to moist but well-drained soil in a sunny position. This is a taxonomically very difficult genus, many of the species now included in it have at times been included in other genera[60]. The plant is heat tolerant in zones 9 through 7. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is a tap root similar to a carrot going directly down [1-2].

## 7.2.45 *Atriplex canescens*

**Grey Sage Brush, Fourwing saltbush**

6 tlin 9 cyuc 4 kcaak 3 tcan 1 dwat 1.8 m hkuc  
htut cyutli hgatkyuctup hwicli hyishrasljut hpa7tli flatprikliwissliphson hpa7tmwatlii nyanhjen hjonli

**drutta Atriplex canescens** is an evergreen Shrub growing to 1.8 m (6ft) by 1.8 m (6ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower in July, and the seeds ripen in August. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed

is required). and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline and saline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

**kaakta Edible Parts:** Leaves **SeedEdible Uses:** Colouring **DrinkLeaves** - cooked or raw[85, 94]. A very acceptable taste with a salty tang[K]. The leaves can be used at any time of the year though winter harvesting must be light because the plant is not growing much at this time of year[K]. Seed - cooked[46, 61]. Ground into a powder, mixed with cereals and used in making cakes etc or used as a piñole[94, 95, 183]. It is small and very fiddly to utilize[K]. The ground up seed can also be mixed with water and drunk as a refreshing beverage[183]. The burnt green herb yields culinary ashes high in minerals and these are used by the Hopi Indians to enhance the colour of blue corn products[183, 257]. The ashes can be used like baking soda[257].

**tcanta Dye Fire retardant Fodder Hedge Hedge Potash**A good hedge in maritime areas, it responds well to trimming[K]. The leaves and stems were burnt by the Hopi Indians and the alkaline ash used to maintain the blue colour when cooking blue corn[216]. A yellow dye is obtained from the leaves and stems[257]. The leaves can be made into a soapy lather and used as a hair wash[257]. The plant has fire-retardant properties and can be used for barrier plantings to control bush fires[200].

**dwatta Skin Stings**The leaves can be made into a soapy lather and used as a wash on itches and rashes such as chickenpox[257]. A poultice of the crushed leaves can be applied to ant bites to reduce the pain and swelling[257].

**propta Seed - sow April/May** in a cold frame in a compost of peat and sand. Germination usually takes place within 1 - 3 weeks at 13°C[134]. Pot up the seedlings when still small into individual pots, grow on in a greenhouse for the first winter and plant out in late spring or early summer after the last expected frosts. Cuttings of half-ripe wood, July/August in a very sandy compost in a frame. Very easy. Pot up as soon as they start to root (about 3 weeks) and plant out in their permanent positions late in the following spring[K]. Cuttings of mature wood of the current season's growth, November/December in a frame. Very easy. Pot up in early spring and plant out in their permanent position in early summer[K].

**nwatta Fodder:** **Bank Management:** **Copice Management:** Fodder **Minor Global Crop**Requires a position in full sun in any well-drained but not too fertile soil[11, 134, 200]. Tolerates saline and very alkaline soils[200]. Plants are very tolerant of maritime exposure, though they dislike wet climates[K]. Resents root disturbance when large. Succeeds in a hot dry position. A very ornamental plant[60], though it is liable to succumb to winter wet when grown on heavy or rich soils[11, 200]. This species forms hybrids with *Atriplex confertifolia* and *A. gardneri*[270]. Dioecious. Male and female plants must be grown if seed is required. Occasional monoecious plants are found[274]. Individual plants can change sex. The change is more generally from female to male and is apparently associated with stress such as cold or drought. It would appear that the change confers a survival advantage on the plant[274].

## 7.2.46 *Atriplex confertifolia*

**Shadscale, Shadscale saltbush**

6 tlin 9 cyuc 4 kcaak 0 tcan 1 dwat 1.8 m hkuc  
htut cyutli hgatkyuctup hwicli hyishrasljut hpa7tli flatprikliwissliphson hpa7tmwatlii nyanhjen hjonli

**drutta Atriplex confertifolia** is an evergreen Shrub growing to 1.8 m (6ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower in June, and the seeds ripen in August. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral

stems. *B. oleracea palmifolia*. The Jersey kale produces a very tall stem which has been used as a walking stick. *B. oleracea ramosa*. The thousand-headed and perennial kales are very cold hardy. Their flavour is stronger than most of the other cultivated forms and they are mainly used as a winter crop. This form is very close to the wild species and has the most potential for developing perennial cultivars. *B. oleracea subaunda*. The savoy cabbages form large heads like the cultivated cabbages (*B. oleracea capitata*). They have a stronger flavour, crinkly leaves and are generally more cold-hardy so can provide a winter crop in areas with quite severe winters. *B. oleracea sabellica*. The curly kales have attractively curled leaves. These are quite cold-tolerant plants and are mainly used to provide edible leaves in winter and spring. *B. oleracea viridis*. Collards are a cold-hardy non-heading form of cabbage, used mainly to provide green leaves in the spring. The plant is heat tolerant in zones 6 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is flat with shallow roots forming a plate near the soil surface [1-2].

### 7.2.43 Amorphophallus konjac

Devil's Tongue, Devil's Tongue, Snake Plant, Konjac, Konnyaku Potato, Voodoo Lily  
6 tin 11 cyuc 4 ckak 2 tcan 2 dwat 1.3 m hkuc  
pcimhmim cyutli tcup hwicli hrasjltuy hpa7tli frusflatpriklwis hpa7tmwatli hjonli

trutta Amorphophallus konjac is an evergreen Perennial growing to 1.3 m (4ft 3in) by 1.3 m (4ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. The flowers are pollinated by Flies. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in light shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Corm - cooked[ 200 ]. The root must be thoroughly boiled or baked, it is acrid when raw (see notes above on 'Known Hazards' [ K ])[ 200 ]. Very large, it can be up to 30cm in diameter[ 266 ]. In Japan the large brown tubers are peeled, cooked and pounded to extract their starch, which is solidified with dissolved limestone into an edible gel called 'Konnyaku' [ 183 ]. Konnyaku is a type of flour valued for its use in many dietary products[ 266 ]. The flour is valued for its ability to clean the digestive tract without being a laxative[ 183 ]. A nutritional analysis is available[ 218 ]. This root is very high in water and low in calories, so it is being promoted as a diet food in N. America[ 218 ]. Especially just before the foliage declines prior to dormancy, the tubers are a rich source of mannann, a polysaccharide of mannose and glucose[ 472 ]. The mannose is extracted and widely used in foods for diabetics[ 472 ]. Glucomannann, a soluble fibre formed from mannann and glucose, cannot be metabolized by the human body, but is metabolized by intestinal bacteria. Inside the digestive system, glucomannann absorbs up to 200 times its weight in water without any negative action upon the digestive system. It therefore can give a feeling of fullness and be of use to aid in weight loss, it also relieves constipation and irritable bowel syndrome, as well as reducing serum cholesterol levels[ 472 ]. Glucomannann is widely used as an emulsifier and stabilizer in foods and drinks[ 472 ].

tcanta Other uses rating: Low (2/5). Agroforestry Uses: A system of cultivation, known as jinjenjo, is often practised in Japan. In this, the plants are grown in a natural plant community and heavily mulching the plants with grain straw or wild herbs. The plants thus grown are remarkably free from

pests and diseases. The largest tubers are harvested at the end of the year, leaving the rest in the ground to grow on for harvest in later years[ 472 ]. Other Uses The plant has insecticidal properties[ 218 ]. Glucomannann, obtained from the tuber, has a wide range of used in various industries. It has gelling and film-forming properties and is widely used as an emulsifier and stabilizer in foods, drinks, cosmetics and the pharmaceutical industry. It is also used as a non-clay drilling fluid in the diamond and oil industries[ 472 ]. Ground cover.

dwatta The root is oxytocic and sialagogue[ 178 ]. It is used in the treatment of cancer[ 218 ]. Glucomannann, a soluble fibre obtained from the tuber, cannot be metabolized by the human body, but is metabolized by intestinal bacteria. Inside the digestive system, glucomannann absorbs up to 200 times its weight in water without any negative action upon the digestive system. It therefore can give a feeling of fullness and be of use to aid in weight loss, it also relieves constipation and irritable bowel syndrome, as well as reducing serum cholesterol levels[ 472 ]. The flowers are febrifuge[ 218 ].

propta Seed - best sown in a pot in a warm greenhouse as soon as it is ripe and the pot sealed in a plastic bag to retain moisture. It usually germinates in 1 - 8 months at 24c[ 133 ]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least a couple of years. Plant them out in late spring or early summer, after the last expected frosts, and give them some protection such as a cloche until they are growing away strongly. Division of offsets[ 1 ]. These are rarely produced [ 1 ].

nwatta Plants can tolerate a minimum temperature of 15c during the growing season, though the optimum range is 20 - 25c[ 472 ]. The best crops are produced on deep, fertile, alluvial soils that are slightly acid[ 300 ]. Dislikes heavy clay soils[ 300 ]. Plants require some shade, especially when young[ 300 ]. Members of this genus generally require a moist but well-drained, humus-rich, fertile soil and a position in dappled shade[ 472 ]. The plant produces one enormous leaf and one flowering stem annually. When ripe for pollination, the flowers have a foetid smell to attract carrion flies and midges. This smell disappears once the flower has been pollinated[ 245 ]. The tubers are planted 15cm deep[ 1 ]. Like many species in the family Araceae, this plant has the ability to heat the flowering spadix as the pollen becomes ready for fertilization. This heat greatly increases the strength of the aroma released by the plant, thus attracting more pollinating insects. It can also have the effect of making the insects more active, thus increasing the level of fertilization[ 472 ]. The plant is heat tolerant in zones 12 through 10. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is a corm swelling at the stem base [1-2].

### 7.2.44 Lomatium dissectum

Fernleaf Biscuitroot, Carrotleaf biscuitroot  
6 tin 10 cyuc 4 ckak 2 tcan 2 dwat 1.4 m hkuc  
htut cyutli kyucctup hwicli hrasjltuy hpa7tli flatpriklwis hpa7tmwatli fyfxre7t hjonli

drutta Lomatium dissectum is a PERENNIAL growing to 1.4 m (4ft 7in). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Leaves Root SeedEdible Uses: Root - cooked[105, 177, 183, 257]. Resinous and bal-

shields[46]. We do not have any more specific information for the wood of this species, but the various species of *Syzygium* tend to have somewhat similar timber. The general description of *syzygium* timber is as follows:- The heartwood is a golden brown, greyish brown or brown, with pink or purplish glints; it is not clearly demarcated from the 1 - 4cm wide band of sapwood. The texture is fine; the grain slightly interlocked, sometimes wavy or irregular; there are resin deposits. The wood is heavy; moderately hard; somewhat durable, being moderately resistant to fungi and termites, but susceptible to dry wood borers. It seasons slowly, with a high risk of checking and distortion; once dry it is moderately stable in service. It works well with ordinary tools, nailing and screwing are good so long as the wood is pre-bored; gluing is correct. The wood is used for musical instruments, tool handles, furniture components, shipbuilding, heavy carpentry, flooring, joinery etc[848].

dwatta None known

propta Seed - best sown when fresh. Either the whole fruit can be sown, or the seed can be separated from the flesh[397]. Germination usually takes 1 - 2 months but, especially if not sown fresh, may be slow and spasmodic[397, 694]. Cuttings of firm, current season's growth[397].

nwatta A tree of warm temperate and subtropical climates, just reaching into tropical areas[397]. It is tolerant of occasional, light frosts[694]. Succeeds in full sun and in partial shade[694]. Prefers rich soils and assured moisture[397]. Succeeds in most soils[694]. Several named forms have been developed for ornamental purposes, including some compact forms that grow no larger than 2 metres[397].

### 7.2.37 Hibiscus sinosyrriacus

Rose Of Sharon  
6 tin 9 cyuc 4 ckak 3 tcan 2 dwat 3 m hkuc  
hmimhtut cyutli tcup hwicli hrasjltuy hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta *Hibiscus sinosyrriacus* is a deciduous Shrub growing to 3 m (9ft) by 2 m (6ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in September, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves Oil RootEdible Uses: Oil TeaThe following notes are for the closely related *H. syriacus*. They quite probably also apply to this species[K]. Young leaves - raw or cooked[2, 177, 179, 183]. A very mild flavour, though slightly on the tough side, they make an acceptable addition to the salad bowl[K]. A tea is made from the leaves[2, 177, 240] or the flowers[183]. Flowers - raw or cooked[74, 105, 183]. A mild flavour and mucilaginous texture, they are delightful in salads, both for looking at and for eating[K]. Root - it is edible but very fibrous[144]. Mucilaginous, without very much flavour[144].

tcanta *Dye Fibre Hair Hedge Oil*The following notes are for the closely related *H. syriacus*. They quite probably also apply to this similar species[K]. A low quality fibre is obtained from the stems. It is used for making cordage and paper[74]. The seed contains about 25% oil[74]. No further details are given, but it is likely to be edible. A hair shampoo is made from the leaves[74]. A blue dye is obtained from the flowers[168]. This species is planted as a hedge in S. Europe[50].

dwatta Anthelmintic Antiphlogistic Demulcent Diuretic Dysentery Emollient Expectorant Febrifuge Ophthalmic Skin Stomachic StypticThe following notes are for the closely related *H. syriacus*. They quite possibly also apply to this species[K]. Ophthalmic, styptic[147, 178]. The leaves are diuretic, expectorant and stomachic[218, 240]. A decoction of the flowers is diuretic, ophthalmic and stomachic[147, 218]. It is also used in the treatment of itch and other skin diseases[240], dizziness and bloody stools accompanied by much gas[147]. A decoction of the root bark is antiphlogistic, demulcent, emollient, febrifuge, haemostatic and vermifuge[218, 240]. It is used in the treatment of diarrhoea, dysentery, dysmenorrhoea[240] and dermatophytosis[147].

propta Seed - sow early spring in a greenhouse. Germination is usually fairly quick. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse for their first year. Plant them out into their permanent positions in late spring or early summer. Some reports say that the seed can be sown in situ outside and that it gives a good rate of germination[78, 80, 113]. Cuttings of half-ripe wood, July/August in a frame. Good percentage[113]. Cuttings of mature wood, early autumn in a frame. Good percentage[113]. Layering in mid summer to early autumn[1].

nwatta Prefers a well-drained humus rich fertile soil in a sheltered position in full sun[200]. Succeeds in any soil of good or moderate quality[11]. Dislikes shade or badly drained soils[11]. Plants grow best with their roots in cool moist soil and their tops in a hot sunny position. Plants are hardy in most parts of the country, tolerating temperatures down to around -15°C[200]. They are best grown in the milder areas, however, because of their habit of flowering late in the season and thus being subject to frost damage[200]. When planted in colder parts of the country they will need some protection for the first few winters[200]. This species is closely related to *H. syriacus*, differing mainly in the larger leaves and larger epicalyx[200]. Plants rarely require pruning[219], though they respond well to pruning and trimming and this is best carried out in the spring or just after flowering[219]. The flowers are produced on the current season's growth[200]. and they only open in sunny weather[219]. Plants are late coming into leaf, usually around the end of May or early June[182]. There are some named varieties selected for their ornamental value[11].

### 7.2.38 Prinsepia utilis

Cherry prinsepia  
6 tin 9 cyuc 4 ckak 4 tcan 2 dwat 3.5 m hkuc  
hmimhtut cyutli tcup hwicli hrasjltuy hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta *Prinsepia utilis* is a deciduous Shrub growing to 3.5 m (11ft) by 3 m (9ft). It is in flower in February, and the seeds ripen in June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Fruit Oil OilEdible Uses: Oil OilFruit - raw or cooked[1, 2, 177, 183]. Liked by children[272]. Sloe-like[146]. It has rather an astringent flavour[K]. The fruit is up to 17mm long and contains a single large seed[K]. An edible oil is obtained from the seed[2, 51, 105, 146]. It is used in cooking[183, 272].

tcanta Hedge Hedge Miscellany Oil Oil Paint Soil stabilization WoodThe seed contains 21% of a fatty oil[240]. As well as being edible, it can also be used for lighting[2, 146, 158, 272]. The oilcake is used for washing clothes[272]. A deep purple colour obtained from the fruits is used for painting windows and walls[272]. Plants are grown as a hedge in the Himalayas[1, 272]. Plants have an extensive root system and are used for binding the soil[272]. Wood - very hard, compact, very liable to split[158].

dwatta *Eczema Miscellany Rubefacient Skin*An oil from the seed is rubefacient[240]. It is applied externally as a treatment for rheumatism and muscular pain caused by hard work[240]. The oil is also applied to the forehead and temples in the treatment of coughs and colds[272]. The heated oilcake is applied as a poultice to the abdomen in the treatment of stomachaches[272]. A paste of this seedcake is used as a poultice to treat ringworm or eczema[272]. The fruit is used in Chinese medicine[129]. We have no more details.

propta Seed - best if given 2 months cold stratification[113]. Sow the seed in autumn if possible, otherwise in late winter or early spring in a cold frame in light shade. Germination may be inhibited by light[113]. Prick out the seedlings when they are large enough to handle into individual pots. Grow them on in a greenhouse or cold frame for their first winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, July/August in a frame[113].

nwatta Agroforestry Services: Living fence Management Standard Regional Crop Staple Crop: OilSucceeds in any

moderately fertile well-drained soil in full sun or light shade[200]. Requires a light not too fertile soil[11]. Plants are hardy to about -10°c[184]. The plants produce flowers and fruits better when they are growing in full sun[200]. Flowers are produced on the previous seasons wood[200] and can be produced in the autumn as well as the spring. The flowers are produced on the current years wood according to another report[182]. Autumn flowers can produce ripe fruit in the following spring. Unfortunately, the plants only produce fruit in Britain after long hot summers[200].

## 7.2.39 Sasa kurilensis

Chishima Zasa

6 tin 9 cyuc 4 kcaak 3 tcan 1 dwat 2.5 m hkuc

hmim cyutli tcup hwicli hrasjltunyk hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Sasa kurilensis is an evergreen Bamboo growing to 2.5 m (8ft 2in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: Seed Shoots StemEdible Uses: Young shoots - cooked[177]. They are so popular in Japan that a license is required in order to collect them[183]. Seed - used as a cereal[177]. The seed is only produced at intervals of many years.

tcanta Soil stabilization WoodThe plant has rampant roots and this can be utilized in soil stabilization schemes[195]. The canes are used for making particle boards such as hardboard[195]. The fibre dimensions mean that it is more suitable for thick paper and fibreboard than for thin papers[195]. Yields in Japan are around 45 tonnes per hectare though the cost of gathering and bundling the canes makes economic use problematic[195]. The canes are also used as plant supports etc. The plant has rampant roots and used as a tough, vigorous groundcover for difficult sites.

dwatta CancerA potential cure for cancer has been discovered in the leaf[195].

propta Seed - if possible, surface sow the seed as soon as it is ripe in a greenhouse at about 20°c. Stored seed is best sown as soon as it is received. Do not allow the compost to dry out. Germination usually takes place fairly quickly so long as the seed is of good quality, though it can take 3 - 6 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a lightly shaded place in the greenhouse until large enough to plant out, which could be a few years. Plants only flower at intervals of several years and so seed is rarely available. Division in late spring as new growth commences. Take large divisions, trying to cause as little root disturbance to the main clump as possible. Grow them on in light shade in a greenhouse in pots of a high fertility sandy medium. Mist the foliage regularly until plants are established. Plant them out into their permanent positions when a good root system has developed, which can take a year or more[200]. Divisions of less than 5 - 6 culms rarely succeed[200].

nwatta Prefers a damp humus rich soil in partial shade[200]. A very hardy species, it grows wild further north than any other bamboo, succeeding even in areas with heavy snow[195]. It tolerates temperatures down to about -20°c[200]. This species is notably resistant to honey fungus[200]. Plants only flower at intervals of many years. When they do come into flower most of the plants energies are directed into producing seed and consequently the plant is severely weakened. They sometimes die after flowering, but if left alone they will usually recover though they will look very poorly for a few years. If fed with artificial NPK fertilizers at this time the plants are more likely to die[122]. A polymorphic species[200]. There is at least one named form, selected for its ornamental value[200]. The rootstock can be rampant and invasive[200], it is said to hamper the regeneration of forests in its native habitat[195]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. An evergreen. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2]. The root pattern

is rhizomatous with underground stems sending roots and shoots along their length [1-2].

## 7.2.40 Amaranthus hybridus

Rough Pigweed, Slim amaranth

6 tin 12 cyuc 4 kcaak 1 tcan 1 dwat 2 m hkuc

htut cyutli tcup hwicli hrasjltunyk hpa7tli flatpriklwis hpa7tmwatli fyif hjonli

drutta Amaranthus hybridus is a ANNUAL growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 6 and is frost tender. It is in flower from July to September. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Leaves SeedEdible Uses: Leaves and young seedlings - cooked as a spinach, added to soups etc or eaten raw[46, 61, 62, 159, 183]. The nutritious leaves have a mild flavour[K]. Seed - raw or cooked[22, 46, 61, 85]. Used as a cereal substitute, the seed is usually ground into a flour for use in porridges, bread etc. It is rather small, about 1mm in diameter[266], but is easy to harvest and very nutritious[K]. The seed can be cooked whole, and becomes very gelatinous like this, but it is rather difficult to crush all of the small seeds in the mouth and thus some of the seed will pass right through the digestive system without being assimilated[K].

tcanta DyeYellow and green dyes can be obtained from the whole plant[168].

dwatta AstringentA tea made from the leaves is astringent[105, 222]. It is used in the treatment of intestinal bleeding, diarrhoea, excessive menstruation etc[222, 257].

propta Seed - sow late spring in situ. An earlier sowing can be made in a greenhouse and the plants put out after the last expected frosts. Germination is usually rapid and good if the soil is warm[133]. A drop in temperature overnight aids germination[133]. Cuttings of growing plants root easily[206].

nwatta Prefers a well-drained fertile soil in a sunny position[200]. Requires a hot sheltered position if it is to do well[K]. Plants should not be given inorganic fertilizers, see notes above on toxicity. Cultivated as a food crop in India[46, 105], there are many named forms[183]. This species has the potential, through crossbreeding, of imparting early maturity to the white seeded grain amaranths[183]. Most if not all members of this genus photosynthesize by a more efficient method than most plants. Called the 'C4 carbon-fixation pathway', this process is particularly efficient at high temperatures, in bright sunlight and under dry conditions[196]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is clumping, giving the plant a clumping habit. The predictable growth behaviour makes it easier to maintain without having to apply containment methods[2-1].

## 7.2.41 Lycium barbarum

Goji, Box Thorn, Matrimony vine

6 tin 9 cyuc 4 kcaak 3 tcan 3 dwat 2.5 m hkuc

hmimhtut cyutli tcup hwicli hyishrasjltunyk hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Lycium barbarum is a deciduous Shrub growing to 2.5 m (8ft) by 4 m (13ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to August, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: Fruit Leaves ShootsEdible Uses: TeaFruit - raw or cooked[2, 105, 146]. The fruit is a berry

about 2cm in diameter[200, 206]. A mild sweet liquorice flavour[206]. Only the fully ripe fruits should be eaten[K]. Young shoots - cooked[2, 46, 85, 105]. Used mainly as a flavouring, they can also be lightly cooked for 3 - 4 minutes and used as a vegetable, the flavour is somewhat cress-like but has also been described as peppermint-like[206]. The leaves will rapidly once they have been harvested[206]. Some caution is advised, see notes at top of the page. The leaves are a tea substitute[183].

tcanta Hedge Hedge Soil stabilizationCan be grown as an informal hedge, succeeding in maritime exposure[59, 200]. Plants have an extensive root system and can be planted to stabilize sandy banks[200, 206].

dwatta Antibacterial Anticholesterolemic Antipyretic Cancer Diuretic Hypoglycaemic Ophthalmic Purgative Skin Tonic VasodilatorA sweet tonic decoction made from the fruits is used to lower blood pressure and blood cholesterol levels[238]. It acts mainly on the liver and kidneys[61, 176, 238]. The fruit is taken internally in the treatment of high blood pressure, diabetes, poor eyesight, vertigo, lumbago, impotence and menopausal complaints[238]. The fruit is harvested when fully ripe and is dried for later use[238]. The root bark is a bitter, cooling, antibacterial herb that controls coughs and lowers fevers, blood pressure and blood cholesterol levels[61, 176, 238]. It is taken internally in the treatment of chronic fevers, internal haemorrhages, nosebleeds, tuberculosis, coughs, asthma etc[238]. It is applied externally to treat genital itching[238]. The bark is harvested in the winter and dried for later use[238]. Diuretic, purgative, [61, 176]. The plant has a long history of medicinal use, both as a general, energy restoring tonic and also to cure a wide range of ailments from skin rashes and eyesight problems to diabetes[206]. A tonic tea is made from the leaves[206]. The fruit of many members of this genus is a very rich source of vitamins and minerals, especially in vitamins A, C and E, flavanoids and other bio-active compounds. It is also a fairly good source of essential fatty acids, which is fairly unusual for a fruit. It is being investigated as a food that is capable of reducing the incidence of cancer and also as a means of halting or reversing the growth of cancers[214].

propta Seed - sow early spring in a greenhouse. Germination is usually good and fairly quick. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse for their first winter. Plant out in late spring or early summer. Pinch out the shoot tips of the young plants in order to encourage bushy growth[78]. Cuttings of half-ripe wood, 5 - 10cm with a heel if possible, July/August in individual pots in a frame. Good percentage[78]. Cuttings of mature wood of the current season's growth, autumn to late winter in a cold frame. High percentage[78, 200]. Division of suckers in late winter. Very easy, the suckers can be planted out direct into their permanent positions. Layering.

nwatta An easily grown plant, it does not require a rich soil, flowering and fruiting better in a well-drained soil of moderate quality[1, 200]. Succeeds in impoverished soils[200], but more fertile soils are best if the plant is being grown for its edible young shoots[206]. Requires a sunny position[200]. Some plants at Kew are growing well in light shade[K]. Tolerates maritime exposure[11, 49, 200]. Plants are hardy to about -15°c[202]. There are some named varieties, selected for their ornamental value[206]. Plants are very tolerant of pruning and can regrow from old wood[202]. Any trimming is best carried out in the spring[188]. Plants produce suckers freely and can become invasive when in a suitable position. Otherwise they can be difficult to establish[202]. There is much confusion over the naming of this species. Most, if not all, of the plants being grown as L. chinense or L. europaeum are in fact this species[11]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is suckering with new plants from underground runners away from the plant [2-1].

## 7.2.42 Brassica oleracea

Wild Cabbage, Broccoli, Tronchuda cabbage, Brussels sprouts, Kohlrabi, Sprouting broccoli

6 tin 9 cyuc 4 kcaak 3 tcan 2 dwat 1.2 m hkuc

hmimhtut cyutli tcup hwicli hrasjltunyk hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Brassica oleracea is a BIENNIAL/PERENNIAL growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from May to August, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked[5]. Slightly bitter raw, they can be cooked in one or more changes of water[183]. We find that the slight bitterness actually enhances the flavour, and this is one of our favourite cooked leaves. The plant can usually be harvested all year round, though there will be little to pick in very cold winters[K].

tcanta A dynamic accumulator gathering minerals or nutrients from the soil and storing them in a more bioavailable form - used as fertilizer or to improve mulch.

dwatta Anthelmintic Cardiotoxic Diuretic Laxative StomachicThe leaves are cardiotoxic and stomachic[240]. They have been used in the treatment of gout and rheumatism[240]. The leaves can be used as a poultice to cleanse infected wounds - the affected area will still hot[254]. The poultice should not be left on too long or it can cause blisters[254]. The seeds are anthelmintic, diuretic, laxative and stomachic[240].

propta Seed - sow April in situ. Seedlings transplant very well and so, if you sow the seed too thickly, it is a simple matter to move some of the plants to give them more space. Cuttings root very easily at almost any time in the growing season[K]. Use shoots about 8cm long of the current year's growth and place them in individual pots in the cuttings frame[K].

nwatta Management: Standard Minor Global Crop Staple Crop: ProteinAn easily grown plant, it succeeds in full sun in any reasonable soil, though it prefers a well-drained fertile preferably alkaline soil[200]. It does well in heavy clay soils. It is often found wild by the coast and tolerates considerable maritime exposure. The true wild cabbage is a short-lived perennial, though we have seen specimens 5 years old or more[K]. This species has long been cultivated for its edible leaves, stems etc and a wide diversity of forms have been developed, including cabbages, cauliflowers, broccolis and Brussels sprouts[5]. Most of these forms are biennial in cultivation, though there are also some perennial forms. These different forms are detailed below and have each been given their own entry in the database. We have chosen the most up to date classification we can find, as treated in 'World Economic Plants'. B. oleracea algolabra. Chinese kales are fast-growing plants with tender edible leaves. Although perennials[200], they are usually grown as annuals and are eaten as a summer and autumn crop whilst still young. B. oleracea botrytis. Cauliflowers are grown mainly for their edible swollen inflorescence. Different cultivars can be used to provide crops all year round. B. oleracea botrytis aparagoides. A short-lived perennial form of cauliflower producing a small cauliflower head in the spring followed by a number of broccoli-like flowering shoots. B. oleracea capitata. These are the cultivated cabbages, grown for their edible leaves that usually form a compact head. Reasonably winter hardy, different cultivars can be used to provide edible plants all year round. B. oleracea costata. Couve tronchuda is a tall-growing form of cabbage. It is less hardy than most other forms of this genus. B. oleracea gemmifera. Brussels sprouts form large edible axillary buds 5cm or more long. They are mainly used as late autumn to spring crops. B. oleracea gongyolodes. Kohl rabi produces an edible swollen stem 8cm or more in diameter. It is reasonably cold hardy and provides crops from mid summer to the winter. B. oleracea italica. The calabresses and sprouting broccolis, grown mainly for their edible flowering shoots. Calabrese is the less hardy and is used mainly as an autumn and early winter crop. The sprouting broccolis are very winter hardy and are grown outdoors through the winter to provide a spring to early summer crop. B. oleracea medullosa. Marrowstem kales have edible leaves and

drutta *Aquilegia buergeriana* is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in May. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves Edible Uses: Flowers - raw. Rich in nectar; they have a sweet taste[172, 183], they make a very attractive addition to mixed salads and can also be used as a thirst-quenching munch in the garden[K]. Leaves - cooked[177]. Some caution is advised - see the notes above on toxicity.

tcanta ParasiticideThe seed is used as a parasiticide to rid the hair of lice[172].

dwatta ParasiticideNone known

propta Seed - best sown as soon as it is ripe in a cold frame. The seed can be slow to germinate[200]. Stored seed can be sown in late winter in a cold frame. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for their first winter. Plant out in late spring or early summer. Division in spring[200].

nwatta Succeeds in ordinary garden soil, preferring a moist but not wet soil and a sunny position[1]. Intolerant of heavy clay[200]. Most species are short-lived, dying out after 2 - 3 years, though they usually produce seed prolifically[200]. However, they are very apt to hybridize with other members of the genus and so it becomes difficult to keep a species true to type if more than one is grown in the garden[200]. Plants seem to be immune to the predations of rabbits[233]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

## 7.2.247 *Polygonum multiflorum*

He Shou Wu, Tuber fleecflower

6 tlin 9 cyuc 2 kcaak 0 tcan 3 dwat m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Polygonum multiflorum* is a PERENNIAL CLIMBER growing to 4.5 m (14ft 9in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from September to October, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves Root Seed Edible Uses: Leaves - raw or cooked. Seed - raw or cooked. It is rather small and fiddly to utilize[105]. Flowers[179]. No more details are given. Root - cooked[2, 177]. It should be washed several times in order to leech out the bitterness[179]. This process will also remove many of the vitamins and minerals from the roots[K]. A famine food, it is only used when all else fails[105].

tcanta None known

dwatta Antibacterial Anticholesterolemic Antipyretic Antispasmodic Antitumor Astringent Cardiotoxic Demulcent Deobstruent Hypoglycaemic Laxative Sedative Tonic UrinaryHe Shou Wu is considered to be one of the most important of the Chinese herbal tonics and is widely used in that country[218]. It is said to restore vitality and virility[174], working especially on the liver and the reproductive, urinary and circulatory systems[238]. Some care should be exercised, however, since excessive doses can cause skin rash and numbness of the extremities[238]. The roots and stems are antibacterial, anticholesterolemic, antispasmodic, astringent, cardiotoxic, demulcent, depurative, hypoglycaemic, laxative, sedative, tonic[116, 147, 174, 176, 238, 279]. The roots are taken internally in the treatment of menstrual and menopausal complaints, constipation in the elderly, swollen lymph glands and high cholesterol levels[238]. They are very effective in reducing high cholesterol levels in the blood and increase blood sugar levels[254]. Externally, they are used to treat ringworm, bleeding wounds and sores[238]. The roots are harvested in the autumn, preferably from plants 3 - 4 years old, and are dried for later use[238]. The leaves and roots tonify the liver and kidneys, fortify the blood,

strengthen the muscles and prevent premature greying of the hair[218]. The stem is deobstruent and sedative[218]. It is taken internally in the treatment of insomnia and neurasthenia whilst it is applied externally to ringworm[176, 238]. The stems are harvested in late summer or early autumn and are dried for later use[238]. Extracts of the plant have shown antipyretic, antitumour, hypoglycaemic and sedative activity[218].

propta Seed - sow spring in a cold frame. Germination is usually free and easy. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer if they have reached sufficient size. If not, overwinter them in a cold frame and plant them out the following spring after the last expected frosts. Division in spring or autumn. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Succeeds in an ordinary garden soil[1] but prefers a moisture retentive not too fertile soil in sun or part shade[200]. Repays generous treatment[1]. This species is hardy to at least -15°C[238]. Plants seem to be immune to the predations of rabbits[233]. There is a suggestion that this plant might be dioecious[178], in which case male and female plants will need to be grown if seed is required.

## 7.2.248 *Adenophora triphylla*

Nan Sha Shen

6 tlin 9 cyuc 2 kcaak 0 tcan 1 dwat 1 m hkuc  
htut cyutli tcup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Adenophora triphylla* is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in September, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Leaves Root Edible Uses: Root - cooked[105, 177]. The root is thick and carrot shaped[275]. Leaves - cooked[105, 177].

tcanta None known

dwatta Antifungal Cardiotoxic ExpectorantThe root is antifungal, carditonic and expectorant[174, 279]. It is used I Korea to treat bronchial catarrh and coughs, especially where there is excess phlegm[279]. The rot has been shown to contain saponins and triterpenes which are responsible for its expectorant action[279].

propta Seed - best sown in a cold frame as soon as it is ripe[200]. The seed can also be sown in spring. Surface sow 2 - 3 seeds per pot in the spring in order to avoid transplanting[133]. We have found that if transplanted when very small seedlings grow away without difficulty[K]. Germinates in 1 - 3 months at 10°C[133]. Plant out into their permanent positions whilst young. Basal cuttings in spring[K]. Division in spring - very difficult because the plant dislikes root disturbance[1].

nwatta Prefers a light rich slightly alkaline soil that is not too dry and a warm sunny position[1, 200]. Prefers a moist peaty soil in sun or partial shade[187]. Plants are hardy to about -20°C[187]. This species is extremely polymorphic, and several varieties and forms have been described in Japan. The many variations in several characters (hairiness, leaf-shape, inflorescence-shape etc.) can be seen in individuals growing intermixed[275]. This species succeeds in a meadow if the grass is not cut until after the plant flowers[200]. Intolerant of root disturbance[1]. The young growth is extremely attractive to slugs, they have been known to destroy even mature plants[K].

## 7.2.249 *Bumelia lycioides*

Shittamwood

6 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 8 m hkuc  
htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwishsom hpa7tmwatli xre7t hjonli

## 7.2.100 *Ipomoea pandurata*

Wild Potato Vine, Man of the earth

6 tlin 9 cyuc 3 kcaak 2 tcan 2 dwat 3.5 m hkuc  
htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Ipomoea pandurata* is a PERENNIAL CLIMBER growing to 3.5 m (11ft 6in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Root Edible Uses: Root - cooked[85]. The young ones are best[62], they become very acrid as they get old[4]. The roots can be up to 75cm long and 12cm in diameter[4, 207] and can weigh 7 kilos[207]. Roots weighing 10 kilos or more are not unknown[274]. They are best if given a long roasting[95]. Roasted roots taste like sweet potato but with some bitterness[207].

tcanta RepellentAn infusion of the plant has been used for soaking sweet potatoes in order to keep away bugs and moles[257].

dwatta Cathartic Diuretic ExpectorantA poultice of the root is applied to aching joints in the treatment of rheumatism[222, 257]. A tea made from the dried root is diuretic, expectorant and laxative[4, 222, 257]. It has been used in the treatment of strangury and calculus diseases, abdominal pains etc[257]. It also slightly influences the lungs, liver and kidneys without excessive diuresis or catharsis[4, 257]. Caution should be employed because the plant can be strongly laxative[21].

propta Pre-soak the seed for 12 hours in warm water, or scarify the seed, and sow in individual pots in a greenhouse in early spring. The seed usually germinates in 1 - 3 weeks at 22°C. Plants are extremely resentful of root disturbance, even when they are quite small, and should be potted up almost as soon as they germinate[219]. Grow them on in the greenhouse for at least their first winter then plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of side shoots in a peaty soil. Layering.

nwatta Requires a rich well-drained loam in a warm sunny position[200]. The hardiest member of the genus, it tolerates frozen soil and should survive winter temperatures down to at least -10°C[260]. A climbing plant, supporting itself by twining around the branches of other plants[219]. A very ornamental plant[1]. This species has become a troublesome weed in many warm countries and is difficult to eradicate because of its deep root[219]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. Growth habit is a single or multiple shooting vine from a crown [1-2]. Herbaceous. The root pattern is a tap root similar to a carrot going directly down [1-2]. The root pattern is tuberous with swollen potato-like roots [1-2].

## 7.2.101 *Rheum nobile*

Sikkim Rhubarb

6 tlin 9 cyuc 3 kcaak 1 tcan 2 dwat 1.5 m hkuc  
hmimhtut cyutli tcup hwicli jlutnyikfrip hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Rheum nobile* is a PERENNIAL growing to 1.5 m (5ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Stem Edible Uses: Leaf stem - raw or cooked[51, 105, 183, 272]. Pleasantly acid, this is a commonly used vegetable where it grows wild[2, 183].

tcanta An ornamental plant[1] hardy to about -15°C.

dwatta Antiemetic Astringent Carminative Depurative Diuretic LaxativeThe root is astringent, carminative, depura-

tive, diuretic, purgative and tonic[51, 91, 240]. Small doses act as an astringent tonic to the digestive system, whilst larger doses act as a mild laxative[232]. The flowering stem is used in Tibetan medicine, it is said to have a sour taste and a heating potency[241]. It is antiemetic, diuretic and laxative[241]. It is used in the treatment of swellings and fullness of the abdomen as well as to rid the body of retained fluids[241].

propta Seed - best sown in autumn in a shaded cold frame[200]. The seed can also be sown in spring in a cold frame. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse or cold frame for their first winter, planting them out in the spring. Division in early spring or autumn[1, 111]. Divide up the rootstock with a sharp spade or knife, making sure that there is at least one growth bud on each division. Larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Prefers a deep, fertile, moderately heavy, humus rich, moisture retentive, well-drained soil in sun or semi-shade. Grows well in heavy clay soils. A very ornamental plant[1], it is hardy to about -15°C[200]. Plants have proved very difficult to grow in cultivation in Britain[187]. Plants in this genus seem to be immune to the predations of rabbits[233]. Hybridizes freely with other members of this genus[200].

## 7.2.102 *Silybum marianum*

Milk Thistle, Blessed milkthistle

6 tlin 9 cyuc 3 kcaak 2 tcan 5 dwat m hkuc  
htut cyutli kyucutcup hwicli hrasjlutnyik hpa7tli flatprikli-wisslip hpa7tmwatli xre7t hjonli

drutta *Silybum marianum* is a BIENNIAL growing to 1.2 m (4ft) by 1 m (3ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year; in flower from July to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: Flowers Leaves Oil Oil Root Stee Uses: Coffee Oil OilRoot - raw or cooked[1, 2, 4, 52, 183]. A mild flavour and somewhat mucilaginous texture[K]. When boiled, the roots resemble salsify (*Tragopogon hispanicus*)[1, 4, 115]. Leaves - raw or cooked[1, 4, 5, 52, 89, 115]. The very sharp leaf-spines must be removed first[46, 183], which is quite a fiddly operation[K]. The leaves are quite thick and have a mild flavour when young, at this time they are quite an acceptable ingredient of mixed salads, though they can become bitter in hot dry weather[K]. When cooked they make an acceptable spinach substitute[238]. It is possible to have leaves available all year round on successional sowings[K]. Flower buds - cooked[1, 238]. A globe artichoke substitute[12, 183], they are used before the flowers open. The flavour is mild and acceptable, but the buds are quite small and even more fiddly to use than globe artichokes[K]. Stems - raw or cooked[4, 100]. They are best peeled and can be soaked to reduce the bitterness[5, 183]. Palatable and nutritious[4, 115], they can be used like asparagus or rhubarb[12] or added to salads. They are best used in spring when they are young[105]. A good quality oil is obtained from the seeds[4]. The roasted seed is a coffee substitute[21, 46, 61, 183].

tcanta Green manure Oil OilA good green manure plant, producing a lot of bulk for incorporation into the soil[K].

dwatta Astringent Bitter Cholagogue Diaphoretic Diuretic Emetic Emmenagogue Hepatic Homeopathy Stimulant Stomachic TonicMilk Thistle has a long history of use in the West as a remedy for depression and liver problems[254]. Recent research has confirmed that it has a remarkable ability to protect the liver from damage resulting from alcoholic and other types of poisoning[254]. The whole plant is astringent, bitter, cholagogue, diaphoretic, diuretic, emetic, em-

menagogue, hepatic, stimulant, stomachic and tonic[4, 21, 160, 165, 238]. It is used internally in the treatment of liver and gall bladder diseases, jaundice, cirrhosis, hepatitis and poisoning[238]. The plant is harvested when in flower and dried for later use[238]. Silymarin, an extract from the seed, acts on the membranes of the liver cells preventing the entry of virus toxins and other toxic compounds and thus preventing damage to the cells[244]. It also dramatically improves liver regeneration in hepatitis, cirrhosis, mushroom poisoning and other diseases of the liver[222, 238, 254]. German research suggests that silybin (a flavonoid component of the seed) is clinically useful in the treatment of severe poisoning by Amanita mushrooms[222]. Seed extracts are produced commercially in Europe[222]. Regeneration of the liver is particularly important in the treatment of cancer since this disease is always characterized by a severely compromised and often partially destroyed liver[K]. A homeopathic remedy is obtained from equal parts of the root and the seed with its hulls still attached[4]. It is used in the treatment of liver and abdominal disorders[9]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve Silybum marianum Milk Thistle for dyspeptic complaints, liver and gallbladder complaints (see [302] for critics of commission E).

propta Seed - if sown in situ during March or April, the plant will usually flower in the summer and complete its life cycle in one growing season[K]. The seed can also be sown from May to August when the plant will normally wait until the following year to flower and thus behave as a biennial[K]. The best edible roots should be produced from a May/June sowing, whilst sowing the seed in the spring as well as the summer should ensure a supply of edible leaves all year round[K].

nwatta Succeeds in any well-drained fertile garden soil[1, 200]. Prefers a calcareous soil[12] and a sunny position[200]. Hardy to about -15°C[200]. The blessed thistle is a very ornamental plant that was formerly cultivated as a vegetable crop[1, 61, 238]. Young plants are prone to damage from snails and slugs[200]. Plants will often self sow freely[K].

## 7.2.103 Brassica napus arvensis

Coleseed

6 tlin 9 cyuc 3 kcaok 0 tcan 2 dwat 1.2 m hkuc hmimhmtt cyutli tcup hwicli hrasjutnykrip hpa7tli frusflat-prikwisslip hpa7tmwatli fyfxre7t hjonli

drutta Brassica napus arvensis is a ANNUAL/BIENNIAL growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from May to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves Oil SeedEdible Uses: Condiment OilLeaves - raw or cooked[4, 34, 37]. Added to salads or used as a potherb[183]. Immature flowering stems - cooked in much the same way as broccoli[183]. An edible oil is obtained from the seed, it is used mainly for cooking purposes, but also for salads[4, 13, 34, 46, 183]. Some caution is advised, see the notes above on toxicity. The sprouted seed is often used as the mustard part of mustard and cress. Eaten in salads[4, 34, 37, 183]. The seed is used as a mustard flavouring[183].

tcanta Fodder Green manure OilThe seed contains up to 45% of an edible semi-drying oil, it is used as a luminant, lubricant, in soap making etc[13, 21, 57, 142]. A good green manure, the deep taproot improves drainage and loosens heavy soils[18, 20, 87].

dwatta Diuretic EmollientThe root is emollient and diuretic[240]. The juice of the roots is used in the treatment of chronic coughs and bronchial catarrh[240, 269]. The seed, powdered, with salt is said to be a folk remedy for cancer[269]. Rape oil is used in massage and oil baths, it is believed to strengthen the skin and keep it cool and healthy. With camphor it is applied as a remedy for rheumatism and stiff joints[269].

propta Seed - sow in situ in early spring to mid-August for a green manure crop.

nwatta Succeeds in full sun in a well-drained fertile preferably alkaline soil[200]. Succeeds in any reasonable soil[52]. Prefers a heavy soil and cool moist conditions[16, 20]. Sunny days and cool nights are favourable for plant growth whilst dry weather at harvest time is essential[269]. Coleseed is reported to tolerate an annual precipitation of 30 to 280cm, an annual average temperature range of 5 to 27°C and a pH in the range of 4.2 to 8.2[269]. Very young plants are susceptible to cold damage, -4°C either killing or injuring seedlings, whereas -2°C has no effect when the plants are more than one month old[269]. Coleseed is the form of this species most often found either escaped or naturalized in Britain. It has a non-tuberous root and has been cultivated as a fodder crop, oil-seed crop and green manure[17]. Coleseed is 70% self-pollinating and 30% cross-pollinated. Even if wind and insects are absent, seed are still produced. Yield increases with honeybees[269]. The growth of this plant is inhibited by field mustard and hedge mustard growing nearby[18, 20]. This species is closely related to B. rapa[200].

## 7.2.104 Quercus phillyreoides

Black ridge oak,

6 tlin 9 cyuc 3 kcaok 2 tcan 2 dwat 9 m hkuc hmimhmtt cyutli tcup hwicli jlutnykrip hpa7tli flatprikkwis hpa7tmwatli hjonli

drutta Quercus phillyreoides is an evergreen Shrub growing to 9 m (29ft 6in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from April to May, and the seeds ripen from October to November. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: SeedEdible Uses: CoffeeSeed - cooked[105]. Up to 2cm long[200]. It can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread. The seed contains bitter tannins, these can be leached out by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute.

tcanta Repellent TanninA mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth[20]. Oak galls are excrescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4].

dwatta Astringent DysenteryAny galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4].

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Prefers a good deep fertile loam which can be on the stiff side[11]. Young plants tolerate reasonable levels

can be found on the same plant) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Leaves SeedEdible Uses: Leaves - cooked as a spinach[257]. Seed - cooked[257]. Used as a flavour[161, 177]. Very small but easy to harvest and very nutritious. The seed can be cooked whole, and becomes very gelatinous like this, but it is rather difficult to crush all of the small seeds in the mouth and thus some of the seed will pass right through the digestive system without being assimilated[K].

tcanta DyeYellow and green dyes can be obtained from the whole plant[168].

dwatta None known

propta Seed - sow late spring in situ. An earlier sowing can be made in a greenhouse and the plants put out after the last expected frosts. Germination is usually rapid and good if the soil is warm[133]. A drop in temperature overnight aids germination[133]. Cuttings of growing plants root easily[206].

nwatta We have very little information on this species and do not know how well it will grow in Britain, though it should succeed as a spring-sown annual. The following notes are based on the general needs of the genus. Prefers a well-drained fertile soil in a sunny position[200]. Requires a hot sheltered position if it is to do well[K]. Plants should not be given inorganic fertilizers, see notes above on toxicity. Most if not all members of this genus photosynthesize by a more efficient method than most plants. Called the 'C4 carbon-fixation pathway', this process is particularly efficient at high temperatures, in bright sunlight and under dry conditions[196].

## 7.2.244 Caulophyllum robustum

Papoose Root

6 tlin 9 cyuc 2 kcaok 0 tcan 2 dwat 0.3 m hkuc pcmhmim cyutli tcup hwicli hrasjut hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

drutta Caulophyllum robustum is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in April, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young leaves - cooked[105, 177].

tcanta None known

dwatta Anthelmintic Antispasmodic Birthing aid Diaphoretic Diuretic Emmenagogue Oxytoxic SedativeThis herb is said to have similar medicinal properties to C. thalictroides[254]. These are:- Papoose root is a traditional herb of the North American Indians and was used extensively by them to facilitate child birth[207]. Modern herbalists still consider it to be a woman's herb and it is commonly used to treat various gynaecological conditions[254]. An acrid, bitter, warming herb, it stimulates the uterus, reduces inflammation, expels intestinal worms and has diuretic effects[238]. The root is anthelmintic, antispasmodic, diaphoretic, diuretic, emmenagogue, oxytoxic and sedative[4, 21, 46, 165, 207]. An infusion of the root in warm water is taken for about 2 weeks before the expected birth date in order to ease the birth[207, 213]. This infusion can also be used as an emmenagogue and a uterine stimulant[213]. Papoose root should therefore be used with some caution by women who are in an earlier stage of pregnancy since it can induce a miscarriage or early delivery[222]. The plant is also taken internally in the treatment of pelvic inflammatory disease, rheumatism and gout[238]. It should not be prescribed for people with hypertension and heart diseases[238]. Any use of this plant is best under the supervision of a qualified practitioner[238]. The roots are normally harvested in the autumn, because they are at their richest at this time[213], and are dried for later use. The root is harvested in early spring as new growth is beginning and is used to make a homeopathic remedy[232]. It is used especially in childbirth and in some forms of rheumatism[232].

propta Seed - best sown as soon as it is ripe in a shady part of a cold frame[200]. If stored seed is used, it should be sown as soon as it is received. Germination can be erratic. Prick out the seedlings as soon as they are large enough to handle and grow them on in a shady part of a greenhouse or cold frame for at least their first winter. Plant them out into their permanent positions during autumn or early winter. Division in spring or just after flowering[200]. Plants are slow to increase[187].

nwatta We have very little information on this species and do not know if it will be hardy in Britain, though judging by its native range it should succeed outdoors in most parts of this country. The following notes are based on the general needs of the genus. Easily grown in a damp light humus-rich woodland soil preferring a position in deep shade[1, 200]. One report says that it is best in a peat garden. The seeds rupture the ovary before they are fully ripe and continue to expand naked, they are bright blue when fully ripe[130].

## 7.2.245 Griselinia littoralis

6 tlin 9 cyuc 2 kcaok 0 tcan 0 dwat 6 m hkuc hmimhmtt cyutli tcup hwicli hrasjut hpa7tli flatprikkwis hpa7tmwatli nyanhjen hjonli

drutta Griselinia littoralis is an evergreen Shrub growing to 6 m (19ft) by 5 m (16ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower in May. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: FruitEdible Uses: Fruit - a bitter flavour[173].

tcanta Hedge Hedge WoodGrows well by the sea, making a good hedge that tolerates maritime exposure[11, 29, 49]. Plants are very amenable to trimming[200], they are best cut in early summer[188] and can be cut right back into old wood if required. A slow-growing plant, but it makes a nice dense hedge[K]. Wood - very durable, firm, dense but slightly brittle. Used for ship building, railway sleepers etc[46, 61, 123].

dwatta None known

propta Seed - best sown as soon as ripe in a greenhouse. It can also be sown in the spring in a cold frame. Prick out the seedlings when they are large enough to handle and grow on for at least their first winter in a greenhouse. Plant out in late spring after the last expected frosts and give some protection for their first winter outdoors. Cuttings of half-ripe wood 7 cm with a heel, July/August in a frame. Keep the foliage moist. Pot up in August and overwinter in a sheltered position, planting out in late spring after the last expected frosts[78]. Cuttings of mature wood, 7 - 10 cm with a heel, October/November in a frame. High percentage[78].

nwatta Prefers a rich light loam in sun or semi-shade[200]. Tolerates chalky soils[11]. Plants are very tolerant of strong maritime winds[182] but they can be damaged by cold dry winds. Tolerating temperatures down to about -10°C, this species is somewhat tender in most parts of Britain[11] though it usually regrows if cut back by frost[200]. The young shoots in spring are often cut back by late frosts[K]. Very tolerant of root disturbance, it transplants well even when quite large though it would then require staking at first when growing in exposed positions[166]. A number of cultivars have been developed for their ornamental value[182, 200]. Plants in this genus are notably resistant to honey fungus[200]. Dioecious. Male and female plants must be grown if seed is required. It self-sows abundantly in the milder areas of Britain if both sexes are grown[11].

## 7.2.246 Aquilegia buergeriana

6 tlin 9 cyuc 2 kcaok 0 tcan 0 dwat 0.6 m hkuc hmimhmtt cyutli tcup hwicli hrasjutnyk hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

in early summer of the following year, or be placed in an outdoor nursery bed for a year or so to increase in size. They might need protection from spring frosts. Cuttings of semi-ripe terminal shoots, 5 - 8cm long, August in a frame. Protect from frost. Forms roots in the spring[78]. Cuttings of mature terminal shoots, 5 - 10cm long, September/October in a cold frame. Takes 12 months[78]. Cuttings of soft to semi-ripe wood, early summer in a frame. Slow but sure.

nwatta Likes abundant moisture at the roots, if grown in drier areas it must be given a deep moist soil[11]. Tolerates poor peaty soils[200]. Succeeds in wet cold and shallow soils but is not very wind-firm in shallow soils[1]. Succeeds in most sites, including limestone[81]. Prefers a pH between 4 to 6[200]. Dislikes shade[200]. Intolerant of atmospheric pollution[11]. Resists wind exposure to some degree[200]. Most trees are only hardy to zone 8 (tolerating temperatures down to about -5 to -10°C) but selected clones can succeed in zone 7 with temperatures down to -15°C[200]. In some upland areas, especially over granitic or other base-poor soils, growth rate and health have been seriously affected by aluminium poisoning induced by acid rain[200]. Plants are strongly outbreeding, self-fertilized seed usually grows poorly[200]. They hybridize freely with other members of this genus[200]. Difficult to establish because it is sensitive to frost until it is 1.5 metres or more tall, young plants should be given a position sheltered from the early morning sun[11]. Established trees can grow quite vigorously making new growth of 60cm per year for a number of years[185]. Plants in general are slow-growing[1888]. Trees should be planted into their permanent positions when they are quite small, between 30 and 90cm. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200].

### 7.2.241 Rosa x beanii

6 tlin 9 cyuc 2 kcaak 0 tcan 1 dwat m hkuc hmimhtut cyutti tcup hwicli hrasjlutnyikfrip hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Rosa x beanii is a deciduous Shrub. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Fruit SeedEdible Uses: Fruit - raw or cooked. There is only a thin layer of flesh surrounding the many seeds[K]. Some care has to be taken when eating this fruit, see the notes above on known hazards. The seed is a good source of vitamin E, it can be ground into a powder and mixed with flour or added to other foods as a supplement[102, 183]. Be sure to remove the seed hairs[102].

tcanta None known

dwatta Antiphlogistic Blood tonic CancerAntiphlogistic, blood tonic[178]. The fruit of many members of this genus is a very rich source of vitamins and minerals, especially in vitamins A, C and E, flavanoids and other bio-active compounds. It is also a fairly good source of essential fatty acids, which is fairly unusual for a fruit. It is being investigated as a food that is capable of reducing the incidence of cancer and also as a means of halting or reversing the growth of cancers[214].

propta Seed. Rose seed often takes two years to germinate. This is because it may need a warm spell of weather after a cold spell in order to mature the embryo and reduce the seedcoat[80]. One possible way to shorten this time is to scarify the seed and then place it for 2 - 3 weeks in damp peat at a temperature of 27 - 32°C (by which time the seed should have imbibed). It is then kept at 3°C for the next 4 months by which time it should be starting to germinate[80]. Alternatively, it is possible that seed harvested 'green' (when it is fully developed but before it has dried on the plant) and sown immediately will germinate in the late winter. This method has not as yet(1988) been fully tested[80]. Seed sown as soon as it is ripe in a cold frame sometimes germinates in spring though it may take 18 months[K]. Stored seed should be sown as early in the year as possible and stratified for 6 weeks at 5°C[200]. It may take 2 years to germinate[200]. Prick out the seedlings into individual pots when they are

large enough to handle. Plant out in the summer if the plants are more than 25cm tall, otherwise grow on in a cold frame for the winter and plant out in late spring. Cuttings of half-ripe wood with a heel, July in a shaded frame. Overwinter the plants in the frame and plant out in late spring[78]. High percentage[78]. Cuttings of mature wood of the current seasons growth. Select pencil thick shoots in early autumn that are about 20 - 25cm long and plant them in a sheltered position outdoors or in a cold frame[78, 200]. The cuttings can take 12 months to establish but a high percentage of them normally succeed[78]. Division of suckers in the dormant season. Plant them out direct into their permanent positions. Layering. Takes 12 months[11].

nwatta Succeeds in most soils[11], preferring a circum-neutral soil and a sunny position[200]. Grows well in heavy clay soils. Dislikes water-logged soils[200]. A rather tender species, it is best grown on a wall in Britain[1, 11]. Grows well with alliums, parsley, mignonette and lupins[18, 20]. Garlic planted nearby can help protect the plant from disease and insect predation[18, 20]. Grows badly with boxwood[18]. A hybrid species, there is enormous confusion over its origins, some botanists believe that it is *R. multiflora* x *R. laevigata* or *R. banksiae*, others believe that it is *R. banksiae* x *R. moschata*[200]. Hybridizes freely with other members of this genus[80]. Plants in this genus are notably susceptible to honey fungus[200].

### 7.2.242 Clinopodium vulgare

Wild Basil

6 tlin 9 cyuc 2 kcaak 0 tcan 1 dwat 0.5 m hkuc hmimhtut cyutti tcup hwicli hrasjlut hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Clinopodium vulgare is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from July to September, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies), insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Condiment TeaEdible leaves - used fresh or dried as a flavouring in cooked foods[5, 8, 12, 183] or fresh as a flavouring in salads[177]. A sweet and aromatic herb tea is made from the fresh leaves[183].

tcanta DyeA yellow and a brown dye are obtained from the leaves[46, 61].

dwatta Aromatic Astringent Cardiotonic Carminative Diaphoretic ExpectorantThe plant is aromatic, astringent, cardiotonic, carminative, diaphoretic and expectorant[4, 145]. An infusion of the plant helps to overcome weak digestion[244].

propta Seed - sow spring in a cold frame. Only just cover the seed. Germination usually takes place within 2 weeks at 21°C. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse. Plant them out in the summer if they have made sufficient growth, otherwise plant them out in late spring or early summer of the following year. Division in spring. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the summer or following spring. Cuttings of soft wood in May or June.

nwatta Succeeds in almost any well-drained soil[1].

### 7.2.243 Amaranthus powellii

Powell's Amaranth

6 tlin 11 cyuc 2 kcaak 1 tcan 0 dwat 1.8 m hkuc htut cyutti tcup hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli fyif hjonli

drutta Amaranthus powellii is a ANNUAL growing to 1.8 m (6ft). See above for USDA hardiness. It is hardy to UK zone 7 and is frost tender. The species is monoecious (individual flowers are either male or female, but both sexes

of side shade[200]. Tolerates moderate exposure[166], surviving well but being somewhat stunted[200]. Rarely fruits well in Britain[11]. Trees at Kew in the hot summer of 1989 carried large crops of seed[K]. The seed takes 2 years to ripen[200]. A very ornamental plant[1]. Hybridizes freely with other members of the genus[200]. Plants in this genus are notably resistant to honey fungus[200].

#### 7.2.105 Brassica napus napus

Rape

6 tlin 9 cyuc 3 kcaak 0 tcan 2 dwat 1.2 m hkuc hmimhtut cyutti tcup hwicli hrasjlutnyikfrip hpa7tli frusflat-prikliwssip hpa7tmwatli fyifre7t hjonli

drutta Brassica napus napus is a ANNUAL/BIENNIAL growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from May to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves Oil OilEdible Uses: Condiment Oil OilLeaves - raw or cooked[4, 34, 37]. Added to salads or used as a potherb[183]. Immature flowering stems - cooked in much the same way as broccoli[183]. An edible oil is obtained from the seed, it is used mainly for cooking purposes, but also for salads[4, 13, 34, 46, 183]. Some caution is advised, see the notes above on toxicity. The sprouted seed is often used as the mustard part of mustard and cress. Eaten in salads[4, 34, 37, 183]. The seed is used as a mustard flavouring[183].

tcanta Oil OilThe seed contains up to 45% of an edible semi-drying oil, it is used as a luminant, lubricant, in soap making etc[13, 21, 57, 142].

dwatta Diuretic EmollientThe root is emollient and diuretic[240]. The juice of the roots is used in the treatment of chronic coughs and bronchial catarrh[240, 269]. The seed, powdered, with salt is said to be a folk remedy for cancer[269]. Rape oil is used in massage and oil baths, it is believed to strengthen the skin and keep it cool and healthy. With camphor it is applied as a remedy for rheumatism and stiff joints[269].

propta Seed - sow spring in situ.

nwatta Succeeds in full sun in a well-drained fertile preferably alkaline soil[200]. Succeeds in any reasonable soil[52]. Prefers a heavy soil and cool moist conditions[16, 20]. Sunny days and cool nights are favourable for plant growth whilst dry weather at harvest time is essential[269]. Rape is reported to tolerate an annual precipitation of 30 to 280cm, an annual average temperature range of 5 to 27°C and a pH in the range of 4.2 to 8.2[269]. Very young plants are susceptible to cold damage, -4°C either killing or injuring seedlings, whereas -2°C has no affect when the plants are more than one month old[269]. Rape is widely cultivated for its oil-rich seeds, there are many named varieties. The oil is high in erucic acid and glucosinolates, both of which have anti-nutritional properties. Cultivars have been developed that have a low content of these items and are therefore suitable for food. Rape is 70% self-pollinating and 30% cross-pollinated. Even if wind and insects are absent, seed are still produced. Yield increases with honeybees[269]. The growth of this plant is inhibited by field mustard and hedge mustard growing nearby[18, 20]. This species is closely related to *B. rapa*[200].

#### 7.2.106 Kosteletzkya pentacarpos

6 tlin 9 cyuc 3 kcaak 0 tcan 0 dwat 1 m hkuc htut cyutti tcup hwicli hrasjlut hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Kosteletzkya pentacarpos is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and

basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves Oil RootEdible Uses: Egg Oil TeaLeaves - raw or cooked[2, 4, 100]. They are used as a potherb or to thicken soups[62, 183]. The leaves can be eaten raw but are rather fibrous and somewhat hairy, though the taste is pleasant[K]. Flowers - raw. Added to salads[61]. The following uses are recorded for *Althaea officinalis*, they are said to also apply to this species[61]:- Root - raw or cooked[61]. When boiled and then fried with onions it is said to make a palatable dish that is often used in times of shortage[4]. The root is used as a vegetable[62, 141, 183], it is also dried then ground into a powder, made into a paste and roasted to make the sweet 'marshmallow'[4, 5, 7, 17, 61]. The water left over from cooking any part of the plant can be used as an egg-white substitute in making meringues etc[62]. The water from the root is the most effective[183], it is concentrated by boiling until it has a similar consistency to egg white. A tea is made from the flowers[183]. A tea can also be made from the root[183].

tcanta Adhesive Fibre OilA strong fibre is obtained from the stems. It is used for making string, nets etc[74]. The following uses are recorded for *Althaea officinalis*, they are said to also apply to this species[61]:- A glue can be made from the root[74]. An oil from the seed is used in making paints and varnishes[74].

dwatta None known

propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring.

nwatta Prefers a deep rich moist sandy soil in a warm sunny position[1, 200]. Plants are hardy to at least -15°C[200].

### 7.2.107 Borago officinalis

Borage, Common borage,Cool-tankard, Tailwort
6 tlin 9 cyuc 3 kcaak 3 tcan 3 dwat 0.6 m hkuc hmimhtut cyutti hgatkuyuctcup hwicli hyishrasjlutnyik hpa7tli flatprikliwssip hpa7tmwatli xre7t hjonli

drutta Borago officinalis is a ANNUAL growing to 0.6 m (2ft) by 0.3 m (1ft in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from June to October, and the seeds ripen from July to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Flowers Leaves OilEdible Uses: Colouring Oil TeaLeaves - raw or cooked[2, 5, 7, 14, 115, 183]. They can be used as a pot-herb or be added to salads[4]. They are also added whole as a flavouring to various drinks such as Pimms and wine-based drinks[238]. The leaves are rich in potassium and calcium, they have a salty cucumber flavour[200]. Very hairy, the whole leaves have an unpleasant feeling in the mouth and so they are best chopped up finely and added to other leaves when eaten in a salad[K]. The leaves should always be used fresh, because they lose their flavour and colour if dried[244]. Flowers - raw. They are used as a decorative garnish on salads and summer fruit drinks[2, 5, 7, 14, 183]. The flowers are very nice, both to look at and to taste with a sweet slightly cucumber-like flavour[K]. A refreshing tea is made from the leaves and/or the flowers[21, 183]. The dried stems are used for flavouring beverages[183]. The seed yields 30% oil, 20% of which is gamma-linolenic acid[141]. Total yields are 0.35 - 0.65 tonnes per hectare[141]. Unfortunately, the seed ripens intermittently over a period of time and falls from the plant when it is ripe, this makes harvesting the seeds in quantity very difficult[K]. An edible blue dye can be obtained from the flowers. It is used to colour vinegar[183].

tcanta Dye Oil RepellentThe growing plant is said to repel insects[14]. A blue dye is obtained from the flowers[7].

This turns pink on contact with acids[238].

dwatta Antirheumatic Demulcent Depurative Diaphoretic Diuretic Emollient Expectorant Febrifuge Hypotensive Lenitive Poulitice Sedative Skin Women's complaintsBorage is a fairly common domestic herbal remedy that has been used since ancient times[244]. It has a particularly good reputation for its beneficial affect on the mind, being used to dispel melancholy and induce euphoria[244]. It is a soothing saline, diuretic herb that soothes damaged or irritated tissues[238]. The leaves, and to a lesser extent the flowers, are demulcent, diaphoretic, depurative, mildly diuretic, emollient, expectorant, febrifuge, lenitive and mildly sedative[4, 7, 9, 14, 201, 238]. An infusion is taken internally in the treatment of a range of ailments including fevers, chest problems and kidney problems[4], though it should not be prescribed to people with liver problems. Externally it is used as a poultice for inflammatory swellings[4, 7]. The leaves are harvested in late spring and the summer as the plant comes into flower. They can be used fresh or dried but should not be stored for more than one year because they soon lose their medicinal properties[238]. The seeds are a rich source of gamma-linolenic acid, this oil helps to regulate the hormonal systems and lowers blood pressure[238]. It is used both internally and externally, helping to relieve skin complaints and pre-menstrual tension[238]. Used for the treatment of phlebitis (inflammation of the veins) [301].

propta Seed - sow April/May in situ. The plants quickly develop a stout tap-root and do not transplant successfully[238]. The seed can also be sown in situ in the autumn, this will produce larger plants and earlier flowering[4]. The plant usually self-sows prolifically.

nwatta Landscape Uses:Border, Foundation, Massing. A very easily grown plant, succeeding in ordinary garden soil[1], preferring a dry soil[37] and a sunny position[138]. It grows particularly well in loose, stony soils with some chalk and sand[244]. Plants are tolerant of poor dry soils, though much bigger specimens are produced when the plants are growing in better conditions[238]. Tolerates a pH in the range 4.8 to 8.3. Borage is often grown as a culinary plant in the herb garden[1, 7]. Although an annual, it usually maintains itself by self-sowing, sometimes in quite a prolific manner, as long as the soil is disturbed by hoeing etc[14, 188]. Plants often develop mildew when growing in dry conditions or towards the end of the growing season[238]. Flowers are a deeper blue when grown in poorer soils[138]. The flowers are rich in a sweet nectar and are very attractive to bees[7, 14, 20, 108, 244]. The growing plant is a good companion for strawberries, tomatoes, courgettes and most other plants[14, 201, 238]. It is said to deter Japanese beetle and tomato hornworms[238]. Special Features:Edible, Fragrant foliage, Not North American native, Invasive, Naturalizing, Suitable for dried flowers, Extended bloom season in Zones 9A and above. The plant is heat tolerant in zones 12 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. A self-seeding annual [1-2].

## 7.2.108 Tritelleia ixoides

Pretty Face, Cook's tritelleia, Golden brodiaea  
6 tin 9 cyuc 3 kcaak 0 tcan 0 dwat 0.6 m hkuc  
htut cyutli kyucup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Tritelleia ixoides is a BULB growing to 0.6 m (2ft) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from May to August, and the seeds ripen in July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium

(loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcaakta Edible Parts: RootEdible Uses: Bulb - raw or cooked[105, 257]. Small[161]. Rich in starch, they can be used like potatoes.

tcanta None known  
dwatta None known  
propta Seed - best sown as soon as it is ripe in a cold frame. Alternatively, the seed can be sown in spring in a cold frame. Germination usually takes place within 1 - 3 months at 15°C. Sow the seed thinly so that there is no need to prick them out and grow the seedlings on in the pot for their first year. Give an occasional liquid feed to ensure that they do not become mineral deficient. Seedlings are prone to damping off so be careful not to overwater them and keep them well ventilated. When they become dormant, pot up the small bulbs placing about 3 in each pot. Grow them on in the greenhouse for another year or two until the bulbs are about 20mm in diameter and then plant them out into their permanent positions when they are dormant in the autumn. Division of flowering size bulbs in autumn. Dig up the clumps of bulbs, replanting the larger ones direct into their permanent positions. It is best to pot up the smaller ones and grow them on in a greenhouse for a year before planting them out when they are dormant in early autumn.

nwatta Easily grown in a bulb frame or a warm sunny position outdoors[90]. Requires a rich well-drained sandy loam[1]. Likes plenty of moisture whilst in growth followed by a warm dry period in late summer and autumn[200]. Bulbs can flower in 2 years from seed[K].

## 7.2.109 Cirsium edule

Edible Thistle

6 tin 9 cyuc 3 kcaak 0 tcan 0 dwat 2 m hkuc  
htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyfuxre7t hjonli

drutta Cirsium edule is a PERENNIAL growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies), beetles. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcaakta Edible Parts: Oil Root StemEdible Uses: Oil-Root - cooked[95, 105, 161, 257]. The root is likely to be rich in inulin, a starch that cannot be digested by humans. This starch thus passes straight through the digestive system and, in some people, ferments to produce flatulence[K]. Young stems - peeled and eaten raw[46, 61, 95, 105]. Soft and sweet[161], they are considered to be a luxury food[257]. Young shoots - raw or cooked as greens[257]. Harvested in spring[257].

tcanta OilThe seed of all species of thistles yields a good oil by expression[4]. No details of potential yields etc are given[K].

dwatta None known  
propta Seed - sow early spring or autumn in situ. Germination usually takes place within 2 - 8 weeks at 20°C.

nwatta An easily grown plant, succeeding in any ordinary garden soil in a sunny position[200]. A monocarpic species, it grows for a number of years without flowering but then dies after flowering[60].

## 7.2.110 Satureja spicigera

Creeping Savory

6 tin 9 cyuc 3 kcaak 3 tcan 2 dwat 0.1 m hkuc  
htut cyutli hgatkyucup hwicli hyshrasjlut hpa7tli flatprikliwisslip hpa7tmwatli xre7t hjonli

drutta Satureja spicigera is a PERENNIAL growing to 0.1 m (0ft 4in) by 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It is noted for attracting wildlife. Suitable for: light (sandy) and medium

to sow the seed in early winter[113]. The germination is variable and can be slow. Prick out the seedlings into individual pots when they are large enough to handle and grow on the plants for at least their first winter in a greenhouse. Plant out into their permanent positions in early summer and consider giving some protection from winter cold for their first year or two outdoors[K]. Cuttings of half-ripe wood from juvenile trees, July in a frame[113]. Layering.

nwatta Landscape Uses:Pest tolerant, Pollard, Specimen, Street tree. Succeeds in an ordinary loamy soil and in dry soils[1, 11]. Requires a sunny position[1]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°C[200]. A very ornamental tree[1, 11]. Any pruning that needs to be done is best carried out in the spring[238]. This species strongly resents being transplanted[113], it should be planted out into its permanent position as young as possible and given some protection from winter cold for its first few winters outdoors. Dioecious, male and female plants must be grown if seed is required. Special Features:Not North American native, Naturalizing, Inconspicuous flowers or blooms.

## 7.2.239 Isatis tinctoria

Woad, Dyer's woad

6 tin 9 cyuc 2 kcaak 0 tcan 3 dwat 1 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwisslip hpa7tmwatli xre7t hjonli

drutta Isatis tinctoria is a BIENNIAL/PERENNIAL growing to 1 m (3ft 3in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from June to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: LeavesEdible Uses: Leaves - they require long soaking in order to remove a bitterness, and even then they are still bitter[177, 179]. There is no record of the seeds being edible, but they contain 12 - 34% protein and 12 - 38% fat on a zero moisture basis[218].

tcanta Dye PreservativeWoad is historically famous as a dye plant, having been used as a body paint by the ancient Britons prior to the invasion of the Romans[238]. A blue dye is obtained from the leaves by a complex process that involves fermenting the leaves and produces a foul stench[6, 14, 46, 57, 100, 238]. The dye is rarely used nowadays, having been replaced first by the tropical Indigofera tinctoria and more recently by synthetic substitutes[238]. Nevertheless, it is a very good quality dye that still finds some use amongst artists etc who want to work with natural dyes. A very good quality green is obtained by mixing it with Dyer's greenwood (Genista tinctoria)[238]. Woad is also used to improve the colour and quality of indigo, as well as to form a base for black dyes[244]. The leaves are harvested when fully grown and 3 - 4 harvests can be made in total[244]. Recent research in Germany has shown that (the dyestuff in?) this plant is a very good preservative for wood[Radio 4 Farming programme].

dwatta Antibacterial Antiviral Astringent CancerWoad has rather a mixed press for its medicinal virtues. One author says it is so astringent that it is not fit to be used internally - it is only used externally as a plaster applied to the region of the spleen and as an ointment for ulcers, inflammation and to staunch bleeding[4]. However, it is widely used internally in Chinese herbal medicine where high doses are often employed in order to maintain high levels of active ingredients[238]. The leaves are antibacterial, anticancer, antiviral, astringent and febrifuge[148, 176, 218, 238]. It controls a wide range of pathogenic organisms, including viruses[218, 238]. It is used internally in the treatment of a wide range of disorders, including meningitis, encephalitis, mumps, influenza, erysipelas, heat rash etc[238]. The leaves are harvested in the summer and can be used fresh or dried[238]. They are also macerated and the blue pigment extracted. This is also used medicinally, particularly in the treatment of high fevers and convulsions in children, coughing of blood and as a detoxifier in infections such as mumps[238]. The

root is antibacterial and anticancer[176]. It is used in the treatment of fevers, pyogenic inflammation in influenza and meningitis, macula in acute infectious diseases, erysipelas, mumps and epidemic parotitis[176]. Its antibacterial action is effective against *Bacillus subtilis*, haemolytic streptococcus, *C. diphtheriae*, *E. coli*, *Bacillus typhi*, *B. paratyphi*, *Shigella dysenteriae*, *S. flexneri* and *Salmonella enteritidis*[176]. Both the leaves and the roots are used in the treatment of pneumonia[218]. The root and the whole plant have anticancer properties whilst extracts of the plant have shown bactericidal properties[218].

propta Seed - sow spring in situ. Fresh seed can also be sown in situ in late summer; it will take 20 months to flower but will produce more leaves[169].

nwatta An easily grown plant, it prefers a well-drained fertile soil in a sunny position[14], though it succeeds in ordinary garden soil[1]. Prefers neutral to alkaline conditions[238]. Plants deplete the soil of nutrients and cannot be grown successfully on the same site for more than two years[4]. Plants are hardy to about -15°C[200]. Woad is a biennial, or occasionally a short-lived perennial plant. It has a very long history as a dye plant, being used by the ancient Britons to give a blue colouring to the skin. At one time woad was widely cultivated for this blue dye obtained from its leaves but with the advent of chemical dyes it has fallen into virtual disuse[4]. It is currently (1993) being grown commercially on a small scale in Germany as a wood preservative (An item on BBC's Radio 4 Farming Programme). Plants self-sow freely when they are grown in a suitable position[14], though they tend not to thrive if grown in the same position for more than two years[238].

## 7.2.240 Picea smithiana

Morinda Spruce

6 tin 9 cyuc 2 kcaak 0 tcan 0 dwat 30 m hkuc  
htut cyutli tcup hwicli hyshrasjlutnyik hpa7tli frusflatprikliwis hpa7tmwatli hjonli

drutta Picea smithiana is an evergreen Tree growing to 30 m (98ft) by 6 m (19ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, and the seeds ripen from October to November. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure. It cannot tolerate atmospheric pollution.

kcaakta Edible Parts: Flowers Inner bark Seed Seedpod Uses: Condiment Gum TeaYoung male catkins - raw or cooked. Used as a flavouring[172]. Immature female cones - cooked. The central portion, when roasted, is sweet and syrupy[172]. Inner bark - dried, ground into a powder and then used as a thickener in soups etc or added to cereals when making bread[172]. An emergency food, it is only used when all else fails. Seed - raw. Too small and fiddly to be worthwhile unless you are desperate[172]. A refreshing tea, rich in vitamin C, can be made from the young shoot tips[172].

tcanta Charcoal Gum Resin Roofing WoodThe bark is very water resistant and is used for roofing and making water troughs[146, 158]. Small quantities of resin are obtained from between the bark and the wood[146]. Wood - soft to moderately hard. Used in construction, shingles, crates, household purposes etc[146, 272]. It is also valued for its use in the pulp industry to make paper[171]. An indifferent fuel but it yields a fairly good charcoal[158].

dwatta Vitamin CNone known

propta Seed - stratification will probably improve germination so sow fresh seed in the autumn in a cold frame if possible[80]. Sow stored seed as early in the year as possible in a cold frame[78]. A position in light shade is probably best[78]. Seed should not be allowed to dry out and should be stored in a cool place[80]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse or cold frame for their first winter. They can be planted out into their permanent positions

hardy to UK zone 7. It is in flower from July to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: RootEdible Uses: The following use is for the closely related *C. tuberosa*, but is also probably appropriate for this species[K]. Tubers - cooked. Rich in starch[105, 177], but with a fairly bland flavour.

tcanta None known

dwatta Aphrodisiac TBAn infusion of the plant is used as an aphrodisiac[207] and as a strengthener for weakened patients with tuberculosis[257].

propta Seed - sow March in a greenhouse. The seed usually germinates in 4 - 5 weeks at 20°C[164]. When they are large enough to handle, prick the seedlings out into individual pots plant them out in late spring or early summer, after the last expected frosts. Division in early spring. Make sure that each portion has at least one growing bud[111, K]. Cuttings during the growing season. Very easy[200].

nwatta Prefers a light well-drained loam with added leaf-mold[42]. Succeeds in an ordinary, reasonably moist soil in a sunny position with some shelter[164]. Plants are hardy to about -10°C if the roots are protected from freezing[187]. It is probably best to dig up the roots in autumn and store them like dahlias in a cool frost free place[200]. When grown in a light well-drained soil and mulched well, the roots usually survive the winter outdoors[1]. This species is closely related to *C. tuberosa*[200]. The flowers are very ephemeral, individual flowers only living for a few hours[266].

### 7.2.236 Vaccinium myrsinites

Florida Evergreen Blueberry, Shiny blueberry

6 tlin 9 cyuc 2 kcak 0 tcan 1 dwat m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta Vaccinium myrsinites is an evergreen Shrub growing to 0.5 m (1ft 8in) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked in pies etc[46, 61, 105, 177, 183]. The fruit is about 6mm in diameter[200].

tcanta None known

dwatta Analgesic Febrifuge OphthalmicThe leaves are analgesic, febrifuge and ophthalmic[257]. An infusion has been used in the treatment of colds, sun sickness, eye diseases, headaches, high fever and diarrhoea[257].

propta Seed - sow late winter in a greenhouse in a lime-free potting mix and only just cover the seed[78]. Stored seed might require a period of up to 3 months cold stratification[113]. Another report says that it is best to sow the seed in a greenhouse as soon as it is ripe[200]. Once they are about 5cm tall, prick the seedlings out into individual pots and grow them on in a lightly shaded position in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 8cm with a heel, August in a frame[78]. Slow and difficult. Layering in late summer or early autumn[78]. Another report says that spring is the best time to layer[200]. Takes 18 months[78]. Division of suckers in spring or early autumn[113].

nwatta Requires a moist but freely-draining lime free soil, preferring one that is rich in peat or a light loamy soil with added leaf-mould[11, 200]. Prefers a very acid soil with a pH in the range of 4.5 to 6, plants soon become chlorotic when lime is present. Succeeds in full sun or light shade though it fruits better in a sunny position[200]. Requires shelter from strong winds[200]. Plants are not very hardy in many parts of Britain but they grow well south and west of London[11]. Dislikes root disturbance, plants are best grown in pots until being planted out in their permanent posi-

tions[200]. Plants in this genus are notably resistant to honey fungus[200].

### 7.2.237 Schisandra repanda

6 tlin 9 cyuc 2 kcak 0 tcan 0 dwat 6 m hkuc hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliws hpa7tmwatli nyanhjen hjonli

drutta Schisandra repanda is a deciduous Climber growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from May to June. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). . The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: TeaFruit - raw or cooked[105, 183]. Used in preserves or to make a tea[177, 183].

tcanta None known

dwatta None known

propta Seed - best sown in the autumn in a cold frame[200, 238]. Pre-soak stored seed for 12 hours in warm water and sow in a greenhouse in the spring[238]. Germination can be slow and erratic. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in the greenhouse for their first 2 years. Plant them out into their permanent positions in early summer. Cuttings of half-ripe wood, 5 - 8cm with a heel, August in a frame. Overwinter in the greenhouse and plant out in late spring[11, 78]. Good percentage[78]. Layering of long shoots in the autumn[200].

nwatta Prefers a rich well-drained moisture retentive soil[11, 200]. Prefers a slightly acid soil but tolerates some alkalinity if plenty of organic matter is added to the soil[200]. Requires some protection from the most intense sunlight[200]. Plants are intolerant of drought[K]. This species has not been properly evaluated for hardiness in Britain but it will probably succeed outdoors in most parts of the country[11], especially if given the protection of a woodland or a wall[K]. The young growth in spring can be damaged by late frosts. Dioecious. Male and female plants must be grown if seed is required.

### 7.2.238 Pistacia chinensis

Chinese Pistache, Chinese Pistachio

6 tlin 9 cyuc 2 kcak 0 tcan 1 dwat 9 m hkuc htut cyutli kyucctup hwicli hrasjlutnyik hpa7tli flatprikliws hpa7tmwatli nyanhjen hjonli

drutta Pistacia chinensis is a deciduous Tree growing to 9 m (29ft 6in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from April to June, and the seeds ripen in October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). . The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Leaves SeedEdible Uses: Young shoots and leaves - cooked. Used as a vegetable[11, 46, 182, 183]. Seed - cooked. It is roasted and then eaten, or is used in confectionery[105, 183].

tcanta Dye Miscellany Rootstock WoodThe plant can be used as a rootstock for the pistachio nut, *P. vera*[200]. A yellow dye can be obtained from the wood[266]. Wood - hard, durable. Used in furniture making and carpentry[51, 266].

dwatta MiscellanyResin from the related *P. lentiscus* is analgesic, antitussive, expectorant and sedative. It would be worthwhile examining this species[218].

propta Pre-soak the seed for 16 hours in alkalinized water[78], or for 3 - 4 days in warm water[1], and sow late winter in a cold frame or greenhouse[78, 113]. Two months cold stratification may speed up germination, so it might be better

(loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Edible Uses: CondimentLeaves - raw or cooked[238]. A peppery flavour, they are used mainly as a flavouring for cooked dishes, especially beans, but are also used as a garnish for salads etc[183]. They have a stronger flavour than summer savory (*S. hortensis*)[238]. The leaves can be used fresh or dried[183].

tcanta A good companion plant in the garden, growing especially well with onions and beans[201]. The plant is said to inhibit the germination of certain seeds[18]. Secretions from the seeds can prevent the germination of nearby seeds[201]. Members of this genus are rarely if ever troubled by browsing deer[233]. Dynamic accumulator

dwatta Antirheumatic Antiseptic Aromatic Carminative Digestive Expectorant Stings StomachicThe whole herb, and especially the flowering shoots, is antiseptic, aromatic, carminative, digestive, expectorant and stomachic[4, 7, 14, 21]. Taken internally, it is said to be a sovereign remedy for colic and a cure for flatulence[4], whilst it is also used to treat nausea, diarrhoea, bronchial congestion, sore throat and menstrual disorders[238]. It should not be prescribed for pregnant women[238]. A sprig of the plant, rubbed onto bee or wasp stings, brings instant relief[4]. The plant is harvested in the summer when in flower and can be used fresh or dried[238]. The essential oil forms an ingredient in lotions for the scalp in cases of incipient baldness[7]. An ointment made from the plant is used externally to relieve arthritic joints[7].

propta Seed - surface sow in April in a greenhouse. Do not allow the compost to dry out. Germination can be slow and erratic[1] but usually takes place within a month[K]. Prick out the seedlings into individual pots as soon as they are large enough to handle. It is usually possible to plant out into their permanent positions during the summer, but if the plants have not grown sufficiently, or if you live in an area of cold winters, it might be best to grow them on in a cold frame for their first winter and plant them out in late spring or early summer of the following year[K]. Cuttings of half-ripe wood, 5 - 8cm taken at a node, July/August in a frame. Pot up in autumn and overwinter in a frame, planting out in late spring or early summer of the following year. A high percentage usually succeed[78]. Cuttings of young wood, preferably with a heel, April/May in a frame[1, 37]. Plant out in the summer if the plants grow well, otherwise overwinter them in a cold frame and plant out in late spring or early summer of the following year[K]. Division in early spring as growth commences[78, 200]. This works best if soil has been mounded up into the bottom 20cm of the plant early in the previous summer[78]. Pot up the divisions and grow them on in a cold frame until they are established. Plant them out in the summer.

nwatta An easily grown plant when given suitable conditions, it prefers a well-drained poor stony soil[4, 14, 27, 52] and succeeds in a hot dry sunny position[200]. It prefers an alkaline soil[200], though is not too fussy. It is intolerant of soils that remain damp and dislikes shade[200]. Plants are hardy to at least -10°C[200] when grown in suitable conditions, but are less hardy in rich soils or damp conditions[K]. A good bee plant[200].

### 7.2.111 Mentha cervina

Hart's Pennyroyal

6 tlin 9 cyuc 3 kcak 0 tcan 2 dwat 0.3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprikliws hpa7tmwatli xre7t hjonli

drutta Mentha cervina is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Edible Uses: TeaThe leaves have a strong spearmint fragrance and can be used to make a herb

tea[183].

tcanta Essential Repellent StrewingAn essential oil is obtained from the whole plant. Rats and mice intensely dislike the smell of mint. The plant was therefore used in homes as a strewing herb and has also been spread in granaries to keep the rodents off the grain[244].

dwatta Antiseptic Carminative FebrifugeA tea made from the leaves of most mint species has traditionally been used in the treatment of fevers, headaches, digestive disorders and various minor ailments[222]. The leaves are harvested as the plant comes into flower and can be dried for later use[238]. The essential oil in the leaves is antiseptic, though it is toxic in large doses[222].

propta Seed - sow spring in a cold frame. Germination is usually fairly quick. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in the summer. Mentha species are very prone to hybridisation and so the seed cannot be relied on to breed true. Even without hybridisation, seedlings will not be uniform and so the content of medicinal oils etc will vary. When growing plants with a particular aroma it is best to propagate them by division[K]. Division can be easily carried out at almost any time of the year, though it is probably best done in the spring or autumn to allow the plant to establish more quickly. Virtually any part of the root is capable of growing into a new plant. Larger divisions can be planted out direct into their permanent positions. However, for maximum increase it is possible to divide the roots up into sections no more than 3cm long and pot these up in light shade in a cold frame. They will quickly become established and can be planted out in the summer.

nwatta Succeeds in most soils and situations so long as the soil is not too dry[1, 16, 200]. Prefers a slightly acid soil[16]. Grows well in heavy clay soils. A sunny position is best for production of essential oils, but it succeeds in partial shade. Most mints have fairly aggressive spreading roots and, unless you have the space to let them roam, they need to be restrained by some means such as planting them in containers that are buried in the soil[K]. Hybridizes freely with other members of this genus. The leaves have a strong peppermint smell. The flowers are very attractive to bees and butterflies[24]. A good companion plant for growing near cabbages and tomatoes, helping to deter insect pests. Members of this genus are rarely if ever troubled by browsing deer[233].

### 7.2.112 Aesculus indica

Indian Horse Chestnut

6 tlin 9 cyuc 3 kcak 0 tcan 1 dwat 30 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliws hpa7tmwatli xre7t hjonli

drutta Aesculus indica is a deciduous Tree growing to 30 m (98ft) by 12 m (39ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from June to July, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: Seed - cooked. It can be dried, ground into a powder and used as a grael[2, 63, 145, 146, 158]. The seed is roasted then eaten in Nepal[272]. It is also dried then ground into a flour and used with wheat flour to develop the flavour when making bread[272]. The seed is quite large, about 35mm in diameter[194], and is easily harvested. Unfortunately it also contains toxic saponins and these need to be removed before it can be eaten. The seed is used as an emergency food in times of famine when all else fails[177]. It is dried and ground into a powder, this is then soaked in water for about 12 hours before use in order to remove the bitter saponins and can be used to make a 'halva'[194]. It is estimated that mature trees yield about 60kg of seeds per annum in the wild[194]. See also the notes above on toxicity.

tcanta Soap WoodSaponins in the seed are used as a soap substitute[169]. The saponins can be easily obtained by chopping the seed into small pieces and infusing them in hot water. This water can then be used for washing the body,

clothes etc. Its main drawback is a lingering odour of horse chestnuts[K]. Wood - soft, close grained. Used for construction, cases, spoons, cups etc[145, 146, 158].

dwatta Acrid Anthelmintic Antirheumatic Astringent Narcotic StomachicThe seed is astringent, acrid and narcotic[272]. An oil from the seed is applied externally in the treatment of skin disease and rheumatism[240, 243, 272]. The juice of the bark is also used to treat rheumatism[272]. A paste made from the oil cake is applied to the forehead to relieve headaches[272]. The seed is given to horses suffering from colic[240, 243]. It is also used as an anthelmintic on horses to rid them of intestinal parasites[272].

propta Seed - best sown outdoors or in a cold frame as soon as it is ripe[11, 80]. The seed germinates almost immediately and must be given protection from severe weather[130]. The seed has a very limited viability and must not be allowed to dry out. Stored seed should be soaked for 24 hours prior to sowing and even after this may still not be viable[80, 113]. It is best to sow the seed with its 'scar' downwards[130]. If sowing the seed in a cold frame, pot up the seedlings in early spring and plant them out into their permanent positions in the summer.

nwatta Prefers a deep loamy well-drained soil but is not too fussy[1, 11, 200]. Succeeds on chalk[11]. Dislikes dry soils[11]. This species does very well in south-west England, growing best in areas where the minimum temperatures do not fall below about -5°C[200]. Young shoots in the spring can be cut back by late frosts in low-lying districts[11, 126]. Trees cast quite a dense shade[194]. Most members of this genus transplant easily, even when fairly large[11].

## 7.2.113 Crataegus aestivalis

Eastern Mayhaw, May hawthorn, Mayhaw, Apple Hawthorn 6 tlin 11 cyuc 3 kcaok 5 tcan 2 dwat 9 m hkuc hmimhtut cyutli hgtaccuphja7n hwicli hrasjlutnykfrip hpa77ti frusflatprikhwis hpa7tmwatli xre7t hjonli

drutta Crataegus aestivalis is a deciduous Shrub growing to 9 m (29ft) by 8 m (26ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower in March, and the seeds ripen from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Midges. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

ckakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[160]. Juicy and acid with a pleasant flavour[2]. It is up to 2cm in diameter[227]. The fruit is frequently used and much prized in parts of southern N. America where it is often gathered in quantity from the wild. Its acid flavour makes it a favourite for preserves and jellies[82, 183, 227]. The fruit can also be dried for later use. There are up to five fairly large seeds in the centre of the fruit, these often stick together and so the effect is of eating a cherry-like fruit with a single seed[K].

tcanta Shelterbelt Soil stabilization WoodBecause it tolerates a wide variety of sites, this species can be used to stabilize banks, for shelterbelts, and to give protection from wind and water erosion[277]. Wood - heavy, hard and strong, but not large enough for commercial use[227]. Useful for making tool handles, mallets and other small items[82].

dwatta Cardiotonic HypotensiveAlthough no specific mention has been seen for this species, the fruits and flowers of many hawthorns are well-known in herbal folk medicine as a heart tonic and modern research has borne out this use. The fruits and flowers have a hypotensive effect as well as acting as a direct and mild heart tonic[222]. They are especially indicated in the treatment of weak heart combined with high blood pressure[222]. Prolonged use is necessary for it to be efficacious[222]. It is normally used either as a tea or a tincture[222].

propta Seed - this is best sown as soon as it is ripe in the autumn in a cold frame, some of the seed will germinate in the spring, though most will probably take another year. Stored seed can be very slow and erratic to germinate, it should be warm stratified for 3 months at 15°C and then cold

stratified for another 3 months at 4°C[164]. It may still take another 18 months to germinate[78]. Scarifying the seed before stratifying it might reduce this time[80]. Fermenting the seed for a few days in its own pulp may also speed up the germination process[K]. Another possibility is to harvest the seed 'green' (as soon as the embryo has fully developed but before the seedcoat hardens) and sow it immediately in a cold frame. If timed well, it can germinate in the spring[80]. If you are only growing small quantities of plants, it is best to pot up the seedlings as soon as they are large enough to handle and grow them on in individual pots for their first year, planting them out in late spring into nursery beds or their final positions. When growing larger quantities, it might be best to sow them directly outdoors in a seedbed, but with protection from mice and other seed-eating creatures. Grow them on in the seedbed until large enough to plant out, but undercut the roots if they are to be left undisturbed for more than two years.

nwatta Landscape Uses:Border, Espalier, Pollard, Specimen, Street tree. A very easily grown plant, it prefers a well-drained moisture retentive loamy soil but is not at all fussy[11, 200, 277]. Once established, it succeeds in excessively moist soils and also tolerates drought[200, 277]. It grows well on a chalk soil and also in heavy clay soils[200]. It thrives in acid soils[160]. A position in full sun is best when plants are being grown for their fruit, they also succeed in semi-shade though fruit yields and quality will be lower in such a position[11, 200]. It succeeds well in exposed positions and tolerates atmospheric pollution[200, 277]. A very hardy species, tolerating temperatures down to about -30°C[160]. This species is closely related to *C. opaca* and is included in that species by some botanists. Hybridizes freely with other members of this genus[200]. Seedling trees take from 5 - 8 years before they start bearing fruit, though grafted trees will often flower heavily in their third year[K]. The flowers have a foetid smell somewhat like decaying fish. This attracts midges which are the main means of fertilization. When freshly open, the flowers have more pleasant scent with balsamic undertones[245]. Seedlings should not be left in a seedbed for more than 2 years without being transplanted[11]. Occasionally cultivated for its fruit in America, there are some named varieties[183]. Special Features:North American native, Attractive flowers or blooms. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2].

## 7.2.114 Mentha pulegium

Pennyroyal

6 tlin 9 cyuc 3 kcaok 0 tcan 3 dwat 0.4 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnykfrip hpa77ti flatprikhwis hpa7tmwatli xre7t hjonli

drutta Mentha pulegium is a PERENNIAL growing to 0.4 m (1ft 4in) by 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from August to October, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

ckakta Edible Parts: LeavesEdible Uses: Condiment TeaLeaves - raw or cooked[2, 9, 27]. Used as a flavouring in salads or cooked foods[183]. A spearmint-like flavour, though rather coarser; it is not used very often in Britain[4]. A herb tea is made from the fresh or dried leaves[183]. For drying, it should be harvested as the plant comes into flower[4].

tcanta Cleanser Essential Pot-pourri Repellent StrewingAn essential oil is obtained from the whole plant, used in soap making[46, 61] and as a cleanser for fabrics[169]. A yield of 14kg of oil per hectare is considered good[4]. The plant has a low spreading habit and can be used as a ground cover, though it is somewhat sparse in the winter and can be invaded by the more aggressive weeds[K]. The growing or dried plant repels fleas, ants, moths, mice

propta Seed - surface sow in spring in a greenhouse and keep moist. Germination should take place within a couple of weeks. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring or early autumn[200]. Very easy, large divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Landscape Uses:Container, Erosion control, Seashore, Specimen, Winter interest. Prefers a deep fertile loamy soil that does not dry out in summer[200] but it also succeeds in any ordinary soil that is not too dry[1, 162], in sun or light shade[200]. Plants can be grown as a focal point in lawns, they also succeed in quite coarse grass[233]. The young growth in spring can be damaged by late frosts. This species is closely related to *M. sachariflorus*[233]. The leaves have saw-toothed edges that can cut the unwary gardener, it is best to wear gloves when working with the plant[200]. Plants seem to be immune to the predations of rabbits[233]. Special Features: Attractive foliage, Not North American native, Suitable for cut flowers, Suitable for dried flowers.

## 7.2.233 Lithocarpus densiflorus

Tanbark Oak

6 tlin 9 cyuc 2 kcaok 0 tcan 1 dwat 10 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyk hpa77ti flatprikhwis hpa7tmwatli hjonli

drutta Lithocarpus densiflorus is an evergreen Tree growing to 10 m (32ft) by 10 m (32ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from April to May. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

ckakta Edible Parts: Oil SeedEdible Uses: OilSeed - cooked[94, 95]. The seed was a staple food for several native North American Indian tribes[257]. It contains bitter-tasting tannins and there are various ways of removing them. The fastest is by soaking the ground-up seed in hot water - if the water is changed at least once the tannins should be removed within 12 hours. Traditionally, the seeds were placed in a cloth bag and either buried in swampy ground or suspended in a running stream for a few months. Once the tannins have been removed, the seed is then dried, ground into a powder and can be used as a porridge or can be mixed with cereal flours in baking bread etc[183, 257]. It has a pleasant taste after it has been leached[161]. The seed is up to 25mm long and wide[82, 229]. The seed is valued for its oil[161].

tcanta Dye Fuel Oil Preservative Tannin WoodThe bark is exceedingly rich in tannin, yielding up to 29%[11, 82, 123, 171]. It has been used as a brown dye and also to preserve rope that is being used in water[257, K]. Wood - hard, strong, close grained, brittle. It is not commercially important and is used mainly for fuel[82, 229].

dwatta Astringent Odontalgic SkinThe bark is very astringent. An infusion is used as a wash for face sores[257]. The infusion can also be held in the mouth to tighten loose teeth[257].

propta The seed is best sown as soon as it is ripe in the autumn in a cold frame[200]. It needs to be protected from mice, squirrels and other seed eaters. The seed has a short viability but can be stored for a few months if kept cool and slightly damp - the salad compartment of a fridge is a good storage place. Germination takes place in the winter or early spring. When they are large enough to handle, prick the seedlings out into individual pots. If the plants are 15cm or more tall by the summer they can be planted out into their permanent positions. Give them a good weed-excluding mulch and some protection from the cold for their first couple of years outdoors. If growth is not sufficient then grow them on in the greenhouse for their first winter and plant them out

into their permanent positions in late spring or early summer, after the last expected frosts.

nwatta Prefers a deep fertile soil with medium drainage[200]. Perfectly hardy at Kew[11], trees produced seed at Kew in the very hot summer of 1989[K]. A slow-growing tree in the wild, living up to 300 - 350 years old[229]. Plants usually flower in the spring and sometimes again in the autumn[188]. The seeds take two seasons to ripen[229]. Prolific crops are usually produced every other year in the wild[229].

## 7.2.234 Thymus caespitius

Cretan Thyme

6 tlin 9 cyuc 2 kcaok 0 tcan 2 dwat 0.1 m hkuc htut cyutli kyuctcup hwicli hrasjlut hpa77ti prikhwis hpa7tmwatli xre7t hjonli

drutta Thymus caespitius is an evergreen Shrub growing to 0.1 m (0ft 4in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

ckakta Edible Parts: Edible Uses: CondimentThe plant is sometimes used as a condiment in cooked foods. The fresh leaves have a tangerine-like scent and can be used with or instead of lemon-scented thyme, *Thymus citriodorus*[183, 238]. If the leaves are to be dried, the plants should be harvested in early and late summer just before the flowers open and the leaves should be dried quickly[200].

tcanta Deodorant Disinfectant EssentialThe essential oil obtained from the leaves is also used in perfumery, as a mouth wash, medicinally etc[200].

dwatta Antiseptic Deodorant DisinfectantThe leaves, and especially the essential oil contained in them, are strongly antiseptic, deodorant and disinfectant[200, 238]. The plant can be used fresh at any time of the year, or it can be harvested as it comes into flower and either be distilled for the oil or dried for later use[238].

propta Seed - sow spring in a cold frame. Seed can also be sown in autumn in a greenhouse. Surface sow or barely cover the seed. Germination can be erratic. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring or autumn[200]. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the summer or the following spring. Cuttings of young shoots, 5 - 8cm with a heel, May/June in a frame[200]. Cuttings of half-ripe wood, 5 - 8cm with a heel, July/August in a frame[200]. Layering.

nwatta Prefers a light, well-drained calcareous soil and a sunny position[200]. Plants tolerate occasional walking on and can be grown in cracks in paths, they also succeed on walls[200]. Thymes dislike wet conditions, especially in the winter. A layer of gravel on the soil around them will help protect the foliage from wet soils[238]. Plants are hardy to at least -15°C[238]. There is at least one named variety, 'Celery' is a low compact grower that forms small mounds of growth. The leaves have a celery-like flavour[183]. The flowers are rich in nectar and are very attractive to honey bees[200]. This is a very difficult genus taxonomically, the species hybridize freely with each other and often intergrade into each other[200].

## 7.2.235 Commelina dianthifolia

Birdbill Dayflower

6 tlin 9 cyuc 2 kcaok 0 tcan 1 dwat 0.1 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlut hpa77ti flatprikhwis hpa7tmwatli xre7t hjonli

drutta Commelina dianthifolia is a PERENNIAL growing to 0.1 m (0ft 4in). See above for USDA hardiness. It is

kcakta Edible Parts: Oil OilEdible Uses: Oil OilAn oil obtained from the seed is used in cooking[2, 11, 109].

tcanta Dye Insecticide Oil OilA non-drying oil is obtained from the seed - used in textile manufacture, soap making and as an illuminant[1, 11, 166, 178]. The oil consists mainly of olein. It is not subject to polymerize or oxidize, nor does it form solids at low temperatures[174]. A grey dye is obtained from the pink or red petals[168]. The seed cake has insecticidal activity[218].

dwatta AnthelminticThe seed oil is used in the treatment of ringworm[218].

propta Seed - can be sown as soon as it is ripe in a greenhouse[113]. Stored seed should be pre-soaked for 24 hours in warm water and the hard covering around the micropyle should be filed down to leave a thin covering[78, 113, 138]. It usually germinates in 1 - 3 months at 23°c[138]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in the greenhouse for at least their first winter. Plant them out into their permanent positions when they are more than 15cm tall and give them some protection from winter cold for their first year or three outdoors[K]. Cuttings of almost ripe wood, 10 - 15cm with a heel, August/September in a shaded frame. High percentage but slow[78]. Cuttings of firm wood, 7 - 10cm with a heel, end of June in a frame[11, 78]. Keep in a cool greenhouse for the first year[11]. Leaf-bud cuttings, July/August in a frame.

nwatta Landscape Uses:Pest tolerant, Standard, Specimen. Prefers a woodland soil but thrives in a warm open well-drained loam if leafmould is added[1, 11, 200]. A calcifuge plant, preferring a pH between 5 and 7[11, 200]. Prefers the partial shade of a light woodland[200]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. It succeeds on a wall at Kew and outdoors in milder areas[11]. Prefers a wet summer and a cool but not very frosty dry winter[200]. Plants are not very self-compatible, self-fertilized flowers produce few seeds and these are of low viability[200]. This species has been cultivated for many centuries in China for the oil in its seed[109, 219]. A very ornamental plant, some named forms have been developed for their ornamental value. This species is closely related to *C. sasanqua*[11]. Special Features:Not North American native, Attractive flowers or blooms.

## 7.2.230 *Polygonatum stananthum*

6 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 1.2 m hkuc pcmhmtt cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli fyfjxre7t hjonli

drutta *Polygonatum stananthum* is a PERENNIAL growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Young shoots - cooked[105, 177]. They can be used as an asparagus substitute. Root - cooked[105, 177]. Rich in starch.

tcanta None known  
dwatta None known

propta Seed - best sown as soon as it is ripe in early autumn in a shady part of a cold greenhouse[200]. Sow stored seed as early in the year as possible. Germination can be slow, they may not come true to type[200] and it takes a few years for them to reach a good size. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a shady position in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in March or October. Larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Prefers a fertile humus rich moisture-retentive well-drained soil in cool shade or semi-shade[200]. Plants

are intolerant of heat and drought but they tolerate most other conditions[200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. The young shoots of most members of this genus are very attractive to slugs. Hybridizes with other members of this genus[200].

## 7.2.231 *Berberis calliantha*

6 tlin 9 cyuc 2 kcaak 0 tcan 2 dwat 0.7 m hkuc hmimhtut cyutli kyuctup hwicli hyishrasljutnyikfrip hpa7tli flatprikliwis hpa7tmwatli fyfjxre7t hjonli

drutta *Berberis calliantha* is an evergreen Shrub growing to 0.7 m (2ft 4in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[K]. An acid flavour[K].

tcanta None known

dwatta Antibacterial Cancer DysenteryBerberine, universally present in rhizomes of *Berberis* species, has marked antibacterial effects. Since it is not appreciably absorbed by the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not be used with *Glycyrrhiza* species (Licorice) because this nullifies the effects of the berberine[218]. Berberine has also shown antitumour activity[218].

propta Seed - best sown as soon as it is ripe in a cold frame, when it should germinate in late winter or early spring[78]. Seed from over-ripe fruit will take longer to germinate[78], whilst stored seed may require cold stratification and should be sown in a cold frame as early in the year as possible[80]. The seedlings are subject to damping off, so should be kept well ventilated[113]. When the seedlings are large enough to handle, prick them out into individual pots and grow them on in a cold frame. If growth is sufficient, it can be possible to plant them out into their permanent positions in the autumn, but generally it is best to leave them in the cold frame for the winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, July/August in a frame. Roots in 4 - 8 weeks[113]. Pot up in spring[113]. Cuttings of mature wood of the current season's growth, preferably with a heel, October/November in a frame[78].

nwatta Prefers a warm moist loamy soil and light shade but it is by no means fastidious, succeeding in thin, dry and shallow soils and in full sun[11, 200]. Grows well in heavy clay soils. Hybridizes freely with other members of this genus[1]. Plants can be pruned back quite severely and re-sprout well from the base[200].

## 7.2.232 *Miscanthus floridulus*

Pacific Island silvergrass, Giant Eulalia Grass, Giant Chinese Silver Grass

6 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 2.5 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Miscanthus floridulus* is a PERENNIAL growing to 2.5 m (8ft 2in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: FlowersEdible Uses: The unopened flower spikes are edible[105, 177].

tcanta Hedge HedgePlants can be grown as a screen. Although they die down in the winter they quickly attain their full height each season[200].

dwatta None known

etc[18, 20, 148, 169, 201, 238]. Rats and mice intensely dislike the smell of mint. The plant was therefore used in homes as a strewing herb and has also been spread in granaries to keep the rodents off the grain[244]. A strong infusion applied to the face will keep gnats away in the summer[245]. The aromatic leaves are used as an ingredient of pot-pourri[238].

dwatta Antiseptic Antispasmodic Carminative Diaphoretic Eczema Emmenagogue Sedative Stimulant Uterine tonicPennyroyal has been used for centuries in herbal medicine. Its main value is as a digestive tonic where it increases the secretion of digestive juices and relieves flatulence and colic[254]. Pennyroyal also powerfully stimulates the uterine muscles and encourages menstruation, thus it should not be prescribed for pregnant women since it can procure abortions, this is especially the case if the essential oil is used[238, 254]. The herb is antiseptic, antispasmodic, carminative, diaphoretic, emmenagogue, sedative and stimulant[4, 9, 46, 165]. A tea made from the leaves has traditionally been used in the treatment of fevers, headaches, minor respiratory infections, digestive disorders, menstrual complaints and various minor ailments[222, 238, 254]. It is occasionally used as a treatment for intestinal worms[254]. Externally, an infusion is used to treat itchiness and formication, inflamed skin disorders such as eczema and rheumatic conditions such as gout[254]. The leaves are harvested in the summer as the plant comes into flower and are dried for later use[4]. The essential oil in the leaves is antiseptic, though it is toxic in large doses[222].

propta Seed - sow spring in a cold frame. Germination is usually fairly quick. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in the summer. *Mentha* species are very prone to hybridisation and so the seed cannot be relied on to breed true. Even without hybridisation, seedlings will not be uniform and so the content of medicinal oils etc will vary. When growing plants with a particular aroma it is best to propagate them by division[K]. Division can be easily carried out at almost any time of the year, though it is probably best done in the spring or autumn to allow the plant to establish more quickly. Virtually any part of the root is capable of growing into a new plant. Larger divisions can be planted out direct into their permanent positions. However, for maximum increase it is possible to divide the roots up into sections no more than 3cm long and pot these up in light shade in a cold frame. They will quickly become established and can be planted out in the summer.

nwatta Succeeds in most soils and situations so long as the soil is not too dry[200]. Plants are very quickly diminished by dry conditions[4]. Prefers a stiff moist soil that is slightly acid[16, 27, 37, 200]. A sunny position is best for production of essential oils, but plants succeed in partial shade. Pennyroyal is often grown in the herb garden and is also cultivated commercially as a medicinal plant[4, 115]. There are two main forms of this species. One has weak prostrate stems and spreads by rooting where the stems touch the ground, it is only 10cm tall[4]. The other is erect, does not spread so freely and grows about 30cm tall, thus making it easier to harvest[4]. There is also at least one named form, called 'Dwarf' it is only a few centimetres tall[183]. The whole plant a strong spearmint smell. The flowers are very attractive to bees and butterflies[24]. A good companion plant for cabbages and tomatoes[20], helping to repel cabbage root fly and other burrowing insects[201]. Members of this genus are rarely if ever troubled by browsing deer[233]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [2-1].

## 7.2.115 *Lepidium sativum*

Cress, Garden cress pepperweed

6 tlin 9 cyuc 3 kcaak 0 tcan 1 dwat 0.5 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Lepidium sativum* is a ANNUAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to July, and the seeds ripen from July to August. The species is hermaphrodite (has

both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves Oil OilEdible Uses: Condiment Oil OilYoung leaves - raw or cooked[2, 5, 27, 34, 52, 183]. A hot cress-like flavour, it makes an excellent addition (in small quantities) to the salad bowl[K]. An analysis is available. Root is used as a condiment[46, 61]. A hot pungent flavour, but the root is rather small and woody[K]. The fresh or dried seedpods can be used as a pungent seasoning[183]. The seed can be sprouted in relatively low light until the shoots are a few centimetres long and then be used in salads[183]. They take about 7 days to be ready and have a pleasantly hot flavour. An edible oil is obtained from the seed[46, 61, 105].

tcanta Oil OilThe seed yields up to 58% of an edible oil that can also be used for lighting[74].

dwatta Antiasthmatic Antiscorbatic Aperient Diuretic Galactagogue Poultice Stimulant Vitamin CThe leaves are antiscorbatic, diuretic and stimulant[46, 240]. The plant is administered in cases of asthma, cough with expectoration and bleeding piles[240]. The root is used in the treatment of secondary syphilis and tenesmus[240]. The seeds are galactagogue. They have been boiled with milk and used to procure an abortion, they have been applied as a poultice to pains and hurts and have also been used as an aperient[240]. Fresh foliage has 37% Ascorbic acid - vitamin C

propta Seed - if you want a succession of young leaves then it is possible to sow the seed in situ every 3 weeks in succession from early spring to early autumn. Germination is very rapid, usually taking place in less than a week. When sowing seed for use in mustard and cress, the seed is soaked for about 12 hours in warm water and then placed in a humid position. Traditionally, it is sown in a tray on a thin layer of soil, or on some moist blotting paper, and the tray is placed in a warm dark place for a few days to encourage rapid and rather etiolated growth. The seedlings can then be placed in a lighter position for a couple more days to turn green before being eaten. The cress seed should be sown about 3 - 4 days before the mustard for them both to be ready at the same time[264].

nwatta An easily grown plant, it succeeds in most soils[52]. For the best results, however, it requires a moist soil and also some shade during the summer to prevent it running straight to seed[27, 37, 52]. Garden cress is often cultivated as a sprouted seed, there are some named varieties[183]. It is the cress of 'mustard and cress'. A very easy and fast crop, it can be ready within 7 days from sowing the seed[27]. It can also be grown outdoors as full grown plants and can provide fresh leaves for the salad bowl all year round from successional sowings. Plants can be overwintered outdoors to provide edible leaves all year round, though they will require some protection if temperatures fall below -5°c[200]. This plant is cultivated in Ethiopia for the edible oil from its seed[183].

## 7.2.116 *Allium geyeri*

Geyer's Onion, Bulbil onion

6 tlin 9 cyuc 3 kcaak 0 tcan 2 dwat 0.5 m hkuc htut cyutli tcup hwicli hrasljut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Allium geyeri* is a BULB growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Bulb - raw or cooked[85, 105, 161]. Used mainly as an onion-flavouring in soups etc, though they were also occasionally eaten raw[257]. The bulbs are eaten by the Navajo Indians[183]. The bulbs are up to 25mm long and 20mm in diameter[200, 270]. Leaves - raw or cooked[85, 105, 161]. Flowers - raw. Used as a garnish on salads.

tcanta RepellentThe juice of the plant is used as a moth repellent. The whole plant is said to repel insects and moles[20].

dwatta Although no specific mention of medicinal uses has been seen for this species, members of this genus are in general very healthy additions to the diet. They contain sulphur compounds (which give them their onion flavour) and when added to the diet on a regular basis they help reduce blood cholesterol levels, act as a tonic to the digestive system and also tonify the circulatory system[K].

propta Seed - sow spring in a greenhouse. The seed can also be sown as soon as it is ripe in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle - if you want to produce clumps more quickly then put three plants in each pot. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in spring once they are growing vigorously and are large enough. Division of the plants in summer as they die down. The divisions can be planted direct into their permanent positions if required.

nwatta Prefers a sunny position in a light well-drained soil[1]. Plants are not hardy in the colder wetter conditions of N.W. Britain and are probably best grown in a bulb frame in most parts of the country[203]. The sub-species *A. geyeri* tenerum forms bulbils in its flowering head[203]. The bulbs should be planted fairly deeply[1]. Most members of this genus are intolerant of competition from other growing plants[203]. Grows well with most plants, especially roses, carrots, beet and chamomile, but it inhibits the growth of legumes[18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 7.2.117 Broussonetia kazinoki

Kozo

6 tlin 9 cyuc 3 kcaak 0 tcan 1 dwat 4.5 m hkuc htut cyutli kyuctcup hwicli hyishrasljutnyik hpa7tli flatpriklwis hpa7tmwatli dyat hjonli

drutta Broussonetia kazinoki is a deciduous Tree growing to 4.5 m (14ft 9in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower in August, and the seeds ripen in September. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil. It can tolerate atmospheric pollution.

kcakta Edible Parts: Flowers Fruit LeavesEdible Uses: Fruit - raw[105, 177]. A sweet taste[4]. The fruit comprises a ball about 1cm in diameter with small edible fruits protruding - there is not much edible flesh but it has a lovely flavour[K]. Prolonged ingestion of the fruit is said to weaken the bones[179]. Leaves - cooked and used as a vegetable[105, 177, 183]. Flowers[105, 177, 183]. No more details.

tcanta FibreA fibre from the bark is used in making paper, cloth, rope etc[46, 61]. It is inferior to *B. papyrifera*[4].

dwatta TonicThe fruit is used as a tonic to increase vision and sexual potency[218].

propta Seed - no pre-treatment is required. Sown in the autumn or spring in a greenhouse, germination usually takes place within 1 - 3 months at 15°C[138]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter, planting them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 8 - 12cm long with a heel, July/August in a frame. High percentage[11, 78]. Cuttings of mature wood of the current season's growth, November in a frame[200]. Root cuttings in winter[200]. Layering in spring[200].

nwatta Easily cultivated in a warm sunny position in any soil of reasonable quality[1, 11], thriving on poor sandy or gravelly soils[200]. Tolerates atmospheric pollution[200]. The young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position

sheltered from the early morning sun[K]. Often cultivated in Japan for the fibre in its bark, the tree is coppiced annually for this purpose[4, 58]. Some plants are monoecious whilst others are dioecious. Male and female plants must usually be grown if seed is required[200].

## 7.2.118 Berberis wilsoniae

Wilson barberry

6 tlin 9 cyuc 3 kcaak 1 tcan 2 dwat 1 m hkuc hnmimhtut cyutli kyuctcup hwicli hyishrasljutnyikfrip hpa7tli flatpriklwis hpa7tmwatli fyfixre7t hjonli

drutta Berberis wilsoniae is an evergreen Shrub growing to 1 m (3ft 3in) by 2 m (6ft). See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: FruitEdible Uses: Fruit raw or cooked. Very acid with a lemon-like flavour, it goes very well in a muesli[K]. Children and some adults like it raw, at least in small quantities, though most adults prefer to cook it and use it in pies, preserves etc[K]. The fruits are about 6mm long[200].

tcanta DyePlants can be grown as a tall ground cover when planted about 60cm apart each way[208]. A yellow dye is obtained from the root. A shrub for thorny barriers to deter unwanted visitors. Berries loved by birds.

dwatta Antibacterial Cancer DysenteryBerberine, universally present in rhizomes of Berberis species, has marked antibacterial effects. Since it is not appreciably absorbed by the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not be used with Glycyrrhiza species (Licorice) because this nullifies the effects of the berberine[218]. Berberine has also shown antitumour activity[218].

propta Seed - best sown as soon as it is ripe in a cold frame, when it should germinate in late winter or early spring[78]. Seed from over-ripe fruit will take longer to germinate[78], whilst stored seed may require cold stratification and should be sown in a cold frame as early in the year as possible[80]. The seedlings are subject to damping off, so should be kept well ventilated[113]. When the seedlings are large enough to handle, prick them out into individual pots and grow them on in a cold frame. If growth is sufficient, it can be possible to plant them out into their permanent positions in the autumn, but generally it is best to leave them in the cold frame for the winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, July/August in a frame. Cuttings of mature wood of the current season's growth, preferably with a heel, October/November in a frame[78].

nwatta Deciduous to semi-evergreen. Prefers a warm moist loamy soil but it is by no means fastidious, succeeding in thin, dry and shallow soils[11, 200]. Grows well in heavy clay soils. Succeeds in full sun or light shade[11, 200]. Hybridizes freely with other members of this genus, especially the closely related *B. aggregata*[11, 200]. The true species is seldom seen in cultivation, having been replaced with its hybrid progeny[182]. There are some named forms, selected for their ornamental value[11]. Plants can be pruned back quite severely, they resprout well from the base[200]. This species is notably resistant to honey fungus[200]. Heat Zone 9-4.

## 7.2.119 Salvia columbariae

Chia, Ziegler's sage

6 tlin 9 cyuc 3 kcaak 0 tcan 2 dwat 0.7 m hkuc htut cyutli hgatkyuctcup hwicli hrasljut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Salvia columbariae is an ANNUAL/PERENNIAL growing to 0.7 m (2ft 4in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from July to September, and

dwatta Antiphlogistic Cancer Cholagogue Cytostatic Depurative PurgativeThe plant is antiphlogistic and depurative[147]. The following report is for the related *P. hexandrum*. It quite probably also applies to this species. The whole plant, but especially the root, is cholagogue, cytostatic and purgative. The plant contains podophyllin, which has an antimyotic effect (it interferes with cell division and can thus prevent the growth of cells). It is, therefore, a possible treatment for cancer, and has been used especially in the treatment of ovarian cancer[46, 51, 57, 64, 65, 124, 244]. However, alopecia is said to be a common side-effect of this treatment[244]. This species contains about twice the quantity of active ingredient than *P. peltatum*[211]. The roots contain several important anti-cancer lignans, including podophyllin and berberine[218]. The roots are also antirheumatic[218]. The root is harvested in the autumn and either dried for later use or the resin is extracted[238]. This plant is highly poisonous and should only be used under the supervision of a qualified practitioner[238]. It should not be prescribed for pregnant women[238].

propta Seed - best sown as soon as it is ripe in a cold frame. Sow stored seed in a cold frame in early spring. The seed germinates in 1 - 4 months at 15°C. Prick out the seedlings into individual pots when they are large enough to handle and grow on in a shady part of the greenhouse for at least 2 growing seasons. Plant them out into their permanent positions in the winter when the plants are dormant. Division in March/April[111].

nwatta Prefers a moist peaty soil and filtered light or shade[4, 111]. Grows well in a moist open woodland[28, 31] and also succeeds under beech trees in a deep moist leafy soil[130]. Plants are fairly hardy, but the new growth in spring is frost tender[233]. Plants in this genus have excited quite a lot of interest for the compounds found in their roots which have been shown to have anti-cancer activity[124]. There are various research projects under way (as of 1990)[124]. This species is closely related to *P. hexandrum*[200]. he plant takes some years to become established[124] but is very long lived in a suitable habitat[130].

## 7.2.227 Juniperus conferta

Shore Juniper

6 tlin 10 cyuc 2 kcaak 3 tcan 0 dwat 0.2 m hkuc hnmimhtut cyutli hgatkyuctcup hwicli hyishrasljutnyik hpa7tli flatprikrlwissip hpa7tmwatli nyanhjen hjonli

drutta Juniperus conferta is an evergreen Shrub growing to 0.2 m (0ft 8in) by 2 m (6ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf all year, and the seeds ripen in October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105]. The cones are about 8 - 10mm in diameter[200].

tcanta A good low ground cover[11], though plants take about 2 years to form effective cover[197]. Plants should be spaced about 90cm apart each way[208].

dwatta None known

propta The seed requires a period of cold stratification. The seed has a hard seedcoat and can be very slow to germinate, requiring a cold period followed by a warm period and then another cold spell, each of 2 - 3 months duration[78, 81]. Soaking the seed for 3 - 6 seconds in boiling water may speed up the germination process[11]. The seed is best sown as soon as it is ripe in a cold frame. Some might germinate in the following spring, though most will take another year. Another possibility is to harvest the seed 'green' (when the embryo has fully formed but before the seedcoat has hardened). The seedlings can be potted up into individual pots when they are large enough to handle. Grow on in pots until large enough, then plant out in early summer. When stored

dry, the seed can remain viable for several years[1]. Cuttings of mature wood, 5 - 10cm with a heel, September/October in a cold frame. Plant out in the following autumn[1, 78]. Layering in September/October. Takes 12 months[78].

nwatta Landscape Uses:Cascades, Container, Erosion control, Ground cover, Massing, Seashore. Succeeds in hot, dry sandy soils and in maritime exposure[11, 166, 200]. Succeeds in most soils if they are well drained, preferring a neutral or slightly alkaline soil[1, 11]. Succeeds in poor soils and tolerates light shade[197]. Plants are not reliably hardy in the coldest areas of the country[208]. Dioecious. Male and female plants must be grown if seed is required. Special Features: Fragrant foliage, Not North American native, There are no flowers or blooms. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is flat with shallow roots spreading near the soil surface [2-1].

## 7.2.228 Castanopsis cuspidata

Japanese Chinquapin

6 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 25 m hkuc hnmim cyutli tcup hwicli jlutnyik hpa7tli flatprik hpa7tmwatli hjonli

drutta Castanopsis cuspidata is an evergreen Tree growing to 25 m (82ft) by 10 m (32ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind, midges. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: Seed - cooked[2, 46, 63, 105, 177]. The cotyledon of the nut is eaten boiled or roasted[183].

tcanta None known

dwatta None known

propta Seed - requires a period of cold stratification and is best sown as soon as it is ripe in a cold frame[138]. The seed has a short viability and should not be allowed to dry out. It can be stored for a few months if kept cool and moist (putting it in a plastic bag that is placed in the salad compartment of a fridge works well). Stored seed should be soaked in warm water for 24 - 48 hours prior to sowing[138]. Germination usually takes place within 1 - 3 months at 15°C[138]. As soon as they are large enough to handle, prick out the seedlings into individual pots and plant them out in mid summer if possible, otherwise grow them on in a cold frame for their first winter and plant them out in late spring. Give the young plants some protection from cold for their first few winters outdoors.

nwatta Prefers a good deep medium to stiff loam[1]. Requires a sheltered position in semi-shade and a lime-free soil[138]. Although cold hardy in Britain, this species really requires a warm continental climate if it is to prosper and it does not do well in the maritime climate of this country[200]. It succeeds in the London area but does not attain its full size there[11]. It grows well in S.W. England[11]. The catkins have an unpleasant hawthorn-like smell to attract midges for their pollination[245].

## 7.2.229 Camellia oleifera

Tea-Oil Plant, Tea Oil Camellia

6 tlin 9 cyuc 2 kcaak 0 tcan 2 dwat 4 m hkuc hnmimhtut cyutli tcup hwicli hrasljut hpa7tli frusflatprik hpa7tmwatli xre7t hjonli

drutta Camellia oleifera is an evergreen Shrub growing to 4 m (13ft) by 1.5 m (5ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in leaf all year, in flower from October to April, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

## 7.2.223 Petasites palmatus

Sweet Butterbur, Golden Palms Coltsfoot, Sweet Coltsfoot, Butterbur  
6 tlin 10 cyuc 2 kcaak 0 tcan 1 dwat 0.4 m hkuc  
pcimhmmihtut cyutli tcuphja7n hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

drutta Petasites palmatus is a PERENNIAL growing to 0.4 m (1ft 4in) by 1 m (3ft 3in) at a fast rate. It is in flower from February to April, and the seeds ripen in April. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta Edible Parts: Flowers StemEdible Uses: SaltY-oung flower stalks, used before the flower buds appear, are boiled until tender and seasoned with salt[172, 177, 183]. Flower buds - cooked[183]. Leafstalks - peeled and eaten raw[105, 177, 183, 257]. The ash of the plant is used as a salt substitute[46, 61, 95, 102, 183]. To prepare the salt, the stems and leaves are rolled up into balls whilst still green, and after being carefully dried they are placed on top of a very small fire on a rock and burned[213].

tcanta None known

dwatta Pectoral Salmatus is a PERENNIAL growing in treating the first stages of grippe and consumption[257]. The dried and grated roots have been applied as a dressing on boils, swellings and running sores[257]. An infusion of the crushed roots has been used as a wash for sore eyes[257]. A syrup for treating coughs and lung complaints has been made from the roots of this species combined with mullein(*Verbascum* sp.) and plum root (*Prunus* sp.)[257].

propta Seed - we have no information on this species but suggest sowing the seed in a cold frame as soon as it is ripe or in early spring. Only just cover the seed and do not allow the compost to dry out. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division succeeds at almost any time of the year. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Landscape Uses:Seashore, Woodland garden. Succeeds in ordinary garden soil[1], but prefers a deep fertile humus-rich soil that is permanently moist but not stagnant, succeeding in shade, semi-shade or full sun[200]. Requires a moist shady position[187]. Plants can be grown in quite coarse grass, which can be cut annually in the autumn[233]. Plants are hardy to about -20°c[187]. A very invasive plant, too rampant for anything other than the wild garden[187, 200]. Dioecious, male and female plants must be grown if seed is required. Special Features:Attractive foliage, North American native, Invasive, Wetlands plant.

## 7.2.224 Arisarum vulgare

Friar’s Cowl

6 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 0.5 m hkuc  
pcimhmim cyutli tcup hwicli hrasljut hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta Arisarum vulgare is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf from October to July, in flower in May. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Root - cooked. The acrid juice should first be removed by thorough and repeated washing leaving behind a nutritious and innocuous residue[2, 105, 177]. Thorough drying or cooking will also destroy any harmful elements of this root[K]. The root is frequently used as an emergency food in times of scarcity, it

is about the size of a walnut[2]. One report suggests that the leaves might be edible[177]. If they are they must be well cooked first[K].

tcanta A good ground-cover plant for a shady place[1].  
dwatta None known

propta Seed - we have no details for this species but suggest sowing the seed in a shady part of the greenhouse as soon as it is ripe in the spring if this is possible. Sow stored seed in early spring. When large enough to handle, prick the seedlings out into individual pots and grow them on for at least the first winter in a greenhouse and plant out when dormant in the summer once the tuber has reached a reasonable size. Division in spring after the plant dies down[1].

nwatta Prefers a woodland soil or a sandy loam with leafmould[1]. Grows well in shady rather moist places[1]. A Mediterranean plant, it commences growth in the autumn and, since the leaves are not very hardy, the plant is best grown under protection[90]. It should succeed outdoors at least in the milder parts of the country, if grown in a sheltered woodland. The plant is hardy to about -10°c for short periods but should be given a good mulch in the winter[200]. The plant becomes dormant in spring/summer[200].

## 7.2.225 Anthriscus sylvestris

Cow Parsley, Wild chervil

6 tlin 9 cyuc 2 kcaak 1 tcan 1 dwat 1.2 m hkuc  
pcimhmmihtut cyutli kyuctcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Anthriscus sylvestris is a BIENNIAL growing to 1.2 m (4ft) by 0.6 m (2ft in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from April to June, and the seeds ripen from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: The leaves are eaten raw, cooked as a potherb or used as a flavouring[5, 12, 53, 183]. They taste somewhat less than wonderful[K]. Root - cooked[183].

tcanta DyeA beautiful green dye is obtained from the leaves and stem but it is not very permanent[115].

dwatta TonicThe root is soaked for several days in rice washings and then cooked with other foods as a tonic for general weakness[218].

propta Seed - sow as soon as ripe (June/July) in situ. The seed can also be sown April/May in situ. It usually germinates in 1 - 3 months at 20°c.

nwatta Succeeds in most soils. Shade tolerant[31]. The root has been recommended for improvement by selection and breeding as an edible crop[183]. This plant looks quite similar to some poisonous species, make sure that you identify it correctly.

## 7.2.226 Podophyllum aurantiocaula

6 tlin 9 cyuc 2 kcaak 0 tcan 2 dwat 0.3 m hkuc  
pcimhmim cyutli tcup hwicli hrasljut hpa7tli flatprikliwis hpa7tmwatli dyatxre7t hjonli

drutta Podophyllum aurantiocaula is a PERENNIAL growing to 0.3 m (1ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from May to June, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs). The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: We have no reports for this species but the following report is for the closely related *P. hexandrum*. Fruit - raw. It must only be eaten when it is fully ripe[1, 2, 61, 105]. Juicy but insipid[130]. The fruit is about 5cm long[200].

tcanta None known

the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: SeedEdible Uses: Condiment DrinkSeed - raw or cooked[92, 94, 95, 257]. Usually ground into a powder and used as piñole or made into dark-coloured cakes and loaves[183], it has a nutty flavour[92]. It can also be mixed with corn meal when making mush or with ground wheat for gruel[183]. Rich in niacin, thiamine, zinc, calcium and manganese[160], it is also a good source of protein and easily digested fats[274]. It has a high food value and is easily digested[92]. The sprouted seeds can be added to salads and sandwiches[160, 183]. A refreshing drink can be made by steeping the seed in cold water[92, 94, 95, 183]. Alternatively, the seed can be roasted and ground into a powder then mixed with water when it soon becomes a copious gelatinous mass[2]. It is very palatable and nutritious[2]. The seed has been used to render water palatable by removing the alkalis[257]. The leaves are occasionally used as a sage-like seasoning[183].

tcanta DisinfectantNone known

dwatta Digestive Disinfectant Febrifuge OphthalmicThe seed is digestive, disinfectant, febrifuge and ophthalmic[94, 257]. An infusion can be used in the treatment of fevers[257]. A poultice of the seed mush can be applied to infections[257]. The seeds have been kept in the mouth, and chewed during long journeys on foot, in order to give strength[257]. The seeds have been used to cleanse the eyes or remove foreign matter from the eyes[257]. No more information is given here, but in other instances the seed has been placed in the eye, it then forms a gelatinous covering to which any foreign matter in the eye adheres. The seed is washed out of the eye by the eyes own tears[K].

propta Seed - sow April in situ. The plant dislikes root disturbance. If seed supplies are limited then it can be sown in a pot in a greenhouse in March/April, potted up into individual pots as soon as the seedlings are large enough to handle then planted out in May. Germination usually takes 10 - 14 days at 20°c.

nwatta Requires a very well-drained light sandy soil in a sunny position[200]. Prefers a rich soil[1]. Plants are lodge resistant[160]. This plant was a staple food crop of the Aztecs[142]. It is often cultivated for its edible seeds, which are used to make a refreshing and nourishing drink. A good bee plant[61]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 7.2.120 Calycanthus occidentalis

Californian Allspice, Western sweetshrub

6 tlin 9 cyuc 3 kcaak 2 tcan 1 dwat 3 m hkuc  
hmimhtut cyutli tcup hwicli hrasljut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Calycanthus occidentalis is a deciduous Shrub growing to 3 m (9ft) by 3 m (9ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to September, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Edible Uses: CondimentThe aromatic bark is dried and used as a substitute for cinnamon and all spice[11, 105]. Some caution is advised, see reports above on toxicity[270].

tcanta Basketry DyeA light brown dye is obtained from the flowers[168]. The wood and the bark from fresh shoots has been used in basket making[257].

dwatta Expectoant StomachicThe bark is expectoant[257]. A decoction of the fresh or dried bark has been used in the treatment of sore throats, severe colds and stomach disorders[257].

propta Seed - best sown in a cold frame as soon as it is ripe. If the seed is harvested 'green' (as soon as it has fully

developed but before it has dried on the plant) and sown immediately it can germinate in 3 weeks[113]. Dried seed germinates in 1 - 6 months at 15°c[138]. Stored seed requires between 3 weeks and 3 months cold stratification before sowing in the spring. When large enough to handle, prick out the seedlings into individual pots and grow them on in the greenhouse for their first winter. Plant out in late spring or early summer of the following year. Cuttings of half-ripe wood, July/August in a frame. They can be difficult[113]. Layering in spring. Sever the new plants in a wet spell of weather about 15 months later and then lift them in the autumn[78]. High percentage[78]. Division of suckers in early spring[11]. Very easy, they can be planted straight out into their permanent positions if required.

nwatta Prefers a light loamy soil that is deep and moist but succeeds in most fertile soils if they are not shallow[11, 182]. Requires a well-drained soil[188]. Prefers a sunny position but it tolerates shade when grown in warm temperate zones[11, 200]. Requires a sheltered position, protected from cold winds[245]. Plants are hardy to about -15°c[184]. The leaves and the flowers are very aromatic according to one report[188], whilst another says that the leaves and wood are pleasantly aromatic, whilst the flowers have no scent[245]. Plants in this genus are notably resistant to honey fungus[200].

## 7.2.121 Ribes curvatum

Granite gooseberry

6 tlin 9 cyuc 3 kcaak 0 tcan 0 dwat 1 m hkuc  
hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Ribes curvatum is a deciduous Shrub growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[177]. A gooseberry with an acid flavour, it is about 7.5mm in diameter[200].

tcanta None known

dwatta None known

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. Stored seed requires 4 - 5 months cold stratification at between -2 to 0°c and should be sown as early in the year as possible[113, 164]. Under normal storage conditions the seed can remain viable for 17 years or more. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter, planting them out in late spring of the following year. Cuttings of half-ripe wood, 10 - 15cm with a heel, July/August in a frame[78, 113]. Cuttings of mature wood of the current year's growth, preferably with a heel of the previous year's growth, November to February in a cold frame or sheltered bed outdoors[78, 200].

nwatta Easily grown in a moisture retentive but well-drained loamy soil of at least moderate quality[11, 200]. Plants are quite tolerant of shade though do not fruit so well in such a position[111]. Hardy to about -20°c[200]. A very ornamental plant[1], it is closely related to *R. niveum*[11, 200]. Plants can harbour a stage of 'white pine blister rust', so they should not be grown in the vicinity of pine trees. Plants in this genus are notably susceptible to honey fungus[200].

## 7.2.122 Tilia caroliniana

Carolina Basswood

6 tlin 9 cyuc 3 kcaak 0 tcan 1 dwat 20 m hkuc  
hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Tilia caroliniana is a deciduous Tree growing to 20 m (65ft 7in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower in July, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and

prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**kcakta Edible Parts:** Leaves**Edible Uses:** TeaYoung leaves - raw[K]. A tea is made from the flowers. A very good chocolate substitute is made from a paste of the ground fruits and flowers[2]. Trials on marketing the product failed because the paste decomposes readily[2].

**tcanta Fibre Wood**A fibre is obtained from the tough inner bark It can be made into diverse items such as mats, shoes and coarse cloth[229]. Wood - soft, light, easily worked. Used for interior finishing, woodenware etc[149].

**dwatta Antispasmodic Diaphoretic Sedative**A tea made from the flowers is antispasmodic, diaphoretic and sedative[226].

**propta Seed** - much of the seed produced in Britain is not viable, cut a few seedcases open to see if there is a seed inside[80]. If possible, obtain fresh seed that is ripe but has not as yet developed a hard seed coat and sow it immediately in a cold frame. It may germinate in the following spring though it could take 18 months[80]. Stored seed can be very slow to germinate. It has a hard seed coat, embryo dormancy and a hard coat on the pericarp. All these factors mean that the seed may take up to 8 years to germinate[80]. One way of shortening this time is to stratify the seed for 5 months at high temperatures (10°C at night, up to 30°C by day) and then 5 months cold stratification[80]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Layering in spring just before the leaves unfurl. Takes 1 - 3 years[78]. Suckers, when formed, can be removed with as much root as possible during the dormant season and replanted immediately[200].

**nwatta** Prefers a good moist loamy alkaline to neutral soil but succeeds on slightly acid soils[11, 200]. Grows poorly on any very dry or very wet soil[200]. Dislikes exposed positions[200]. Succeeds in sun or semi-shade[188]. One report suggests that this tree is probably tender in Britain[11] whilst another says that it succeeds in zone 7, which means that it should be hardy in most of Britain[200]. A fast-growing tree in its native habitats[227], but it prefers a continental climate, growing more slowly and not producing fertile seed in areas with cool summers[200]. Lime trees tend to hybridise freely if other members of the genus are growing nearby[238]. If growing plants from seed it is important to ensure the seed came from a wild source or from an isolated clump of the single species[K]. Grows best in a woodland situation, young plants tolerate a reasonable level of side shade[200]. A good bee plant[149]. Trees are usually attacked by aphids which cover the ground and the leaves with a sticky honeydew[188]. Quite tolerant of root disturbance, semi-mature trees up to 5 metres tall have been transplanted successfully. Plants in this genus are notably resistant to honey fungus[200].

## 7.2.123 *Camelina sativa*

Gold Of Pleasure

6 tlin 9 cyuc 3 kcaak 0 tcan 0 dwat 0.6 m hkuc

hmimhnt cyutli kyucup hwicli hyhisrasjltunyk hpa7tli flat-prikkwis hpa7tmwatli xre7t hjonli

**drutta** *Camelina sativa* is a ANNUAL growing to 0.6 m (2ft) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to July, and the seeds ripen in August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

**kcakta Edible Parts:** Oil **OilEdible Uses:** Oil **Oil**An edible oil is obtained from the seed[2, 17, 105, 177, 183].

**tcanta Broom Fibre Oil Oil**An oil from the seed is used as a luminant and as an emollient for softening the skin[100]. A fibre is obtained from the stems[2, 200]. The stems are used for making brooms[2].

**dwatta** None known

**propta** Seed - sow mid spring in situ.

**nwatta** An easily grown plant, succeeding in most soils and preferring a sunny position[K]. It does well on poor land[115]. Plants can self-sow when well-sited[K]. 'Gold of Pleasure' is occasionally cultivated for the oil in its seed[17, 171]. This species is a bad companion plant, depressing the growth of nearby plants[18]. It has become a noxious weed of cultivated fields in some of the areas into which it has been introduced[2].

## 7.2.124 *Pleioblastus hindsii*

Hinds' cane-bamboo

6 tlin 9 cyuc 3 kcaak 0 tcan 0 dwat 3.5 m hkuc

pcimhmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

**drutta** *Pleioblastus hindsii* is an evergreen Bamboo growing to 3.5 m (11ft) by 1 m (3ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

**kcakta Edible Parts:** Stem**Edible Uses:** Young shoots - cooked[105, 177]. A good flavour. The stems are about 1cm in diameter[266].

**tcanta Hedge Hedge Musical Plant support**Canes can be used as plant supports[25] and also make good flutes. The plant can be used as a screen or a hedge[25, 195].

**dwatta** None known

**propta** Seed - if possible, surface sow the seed as soon as it is ripe in a greenhouse at about 20°C. Stored seed should be sown as soon as it is received. Do not allow the compost to dry out. Germination usually takes place fairly quickly so long as the seed is of good quality, though it can take 3 - 6 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a lightly shaded place in the greenhouse or cold frame until they are large enough to plant out, which could be a number of years. The plants only flower at intervals of several years and so seed is rarely available. Division as the plant comes into growth in spring. Take divisions with at least three canes in the clump, trying to cause as little root disturbance to the main plant as possible. Grow them on in light shade in a greenhouse in pots of a high fertility sandy medium. Mist the foliage regularly until plants are established. Plant them out into their permanent positions when a good root system has developed, which can take a year or more[200].

**nwatta** Succeeds in most soils[25] but prefers a good loamy soil in a sheltered position in semi-shade[1]. Requires deep shade[25] and a position sheltered from north and east winds[11]. Dislikes drought[1]. This species is notably resistant to honey fungus[200]. Plants only flower at intervals of many years. When they do come into flower most of the plants energies are directed into producing seed and consequently the plant is severely weakened. They sometimes die after flowering, but if left alone they will usually recover though they will look very poorly for a few years. If fed with artificial NPK fertilizers at this time the plants are more likely to die[122]. Closely related to *P. gramineus*[1]. This species is cultivated for its edible shoots in China[195]. The rootstock is running and invasive[25]. New shoots are produced from April[25].

## 7.2.125 *Quercus oblongifolia*

Mexican Blue Oak

6 tlin 9 cyuc 3 kcaak 2 tcan 2 dwat 8 m hkuc

hmimhnt cyutli tcup hwicli jltunyk hpa7tli flatprikkwis hpa7tmwatli hjonli

**drutta** *Quercus oblongifolia* is an evergreen Shrub growing to 8 m (26ft 3in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower in May, and the seeds ripen all year. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It

**drutta** *Boehmeria nivea* is an evergreen Perennial growing to 1.8 m (6ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

**kcakta Edible Parts:** Leaves **RootEdible Uses:** Edible portion: Root, Leaves, Seeds - oil. Root - peeled and boiled. A pleasant, sweet taste[ 179 ]. We can detect very little flavour, but the root has a very strange mucilaginous texture that does not appeal to most people who have tried it[ K ]. Once in the mouth, it takes a lot of chewing before it is ready to be swallowed[ K ]. The leaves are used for making cakes[ 283 ]. This report could refer to the plants use as a poultice[ K ]. They are also used as a dye to make black rice cake.

**tcanta Fibre Fodder Paper**Agroforestry **Uses:** Planted to prevent erosion in gullies[ 331 ]. Other Uses A fibre is obtained from the inner bark of the stem - of excellent quality, it is highly water-resistant and has a greater tensile strength than cotton[ 418 ]. It is used for textiles, linen etc and is said to be moth-proof[ 1, 46, 57, 61, 74, 171 ]. It is best harvested as the female flowers open[ 169 ]. The outer bark is removed and then the fibrous inner bark is taken off and boiled before being woven into thread[ 178 ]. The fibres are the longest known in the plant realm.[ 61, 171 ] The tensile strength is 7 times that of silk and 8 times that of cotton, this is improved on wetting the fibre[ 61 ]. The fibre is also used for making paper[ 189 ]. The leaves are removed from the stems, the stems are steamed and the fibres stripped off. The fibres are cooked for 2 hours with lye, fresh material might require longer cooking, and they are then beaten in a Hollander beater[ 189 ] before being made into paper.

**dwatta** Antiphlogistic Astringent Demulcent Diuretic Febrifuge Haemostatic Poulitce Resolvent Vulnerary Women's complaintsAntiphlogistic, demulcent, diuretic, febrifuge, haemostatic and vulnerary. Used to prevent miscarriages and promote the drainage of pus[ 147, 178 ]. The leaves are astringent and resolvent[ 218, 240 ]. They are used in the treatment of fluxes and wounds[ 218 ]. The root contains the flavonoid rutin[ 283 ]. It is antiabortifacient, antibacterial, cooling, demulcent, diuretic, resolvent and uterosedative[ 218, 283 ]. It is used in the treatment of threatened abortions, colic of pregnancy, haemorrhoids, leucorrhoea, impetigo etc[ 283 ]. The fresh root is pounded into a mush and used as a poultice[ 283 ].

**propta** Seed - sow in pots and only just cover the seed. When they are large enough to handle, prick the seedlings out into individual pots and plant them out when at least 20cm tall. Division. Very easy, larger divisions can be planted straight into their permanent positions whilst smaller clumps are best planted in a nursery until they are growing away well. Layering. Basal cuttings. Harvest new shoots when they are about 10 - 15cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade until they are rooting well.

**nwatta** Fodder: Bank Industrial Crop: Fiber Management: Fodder Management: Hay Minor Global Crop Staple Crop: ProteinA plant of the sub-tropics to the tropics, also succeeding in warm temperate areas. The plant can be grown between latitudes 6 - 45°N and 9 - 38°S. It is adapted to a relative air humidity about 80%. Both excessive rainfall and drought affects the quality of the fibre. Relatively flat areas, not subject to flooding as well as gentle sloping lands, not subject to erosion are suitable for ramie production. It is found at elevations up to 1,300 metres. It grows best in areas where annual daytime temperatures are within the range 17 - 27°C, but can tolerate 10 - 34°C[ 418 ]. It prefers a mean annual rainfall in the range 1,500 - 2,500mm, but tolerates 1,000 - 4,000mm[ 418 ]. Requires a rich warm sandy soil that is very well drained[ 1, 57, 123, 200 ]. Succeeds in a wide range of soils so long as they are fertile[ 418 ]. Intolerant of wet soils[ 200 ]. This is a very greedy plant that can soon impoverish a soil, it requires a lot of feeding if it is to perform well[ 123 ]. All plant remains, after the fibre has been removed, should be returned to the soil[ 123 ]. Prefers a pH in the range 5.4 - 6.5, tolerating 4.8 - 7.5[ 418 ]. *Boehmeria nivea* is an extremely variable species

that is widespread over large areas of subtropical and tropical Asia. Its complex species includes several infraspecific taxa, four varieties of which are found in China[ 266 ]. The sub-species *B. Nivea tenacissima*. (Gaud.)Miquel., which produces the fibre 'Rhea' is a native of Malaysia and is not hardy in Britain[ 200 ]. Yields are from 375 to 900 kilos of fibre (per acre?)[ 123 ]. Two to four harvests per year are possible depending upon the climate, it is harvested as the stems turn brown[ 123 ]. Yields of green plants may in temperate regions vary between 15 - 20 tonnes/ha and in tropical areas 8 - 10 tonnes/ha. Yields of about 1400 kg fibre/ha have been reported[ 418 ]. There are an increase in yields in the 2nd and 3rd year[ 418 ]. Stems can be harvested 2 - 3 times per year in temperate areas, 4 - 5 times in subtropical areas and in the tropics up to 6 crops can be produced annually[ 418 ]. The crop is normally replanted after 7 - 10 years, but may persist for 20 years[ 418 ]. The plant tends to take up whatever minerals are present in the soil. This could cause problems for example high uptake of molybdenum can lead to conditioned copper deficiency[ 289 ]. Found In: Africa, Asia, Australia, Bangladesh, Brazil, China\*, East Africa, Fiji, Haiti, Hawaii, India, Indochina, Indonesia, Japan, Laos, Malaysia, Mozambique, Norfolk Island, Pacific, Philippines, Rwanda, SE Asia, South America, Taiwan, USA, Vietnam.

## 7.2.222 *Mahonia gracilipes*

6 tlin 9 cyuc 2 kcaak 0 tcan 2 dwat 1.5 m hkuc

pcimhmim cyutli tcup hwicli hyhisrasjltunyk hpa7tli flat-prikkwis hpa7tmwatli xre7t hjonli

**drutta** *Mahonia gracilipes* is an evergreen Shrub growing to 1.5 m (5ft) by 2 m (6ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

**kcakta Edible Parts:** Fruit**Edible Uses:** Fruit - raw or cooked. We have no specific information on the fruit of this species, but all members of the genus have more or less edible fruit.

**tcanta** None known

**dwatta** Antibacterial Antitumor Bitter DysenteryBerberine, universally present in rhizomes of *Mahonia* species, has marked antibacterial effects[218] and is used as a bitter tonic[213]. Since it is not appreciably absorbed by the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not be used with Glycyrrhiza species (Licorice) because this nullifies the effects of the berberine[218]. Berberine has also shown antitumour activity[218]. The root and root bark are best harvested in the autumn[213].

**propta** Seed - best sown as soon as it is ripe in a cold frame[78]. It usually germinates in the spring[K]. 'Green' seed (harvested when the embryo has fully developed but before the seed case has dried) should be sown as soon as it is harvested and germinates within 6 weeks[K]. Stored seed should be sown as soon as possible in late winter or spring. 3 weeks cold stratification will improve its germination, which should take place in 3 - 6 months at 10°C. Prick out the seedlings when they are large enough to handle and grow them on in a cold frame for at least their first winter. Plant them out in late spring or early summer. Division of suckers in spring[78]. Whilst they can be placed direct into their permanent positions, better results are achieved if they are potted up and placed in a frame until established[11]. Leaf cuttings in the autumn.

**nwatta** An easily grown shrub, it thrives in any good garden soil[11] including heavy clays. Prefers a semi-shaded woodland position in a damp, slightly acid to neutral humus-rich soil[200]. Plants can tolerate temperatures down to about -10°C[200]. Plants are very tolerant of pruning and can be cut right back into old wood if they have outgrown their welcome[182]. Plants produce suckers and form gradually spreading clumps[200]. Hybridizes freely with other members of this genus.

Plants can harbour a stage of 'white pine blister rust', so they should not be grown in the vicinity of pine trees[155]. Plants in this genus are notably susceptible to honey fungus[200]. The fruit is produced on long sprigs and is therefore easier to harvest[119]. It is being used in modern breeding programmes for blackcurrants[119].

### 7.2.218 Erysimum hieraciifolium

European wallflower,

6 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 0.6 m hkuc hmimhtut cyutli tcup hwicli hyhisrasjltunyk hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Erysimum hieraciifolium is a BIENNIAL/PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August. The species is hermaphrodite (has both male and female organs). It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: LeavesEdible Uses: Tender young shoots and leaves - cooked as a vegetable[272].

tcanta None known

dwatta None known

propta Seed - sow spring or late summer in situ. Germination should take place within 3 weeks.

nwatta Prefers a position in full sun in a circumneutral soil[200]. Succeeds in ordinary garden soils, tolerating poor and dry soils[200]. Plants are short-lived perennials and are often biennial[200]. A good nectar source for butterflies[200].

### 7.2.219 Yucca harrimaniae

Spanish Bayonet, New Mexico Spanish bayonet

6 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 0.4 m hkuc hmimhtut cyutli hgatkuyuctup hwicli hyhisrasjltunyk hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Yucca harrimaniae is an evergreen Shrub growing to 0.4 m (1ft 4in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Hand. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerates strong winds but not maritime exposure.

kcaakta Edible Parts: Flowers Fruit StemEdible Uses: Fruit - the immature fruit is cooked. A bitter taste, but most of the bitterness is in the skin[85]. Flowers - raw or cooked[85]. They are delicious raw, and can also be dried, crushed and used as a flavouring[164]. Flowering stem - peeled, cooked and used like asparagus[164]. The whitish inner portion is eaten[85].

tcanta Broom Fibre SoapA fibre obtained from the leaves is used for making ropes, baskets and mats[82, 85, 169]. The leaves themselves can be used as paint brushes[92], brooms or woven to make mats etc[85]. The roots are rich in saponins and can be used as a soap substitute[85].

dwatta None known

propta Seed - sow spring in a greenhouse. Pre-soaking the seed for 24 hours in warm water may reduce the germination time. It usually germinates within 1 - 12 months if kept at a temperature of 20°C. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse or cold frame for at least their first two winters. Plant them out into their permanent positions in early summer and consider giving them some winter protection for at least their first winter outdoors - a simple pane of glass is usually sufficient[K]. Seed is not produced in Britain unless the flowers are hand pollinated. Root cuttings in late winter or early spring. Lift in April/May and remove small buds from base of stem and rhizomes. Dip in dry wood ashes to stop any bleeding and plant in a sandy soil in pots

in a greenhouse until established[78]. Division of suckers in late spring[111]. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the following spring.

nwatta Thrives in any soil but prefers a sandy loam and full exposure to the south[11]. Requires a sunny position[11]. Plants are hardier when grown on poor sandy soils[200]. Established plants are very drought resistant, this species is also tolerant of cool damp weather[11]. Hardy to at least -30°C[164]. Closely allied to *Y. glauca*[1]. In the plants native environment, its flowers can only be pollinated by a certain species of moth. This moth cannot live in Britain and, if fruit and seed is required, hand pollination is necessary. This can be quite easily and successfully done using something like a small paint brush. Individual crowns are monocarpic, dying after flowering[233]. However, the crown will usually produce a number of sideshoots before it dies and these will grow on to flower in later years[233]. Plants in this genus are notably resistant to honey fungus[200]. Members of this genus seem to be immune to the predations of rabbits[233]

### 7.2.220 Anagallis arvensis

Scarlet Pimpernel

6 tlin 9 cyuc 2 kcaak 3 tcan 2 dwat 0.1 m hkuc

htut cyutli kyuctup hwicli hrasjltunyk hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Anagallis arvensis is an ANNUAL growing to 0.1 m (0ft 4in) by 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from June to August, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcaakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked[2, 105, 115]. Used in salads[4] and as a spinach[2]. The tender shoots are cooked as a vegetable[272]. It is best not to eat these leaves[55, 238], see the notes above on toxicity.

tcanta SoapThe squeezed plant is used in Nepal for washing and bathing[272]. Anagallis arvensis is insecticidal or at least is repellent to some insects. Dynamic accumulator.

dwatta Antidepressant Antipruritic Antitussive Antiviral Cholagogue Diaphoretic Diuretic Epilepsy Expectorant Homeopathy Nervine Purgative Stimulant VulneraryThe scarlet pimpernel was at one time highly regarded as a medicinal herb, especially in the treatment of epilepsy and mental problems[254], but there is little evidence to support its efficacy and it is no longer recommended for internal use because it contains toxic saponins and cytotoxic cucurbitacins[238, 254]. The whole herb is antitussive, cholagogue, diaphoretic, diuretic, expectorant, nervine, purgative, stimulant and vulnerary[4, 7, 9, 21, 46]. It can be taken internally or applied externally as a poultice[7]. An infusion is used in the treatment of dropsy, skin infections and disorders of the liver and gall bladder[9, 272]. The plant is best harvested in June and can be dried for later use[4]. Use with caution[21], large doses can cause polyuria and tremor[7]. A homeopathic remedy is made from the plant[9]. It is used internally to treat itchy skins and externally to remove warts[9].

propta Seed - sow spring in situ.

nwatta Prefers a sunny position and a good soil[1]. Succeeds in dry or sandy soils[238]. The flowers open at about 8 am and close at 3pm each day, though they close earlier if it rains. The flowers are also said to foretell wet weather if they close early[207].

### 7.2.221 Boehmeria indica

Ramie, Chinese Grass, Chinese Silk Plant

6 tlin 9 cyuc 2 kcaak 5 tcan 2 dwat 1.8 m hkuc hmimhtut cyutli kyuctup hwicli hras hpa7tli frusflatprikliwis hpa7tmwatli hjonli

prefers moist soil. The plant can tolerates strong winds but not maritime exposure.

kcaakta Edible Parts: SeedEdible Uses: CoffeeSeed - raw or cooked[161, 181]. A staple food for some native North American Indian tribes[257]. Very sweet[177, 200], it is up to 2cm long and 8mm wide[82, 200]. The seed can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread. If any seed contains bitter tannins, these can be leached out by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute.

tcanta Repellent Tannin WoodA mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth[20]. Oak galls are excrescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4]. Wood - very heavy, hard, strong, brittle[82]. It is sometimes used as a fuel[82].

dwatta Astringent DysenteryAny galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4].

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Young plants tolerate reasonable levels of side shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. Prefers warmer summers than are usually experienced in Britain, trees often grow poorly in this country and fail to properly ripen their wood resulting in frost damage overwinter[200]. The tree flowers on new growth produced in spring, the seed ripening in its first year[200, 229]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. Hybridizes freely with other members of the genus[200]. Plants in this genus are notably resistant to honey fungus[200].

### 7.2.126 Torreya californica

California Nutmeg

6 tlin 9 cyuc 3 kcaak 0 tcan 1 dwat 15 m hkuc

pchimimhtut cyutli tcup hwicli hrasjltunyk hpa7tli frusflatprikliwsslip hpa7tmwatli nyanhjen hjonli

drutta Torreya californica is an evergreen Tree growing to 15 m (49ft) by 8 m (26ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower in May, and the seeds ripen from September to November. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and very alkaline soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Oil SeedEdible Uses: OilSeed - raw or cooked[183]. The seeds are roasted and eaten[257]. They are rich in oil[105, 161]. The ovoid seed is up to 2cm long[K]. An edible oil is obtained from the seed[177, 183].

tcanta Basketry Oil WoodThe roots have been used as splints in basketry[257]. Wood - straight-grained, strong, light, soft, easily worked. Of no commercial value[229], though it is occasionally used for fence posts[82, 229].

dwatta Analgesic Diaphoretic Effrigitic Stomachic TBThe nuts have been chewed as a treatment for indigestion[257]. A decoction of the nuts has been used in the treatment of tuberculosis[257]. The crushed seeds have been rubbed on the temples in the treatment of headaches[257]. They have also been rubbed on the body to cause sweating in the treatment of chills and fevers[257].

propta Seed - best sown as soon as it is ripe in a cold frame. Some of the seed should germinate in the following spring though much of it might take another 12 months. Stored seed requires a period of cold stratification and can take 18 months or more to germinate. Prick out the seedlings into individual pots as soon as growth is observed and grow them on in light shade in the greenhouse for at least the next couple of winters, making sure to pot them on into larger pots as and when required. Plant them out into their permanent positions in early summer when the plants are at least 20cm tall. Cuttings of half-ripe shoots in late summer[1]. Cuttings do not grow well[11]. Layering.

nwatta Succeeds in ordinary garden soil, tolerating some lime[1]. Undemanding as to the soil pH[200]. Dislikes wind exposure[200]. Requires a sheltered position and either high humidity or a moist riverside soil[200]. Tolerates woodland shade very well[200]. One report says that trees are only hardy in the milder parts of Britain[1], whilst another says that trees are hardy in Britain at least as far north as Edinburgh[200]. This species is the only member of the genus that is fully adapted to cool maritime sites. It can actually grow faster in such a position than it does in the wild[200]. Trees in general grow better in the wetter western part of Britain[81]. Usually slow growing, though trees occasionally increase by 60cm in a year[185]. The bruised leaves release a powerful resinous smell[245]. The fruits are also aromatic[245]. The seed takes two summers to mature[229]. Trees often crop well at Kew, but there were no seeds formed in 1994[K]. A tree in fairly deep shade at Kew was carrying a good crop of seeds in the summer of 1996[K]. Plants are usually dioecious, but isolated female plants have been known to bear fruit in the absence of a pollinating male[11]. Plants are sometimes monoecious with dioecious branches. Male and female plants must usually be grown if seed is required.

### 7.2.127 Vitis cinerea

Spanish Grape

6 tlin 9 cyuc 3 kcaak 0 tcan 0 dwat 10 m hkuc

hmimhtut cyutli kyuctup hwicli hrasjltunyk hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Vitis cinerea is a deciduous Climber growing to 10 m (32ft 10in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to July, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcaakta Edible Parts: Fruit Leaves SapEdible Uses: Fruit - raw or dried for winter use[161, 177]. A rich pleasant flavour[2, 183]. The fruit is rather small, but it is borne in very large clusters[2]. It has a slightly bitter flavour, but is pleasant when fully ripe[200]. Young leaves are wrapped around other foods and then baked, they impart a pleasant flavour. Young tendrils - raw or cooked.

tcanta DyeUsed as a rootstock[183]. A yellow dye is obtained from the fresh or dried leaves[168].

dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe[K]. Six weeks cold stratification improves the germination rate, and so stored seed is best sown in a cold frame as soon as it is obtained. Germination should take place in the first spring, but sometimes takes another 12 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant out in early summer. Cuttings of mature wood of the current seasons growth, December/January in a

frame. These cuttings can be of wood 15 - 30cm long or they can be of short sections of the stem about 5cm long with just one bud at the top of the section. In this case a thin, narrow strip of the bark about 3cm long is removed from the bottom half of the side of the stem. This will encourage callusing and the formation of roots. Due to the size of these cuttings they need to be kept in a more protected environment than the longer cuttings. Layering.

nwatta Prefers a deep rich moist well-drained moderately fertile loam[1, 200]. Grows best in a calcareous soil[200]. Succeeds in sun or partial shade though a warm sunny position is required for the fruit to ripen[200]. Plants climb by means of tendrils[182]. Any pruning should be carried out in winter when the plants are dormant otherwise they bleed profusely[182, 200]. This species is used in breeding programmes for improved grape cultivars[183]. It produces very large clusters of remarkably small fruits[2]. Plants in this genus are notably susceptible to honey fungus[200].

### 7.2.128 Asparagus cochinchinensis

Chinese Asparagus

6 tlin 9 cyuc 3 kcaak 0 tcan 3 dwat 1.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Asparagus cochinchinensis is a PERENNIAL growing to 1.5 m (5ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to June, and the seeds ripen in September. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: Fruit RootEdible Uses: Tubers - cooked[1, 61, 177]. The tubers are up to 5cm long and 2m wide[266]. They are washed to remove the bitterness, the fibrous core is removed and the root is then boiled[46, 179]. It tastes like asparagus[22]. Another report says that the tubers are eaten after preserving in sugar[183]. The fruit is said to be edible[183]. The fruit is about 6 - 8mm in diameter[200]. Another report says that the berries are harmful if eaten[238].

tcanta InsecticideKills the larvae of flies and mosquitoes[176]. No more details.

dwatta Antibacterial Antiinflammatory Antipyretic Antiseptic Antitussive Cancer Diuretic Expectorant Infertility Nervine Sialogogue Stomachic TonicThis species has been used in traditional Chinese medicine for over 2,000 years[238]. The roots contain asparagine, mucilage, starch and sugars[283]. The dried root is antibacterial, anti-inflammatory, antipyretic, antiseptic, antitussive, diuretic, expectorant, nervine, sialogogue, stomachic, nervous stimulant and tonic[176, 178, 218, 238, 279]. It is taken internally in the treatment of fevers, debility, sore throats, coughs etc[238]. It is often decocted with other herbs and used in the treatment of a wide range of ailments including diabetes mellitus[218]. It is commonly used in restorative recipes together with *Rehmannia glutinosa* and *Codonopsis javanica*[283]. Prolonged usage is recommended for the treatment of impotence[218]. The root is harvested when the plant is dormant and is dried for later use[238]. The plant has a folk history for the treatment of cancer, modern research has detected antitumour activity and it is now being studied for the treatment of lung cancer[218].

propta Seed - pre-soak for 12 hours in warm water and then sow in spring or as soon as the seed is ripe in early autumn in a greenhouse. It usually germinates in 3 - 6 weeks at 25°c[134]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a sunny position in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer[K]. Division in early spring as the plant comes into growth.

nwatta Easily grown in any good garden soil[200]. Prefers a rich light well-drained sandy loam in a sunny posi-

tion[238]. Plants are almost hardy in Britain according to one report[1], whilst others say that the plants tolerate temperatures down to between -10 and -15°c[200, 238]. Dioecious. Male and female plants must be grown if seed is required.

### 7.2.129 Actinidia callosa

6 tlin 9 cyuc 3 kcaak 0 tcan 0 dwat 9 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Actinidia callosa is a deciduous Climber growing to 9 m (29ft 6in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from June to July, and the seeds ripen from October to November. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Bees, insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[272]. A very delicate flavour[2, 51, 105, 146, 177]. An acid flavour[183]. The fruit can be dried[183]. The fruits are grayish-green when fully ripe and 18 - 50mm long[266]. They contain a number of small seeds, but these are easily eaten with the fruit[K].

tcanta WoodThe wood is porous[146].

dwatta None known

propta Seed - sow spring in a greenhouse[133]. It is probably best if the seed is given 3 months stratification[113], either sow it in a cold frame as soon as it is ripe in November or as soon as it is received. Fresh seed germinates in 2 - 3 months at 10°c, stored seed can take longer[133]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least their first winter. When the plants are 30cm or more tall, plant them out into their permanent positions in late spring or early summer, after the last expected frosts[K]. Most seedlings are male[126]. The seedlings are subject to damping off, they must be kept well ventilated[113]. Cuttings of softwood as soon as ready in spring in a frame[K]. Cuttings of half-ripe wood, July/August in a frame. Very high percentage[113]. Cuttings of ripe wood, October/November in a frame.

nwatta Prefers a sound loamy neutral soil[1, 200]. Succeeds in semi-shade but full sun is best for fruit production[200]. Prefers a sheltered position[200]. Plants are not fully hardy in much of Britain[219]. Young spring growth is susceptible to frost damage[160]. Fruits are formed on second year wood and also on fruit spurs on older wood[126], any pruning is best carried out in the winter[219]. This is a climbing plant, supporting itself by twining around branches etc[200]. A very ornamental plant[146], there are some named varieties developed for their edible fruit[183]. A polymorphic species, there are a number of sub-species[198]. Plants in this genus are notably resistant to honey fungus[200]. Dioecious. Male and female plants must be grown if seed is required.

### 7.2.130 Anthriscus cerefolium

Chervil, Garden chervil

6 tlin 9 cyuc 3 kcaak 0 tcan 2 dwat 0.5 m hkuc

pchimhmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyixre7t hjonli

drutta Anthriscus cerefolium is a BIENNIAL growing to 0.5 m (1ft 8in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from May to June, and the seeds ripen from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Condi-mentEdible leaves - raw in salads or used as a flavouring in

### 7.2.215 Citroncirus webberi

Citrange

6 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat m hkuc

htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Citroncirus webberi is an evergreen Tree. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: The acid fruit can be used for drinks and marmalade[183, 200]. The fruit is 5 - 7cm in diameter[200].

tcanta RootstockThis species can be used as a rootstock for the sweet orange, conferring a greater tolerance to cold weather[183].

dwatta None known

propta The following notes are based on Citrus species. They are probably applicable here as well, even though this is a bi-generic hybrid, since any seed might be produced polyembryonically. The seed is best sown in a greenhouse as soon as it ripe after thoroughly rinsing it[164, 200]. Sow stored seed in March in a greenhouse[3]. Germination usually takes place within 2 - 3 weeks at 13°c. Seedlings are liable to damp off so they must be watered with care and kept well ventilated. The seed is usually polyembryonic, two or more seedlings arise from each seed and they are genetically identical to the parent but they do not usually carry any virus that might be present in the parent plant[200]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least three growing seasons before trying them outdoors. Plant them out in the summer and give them some protection from the cold for their first few winters outdoors. Cuttings of half-ripe wood, July/August in a frame. Layering in October.

nwatta Prefers a moderately heavy loam with a generous amount of compost and sand added and a very sunny position[1, 200]. When growing plants in pots, a compost comprising equal quantities of loam and leafmold plus a little charcoal should produce good results[260]. Do not use manure since Citrus species dislike it[260]. When watering pot plants it is important to neither overwater or underwater since the plant will soon complain by turning yellow and dying. Water only when the compost is almost dry, but do not allow it to become completely dry[260]. Reasonably cold resistant, dormant plants can tolerate temperatures down to about -10°c, especially if they are grafted onto a Poncirus trifoliata rootstock[200]. The young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. A group of hybrids of garden origin, Poncirus trifoliata x Citrus sinensis[183]. Generally, these hybrids combine the qualities of cold hardiness and bitterness from Poncirus trifoliata with the larger more orange-like fruits of Citrus sinensis[183]. They are occasionally cultivated for their edible fruit, but more usually for their use as a rootstock, there are some named varieties[183, 200]. 'Morton' has very juicy fruits and is cold resistant[200]. 'Rusk' is very juicy and much less bitter than most forms[200].

### 7.2.216 Scirpus validus

River Club-Rush

6 tlin 9 cyuc 2 kcaak 0 tcan 1 dwat 1.5 m hkuc

hmimhtut cyutli tcuphja7nhs6s hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Scirpus validus is a PERENNIAL growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can grow in water.

kcakta Edible Parts: Leaves Pollen Root SeedEdible Uses: Root - raw or cooked[159, 161, 172, 183]. Rich in starch. The root contains a meagre amount of starch[193].

The sweet roots are eaten raw in mid summer[257]. The bruised young roots, when boiled in water, furnish a sweet syrup[183]. The rhizomes are 3 - 10mm in diameter[270]. Young shoots - cooked[55, 62, 85, 183]. The tender base of the stem is eaten raw in salads[183, 257]. The pollen is used in soups or mixed with flour and used in making bread[177, 183]. It is rich in protein. Seed[62, 85, 159, 183]. No further details are given but it is probably ground into a powder and used in making bread etc. The seed is small and rather fiddly to harvest and utilize.

tcanta Basketry WeavingThe stems are used in weaving and basket making[189, 257]. They are used to make good quality mats for use on the floor, for sleeping on and for making temporary partitions[257]. The stems are pulled off the plant rather than cut to ensure the maximum length of stem[257].

dwatta Astringent Diuretic HaemostaticThe root is astringent and diuretic[152]. The stem pith is haemostatic[257]. A poultice of the stem pith has been placed under a dressing in order to stop wounds bleeding[257].

propta Seed - sow in a cold frame as soon as it is ripe in a pot standing in 3cm of water. Only just cover the seed with soil[200]. The seed usually germinates fairly quickly. Prick out the plants when large enough to handle and plant out in their permanent positions in early summer. Division in spring. Very easy, larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Succeeds in any wet to moisture retentive ground, pond margins and shallow water in full sun or shade[200].

### 7.2.217 Ribes bracteosum

Stink Currant

6 tlin 9 cyuc 2 kcaak 0 tcan 1 dwat 2.5 m hkuc

htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Ribes bracteosum is a deciduous Shrub growing to 2.5 m (8ft 2in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[2, 85, 101, 118]. Not very palatable[200]. The fruit can cause stomach upsets if eaten in large quantities[257]. The fruit has a mild blackcurrant flavour, though it is not so juicy, has a mealy texture and a slight bitterness[K]. It ripens in September and is acceptable in small quantities raw[K], it can also be used in pies, preserves etc and makes an excellent jam[177, 183, 257]. It can be dried and stored for winter use[177, 183]. Native North American Indians considered the fruit to be constipating and so would eat it with oil[256]. The fruit is about 5mm in diameter[200], it is produced on long racemes, making it much easier to harvest than most currants[K].

tcanta Miscellany NeedlesNone known

dwatta Laxative MiscellanyThe fruits can be eaten in quantity as a laxative[257]. An infusion of the stems has been given to children as a treatment for colds[257].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. Stored seed requires 3 months cold stratification at 2 to 5°c and should be sown as early in the year as possible[113, 164]. Under normal storage conditions the seed can remain viable for 17 years or more. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter, planting them out in late spring of the following year Cuttings of half-ripe wood, 10 - 15cm with a heel, July/August in a frame[78, 113]. Cuttings of mature wood of the current year's growth, preferably with a heel of the previous year's growth, November to February in a cold frame or sheltered bed outdoors[78, 200].

nwatta Easily grown in a moisture retentive but well-drained loamy soil of at least moderate quality[11, 200]. Requires a sunny position[111]. Hardy to about -20°c[200].

tuber is 3 - 5cm in diameter[266]. Some caution is advised, see the notes above on toxicity.

tcanta None known  
dwatta None known

propta Seed - best sown as soon as it is ripe in a shady position in a cold frame[134]. Stored seed remains viable for at least a year and can be sown in spring in the greenhouse but it will probably require a period of cold stratification. Germination usually takes place in 1 - 6 months at 15°C[134]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least a couple of years until the corms are more than 20mm in diameter. Plant out into their permanent positions whilst they are dormant. Division of tubers when the plant dies down in late summer.

nwatta Prefers a cool peaty soil in the bog, woodland garden or a sheltered border in semi-shade[200]. Prefers a loamy or peaty soil[1] and will tolerate a sunny position if the soil is moist but not water-logged and the position is not too exposed[1, 200]. Plants are nearly hardy in Britain, they normally succeed outdoors in the milder areas of the country[1]. Tubers should be planted about 15cm deep[233]. Only plant out full sized tubers and mulch them with organic matter in the winter[200]. Plants multiply quickly once they are established[200]. Plants need protection from slugs[200]. This species has very large leaves, to 40cm long[200]. Most species in this genus are dioecious, but they are sometimes monoecious and can also change sex from year to year.

## 7.2.212 Ribes californicum

Hillside Gooseberry

6 tlin 9 cyuc 2 kcak 0 tcan 0 dwat m hkuc  
htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliws hpa7tmwatli xre7t hjonli

drutta Ribes californicum is a deciduous Shrub. See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105, 161, 177, 257]. The fruit can also be made into preserves or can be dried for winter use[257].

tcanta None known  
dwatta None known

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. Stored seed requires 3 months cold stratification at 1 to 5°C and should be sown as early in the year as possible[113, 164]. Under normal storage conditions the seed can remain viable for 17 years or more. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter, planting them out in late spring of the following year. Cuttings of half-ripe wood, 10 - 15cm with a heel, July/August in a frame[78, 113]. Cuttings of mature wood of the current year's growth, preferably with a heel of the previous year's growth, November to February in a cold frame or sheltered bed outdoors[78, 200].

nwatta Easily grown in a moisture retentive but well-drained loamy soil of at least moderate quality[11, 200]. Requires a sunny position[11]. Hardy to about -20°C[200]. This species is closely related to *R. menziesii*[200]. A polymorphic species[71]. Plants can harbour a stage of 'white pine blister rust', so they should not be grown in the vicinity of pine trees[155]. Plants in this genus are notably susceptible to honey fungus[200].

## 7.2.213 Digitaria sanguinalis

Crab Grass, Hairy crabgrass

6 tlin 9 cyuc 2 kcak 2 tcan 1 dwat 0.5 m hkuc  
htut cyutli tcup hwicli hrasjlut hpa7tli flatprikliws hpa7tmwatli xre7t hjonli

drutta *Digitaria sanguinalis* is an ANNUAL growing to 0.5 m (1ft 8in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from August to September. The species is hermaphrodite (has both male and female

organs) and is pollinated by Wind. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: Seed - ground up and used as a flour[2, 57, 105]. It has excellent keeping qualities[74] and makes a fine white flour that can be used for semolina[74, 115].

tcanta Fodder PaperA fibre obtained from the plant is used in making paper[74]. Animals: Fodder/animal feed, Forage.

dwatta Emetic Ophthalmic VDA decoction of the plant is used in the treatment of gonorrhoea[218]. A folk remedy for cataracts and debility, it is also said to be emetic[178, 218].

propta Seed - best sown in situ in the spring[162]. Only just cover the seed.

nwatta Prefers a sandy soil[50]. Requires a warm sheltered position[162]. This species is occasionally cultivated, especially in Poland, for its edible seed. Special Features: Invasive.

## 7.2.214 Chusquea quila

Argentinian quila

6 tlin 9 cyuc 2 kcak 0 tcan 0 dwat 5 m hkuc  
hmim cyutli hgattcup hwicli hrasjlutnyik hpa7tli flatprikliws hpa7tmwatli xre7t hjonli

drutta *Chusquea quila* is an evergreen Bamboo growing to 5 m (16ft) by 2.5 m (8ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil and can tolerate drought.

kcakta Edible Parts: StemEdible Uses: Young shoots - cooked[25, 177].

tcanta Musical WoodThe canes are used in making musical instruments, plain furniture and fencing[139].

dwatta None known

propta Seed - surface sow as soon as it is ripe in a greenhouse at about 20°C. Do not allow the compost to dry out. Germination usually takes place fairly quickly so long as the seed is of good quality, though it can take 3 - 6 months. Grow on in a lightly shaded place in the greenhouse until large enough to plant out. Seed is rarely available. Division in spring as new growth commences. Very difficult[200]. Take divisions with at least four canes in the clump, trying to cause as little root disturbance to the main plant as possible. Grow them on in light shade in a greenhouse in pots of a high fertility sandy medium. Mist the foliage regularly until plants are established. Plant them out into their permanent positions when a good root system has developed, which can take a year or more[200]. Basal cane cuttings.

nwatta Prefers a damp humus rich soil[200]. Prefers an open loam of reasonable quality, doing well on peat[11]. Likes plenty of moisture in the growing season[11]. Established plants are drought tolerant[25, 162, 195]. They require a position sheltered from cold north and east winds[11, 200]. A very hardy plant[25, 162], tolerating temperatures down to about -15°C[200]. Another report says that the plant is probably only hardy in the milder areas of the country[1]. It succeeds outdoors at Edinburgh Botanical Gardens[195] and is growing well at Kew[K]. This species is found further south in the world than any other species of bamboo, it grows in Chile as far south as latitude 47°south[195]. The rootstock is caespitose, new shoots are produced from late April and can grow 15cm overnight[25]. Plants take 2 - 3 years to settle down after being moved but are then quite fast growing[188]. This species is notably resistant to honey fungus[200]. Plants flower and produce seed annually in the wild without dying as a result of the flowering[162]. Plants of the cultivar 'Tenuis' have been observed to be flowering in 1994, this is the first record of this species flowering in the northern hemisphere[214].

cooked foods such as soups and stews[2, 14, 21, 27, 46, 61, 100, 244]. A mild aromatic flavour[183] that is suggestive of aniseed[238]. The leaves are often used as a flavouring, they form the basis of the seasoning 'fines herbes'[200] and are an essential ingredient of 'bouquet garni'[244]. The leaves should always be used fresh because the delicate flavour does not withstand drying or prolonged cooking[238, 244]. The leaves are ready for harvesting in about 8 weeks from sowing, the plant responds well to cut and come again harvesting[200]. The flowers are used as a seasoning[183]. The root is said to be edible[177, 183].

tcanta RepellentThe growing plant is said to repel slugs[238].

dwatta Digestive Diuretic Expectorant Ophthalmic Poulitice StimulantChervil is not widely used as a medicinal herb, though it is sometimes employed as a 'spring tonic' for cleansing the liver and kidneys, is a good remedy for settling the digestion and is said to be of value in treating poor memory and mental depression[238, 244, 254]. The fresh plant, harvested just before flowering, is digestive, diuretic, expectorant, poulitice and stimulant[9, 21, 201]. The juice is used in the treatment of dropsy, arthritis and chronic skin ailments[9]. The bruised leaves are used as a poultice for slow-healing wounds[9] and a warm poultice is applied to painful joints[268]. An infusion of the fresh leaves is also used as an eyewash to treat sore or inflamed eyes[244].

propta Seed - sow in situ in succession from February to October. The seed usually germinates in 2 - 3 weeks[200]. The February, September and October sowings should be made in a very sheltered warm and sunny position outdoors or under some protection such as a frame. Other sowings can be made in a position that has at least some shade from the midday sun since the plant runs to seed quickly if it gets too hot or the soil is dry[238]. The seed only remains viable for about a year[238].

nwatta Prefers a well-drained moisture retentive soil[200]. Plants dislike hot dry summers[200], it is best to give summer crops a cool shady position but winter crops require a sunny position[14, 18, 37, 52]. Tolerates a pH in the range 5.8 to 7.6. Plants are hardy to about -10°C[200]. Chervil is occasionally cultivated as a salad plant, especially in France[268]. There are some named varieties[183]. It can supply fresh leaves all year round from successional sowings, especially if given some protection in winter[238]. Although a biennial, it is usually cultivated as an annual[238]. It often self-sows when grown in a suitable position[18, 200]. Be careful if harvesting this plant from the wild because it is superficially similar to some poisonous species such as young plants of hemlock, *Conium maculatum*[244]. Chervil is an aromatic plant with pleasantly scented leaves[245]. It is said to be a good companion plant for growing with carrots and radishes[18, 201], the radishes becoming hotter and crisper[201]. It also grows well with dill and coriander[201]. When grown with lettuces it is said to protect them from aphids and ants, the plant is also said to repel slugs[238].

## 7.2.131 Vaccinium crassifolium

Creeping Blueberry

6 tlin 9 cyuc 3 kcak 2 tcan 0 dwat 0.1 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta *Vaccinium crassifolium* is an evergreen Shrub growing to 0.1 m (0ft 4in) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105, 183]. The flavour is sweet but bland[43]. The fruit is about 4mm in diameter[200].

tcanta Plants can be grown as a ground cover, the cultivars 'Bloodstone' and 'Well's Delight' have been specially recommended[183, 200].

dwatta None known

propta Seed - sow late winter in a greenhouse in a lime-free potting mix and only just cover the seed[78]. Stored

seed might require a period of up to 3 months cold stratification[113]. Another report says that it is best to sow the seed in a greenhouse as soon as it is ripe[200]. Once they are about 5cm tall, prick the seedlings out into individual pots and grow them on in a lightly shaded position in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 8cm with a heel, August in a frame[78]. Slow and difficult. Layering in late summer or early autumn[78]. Another report says that spring is the best time to layer[200]. Takes 18 months[78]. Division of suckers in spring or early autumn[113].

nwatta Requires a moist but freely-draining lime free soil, preferring one that is rich in peat or a light loamy soil with added leaf-mould[11, 200]. Prefers a very acid soil with a pH in the range of 4.5 to 6, plants soon become chlorotic when lime is present. Succeeds in full sun or light shade though it fruits better in a sunny position[200]. Requires shelter from strong winds[200]. Not fully hardy in Britain, it is best grown in the milder areas of the country and is reluctant to flower in colder areas[1, 11, 182]. Dislikes root disturbance, plants are best grown in pots until being planted out in their permanent positions[200]. Occasionally cultivated for its edible fruit, there are some named varieties. 'Well's Delight' grows only 12 - 20cm tall, forming a nearly solid evergreen carpet and is recommended as an ornamental low-maintenance ground cover plant[183]. The fruit has a slight aromatic flavour[183]. 'Bloodstone' is another cultivar that has been recommended for ground cover[200]. Plants in this genus are notably resistant to honey fungus[200]. The plant is heat tolerant in zones 7 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. An evergreen. A clumping mat former. Forming a dense prostrate carpet with a limited spread [1-2].

## 7.2.132 Umbilicus rupestris

Pennywort

6 tlin 9 cyuc 3 kcak 0 tcan 1 dwat 0.3 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprikliws hpa7tmwatli fyfmxre7t hjonli

drutta *Umbilicus rupestris* is an evergreen Perennial growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower from June to August, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects? Self. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked[2, 105, K]. A very acceptable mild flavour in the winter and early spring, they can be used in quantity in salads at this time[K]. The leaves become rather stronger-tasting in the summer and are not so pleasant then[K].

tcanta None known

dwatta Analgesic Diuretic Epilepsy PouliticeThe leaves are mildly analgesic[7]. The juice and extract of the plant have an old reputation for the treatment of epilepsy[4]. The leaves are also made into a poultice and used in the treatment of piles, slight burns and scalds[4, 7]. A decoction of the leaves is considered to be cooling and diuretic and the juice taken inwardly is said to be excellent for treating inflammations of the liver and spleen[4].

propta Seed - sow spring in a cold frame and only just cover the seed. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in early summer. Division in spring. Very easy, pant

them straight out into their permanent positions. Leaf cuttings[200].

nwatta An easily grown plant, succeeding in any near neutral, gritty, moisture retentive but well-drained soil in sun or light shade[200]. Plants are often found growing on walls, even succeeding on old brick and mortar walls[K] Plants are hardy to about -15°c[200]. A very attractive plant for the rock garden[53], the leaves often stay green all winter[4].

## 7.2.133 Aesculus californica

Californian Buckeye, California Horsechestnut  
6 tin 10 cyuc 3 kcaak 0 tcan 1 dwat 12 m hkuc  
htut cyutli kyuctcup hwicli hrasjlutnyk hpa7tli flatprikliws  
hpa7tmwatli xre7t hjonli

drutta Aesculus californica is a deciduous Tree growing to 12 m (39ft) by 10 m (32ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from July to August, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: SeedEdible Uses: Seed - cooked[22, 46, 63, 92, 94, 95]. It can be dried, ground into a powder and used as a gruel[2]. The seed contains about 23% protein and has an agreeable taste[213]. The seed is large, and can be up to 5cm in diameter[82]. It is often produced abundantly in the warmer areas of Britain and is easily harvested[K]. This was the most commonly used *Aesculus* species in N. America[213]. It does, however, contain poisonous saponins (see the notes above on toxicity) and so needs careful preparation before being eaten. The seed needs to be leached of these toxins before it becomes safe to eat - the Indians would do this by slow-roasting the nuts (which would have rendered the saponins harmless) and then cutting them into thin slices, putting them into a cloth bag and rinsing them in a stream for 2 - 5 days[213]. Most of the minerals etc would also have been leached out by this treatment[K].

tcanta Friction sticks Soap WoodThe seed is rich in saponins, these are used as a soap substitute[169]. The saponins can be easily obtained by chopping the seed into small pieces and infusing them in hot water. This water can then be used for washing the body, clothes etc. Its main drawback is a lingering odour of horse chestnuts[K]. Wood - soft, light, very close grained[82]. Of no value as a lumber[229]. The wood was used as friction sticks for making fire by the North American Indians[257].

dwatta Expectorant Odontalgic SalveThe seed contains saponins and can be used as an expectorant[94]. The crushed fruit is applied as a salve on haemorrhoids[257]. A decoction of the bark is used in the treatment of toothache and loose teeth[257].

propta Seed - best sown outdoors or in a cold frame as soon as it is ripe[11, 80]. The seed germinates almost immediately and must be given protection from severe weather[130]. The seed has a very limited viability and must not be allowed to dry out. Stored seed should be soaked for 24 hours prior to sowing and even after this may still not be viable[80, 113]. It is best to sow the seed with its 'scar' downwards[130]. If sowing the seed in a cold frame, pot up the seedlings in early spring and plant them out into their permanent positions in the summer.

nwatta Landscape Uses:Erosion control, Specimen. Prefers a deep loamy well-drained soil but is not too fussy[11]. Requires a position in full sun[200]. Prefers dry sunny locations[126]. Although fairly hardy throughout Britain, it grows best in areas where winter temperatures do not fall below -10°c[200]. A moderately fast-growing and long-lived tree in the wild[229], in Britain it grows best in eastern and south-eastern England. Plants thrive at Kew[11]. Most members of this genus transplant easily, even when fairly large[11]. Special Features:North American native, Flowers have an unpleasant odor, Blooms are very showy.

## 7.2.134 Mahonia trifoliolata

Mexican Barberry, Algeria  
6 tin 9 cyuc 3 kcaak 4 tcan 2 dwat 2 m hkuc  
htut cyutli kyuctcup hwicli hrasjlutnyk hpa7tli flatprikliws  
hpa7tmwatli xre7t hjonli

drutta Mahonia trifoliolata is an evergreen Shrub growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: FruitEdible Uses: CoffeeFruit - raw or cooked[2, 3, 85]. An acid flavour but nice, especially when added to porridges or muesli[K]. A subtle tart flavour, it is pleasant to eat raw[183]. Unfortunately there is relatively little flesh and a lot of seeds[K]. The fruit is also used to make preserves[149, 183]. The roasted seed is a coffee substitute[149].

tcanta Dye Hedge Hedge Ink TanninA yellow dye is obtained from the inner bark of the stem and roots[46, 61, 149, 181]. It is green according to another report[168]. An ink is made from the wood[46, 61]. Dark green, violet and dark blue-purple dyes are obtained from the fruit[168]. A green dye is obtained from the leaves[168]. Makes a good hedge[149]. The wood is a source of tannin[46].

dwatta Antibacterial Antitumor Dysentery TonicBerberine, universally present in rhizomes of Mahonia species, has marked antibacterial effects[218] and is used as a bitter tonic[181, 213]. Since it is not appreciably absorbed by the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not be used with *Glycyrrhiza* species (Licquorice) because this nullifies the effects of the berberine[218]. Berberine has also shown antitumour activity[218]. The root and root bark are best harvested in the autumn[213].

propta Seed - best sown as soon as it is ripe in a greenhouse[78]. It usually germinates in the spring[K]. 'Green' seed (harvested when the embryo has fully developed but before the seed case has dried) should be sown as soon as it is harvested and germinates within 6 weeks[K]. Stored seed should be sown as soon as possible in late winter or spring. 3 weeks cold stratification will improve its germination, which should take place in 3 - 6 months at 10°c. Prick out the seedlings when they are large enough to handle and grow them on in the greenhouse for at least their first winter. Plant them out in late spring or early summer and consider giving them some protection from the cold for their next winter. Division of suckers in spring[78]. Whilst they can be placed direct into their permanent positions, better results are achieved if they are potted up and placed in a frame until established[11]. Leaf cuttings in the autumn.

nwatta Unlike most members of the genus, this species requires a dry, perfectly drained position in full sun, a gritty slightly acid soil is best[200]. It does well in a hot, dry position[167]. Succeeds in a good garden soil[11]. The form in general cultivation in Britain (*M. trifoliolata* glauca. I.M.Johnst.) comes from the southern part of its range[67], it is only hardy on a sunny wall in this country or as a free-standing shrub in the very mildest areas[3, 11]. The young growth in spring can be damaged by late frosts. A good bee plant[149]. Resistant to honey fungus[88].

## 7.2.135 Phyllostachys praecox

Violet Bamboo  
6 tin 10 cyuc 3 kcaak 3 tcan 0 dwat 6 m hkuc  
pcimhmimhtut cyutli tcup hwicli hrasjlutnyk hpa7tli flatprikliws  
hpa7tmwatli xre7t hjonli

drutta Phyllostachys praecox is an evergreen Bamboo growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade

given some protection from winter cold for their first winter or two outdoors. Layering in early spring[200].

nwatta Landscape Uses:Espalier, Firewood, Pest tolerant, Aggressive surface roots possible, Screen, Seashore, Specimen, Street tree. Best grown in a warm position in a moderately rich free soil of an open texture[1]. Tolerates moderately limy soils[200, 202] so long as they are deep and rich in humus[188]. The branches are brittle so a sheltered position is required[200]. Another part of the same book says that this species is fairly wind-resistant[200]. Succeeds in full sun or semi-shade[219]. Plants are hardy to about -10°c[200]. The fleshy roots are easily damaged and any transplanting is best done during a spell of mild moist weather in late spring[182]. A very ornamental plant[1], a number of named forms have been developed[200]. The flowers are very large (up to 25cm across) and have a delicious and very powerful scent[202, 245]. This is perhaps the most strongly scented flower in the world[245]. They can be produced in trees as young as 10 years old[229]. The form 'Exmouth Variety' (also known as elliptica) produces its flowers when younger than the species, these flowers have a refreshing lemon scent[245]. There is no main flush of flowering, instead the flowers open intermittently throughout the summer[K]. Plants do not normally need pruning, any cutting out of dead wood etc is best carried out in July[219]. Special Features: Attracts birds, Attractive foliage, North American native, Fragrant flowers, Attractive flowers or blooms.

## 7.2.209 Pistacia atlantica

Betoum, Mt. Atlas mastic tree, Mount Atlas Mastic  
6 tin 9 cyuc 2 kcaak 0 tcan 1 dwat 20 m hkuc  
htut cyutli kyuctcup hwicli hrasjlut hpa7tli flatprikliws  
hpa7tmwatli nyanhjen hjonli

drutta Pistacia atlantica is a deciduous Tree growing to 20 m (65ft 7in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 9. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). . The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Fruit OilEdible Uses: Gum OilFruit - raw[61, 177]. A turpentine flavour[183]. The fruit is about 8mm long and 6mm wide and contains a single seed[200]. An excellent edible oil is obtained from the seed[183].

tcanta Dye Gum Ink Oil Resin Rootstock Tannin WoodUsed as a rootstock for *P. vera*, the pistachio nut[183]. A resin is obtained from the tree[117]. No more details. A gum is obtained from the tree. It is used medicinally[93]. It is possible that the gum and the resin are the same thing[K]. Tannin is obtained from galls that develop on the tree as a result of a fungus. It is used to make an ink and a dye[61]. The leaves contain 22.2% tannin[223]. The wood is useful[46].

dwatta AntisepticAntiseptic[93].  
propta Pre-soak the seed for 16 hours in alkalinized water[78], or for 3 - 4 days in warm water[1], and sow late winter in a cold frame or greenhouse[78, 113]. Two months cold stratification may speed up germination, so it might be better to sow the seed in early winter[113]. The germination is variable and can be slow. Prick out the seedlings into individual pots when they are large enough to handle and grow on the plants for at least their first winter in a greenhouse. Plant out into their permanent positions in early summer and consider giving some protection from winter cold for their first year or two outdoors[K]. Cuttings of half-ripe wood from juvenile trees, July in a frame[113]. Layering.

nwatta Requires a sunny position in a deep well-drained light soil[200]. Succeeds in dry soils. This species is not very cold-hardy in Britain[1], though it can succeed outdoors in the mildest areas of the country. This plant is sometimes grown near *P. vera*, the pistachio, as a pollinator[183]. Any pruning that needs to be done is best carried out in the spring[238]. Plants are prone to fungal root rots[200]. Dioecious, male and female plants must be grown if seed is required. Special Features:Not North American native, Naturalizing, Inconspicuous flowers or blooms.

## 7.2.210 Lactuca serriola

Prickly Lettuce  
6 tin 9 cyuc 2 kcaak 0 tcan 3 dwat 1.5 m hkuc  
htut cyutli tcup hwicli hrasjlut hpa7tli flatprikliws  
hpa7tmwatli fyikre7t hjonli

drutta Lactuca serriola is a BIENNIAL growing to 1.5 m (5ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to September, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs). The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Leaves Oil OilEdible Uses: Oil OilYoung leaves - raw or cooked[13, 55, 62]. A bitter flavour[85]. The young tender leaves are mild and make an excellent salad[183, 217], but the whole plant becomes bitter as it gets older, especially when coming into flower[K]. As a potherb it needs very little cooking[183]. Large quantities can cause digestive upsets[62]. Young shoots - cooked. Used as an asparagus substitute[13]. An edible oil is obtained from the seed[46, 61, 105]. The oil must be refined before it is edible[114]. A pleasant flavour[114, 183].

tcanta Oil OilThe seed contains 35.2% of a semi-drying oil[240]. It is used in soap making, paints, varnishes etc[114].

dwatta Anodyne Antipyretic Diuretic Homeopathy Hypnotic Narcotic Sedative UrinaryThe whole plant is rich in a milky sap that flows freely from any wounds. This hardens and dries when in contact with the air[4]. The sap contains 'lactucarium', which is used in medicine for its anodyne, antispasmodic, digestive, diuretic, hypnotic, narcotic and sedative properties[9, 21, 46, 165, 192, 213, 238]. Lactucarium has the effects of a feeble opium, but without its tendency to cause digestive upsets[4], nor is it addictive[7]. It is taken internally in the treatment of insomnia, anxiety, neuroses, hyperactivity in children, dry coughs, whooping cough, rheumatic pain etc[238]. Concentrations of lactucarium are low in young plants and most concentrated when the plant comes into flower[238]. It is collected commercially by cutting the heads of the plants and scraping the juice into china vessels several times a day until the plant is exhausted[4]. This species does not contain as much lactucarium as *L. virosa*[4]. An infusion of the fresh or dried flowering plant can also be used[9]. The plant should be used with caution, and never without the supervision of a skilled practitioner. Even normal doses can cause drowsiness whilst excess causes restlessness[238] and overdoses can cause death through cardiac paralysis[7, 9]. The fixed oil from the seeds is said to possess antipyretic and hypnotic properties[240]. A homeopathic remedy is made from the plant[9]. It is used in the treatment of chronic catarrh, coughs, swollen liver, flatulence and ailments of the urinary tract[9].

propta Seed - sow spring in situ and only just cover the seed. Germination is usually fairly quick.

nwatta Prefers a light sandy loam in a sunny position[1, 13]. The wild lettuce is cultivated for the oil in its seed in Egypt[46, 61]. A compass plant, the top leaves align north-south[200].

## 7.2.211 Arisaema costatum

6 tin 9 cyuc 2 kcaak 0 tcan 0 dwat 0.6 m hkuc  
pcimhmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprikliws  
hpa7tmwatli dyat hjonli

drutta Arisaema costatum is a PERENNIAL growing to 0.6 m (2ft) by 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to July. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Flies. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Root - cooked. It is boiled, dried and then ground into a powder[2, 177]. The

cially in the winter. A layer of gravel on the soil around them will help protect the foliage from wet soils[238]. Plants are hardy to about -10°c[200]. This species used to be cultivated as a culinary herb in the herb garden but it has now fallen into disuse[2]. The flowers are rich in nectar and are very attractive to honey bees[89, 148, 200, 238]. The growing plant is a beneficial companion for most plants[54]. The plant is powerfully pungent when handled[245]. This is a very difficult genus taxonomically, the species hybridize freely with each other and often intergrade into each other[200].

## 7.2.206 Yucca filifera

6 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 10 m hkuc hmimhtut cyutli hgtakuyuctup hwicli hyhrasljutnyik hpa7tli flatprikklwis hpa7tmwatli xre7t hjonli

drutta Yucca filifera is an evergreen Shrub growing to 10 m (32ft 10in). See above for USDA hardness. It is hardy to UK zone 7. It is in leaf all year, in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Hand. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Flowers Fruit StemEdible Uses: Fruit - raw or cooked. Flowers - raw or cooked. Delicious raw, they can also be dried, crushed and used as a flavouring[164]. Flowering stem - cooked and used like asparagus[164].

tcanta Fibre SoapA fibre obtained from the leaves is used for making ropes, baskets and mats[82, 169]. The roots are rich in saponins and can be used as a soap substitute[82].

dwatta None known  
 propta Seed - sow spring in a greenhouse. Pre-soaking the seed for 24 hours in warm water may reduce the germination time. It usually germinates within 1 - 12 months if kept at a temperature of 20°c. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse or cold frame for at least their first two winters. Plant them out into their permanent positions in early summer and consider giving them some winter protection for at least their first winter outdoors - a simple pane of glass is usually sufficient[K]. Seed is not produced in Britain unless the flowers are hand pollinated. Root cuttings in late winter or early spring. Lift in April/May and remove small buds from base of stem and rhizomes. Dip in dry wood ashes to stop any bleeding and plant in a sandy soil in pots in a greenhouse until established[78]. Division of suckers in late spring. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the following spring.

nwatta Thrives in any soil but prefers a sandy loam and full exposure to the south[11]. Can succeed in light shade[K]. Plants are hardier when grown on poor sandy soils[200]. Established plants are very drought resistant[200]. Hardy to at least -5°c according to one report[200], whilst another says that it is hardy to about -30c[164]. The leaves can be damaged by strong winds[11]. In the plants native environment, its flowers can only be pollinated by a certain species of moth. This moth cannot live in Britain and, if fruit and seed is required, hand pollination is necessary. This can be quite easily and successfully done using something like a small paint brush. Individual crowns are monocarpic, dying after flowering[233]. However, the crown will usually produce a number of sideshoots before it dies and these will grow on to flower in about four years[233]. Plants in this genus are notably resistant to honey fungus[200]. Members of this genus seem to be immune to the predations of rabbits[233]

## 7.2.207 Ehretia ovalifolia

6 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 12 m hkuc htut cyutli tcup hwicli hrasljut hpa7tli flatprikklwis hpa7tmwatli xre7t hjonli

drutta Ehretia ovalifolia is a deciduous Tree growing to 12 m (39ft 4in). See above for USDA hardness. It is

hardy to UK zone 7 and is not frost tender. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Fruit LeavesEdible Uses: Fruit. No more details. Young buds and leaves[105, 177]. No more details.

tcanta WoodNone known  
 dwatta None known  
 propta Seed - we have no information on this species but suggest sowing it as soon as it is ripe in a greenhouse. Sow stored seed in late winter or early spring. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame.

nwatta Prefers a moderately fertile well-drained sandy loam in a sunny position[200]. Requires a sheltered position[299]. Plants are shade tolerant in continental climates but they require more sun in maritime areas in order to ripen the wood[200]. Rich fertile soils tend to encourage soft sappy growth which is then subject to frost damage over winter[200]. Young trees are tender in Britain but they become perfectly hardy as they grow older[11]. The young growth in spring is frost-tender[K]. Closely allied to *E. acuminata* and included in that species by some botanists[11]. A tree was 10 metres tall at Bath botanical gardens in 1989[K]. The flowers, which are produced on the ripened wood of the previous season's growth, have a soft sweet perfume[245].

## 7.2.208 Magnolia grandiflora

Southern Magnolia, Bull Bay, Large-flowered Magnolia, Southern Magnolia  
 6 tlin 10 cyuc 2 kcaak 0 tcan 2 dwat 10 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikklwis hpa7tmwatli dyatxre7t hjonli

drutta Magnolia grandiflora is an evergreen Tree growing to 10 m (32ft) by 10 m (32ft) at a medium rate. See above for USDA hardness. It is hardy to UK zone 6. It is in leaf all year, in flower from June to September, and the seeds ripen from September to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Beetles. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: FlowersEdible Uses: Condiment-The flowers are pickled in some parts of England and are considered to have an exquisite flavour[2, 183]. They are also said to be used as a spice and a condiment[183].

tcanta Essential Shelterbelt WoodA fairly wind-tolerant tree, it can be used in shelterbelt plantings[200]. An essential oil is obtained from the flowers[240]. Wood - hard and fairly heavy, but weak and not durable[227]. White when first cut, it turns brown on exposure to air[229]. It is used in limited amounts for fuel, baskets, crates, woodenware and furniture[82, 227].

dwatta Diaphoretic Hypotensive Malaria Salve Stimulant TonicThe bark is diaphoretic, stimulant, tonic[46, 61, 240]. It is used in the treatment of malaria and rheumatism[240]. A decoction has been used as a wash and a bath for prickly heat itching[257]. The decoction has also been used as a wash for sores and as a steam bath for treating dropsy[257]. An alcoholic extract of the plant reduces the blood pressure, produces a slight acceleration in respiration but has no action on the heart[240].

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed must be kept cold over the winter and should be sown in late winter in a cold frame[200]. The seed usually germinates in the spring but it can take 18 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in a cold frame or greenhouse for at least their first winter. They can be planted out into their permanent positions when they are more than 15cm tall, though should be well mulched and

(deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Shoots StemEdible Uses: Young shoots - cooked. A delicious flavour[266]. This is one of the first species to be ready to eat in the spring, the young shoots are usually boiled in at least one change of water. The shoots, which are 4 - 6cm in diameter[266], are harvested in the spring when they are about 8cm above the ground, cutting them about 5cm below soil level.

tcanta A recommended species for producing canes. Agroforestry Uses: This is a good companion species to grow in a woodland because the plants have shallow root systems that do not compete with deep tree roots[195 ].

dwatta None known  
 propta Seed - surface sow as soon as it is ripe in a greenhouse at about 20°c. Do not allow the compost to dry out. Germination usually takes place fairly quickly so long as the seed is of good quality, though it can take 3 - 6 months. Grow on in a lightly shaded place in the greenhouse until large enough to plant out. Seed is rarely available. Division in spring as new growth commences. Divisions from the open ground do not transplant well, so will need careful treatment and nurturing under cover in pots until at least late spring[238]. Division is best carried out in wet weather and small divisions will establish better than large clumps[238]. Another report says that you can take large divisions from established clumps and transfer them straight to their permanent positions, misting or drenching them frequently until they are established[200]. Basal cane cuttings in spring.

nwatta Cultivated in the warm temperate and subtropical regions of southern China. In cultivation outside of China it has withstood temperatures down as low as -15°c for short periods. Succeeds in full sun and in partial shade. Species in this genus generally tolerate a wide range of soils and sites, though they prefer a damp humus-rich soil in sun or semi-shade[1

1, 200  
 1. They grow best in a position sheltered from cold winds[11  
 1. Plants are generally not very tolerant of dry conditions[1

1. Bamboos have an interesting method of growth. Each plant produces a number of new stems annually - these stems grow to their maximum height in their first year of growth, subsequent growth in the stem being limited to the production of new side branches and leaves. In the case of some mature tropical species the new stem could be as much as 30 metres tall, with daily increases in height of 30cm or more during their peak growth time. This makes them some of the fastest-growing species in the world[K

1. Bamboos in general are usually monocarpic, living for many years before flowering, then flowering and seeding profusely for a period of 1 - 3 years before usually dying. This pattern can vary - sometimes flowering is sporadic, with plants flowering annually and not dying; at other times it is gregarious with all the plants in a specific species coming into flower at the same time. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is clumping, giving the plant a clumping habit. The predictable growth behaviour makes it easier to maintain without having to apply containment methods[2-1].

## 7.2.136 Camassia scilloides

Atlantic Camas  
 6 tlin 9 cyuc 3 kcaak 0 tcan 0 dwat 0.6 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyikfrip hpa7tli flatprikklwis hpa7tmwatli xre7t hjonli

drutta Camassia scilloides is a BULB growing to 0.6 m (2ft). See above for USDA hardness. It is hardy to UK zone 7 and is not frost tender. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Bulb - raw or cooked[257]. The bulb was an important food for several native North American Indian tribes who used it in a variety of ways[257]. It can be baked or dried and made into a powder which can be used as a thickener in stews or as an additive to cereal flours when making bread, cakes etc[62, K]. The bulb is about 4cm long and 15mm wide[235].

tcanta None known  
 dwatta None known  
 propta Seed - best sown as soon as it is ripe in a cold frame[134]. The seed can also be sown in a cold frame in spring[134]. It usually germinates in 1 - 6 months at 15°c, but it can be erratic[138]. Sow the seed thinly so that it does not need to be thinned and allow the seedlings to grow on undisturbed for their first year. Give an occasional liquid feed to ensure that the plants do not become nutrient deficient. When the plants are dormant in late summer, pot up the small bulbs putting 2 - 3 bulbs in each pot. Grow them on for another one or two years in a cold frame before planting them out when dormant in late summer. Offsets in late summer. The bulb has to be scored in order to produce offsets.

nwatta Succeeds in almost any soil[42]. Grows well in heavy clay soils. Prefers a rather heavy loam[1] that has plenty of moisture in spring but does not remain wet over the winter[138, 200]. Dislikes dry soils[200]. Tolerates partial shade[138, 200]. Plant bulbs 7 - 10cm deep in early autumn and then leave them undisturbed.

## 7.2.137 Lilium bulbiferum

Fire Lily, Orange lily  
 6 tlin 9 cyuc 3 kcaak 0 tcan 0 dwat 1.2 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikklwis hpa7tmwatli xre7t hjonli

drutta Lilium bulbiferum is a BULB growing to 1.2 m (4ft). See above for USDA hardness. It is hardy to UK zone 7. It is in flower from June to July, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Bulb - cooked. Sweet and mealy[177], they make very fair eating and can be used as a potato substitute[2].

tcanta None known  
 dwatta None known  
 propta Seed - delayed hypogaeal germination[130]. Best sown as soon as ripe in a cold frame, it should germinate in spring[143]. Stored seed will require a warm/cold/warm cycle of stratification, each period being about 2 months long[163]. Grow on in cool shady conditions. Great care should be taken in pricking out the young seedlings, many people leave them in the seed pot until they die down at the end of their second years growth. This necessitates sowing the seed thinly and using a reasonably fertile sowing medium. The plants will also require regular feeding when in growth. Divide the young bulbs when they are dormant, putting 2 - 3 in each pot, and grow them on for at least another year before planting them out into their permanent positions when the plants are dormant[K]. Division with care in the autumn once the leaves have died down. Replant immediately[200]. Bulbils - gather in late summer when they start to fall off the stems and pot up immediately. Grow on in a greenhouse until large enough to go outside[163]. Bulb scales can be removed from the bulbs in early autumn. If they are kept in a warm dark place in a bag of moist peat, they will produce bulblets. These bulblets can be potted up and grown on in the greenhouse until they are large enough to plant out[200].

nwatta Prefers an open free-draining humus-rich loamy soil with its roots in the shade and its head in the sun[200]. Succeeds in ordinary garden soil[1, 143] and in calcareous soils[90, 200]. Prefers summer shade[200]. Stem rooting, the bulbs should be planted 15cm deep[43, 143, 200]. Early to mid autumn is the best time to plant out the bulbs in cool temperate areas, in warmer areas they can be planted out as late as late autumn[200]. This is one of the easiest lilies to grow[47], it is cultivated for its edible bulb in Japan[2]. The plant should be protected against slugs in early spring. If the

shoot tip is eaten out the bulb will not grow in that year and will lose vigour[200]. The typical form of this species forms bulbils on its stems[200]. The sub-species *L. bulbiferum* croceum does not normally produce bulbils[188].

### 7.2.138 Mahonia confusa

6 tlin 9 cyuc 3 kcaak 0 tcan 2 dwat 1.5 m hkuc pcmihmtt cyutli tcup hwicli hyishrasljutnyvikfriphpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Mahonia confusa is an evergreen Shrub growing to 1.5 m (5ft) by 2 m (6ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower from October to December, and the seeds ripen from April to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acidic, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. An acid but nice flavour and fairly juicy, it makes a pleasant nibble and is nice in other dishes, especially when added to muesli or porridge[K]. Unfortunately, there is relatively little flesh and a lot of seeds[K]. The fruit ripens in early to mid spring, a time when little other fresh fruit is available in the garden[K].

tcanta None known

dwatta Cancer Dysentery Febrifuge OdontalgicThe leaf is used in the treatment of cancer[218]. A decoction of the root is febrifuge and odontalgic[218]. Berberine, universally present in rhizomes of Mahonia species, has marked antibacterial effects[218] and is used as a bitter tonic[213]. Since it is not appreciably absorbed by the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not be used with Glycyrrhiza species (Licorice) because this nullifies the effects of the berberine[218]. Berberine has also shown antitumor activity[218]. The root and root bark are best harvested in the autumn[213].

propta Seed - best sown as soon as it is ripe in a greenhouse[78]. It usually germinates in the spring[K]. 'Green' seed (harvested when the embryo has fully developed but before the seed case has dried) should be sown as soon as it is harvested and germinates within 6 weeks[K]. Stored seed should be sown as soon as possible in late winter or spring. 3 weeks cold stratification will improve its germination, which should take place in 3 - 6 months at 10°C. Prick out the seedlings when they are large enough to handle and grow them on in the greenhouse for at least their first winter. Plant them out in late spring or early summer and consider giving them some protection from the cold for their next winter. Division of suckers in spring[78]. Whilst they can be placed direct into their permanent positions, better results are achieved if they are potted up and placed in a frame until established[11]. Leaf cuttings in the autumn.

nwatta An easily grown shrub, it thrives in any good garden soil[11] including heavy clays. Prefers a semi-shaded woodland position in a damp, slightly acid to neutral humus-rich soil[200]. Plants can tolerate temperatures down to about -10°C[260]. Only introduced to Britain in 1980, the plant is growing so well here that within six years it was being distributed commercially from home-produced seedlings[11]. The young growth in spring can be damaged by late frosts. Plants are very tolerant of pruning and can be cut right back into old wood if they have outgrown their welcome[182]. Closely related to *M. fortunei*[11]. It hybridizes freely with other members of this genus. The flowers are very sweetly scented[184].

### 7.2.139 Quercus virginiana

Live Oak

6 tlin 9 cyuc 3 kcaak 0 tcan 2 dwat 20 m hkuc hmimhmtt cyutli kyuctcup hwicli jltunykifriphpa7tli flatprikliwshom hpa7tmwatli hjonli

drutta Quercus virginiana is an evergreen Tree growing to 20 m (65ft 7in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in

leaf all year, in flower in April. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in saline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: Oil SeedEdible Uses: Coffee OilSeed - raw or cooked[63, 161, 171]. Low in tannin, it has a sweet flavour[82]. The seed is usually produced in clusters of 3 - 5 and is about 25mm long and 10mm wide[82, 200]. It is about 12mm long according to another report[227]. It can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread. The seed contains bitter tannins, these can be leached out by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. An edible oil obtained from the seed is used for cooking[149, 161, 177]. The roasted seed is a coffee substitute.

tcanta Oil Repellent Tannin WoodA mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth[20]. Oak galls are excrescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4]. The bark is a commercial source of tannin[149, 227]. Dyes of various colours can be obtained from the bark[257]. Wood - very heavy, hard, strong, tough, close grained but difficult to work. It weighs 59lb per cubic foot. It is used for making hubs, cogs, shipbuilding etc[46, 61, 82, 149, 171, 227]. A very good fuel[229].

dwatta Analgesic Antihæmorrhoidal Astringent DysenteryThe bark is astringent[257]. A decoction has been used in the treatment of dysentery[257]. A decoction of the wood chips or the bark has been applied externally as an astringent analgesic to treat aches and pains, sores and hæmorrhoids[257]. Any galls produced on the tree are strongly astringent and can be used in the treatment of hæmorrhages, chronic diarrhoea, dysentery etc[4].

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Young plants tolerate reasonable levels of shade[200]. Trees can stand considerable salinity, often growing close to the sea[227]. They tolerate moderate exposure, surviving well but being somewhat stunted[200]. This species seems to be susceptible to soil types, producing dwarf forms and diverse leaf forms under certain conditions[227]. Prefers warmer summers than are usually experienced in Britain, trees often grow poorly in this country and fail to properly ripen their wood resulting in frost damage overwinter[11, 200]. The tree flowers on new growth produced in spring, the seed ripening in its first year[200, 229]. Abundant crops are usually produced in the wild[229]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. Hybridizes freely with other members of the genus[200]. Plants in this genus are notably resistant to honey fungus[200].

seed might require a period of up to 3 months cold stratification[113]. Another report says that it is best to sow the seed in a greenhouse as soon as it is ripe[200]. Once they are about 5cm tall, prick the seedlings out into individual pots and grow them on in a lightly shaded position in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 8cm with a heel, August in a frame[78]. Slow and difficult. Layering in late summer or early autumn[78]. Another report says that spring is the best time to layer[200]. Takes 18 months[78]. Division of suckers in spring or early autumn[113].

nwatta Requires a moist but freely-draining lime free soil, preferring one that is rich in peat or a light loamy soil with added leaf-mould[11, 200]. Prefers a very acid soil with a pH in the range of 4.5 to 6, plants soon become chlorotic when lime is present. Succeeds in full sun or light shade though it fruits better in a sunny position[200]. Requires shelter from strong winds[200]. Dislikes root disturbance, plants are best grown in pots until being planted out in their permanent positions[200]. Plants are deciduous when growing in cold climates[11]. Plants in this genus are notably resistant to honey fungus[200].

### 7.2.204 Ophrys bertolonii

6 tlin 9 cyuc 2 kcaak 0 tcan 2 dwat 0.4 m hkuc hmimhmtt cyutli tcup hwicli hrasljutnyvik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Ophrys bertolonii is a PERENNIAL growing to 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Root - cooked. It is a source of 'salep', a fine white to yellowish-white powder that is obtained by drying the tuber and grinding it into a powder[200]. Salep is said to be very nutritious and is made into a drink or added to other cereals and used in bread etc[183]. One ounce of salep is said to be enough to sustain a person for a day[100, 115]. The salep can also be made into a drink[100].

tcanta None known

dwatta Demulcent NutritiveSalep (see above for more details) is very nutritive and demulcent[4]. It has been used as a diet of special value for children and convalescents, being boiled with water, flavoured and prepared in the same way as arrowroot[4]. Rich in mucilage, it forms a soothing and demulcent jelly that is used in the treatment of irritations of the gastro-intestinal canal[4]. One part of salep to fifty parts of water is sufficient to make a jelly[4]. The tuber, from which salep is prepared, should be harvested as the plant dies down after flowering and setting seed[4].

propta Seed - surface sow, preferably as soon as it is ripe, in the greenhouse and do not allow the compost to dry out. The seed of this species is extremely simple, it has a minute embryo surrounded by a single layer of protective cells. It contains very little food reserves and depends upon a symbiotic relationship with a species of soil-dwelling fungus. The fungal hyphae invade the seed and enter the cells of the embryo. The orchid soon begins to digest the fungal tissue and this acts as a food supply for the plant until it is able to obtain nutrients from decaying material in the soil[200]. It is best to use some of the soil that is growing around established plants in order to introduce the fungus, or to sow the seed around a plant of the same species and allow the seedlings to grow on until they are large enough to move. This species only rarely forms new offsets and so division is seldom feasible, the following methods can be tried, however[230]. Division of the tubers as the flowers fade[230]. This species produces a new tuber towards the end of its growing season. If this is removed from the plant as its flowers are fading, the shock to the plant can stimulate new tubers to be formed. The tuber should be treated as being dormant, whilst the remaining plant should be encouraged to continue in growth in order to give it time to produce new tubers[230]. Division can also be carried out when the plant has a fully developed rosette of leaves but before it comes

into flower[230]. The entire new growth is removed from the old tuber from which it has arisen and is potted up, the cut being made towards the bottom of the stem but leaving one or two roots still attached to the old tuber. This can often be done without digging up the plant. The old tuber should develop one or two new growths, whilst the new rosette should continue in growth and flower normally[230].

nwatta Plants can be grown in a lawn, but the lawn must not be cut until the plants have set seed[200]. Orchids are, in general, shallow-rooting plants of well-drained low-fertility soils. Their symbiotic relationship with a fungus in the soil allows them to obtain sufficient nutrients and be able to compete successfully with other plants. They are very sensitive to the addition of fertilizers or fungicides since these can harm the symbiotic fungus and thus kill the orchid[230]. This symbiotic relationship makes them very difficult to cultivate, though they will sometimes appear uninvited in a garden and will then thrive. Transplanting can damage the relationship and plants might also thrive for a few years and then disappear, suggesting that they might be short-lived perennials[230]. The flowers resemble a female insect and also emit a scent similar to female pheromones, they are pollinated by a male insect of that species attempting to copulate with the flower[200]. Tubers should be planted out whilst they are dormant, this is probably best done in the autumn[200]. They should be planted at least 5cm below soil level[200].

### 7.2.205 Thymus capitatus

Headed Savory, Thymus

6 tlin 9 cyuc 2 kcaak 0 tcan 2 dwat 0.3 m hkuc hpa7tli kyuctcup hwicli hrasljut hpa7tli prikliwis hpa7tmwatli xre7t hjonli

drutta Thymus capitatus is an evergreen Shrub growing to 0.3 m (1ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: LeavesEdible Uses: Condiment TeaThe plant is sometimes used as a condiment[183]. An essential oil from the plant is used for flavouring baked goods, condiments, beverages, ice creams etc. It is called 'Spanish oregano oil'[183, 238]. Leaves - raw in salads or added as a flavouring to cooked foods[2]. An aromatic tea is made from the leaves. If the leaves are to be dried, the plants should be harvested in early and late summer just before the flowers open and the leaves should be dried quickly[200].

tcanta Deodorant Disinfectant EssentialThe essential oil, known as 'Spanish oregano oil', obtained from the leaves is also used in perfumery and soaps, as a mouth wash, medicinally etc[46, 57, 89, 100, 200, 238].

dwatta Antiseptic Deodorant DisinfectantThe leaves, and especially the essential oil contained in them, are strongly antiseptic, deodorant and disinfectant[200, 238]. The plant can be used fresh at any time of the year, or it can be harvested as it comes into flower and either be distilled for the oil or dried for later use[238]. The essential oil should not be used in aromatherapy because it is highly irritant to the mucous membranes[238].

propta Seed - sow spring in a cold frame. Seed can also be sown in autumn in a greenhouse. Surface sow or barely cover the seed. Germination can be erratic. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring or autumn[200]. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the summer or the following spring. Cuttings of young shoots, 5 - 8cm with a heel, May/June in a frame[200]. Cuttings of half-ripe wood, 5 - 8cm with a heel, July/August in a frame[200]. Layering.

nwatta Prefers a light, well-drained calcareous soil and a sunny position[200]. Thymes dislike wet conditions, espe-

says that they are hardy to about -10°C, and that the stem tips are often killed back in the winter though the plant soon recovers[202]. Climbs by means of twining[182]. It is self-supporting[200] and fast-growing[202]. Any pruning is best carried out in late winter and early spring[202]. A very ornamental plant[1], there are some named varieties[200]. The flowers are very fragrant[202] and the plant is sometimes cultivated for the essential oil in its flowers, the sub-species *J. officinale grandiflorum* (L.) Kobuski. is used[171]. Flowers are produced on the current year's growth and also on older wood[202]. Plants in this genus are notably resistant to honey fungus[200].

## 7.2.201 Artemisia tripartita

Threetip Sage Brush, Wyoming threetip sagebrush  
6 tlin 9 cyuc 2 kcaak 0 tcan 1 dwat 1.8 m hkuc  
htuc cyutli hgatkuyctcup hwicli hyhshrasjlut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Artemisia tripartita is a SHRUB growing to 1.8 m (6ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Leaves SeedEdible Uses: Leaves[61]. No further details are given. Seed[46, 61, 105, 161, 257]. No further details are given, but the seed is very small and fiddly to use[K].

tcanta TinderThe bark is used as a tinder when making fires[257].

dwatta Diaphoretic VulneraryAn infusion of the roots, or a decoction of the leaves and branches, is used in the treatment of colds, sore throats, tonsillitis, headaches etc[257]. An infusion of the plant is used as a wash for wounds caused by the removal of corns[257].

propta Seed - surface sow from late winter to early summer in a greenhouse in a very free-draining soil, but do not allow it to dry out. The seed usually germinates in 1 - 2 weeks in a warm greenhouse[164]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter, planting them out in late spring or early summer. Cuttings of half-ripe wood, July/August in a frame. Very slow to root[111] Division in spring or autumn. Layering[164].

nwatta Easily grown in a well-drained circumneutral or slightly alkaline loamy soil, preferring a sunny position[1, 200]. Succeeds in most soils including those of low fertility[164]. Plants are longer lived, more hardy and more aromatic when they are grown in a poor dry soil[245]. Established plants are very drought tolerant[200]. Plants resprout freely after a fire[60, 164]. The sub-species *A. tripartita rupicola* is a dwarf form growing only 15cm tall, whilst *A. tripartita tripartita* grows to 1.8 metres[164]. Plants in this genus are notably resistant to honey fungus[200]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 7.2.202 Quercus infectoria

Aleppo Oak, Oak  
6 tlin 8 cyuc 2 kcaak 0 tcan 2 dwat 1.8 m hkuc  
hmimhtut cyutli tcup hwicli jlutnyik hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta Quercus infectoria is an evergreen Shrub growing to 1.8 m (6ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: SeedEdible Uses: Seed - cooked. It can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread. The seed contains bitter tannins, these can be leached out by

thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute.

tcanta Ink TanninAn ink is made from the tannin-rich galls[171]. The galls are caused by the activity of the Cynipid fly *Cynips tinctoria*[223]. The galls contain 36 - 58% tannin[223]. An extract of the galls is mixed with ferrous sulphate together with a gum and colouring in order to make the ink[171]. We are not sure if the galls are meant to be used before or after the insect has left them[K].

dwatta Astringent Dysentery EczemaThe bark and acorns are astringent[240]. They are used in the treatment of intertrigo, impetigo and eczema[240]. Any galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4].

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Landscape Uses:Specimen. Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Young plants tolerate reasonable levels of shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. Prefers warmer summers than are usually experienced in Britain, trees often grow poorly in this country and fail to properly ripen their wood resulting in frost damage overwinter[200]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. Hybridizes freely with other members of the genus[200]. Plants in this genus are notably resistant to honey fungus[200]. Special Features:Not North American native, Inconspicuous flowers or blooms.

## 7.2.203 Vaccinium arboreum

Farkleberry  
6 tlin 9 cyuc 2 kcaak 0 tcan 1 dwat 5 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta Vaccinium arboreum is an evergreen Tree growing to 5 m (16ft 5in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from July to August, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. Dry and slightly astringent but with a pleasant flavour[82]. Dry and insipid according to another report[183] whilst another says that it is dry, sweet and mealy[227] and yet another says that it is bitter and inedible[200]. The fruit is about 6mm in diameter[200].

tcanta Rootstock Tannin WoodSaid to be an excellent rootstock for 'Rabbiteye' blueberries (*V. ashei*) [183]. Tannin is obtained from the bark and root[82, 227]. Wood - heavy, hard, very close grained. It weighs 48lb per cubic foot. Used for making tool handles and other small articles[82, 227].

dwatta Astringent DysenteryThe berries, root-bark and leaves are very astringent and have been used internally in the treatment of diarrhoea, dysentery etc[4, 82, 229]. The infusion is valuable in treating sore throats, chronic ophthalmia, leucorrhoea etc[4].

propta Seed - sow late winter in a greenhouse in a lime-free potting mix and only just cover the seed[78]. Stored

## 7.2.140 Rheum palmatum

Turkey Rhubarb, Chinese Rhubarb - Da Huang, Chinese rhubarb

6 tlin 9 cyuc 3 kcaak 2 tcan 5 dwat 3 m hkuc  
hmimhtut cyutli tcup hwicli jlutnyikfrip hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Rheum palmatum is a PERENNIAL growing to 3 m (9ft) by 2 m (6ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to July, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: StemEdible Uses: Leaf stem - raw or cooked[2, 7, 105, 183]. The stem is superior in flavour to the common rhubarb and quite tender[2]. An acid flavour, it is sometimes used as a cooked fruit substitute[K].

tcanta Fungicide InsecticideAn insect spray is made from the leaves[20]. This spray is also said to help prevent clubroot of brassicas[20]. The cultivar 'Atrosanguineum' can be used as a ground cover plant in a sunny position[188]. Other forms can also be used, they are best planted about 1.8 metres apart each way[208].

dwatta Anticholesterolemic Antiseptic Antispasmodic Antitumor Aperient Astringent Chologogue Demulcent Diuretic Homeopathy Laxative Purgative Stomachic TonicChinese rhubarb, called Da Huang in China, has a long and proven history of herbal usage, its main effect being a positive and balancing effect upon the whole digestive system. It is one of the most widely used herbs in Chinese medicine[238]. It has a safe and gentle action, safe even for children to use[254]. The plant is also part of a North American formula called *essiac* which is a popular treatment for cancer. Its effectiveness has never been reliably proven or disproven since controlled studies have not been carried out. The other herbs included in the formula are *Arctium lappa*, *Ulmus rubra* and *Rumex acetosella*[254]. The root is anticholesterolemic, antiseptic, antispasmodic, antitumor, aperient, astringent, chologogue, demulcent, diuretic, laxative, purgative, stomachic and tonic[4, 7, 9, 21, 91, 171, 176, 238]. The roots contain anthraquinones, which have a purgative effect, and also tannins and bitters, which have an opposite astringent effect[244]. When taken in small doses, it acts as an astringent tonic to the digestive system, whilst larger doses act as a mild laxative[232, 244]. The root is taken internally in the treatment of chronic constipation, diarrhoea, liver and gall bladder complaints, haemorrhoids, menstrual problems and skin eruptions due to an accumulation of toxins[238]. This remedy is not prescribed for pregnant or lactating women, nor for patients with intestinal obstruction[238]. Externally, the root is used in the treatment of burns[238]. The roots are harvested in October from plants that are at least six years old, they are then dried for later use[4]. A homeopathic remedy is prepared from the dried root[232]. This is used especially in the treatment of diarrhoea in teething children[232]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve *Rheum palmatum* for constipation (see [302] for critics of commission E).

propta Seed - best sown in autumn in a shaded cold frame[200]. The seed can also be sown in spring in a cold frame. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse or cold frame for their first winter, planting them out in the spring. Division in early spring or autumn[1, 111]. Divide up the rootstock with a sharp spade or knife, making sure that there is at least one growth bud on each division. Larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Prefers a deep, fertile, moderately heavy, humus rich, moisture retentive, well-drained soil in sun or semi-shade[200]. Grows well in heavy clay soils. Plants can be grown in quite coarse grass, which can be cut annually in the autumn[233]. Hardy to at least -15°C[200]. A very ornamental plant[1], there is at least one named variety[183]. Hy-

bridizes freely with other members of this genus[200]. The sub-species *R. palmatum tanguticum* is cultivated as a medicinal plant in China[61, 244], it was at one time a popular purgative in Europe[50]. Plants in this genus seem to be immune to the predations of rabbits[233]. Turkish rhubarb is a good companion plant for columbine (*Aquilegia spp*) [20]. The plant is heat tolerant in zones 9 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2].

## 7.2.141 Quercus emoryi

Black Oak, Emory oak  
6 tlin 9 cyuc 3 kcaak 0 tcan 2 dwat 12 m hkuc  
hmimhtut cyutli tcup hwicli jlutnyik hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta Quercus emoryi is an evergreen Tree growing to 12 m (39ft 4in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower in May, and the seeds ripen in September. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: SeedEdible Uses: CoffeeSeed - raw or cooked[257]. A sweet taste[63, 85, 161], it is an important item of food for the Indians in S. Arizona and northern Mexico and is sold in the local markets there[46, 82, 85]. The seed is up to 2cm long and 1cm thick[82, 200]. It can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread. If the seed contains bitter tannins, these can be leached out by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute.

tcanta Fodder Fuel Repellent Tannin WoodA mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth[20]. Oak galls are excrescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4]. Wood - heavy, hard, strong, brittle, close grained[82]. Of little value commercially, though it is an important fuel in its native range[229].

dwatta Astringent DysenteryAny galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4].

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left

in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Fodder: Mast Management: Standard Staple Crop: Balanced carb Wild Staple CropPrefers a good deep fertile loam which can be on the stiff side[1, 11]. Young plants tolerate reasonable levels of side shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. Prefers warmer summers than are usually experienced in Britain, trees often grow poorly in this country and fail to properly ripen their wood resulting in frost damage overwinter[200]. A slow-growing tree in its native range[229]. Seed production is cyclical, with a year of high production followed by a few years of low production. The tree flowers on new growth produced in spring, the seed ripening in its first year[200, 229]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. Hybridizes freely with other members of the genus[200]. Plants in this genus are notably resistant to honey fungus[200].

## 7.2.142 Brassica rapa perviridis

Mustard Spinach  
6 tin 9 cyuc 3 kcaak 0 tcan 0 dwat 0.5 m hkuc  
hmimhtut cyutli hgattucp hwicli hrasjltunyk hpa7tli flatprikliwis hpa7tmwatli fyixre7t hjonli

drutta Brassica rapa perviridis is a BIENNIAL growing to 0.5 m (1ft 8in) by 0.5 m (1ft 8in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from May to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil and can tolerate drought.

kcaakta Edible Parts: Flowers LeavesEdible Uses: Leaves - raw or cooked[206]. The flavour is a happy compromise between the blandness of cabbages and the sharpness of the oriental mustards[206]. The plant can be eaten at any stage from seedling to mature plant[206]. Flowering stems - raw or cooked[206]. Sweet and succulent, but becoming hotter as the plant matures[206].

tcanta None known  
dwatta None known  
propta Seed - sow in situ April to September[206]. Some varieties can also be sown in a cold greenhouse in late autumn, winter or early spring to provide leaves overwinter and in late spring.

nwatta Succeeds in full sun in a moisture-retentive well-drained fertile preferably alkaline soil[200, 206]. Prefers a cool moist reasonably fertile soil[52]. The plant is somewhat deeper rooted than many of the oriental brassicas and is more tolerant of drought, though it grows best if it is not short of water[206]. Mustard spinach is widely cultivated in the Orient for its edible leaves, there are many named varieties[206]. It takes 55 - 80 days for plants to reach maturity from sowing[206]. This is a very hardy plant, although knocked back, it has withstood temperatures down to about -14°C and can be cropped for most of the year[206]. It is much less likely to bolt from a spring sowing and is fairly resistant to summer heat[206].

## 7.2.143 Mahonia pumila

Dwarf Barberry  
6 tin 9 cyuc 3 kcaak 3 tcan 2 dwat 0.3 m hkuc  
hmimhtut cyutli hgatkuyctucp hwicli hrasjltunyk hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Mahonia pumila is an evergreen Shrub growing to 0.3 m (1ft) by 2 m (6ft 7in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcaakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. We have seen no reports of edibility for this species, but it is certainly not poisonous. The fruit is likely to have an acid flavour and be suitable for making jams, jellies etc. The fruit is about 10mm in diameter[200].

tcanta DyeA yellow dye is obtained from the inner bark of the stem and roots[155, 257]. It is green[168]. Dark green, violet and dark blue-purple dyes are obtained from the fruit[168]. A green dye is obtained from the leaves[168]. This species forms suckers freely and should make a good dense ground cover in a sunny position[11].

dwatta Antibacterial Antitumor Blood tonic Dysentery TonicA decoction of the roots is used as a blood tonic and as a treatment for coughs[257]. Berberine, universally present in rhizomes of Mahonia species, has marked antibacterial effects[218] and is used as a bitter tonic[213]. Since it is not appreciably absorbed by the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not be used with Glycyrrhiza species (Liquorice) because this nullifies the effects of the berberine[218]. Berberine has also shown antitumour activity[218]. The root and root bark are best harvested in the autumn[213].

propta Seed - best sown as soon as it is ripe in a cold frame[78]. It usually germinates in the spring[K]. 'Green' seed (harvested when the embryo has fully developed but before the seed case has dried) should be sown as soon as it is harvested and germinates within 6 weeks[K]. Stored seed should be sown as soon as possible in late winter or spring. 3 weeks cold stratification will improve its germination, which should take place in 3 - 6 months at 10°C. Prick out the seedlings when they are large enough to handle and grow them on in a cold frame for at least their first winter. Plant them out in late spring or early summer. Division of suckers in spring[78]. Whilst they can be placed direct into their permanent positions, better results are achieved if they are potted up and placed in a frame until established[11]. Leaf cuttings in the autumn.

nwatta An easily grown plant, it thrives in any good well-drained garden soil[11], preferring one on the dryish side. Prefers a sunny position[11], but also succeeds in the light shade of trees[K]. This species is hardy to about -15°C if growing in a sheltered position[184]. Established plants sucker freely and form quite dense thickets[200]. Resistant to honey fungus[88].

## 7.2.144 Castanea alnifolia

Bush Chinkapin  
6 tin 9 cyuc 3 kcaak 2 tcan 0 dwat 1 m hkuc  
htut cyutli hgatkuyctucp hwicli hyishrasjltunyk hpa7tli frusflatprik hpa7tmwatli hjonli

drutta Castanea alnifolia is a deciduous Shrub growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in July, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcaakta Edible Parts: SeedEdible Uses: Seed - raw or cooked[105, 177]. Of excellent quality[183]. The seed is small but it is sweet and larger than C. pumila[11, 183] though produced less abundantly[11]. Eaten raw, there is a distinct astringency, especially if the fleshy inner skin beneath the outer shell of the seed is not removed[K]. When cooked, however, and especially when baked, the seed becomes much sweeter and has a floury texture[K]. It then makes an excellent food and can be used as a staple food in much the same way as potatoes or cereals[K]. The burs have less prickles, making it easier to harvest the seed[183].

tcanta TanninThe bark, leaves, wood and seed husks all contain tannin.

dwatta None known  
propta Seed - where possible sow the seed as soon as it is ripe in a cold frame or in a seed bed outdoors[78]. The seed must be protected from mice and squirrels. The seed has a short viability and must not be allowed to become dry. It can

dwatta Antibacterial Antiphlogistic Depurative FebrifugeAntibacterial, antiphlogistic[174]. There are growth-promoting substances in the leaves[174]. The whole plant is depurative, febrifuge and suppurative[147, 218]. Its use promotes the drainage of pus[147]. A decoction is used in the treatment of boils and abscesses, poisonous snakebites, otitis media, acute attacks of convulsions and haematemesis[147]. The leaf juice is applied to aching ears, abscesses and inflammations[218].

propta Seed - we have no information for this species but suggest sowing the seed in a cold frame in the spring. Surface sow, or only just cover the seed, and make sure that the compost does not dry out. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse or cold frame for their first winter. Plant them out in late spring after the last expected frosts. Division in spring. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Landscape Uses:Alpine garden, Container, Ground cover, Massing, Rock garden, Woodland garden. Prefers a cool position in a moist humus-rich soil[1]. Prefers an acid soil[200]. Thrives on heavy soils in the milder areas of the country[208]. Usually thrives in a poor soil with a northerly aspect[1]. Grows well in light woodland[200] or in a shady position in a rock garden. The plant is hardy to about -10°C[187]. The leaves and the flowers, however, are liable to be damaged by autumn frosts[200]. A very ornamental plant[1], it is sometimes grown as a house plant[200]. A polymorphic species[1], it is closely related to S. cortusifolia, differing in having runners[200]. Special Features:Attractive foliage, Not North American native, Naturalizing, Inconspicuous flowers or blooms. The plant is heat tolerant in zones 9 through 5. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-11 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. An evergreen. A clumping mat former. Forming a dense prostrate carpet spreading indefinitely [1-2].

## 7.2.199 Vitis davidii

Spiny Vitis  
6 tin 9 cyuc 2 kcaak 0 tcan 0 dwat 15 m hkuc  
hmimhtut cyutli kyuctucp hwicli hrasjltunyk hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Vitis davidii is a deciduous Climber growing to 15 m (49ft 3in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from June to July and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcaakta Edible Parts: Fruit LeavesEdible Uses: Fruit - raw or dried for winter use[1, 61]. A harsh flavour[22, 183]. A pleasant flavour according to other reports[11, 200]. Small but sweet[182]. The fruit is about 16mm in diameter[200]. Young leaves are wrapped around other foods and then baked, they impart a pleasant flavour[55]. Young tendrils - raw or cooked[55, 85].

tcanta DyeA yellow dye is obtained from the fresh or dried leaves[168]. Plants can be used as a ground cover in a sunny position[188]. They are best spaced about 3.5 metres apart each way[208]. They can be encouraged to cover the ground by laying brushwood flat on the ground and pegged into position. The twigs would eventually rot and the plant would assume complete and constant control[208].

dwatta None known  
propta Seed - best sown in a cold frame as soon as it is ripe[K]. Six weeks cold stratification improves the germination rate, and so stored seed is best sown in a cold frame as soon as it is obtained. Germination should take place in the first spring, but sometimes takes another 12 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant out in early summer. Cuttings of mature wood of the current seasons growth, December/January in a frame. These cuttings can be of wood 15 - 30cm long or they can be of short sections of the stem about 5cm long with just one bud at the top of the section. In this case a thin, narrow strip of the bark about 3cm long is removed from the bottom half of the side of the stem. This will encourage callusing and the formation of roots. Due to the size of these cuttings they need to be kept in a more protected environment than the longer cuttings. Layering.

nwatta Prefers a deep rich moist well-drained moderately fertile loam[1, 200]. Grows best in a calcareous soil[200]. Succeeds in sun or partial shade though a warm sunny position is required for the fruit to ripen[200]. The young growth in spring can be damaged by late frosts. Plants climb by means of tendrils[182]. They grow particularly well into elm trees[18]. Any pruning should be carried out in winter when the plants are dormant otherwise they bleed profusely[182, 200]. Plants are occasionally cultivated for their edible fruits[46, 61]. Plants in this genus are notably susceptible to honey fungus[200].

## 7.2.200 Jasminum officinale

Jessamine, Poet's jasmine  
6 tin 9 cyuc 2 kcaak 0 tcan 2 dwat 10 m hkuc  
hmimhtut cyutli tcup hwicli hrasjltunyk hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Jasminum officinale is a deciduous Climber growing to 10 m (32ft) by 10 m (32ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: FlowersEdible Uses: Condition TeaFlowers - fragrant. Eaten or used to flavour or scent tea[183]. The dried flowers are a tea substitute[177]. An essential oil from the flowers is used as a condiment in various foods, especially Maraschino cherries but also baked goods, ice cream, sweets, chewing gum etc[183, 238]. It imparts a bitter-sweet floral tone[183].

tcanta Essential ParasiticideAn essential oil from the flowers is used in perfumery[46, 171, 200]. The flowers are picked soon after opening each morning and used fresh for oil extraction[238].

dwatta Antiseptic Antispasmodic Aphrodisiac Aromatherapy Galactogogue Parasiticide TonicThe leaf juice is applied to corns and ear discharges[218, 240]. The leaves contain salicylic acid (found also in the bark of Salix species and used as an analgesic, febrifuge etc)[218, 240]. The root is used in the treatment of ringworm[240]. The flowers are aphrodisiac, antiseptic, antispasmodic, galactogogue and tonic[178, 218, 238]. They are mainly used in aromatherapy (see below). The essential oil is used in aromatherapy. Its keyword is 'Aphrodisiac'[210]. It is used in the treatment of depression, nervous tension, impotence, frigidity, menstrual disorders and weak digestion[238].

propta Seed - best sown as soon as it is ripe in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame. Very easy. Cuttings of mature wood in November. Layering.

nwatta Succeeds in a good well-drained loam[200], preferring a sunny position[182]. Very shade tolerant, it succeeds on a north facing wall[200]. Plants are hardy to about -15°C[184]. They require the protection of a wall in northern Britain but are fully hardy in the south[11]. Another report

given a deep moist soil[11]. Tolerates poor peaty soils[200]. Succeeds in wet cold and shallow soils but is not very wind-firm in shallow soils[1]. Resists wind exposure to some degree[200]. A shallow-rooted tree, in the wild it is often blown down by strong winds[229]. Prefers a pH between 4 to 6[200]. Dislikes shade[200]. Intolerant of atmospheric pollution[11]. This species has been planted experimentally as a timber crop in N. Europe[50]. It is slow to get started, but can then grow fairly rapidly when established though it soon slows down and seems to be fairly short-lived in cultivation, around 100 years is probably the limit[185]. Wild trees live about 300 - 400 years[229]. In some upland areas, especially over granitic or other base-poor soils, growth rate and health have been seriously affected by aluminium poisoning induced by acid rain[200]. Seed production commences when the tree is about 15 years old, though reliable crops are not produced for another 5 - 10 years[229]. Heavy crops occur every 4 - 6 years[229]. Plants are strongly outbreeding, self-fertilized seed usually grows poorly[200]. They hybridize freely with other members of this genus[200]. Closely related to and hybridizes in the wild with *P. mariana*[229]. It is believed by some botanists to be a hybrid between *P. mariana* and *P. glauca*[226]. Trees should be planted into their permanent positions when they are quite small, between 30 and 90cm. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200]. The crushed leaves are redolent of apples or camphor[185]. Special Features: North American native, Inconspicuous flowers or blooms.

## 7.2.196 Ampelopsis arborea

Pepper Vine

6 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 10 m hkuc hmimhtut cyutli tcup hwicli jlut hpa7tli flatprikwis hpa7tmwatli hjonli

drutta Ampelopsis arborea is an evergreen Climber growing to 10 m (32ft 10in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from July to August. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). Suitable for: medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. A poor taste[177]. The fruit is about 8mm in diameter and contains 3 seeds[200, 235]. It is carried in small bunches on the plant, rather like grapes[K]. The flesh is thin and inedible[235].

tcanta None known  
dwatta None known

propta Seed - sow in pots in a cold frame in the autumn or stratify for 6 weeks at 5°C and sow in the spring[200]. Germination can be quite slow, sometimes taking more than a year. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. When they are more than 20cm tall, they can be planted out into their permanent positions, preferably in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm long, July/August in a frame[78]. Cuttings or eyes in late autumn or winter. Either place them in the ground in a greenhouse or cold frame, or put them in pots. An eye cutting is where you have just one bud at the top and a short length of stem with a small part of the bark removed. These normally root well and grow away vigorously, being ready to plant into their permanent positions the following autumn. Layering into pots in late summer. Partially sever the stem in spring and then lift the new plants in the autumn[78].

nwatta Prefers a deep rich loam in a warm sheltered position in sun or semi-shade[200]. A very ornamental plant[1], when dormant it is quite hardy in Britain, but is better grown on a wall[11]. The young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. It rarely flowers or fruits in this country except after a long hot summer[11, 182, 200]. Plants are deciduous in cold winters[219]. Plants climb by means of coiling tendrils but large plants often need tying in to support the weight of

foliage[200]. Any pruning is best carried out in the winter[219].

## 7.2.197 Amaranthus blitoides

Mat Amaranth

6 tlin 10 cyuc 2 kcaak 1 tcan 0 dwat 0.2 m hkuc htut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikwis hpa7tmwatli fyif hjonli

drutta Amaranthus blitoides is a ANNUAL growing to 0.2 m (0ft 8in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 6 and is frost tender. It is in leaf from April to October, in flower from August to September, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcaakta Edible Parts: Leaves SeedEdible Uses: Leaves - raw or cooked[46, 61, 95, 105]. Rich in vitamins and minerals, it is used as a spinach[206, K]. The leaves can be dried and used as a winter food[257]. Seed - raw or cooked[46, 61, 95, 105, 257]. Very small and fiddly, about 1.5mm in diameter[266], but the seed is very nutritious. Rich in starch[177]. The seed can be ground into a powder and used in making porridge, bread, mush, as a flavouring in soups etc[257]. The seed can be cooked whole, and becomes very gelatinous like this, but it is rather difficult to crush all of the small seeds in the mouth and thus some of the seed will pass right through the digestive system without being assimilated[K].

tcanta Adhesive DyeYellow and green dyes can be obtained from the whole plant[168]. A glue is made from the plant[257]. No more information is given, it is likely that the starch from the seed was used[K].

dwatta None known

propta Seed - sow late spring in situ. An earlier sowing can be made in a greenhouse and the plants put out after the last expected frosts. Germination is usually rapid and good if the soil is warm[133]. A drop in temperature overnight aids germination[133]. Cuttings of growing plants root easily[206].

nwatta Prefers a well-drained fertile soil in a sunny position[200]. Requires a hot sheltered position if it is to do well[K]. Plants should not be given inorganic fertilizers, see notes above on toxicity. There is some confusion over the correct name for this species, some authorities say that it is part of *A. graecizans*[58, 60], whilst others say that it is a distinct species[50]. Most if not all members of this genus photosynthesize by a more efficient method than most plants. Called the 'C4 carbon-fixation pathway', this process is particularly efficient at high temperatures, in bright sunlight and under dry conditions[196].

## 7.2.198 Saxifraga stolonifera

Strawberry Saxifrage, Creeping Saxifrage, Strawberry Geranium, Strawberry Begonia

6 tlin 10 cyuc 2 kcaak 2 tcan 2 dwat 0.2 m hkuc hmim cyutli tcup hwicli hyishrasljutnyikrip hpa7tli flatprikwis hpa7tmwatli hjonli

drutta Saxifraga stolonifera is an evergreen Perennial growing to 0.2 m (0ft 8in) by 0.3 m (1ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in leaf all year, in flower from July to August. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcaakta Edible Parts: Leaves StemEdible Uses: Leaves - raw or cooked[105, 177]. Relished in Japan when boiled or fried and used in salads[183]. Flowering stem - said to be tasty when salted[183].

tcanta Can be grown as a ground cover plant in a shady position[188]. Plants should be spaced about 45cm apart each way[208].

be stored in a cool place, such as the salad compartment of a fridge, for a few months if it is kept moist, but check regularly for signs of germination. The seed should germinate in late winter or early spring. If sown in an outdoor seedbed, the plants can be left in situ for 1 - 2 years before planting them out in their permanent positions. If grown in pots, the plants can be put out into their permanent positions in the summer or autumn, making sure to give them some protection from the cold in their first winter[K]. Division of suckers in winter[200]. They can be planted straight out into their permanent positions.

nwatta Prefers a good well-drained slightly acid loam but succeeds in dry soils[1, 11, 200]. Once established, it is very drought tolerant[1, 11, 200]. Very tolerant of highly acid, infertile dry sands[200]. Averse to calcareous soils but succeeds on harder limestones[11, 200]. This species only rarely thrives in areas with hot summers[200], it may not be hardy in Britain[11]. Another report says that it succeeds in climatic zone 7 and should therefore tolerate temperatures down to at least -10°C[200]. Usually a small shrub[11], this species occasionally reaches small-tree size (as *C. alnifolia* floridana. Sarg.][82] This species is similar to and often confused with *C. pumila*[1, 11]. An excellent soil-enriching understorey shrub in pine forests[200]. It grows into a clump by means of suckers[183, 200]. Flowers are produced on wood of the current year's growth[229]. Plants are fairly self-sterile[200]. They hybridize freely with other members of this genus[200]. Plants in this genus are notably resistant to honey fungus[200].

## 7.2.145 Viola cornuta

Horned Violet, Bedding Pansy, Tufted Pansy,

6 tlin 11 cyuc 3 kcaak 0 tcan 0 dwat 0.2 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Viola cornuta is an evergreen Perennial growing to 0.2 m (0ft 8in) by 0.2 m (0ft 8in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf all year, in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Flowers LeavesEdible Uses: TeaY-oung leaves and flower buds - raw or cooked[172]. When added to soup they thicken it in much the same way as okra[85, 159]. Flowers - raw[172]. A tea can be made from the leaves[85].

tcanta A useful ground cover plant for a cool open situation[197]. It needs weeding for the first year or two[197] but then forms an effective weed-excluding cover[233]. Plants are best spaced about 60cm apart each way[208].

dwatta None known

propta Seed - best sown in the autumn in a cold frame. Sow stored seed in early spring in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in the summer. Division in the autumn or just after flowering. Larger divisions can be planted out direct into their permanent positions, though we have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the summer or the following spring.

nwatta Landscape Uses:Border, Container, Rock garden, Woodland garden. Easily grown in any fertile soil in full sun or partial shade[233]. Prefers a well-drained moisture-retentive soil[188]. Tolerates sandstone and limestone soils but becomes chlorotic if the pH is too high. Prefers a pH between 6 and 6.5[200]. A very ornamental plant, there are many named forms[200]. If the plants are cut back after flowering they will flower again in late summer[208]. All members of this genus have more or less edible leaves and flower buds, though those species with yellow flowers can cause diarrhoea if eaten in large quantities[62, 85, 159]. This species has deep-violet flowers[233]. Special Features: Naturalizing, Suitable for cut flowers.

## 7.2.146 Pinus lambertiana

Sugar Pine

6 tlin 9 cyuc 3 kcaak 0 tcan 2 dwat 75 m hkuc htut cyutli hgatkuyctup hwicli hyishrasljut hpa7tli flatprik hpa7tmwatli dyat hjonli

drutta Pinus lambertiana is an evergreen Tree growing to 75 m (246ft 1in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from May to June, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure.

kcaakta Edible Parts: SeedEdible Uses: Condi-ment Gum SweetenerSeed - raw or cooked[1, 2, 62, 63, 92, 257]. A good size, up to 15mm x 10mm[200]. A pleasant sweet nutty flavour[11, 183], with a hint of resin[2]. The nut, together with the shell, can be pulverised into a nut butter[84]. A sugar is obtained from boiling off the water in the sap[1, 2, 63, 92, 94]. Some caution is advised since it is laxative if used in large quantities[95]. A sweet sugar-like substance exudes from wounds made in the heartwood of the tree[81, 82, 183] and also from the cones. It is sometimes used for sweetening foods, though in large quantities it is laxative[2, 183]. The pitch obtained from the trunk is allowed to harden and is then used as a chewing gum[257]. A vanillin flavouring is obtained as a by-product of other resins that are released from the pulpwood[200].

tcanta Adhesive Dye Gum Herbicide Pitch WoodA tan or green dye is obtained from the needles[168]. The needles contain a substance called terpene, this is released when rain washes over the needles and it has a negative effect on the germination of some plants, including wheat[201]. Yields a pitch, though it is not commercially important[64]. Oleo-resins are present in the tissues of all species of pines, but these are often not present in sufficient quantity to make their extraction economically worthwhile[64]. The resins are obtained by tapping the trunk, or by destructive distillation of the wood[4, 64]. In general, trees from warmer areas of distribution give the higher yields[64]. Turpentine consists of an average of 20% of the oleo-resin[64] and is separated by distillation[4, 64]. Turpentine has a wide range of uses including as a solvent for waxes etc. for making varnish, medicinal etc[4]. Rosin is the substance left after turpentine is removed. This is used by violinists on their bows and also in making sealing wax, varnish etc[4]. Pitch can also be obtained from the resin and is used for waterproofing, as a wood preservative etc. The resin is used as an adhesive[257]. Wood - light, soft, straight but coarse grained. Used for lumber; interior finishes etc[46, 82, 84, 171, 229].

dwatta Carminative Laxative Ophthalmic PoulitceThe turpentine obtained from the resin of all pine trees is antiseptic, diuretic, rubefacient and vermifuge[4]. It is a valuable remedy used internally in the treatment of kidney and bladder complaints and is used both internally and as a rub and steam bath in the treatment of rheumatic affections[4]. It is also very beneficial to the respiratory system and so is useful in treating diseases of the mucous membranes and respiratory complaints such as coughs, colds, influenza and TB[4]. Externally it is a very beneficial treatment for a variety of skin complaints, wounds, sores, burns, boils etc and is used in the form of liniment plasters, poultices, herbal steam baths and inhalers[4]. The sap is carminative and laxative[257]. The dried sap powder has been eaten in the treatment of stomach gas, constipation, ulcers etc[46, 61, 84, 92, 94]. It has also been used to make eye drops to treat sore eyes[257].

propta It is best to sow the seed in individual pots in a cold frame as soon as it is ripe if this is possible otherwise in late winter. A short stratification of 6 weeks at 4°C can improve the germination of stored seed[80]. Plant seedlings out into their permanent positions as soon as possible and protect them for their first winter or two[11]. Plants have a very sparse root system and the sooner they are planted into their permanent positions the better they will grow[K]. Trees should be planted into their permanent positions when they are quite small, between 30 and 90cm[200]. We actually plant them out when they are about 5 - 10cm tall. So long

as they are given a very good weed-excluding mulch they establish very well[K]. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200]. Cuttings. This method only works when taken from very young trees less than 10 years old. Use single leaf fascicles with the base of the short shoot. Disbudding the shoots some weeks before taking the cuttings can help. Cuttings are normally slow to grow away[81].

nwatta Thrives in a light well-drained sandy or gravelly loam[1, 11]. Dislikes poorly drained moorland soils[1]. Established plants tolerate drought[200]. Plants have a deep taproot that anchors them firmly when growing in a windy site[229]. A very vigorous tree in Britain, capable of growing 1 metre per year when young[185]. The trees are long-lived in their native environment, but can take 100 years or more before they come into reliable seed bearing[229]. Even then seed production is sparse, with good yields only every 4 - 5 years[229]. The cones open and shed their seed in early autumn whilst still attached to the tree[82, 226]. They are up to 45cm long and often drip with a sweet sap[81]. Unfortunately the cones are seldom borne in Britain[11], though a tree at Hawkestone Park in Shropshire often bears cones[11]. Leaf secretions inhibit the germination of seeds, thereby reducing the amount of plants that can grow beneath the tree[18]. Trees are susceptible to the 'black pine blister rust' and should not be grown near to blackcurrants[120, 200]. This rust killed off all the plantings of this species that were made prior to 1960[185]. Plants in this genus are notably susceptible to honey fungus[200]. Plants are strongly outbreeding, self-fertilized seed usually grows poorly[200]. They hybridize freely with other members of this genus[200]. The crushed leaves and shoots have a sweet grapefruit-like aroma[185].

## 7.2.147 Capsella bursa

Shepherd's Purse  
6 tin 10 cyuc 3 kcaak 3 tcan 2 dwat 0.3 m hkuc  
hmimhtut cyutli kyuctup hwicli hrasjlutnyik hpa7tli frusflat-prikwishsom hpa7tmwatli fyfixre7t hjonli

drutta Capsella bursa-pastoris is a ANNUAL growing to 0.3 m (1ft) by 0.1 m (0ft 4in). See above for USDA hardness. It is hardy to UK zone 6 and is not frost tender. It is in flower all year, and the seeds ripen all year. The species is hermaphrodite (has both male and female organs). The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and saline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcaakta Edible Parts: Leaves Oil SeedEdible Uses: Condiment OilLeaves - raw or cooked[2, 4, 5, 52, 94]. The young leaves, used before the plant comes into flower, make a fine addition to salads[9]. The leaves are a cress and cabbage substitute[12], becoming peppery with age[172]. Leaves are usually available all year round, though they can also be dried for later use[12]. The leaves contain about 2.9% protein, 0.2% fat, 3.4% carbohydrate, 1% ash. They are rich in iron, calcium and vitamin C[179]. A zero moisture basis analysis is available[218]. The young flowering shoots can be eaten raw or cooked[264]. They are rather thin and fiddly but the taste is quite acceptable. They can be available at most times of the year. Seed - raw or cooked[94, 172]. It can be ground into a meal and used in soups etc[102, 183]. It is very fiddly to harvest and utilize, the seed is very small[85]. The seed contains 35% of a fatty oil[179]. This oil can be extracted and is edible[74]. The seedpods can be used as a peppery seasoning for soups and stews[183]. The fresh or dried root is a ginger substitute[85, 172, 183].

tcanta Insecticide Oil Soil reclamationThe seed, when placed in water, attracts mosquitoes. It has a gummy substance that binds the insects mouth to the seed[201]. The seed also releases a substance toxic to the larvae. ½ kilo of seed is said to be able to kill 10 million larvae[172]. Plants can be grown on salty or marshy land in order to reclaim it by absorbing the salt and 'sweetening' the soil[201]. Birds are very fond of the seeds of shepherd's purse[201]. Dynamic accumulator.

dwatta Antiscorbutic Astringent Cancer Diuretic Emmenagogue Haemostatic Homeopathy Hypotensive Oxytoxic Stimulant Urinary Vasoconstrictor Vasodilator Vitamin C VulneraryShepherd's purse is little used in herbalism, though it is a commonly used domestic remedy, being especially efficacious in the treatment of both internal and external bleeding, diarrhoea etc[4, 222]. A tea made from the whole plant is antiscorbutic, astringent, diuretic, emmenagogue, haemostatic, hypotensive, oxytoxic, stimulant, vasoconstrictor, vasodilator and vulnerary[4, 7, 9, 13, 21, 46, 147, 165, 172, 176, 222]. A tea made from the dried herb is considered to be a sovereign remedy against haemorrhages of all kinds - the stomach, the lungs, the uterus and more especially the kidneys[4, 222]. The plant can be used fresh or dried, for drying it is harvested in the summer[9]. The dried herb quickly loses its effectiveness and should not be stored for more than a year[9]. Clinical trials on the effectiveness of this plant as a wound herb have been inconclusive[244]. It appears that either it varies considerably in its effectiveness from batch to batch, or perhaps a white fungus that is often found on the plant contains the medically active properties[244]. The plant has been ranked 7th amongst 250 potential anti-fertility plants in China[218]. It has proven uterine-contracting properties and is traditionally used during childbirth[222]. The plant is a folk remedy for cancer - it contains fumaric acid which has markedly reduced growth and viability of Ehrlich tumour in mice[218]. A homeopathic remedy is made from the fresh plant[4]. It is used in the treatment of nose bleeds and urinary calculus[7]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve Capsella bursa-pastoris Shepherd's Purse for nose bleeds, premenstrual syndrome, wounds and burns (see [302] for critics of commission E).

propta Seed - sow in situ February to May. Seed can also be sown as late as mid autumn[206]. A common weed of disturbed ground, the plant does not normally need any help to maintain itself[K].

nwatta Plants flourish in most soils[17]. They will grow even in the poorest of soils, though in such a situation the plants might only reach a few centimetres tall before they flower and set seed[4]. In rich soils plants will take longer to go to seed and will grow up to 60cm tall[4]. Shepherd's purse is a very common garden weed that can spread freely in cultivated ground. It is usually in flower and producing seed in all months of the year. This species is a prime example of how a plant can be viewed as an annoying weed in some areas of the world whilst in others it is actually cultivated for its wide range of uses[4, 183]. The plant is extensively cultivated in some areas of the world as a cabbage-flavoured spring greens[268], in Japan it is one of the essential ingredients of a ceremonial rice and barley gruel that is eaten on January 7th[183]. The leaves grow rather larger under cultivation, they can be harvested about a month after sowing and can be treated as a cut and come again crop[206]. They do run to seed fairly rapidly, however, especially in hot dry weather or when in poor soils[206, K]. A member of the cabbage family, it is a host plant for many diseases of Brassicaceae[200].

## 7.2.148 Vitis berlandieri

Spanish Grape  
6 tin 9 cyuc 3 kcaak 0 tcan 0 dwat 10 m hkuc  
hmimhtut cyutli kyuctup hwicli hrasjlutnyik hpa7tli flat-prikwish hpa7tmwatli xre7t hjonli

drutta Vitis berlandieri is a deciduous Climber growing to 10 m (32ft 10in). See above for USDA hardness. It is hardy to UK zone 7. It is in flower from June to July, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcaakta Edible Parts: Fruit LeavesEdible Uses: Fruit - raw or dried for winter use[161, 177]. A rich pleasant flavour[2, 183]. The fruit is rather small, but it is borne in very large clusters[2]. It has a slightly bitter flavour, but is pleasant when fully ripe[200]. Young leaves are wrapped

berries are pounded to a pulp and used in the form of a tincture for the relief of paralysis, pains in the limbs, weakness etc[4]. The root is expectorant, febrifuge and tonic[240]. It is used in the treatment of colds and rheumatic ailments[218]. It is harvested in late summer and autumn, and dried for later use[238]. The plant is said to be a malarial preventative and is also used in the treatment of bacterial dysentery - extracts of the leaves have shown bactericidal and antitumor activity[218].

propta Seed - sow March in a greenhouse. It does not need any pre-treatment[113]. Germination is usually free and quick. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in early summer of the following year. Cuttings of half-ripe wood, 5 - 8cm with a heel, July/August in a frame. Good percentage[78]. Cuttings of mature wood of the current seasons growth, November in a cold frame[113].

nwatta Landscape Uses:Border, Container, Pollard, Standard, Specimen. An easily grown plant, it prefers a light well-drained loamy soil in a warm sunny position sheltered from cold drying winds[1, 200]. Succeeds in poor dry soils[238]. Plants tolerate temperatures down to about -10°C[200]. They are not very hardy in Britain, they succeeded outdoors at Kew[K], but in general are best given the protection of a sunny wall outside the milder areas of the country[11]. Plants only flower freely after a warm summer, so they are best grown against a sunny wall even in areas where they are hardy[219]. The flowers are produced so late in the season that they are unlikely to produce viable seed in this country even if they flower properly[K]. The plants require abundant summer sunshine in order to ripen their wood fully, the well-ripened wood is more frost resistant[11, 166]. There are some named forms, selected for their ornamental value[219]. The leaves and stems are strongly aromatic[182]. The flowers have a most pronounced musk-like perfume[245]. Special Features: Not North American native, Fragrant flowers, Attractive flowers or blooms.

## 7.2.194 Dryopteris carthusiana

Narrow Buckler Fern, Spinulose woodfern  
6 tin 8 cyuc 2 kcaak 0 tcan 4 dwat 1 m hkuc  
hmim cyutli tcup hwiicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli hjonli

drutta Dryopteris carthusiana is a FERN growing to 1 m (3ft 3in) by 0.5 m (1ft 8in) at a medium rate. See above for USDA hardness. It is hardy to UK zone 5. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland). It prefers moist or wet soil.

kcaakta Edible Parts: Leaves RootEdible Uses: Root-baked[61]. Some caution is advised, see notes above on toxicity. Old leafstalks on the underground stems can be roasted, peeled and the inner portion eaten[257]. Young curled fronds, harvested as they are developing in the spring, can be boiled and eaten like asparagus[257].

tcanta When spaced about 30cm apart each way, the plants can be grown as a ground cover[208].

dwatta VermifugeThe root contains 'filicin', a substance that paralyses tapeworms and other internal parasites and has been used as a worm expellent[4, 222, 238]. It is one of the most effective treatments known for tapeworms - its use should be immediately followed by a non-oily purgative such as magnesium sulphate in order to expel the worms from the body[238]. An oily purge, such as castor oil, increases the absorption of the fern root and can be dangerous[238]. The root is harvested in the autumn and can be dried for later use, it should not be stored for longer than 12 months[238]. This remedy should be used with caution and only under the supervision of a qualified practitioner[238]. The root is toxic and the dosage is critical[238]. See also the notes above on toxicity.

propta Spores - can be sown at any time of the year in a greenhouse. Surface sow on a sterilised compost and keep moist, possibly by placing the pot in a plastic bag. Germinates in 1 - 3 months at 20°C. Put up small clumps of the plants when they are large enough to handle and grow on in a shady part of the greenhouse until large enough to plant out. Division in spring. Larger clumps can be replanted direct into their permanent positions, though it is best to pot

up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Landscape Uses:Foundation, Ground cover, Massing, Woodland garden. Prefers an acid to neutral soil, succeeding in ordinary fertile soil in a shady position[175, 200]. Requires permanently moist conditions at its roots. A very ornamental plant[1], it is often evergreen in mild winters[188]. Plants spread slowly at the rootstock[233]. Members of this genus are rarely if ever troubled by browsing deer[233]. Special Features:Attractive foliage, Not North American native, Naturalizing, There are no flowers or blooms.

## 7.2.195 Picea rubens

Red Spruce  
6 tin 7 cyuc 2 kcaak 0 tcan 1 dwat 30 m hkuc  
hpa7tli cyutli tcup hwiicli hyishrasjlutnyik hpa7tli frusflatprik hpa7tmwatli hjonli

drutta Picea rubens is an evergreen Tree growing to 30 m (98ft 5in) at a fast rate. See above for USDA hardness. It is hardy to UK zone 3. It is in leaf all year, and the seeds ripen from October to November. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure. It cannot tolerate atmospheric pollution.

kcaakta Edible Parts: Flowers Inner bark Leaves SeedE Uses: Gum TeaYoung shoots. An emergency food, used when all else fails[177]. Young male catkins - raw or cooked. Used as a flavouring[172]. Immature female cones - cooked. The central portion, when roasted, is sweet and syrupy[172]. The cones are 3 - 5cm in diameter[82]. Inner bark - dried, ground into a powder and then used as a thickener in soups etc or added to cereals when making bread[172]. An emergency food, it is only used when all else fails. Seed - raw[172]. The seed is about 2 - 4mm long[229] and is too small and fiddly to be worthwhile unless you are desperate[172]. A refreshing tea, rich in vitamin C, can be made from the young shoot tips[172, 257]. A gum is exuded from the tree as a result of injury to the sapwood. It is used for chewing[46, 61, 171].

tcanta Basketry Fibre Gum Pitch WoodThe bark has been used to make baskets[257]. Pitch can be obtained from the trunk[257]. The roots have been used to make thread for sewing baskets, canoe skins etc[257]. Wood - straight-grained, soft, light, not strong[46, 61, 171, 229]. It weighs 28lb per cubic foot[235]. Used for boxes, sash frames etc. It is also valued for its use in the pulp industry to make paper[46, 61, 171, 229] and is commonly used to produce stringed musical instruments[229].

dwatta Pectoral Poultice Vitamin CA tea made from the boughs has been used in the treatment of colds and to 'break out' measles[222, 257]. The pitch from the trunk has been used as a poultice on rheumatic joints, the chest and the stomach in order to relieve congestion and pain[222]. A decoction of the bark has been used in the treatment of lung complaints and throat problems[257].

propta Seed - stratification will probably improve germination so sow fresh seed in the autumn in a cold frame if possible[80]. Sow stored seed as early in the year as possible in a cold frame[78]. A position in light shade is probably best[78]. Seed should not be allowed to dry out and should be stored in a cool place[80]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse or cold frame for their first winter. They can be planted out into their permanent positions in early summer of the following year, or be placed in an outdoor nursery bed for a year or so to increase in size. They might need protection from spring frosts. Cuttings of semi-ripe terminal shoots, 5 - 8cm long, August in a frame. Protect from frost. Forms roots in the spring[78]. Cuttings of mature terminal shoots, 5 - 10cm long, September/October in a cold frame. Takes 12 months[78]. Cuttings of soft to semi-ripe wood, early summer in a frame. Slowing but sure.

nwatta Landscape Uses:Screen, Specimen. Likes abundant moisture at the roots, if grown in drier areas it must be

dwatta Anthelmintic Aromatic Astringent Febrifuge Laxative PurgativeThe fruit is aromatic, cooling and laxative[240]. Its use allays thirst and it is of help in the treatment of fevers[240]. The bark is anthelmintic and purgative[240]. A paste of the bark is used in the treatment of gingivitis[272]. A decoction of the leaves is used as a gargle in inflammation of the vocal chords[240]. The root is anthelmintic and astringent[240]. A decoction of the root is used in the treatment of internal parasitid[272].

propta The seed germinates best if given 2 - 3 months cold stratification[80, 98]. Sow the seed as soon as it is ripe if possible, otherwise in February in a cold frame. The seed usually germinates in the first spring, though it sometimes takes another 12 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the cold frame for their first winter. Plant them out in late spring or early summer after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in a frame. Plant out in spring. A good percentage take, though they sometimes fail to thrive[78, 113]. Cuttings of mature wood of the current season's growth, 25 - 30cm with a heel of 2 year old wood, autumn or early spring in a cold frame or a shady bed outside[78, 113, 200]. Bury the cuttings to threequarters of their depth. Layering in autumn[200].

nwatta Prefers a warm well-drained loamy soil in a sunny position[1, 11]. Mulberries have brittle roots and so need to be handled with care when planting them out[238]. Any pruning should only be carried out in the winter when the plant is fully dormant because mulberries bleed badly when cut[238]. Ideally prune only badly placed branches and dead wood[238]. This species is closely related to *M. indica*, and is seen as conspecific by some botanists[266]. Plants in this genus are notably resistant to honey fungus[200]. Special Features: Not North American native, Inconspicuous flowers or blooms.

### 7.2.191 Torreya fargesii

6 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 20 m hkuc pcmhmmhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flat-prikliwis hpa7tmwatli nyanhjen hjonli

drutta Torreya fargesii is an evergreen Tree growing to 20 m (65ft 7in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from April to May, and the seeds ripen from October to November. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Oil Oil SeedEdible Uses: Oil OilSeed[81]. No further details are given, but it is likely to be oily and to be eaten raw or cooked. An oil is obtained from the seed[105, 177].

tcanta Oil Oil WoodAn oil is extracted from the seed[266]. The high quality timber is used in constructing houses, bridges, and furniture, and making implements and utensils[266].

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame. Some of the seed should germinate in the following spring though much of it might take another 12 months. Stored seed requires a period of cold stratification and can take 18 months or more to germinate. Prick out the seedlings into individual pots as soon as growth is observed and grow them on in light shade in the greenhouse for at least the next couple of winters, making sure to pot them on into larger pots as and when required. Plant them out into their permanent positions in early summer when the plants are at least 20cm tall. Cuttings of half-ripe shoots in late summer[1]. Cuttings do not grow well[11]. Layering.

nwatta Succeeds in ordinary garden soil, tolerating some lime[1]. Requires a sheltered position and either high humidity or a moist riverside soil[200]. Dislikes wind exposure[200]. Tolerates woodland shade very well[200]. Requires hot, very humid summers for best growth[200]. This

species is considered to be suitable for afforestation and reforestation in China[266]. Trees are hardy only in the milder areas of Britain[81]. The seed takes two summers to mature[229]. Plants are dioecious, but sometimes monoecious plants are seen bearing dioecious branches. Male and female plants must be grown if seed and fruit is required.

### 7.2.192 Fibigia clypeata

6 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 0.6 m hkuc htut cyutli hgatkuyctcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Fibigia clypeata is a PERENNIAL growing to 0.6 m (2ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in June, and the seeds ripen in August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcaakta Edible Parts: LeavesEdible Uses: Young leaves - raw[177]. Used as a cress in salads[2, 183].

tcanta None known

dwatta None known

propta Seed - sow early spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in late spring. If you have sufficient seed then it is worth making an outdoor sowing in situ in the middle of spring.

nwatta Prefers a hot dry well-drained soil in a sunny position[1, 200].

### 7.2.193 Vitex negundo

Huang Ping, Chinese chastetree, Cut Leaf Vitex, Cut-leaf Chastetree

6 tlin 9 cyuc 2 kcaak 0 tcan 3 dwat 3 m hkuc htut cyutli kyucctup hwicli hyishrasjlut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Vitex negundo is a deciduous Shrub growing to 3 m (9ft) by 3 m (9ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcaakta Edible Parts: SeedEdible Uses: Condiment TeaSeed - occasionally used as a condiment[177, 183], it is a pepper substitute. When washed to remove the bitterness it can be ground into a powder and used as a flour[179], though it is very much a famine food used only when all else fails[177]. A tea is made from the roots and leaves[177, 183].

tcanta Basketry Hedge Hedge Insecticide Repellent Soil stabilizationYoung stems are used in basket making and for making wattles[51, 146, 158, 272]. The leaves are used to repel insects in grain stores[51, 146]. Extracts of the leaves have insecticidal activity[218]. The fresh leaves are burnt with grass as a fumigant against mosquitoes[238]. The plant is grown on slopes to counter land slides[272].

dwatta Antibacterial Antitumor Astringent Dysentery Expectorant Febrifuge Malaria Sedative Tonic VermifugeThis species is widely used in Chinese herbal medicine, it is the second most important treatment for chronic bronchitis[218]. (The sub-species *V. negundo cannabifolia* (Sieb. and Zucc.)Hand-Mazz. is used.) The leaves are astringent, febrifuge, sedative, tonic and vermifuge[146, 147, 178, 218, 240]. They are useful in dispersing swellings of the joints from acute rheumatism, and of the testes from suppressed gonorrhoea[240]. The juice of the leaves is used for removing foetid discharges and worms from ulcers, whilst an oil prepared with the leaf juice is applied to sinuses and scrofulous sores[240].They are harvested in early summer and used fresh or dried[238]. A decoction of the stems is used in the treatment of burns and scalds[218]. The dried fruit is vermifuge[240]. The fruit is also used in the treatment of angina, colds, coughs, rheumatic difficulties etc[218]. The fresh

around other foods and then baked, they impart a pleasant flavour: Young tendrils - raw or cooked.

tcanta Dye RootstockUsed as a rootstock[183]. A yellow dye is obtained from the fresh or dried leaves[168].

dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe[K]. Six weeks cold stratification improves the germination rate, and so stored seed is best sown in a cold frame as soon as it is obtained. Germination should take place in the first spring, but sometimes takes another 12 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant out in early summer. Cuttings of mature wood of the current seasons growth, December/January in a frame. These cuttings can be of wood 15 - 30cm long or they can be of short sections of the stem about 5cm long with just one bud at the top of the section. In this case a thin, narrow strip of the bark about 3cm long is removed from the bottom half of the side of the stem. This will encourage callusing and the formation of roots. Due to the size of these cuttings they need to be kept in a more protected environment than the longer cuttings. Layering.

nwatta Prefers a deep rich moist well-drained moderately fertile loam[1, 200]. Grows best in a calcareous soil[200]. Succeeds in sun or partial shade though a warm sunny position is required for the fruit to ripen[200]. Plants climb by means of tendrils[182]. Any pruning should be carried out in winter when the plants are dormant otherwise they bleed profusely[182, 200]. This species is used in breeding programmes for improved grape cultivars[183]. It produces very large clusters of remarkably small fruits[2]. Plants in this genus are notably susceptible to honey fungus[200].

### 7.2.149 Mahonia x media

6 tlin 9 cyuc 3 kcaak 0 tcan 2 dwat m hkuc pcmhmmhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flat-prikliwis hpa7tmwatli xre7t hjonli

drutta Mahonia x media is an evergreen Shrub growing to 2 m (6ft) by 3 m (9ft). See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in leaf all year, in flower from February to April, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. An acid flavour but the fruit is rather nice raw, especially when added to muesli or porridge[K]. Unfortunately, there is relatively little flesh and a lot of seeds[K]. The fruit ripens in early spring and good crops have often been seen on plants growing in sheltered positions[K]. The fruit is produced in large clusters and so is easy to harvest[K].

tcanta None known

dwatta Antibacterial Antitumor Dysentery TonicBerberine, universally present in rhizomes of Mahonia species, has marked antibacterial effects[218] and is used as a bitter tonic[213]. Since it is not appreciably absorbed by the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not be used with Glycyrrhiza species (Licuorice) because this nullifies the effects of the berberine[218]. Berberine has also shown antitumour activity[218]. The root and root bark are best harvested in the autumn[213].

propta Seed - this is a hybrid species and seed will not come true, though some interesting plants might be produced. The seed is best sown as soon as it is ripe in a cold frame[78]. It usually germinates in the spring[K]. ‘Green’ seed (harvested when the embryo has fully developed but before the seed case has dried) should be sown as soon as it is harvested and germinates within 6 weeks[K]. Stored seed should be sown as soon as possible in late winter or spring. 3 weeks cold stratification will improve its germination, which should take place in 3 - 6 months at 10°C. Prick out the seedlings when they are large enough to handle and grow them on in a cold frame for at least their first winter. Plant

them out in late spring or early summer. Division of suckers in spring[78]. Whilst they can be placed direct into their permanent positions, better results are achieved if they are potted up and placed in a frame until established[11]. Leaf cuttings in the autumn. Stems will often root if they are stuck in the ground with most of their leaves removed[182].

nwatta An easily grown shrub, it thrives in any good garden soil including heavy clays. Prefers a semi-shaded woodland position in a damp, slightly acid to neutral humus-rich soil. Survives under very heavy tree shade. The fully dormant plant is hardy to about -15°C[184], though the young growth in spring can be damaged by late frosts. Commonly grown as an ornamental plant, there are several named varieties[182]. This plant often produces a good crop of fruit in April and May. It seems that a sheltered position helps to ensure a good crop, as does growing more than one cultivar together and perhaps also one or both of the parents (*M. bealei* and *M. japonica*)[K]. The cultivars ‘Charity’ and ‘Lionel Fortescue’ have both been seen on a number of occasions with heavy crops[K]. The flowers are very sweetly scented[182].

#### 7.2.150 Allium bolanderi

Bolander's Onion

6 tlin 9 cyuc 3 kcaak 0 tcan 2 dwat 0.2 m hkuc htut cyutli tcup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Allium bolanderi is a BULB growing to 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcaakta Edible Parts: Flowers Leaves RootEdible Uses: Bulb - raw or cooked[105, 161, 177, 257]. The bulb is 10 - 25mm wide[200]. Leaves - raw or cooked. Flowers - raw. Used as a garnish on salads.

tcanta RepellentThe juice of the plant is used as a moth repellent. The whole plant is said to repel insects and moles[20].

dwatta Although no specific mention of medicinal uses has been seen for this species, members of this genus are in general very healthy additions to the diet. They contain sulphur compounds (which give them their onion flavour) and when added to the diet on a regular basis they help reduce blood cholesterol levels, act as a tonic to the digestive system and also tonify the circulatory system[K].

propta Seed - sow spring in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle - if you want to produce clumps more quickly then put three plants in each pot. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in spring once they are growing vigorously and are large enough. Division in spring. The plants divide successfully at any time in the growing season, pot up the divisions in a cold frame or greenhouse until they are growing well and then plant them out into their permanent positions.

nwatta Prefers a sunny position in a light well-drained soil[1]. The bulbs should be planted fairly deep[1]. Most members of this genus are intolerant of competition from other growing plants[203]. Grows well with most plants, especially roses, carrots, beet and chamomile, but it inhibits the growth of legumes[18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. Members of this genus are rarely if ever troubled by browsing deer[233].

### 7.2.151 Quercus hispanica

6 tlin 9 cyuc 3 kcaak 0 tcan 2 dwat 20 m hkuc hmimhtut cyutli tcup hwicli jlutnyikfrip hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta Quercus hispanica is a deciduous Tree growing to 20 m (65ft) by 13 m (42ft). See above for USDA hardiness. It is hardy to UK zone 7. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind.

Suitable for: medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

**kcakta Edible Parts:** Seed**Edible Uses:** Seed - cooked. Up to 2.5cm long. It can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread. The seed contains bitter tannins, these can be leached out by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute.

**tcanta Cork Repellent Tannin Wood**The bark is a source of cork, it can be used for heat and sound insulation, flooring, floats etc. The bark is harvested every 6 - 12 years, being carefully removed so as not to harm the tree. A mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth. Oak galls are excrecences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4]. Wood -

**dwatta Astringent Dysentery**Any galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4].

**propta Seed** - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly. This is a cultivar and it will not breed true from seed.

**nwatta** Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Young plants tolerate reasonable levels of side shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. Grows fairly well in Britain, because of its hybrid parentage between the cork oak and the Turkey oak this tree is potentially a good source of cork for Britain. There are a number of named forms. 'Diversifolia' has a bark that is more corky than the type[11]. Hybridizes freely with other members of the genus[200]. Plants in this genus are notably resistant to honey fungus[200].

## 7.2.152 Crambe orientalis

6 tlin 9 cyuc 3 kcaok 0 tcan 0 dwat 1.2 m hkuc hmimhtut cyutli tcup hwicli hyishrasjlutnyik hpa7tli prik-lwis hpa7tmwatli xre7t hjonli

**drutta Crambe orientalis** is a PERENNIAL growing to 1.2 m (4ft) by 1.2 m (4ft) in. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower in June, and the seeds ripen in August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**kcakta Edible Parts:** Leaves Root Stem**Edible Uses:** CondimentLeaves - cooked. Immature flowering stems - raw or cooked and used like broccoli[2, 74, 105, 183]. Root - cooked. It is very thick and can be used as a horseradish substitute[2, 105, 183].

**tcanta** None known  
**dwatta** None known

**propta Seed** - sow March/April in a seedbed outdoors and either thin the plants out or move them to their permanent positions when about 10cm tall[111]. The young plants are very attractive to slugs so some protection will often be needed. Germination can be slow so it is best to sow the seed in pots in a cold frame[164]. Germination usually takes place in 3 - 26 weeks at 15°c[164]. Prick out the seedlings into individual pots as soon as they are large enough to handle and plant out into their permanent positions when they are at least 10cm tall. Division in spring or autumn[1, 111]. Dig up the root clump and cut off as many sections as you require, making sure they all have at least one growing point. The larger of these divisions can be planted out straight into their permanent positions, though small ones are best potted up and grown on in a cold frame until they are established. Root cuttings, 3 - 10 cm long, in spring[104]. These can be planted straight into the open ground or you can pot them up in the greenhouse and plant them out once they are growing strongly.

**nwatta** An easily grown species, succeeding in a good loam and an open sunny position[1]. Prefers a slightly alkaline soil in a position sheltered from strong winds[200]. Tolerates poor soil and some shade[200]. Dislikes acid soils[1]. Prefers a rather dry soil[187]. Plants are hardy to about -20°c[187]. A deep-rooted plant[233], it dislikes root disturbance[164].

## 7.2.153 Sorbus devoniensis

Devon Whitebeam

6 tlin 9 cyuc 3 kcaok 2 tcan 0 dwat 13 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikklwis hpa7tmwatli fyixre7t hjonli

**drutta Sorbus devoniensis** is a deciduous Tree growing to 13 m (42ft 8in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from May to June, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects, Apomictic (reproduce by seeds formed without sexual fusion). The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

**kcakta Edible Parts:** Fruit**Edible Uses:** Fruit - raw or cooked. The fruit is usually blotted if it is going to be eaten raw[3, 5, 11]. This involves storing the fruit in a cool dry place until it is almost but not quite going rotten. At this stage the fruit has a delicious taste, somewhat like a luscious tropical fruit[K]. The fruit is up to 15mm across[200] and is produced in bunches which makes harvesting easier[K].

**tcanta** Attracts wildlife.

**dwatta** None known

**propta Seed** - best sown as soon as it is ripe in a cold frame[78, 80]. If you have sufficient seed it can be sown in an outdoor seedbed[78, 80]. Stored seed germinates better if given 2 weeks warm then 14 - 16 weeks cold stratification[98], so sow it as early in the year as possible. Prick out the seedlings into individual pots when they are large enough to handle. Seedlings are very slow to put on top-growth for their first year or two[11], but they are busy building up a good root system. It is best to keep them in pots in a cold frame for their first winter and then plant them out into their permanent positions in late spring.

**nwatta** Succeeds in most reasonably good soils in an open sunny position[11]. Tolerates light shade[188], though it fruits better in a sunny position[K]. At one time the fruits of this species were collected and sold in local markets in S.W. England[11, 183]. Plants are susceptible to fireblight[188]. It is part of the aggregate species *S. latifolia*, it breeds true because its seed is produced apomictically[17]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

zone 7. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil and can tolerate drought. It can tolerate atmospheric pollution.

**kcakta Edible Parts:** Fruit**Edible Uses:** Fruit - raw or cooked[177]. The fruit is about 3cm in diameter[200].

**tcanta** None known

**dwatta** None known

**propta Seed** - best sown in a cold frame as soon as it is ripe in the autumn, it will then usually germinate in mid to late winter. Stored seed requires 8 - 10 weeks cold stratification at 1°c and should be sown as early in the year as possible[200]. Temperatures over 15 - 20°c induce a secondary dormancy in the seed[200]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in a cold frame or greenhouse for their first year. Plant them out in late spring or early summer of the following year.

**nwatta** Prefers a good well-drained loam in full sun[200]. Grows well in heavy clay soils. Tolerates light shade but does not fruit so well in such a position. Tolerates atmospheric pollution, excessive moisture and a range of soil types if they are moderately fertile[200]. Established plants are drought tolerant[200]. Plants are hardy to about -15°c[200]. This species is closely related to *P. amygdaliformis*[11].

## 7.2.188 Cardamine lyrata

6 tlin 9 cyuc 2 kcaok 0 tcan 0 dwat 0.5 m hkuc hmimhtut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flatprikklwis hpa7tmwatli fyixre7t hjonli

**drutta Cardamine lyrata** is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to June, and the seeds ripen from May to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

**kcakta Edible Parts:** Leaves Root**Edible Uses:** Leaves - raw or cooked[105, 177]. Root - raw or cooked[105, 177].

**tcanta** None known

**dwatta** None known

**propta Seed** - sow spring in a cold frame. Germination usually takes place within 1 - 3 weeks at 15°c[175]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in a greenhouse or cold frame for the first two years, planting them out when dormant in late summer. Division in early spring or after the plant dies down in the summer. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

**nwatta** Succeeds in most soils[1]. Prefers a moist humus rich soil in shade or semi-shade[200]. A stoloniferous species[200].

## 7.2.189 Ephedra gerardiana

Ma Huang, Gerard jointfir

6 tlin 9 cyuc 2 kcaok 0 tcan 4 dwat 0.6 m hkuc htut cyutli hgtakkyuctup hwicli hrasjlut hpa7tli flatprikklwis hpa7tmwatli nyanhjen hjonli

**drutta Ephedra gerardiana** is an evergreen Shrub growing to 0.6 m (2ft) by 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It

cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

**kcakta Edible Parts:** Fruit**Edible Uses:** Fruit - raw[105, 146]. A sweet flavour[158]. The fruit is about 7mm in diameter[200].

**tcanta Fuel**The wood is very close grained[158]. Too small for commercial exploitation, though it is used locally for fuel[146]. A good ground cover plant for dry soils[188]. Plants should be spaced about 60cm apart each way[208].

**dwatta Antiasthmatic Antirheumatic Cardiotonic Diaphoretic Diuretic** Fibrifuge Tonic Vasodilator VD VulneraryMembers of this genus contain various medicinally active alkaloids (but notably ephedrine) and they are widely used in preparations for the treatment of asthma and catarrh[238]. Ephedrine acts promptly to reduce swellings of the mucous membranes and has antispasmodic properties, thus making it valuable in the treatment of asthma[4]. This species contains between 0.28 and 2.79 alkaloids[240]. The whole plant can be used at much lower concentrations than the isolated constituents - unlike using the isolated ephedrine, using the whole plant rarely gives rise to side-effects[254]. The plant also has antiviral effects, particularly against influenza[238]. The stems are a pungent, bitter, warm herb that dilates the bronchial vessels whilst stimulating the heart and central nervous system[238]. The stems are also diaphoretic, diuretic and vasodilator[4, 61, 165, 238]. They are used internally in the treatment of asthma, hay fever and allergic complaints[238]. They are also combined with a number of other herbs and used in treating a wide range of complaints[238]. This herb should be used with great caution, preferably under the supervision of a qualified practitioner[238]. It should not be prescribed to patients who are taking monoamine oxidase inhibitors, or suffering from high blood pressure, hyperthyroidism or glaucoma[238]. Ephedrine is seen as a performance-boosting herb and, as such, is a forbidden substance in many sporting events such as athletics[K]. The stems are used in Tibetan medicine, where they are considered to have a bitter taste and a cooling potency[241]. Fibrifuge, tonic and vulnerary, they are used in the treatment of severe bleeding and chronic fevers[241]. A decoction of the stems and roots is used in Russia to treat rheumatism and syphilis[243]. The stems can be harvested at any time of the year and are dried for later use[238]. The juice of the berries is used to treat respiratory affections[243].

**propta Seed** - best sown as soon as it is ripe in the autumn in a greenhouse[200]. It can also be sown in spring in a greenhouse in a sandy compost[K]. Prick out the seedlings into individual pots as soon as they are large enough to handle and grow them on for at least their first winter in a greenhouse. Plant out in the spring or early summer after the last expected frosts and give some protection in their first winter[K]. Division in spring or autumn[238]. Layering.

**nwatta** Requires a well-drained loamy soil and a sunny position[11]. Established plants are drought resistant and are also lime tolerant[200]. Plants are hardy to about -15°c[200]. Dioecious. Male and female plants must be grown if seed is required.

## 7.2.190 Morus australis

Korean Mulberry, Aino Mulberry

6 tlin 9 cyuc 2 kcaok 0 tcan 2 dwat 7.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikklwis hpa7tmwatli fyit hjonli

**drutta Morus australis** is a deciduous Tree growing to 7.5 m (24ft 7in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to June, and the seeds ripen from July to September. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**kcakta Edible Parts:** Fruit**Edible Uses:** Fruit - raw[3, 272]. Sweet and juicy[183] but insipid[1, 11]. The fruit is about 15mm in diameter[200].

**tcanta Fibre**The bark fibers are used for making paper[266].

mulch in the autumn[238, K]. This species is probably a hybrid between sweet marjoram (*O. majorana*) and Oregano (*O. vulgare*). It resembles *O. majorana* in appearance and aroma, and has the same culinary uses, but is more tolerant of British winters[238]. A good companion plant, improving the flavour of nearby plants[14, 18, 20]. The flowers are very attractive to bees[108]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 7.2.185 Quercus acuta

Japanese Evergreen Oak  
6 tlin 9 cyuc 2 kcaak 0 tcan 2 dwat 25 m hkuc  
hmimhtut cyutli tcup hwicli jltunyk hpa7tli flatprklwis hpa7tmwatli hjonli

drutta *Quercus acuta* is an evergreen Tree growing to 25 m (82ft 0in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: SeedEdible Uses: Seed - cooked[105, 177]. About 2cm long[200]. It can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread. The seed contains bitter tannins, these can be leached out by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute.

tcanta Repellent Tannin WoodA mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth. Oak galls are excrescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4].

dwatta Astringent DysenteryAny galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4].

propta Seed - quickly loses viability if allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed but must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Landscape Uses:Screen, Specimen, Street tree. Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Unsuitable for chalky soils[1]. Young plants tolerate reasonable levels of side shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. Prefers warmer summers than are usually experienced in Britain, trees often grow poorly in this country and fail to properly ripen their wood resulting in frost damage overwinter[200]. A very ornamental tree[1], it grows best in the milder areas of the country[11]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. Hybridizes freely with other members of the genus[200]. Plants in this genus are notably resistant to honey fungus[200]. Special Features:Attractive foliage, Not North American native, Inconspicuous flowers or blooms.

## 7.2.186 Saussurea costus

Costus  
6 tlin 9 cyuc 2 kcaak 0 tcan 3 dwat 3 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprklwis hpa7tmwatli xre7t hjonli

drutta *Saussurea costus* is a PERENNIAL growing to 3 m (9ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Edible Uses: CondimentThe aromatic root is sometimes used as a spice[183]. It has a characteristic penetrating odour reminiscent of violet, orris and vetiver[183].

tcanta Essential Hair IncenseAn essential oil obtained from the roots is used medicinally, in perfumery, incenses and as a hair rinse when it is said to darken grey hair[61]. It has a strong lingering scent[238]. The smell is at first like violets, but as it ages it can become more fur-like or eventually become unpleasantly goat-like[245]. The roots are cut into lengths about 8cm long and then dried before being exported[211]. Smaller pieces of the root are ground into a powder and then used to make incense sticks[211]. The longer clean pieces are cut into very thin slices and then burnt at shrines or used as a tonic in hot baths[211].

dwatta Anodyne Antibacterial Antispasmodic Aphrodisiac Carminative Emmenagogue Skin Stimulant Tonic VermifugeCostus is a commonly used medicinal herb in China and is considered to be one of their 50 fundamental herbs[218]. It is also used in Ayurvedic medicine where it is valued mainly for its tonic, stimulant and antiseptic properties[254]. It is said to be aphrodisiac and to be able to prevent the hair turning grey[254]. The root is anodyne, antibacterial, antispasmodic, aphrodisiac, carminative, skin, stimulant, stomachic, tonic and vermifuge[61, 147, 176, 218]. It is used internally in the treatment of abdominal distension and pain, chest pains due to liver problems and jaundice, gall bladder pain, constipation associated with energy stagnation, and asthma[238]. The root is harvested in the autumn or spring and either dried for later use or decocted for the essential oil[238]. It is normally used with other herbs[218]. The root is also used in Tibetan medicine where it is considered to have an acrid, sweet and bitter taste with a neutral potency[241]. It is used in the treatment of swelling and fullness of the stomach, blockage and irregular menses, pulmonary disorders, difficulty in swallowing and rotting/wasting of muscle tissues[241]. An oil from the root is very beneficial in the treatment of rheumatism[211].

propta Seed - we have no information for this species but suggest sowing the seed in a cold frame in the spring. Surface sow, or only just cover the seed, and make sure that the compost does not dry out. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse or cold frame for their first winter. Plant them out in late spring after the last expected frosts. Division in spring might be possible.

nwatta Succeeds in most soils in a sunny well-drained position[1]. Cultivated as a medicinal plant and for its use in perfumery in the Himalayas[51, 245]. The dried root has something of the mossy smell of violets when fresh, becoming fur-like or even unpleasantly goat-like with age[245]. Most of the roots are exported to China and Japan and the plant forms quite a large article of commerce in Kashmir, the trade being controlled by the State[211]. Wild plants have been greatly over-collected and the plant has been placed on the CITES I list of endangered species - it is now illegal to dig them up for export[238].

## 7.2.187 Pyrus persica

6 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 6 m hkuc  
hmimhtut cyutli hgattcup hwicli hrasjlutnyik hpa7tli flatprklwis hpa7tmwatli xre7t hjonli

drutta *Pyrus persica* is a deciduous Tree growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK

## 7.2.154 Allium carinatum

Keeled Garlic  
6 tlin 9 cyuc 3 kcaak 0 tcan 2 dwat 0.6 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyikfrp hpa7tli flatprklwis hpa7tmwatli xre7t hjonli

drutta *Allium carinatum* is a BULB growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Bulb - raw or cooked[22]. The bulb is very small, about 15mm tall and 10mm in diameter[203, 235]. Leaves - raw or cooked. Flowers - raw. Bulbils - raw or cooked. Rather small and fiddly to use, but they have a fairly pleasant onion/garlic flavour[K].

tcanta RepellentThe juice of the plant is used as a moth repellent. The whole plant is said to repel insects and moles[20].

dwatta Although no specific mention of medicinal uses has been seen for this species, members of this genus are in general very healthy additions to the diet. They contain sulphur compounds (which give them their onion flavour) and when added to the diet on a regular basis they help reduce blood cholesterol levels, act as a tonic to the digestive system and also tonify the circulatory system[K].

propta Seed - sow spring in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle - if you want to produce clumps more quickly then put three plants in each pot. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in spring once they are growing vigorously and are large enough. Division in spring. Very easy, the plants divide successfully at any time in the growing season and the divisions can be planted straight out into their permanent positions if required. Bulbils are harvested in late summer and can be planted out immediately in situ or stored and planted out in spring.

nwatta Prefers a sunny position in a light well-drained soil[1]. Succeeds in clay soils[203]. The bulbs should be planted fairly deeply[1]. Most members of this genus are intolerant of competition from other growing plants[203]. Grows well with most plants, especially roses, carrots, beet and chamomile, but it inhibits the growth of legumes[18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. A good plant for the wild garden[42]. This species can become very invasive by means of its bulbils[203]. The sub-species *A. carinatum pulchellum* Bonnier, and *Layens.* is much better behaved and makes a good garden plant[203]. Closely allied to *A. oleraceum*[1]. Produces new growth in early autumn[K]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 7.2.155 Commelina communis

Day Flower, Asiatic dayflower  
6 tlin 9 cyuc 3 kcaak 1 tcan 2 dwat 0.8 m hkuc  
hmimhtut cyutli kyuctcup hwicli hrasjlut hpa7tli flatprklwis hpa7tmwatli xre7t hjonli

drutta *Commelina communis* is a PERENNIAL growing to 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Flowers LeavesEdible Uses: Leaves, flowers and young shoots - raw or cooked[2, 105, 177]. Chopped finely and added to salads or cooked as a potherb[183]. A sweet taste with a mucilaginous texture[179].

tcanta DyeA bright blue dye is obtained from the petals[74].

dwatta Antibacterial Astringent Depurative Diuretic FebrifugeThe leaves are depurative, diuretic and febrifuge[116, 147]. Used as a throat gargle to relieve sore throats and tonsillitis[116, 266]. A decoction of the dried plant is used to treat bleeding, diarrhoea, fever etc[218]. Extracts of the plant show antibacterial activity[218].

propta Seed - sow March in a greenhouse. The seed usually germinates in 4 - 5 weeks at 20°C[164]. When they are large enough to handle, prick the seedlings out into individual pots plant them out in late spring or early summer, after the last expected frosts. Division in early spring. Make sure that each portion has at least one growing bud[111, K]. Cuttings during the growing season. Very easy[200].

nwatta Prefers a light well-drained loam with added leaf-mold[1, 42]. Requires a sheltered position[42]. This species is commonly cultivated as a vegetable in China[2]. The plant can be invasive[42], the stems sprawling along the ground and rooting as they go[K].

## 7.2.156 Aster scaber

6 tlin 9 cyuc 3 kcaak 2 tcan 0 dwat 1.2 m hkuc  
htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprklwis hpa7tmwatli fyfxre7t hjonli

drutta *Aster scaber* is a PERENNIAL growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from August to October, and the seeds ripen from September to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young plant[105, 177]. Frequently used in Korean cuisine and called *chamchi* or *chwinamul*. The leaves are stir-fried or blanched. Used in *namul* - A Korean herbal side dish. Used as a flavoring herb in *kimchi* or rice.

tcanta Attracts wildlife. A good food forest plant for moist soil and sunny conditions.

dwatta None known  
propta Seed - surface sow in spring in a cold frame. Do not allow the compost to become dry. Pre-chilling the seed for two weeks can improve germination rates[134]. Germination usually takes place within 2 weeks at 20°C[134]. When large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring or autumn[200]. Very easy, larger divisions can be planted straight into their permanent positions whilst smaller clumps are best potted up and kept in a cold frame until they are growing away well.

nwatta Succeeds in most good garden soils[1], preferring one that is well-drained and moisture retentive[200]. Prefers a sunny position[200]. Most species in this genus seem to be immune to the predations of rabbits[233]. Hybridizes freely with other members of this genus[200].

## 7.2.157 Poncirus trifoliata

Bitter Orange, Hardy orange, Trifoliat Orange, Japanese Hardy Orange

6 tlin 9 cyuc 3 kcaak 3 tcan 2 dwat 3 m hkuc  
hmimhtut cyutli tcup hwicli hyishrasjlutnyik hpa7tli frusflatprklwisslip hpa7tmwatli fyfxre7t hjonli

drutta *Poncirus trifoliata* is a deciduous Shrub growing to 3 m (9ft) by 3 m (9ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from April to May, and the seeds ripen from September to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Fruit LeavesEdible Uses: Condi-mentFruit - cooked. A bitter and acrid flavour, but it can be used to make a marmalade[3, 11, 105]. The fruit is also

used to make a refreshing drink[61, 183]. The freshly picked fruit yields little juice but if stored for 2 weeks it will yield about 20% juice[183], which is rich in vitamin C. Yields of up to 14 kilos of fruit per plant have been achieved in America[160]. The fruit is 2 - 3cm wide[188], though most of this is the skin[K]. The fruit peel can be used as a flavouring[183]. Young leaves - cooked[183].

tcanta Hedge Hedge RootstockUsed as a rootstock for Citrus species (oranges, lemons etc)[105, 160]. It confers an extra 3°C resistance to the cold[160]. The plant is very thorny and makes an excellent impenetrable barrier or hedge[3, 11, 29], though this barrier is not very dense[K]. The plants are very tolerant of pruning[182], they are best clipped in early summer shortly after flowering[200, 245].

dwatta Antiemetic Antispasmodic Carminative Deobstruent Digestive Diuretic Expectorant Laxative Odontalgic Stimulant Stomachic Vasoconstrictor Vitamin CThe thorns are used in the treatment of toothache[218]. The stem bark is used in the treatment of colds[218]. The fruits contain a number of medically active constituents including flavonoids, coumarins, monoterpenes and alkaloids[279]. The fruit, with the endocarp and seeds removed, is carminative, deobstruent and expectorant[176]. It is used in the treatment of dyspepsia, constipation and abdominal distension, stuffy sensation in the chest, prolapse of the uterus, rectum and stomach[176]. It is milder in effect than the immature fruit and is better used for removing stagnancy of food and vital energy in the spleen and stomach[176]. The unripe fruit is anti-diarrhetic, antiemetic, antispasmodic, deobstruent, digestive, diuretic, laxative, stimulant, stomachic and vasoconstrictor[147, 176, 178, 218]. It is used in the treatment of dyspepsia, constipation and abdominal distension, stuffy sensation in the chest, prolapse of the uterus, rectum and stomach, shock[176].

propta Seed - best sown as soon as it is ripe in a cold frame[200]. Cold stratify stored seed for 4 weeks and sow early spring in a greenhouse[113]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in early summer. Cuttings of half-ripe wood, June/July in a frame[1].

nwatta Landscape Uses:Border, Espalier, Foundation, Hedge, Screen, Standard, Winter interest. An easily grown plant, it succeeds in an ordinary garden soil[1], preferably well-drained[182], but prefers a fertile light sandy soil in a sunny position[11, 200]. A plant is growing and fruiting well in light woodland shade at Cambridge Botanical Gardens[K]. Plants dislike soil cultivation close to their roots and so should either be well mulched to prevent weed growth, or hand weeded[202]. Succeeds in poor acid soils[229]. Plants also succeed in chalk-laden soils[245]. Hardy to about -15°C[184]. Plants have survived -30°C of frost without injury according to one report[11]. The bitter orange hybridizes with Citrus species and could possibly be used in breeding programmes to produce hardier forms of oranges, lemons etc[61, 160]. It could also be of value in conferring disease resistance, tolerance of poorer soils and dwarfing characteristics. The flowers are produced on the previous years wood[200]. The whole plant, but especially the flowers[202], is strongly aromatic[182]. A very ornamental plant[1, 11], the fruits are freely formed in south-western Britain[11, 59]. A hedge at Wisley in a semi-shaded position fruits heavily in most years[K]. Another report says that warm autumns are required if the plant is to fruit freely. Fertile seed is produced after warm summers[182]. Plants are relatively short-lived, deteriorating after about 25 years[202]. Special Features: Not North American native, Naturalizing, Fragrant flowers, Attractive flowers or blooms.

## 7.2.158 Foeniculum vulgare azoricum

Florence Fennel

6 tlin 9 cyuc 3 kcaak 3 tcan 3 dwat 1.5 m hkuc  
htut cyuti kyuctcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatti fyfxfre7t hjonli

drutta Foeniculum vulgare azoricum is a PERENNIAL growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from August to October, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is

self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate strong winds but not maritime exposure.

kckahta Edible Parts: Leaves Root Seed StemEdible Uses: CondimentLeaves - raw or cooked[52]. A delicious aniseed flavour, the young leaves are best since older ones become tough. They make a very nice addition to mixed salads[K]. Leaf stalks and stem base - raw, cooked or used as a flavouring in soups etc[50, 61, 183]. A strong, aniseed flavour[K]. They are often blanched before being eaten[183]. Very low in carbohydrates, proteins and fats[132]. Seeds raw or cooked. They have a delicious aniseed flavour and are used as a flavouring in cakes, bread etc[52, 183]. Root-cooked[53]. The flavour is somewhat parsnip-like[K]. A herb tea can be made from the seeds or the leaves[16, 183].

tcanta Dye Essential Repellent StrewingThe seed yields up to 5% of an essential oil[1, 4, 46]. This is used medicinally, as a food flavouring, in toothpastes, soaps, perfumery, air fresheners etc[1, 46, 238]. The flavour of fennel oil depends upon its two main constituents. 'Fenchone' is a bitter tasting element whilst 'anethole' has a sweet anise-like flavour[238]. The proportions of these two ingredients varies according to strain and region. Plants growing in the Mediterranean and southern Europe usually have a sweet oil whilst plants growing in central and northern Europe usually produce a more bitter oil[238]. The quality of the oil also depends upon how well the seed has been dried - the oil from fully ripened and dried seeds being much sweeter and more fragrant[245]. The dried plant is an insect repellent[14, 53], the crushed leaves are effective for keeping dogs free of fleas[201]. The plant was formerly used as a strewing herb[201]. Yellow and brown dyes are obtained from the flowers and leaves combined[168].

dwatta Analgesic Antinflammatory Antispasmodic Aromatic Carminative Diuretic Emmenagogue Expectorant Galactogogue Hallucinogenic Stimulant Stomachic UrinaryFennel is a commonly used household remedy, being useful in the treatment of a variety of complaints, especially those of the digestive system. The seeds, leaves and roots can be used, but the seeds are most active medicinally and are the part normally used[4]. An essential oil is often extracted from the seed for medicinal use, though it should not be given to pregnant women[4, 238]. The plant is analgesic, anti-inflammatory, antispasmodic, aromatic, carminative, diuretic, emmenagogue, expectorant, galactogogue, hallucinogenic, laxative, stimulant and stomachic[4, 7, 9, 21, 147, 165, 176, 192, 238]. Fennel is often added to purgatives in order to allay their tendency to cause gripe, and also to improve the flavour[4]. An infusion of the root is used to treat urinary disorders[238]. An essential oil obtained from the seed is used in aromatherapy. Its keyword is 'Normalising'[210]. The essential oil is bactericidal, carminative and stimulant[218]. Some caution is advised, see notes above on toxicity[222].

propta Seed - best sown in early spring in situ[1]. Division in March as the new growth appears[16, 200].

nwatta Succeeds in most soils[1] but prefers a sunny dry position[200]. A cultivated form of *F. vulgare*, grown for its edible swollen leaf bases, there are some named varieties[183]. This is the genuine Florence fennel[200]. Attracts bees and hoverflies[24]. Fennel is a poor companion plant in the garden, it inhibits the growth of nearby plants, especially beans, tomatoes and kohlrabi[14, 18]. It is itself inhibited by wormwood and coriander[14, 18].

## 7.2.159 Corylus jacquemontii

Indian Tree Hazel

6 tlin 9 cyuc 3 kcaak 0 tcan 0 dwat 25 m hkuc  
hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwisslip hpa7tmwatti fyif hjonli

drutta Corylus jacquemontii is a deciduous Tree growing to 25 m (82ft 0in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from April to May, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow

hmimhtut cyuti kyuctcup hwicli hrasljutnyik hpa7tli priklwis hpa7tmwatti fyfxfre7t hjonli

drutta Ophrys apifera is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from April to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kckahta Edible Parts: RootEdible Uses: Root - cooked. It is a source of 'salep', a fine white to yellowish-white powder that is obtained by drying the tuber and grinding it into a powder[200]. Salep is said to be very nutritious and is made into a drink or added to other cereals and used in bread etc[183]. One ounce of salep is said to be enough to sustain a person for a day[100, 115]. The salep can also be made into a drink[100].

tcanta None known

dwatta Demulcent NutritiveSalep (see above for more details) is very nutritive and demulcent[4]. It has been used as a diet of special value for children and convalescents, being boiled with water, flavoured and prepared in the same way as arrowroot[4]. Rich in mucilage, it forms a soothing and demulcent jelly that is used in the treatment of irritations of the gastro-intestinal canal[4]. One part of salep to fifty parts of water is sufficient to make a jelly[4]. The tuber, from which salep is prepared, should be harvested as the plant dies down after flowering and setting seed[4].

propta Seed - surface sow, preferably as soon as it is ripe, in the greenhouse and do not allow the compost to dry out. The seed of this species is extremely simple, it has a minute embryo surrounded by a single layer of protective cells. It contains very little food reserves and depends upon a symbiotic relationship with a species of soil-dwelling fungus. The fungal hyphae invade the seed and enter the cells of the embryo. The orchid soon begins to digest the fungal tissue and this acts as a food supply for the plant until it is able to obtain nutrients from decaying material in the soil[200]. It is best to use some of the soil that is growing around established plants in order to introduce the fungus, or to sow the seed around a plant of the same species and allow the seedlings to grow on until they are large enough to move. This species only rarely forms new offsets and so division is seldom feasible, the following methods can be tried, however[230]. Division of the tubers as the flowers fade[230]. This species produces a new tuber towards the end of its growing season. If this is removed from the plant as its flowers are fading, the shock to the plant can stimulate new tubers to be formed. The tuber should be treated as being dormant, whilst the remaining plant should be encouraged to continue in growth in order to give it time to produce new tubers[230]. Division can also be carried out when the plant has a fully developed rosette of leaves but before it comes into flower[230]. The entire new growth is removed from the old tuber from which it has arisen and is potted up, the cut being made towards the bottom of the stem but leaving one or two roots still attached to the old tuber. This can often be done without digging up the plant. The old tuber should develop one or two new growths, whilst the new rosette should continue in growth and flower normally[230].

nwatta Plants can be grown in a lawn, but the lawn must not be cut until the plants have set seed[200]. When well-suited, the plants can multiply rapidly[230]. Grows well in a sunny dry border or on a screed[230]. Orchids are, in general, shallow-rooting plants of well-drained low-fertility soils. Their symbiotic relationship with a fungus in the soil allows them to obtain sufficient nutrients and be able to compete successfully with other plants. They are very sensitive to the addition of fertilizers or fungicides since these can harm the symbiotic fungus and thus kill the orchid[230]. This symbiotic relationship makes them very difficult to cultivate, though they will sometimes appear uninvited in a garden and will then thrive. Transplanting can damage the relationship and plants might also thrive for a few years and then disappear, suggesting that they might be short-lived perennials[230]. This species can often appear in disturbed habitats well away from its normal preferred sites on chalk and limestone hills[230]. The flowers resemble a female insect and also emit a scent similar to female pheromones. This species is unique in the genus, however, in that it is not pollinated by

insects but is self-pollinated[230]. Tubers should be planted out whilst they are dormant, this is probably best done in the autumn[200]. They should be planted at least 5cm below soil level[200].

## 7.2.184 Origanum x majoricum

Hardy Marjoram

6 tlin 9 cyuc 2 kcaak 0 tcan 2 dwat m hkuc  
hmimhtut cyuti kyuctcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatti xre7t hjonli

drutta Origanum x majoricum is a PERENNIAL growing to 0.6 m (2ft) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to September, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kckahta Edible Parts: LeavesEdible Uses: Condiment TeaThe following uses are for *O. majorana*. They almost certainly also apply to this plant. Leaves - raw or cooked[2, 52]. Sweet marjoram is widely used as a flavouring for salad dressings, vegetables, legumes and oils[7, 14, 27, 61, 171, 238]. It has a more delicate flavour than the closely related oregano (*Origanum vulgare*), and is best when used fresh and only added towards the end of cooking[238]. The aromatic seeds are used as a flavouring in sweets, drinks etc[183]. A herb tea is made from the fresh or dried leaves[21, 183]. The flavour resembles a blend of thyme, rosemary and sage[183].

tcanta Disinfectant Dye EssentialThe following uses are for *O. majorana*. They almost certainly also apply to this plant. The leaves and flowers yield 0.3 - 0.4% essential oil by steam distillation[240]. Called 'Oil of Sweet Marjoram', it is used as a food flavouring and in perfumery, soaps, hair products etc[57, 61, 171, 238]. The plant is often used to disinfect bee hives[7].

dwatta Antiseptic Antispasmodic Aromatherapy Carmative Chologogue Diaphoretic Disinfectant Emmenagogue Expectorant Stimulant Stomachic TonicThe following uses are for *O. majorana*. They almost certainly also apply to this plant. The herb is antiseptic, antispasmodic, carminative, chologogue, diaphoretic, diuretic, emmenagogue, expectorant, stimulant, stomachic and mildly tonic[4, 7, 21]. It is taken internally in the treatment of bronchial complaints, tension headaches, insomnia, anxiety, minor digestive upsets and painful menstruation[238]. It should not be prescribed for pregnant women[238]. Externally, it is used to treat muscular pain, bronchial complaints, arthritis, sprains and stiff joints[238]. The plant is harvested as flowering begins and can be used fresh or dried. Marjoram is often used medicinally in the form of the essential oil, about 400 grams being obtained from 70 kilos of the fresh herb[4]. The oil is used as an external application for sprains, bruises etc[4]. The essential oil is used in aromatherapy. Its keyword is 'Muscle relaxant'[210].

propta Seed - this species is a sterile hybrid and so does not produce seed. If you wanted to grow it from seed then you would need to hybridise *O. vulgare* x *O. majorana*. The resulting seedlings would be rather variable. Division in March or October. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer. Basal cuttings of young barren shoots in June. Very easy. Harvest the shoots with plenty of underground stem when they are about 8 - 10cm above the ground. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Requires a rather dry, warm, well-drained soil, but is not fussy as to soil type[18], thriving on chalk[1, 37]. Prefers slightly alkaline conditions[200]. Plants are not hardy in all parts of Britain, they tolerate temperatures down to about -5°C, possibly lower if the roots are given a good

or spring. Stored seed should be pre-soaked in warm water for 48 hours and then given 2 weeks warm followed by 3 - 4 months cold stratification[164]. Germinates in 1 - 6 months at 20°c[164]. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame or sheltered place outdoors for their first winter. Plant them out into their permanent positions in late spring or early summer[K]. Layering in autumn. Easy, it takes about 6 months[78, 200].

nwatta An easily grown plant, it succeeds in most soils, but is in general more productive of seeds when grown on soils of moderate fertility[11, 200]. It does less well in rich heavy soils or poor ones[11, 63]. Does well in a loamy soil[11]. Very suitable for an alkaline soil[11], but it dislikes very acid soils[17]. Plants are fairly wind tolerant[1, 11]. An upright growing tree that does not produce suckers[183]. This species is closely related to *C. ferox*[11, 200]. Members of this genus bear transplanting well and can be easily moved even when relatively large[11].

### 7.2.181 Crambe kotschyana

6 tin 9 cyuc 2 kcak 0 tcan 1 dwat 2.5 m hkuc hmimhtut cyutli kyucyuc hwicli hyishrasjlutnyik hpa7tli prikhlwis hpa7tmwatli xre7t hjonli

drutta Crambe kotschyana is a PERENNIAL growing to 2.5 m (8ft) by 2.5 m (8ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower in June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in nutritionally poor soil. Suitable pH: neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Leaves - cooked[51]. Used as a vegetable[266]. Root - cooked[51, 145]. Used as a vegetable[266]. Nutritious[74].

tcanta None known

dwatta AntipruriticAntipruritic[145].

propta Seed - sow March/April in a seedbed outdoors and either thin the plants out or move them to their permanent positions when about 10cm tall[111]. The young plants are very attractive to slugs so some protection will often be needed. Germination can be slow so it is best to sow the seed in pots in a cold frame[164]. Germination usually takes place in 3 - 26 weeks at 15°c[164]. Prick out the seedlings into individual pots as soon as they are large enough to handle and plant out into their permanent positions when they are at least 10cm tall. Division in spring or autumn[1, 111]. Dig up the root clump and cut off as many sections as you require, making sure they all have at least one growing point. The larger of these divisions can be planted out straight into their permanent positions, though small ones are best potted up and grown on in a cold frame until they are established. Root cuttings, 3 - 10 cm long, in spring[104]. These can be planted straight into the open ground or you can pot them up in the greenhouse and plant them out once they are growing strongly.

nwatta An easily grown plant, succeeding in a good loam and an open sunny position[1]. Prefers a slightly alkaline soil in a position sheltered from strong winds[200]. Tolerates poor soil and some shade[200]. Dislikes acid soils[1]. Prefers a rather dry soil[187]. Plants are hardy to about -20°c[187]. A deep-rooted plant[233], it dislikes root disturbance[164]. Plants can be grown in the summer meadow if the grass is not cut too low (since this would damage the growing point)[200]. A good bee plant[74]. Very closely related to *C. cordifolia*[200] and considered by some botanists to be no more than a variety of that species, differing mainly in its larger flowers[1].

### 7.2.182 Crataegus apiifolia

Parsley-Leaved Hawthorn

6 tin 9 cyuc 2 kcak 0 tcan 2 dwat 4 m hkuc hmimhtut cyutli hgattcuphja7n hwicli hrasjlutnyikfrip hpa7tli flatprikhlwis hpa7tmwatli xre7t hjonli

drutta Crataegus apiifolia is a deciduous Shrub growing to 4 m (13ft 1in). See above for USDA hardiness. It is hardy

to UK zone 7 and is not frost tender. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Midges. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[183]. The fruit can be used in making pies, preserves, etc, and can also be dried for later use. About 7.5mm in diameter[200] with a thin flesh[227]. There are up to five fairly large seeds in the centre of the fruit, these often stick together and so the effect is of eating a cherry-like fruit with a single seed[K].

tcanta RootstockUsed as a dwarfing rootstock for *C. aestivalis*[183]. Wood - heavy, hard, strong, close-grained[82, 227, 235]. It weighs 46lb per cubic foot[227, 235]. It has no particular commercial value[227], though it is useful for making tool handles, mallets and other small items[82].

dwatta Cardiotoxic HypotensiveAlthough no specific mention has been seen for this species, the fruits and flowers of many hawthorns are well-known in herbal folk medicine as a heart tonic and modern research has borne out this use. The fruits and flowers have a hypotensive effect as well as acting as a direct and mild heart tonic[222]. They are especially indicated in the treatment of weak heart combined with high blood pressure[222]. Prolonged use is necessary for it to be efficacious[222]. It is normally used either as a tea or a tincture[222].

propta Seed - this is best sown as soon as it is ripe in the autumn in a cold frame, some of the seed will germinate in the spring, though most will probably take another year. Stored seed can be very slow and erratic to germinate, it should be warm stratified for 3 months at 15°c and then cold stratified for another 3 months at 4°c[164]. It may still take another 18 months to germinate[78]. Scarifying the seed before stratifying it might reduce this time[80]. Fermenting the seed for a few days in its own pulp may also speed up the germination process[K]. Another possibility is to harvest the seed 'green' (as soon as the embryo has fully developed but before the seedcoat hardens) and sow it immediately in a cold frame. If timed well, it can germinate in the spring[80]. If you are only growing small quantities of plants, it is best to pot up the seedlings as soon as they are large enough to handle and grow them on in individual pots for their first year, planting them out in late spring into nursery beds or their final positions. When growing larger quantities, it might be best to sow them directly outdoors in a seedbed, but with protection from mice and other seed-eating creatures. Grow them on in the seedbed until large enough to plant out, but undercut the roots if they are to be left undisturbed for more than two years.

nwatta A very easily grown plant, it prefers a well-drained moisture retentive loamy soil but is not at all fussy[11, 200]. Once established, it succeeds in excessively moist soils and also tolerates drought[200]. It grows well on a chalk soil and also in heavy clay soils[200]. A position in full sun is best when plants are being grown for their fruit, they also succeed in semi-shade though fruit yields and quality will be lower in such a position[11, 200]. Most members of this genus succeed in exposed positions, they also tolerate atmospheric pollution[200]. This species is not hardy in all parts of Britain, it usually succeeds outdoors for a number of years at Kew, but is killed in severe winters there[11]. It does not seem to fruit well in Britain[11]. The flowers have a foetid smell somewhat like decaying fish. This attracts midges which are the main means of fertilization. When freshly open, the flowers have more pleasant scent with balsamic undertones[245]. Hybridizes freely with other members of this genus[200]. Seedling trees take from 5 - 8 years before they start bearing fruit, though grafted trees will often flower heavily in their third year[K]. Seedlings should not be left in a seedbed for more than 2 years without being transplanted[11].

### 7.2.183 Ophrys apifera

Bee Orchid

6 tin 9 cyuc 2 kcak 0 tcan 2 dwat 0.5 m hkuc

in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: Oil SeedEdible Uses: OilSeed - raw or cooked[51, 105]. Rich in oil. The seed ripens in mid to late autumn and will probably need to be protected from squirrels[K]. When kept in a cool place, and not shelled, the seed should store for at least 12 months[K]. An edible oil is obtained from the seed.

tcanta OilNone known

dwatta None known

propta Seed - best sown as soon as it is harvested in autumn in a cold frame[164]. Germinates in late winter or spring. Stored seed should be pre-soaked in warm water for 48 hours and then given 2 weeks warm followed by 3 - 4 months cold stratification[164]. Germinates in 1 - 6 months at 20°c[164]. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame or sheltered place outdoors for their first winter. Plant them out into their permanent positions in late spring or early summer[K]. Layering in autumn. Easy, it takes about 6 months[78, 200].

nwatta An easily grown plant, it succeeds in most soils, but is in general more productive of seeds when grown on soils of moderate fertility[11, 200]. It does less well in rich heavy soils or poor ones[11, 63]. Does well in a loamy soil[11]. Very suitable for an alkaline soil[11], but it dislikes very acid soils[17]. Plants are fairly wind tolerant[1, 11]. This species is cultivated for its edible seed in Asia[51], it frequently sets fruit at Kew[11]. Closely allied to *C. colurna*[11], and considered to be no more than a sub-species by some botanists, it is an upright growing tree that does not produce suckers[183]. Members of this genus bear transplanting well and can be easily moved even when relatively large[11].

### 7.2.160 Allium kunthii

Kunth's onion

6 tin 9 cyuc 3 kcak 0 tcan 2 dwat 0.4 m hkuc

htut cyutli tcup hwicli hrasjlut hpa7tli flatprikhlwis hpa7tmwatli xre7t hjonli

drutta Allium kunthii is a BULB growing to 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Bulb - raw or cooked. Used as a flavouring[177]. The small bulbs are usually less than 2cm in diameter[270]. Leaves - raw or cooked. Flowers - raw. Used as a garnish on salads.

tcanta RepellentThe juice of the plant is used as a moth repellent. The whole plant is said to repel insects and moles[20].

dwatta Although no specific mention of medicinal uses has been seen for this species, members of this genus are in general very healthy additions to the diet. They contain sulphur compounds (which give them their onion flavour) and when added to the diet on a regular basis they help reduce blood cholesterol levels, act as a tonic to the digestive system and also tonify the circulatory system[K].

propta Seed - sow spring in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle - if you want to produce clumps more quickly then put three plants in each pot. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in spring once they are growing vigorously and are large enough. Division in spring. The plants divide successfully at any time in the growing season, pot up the divisions in a cold frame or greenhouse until they are growing well and then plant them out into their permanent positions.

nwatta Prefers a sunny position in a light well-drained soil[1]. The bulbs should be planted fairly deeply[11]. Most members of this genus are intolerant of competition from other growing plants[203]. Grows well with most plants, especially roses, carrots, beet and chamomile, but it inhibits the growth of legumes[18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the

other[201]. Members of this genus are rarely if ever troubled by browsing deer[233].

### 7.2.161 Alliaria petiolata

Garlic Mustard

6 tin 8 cyuc 3 kcak 1 tcan 2 dwat 1 m hkuc

pcimhmm cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flatprikhlwis hpa7tmwatli fyikxre7t hjonli

drutta Alliaria petiolata is a BIENNIAL growing to 1 m (3ft 3in) by 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from April to June, and the seeds ripen from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist or wet soil.

kcakta Edible Parts: Flowers Leaves SeedpodEdible Uses: Young leaves - raw or cooked as a potherb or as a flavouring in cooked foods[4, 5, 9, 12, 62, 115, 244]. A mild garlic and mustard flavour, the leaves are also believed to strengthen the digestive system[244]. They can be finely chopped and added to salads[7, 183]. The leaves are available very early in the year and provide a very acceptable flavouring for salads in the winter[K]. Flowers and young seed pods - raw[62]. A mild, garlic-like flavour[K].

tcanta DyeA yellow dye is obtained from the whole plant[7].

dwatta Antiasthmatic Antiscorbutic Antiseptic Deobstruent Diaphoretic Eczema Sternumatory Vermifuge VulneraryGarlic mustard has been little used in herbal medicine[268]. The leaves and stems are antiasthmatic, antiscorbutic, antiseptic, deobstruent, diaphoretic, vermifuge and vulnerary[4, 7]. The leaves have been taken internally to promote sweating and to treat bronchitis, asthma and eczema[4]. Externally, they have been used as an antiseptic poultice on ulcers etc[4], and are effective in relieving the itching caused by bites and stings[244]. The leaves and stems are harvested before the plant comes into flower and they can be dried for later use[238]. The roots are chopped up small and then heated in oil to make an ointment to rub on the chest in order to bring relief from bronchitis[245]. The juice of the plant has an inhibitory effect on *Bacillus pycocyanoid* and on gram-negative bacteria of the typhoid-paratyphoid-enteritis group[240]. The seeds have been used as a snuff to excite sneezing[4].

propta Seed - sow outdoors in situ either in spring or autumn.

nwatta Prefers a damp rich alluvial soil[7, 53]. Succeeds in damp shady places where few other herbs will grow[238]. A good woodland edge plant, it also grows well in the bottom of hedgerows[24] and will self-sow freely in suitable conditions[238]. On a calm day the plant emits a strong smell of garlic. This is especially pronounced if the leaves are bruised[245]. This species is an important food source for the orange-tip butterfly[238]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [2-1].

### 7.2.162 Yushania maculata

Maculata bamboo

6 tin 10 cyuc 3 kcak 3 tcan 0 dwat m hkuc hmimhtut cyutli hgattcuphja7n hwicli hrasjlutnyik hpa7tli flatprikhlwis hpa7tmwatli hjonli

drutta Yushania maculata is an evergreen Bamboo growing to 5 m (16ft) by 2.5 m (8ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. The flowers are pollinated by Wind. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil and

can tolerate drought. The plant can tolerates strong winds but not maritime exposure. It cannot tolerate atmospheric pollution.

kcakta Young stems. Shoots emerge summer to early autumn. Shoots have pleasant taste and are free of bitterness[1-9]. Harvested shoots are steamed, cut lengthwise, cleaned and sterilized for 15 minutes in pure or salted boiling water before eating or canning[ 310 ].

tcanta Canes are used as plant supports, they must be properly ripened[25, 158, 195]. The plant makes an attractive hedge or screen, eventually becoming very dense[195]. Erosion Control. Suggested landscape design uses: Ornamental - bluey-green canes and the shape looks like a waterfall of leaves, Architectural, Hedging/Screens, tropical garden effect, Roof terrace. Wildlife Shelter for birds and small mammals. Drought- and wind-tolerant.

dwatta None Known

propta Seed - surface sow as soon as it is ripe in a greenhouse at about 20?c. Do not allow the compost to dry out. Germination usually takes place fairly quickly so long as the seed is of good quality, though it can take 3 - 6 months. Grow on in a lightly shaded place in the greenhouse until the seedlings are large enough to plant out, which could take a few years. Seed is rarely available. Division in late spring[25]. Best done as the new shoots first appear above ground[25]. Take divisions with at least three canes in the clump, trying to cause as little root disturbance to the main plant as possible. Grow them on in light shade in a greenhouse in pots of a high fertility sandy medium. Mist the foliage regularly until plants are established. Plant them out into their permanent positions when a good root system has developed, which can take a year or more[200]. Basal cane cuttings[25].

nwatta Yushania maculata is a large and fast-growing perennial bamboo forming clumps of blue stems with reddish clum sheaths and sparse narrow, glossy green leaves. A temperate plant growing in pine forests 1,800-3,500m above sea level. Canes are 1-2cm diameter and 3-5m high. The Yushania genus are a large group of spreading thornless frost-hardy bamboos. Yushania has long-necked rhizomes that enable the plants to spread further, giving it a semi-running habit under suitable conditions. The name Yushania refers to the mountain 'Yu Shan' of the central mountain range of Taiwan. Yushania maculata has attractive bluey-green canes with the plant shape looks like a waterfall of leaves. pH Range: 5.5 to 6.5. Soil Range: Sandy Loam to Clay Loam. Water Range: Normal to Moist. Drought- and wind-tolerant, it grows up to 3.5m (12ft) in 10 years. Light: Partial Shade, Full Shade, Full Sun but prefers full sun to light shade. It does poorly in high Heat and high Humid conditions (e.g. southeast USA).

### 7.2.163 Bunias erucago

Corn Rocket, Crested wartycabbage

6 tlin 9 cyuc 3 kcak 0 tcan 0 dwat 0.6 m hkuc htut cyutli tcup hwicli hyishrasljutnyik hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Bunias erucago is a ANNUAL/BIENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to August, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Leaves and young stems - raw or cooked[2, 64, 61, 105, 177]. A characteristic aromatic flavour that goes well with beans[183]. The young and tender leaves make a refreshing spring soup[89, 183]. Root - raw[17, 264]. It can be sliced thinly or grated and then be added to salads[89].

tcanta None known

dwatta None known

propta Seed - sow March to August in situ in order to obtain a succession of fresh young leaves. The seed usually germinates within 2 weeks.

nwatta Succeeds in most soils[1], including poor ones[132], preferring a sunny position[200].

### 7.2.164 Imperata cylindrica

Cogongrass, Japanese Blood Grass

6 tlin 9 cyuc 3 kcak 0 tcan 3 dwat 1.2 m hkuc htut cyutli hgatkycutcup hwicli hyishrasljutnyik hpa7tli flat-prikliwis hpa7tmwatli xre7t hjonli

drutta Imperata cylindrica is a PERENNIAL growing to 1.2 m (4ft) by 0.6 m (2ft in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in flower from August to September, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

kcakta Edible Parts: Flowers Leaves RootEdible Uses: SaltYoung inflorescence and young shoots - cooked[177, 179]. Root - fibrous but pleasant to chew, containing starch and sugar[144, 177, 179]. Fairly sweet, the taste is sweetest in the wet season in Australia and worst from plants growing in sand[193]. The ash of the plant is used as a salt substitute[177].

tcanta Paper Soil stabilization Stuffing Thatching WeavingThe leaves are woven to make mats, bags and rain-coats[46, 61, 193]. The inflorescences are valued for stuffing pillows and cushions[272]. The stems are used in thatching roofs[46, 61, 178, 272]. A fibre obtained from the leaves is used in making paper[46, 61, 154]. Can be planted on sandy soils to prevent erosion[154, 272]. The plants form impenetrably dense clumps and when planted close together in drifts make an excellent ground cover[200].

dwatta Anthelmintic Antibacterial Antinivous Astringent Cancer Diuretic Dysentery Emollient Febrifuge Restorative Sialagogue Styptic Tonic UrinaryThe flowers and the roots are antibacterial, diuretic, febrifuge, sialagogue, styptic and tonic[147, 176, 178]. The flowers are used in the treatment of haemorrhages, wounds etc[218]. They are decocted and used to treat urinary tract infections, fevers, thirst etc[147, 218]. The root is astringent, antifebrile, antinivous, diuretic, emollient, haemostatic, restorative and tonic[218, 240]. It is used in the treatment of nose bleeds, haematuria, haematemesis, oedema and jaundice[176]. The root has antibacterial action against Staphylococcus aureus, Bacillus dysenteriae etc[176]. A decoction of the root is used as an anthelmintic and also to treat digestive disorders such as indigestion, diarrhoea and dysentery[272]. The root bark is febrifuge, restorative and tonic[218]. Extracts of the plant have shown viricidal and anticancer activity[218].

propta Seed - surface sow in spring in a greenhouse. The seed germinates quickly, prick out the seedlings into individual pots when they are large enough to handle and plant them out in the summer. Division in spring as the plant comes into growth. Division is very easy and can be carried out at almost any time in the year, though winter divisions are best potted up in the greenhouse and planted out in late spring[K].

nwatta Landscape Uses:Alpine garden, Border, Massing, Rock garden, Specimen. Succeeds in ordinary garden soil in sun or partial shade[162, 187]. This species is only hardy in the southern part of Brtain, tolerating temperatures down to about -15°c when dormant[187], though the young growth in spring can be damaged by late frosts. The var. I. cylindrica major. (Nees.)C.E.Hubb. is used medicinally in China[176] and as a wild food in Australia[193]. This species is quite closely related to sugar cane, it has been interbred experimentally with that species in India[193]. Plants grow away vigorously after a fire, often spreading freely to infest the burnt areas[144, 193]. Special Features:Attractive foliage, There are no flowers or blooms.

### 7.2.165 Brassica napus pabularia

Rape Kale

6 tlin 9 cyuc 3 kcak 0 tcan 2 dwat 1.2 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyikrip hpa7tli frusflat-prikliwsslip hpa7mwatli fyifxre7t hjonli

drutta Brassica napus pabularia is a ANNUAL/BIENNIAL growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost

pots when they are large enough to handle and grow them on for at least their first winter in a greenhouse. Plant out in early summer and give some protection for their first winter outdoors. Cuttings of half-ripe wood, 5 - 8cm with a heel, August in a frame. Overwinter in the greenhouse and plant out in late spring[11, 78]. Good percentage[78]. Layering of long shoots in the autumn[200].

nwatta Succeeds in any fertile garden soil[182]. Requires a sheltered position in a moderately fertile well-drained neutral to acid soil[200]. Prefers a position in semi-shade[219]. This species is not very hardy in Britain, though it succeeds when grown against a sunny wall in the milder areas of the country[182]. The flowers emit a soft sweet perfume[245]. Flowers are produced on the current year's growth[219]. Plants do not really require pruning[219]. Dioecious, male and female plants must be grown if fruit and seed is required[182].

### 7.2.178 Clinopodium chinense

6 tlin 9 cyuc 2 kcak 0 tcan 0 dwat 0.5 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Clinopodium chinense is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from August to September, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: TeaYoung leaves - cooked[105, 177]. A sweet and aromatic herb tea is made from the leaves[200].

tcanta None known

dwatta None known

propta Seed - sow spring in a cold frame. Only just cover the seed. Germination usually takes place within 2 weeks at 21°c. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse. Plant them out in the summer if they have made sufficient growth, otherwise plant them out in late spring or early summer of the following year. Division in spring. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the summer or following spring. Cuttings of soft wood in May or June.

nwatta Succeeds in almost any well-drained soil[1]. A polymorphic species[58]. Plants are best grown in a rock garden[1].

### 7.2.179 Physalis alkekengi

Winter Cherry, Strawberry groundcherry,Ground Cherry, Chinese Lantern
6 tlin 9 cyuc 2 kcak 0 tcan 2 dwat 0.3 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Physalis alkekengi is a PERENNIAL growing to 0.3 m (1ft) by 0.6 m (2ft in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Fruit LeavesEdible Uses: Fruit - raw or cooked[1, 2, 105]. Rich in vitamins[100], with twice the vitamin C of lemons[179], but not much taste[178]. Another report says that they are juicy but with a bitter acid flavour[4], whilst another says that they add a delicious flavour to salads[7]. We have found them to be bitter and rather unpleasant[K]. The fruit is a berry about 17mm in diameter[200]. The plant conveniently wraps up each fruit in its own 'paper bag' (botanically, the calyx) to protect it from pests and the elements. This calyx is toxic and should not be

eaten[34, 65]. Young leaves - cooked[105, 170, 179]. Caution is advised, the leaves are almost certainly poisonous, at least when raw.

tcanta None known

dwatta Antiphlogistic Antirheumatic Antitussive Aperient Diuretic Expectorant Febrifuge Homeopathy Lithontripic Malaria Urinary Vitamin CThe plant has a long history of herbal use, and an interesting chemistry, but it is seldom used in modern practice[238]. The whole plant is antiphlogistic, antipyretic, antitussive and expectorant[9, 61, 147, 178, 218]. It has been used in the treatment of urinary and skin diseases[240]. Some caution is recommended since an overdose of the plant is said to easily precipitate an abortion[218]. The fruit is aperient, strongly diuretic and lithontripic[4, 7, 9, 218]. It is used internally in the treatment of gravel, suppression of urine etc and is highly recommended in fevers and in gout[4, 238]. The fruit is harvested when fully ripe and can be used fresh, juiced or dried[238]. The calyx should be removed[238]. The leaves and stems are febrifuge and slightly tonic[4]. They are used in the treatment of the malaise that follows malaria, and for weak or anaemic people[4]. The fresh leaves have been used externally to make soothing poultices in the treatment of skin inflammations[238, 244]. The seed is used to promote early labour[218]. A homeopathic remedy is made from the fruit. It is used in the treatment of kidney and bladder disorders[9].

propta Seed - sow March/April in a greenhouse only just covering the seed. Germination usually takes place quickly and freely. Prick out the seedlings into individual pots of fairly rich soil when they are large enough to handle and plant them out in early summer. Diurnal temperature fluctuations assist germination[170]. Division in spring[111]. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer. Basal cuttings in early summer[111]. Harvest the shoots with plenty of underground stem when they are about 8 - 10cm above the ground. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Landscape Uses:Border, Container. Succeeds in any well-drained soil in full sun or light shade[111, 200]. The fully dormant plant is hardy in most of Britain, though the young growth in spring can be damaged by late frosts. A very ornamental plant[1] though it can be invasive[200]. The subspecies P. alkekengi francheti. Mak. (sometimes treated as a separate species) is a more vigorous form of the species with larger fruits[200]. Slugs are very fond of the new growth in spring and can destroy even quite large clumps[K]. Special Features: Naturalizing, Suitable for dried flowers.

### 7.2.180 Corylus tibetica

6 tlin 9 cyuc 2 kcak 0 tcan 0 dwat 15 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwsslip hpa7tmwatli fyif hjonli

drutta Corylus tibetica is a deciduous Tree growing to 15 m (49ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from April to May, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: Oil SeedEdible Uses: OilSeed - raw or cooked[63, 105, 146, 177]. Rich in oil. The seed, in its shell, is about 10 - 15mm in diameter[266]. The seed ripens in mid to late autumn and will probably need to be protected from squirrels[K]. When kept in a cool place, and not shelled, the seed should store for at least 12 months[K]. An edible oil is obtained from the seed.

tcanta OilNone known

dwatta None known

propta Seed - best sown as soon as it is harvested in autumn in a cold frame[164]. Germinates in late winter

plants must be grown if seed is required). and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. Used like huckleberries[11, 69, 177]. The fruit is up to 22mm in diameter[200].

tcanta None known  
dwatta None known

propta The seed requires a period of cold stratification. Pre-chill for 4 - 10 weeks and then surface sow in a lime-free compost in a shady part of the greenhouse and keep the compost moist[78]. The seed usually germinates well, usually within 1 - 2 months at 20°c, but the seedlings are liable to damp off. It is important to water them with care and to ensure that they get plenty of ventilation. Watering them with a garlic infusion can also help to prevent damping off[K]. Prick out the seedlings into individual pots when they are about 25mm tall and grow them on in light shade in the greenhouse for at least their first winter[K]. Plant them out in late spring or early summer. The seedlings are susceptible to spring frosts so might need some protection for their first few years outdoors. The leaves remain very small for the first few years[11]. Cuttings of half-ripe wood 3 - 6cm long, July/August in a frame in a shady position. They form roots in late summer or spring[78]. A good percentage usually take. Division in spring just before new growth begins. 'Drop' the plants 12 months earlier by digging them up and replanting them deeper in the soil so that the branches are buried and can form roots. This works best in a sandy soil[78]. It is best to pot up the divisions and grow them on in a lightly shaded position in a greenhouse until they are established. Plant them out in the summer. Layering in September/October. Takes 12 months[78].

nwatta Requires a light moist but well-drained humus-rich lime-free soil in sun or semi-shade[1, 11]. Grows well in a rock garden[11]. Fruits are produced abundantly on plants growing in the wild[11]. Dioecious. Male and female plants must be grown if seed is required. Plants in this genus are notably resistant to honey fungus[200].

## 7.2.175 Adenophora denticulata

6 tlin 9 cyuc 2 kcak 0 tcan 0 dwat 0.5 m hkuc  
htut cyutli tcup hwicli hrasljut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Adenophora denticulata is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in July, and the seeds ripen in August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Root - cooked. A sweet flavour[74].

tcanta None known  
dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe[200]. The seed can also be sown in spring. Surface sow 2 - 3 seeds per pot in the spring in order to avoid transplanting[133]. We have found that if transplanted when very small seedlings grow away without difficulty[K]. Germinates in 1 - 3 months at 10°c[133]. Plant out into their permanent positions whilst young. Basal cuttings in spring[K]. Division in spring - very difficult because the plant dislikes root disturbance[1].

nwatta Prefers a light rich slightly alkaline soil that is not too dry, and a warm sunny position[1, 200]. Intolerant of root disturbance[1]. The young growth is extremely attractive to slugs, they have been known to destroy even mature plants[K].

## 7.2.176 Codonopsis lanceolata

TodoK

6 tlin 9 cyuc 2 kcak 0 tcan 2 dwat 1.5 m hkuc

hmimhtut cyutli tcup hwicli hrasljut hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Codonopsis lanceolata is a PERENNIAL CLIMBER growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from August to September, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, wasps. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Root - raw or cooked[105, 177]. The plant produces thick tubers[275]. Young plant - raw or cooked[105, 177]. A nutritional analysis is available[218].

tcanta None known

dwatta Aphrodisiac Depurative Emmenagogue Galactogogue TonicAphrodisiac, tonic[46, 61]. The root is anticancer, depurative, emmenagogue and galactogogue[147, 218]. A decoction is used in the treatment of lung abscesses, milk-flow obstruction, amenorrhoea, acute and inflamed boils and abscesses and lymphadenopathy[147].

propta Seed - surface sow in spring to early summer in an ericaceous compost in a greenhouse. Do not allow the compost to dry out. The seed usually germinates in 1 - 6 weeks at 20°c[164]. Prick out the seedlings into individual pots as soon as they are large enough to handle and grow them on in a greenhouse for their first winter. Plant out in late spring or early summer and protect them from slugs until the plants are well established[K]. Division in spring, with care, since the plant resents root disturbance[200]. We have found it best to take small divisions that are teased out from the sides of the main clump so as to cause the least possible disturbance to the plants and to avoid having to dig up the clump. These small divisions need to be potted up and placed in light shade in a greenhouse until they are rooting well. They can be planted out into their permanent positions in the summer if they are large enough, otherwise in the following spring[K].

nwatta Prefers a well-drained fertile light soil in full sun or semi shade[1, 200]. Plants only succeed in full sun if the soil remains moist during the growing season[200]. Prefers a slightly acid soil[164]. Dormant plants are hardy to about -20°c[187]. The young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. A lot of confusion exists over the correct authorship of this specific name. Apart from the one mentioned above there are also: -(Sieb. and Zucc.)Trautv.; Benth.; and Benth. and Hook. A climbing plant, supporting itself by twining and scrambling over other plants[219]. The plant resents root disturbance and should be planted out into its permanent position as soon as possible[164]. Plants are very susceptible to the ravages of slugs. The young shoots in spring are particularly at risk, though older growth is also eaten[K]. It is best grown on a high bank in order to give a good view of the flowers[1].

## 7.2.177 Kadsura japonica

6 tlin 9 cyuc 2 kcak 0 tcan 1 dwat 3.5 m hkuc  
hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprik hpa7tmwatli nyanhjen hjonli

drutta Kadsura japonica is an evergreen climber growing to 3.5 m (11ft 6in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower from June to September. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). . The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[177]. The fruit is up to 6mm long[219].

tcanta None known

dwatta Antidiarrhoeal Stomachic TonicA decoction of the dried fruits is bechic, stomachic and tonic[218].

propta Seed - best sown when it is ripe in the autumn in a cold frame[200]. Prick out the seedlings into individual

tender. It is in flower from May to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves Oil OilEdible Uses: Oil OilLeaves - raw or cooked[4, 34, 37]. Added to salads or used as a potherb[183]. Immature flowering stems - cooked in much the same way as broccoli[183]. An edible oil is obtained from the seed, it is used mainly for cooking purposes, but also for salads[4, 13, 34, 46, 183]. Some caution is advised, see the notes above on toxicity. The sprouted seed is often used as the mustard part of mustard and cress. Eaten in salads[4, 34, 37, 183]. The seed is used as a mustard flavouring[183].

tcanta Oil OilThe seed contains up to 45% of an edible semi-drying oil, it is used as a luminant, lubricant, in soap making etc[13, 21, 57, 142].

dwatta Diuretic EmollientThe root is emollient and diuretic[240]. The juice of the roots is used in the treatment of chronic coughs and bronchial catarrh[240, 269]. The seed, powdered, with salt is said to be a folk remedy for cancer[269]. Rape oil is used in massage and oil baths, it is believed to strengthen the skin and keep it cool and healthy. With camphor it is applied as a remedy for rheumatism and stiff joints[269].

propta Seed - sow spring in situ.

nwatta Succeeds in full sun in a well-drained fertile preferably alkaline soil[200]. Succeeds in any reasonable soil[52]. Prefers a heavy soil and cool moist conditions[16, 20]. Tolerates a pH in the range 4.2 to 8.3. Very young plants are susceptible to cold damage, -4°C either killing or injuring seedlings, whereas -2°C has no effect when the plants are more than one month old[269]. The rape kales have non-tuberous roots. They are cultivated for their edible leaves. Plants are intolerant of root disturbance and so should not be transplanted[200]. Rape kale is 70% self-pollinating and 30% cross-pollinated. Even if wind and insects are absent, seed are still produced. Yield increases with honeybees[269]. The growth of this plant is inhibited by field mustard and hedge mustard growing nearby[18, 20]. This species is closely related to *B. rapa*[200].

## 7.2.166 Ornithogalum umbellatum

Star Of Bethlehem, Dove's Dung

6 tlin 9 cyuc 3 kcak 0 tcan 1 dwat 0.3 m hkuc  
hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Ornithogalum umbellatum is a BULB growing to 0.3 m (1ft) by 0.2 m (0ft 8in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from April to May, and the seeds ripen from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers RootEdible Uses: Bulb - raw or cooked[2, 5, 46, 61, 183]. The bulbs can be dried and ground into a powder[207]. Whilst the bulbs are palatable and wholesome according to some reports[2, 4, 115], some caution is advised. See the notes above on toxicity. Flowers - baked in bread[183].

tcanta None known

dwatta BachA homeopathic remedy is made from the bulbs[4]. It is useful in the treatment of certain forms of cancer[4]. The plant is used in Bach flower remedies - the keywords for prescribing it are 'After effect of shock, mental or physical'[209]. It is also one of the five ingredients in the 'Rescue remedy'[209].

propta Seed - best sown as soon as it is ripe in a cold frame[200]. Sow the seed thinly and leave the seedlings undisturbed in the pots for their first dormancy, but apply liquid feed at intervals, especially in their second year of growth. Divide the bulbs at the end of their second year of

growth, putting 2 - 3 bulbs in each pot. Grow them on for one more year and then plant them out into their permanent positions whilst they are dormant. The seed can also be sown in a cold frame in early spring. Division of offsets in September/October[200]. The larger bulbs can be replanted immediately into their permanent positions. It is best to pot up the smaller bulbs and grow them on for a year before planting them out when dormant in late summer.

nwatta Landscape Uses:Border, Container, Woodland garden. An easily grown plant, succeeding in an ordinary garden soil[1, 42]. Tolerates partial shade[200]. Hardy to about -20°c[200]. The dormant bulbs are very hardy and will withstand soil temperatures down to at least -10°c[214]. A very ornamental plant[1], but it can be invasive where conditions suit it[200]. It can be naturalized in short turf or thin grass below shrubs[200], though this should not be mown from the time the bulbs start to grow until they have set seed and the leaves are dying down. Special Features:Not North American native, Invasive, Naturalizing, Suitable for cut flowers.

## 7.2.167 Acorus gramineus

Grass-leaved Sweet Rush, Japanese Sweet Flag, Dwarf Sweet Flag

6 tlin 10 cyuc 3 kcak 0 tcan 3 dwat 0.3 m hkuc  
htut cyutli tcupha7nhs6s hwicli hrasljutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Acorus gramineus is an evergreen Perennial growing to 0.3 m (1ft) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in leaf all year, in flower from June to July, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist or wet soil and can grow in water.

kcakta Edible Parts: RootEdible Uses: CondimentRoot - raw or cooked[105, 177]. It should be peeled, finely chopped and soaked in several changes of water first[183]. A stronger and more pleasing taste than *A. calamus*[2, 183]. The root is also used as a ginger substitute[177]. Some caution is advised, see the notes above on toxicity.

tcanta Essential Insecticide Parasiticide RepellentThe dried root repels insects[178]. It is probably also insecticidal[178, 240] and is used in Vietnam to kill lice, bugs and fleas[283]. An essential oil is obtained from the plant[240]. A useful ground cover plant, forming a spreading clump[208].

dwatta Anodyne Antibacterial Antifungal Antiperiodic Antirheumatic Antispasmodic Aromatic Cardiac Carminative Diaphoretic Diuretic Emmenagogue Epilepsy Expectorant Fibrifuge Parasiticide Sedative Stimulant Stomachic Tonic VermifugeThe root is antifungal, antibacterial, antiperiodic, antirheumatic, antispasmodic, aromatic, cardiac, carminative, diaphoretic, emmenagogue, fibrifuge, sedative, stimulant, stomachic, tonic and vermifuge[4, 7, 9, 21, 61, 147, 165, 176, 178, 218, 238, 240, 279]. It is also powdered and applied to bleeding gums[218, 238]. It is used internally in the treatment of digestive problems - particularly gastralgia and diarrhoea[283], cough, bronchial asthma, neurasthenia, depression, epilepsy etc[176, 238, 283]. Externally, it is used to treat body parasites, dermatosis and haemorrhoids[283]. The root can be harvested at any time of the year, except when the plant is in flower[238]. The root contains an essential oil consisting of asarone and asaryl aldehyde, plus a bitter glucoside acorin[176, 283]. Asarone increases the hypnotic effect of barbiturates and ethanol, lowers blood pressure and is antibacterial against *Staphylococcus aureus*, streptococci and mycobacterium[176]. The whole plant is anodyne, antiperiodic, antispasmodic, digestive, diaphoretic, diuretic, expectorant, sedative, stimulant, stomachic, sudorific, tonic, vermifuge[218].

propta Seed - best sown in a cold frame as soon as it is ripe. Stand the pot in about 3cm of water. Pot up young seedlings as soon as they are large enough to handle, keep them wet by standing the pots in shallow water and overwinter for the first year in a greenhouse or cold frame. Division in spring just before growth starts[1]. Very easy, the plants can be divided at any time in the growing season and can be planted direct into their permanent positions[K].

nwwatta Landscape Uses:Container, Foundation, Ground cover, Massing, Rock garden, Seashore. Grows well in shallow water margins of ponds etc[1, 2], though it can also succeeds in drier habitats[56]. Requires a sunny position[200]. A very ornamental plant, there are some named varieties[208, 238]. The cultivar ‘Pusillus’ can be grown as a submerged aquatic plant[238]. Special Features:Attractive foliage, Fragrant foliage, Not North American native, Naturalizing, Wetlands plant, Inconspicuous flowers or blooms.

## 7.2.168 Tulipa edulis

6 tlin 9 cyuc 2 kcaak 0 tcan 2 dwat 0.2 m hkuc htut cyutli tcup hwcili hrasljut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Tulipa edulis is a BULB growing to 0.2 m (0ft 8in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from March to April, and the seeds ripen from May to June. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcaakta Edible Parts: Leaves RootEdible Uses: Bulb - cooked[22, 105]. A source of starch[46, 61]. The bulb can be up to 4cm in diameter[266]. Leaves - cooked[46, 61, 105]. Unless you have more plants than you need this practise is not recommended since it will greatly weaken the plant[K]. tcanta None known

dwatta Antidote Antipyretic Cancer Depurative Expecto- rant Febrifuge LaxativeThe inner portion of the bulb is anti- dote, antipyretic, depurative, expecto- rant, febrifuge and lax- ative[147, 218]. It is used, mainly as a poultice, in the treat- ment of ulcers and abscesses[147]. The plant has been used in the treatment of cancer[218]. The leaves are applied exter- nally to abscesses, buboes and breast diseases[218]. The flowers are used in the treatment of dysuria[218].

propta Seed - best sown in a shady part of the cold frame as soon as it is ripe in early summer[1], or in the early autumn[200]. A spring sowing of stored seed in the greenhouse also succeeds[K]. Sow the seed thinly so that the seedlings can be grown on without disturbance for their first growing season - apply liquid feeds to the pot if necessary. Divide the bulbs once the plants have become dormant, putting 3 - 4 bulbs in each pot. Grow the on in the greenhouse for at least the next year, planting them out when dormant. Division of offsets in July. Larger bulbs can be planted out straight into their permanent positions, or can be stored in a cool place and then be planted out in late autumn. It is best to pot up smaller bulbs and grow them on in a cold frame for a year before planting them out when they are dormant in late sum- mer to the middle of autumn.

nwwatta Easily grown in a well-drained soil in a sunny position[1, 90]. This species is not fully hardy in Britain, the plants come into growth in the winter and need protection from severe weather and so are best grown in a bulb frame[1]. Plants are dormant in summer but do not require protection from rain[90]. Bulbs can be harvested in June af- ter they have died down and then stored in a cool dry place, being planted out again in October.

## 7.2.169 Glaucium flavum

Horned Poppy, Yellow hornpoppy

6 tlin 9 cyuc 2 kcaak 0 tcan 1 dwat 0.6 m hkuc htut cyutli hgatkuyctucp hwcili hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Glaucium flavum is a PERENNIAL growing to 0.6 m (2ft) by 0.5 m (1ft 8in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from June to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

kcaakta Edible Parts: Oil OilEdible Uses: Oil OilA clear yellow edible oil is obtained from the seed[2, 46, 61, 183].

tcanta Oil OilAn oil obtained from the seed is used for as a fuel for lighting, it burns cleanly[2]. It is also used in soap making[46].

dwatta PoulticePoultice[66].

propta The seed can be sown in the middle of spring or in autumn in a cold frame. A period of cold stratification improves germination. As soon as they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts[1]. If you have sufficient seed it should be worthwhile trying an outdoor sowing in situ in mid spring[1].

nwwatta Easily grown in any good well-drained soil[1, 200]. Requires a very well-drained poor soil[187]. Prefers a hot dry position[166] and dislikes shade[200]. A very or- namental but short-lived perennial[1], it is hardy to about -10°C[187]. Plants are resentful of root disturbance and should be placed in their final positions as soon as possible[200]. Flowers are produced in the first year from seed[200].

## 7.2.170 Acer palmatum

Japanese Maple

6 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat 8 m hkuc hmimhtut cyutli tcup hwcili hrasljutnyikfrip hpa7tli frusflat- prikliwis hpa7tmwatli hjonli

drutta Acer palmatum is a deciduous Tree growing to 8 m (26ft) by 6 m (19ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from May to June. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Leaves SapEdible Uses: The sap contains a certain amount of sugar and can either be used as a drink, or can be concentrated into a syrup by boiling off the water[105, 177, 183]. The syrup is used as a sweet- ener on many foods. The concentration of sugar is consid- erably lower than in the sugar maples (A. saccharum). The tree trunk is tapped in the early spring, the sap flowing bet- ter on warm sunny days following a frost. The best sap pro- duction comes from cold-winter areas with continental cli- mates. Leaves - cooked[105, 177, 179]. We have eaten nicer leaves[K].

tcanta PreservativeThe leaves are packed around ap- ples, rootcrops etc to help preserve them[18, 20].

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame, it usually germinates in the following spring. Pre-soak stored seed for 24 hours and then stratify for 2 - 4 months at 1 - 8°C. It can be slow to germinate. The seed can be har- vested ‘green’ (when it has fully developed but before it has dried and produced any germination inhibitors) and sown im- mediately. It should germinate in late winter. If the seed is harvested too soon it will produce very weak plants or no plants at all[80, 113]. When large enough to handle, prick the seedlings out into individual pots and grow them on until they are 20cm or more tall before planting them out in their per- manent positions. Layering, which takes about 12 months, is successful with most species in this genus. Cuttings of young shoots in June or July. The cuttings should have 2 - 3 pairs of leaves, plus one pair of buds at the base. Remove a very thin slice of bark at the base of the cutting, rooting is improved if a rooting hormone is used. The rooted cuttings must show new growth during the summer before being potted up otherwise they are unlikely to survive the winter. Only strong-growing cultivars succeed from cuttings, plants of the dissected or variegated cultivars will rarely grow into good plants.

nwwatta Landscape Uses:Border, Pest tolerant, Rock gar- den, Standard, Specimen, Woodland garden. Of easy cul- tivation, it succeeds in most soils preferring a good moist well-drained soil on the acid side and partial shade[11, 182].

Grows well in heavy clay soils. Chlorosis can sometimes de- velop as a result of iron deficiency when the plants are grown in alkaline soils, but in general maples are not fussy as to soil pH. Requires some shelter in the cooler areas of Britain and protection from cold drying winds[1]. Plants are hardy to about -25°C[184], but spring growth is subject to damage by late frosts[11]. A very ornamental tree[1], it is a poly- morphic species[1] and there are many named varieties[11, 182]. Grows well with rhododendrons. Most maples are bad companion plants, inhibiting the growth of nearby plants[18, 20]. Special Features:Attractive foliage, Not North American native, Inconspicuous flowers or blooms.

## 7.2.171 Viburnum japonicum

6 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 1.8 m hkuc hmimhtut cyutli tcup hwcili hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli dyatre7t hjonli

drutta Viburnum japonicum is an evergreen Shrub grow- ing to 1.8 m (6ft) at a slow rate. See above for USDA hardi- ness. It is hardy to UK zone 7. It is in leaf all year, in flower in June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and ba- sic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Fruit LeavesEdible Uses: Fruit - raw or cooked[105, 177]. The ovoid fruit is about 8mm long and contains a single large seed[200]. Leaves - cooked. A famine food, they are only used when all else fails[179].

tcanta None known

dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe. Germination can be slow, sometimes taking more than 18 months. If the seed is harvested ‘green’ (when it has fully developed but before it has fully ripened) and sown immedi- ately in a cold frame, it should germinate in the spring[80]. Stored seed will require 2 months warm then 3 months cold stratification and can still take 18 months to germinate[113]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame or greenhouse. Plant out into their permanent positions in late spring or early summer of the following year. Cuttings of soft-wood, early summer in a frame[200]. Pot up into individual pots once they start to root and plant them out in late spring or early summer of the following year. Cut- tings of half-ripe wood, 5 - 8 cm long with a heel if possi- ble, July/August in a frame[78, 113]. Plant them into indi- vidual pots as soon as they start to root. These cuttings can be difficult to overwinter, it is best to keep them in a green- house or cold frame until the following spring before planting them out[113]. Cuttings of mature wood, winter in a frame. They should root in early spring - pot them up when large enough to handle and plant them out in the summer if suf- ficient new growth is made, otherwise keep them in a cold frame for the next winter and then plant them out in the spring. Layering of current seasons growth in July/August. Takes 15 months[78].

nwwatta An easily grown plant, it succeeds in most soils but is ill-adapted for poor soils and for dry situations[1]. It prefers a deep rich loamy soil in sun or semi-shade[11, 200]. Requires woodland conditions but without competition from other plants. Best if given shade from the early morning sun in spring[200]. This species is hardy at Kew Botani- cal Gardens but it prefers a warmer climate[11]. Plants are slow-growing in Britain[219], they probably do best if given a warm position against a sunny wall[219]. Plants are self- incompatible and need to grow close to a genetically distinct plant in the same species in order to produce fruit and fertile seed[11, 200]. A foetid smelling plant[58], but the flowers are very fragrant with a jonquil-like scent[219, 245]. This species is closely related to *V. odoratissimum*[1].

## 7.2.172 Duchesnea filipendula

6 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 0.1 m hkuc htut cyutli tcup hwcili hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli fyfixre7t hjonli

drutta Duchesnea filipendula is a PERENNIAL growing to 0.1 m (0ft 4in) by 1 m (3ft 3in). See above for USDA hardi- ness. It is hardy to UK zone 7. It is in flower from May to October, and the seeds ripen from July to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcaakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[61, 177]. The fruit has the appearance and texture of a strawberry but very little flavour[K].

tcanta None known

dwatta None known

propta Seed - sow spring in a sunny position in a green- house. Germination usually takes place within 1 - 6 weeks or more at 15°C. A period of cold stratification may speed up germination. When large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division of runners in spring or late summer. Very easy, they can be planted out straight into their permanent positions.

nwwatta We have very little information on this species and do not know if it will be hardy in Britain. Judging by other members of this genus it probably prefers a moist but well- drained soil in a sunny position and grows well in a rock gar- den. This species is cultivated for its edible fruit in China[61].

## 7.2.173 Aquilegia shockleyi

6 tlin 9 cyuc 2 kcaak 0 tcan 1 dwat 0.8 m hkuc hmimhtut cyutli tcup hwcili hrasljut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Aquilegia shockleyi is a PERENNIAL growing to 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from April to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: FlowersEdible Uses: Flowers - raw. Rich in nectar, they are sweet and delightful[172], they make a very attractive addition to mixed salads and can also be used as a thirst-quenching munch in the garden[K].

tcanta Parasiticide ParasiticideThe seed is used as a pa- rasiticide to rid the hair of lice[172].

dwatta Antispasmodic Diaphoretic Parasiticide Parasi- ticide Resolvent SalveAntispasmodic, diaphoretic, parasi- ticide, resolvent, salve[172].

propta Seed - best sown as soon as it is ripe in a cold frame. The seed can be slow to germinate[200]. Stored seed can be sown in late winter in a cold frame. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for their first winter. Plant out in late spring or early summer. Division in spring[200].

nwwatta Succeeds in ordinary garden soil, preferring a moist but not wet soil and a sunny position[1]. Intolerant of heavy clay[200]. Most species are short-lived, dying out after 2 - 3 years, though they usually produce seed prolifically[200]. However, they are very apt to hybridize with other members of the genus and so it becomes difficult to keep a species true to type if more than one is grown in the garden[200]. Plants seem to be immune to the predations of rabbits[233]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

## 7.2.174 Gaultheria pumila

6 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 0.1 m hkuc hmimhtut cyutli tcup hwcili hrasljut hpa7tli frusflat hpa7tmwatli nyanhjen hjonli

drutta Gaultheria pumila is an evergreen Shrub growing to 0.1 m (0ft 4in) by 0.6 m (2ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from April to May. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female

kcakta Edible Parts: FruitEdible Uses: The following notes are for *C. macrophylla*, they quite probably also apply to this closely related species[K]. Fruit - raw or cooked[2, 105, 146, 158, 200, 218]. The fruit is about 6mm in diameter[200].

tcanta WoodThe following notes are for *C. macrophylla*, they quite probably also apply to this closely related species[K]. Wood - hard, close grained, warps badly[158]. It makes a good charcoal[146, 158].

dwatta Anodyne Astringent Dysentery TonicThe following notes are for *C. macrophylla*, they quite probably also apply to this closely related species[K]. Anodyne, astringent, tonic[178]. The wood is anodyne and a uterosedative[218]. The stem bark is used in the treatment of dysentery[218].

propta Seed - best sown as soon as it is ripe in a cold frame or in an outdoors seedbed if there is sufficient seed[80, 113]. The seed must be separated from the fruit flesh since this contains germination inhibitors[80, 164]. Stored seed should be cold stratified for 3 - 4 months and sown as early as possible in the year[164]. Scarification may also help as may a period of warm stratification before the cold stratification[80, 164]. Germination, especially of stored seed, can be very slow, taking 18 months or more[164]. Prick out the seedlings of cold-frame sown seeds into individual pots as soon as they are large enough to handle and grow the plants on for their first winter in a greenhouse, planting out in the spring after the last expected frosts. Cuttings of half-ripe side shoots, July/August in a frame[188]. Cuttings of mature wood of the current year's growth, taken with a heel if possible, autumn in a cold frame. High percentage[78]. Layering of new growth in June/July. Takes 9 months[78].

nwatta An easily grown plant, it succeeds in any soil of good or moderate fertility[1], ranging from acid to shallow chalk[200]. Grows well in heavy clay soils. Succeeds in full sun or light shade[188], growing well in thin woodland[11]. This species is closely related to *C. macrophylla*[200]. Plants in this genus are notably resistant to honey fungus[200].

## 7.2.406 Cardamine trifolia

6 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 0.2 m hkuc pcmhmm cyutli tcup hwicli hrasljutnyk hpa7tli flatprikliw hpa7tmwatli fyifxre7t hjonli

drutta Cardamine trifolia is an evergreen Perennial growing to 0.2 m (0ft 8in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from April to June, and the seeds ripen from May to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: We have no information on this species but the leaves are almost certainly edible either raw or cooked[K].

tcanta An excellent ground cover for woodland or under shrubs[208]. Plants should be spaced about 30cm apart each way[208].

dwatta None known

propta Seed - sow spring in a cold frame. Germination usually takes place within 1 - 3 weeks at 15°C[175]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in a greenhouse or cold frame for the first two years, planting them out when dormant in late summer. Division in early spring or after the plant dies down in the summer. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Succeeds in most soils so long as they are not dry[1]. Prefers a moist humus rich soil in shade or semi-shade[200]. A mat-forming stoloniferous species[200].

## 7.2.407 Saxifraga cortusifolia

6 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 0.4 m hkuc hnmim cyutli tcuphja7n hwicli hrasljutnyk hpa7tli flatprikliw

hpa7tmwatli xre7t hjonli

drutta Saxifraga cortusifolia is a PERENNIAL growing to 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist or wet soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked[177].

tcanta None known

dwatta None known

propta Seed - we have no information for this species but suggest sowing the seed in a cold frame in the spring. Surface sow, or only just cover the seed, and make sure that the compost does not dry out. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse or cold frame for their first winter. Plant them out in late spring after the last expected frosts. Division in spring. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Prefers a cool position in a moist humus-rich soil[1]. Prefers an acid soil[200]. Grows well in light woodland[200] or in a shady position in the rock garden. This species is not very hardy in Britain according to one report[1], whilst another says that it is in climatic zone 7 and should therefore succeed outdoors in most parts of this country[200]. However, the leaves and the flowers are liable to be frost-damaged by autumn frosts[200]. A polymorphic species[1], it is closely related to *S. stolonifera*, differing in not having runners[200].

## 7.2.408 Geum japonicum

6 tlin 9 cyuc 1 kcaak 0 tcan 2 dwat 0.6 m hkuc hnmimhtut cyutli tcup hwicli hrasljutnyk hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Geum japonicum is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from June to July, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: The plant is edible[46, 105]. No further details are given.

tcanta None known

dwatta Astringent Diuretic PouliticeThe root is used as a poultice, applied externally to boils and ulcers[178, 218]. The whole plant is diuretic and astringent[222]. It is cooked with other foods as an astringent in the treatment of coughs and haemoptysis[218].

propta Seed - sow spring or autumn in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer' Division in spring or autumn. This should be done every 3 - 4 years in order to maintain the vigour of the plant[200]. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Easily grown in any moderately good garden soil that is well-drained[1]. Prefers a soil rich in organic matter[200]. Hybridizes freely with other members of this genus[200].

## 7.2.409 Iberis amara

Rocket Candytuft, Annual candytuft  
6 tlin 9 cyuc 1 kcaak 0 tcan 2 dwat 0.3 m hkuc htut cyutli kyuctcup hwicli hyishrasljutnyk hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Bumelia lycioides* is a deciduous Tree growing to 8 m (26ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from August to September, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in saline soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit[177]. No further details. The fruit has a thick flesh and is about 10mm in diameter[82, 200].

tcanta WoodWood - heavy, hard, not strong, close grained[82, 229]. It weighs about 46lb per cubic foot[235]. Of no commercial value, it is used for tool handles, cabinet making etc[82, 229].

dwatta None known

propta Seed - we have no details on this species but would suggest that if ripe seed can be obtained it should be sown straight away in a cold greenhouse. Stored seed can be sown in late winter or early spring in a greenhouse. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter, planting them out into their permanent positions in late spring or early summer, after the last expected frosts.

nwatta Succeeds in a warm sunny site in any freely draining moderately fertile soil[200]. Plants are cut back by temperatures below about -15°C but they regenerate freely from the base [200]. Succeeds outdoors at Kew[11], though it is not very vigorous[K]. This species rarely, if ever, fruits in Britain[11]. The tree at Kew flowered freely in the long hot summer of 1989 but did not produce fruit[K].

## 7.2.250 Oenothera elata hookeri

Hooker's Evening Primrose  
6 tlin 9 cyuc 2 kcaak 2 tcan 1 dwat 0.8 m hkuc htut cyutli kyuctcup hwicli hrasljut hpa7tli flatprikliw hpa7tmwatli fyifxre7t hjonli

drutta *Oenothera elata hookeri* is a BIENNIAL/PERENNIAL growing to 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to October, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Lepidoptera (Moths and Butterflies), bees. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Leaves Root SeedpodEdible Uses: Root - cooked. Boiled and eaten like parsnip[183]. Young shoots - raw or cooked. Added to salads or boiled as a potato[183]. They are usually blanched before use[183]. A mucilaginous texture. The young pod-like fruits can be eaten when cooked[183].

tcanta None known

dwatta PouliticeThe plant has been used in the treatment of colds[257]. A poultice of the roots or the leaves has been used in the treatment of sores and swellings[257].

propta Seed - sow in situ from late spring to early summer.

nwatta Prefers a dryish well-drained sandy loam and full sun. Heavy clay soils may induce winter rots. Succeeds on poor soils. The flowers open in the evening, they are richly scented and are very attractive to moths. The seeds are a good food source for birds, especially finches. Plants usually mutate freely. This species is very closely related to, and perhaps no more than a part of, *O. biennis*[204]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is fleshy. Thick or swollen - fibrous or tap root [2-1].

## 7.2.251 Satureja thymbra

Thyme-Leaved Savory  
6 tlin 9 cyuc 2 kcaak 3 tcan 2 dwat 0.4 m hkuc

hnmimhtut cyutli tcup hwicli hrasljutnyk hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Satureja thymbra* is a SHRUB growing to 0.4 m (1ft 4in) by 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to June. The species is hermaphrodite (has both male and female organs). It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Edible Uses: Condiment TeaThe leaves have a thyme-like flavour and are used as a seasoning for pulses, savoury breads, brine-cured olives, vegetables etc[4, 177, 183, 238]. The leaves and young shoots are used as a tea substitute. It is said that this make one of the best-tasting of all herb teas[183].

tcanta Cleanser EssentialA strong infusion of the herb is used in the autumn to clean wine barrels in preparation for the new vintage[183]. An essential oil is obtained from the plant, it contains 19% thymol[4] and is also rich in carvacrol[238]. It is used in the pharmaceutical industry[238]. A good bee plant[148]. Members of this genus are rarely if ever troubled by browsing deer[233]. Dynamic accumulator.

dwatta Antibacterial Aromatic Digestive Expectorant TonicThe leaves are antibacterial, aromatic, digestive, expectorant and tonic[148, 238]. They are used internally to treat minor digestive discomfort and bronchial congestion[238]. The leaves are harvested during the growing season and can be used fresh or dried[238].

propta Seed - surface sow in April in a greenhouse. Do not allow the compost to dry out. Germination can be slow and erratic[1] but usually takes place within a month[K]. Prick out the seedlings into individual pots as soon as they are large enough to handle. It is usually possible to plant out into their permanent positions during the summer, but if the plants have not grown sufficiently, or if you live in an area of cold winters, it might be best to grow them on in a cold frame for their first winter and plant them out in late spring or early summer of the following year[K]. Cuttings of half-ripe wood, 5 - 8cm taken at a node, July/August in a frame. Pot up in autumn and overwinter in a frame, planting out in late spring or early summer of the following year. A high percentage usually succeed[78]. Cuttings of young wood, preferably with a heel, April/May in a frame[1, 37]. Plant out in the summer if the plants grow well, otherwise overwinter them in a cold frame and plant out in late spring or early summer of the following year[K]. Division in early spring as growth commences[78, 200]. This works best if soil has been mounded up into the bottom 20cm of the plant early in the previous summer[78]. Pot up the divisions and grow them on in a cold frame until they are established. Plant them out in the summer.

nwatta Requires a sunny position in a well-drained soil[200]. Plants are intolerant of soils that remain damp[200]. Prefers a neutral to alkaline soil[238]. This species is not very hardy outdoors in Britain, plants suffer damage at temperatures below freezing but they can be grown as annuals, flowering and setting seed in their first year[200]. Plants will be hardier in soils that are very well drained and also if the soil is a bit on the poor side[K].

## 7.2.252 Arisaema tortuosum

Arisaema  
6 tlin 9 cyuc 2 kcaak 0 tcan 2 dwat 0.6 m hkuc pcmhmmimhtut cyutli tcup hwicli hrasljut hpa7tli flatprikliw hpa7tmwatli dyat hjonli

drutta *Arisaema tortuosum* is a PERENNIAL growing to 0.6 m (2ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to June. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Flies. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Tuber - it must be thoroughly dried or cooked before being eaten[51, 177].

The tubers are boiled and eaten in Nepal, mixed with lime juice (Citrus aurantifolia) or another sour substance[272]. The tubers are buried in masses in pits until acetous fermentation takes place, they are then dug up, washed and cooked, by which means their acrimonious principles are in part dispersed[2]. However, violent illness has still been known to follow a hearty meal of the tubers[2]. See also the notes above on toxicity.

tcanta InsecticideThe tubers have insecticidal properties[272].

dwatta VermifugeThe roots have been used as a vermifuge in cattle[240, 243]. The juice of the tubers is applied to the wounds of cattle in order to kill any parasites[272]. The dried powdered tubers is applied to snake bites[272]. The seeds have been mixed with salt and used to treat colic in sheep[240, 243, 272].

propta Seed - best sown as soon as it is ripe in a shady position in a cold frame[134]. Stored seed remains viable for at least a year and can be sown in spring in the greenhouse but it will probably require a period of cold stratification. Germination usually takes place in 1 - 6 months at 15°C[134]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least a couple of years until the corms are more than 20mm in diameter. Plant out into their permanent positions whilst they are dormant. Division of tubers when the plant dies down in late summer.

nwatta Prefers a cool peaty soil in the bog garden, woodland garden or a sheltered border in semi-shade[134, 200]. Prefers a loamy or peaty soil and will tolerate a sunny position if the soil is moist but not water-logged and the position is not too hot or exposed[1, 200]. Plants are not very hardy outdoors in Britain and are normally best if given protection[1]. However, they can succeed outdoors in the milder areas of the country if the tubers are planted about 20cm deep[200]. Plants require protection from slugs[200]. Most species in this genus are dioecious, but they are sometimes monoecious and can also change sex from year to year. This species usually bears either monoecious or all male flowers[266].

### 7.2.253 Berberis empetrifolia

6 tlin 9 cyuc 2 kcaak 0 tcan 2 dwat 0.3 m hkuc hmimhtut cyutli kyuctcup hwicli hyishrasjltunykfrip hpa7tli flatpriklwis hpa7tmwatli fyifkre7t hjonli

drutta Berberis empetrifolia is an evergreen Shrub growing to 0.3 m (1ft) by 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower in May, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[2, 69, 105, 177]. The fruits are about 7mm long[200].

tcanta DyeA yellow dye is obtained from the root and bark.

dwatta Antibacterial Cancer DysenteryBerberine, universally present in rhizomes of Berberis species, has marked antibacterial effects. Since it is not appreciably absorbed by the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not be used with Glycyrrhiza species (Licquorice) because this nullifies the effects of the berberine[218]. Berberine has also shown antitumour activity[218].

propta Seed - best sown as soon as it is ripe in a cold frame, when it should germinate in late winter or early spring[78]. Seed from over-ripe fruit will take longer to germinate[78], whilst stored seed may require cold stratification and should be sown in a cold frame as early in the year as possible[80]. The seedlings are subject to damping off, so should be kept well ventilated[113]. When the seedlings are large enough to handle, prick them out into individual pots and grow them on in a cold frame. If growth is sufficient, it can be possible to plant them out into their permanent positions in the autumn, but generally it is best to leave them in the cold frame for the winter and plant them out in late spring or early summer of the following year. Cuttings of

half-ripe wood, July/August in a frame[11, 113]. Pot up in the spring[113]. Cuttings of mature wood of the current season's growth, preferably with a heel, October/November in a frame[78].

nwatta Prefers a warm moist loamy soil and light shade but it is by no means fastidious, succeeding in thin, dry and shallow soils[11, 200]. Grows well in heavy clay soils. Plants are hardy to about -15°C[184]. Hybridizes freely with other members of this genus[1]. Plants can be pruned back quite severely, they resprout well from the base[200].

### 7.2.254 Vitis californica

California Grape, California wild grape
6 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 9 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjltunyk hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Vitis californica is a deciduous Climber growing to 9 m (29ft 6in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from June to July, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Fruit LeavesEdible Uses: Fruit - raw, cooked or dried for winter use[105, 161, 177, 257]. It can also be made into jellies, pies etc[183]. The fruit is quite juicy but is very small. The fruit is about 8mm in diameter[200], but it has a thin flesh and is of little value even in America for its fruit[11, 200]. Young leaves are wrapped around other foods and then baked, they impart a pleasant flavour. Young tendrils - raw or cooked. A pleasantly sour snack when eaten raw[183].

tcanta Basketry Dye StringA yellow dye is obtained from the fresh or dried leaves[168]. The roots have been used as a basketry material for basket bottoms[257]. Woody parts of the vines have been used for the rims of large cone-shaped carrying baskets[257]. Smaller vines have been twisted to make a strong rope[257].

dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe[K]. Six weeks cold stratification improves the germination rate, and so stored seed is best sown in a cold frame as soon as it is obtained. Germination should take place in the first spring, but sometimes takes another 12 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant out in early summer. Cuttings of mature wood of the current seasons growth, December/January in a frame. These cuttings can be of wood 15 - 30cm long or they can be of short sections of the stem about 5cm long with just one bud at the top of the section. In this case a thin, narrow strip of the bark about 3cm long is removed from the bottom half of the side of the stem. This will encourage callusing and the formation of roots. Due to the size of these cuttings they need to be kept in a more protected environment than the longer cuttings. Layering.

nwatta Prefers a deep rich moist well-drained moderately fertile loam[1, 200]. Grows best in a calcareous soil[200]. Succeeds in sun or partial shade though a warm sunny position is required for the fruit to ripen[200]. The young growth in spring can be damaged by late frosts. Plants climb by means of tendrils[182]. Any pruning should be carried out in winter when the plants are dormant otherwise they bleed profusely[182, 200]. Plants in this genus are notably susceptible to honey fungus[200].

### 7.2.255 Adenophora verticillata

6 tlin 9 cyuc 2 kcaak 0 tcan 2 dwat 1 m hkuc hmimhtut cyutli tcup hwicli hrasjltut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Adenophora verticillata is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in June, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for:

propta Seed - sow March/April in a greenhouse[200]. Germination usually takes place within 2 weeks. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in early summer. In areas where the plant is towards the limits of its hardiness, it is best to grow the plants on in a greenhouse for their first winter and plant them out in late spring of the following year. Cuttings of half-ripe wood succeed at almost any time in the growing season[200].

nwatta Requires a very well-drained light sandy soil in a sunny position[200]. Prefers a rich soil[1]. Plants can be killed by excessive winter wet[200]. Members of this genus are rarely if ever troubled by browsing deer[233].

### 7.2.402 Sedum spurium

Caucasian Stonecrop
6 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 0.2 m hkuc htut cyutli hgatkyuctcup hwicli hyishrasjltunyk hpa7tli flatpriklwis hpa7tmwatli fyifkre7t hjonli

drutta Sedum spurium is an evergreen Perennial growing to 0.2 m (0ft 8in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked. The leaves are thick and juicy but somewhat astringent and with a slight bitterness[K].

tcanta Can be used as a ground cover plant in a sunny position[197, 208]. It requires weeding for the first year or so[197].

dwatta None known

propta Seed - surface sow in spring in well-drained soil in a sunny position in a greenhouse. Do not allow the soil to dry out. Prick out the seedlings into individual pots when they are large enough to handle. If sufficient growth is made, it is possible to plant them out during the summer, otherwise keep them in a cold-frame or greenhouse for their first winter and plant them out in early summer of the following year[K]. Division is very easy and can be carried out at almost any time in the growing season, though is probably best done in spring or early summer. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Succeeds in most soils[188] but prefers a fertile well-drained soil in a sunny position[200]. Established plants are drought tolerant[200]. Tolerates poor soils. Hardy to about -5°C[200]. A mat-forming plant, it is very invasive[83]. The flowers of this species are white or pink[200]. All members of this genus are said to have edible leaves, though those species that have yellow flowers can cause stomach upsets if they are eaten in quantity[62, 85]. Plants in this genus seem to be immune to the predations of rabbits[233].

### 7.2.403 Chamaedaphne calyculata

Leather Leaf

6 tlin 9 cyuc 1 kcaak 0 tcan 1 dwat 0.8 m hkuc hmimhtut cyutli tcup hwicli hrasjltunyk hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta Chamaedaphne calyculata is an evergreen Shrub growing to 0.8 m (2ft 7in) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from April to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Edible Uses: TeaAn aromatic tea-like beverage is brewed from the fresh or dried leaves[161,

177, 183, 257]. Some reports say that boiling or steeping can extract a harmful toxin 'andromedotoxin' and it is recommended that the leaves are put in a jar of water and left in a sunny position to brew in order to make 'sun-tea'[183].

tcanta None known

dwatta Antiphlogistic FebrifugeA poultice of the leaves has been applied to inflammations[257]. An infusion of the leaves has been used to treat fevers[257].

propta Seed - sow February in a lime-free compost in a greenhouse and only just cover the seed[78]. Do not allow the compost to dry out and keep the pot in a shady position. Germination is usually fair, taking 1 - 12 months at 15°C, though 4 weeks cold stratification may reduce this time[164]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts[164]. Cuttings of almost ripe side-shoots, 4 - 5cm long with a heel, August in a frame. A variable degree of success[78]. It can help to prune the plants lightly after flowering in order to encourage vigorous growth from which to take the cuttings[78]. Layering in August. Takes 18 months. High percentage[78].

nwatta Thrives in a moist well-drained lime-free soil in sun or semi-shade[1, 200]. Best if given some protection from the midday sun[1]. Plants are hardy to about - 25°C[184]. There are some named forms, selected for their ornamental value. 'Nana' is a dwarf compact form that is good for shady areas[183]. The flowers have a delicate refreshing scent[245].

### 7.2.404 Dracocephalum heterophyllum

6 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 0.3 m hkuc hmimhtut cyutli tcup hwicli hrasjltunyk hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Dracocephalum heterophyllum is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Root - cooked[105, 177].

tcanta None known

dwatta None known

propta Seed - sow in an outdoor seedbed in April/May. The seed usually germinates in 1 - 4 weeks at 15°C[175]. If seed is in short supply then we would recommend sowing it in a pot in a cold frame, potting it up as soon as it is large enough to handle and growing it on in the frame for the first winter, planting out in late spring. Division in spring or autumn[200]. Basal cuttings in April/May[1, 200]. Harvest the shoots when they are about 10 - 15cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Grows best in a sunny position in a fertile well-drained soil according to some reports[200, 245] whilst other reports say that it prefers a cool position and some shade[1, 175]. Prefers some shelter and a moist but not wet soil[175].

### 7.2.405 Cornus monbeigii

6 tlin 9 cyuc 1 kcaak 0 tcan 2 dwat m hkuc hmimhtut cyutli tcup hwicli hrasjltunykfrip hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Cornus monbeigii is a deciduous Shrub growing to 5 m (16ft 5in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August, and the seeds ripen from September to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

plant, specimens can survive in the garden for at least 50 years[200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. A very greedy plant inhibiting the growth of nearby plants, especially legumes[54]. Strongly resents root disturbance, taking some time to recover after being divided[1]. Peony species are usually self-fertile, though they will also hybridise with other species if these flower nearby at the same time[250]. Plants take 4 - 5 years to flower from seed[200]. They generally breed true from seed[1].

## 7.2.398 Ornithogalum narbonense

Star Of Bethlehem  
6 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 0.4 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

drutta Ornithogalum narbonense is a BULB growing to 0.4 m (1ft 4in) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from April to June, and the seeds ripen from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Bulb[46, 61, 177]. No further details are given, though it is probably cooked before being eaten. Some caution is advised, see the notes above on toxicity.

tcanta None known  
dwatta None known  
propta Seed - best sown as soon as it is ripe in a cold frame[200]. Sow the seed thinly and leave the seedlings undisturbed in the pots for their first dormancy, but apply liquid feed at intervals, especially in their second year of growth. Divide the bulbs at the end of their second year of growth, putting 2 - 3 bulbs in each pot. Grow them on for one more year and then plant them out into their permanent positions whilst they are dormant. The seed can also be sown in a cold frame in early spring. Division of offsets in September/October[200]. The larger bulbs can be replanted immediately into their permanent positions. It is best to pot up the smaller bulbs and grow them on for a year before planting them out when dormant in late summer.

nwatta An easily grown plant[90], it succeeds in any position[42] in ordinary garden soil[1]. Prefers a sunny position[200]. Succeeds in short grass[90], though this should not be mown from the time the bulbs start to grow until they have set seed and the leaves are dying down. Plants are hardy to about -10°C[200].

## 7.2.399 Goodyera oblongifolia

Western Rattlesnake Plantain  
6 tlin 9 cyuc 1 kcaak 0 tcan 1 dwat 0.3 m hkuc  
hmimhtut cyutli kyuctup hwicli hrasjlut hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

drutta Goodyera oblongifolia is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Edible Uses: GumAn exudation from the plant is used as a chewing gum[105, 161, 177].

tcanta GumNone known  
dwatta Poulitice TonicAn infusion of the plants has been used as a tonic[257]. A poultice of the softened leaves has been applied to cuts and sores[257]. An infusion of the leaves has been used in the bath water for treating stiff muscles[257].

propta Seed - surface sow, preferably as soon as it is ripe, in the greenhouse and do not allow the compost to dry out. The seed of this species is extremely simple, it has a minute embryo surrounded by a single layer of protective cells. It contains very little food reserves and depends upon

a symbiotic relationship with a species of soil-dwelling fungus. The fungal hyphae invade the seed and enter the cells of the embryo. The orchid soon begins to digest the fungal tissue and this acts as a food supply for the plant until it is able to obtain nutrients from decaying material in the soil[200]. It is best to use some of the soil that is growing around established plants in order to introduce the fungus, or to sow the seed around a plant of the same species and allow the seedlings to grow on until they are large enough to move. Division is best carried out in the spring[230]. Each division should have a leading point and two, or preferably three, joints of the rhizome[230]. More propagating material can be obtained by cutting halfway through the rhizome during the previous growing season at the point where you wish to divide[230]. This will stimulate the production of growth buds at the point of division[230].

nwatta Requires a somewhat shady site and a well-drained compost of peat, leafmold and sand[1]. Does well in the woodland garden[42, 230]. This species is not very hardy in Britain, it is suitable for cultivation in a cool greenhouse or, perhaps, for a select position outdoors[1]. It is closely related to the British native species *G. repens*[230]. Orchids are, in general, shallow-rooting plants of well-drained low-fertility soils. Their symbiotic relationship with a fungus in the soil allows them to obtain sufficient nutrients and be able to compete successfully with other plants. They are very sensitive to the addition of fertilizers or fungicides since these can harm the symbiotic fungus and thus kill the orchid[230].

## 7.2.400 Amsinckia lycopsoides

Tarweed Fiddleneck  
6 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 0.6 m hkuc  
htut cyutli kyuctup hwicli hrasjlutnyik hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

drutta Amsinckia lycopsoides is a ANNUAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Leaves SeedEdible Uses: Fresh juicy shoots[161, 177, 257]. No more details are given. Seed - raw[257]. The parched seed is ground into a powder then made into cakes and eaten without being cooked[257]. If this species is like most other members of the family Boraginaceae, the seed is likely to ripen over a period of time and individual seeds fall from the plant when they are ripe. This will make harvesting any quantity of seed very fiddly and time consuming[K].

tcanta None known  
dwatta None known  
propta Seed - sow late spring in situ[200].  
nwatta Succeeds in ordinary garden soil in full sun[1, 200].

## 7.2.401 Salvia lanata

6 tlin 9 cyuc 1 kcaak 0 tcan 1 dwat 0.3 m hkuc  
htut cyutli kyuctup hwicli hrasjlut hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

drutta Salvia lanata is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: StemEdible Uses: Stems are peeled and eaten[2, 177].

tcanta None known  
dwatta Astringent Dysentery Emetic PouliticeThe roots are used in the treatment of colds and coughs[240]. The seed is emetic[240]. It is used in the treatment of dysentery, haemorrhoids, colic and, externally, boils[240]. A poultice of the leaves is used as a dressing for wounds and is also applied to itchy skin[240].

light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Root - raw or cooked[46, 61, 105, 177]. A sweet taste[74]. Leaves-cooked[105, 177].

tcanta None known  
dwatta Antidote Antifungal Cardiotoxic Expectorant Febrifuge Sialagogue Stomachic Women's complaintsThis is a commonly used medicinal plant in China. The root is antidote, antifungal, cardiotoxic, expectorant, febrifuge, expectorant, sialagogue, stomachic and tonic[176, 218]. It is used in the treatment of women's diseases, chronic bronchitis with dry cough, pulmonary infections with cough and thick yellow sputum, dry throat[218].

propta Seed - best sown in a cold frame as soon as it is ripe[200]. The seed can also be sown in spring. Surface sow 2 - 3 seeds per pot in the spring in order to avoid transplanting[133]. We have found that if transplanted when very small seedlings grow away without difficulty[K]. Germinates in 1 - 3 months at 10°C[133]. Plant out into their permanent positions whilst young. Basal cuttings in spring[K]. Division in spring - very difficult because the plant dislikes root disturbance[1].

nwatta Prefers a light rich slightly alkaline soil that is not too dry, and a warm sunny position[1, 200]. Grows well in the semi-shade of shrubs or in light woodland[88]. Plants are intolerant of root disturbance[1]. The young growth is extremely attractive to slugs, they have been known to destroy even mature plants[K].

## 7.2.256 Cuphea viscosissima

Tarweed, Blue waxweed  
6 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 0.5 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

drutta Cuphea viscosissima is a ANNUAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta The plant has potential as an oil seed crop (World Economic Plants)

tcanta None known  
dwatta None known  
propta Seed - this can be sown in a greenhouse in early spring, putting the young plants out in late spring after the last expected frosts. Seed can also be sown outdoors in situ in mid to late spring.

nwatta Succeeds in any reasonably fertile soil in full sun or part shade[200].

## 7.2.257 Acer distylum

6 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 1.5 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprikkwis hpa7tmwatli hjonli

drutta Acer distylum is a deciduous Tree growing to 15 m (49ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in June, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: SapEdible Uses: SweetenerThe sap contains a certain amount of sugar and can either be used as a drink, or can be concentrated into a syrup by boiling off the water[105, 177, 183]. The syrup is used as a sweetener on many foods. The concentration of sugar is considerably lower than in the sugar maples (*A. saccharum*). The tree trunk is tapped in the early spring, the sap flowing better on warm sunny days following a frost. The best sap production comes from cold-winter areas with continental climates.

tcanta PreservativeThe leaves are packed around apples, root crops etc to help preserve them[18, 20].

dwatta None known  
propta Seed of plants grown in gardens can be relied upon to breed true. It is best sown as soon as it is ripe in a cold frame, it usually germinates in the following spring. Pre-soak stored seed for 24 hours and then stratify for 2 - 4 months at 1 - 8°C. It can be slow to germinate. The seed can be harvested 'green' (when it has fully developed but before it has dried and produced any germination inhibitors) and sown immediately. It should germinate in late winter. If the seed is harvested too soon it will produce very weak plants or no plants at all[80, 113]. When large enough to handle, prick the seedlings out into individual pots and grow them on until they are 20cm or more tall before planting them out in their permanent positions. Layering, which takes about 12 months, is successful with most species in this genus. Cuttings of young shoots in June or July. The cuttings should have 2 - 3 pairs of leaves, plus one pair of buds at the base. Remove a very thin slice of bark at the base of the cutting, rooting is improved if a rooting hormone is used. The rooted cuttings must show new growth during the summer before being potted up otherwise they are unlikely to survive the winter. This species is quite difficult to grow away well from cuttings.

nwatta Of easy cultivation, it prefers a good moist well-drained soil[11], preferring a sunny position but tolerating some shade[11, 200]. Grows well in heavy clay soils. Chlorosis can sometimes develop as a result of iron deficiency when the plants are grown in alkaline soils, but in general maples are not fussy as to soil pH. Most maples are bad companion plants, inhibiting the growth of nearby plants[18, 20]. Plants are usually monoecious, but hermaphrodite forms occur[275].

## 7.2.258 Celtis tournefortii

Ornital hackberry  
6 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 8 m hkuc  
htut cyutli hgatkuyuctup hwicli hyishrasjlut hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

drutta Celtis tournefortii is a deciduous Tree growing to 8 m (26ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in April, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw[105, 177]. Small[183]. We have no further information, but the fruit is liable to consist of a thin, sweet, though dry and mealy flesh around a large seed[K].

tcanta None known  
dwatta None known  
propta Seed - best sown as soon as it is ripe in a cold frame[200]. Stored seed is best given 2 - 3 months cold stratification and then sown February/March in a greenhouse[78, 200]. Germination rates are usually good, though the stored seed might take 12 months or more to germinate. The seed can be stored for up to 5 years[113]. As soon as they are large enough to handle, prick the seedlings out into individual pots. The leaves of seedlings often have a lot of white patches without chlorophyll, this is normal and older plants produce normal green leaves. Grow the seedlings on in a cold frame for their first winter, and plant them out in the following late spring or early summer[K]. Give them some protection from the cold for their first winter outdoors. Cuttings

nwatta Succeeds in any reasonably good soil, preferring a good fertile well-drained loamy soil[1, 11, 200]. Succeeds on dry gravels and on sandy soils[200]. Established plants are very drought resistant[200]. Trees prefer hotter summers and more sunlight than are normally experienced in Britain, they often do not fully ripen their wood when growing in this country and they are then very subject to die-back in winter[1, 11, 200]. Trees can be very long-lived, perhaps to 1000 years[200]. This tree is more likely to thrive in Britain than most species in the genus[200]. This species is closely

related to *C. glabrata*[11]. Plants in this genus are notably resistant to honey fungus[200].

## 7.2.259 Brassica rapa dichotoma

Indian Rape

6 tlin 9 cyuc 2 kcaok 0 tcan 0 dwat 0.9 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta *Brassica rapa dichotoma* is a BIENNIAL growing to 0.9 m (3ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Leaves - raw or cooked. A bit on the coarse side, though the young leaves can be added in moderation to salads whilst older leaves make an acceptable vegetable[K]. An edible oil is obtained from the seeds.

tcanta None known  
dwatta None known  
propta Seed - sow in situ in the spring.

nwatta Succeeds in full sun in a well-drained fertile preferably alkaline soil[200]. Prefers a light sandy soil and dislikes a heavy soil[37]. Prefers cool moist growing conditions[16]. Succeeds in any reasonable soil. Tolerates a pH in the range 4.3 to 8.3. Indian rape is cultivated mainly in India and Nepal for its oil-rich seeds.

## 7.2.260 Yucca gloriosa

Spanish Dagger, moundlily yucca, Palm Lily, Roman Candle, Mound Lily Yucca, Spanish Dagger  
6 tlin 11 cyuc 2 kcaok 0 tcan 1 dwat 1.8 m hkuc hmimhtut cyutli hgatkyuctup hwicli hyishrasjlut hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta *Yucca gloriosa* is an evergreen Shrub growing to 1.8 m (6ft) by 1.2 m (4ft in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Hand. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

kcakta Edible Parts: Flowers Fruit Root StemEdible Uses: Fruit - raw or cooked. The fruit is up to 10cm long and 26mm wide[229]. The fruit is very rarely produced in the wild[82]. Flowers - raw or cooked. They are delicious raw, and can also be dried, crushed and used as a flavouring[164]. Flowering stem - cooked and used like asparagus[164]. Root - cooked. It can be dried, ground into a powder and made into a bread[105].

tcanta Fibre SoapA fibre obtained from the leaves is used for making cloth, ropes, baskets and mats[46, 61, 82, 169]. The roots are rich in saponins and can be used as a soap substitute[82].

dwatta Detergent PurgativeThe fruit is purgative[240]. The root is detergent[240].

propta Seed - sow spring in a greenhouse. Pre-soaking the seed for 24 hours in warm water may reduce the germination time. It usually germinates within 1 - 12 months if kept at a temperature of 20°C. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse or cold frame for at least their first two winters. Plant them out into their permanent positions in early summer and consider giving them some winter protection for at least their first winter outdoors - a simple pane of glass is usually sufficient[K]. Seed is not produced in Britain unless the flowers are hand pollinated. Root cuttings in late winter or early spring. Lift in April/May and remove small buds from base of stem and rhizomes. Dip in dry wood ashes to stop any bleeding and plant in a sandy soil in pots

in a greenhouse until established[78]. Cuttings can be made of the tops of old plants. These normally root quite easily in the growing season[11].

nwatta Agroforestry Services: Living fence Industrial Crop: Fiber Management: Standard Regional CropLandscape Uses:Massing, Specimen. Thrives in any soil but prefers a sandy loam and full exposure to the south[11]. Plants are harder when grown on poor sandy soils[200]. Established plants are very drought resistant[190]. Judging by its native habitat, this plant should tolerate maritime exposure[K]. Very cold hardy, tolerating temperatures down to at least -15°C[200], or to -25°C according to another report[187], but plants are subject to injury and decay by winter damp and snow[11]. A very ornamental plant[1], there are some named varieties[187]. Plants do not flower every year, requiring hot summers to initiate flowering[190]. The flowers are produced in the autumn and are often damaged by early frosts[233]. The scent of the flowers is most pronounced at night[245]. In the plants native environment, its flowers can only be pollinated by a certain species of moth. This moth cannot live in Britain and, if fruit and seed is required, hand pollination is necessary. This can be quite easily and successfully done using something like a small paint brush. Individual crowns are monocarpic, dying after flowering[233]. However, the crown will usually produce a number of sideshoots before it dies and these will grow on to flower in later years[233]. Plants in this genus are notably resistant to honey fungus[200]. Members of this genus seem to be immune to the predations of rabbits[233]. Special Features:North American native, Attracts butterflies, Fragrant flowers, Blooms are very showy.

## 7.2.261 Pinus culminicola

Cerro Potosi Pinyon

6 tlin 9 cyuc 2 kcaok 0 tcan 2 dwat 5 m hkuc htut cyutli hgatkyuctup hwicli hyishrasjlut hpa7tli flatprik hpa7tmwatli dyat hjonli

drutta *Pinus culminicola* is an evergreen Tree growing to 5 m (16ft 5in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: SeedEdible Uses: CondimentSeed-raw or cooked[81]. The oil-rich seed has a resinous flavour. A vanillin flavouring is obtained as a by-product of other resins that are released from the pulpwood[200].

tcanta Dye Herbicide WoodA tan or green dye is obtained from the needles[168]. The needles contain a substance called terpene, this is released when rain washes over the needles and it has a negative effect on the germination of some plants, including wheat[201]. Oleo-resins are present in the tissues of all species of pines, but these are often not present in sufficient quantity to make their extraction economically worthwhile[64]. The resins are obtained by tapping the trunk, or by destructive distillation of the wood[4, 64]. In general, trees from warmer areas of distribution give the higher yields[64]. Turpentine consists of an average of 20% of the oleo-resin[64] and is separated by distillation[4, 64]. Turpentine has a wide range of uses including as a solvent for waxes etc, for making varnish, medicinal etc[4]. Rosin is the substance left after turpentine is removed. This is used by violinists on their bows and also in making sealing wax, varnish etc[4]. Pitch can also be obtained from the resin and is used for waterproofing, as a wood preservative etc.

dwatta The turpentine obtained from the resin of all pine trees is antiseptic, diuretic, rubefacient and vermifuge[4]. It is a valuable remedy used internally in the treatment of kidney and bladder complaints and is used both internally and as a rub and steam bath in the treatment of rheumatic affections[4]. It is also very beneficial to the respiratory system and so is useful in treating diseases of the mucous membranes and respiratory complaints such as coughs, colds, influenza and TB[4]. Externally it is a very beneficial treatment for a variety of skin complaints, wounds, sores, burns, boils

stratification at between 0 and 5°C and should be sown as early in the year as possible[113, 164]. Under normal storage conditions the seed can remain viable for 17 years or more. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter, planting them out in late spring of the following year. Cuttings of half-ripe wood, 10 - 15cm with a heel, July/August in a frame[78, 113]. Cuttings of mature wood of the current year's growth, preferably with a heel of the previous year's growth, November to February in a cold frame or sheltered bed outdoors[78, 200].

nwatta Easily grown in a moisture retentive but well-drained loamy soil of at least moderate quality[11, 200]. Requires a sunny position[11]. Hardy to about -20°C[200]. A very ornamental plant[60], it is closely related to *R. menziesii*[1]. Plants can harbour a stage of 'white pine blister rust', so they should not be grown in the vicinity of pine trees[155]. Plants in this genus are notably susceptible to honey fungus[200].

## 7.2.395 Artemisia indica

6 tlin 9 cyuc 1 kcaok 0 tcan 3 dwat 1.2 m hkuc hmimhtut cyutli kyuctup hwicli hrasjlut hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta *Artemisia indica* is a ANNUAL/PERENNIAL growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from August to October, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: LeavesEdible Uses: Colouring CondimentYoung leaves - cooked and eaten with barley[183]. The leaves are also pounded with steamed glutinous rice to give a flavour and colouring[177, 183].

tcanta Essential InsecticideThe plant yields about 0.2% essential oil. This is a good larvicide and a feeble insecticide[240]. The dried leaves and flowers are used as an incense[272].

dwatta Anthelmintic Antiseptic Antispasmodic Dysentery Emmenagogue Expectorant Ophthalmic Stomachic TonicThe leaves and flowering stems are anthelmintic, antiseptic, antispasmodic, emmenagogue, expectorant and stomachic[240, 272]. An infusion is used in the treatment of nervous and spasmodic affections, in asthma and in diseases of the brain[240, 272]. This infusion is also considered to be helpful in improving the appetite[272]. The juice of the plant is used in Nepal to treat diarrhoea, dysentery and abdominal pains[272]. It is used as an eyewash where it is said to relieve the burning sensation in conjunctivitis[272]. A paste of the plant is applied externally to treat wounds[272]. The roots are antiseptic and are a tonic for the kidneys[240, 266, 272].

propta Seed - surface sow spring in a greenhouse. Do not allow the compost to dry out. When large enough to handle, prick the seedlings out into individual pots and plant them out in early summer. The seed can also be sown in situ in late spring.

nwatta Easily grown in a well-drained circumneutral or slightly alkaline loamy soil, preferring a sunny position[1, 200]. Plants are annuals or short-lived perennials[200]. Plants are longer lived, more hardy and more aromatic when they are grown in a poor dry soil[245]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 7.2.396 Bromus rigidus

Rippgut Brome

6 tlin 9 cyuc 1 kcaok 0 tcan 0 dwat 1 m hkuc htut cyutli hgatkyuctup hwicli hyishrasjlutnyik hpa7tli flatprikwis hpa7tmwatli fyifxre7t hjonli

drutta *Bromus rigidus* is a ANNUAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Cleistogomy (self-pollinating without flow-

ers ever opening). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: SeedEdible Uses: Seed[161, 177]. Used as a piñole, or dried then ground into a powder and mixed with water to make a gruel[257]. The seed is small and would be rather fiddly to use[K].

tcanta None known  
dwatta None known  
propta Seed - sow spring or autumn in situ and only just cover. Germination should take place within 2 weeks.

nwatta Succeeds in ordinary well-drained garden soil in a sunny position[138, 200]. The plant has cleistogamous flowers, these flowers do not open but produce seed by means of self-fertilization.

## 7.2.397 Paeonia japonica

Yama-Shakuyaku

6 tlin 9 cyuc 1 kcaok 0 tcan 1 dwat 0.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikrip hpa7tli flatprikwis hpa7tmwatli fyifxre7t hjonli

drutta *Paeonia japonica* is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Flowers[177]. No further details are given. Young leaves - cooked[177].

tcanta None known  
dwatta Analgesic Antibacterial Antiinflammatory Antispasmodic Diuretic Febrifuge SedativeThe root is analgesic, antibacterial, anti-inflammatory, antispasmodic, diuretic, febrifuge and sedative[174]. A tea made from the dried crushed petals of various peony species has been used as a cough remedy, and as a treatment for haemorrhoids and varicose veins[250].

propta Seed - best sown as soon as it is ripe in a cold frame[250]. When sown fresh, the seed produces a root about 6 weeks after sowing with shoots formed in the spring[200]. Stored seed is much slower, it should be sown as soon as possible in a cold frame but may take 18 months or more to germinate[200]. The roots are very sensitive to disturbance, so many growers allow the seedlings to remain in their pots for 2 growing seasons before potting them up. This allows a better root system to develop that is more resilient to disturbance[250]. If following this practice, make sure you sow the seed thinly, and give regular liquid feeds in the growing season to ensure the plants are well fed. We usually prick out the seedlings into individual pots as soon as they are large enough to handle, and then grow them on in a cold frame for at least two growing seasons before planting them out when they are in growth in the spring[K]. Division with great care in spring or autumn. Each portion must have a leaf bud. If the lifted root is stood in shade for several hours it becomes less brittle and easier to divide[200]. Divisions that have several buds will usually flower in the second year, but those that only have one or two buds will take a number of years before they have grown sufficiently to flower[250].

nwatta Requires a deep rich soil, preferably neutral or slightly alkaline[1], doing quite well in sun or light shade[1, 200]. Plants are tolerant of a wide range of soil conditions, but will not survive if the soil becomes waterlogged or is too dry[250]. This species is lime tolerant[200]. Plants grown on sandy soils tend to produce more leaves and less flowers, whilst those growing on clay take longer to become established but produce better blooms[250]. Closely related to *P. obovata*, this species is not easily cultivated in Britain and tends to be a poor doer here[200]. Plants offered under this name in British nurseries are often *P. suffruticosa* 'Japanese'[200]. Some botanists now treat this plant as no more than a form of *P. lactiflora*[250]. A very long-lived

disturbance, so many growers allow the seedlings to remain in their pots for 2 growing seasons before potting them up. This allows a better root system to develop that is more resilient to disturbance[250]. If following this practice, make sure you sow the seed thinly, and give regular liquid feeds in the growing season to ensure the plants are well fed. We usually prick out the seedlings into individual pots as soon as they are large enough to handle, and then grow them on in a cold frame for at least two growing seasons before planting them out when they are in growth in the spring[K].

**nwatta** Requires a deep rich soil, preferably neutral or slightly alkaline[1], doing quite well in sun or light shade[1]. Prefers a limy soil and a sheltered position[200]. Plants are tolerant of a wide range of soil conditions, but will not survive if the soil becomes waterlogged or is too dry[250]. This species is lime tolerant[200]. Plants grown on sandy soils tend to produce more leaves and less flowers, whilst those growing on clay take longer to become established but produce better blooms[250]. Hardy to about -15°c[250], plants do better in the north of Britain than they do in the south and are generally best if given an open northerly aspect[11]. This species is not recognised by some Chinese botanists, who hold that it is no more than a form of *P. delavayi*[214]. A very ornamental plant[1]. It grows best in areas with long hot summers[1] and requires an airy position because it is very subject to fungal attack[11]. Plants in this genus are notably susceptible to honey fungus[200]. Plants come into growth early in the year and are then subject to damage by late frosts, they are therefore best sited in a position that is shaded from the morning sun[11]. The branches are brittle and very subject to wind damage, especially when young[200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. A very greedy plant inhibiting the growth of nearby plants, especially legumes[54]. The plant does not really need much pruning apart from removing dead or diseased stems. It is, however, very tolerant of pruning and can be cut right back to ground level if it requires rejuvenation[200]. This species strongly resents root disturbance, taking some time to recover after being divided[1]. Peony species are usually self-fertile, though they will also hybridise with other species if these flower nearby at the same time[250]. Plants take 4 - 5 years to flower from seed[200]. They generally breed true from seed[1]. Cultivated in China as a medicinal plant[214].

## 7.2.393 Paeonia szechuanica

Tree Peony  
6 tlin 9 cyuc 1 kcaak 0 tcan 2 dwat 1.5 m hkuc  
hmmhtut cyutli tcup hwicli hrasljutnyikfrp hpa7tli flatprik-  
wissip hpa7tmwatli fyfxfre7t hjonli

**drutta** *Paeonia szechuanica* is a deciduous Shrub growing to 1.5 m (5ft) by 3 m (9ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**ckakta** Edible Parts: FlowersEdible Uses: The following use is for *P. suffruticosa*. It quite probably also applies to this closely-related species.[K - see 214]. Flowers - cooked[46, 61, 177]. The fallen flower petals are parboiled and sweetened for a teatime delicacy, or cooked in various dishes[183].

**tcanta** None known

**dwatta** Analgesic Antibacterial Antinflammatory Antispasmodic tea made from the dried crushed petals of various peony species has been used as a cough remedy, and as a treatment for haemorrhoids and varicose veins[250]. The following uses are for *P. suffruticosa*. They quite probably also apply to this closely-related species.[K - see 214]. The root and root bark is analgesic, antibacterial, anti-inflammatory, antipyretic, antispasmodic, emmenagogue, sedative, styptic and tonic[46, 61, 174, 176, 178, 218]. An extract of the plant has antibacterial activity[218]. The plant is used internally in the treatment of fevers, boils, menstrual disorders, nosebleeds, ulcers, irritability and gastro-intestinal infections[238]. This remedy should only be used under the

supervision of a qualified practitioner[238]. The herb acts as a synergist when used with liquorice (*Glycyrrhiza* spp)[218].

**propta** Seed - best sown as soon as it is ripe in a cold frame[250]. When sown fresh, the seed produces a root about 6 weeks after sowing with shoots formed in the spring[200]. Stored seed is much slower, it should be sown as soon as possible in a cold frame but may take 18 months or more to germinate[200]. The roots are very sensitive to disturbance, so many growers allow the seedlings to remain in their pots for 2 growing seasons before potting them up. This allows a better root system to develop that is more resilient to disturbance[250]. If following this practice, make sure you sow the seed thinly, and give regular liquid feeds in the growing season to ensure the plants are well fed. We usually prick out the seedlings into individual pots as soon as they are large enough to handle, and then grow them on in a cold frame for at least two growing seasons before planting them out when they are in growth in the spring[K].

**nwatta** Requires a deep rich soil, preferably neutral or slightly alkaline[1], doing quite well in sun or light shade[1]. Prefers a limy soil and a sheltered position[200]. Plants are tolerant of a wide range of soil conditions, but will not survive if the soil becomes waterlogged or is too dry[250]. This species is lime tolerant[200]. Plants grown on sandy soils tend to produce more leaves and less flowers, whilst those growing on clay take longer to become established but produce better blooms[250]. Hardy to about -20°c[184], plants do better in the north of Britain than they do in the south and are generally best if given an open northerly aspect[11]. A very ornamental plant[1]. It grows best in areas with long hot summers[1] and requires an airy position because it is very subject to fungal attack[11]. Plants in this genus are notably susceptible to honey fungus[200]. Plants come into growth early in the year and are then subject to damage by late frosts, it is therefore best to site them in a position with shade from the early morning sun[11]. The branches are brittle and very subject to wind damage, especially when young[200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. A very greedy plant inhibiting the growth of nearby plants, especially legumes[54]. The plant does not really need much pruning apart from removing dead or diseased stems. It is, however, very tolerant of pruning and can be cut right back to ground level if it requires rejuvenation[200]. Strongly resents root disturbance, taking some time to recover after being divided[1]. Peony species are usually self-fertile, though they will also hybridise with other species if these flower nearby at the same time[250]. Plants take 4 - 5 years to flower from seed[200]. They generally breed true from seed[1]. Cultivated in China as a medicinal plant[214].

## 7.2.394 Ribes lobbii

Gummy Gooseberry

6 tlin 9 cyuc 1 kcaak 0 tcan 1 dwat 1.8 m hkuc  
htut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikwis  
hpa7tmwatli xre7t hjonli

**drutta** *Ribes lobbii* is a deciduous Shrub growing to 1.8 m (6ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

**ckakta** Edible Parts: FruitEdible Uses: Fruit - raw or cooked[101, 105, 161, 257]. Generally considered to be unpalatable, but they were occasionally eaten by some native North American Indian tribes[256].

**tcanta** Needles StringThe roots have been boiled with cedar (*Juniperus* spp, *Thuja* sp.) and wild rose (*Rosa* spp) roots, then pounded and woven into rope[257]. The sharp thorns have been used as probes for boils, for removing splinters and for tattooing[257].

**dwatta** Astringent Poultice SalveThe root has been used in the treatment of diarrhoea[257]. A poultice of the roots and salt water has been applied to mouth sores, body sores, blisters and carbuncles[257]. The root ash, mixed with oil, has been used as a salve on boils[257].

**propta** Seed - best sown as soon as it is ripe in the autumn in a cold frame. Stored seed requires 3 months cold

etc and is used in the form of liniment plasters, poultices, herbal steam baths and inhalers[4].

**propta** It is best to sow the seed in individual pots in a cold frame as soon as it is ripe if this is possible otherwise in late winter. A short stratification of 6 weeks at 4°c can improve the germination of stored seed[80]. Plant seedlings out into their permanent positions as soon as possible and protect them for their first winter or two[11]. Plants have a very sparse root system and the sooner they are planted into their permanent positions the better they will grow[K]. Trees should be planted into their permanent positions when they are quite small, between 30 and 90cm[200]. We actually plant them out when they are about 5 - 10cm tall. So long as they are given a very good weed-excluding mulch they establish very well[K]. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200]. Cuttings. This method only works when taken from very young trees less than 10 years old. Use single leaf fascicles with the base of the short shoot. Disbudding the shoots some weeks before taking the cuttings can help. Cuttings are normally slow to grow away[81].

**nwatta** Thrives in a light well-drained sandy or gravelly loam[1, 11]. Dislikes poorly drained moorland soils[1]. Established plants tolerate drought, succeeding in hot dry positions[200]. A slow growing plant[81], but when mature it is fully hardy in Britain[200]. Young trees are less hardy than mature specimens, only tolerating temperatures down to about -3°c[260]. Plants are often sub-dioecious[200]. Plants are strongly outbreeding, self-fertilized seed usually grows poorly[200]. They hybridize freely with other members of this genus[200]. The cones open and shed their seed whilst still attached to the tree[226]. Leaf secretions inhibit the germination of seeds, thereby inhibiting the growth of other plants below the tree[18]. Plants in this genus are notably susceptible to honey fungus[200].

## 7.2.262 Pinus ayacahuite

Mexican White Pine

6 tlin 9 cyuc 2 kcaak 0 tcan 2 dwat 55 m hkuc  
htut cyutli hgaktyucutp hwicli hyishrasljut hpa7tli flatprik  
hpa7tmwatli dyat hjonli

**drutta** *Pinus ayacahuite* is an evergreen Tree growing to 55 m (180ft 5in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

**ckakta** Edible Parts: SeedEdible Uses: CondimentSeed-raw or cooked[183]. The seed is about 8mm long[200]. Rich in oil, the seed has a resinous flavour. A vanillin flavouring is obtained as a by-product of other resins that are released from the pulpwood[200].

**tcanta** Dye Herbicide Resin WoodA tan or green dye is obtained from the needles[168]. The needles contain a substance called terpene, this is released when rain washes over the needles and it has a negative effect on the germination of some plants, including wheat[201]. Oleo-resins are present in the tissues of all species of pines, but these are often not present in sufficient quantity to make their extraction economically worthwhile[64]. The resins are obtained by tapping the trunk, or by destructive distillation of the wood[4, 64]. In general, trees from warmer areas of distribution give the higher yields[64]. Turpentine consists of an average of 20% of the oleo-resin[64] and is separated by distillation[4, 64]. Turpentine has a wide range of uses including as a solvent for waxes etc, for making varnish, medicinal etc[4]. Rosin is the substance left after turpentine is removed. This is used by violinists on their bows and also in making sealing wax, varnish etc[4]. Pitch can also be obtained from the resin and is used for waterproofing, as a wood preservative etc.

**dwatta** The turpentine obtained from the resin of all pine trees is antiseptic, diuretic, rubefacient and vermifuge[4]. It is a valuable remedy used internally in the treatment of kidney and bladder complaints and is used both internally and

as a rub and steam bath in the treatment of rheumatic affections[4]. It is also very beneficial to the respiratory system and so is useful in treating diseases of the mucous membranes and respiratory complaints such as coughs, colds, influenza and TB[4]. Externally it is a very beneficial treatment for a variety of skin complaints, wounds, sores, burns, boils etc and is used in the form of liniment plasters, poultices, herbal steam baths and inhalers[4].

**propta** It is best to sow the seed in individual pots in a cold frame as soon as it is ripe if this is possible otherwise in late winter. A short stratification of 6 weeks at 4°c can improve the germination of stored seed[80]. Plant seedlings out into their permanent positions as soon as possible and protect them for their first winter or two[11]. Plants have a very sparse root system and the sooner they are planted into their permanent positions the better they will grow[K]. Trees should be planted into their permanent positions when they are quite small, between 30 and 90cm[200]. We actually plant them out when they are about 5 - 10cm tall. So long as they are given a very good weed-excluding mulch they establish very well[K]. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200]. Cuttings. This method only works when taken from very young trees less than 10 years old. Use single leaf fascicles with the base of the short shoot. Disbudding the shoots some weeks before taking the cuttings can help. Cuttings are normally slow to grow away[81].

**nwatta** Thrives in a light well-drained sandy or gravelly loam[1]. Dislikes poorly drained moorland soils[1]. Established plants tolerate drought[200]. Growth of older trees tends to be very slow but many younger trees are growing fairly quickly averaging more than 30cm a year[185]. This tree is unique in being the only tree from the tropics (it is found between latitudes 14 and 20°north) to succeed in central Scotland, latitude 57°north[200]. It tolerates temperatures down to about -15°c[260]. The cones open and shed their seed whilst still attached to the tree[226]. Plants are strongly outbreeding, self-fertilized seed usually grows poorly[200]. They hybridize freely with other members of this genus[200]. Seed cones are up to 30cm long[200]. A tree at Kew in January 1995 was about 12 metres tall and had well over 50 large cones on it. Another mature tree of the same species growing nearby had only a very few cones[K]. Leaf secretions inhibit the germination of seeds, thereby inhibiting the growth of other plants below the tree[18]. Plants in this genus are notably susceptible to honey fungus[200].

## 7.2.263 Juniperus rigida

Temple Juniper, Needle Juniper

6 tlin 7 cyuc 2 kcaak 0 tcan 1 dwat 8 m hkuc  
htut cyutli hgaktyucutp hwicli hrasljutnyik hpa7tli flatprik-  
lwissip hpa7tmwatli nyanhjen hjonli

**drutta** *Juniperus rigida* is an evergreen Tree growing to 8 m (26ft) by 8 m (26ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf all year, and the seeds ripen in October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

**ckakta** Edible Parts: Fruit OilEdible Uses: Condiment OilFruit - raw or cooked[183]. It can also be ground into a powder and used as a spice[105, 177, 183]. The cones are about 7 - 11mm in diameter, they take 2 years to mature[200].

**tcanta** Oil WoodAn oil is obtained from the fruit. It is mentioned as being diuretic[61], is this an essential oil? Wood. Used for construction, agricultural implements, fencing etc[61].

**dwatta** DiureticThe fruit is diuretic[61, 254].

**propta** The seed requires a period of cold stratification. The seed has a hard seedcoat and can be very slow to germinate, requiring a cold period followed by a warm period and then another cold spell, each of 2 - 3 months duration[78, 81]. Soaking the seed for 3 - 6 seconds in boiling water may

speed up the germination process[11]. The seed is best sown as soon as it is ripe in a cold frame. Some might germinate in the following spring, though most will take another year. Another possibility is to harvest the seed 'green' (when the embryo has fully formed but before the seedcoat has hardened). The seedlings can be potted up into individual pots when they are large enough to handle. Grow on in pots until large enough, then plant out in early summer. When stored dry, the seed can remain viable for several years[1]. Cuttings of mature wood, 5 - 10cm with a heel, September/October in a cold frame. Plant out in the following autumn[1, 78]. Laying in September/October. Takes 12 months[78].

nwatta Landscape Uses:Screen, Specimen. Succeeds in most soils if they are well drained, preferring a neutral or slightly alkaline soil[1] and succeeding on chalk[200]. Established plants are drought tolerant, succeeding in hot dry positions[200]. A very ornamental plant[1], it thrives in S. England[11]. Trees are very slow growing in Britain, normally averaging only 15cm a year increase in height[185]. Cultivated for its wood in Asia[61]. Dioecious. Male and female plants must be grown if seed is required. Special Features: Fragrant foliage, Inconspicuous flowers or blooms.

### 7.2.264 Ophrys araneola

6 tin 9 cyuc 2 kcaak 0 tcan 2 dwat 0.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwlis hpa7tmwatli xre7t hjonli

drutta Ophrys araneola is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from April to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: RootEdible Uses: Root - cooked. It is a source of 'salep', a fine white to yellowish-white powder that is obtained by drying the tuber and grinding it into a powder[200]. Salep is said to be very nutritious and is made into a drink or added to other cereals and used in bread etc[183]. One ounce of salep is said to be enough to sustain a person for a day[100, 115]. The salep can also be made into a drink[100].

tcanta None known

dwatta Demulcent NutritiveSalep (see above for more details) is very nutritive and demulcent[4]. It has been used as a diet of special value for children and convalescents, being boiled with water, flavoured and prepared in the same way as arrowroot[4]. Rich in mucilage, it forms a soothing and demulcent jelly that is used in the treatment of irritations of the gastro-intestinal canal[4]. One part of salep to fifty parts of water is sufficient to make a jelly[4]. The tuber, from which salep is prepared, should be harvested as the plant dies down after flowering and setting seed[4].

propta Seed - surface sow, preferably as soon as it is ripe, in the greenhouse and do not allow the compost to dry out. The seed of this species is extremely simple, it has a minute embryo surrounded by a single layer of protective cells. It contains very little food reserves and depends upon a symbiotic relationship with a species of soil-dwelling fungus. The fungal hyphae invade the seed and enter the cells of the embryo. The orchid soon begins to digest the fungal tissue and this acts as a food supply for the plant until it is able to obtain nutrients from decaying material in the soil[200]. It is best to use some of the soil that is growing around established plants in order to introduce the fungus, or to sow the seed around a plant of the same species and allow the seedlings to grow on until they are large enough to move. This species only rarely forms new offsets and so division is seldom feasible, the following methods can be tried, however[230]. Division of the tubers as the flowers fade[230]. This species produces a new tuber towards the end of its growing season. If this is removed from the plant as its flowers are fading, the shock to the plant can stimulate new tubers to be formed. The tuber should be treated as being dormant, whilst the remaining plant should be encouraged to continue in growth in order to give it time to produce new tubers[230]. Division can also be carried out when the plant has a fully developed rosette of leaves but before it comes into flower[230]. The entire new growth is removed from the

old tuber from which it has arisen and is potted up, the cut being made towards the bottom of the stem but leaving one or two roots still attached to the old tuber. This can often be done without digging up the plant. The old tuber should develop one or two new growths, whilst the new rosette should continue in growth and flower normally[230].

nwatta Plants can be grown in a lawn, but the lawn must not be cut until the plants have set seed[200]. Orchids are, in general, shallow-rooting plants of well-drained low-fertility soils. Their symbiotic relationship with a fungus in the soil allows them to obtain sufficient nutrients and be able to compete successfully with other plants. They are very sensitive to the addition of fertilizers or fungicides since these can harm the symbiotic fungus and thus kill the orchid[230]. This symbiotic relationship makes them very difficult to cultivate, though they will sometimes appear uninvited in a garden and will then thrive. Transplanting can damage the relationship and plants might also thrive for a few years and then disappear, suggesting that they might be short-lived perennials[230]. The flowers resemble a female insect and also emit a scent similar to female pheromones, they are pollinated by a male insect of that species attempting to copulate with the flower[200]. Tubers should be planted out whilst they are dormant, this is probably best done in the autumn[200]. They should be planted at least 5cm below soil level[200].

### 7.2.265 Chusquea culeou

Culeu

6 tin 9 cyuc 2 kcaak 0 tcan 0 dwat 5 m hkuc hmim cyutli hgattcup hwicli hrasjlutnyik hpa7tli flatprikwlis hpa7tmwatli xre7t hjonli

drutta Chusquea culeou is an evergreen Bamboo growing to 5 m (16ft) by 2.5 m (8ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil and can tolerate drought.

kcaakta Edible Parts: StemEdible Uses: Young shoots - cooked[25, 177].

tcanta Musical WoodThe canes are used in making musical instruments, plain furniture and fencing[139].

dwatta None known

propta Seed - surface sow as soon as it is ripe in a greenhouse at about 20°C. Do not allow the compost to dry out. Germination usually takes place fairly quickly so long as the seed is of good quality, though it can take 3- 6 months. Grow on in a lightly shaded place in the greenhouse until large enough to plant out. Seed is rarely available. Division in spring as new growth commences. Very difficult[200]. Take divisions with at least four canes in the clump, trying to cause as little root disturbance to the main plant as possible. Grow them on in light shade in a greenhouse in pots of a high fertility sandy medium. Mist the foliage regularly until plants are established. Plant them out into their permanent positions when a good root system has developed, which can take a year or more[200]. Basal cane cuttings.

nwatta Prefers a damp humus rich soil[200]. Prefers an open loam of reasonable quality, doing well on peat[11]. Likes plenty of moisture in the growing season[11]. Established plants are drought tolerant[25, 162, 195]. They require a position sheltered from cold north and east winds[11, 200]. A very hardy plant[25, 162], tolerating temperatures down to about -15°C[200]. Another report says that the plant is probably only hardy in the milder areas of the country[1]. It succeeds outdoors at Edinburgh Botanical Gardens[195] and is growing well at Kew[K]. This species is found further south in the world than any other species of bamboo, it grows in Chile as far south as latitude 47°south[195]. The rootstock is caespitose, new shoots are produced from late April and can grow 15cm overnight[25]. Plants take 2 - 3 years to settle down after being moved but are then quite fast growing[162]. Another report says that they are slow growing[188]. This species is notably resistant to honey fungus[200]. Plants flower and produce seed annually in the wild without dying as a result of the flowering[162]. Plants of the cultivar 'Tenius' have been observed to be flowering in

dwatta Anodyne Antibacterial Anticoagulant Antifungal Antiinflammatory Antiphlogistic Antirheumatic Antispasmodic Antitumor Epilepsy Expectorant Sedative Stomachic-Tian Nan Xing has been used in Chinese herbal medicine for thousands of years and is valued especially for its beneficial affect upon the chest[254]. When prescribed internally it is always used dried and in conjunction with fresh ginger root[254]. The root is an acrid irritant herb that is anodyne, antibacterial, antifungal, antiphlogistic, antirheumatic, anticancer, antispasmodic, antitumor, expectorant, sedative and stomachic[147, 176, 218, 238]. The dried root is used internally in the treatment of coughs with profuse phlegm, tumours, cervical cancer, epilepsy, tetanus and complaints involving muscular spasms[176, 238]. The fresh root is applied externally as a poultice to ulcers and other skin complaints[254]. The root is harvested when the plant is dormant in the autumn or winter and is dried for later use[238]. The whole plant is anticoagulant, anti-inflammatory, anti-spasmodic and anodyne[218].

propta Seed - best sown as soon as it is ripe in a shady position in a cold frame[134]. Stored seed remains viable for at least a year and can be sown in spring in the greenhouse but it will probably require a period of cold stratification. Germination usually takes place in 1 - 6 months at 15°C[134]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least a couple of years until the corms are more than 20mm in diameter. Plant out into their permanent positions whilst they are dormant. Division of tubers when the plant dies down in late summer.

nwatta Prefers a cool peaty soil in the bog, woodland garden or a sheltered border in semi-shade[200]. Prefers a loamy or peaty soil[1] and will tolerate a sunny position if the soil is moist but not water-logged and the position is not too exposed[1, 200]. This species requires a warm corner in British gardens[233]. Plants are nearly hardy in Britain, they normally succeed outdoors in the milder areas of the country[1]. They tolerate temperatures down to about -10°C[90], though the young growth can be damaged by spring frosts[238]. Tubers should be planted about 10cm deep[233]. Only plant out full sized tubers and mulch them with organic matter in the winter[200]. Plants need protection from slugs[200]. Most species in this genus are dioecious, but they are sometimes monoecious and can also change sex from year to year.

### 7.2.390 Geranium nepalense

Nepalese Crane's Bill

6 tin 9 cyuc 1 kcaak 0 tcan 2 dwat 1 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwlis hpa7tmwatli xre7t hjonli

drutta Geranium nepalense is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcaakta Edible Parts: Fruit LeavesEdible Uses: Leaves[179]. No further details are given. Fruits - chewed fresh[272]. The fruit is a small dry capsule[K].

tcanta Dye TanninA red dye is obtained from the root, it is similar to Rubia cordifolia[61]. The root contains 25 - 32% tannins[272].

dwatta Antibacterial AstringentThe whole plant is antibacterial and astringent[145, 174, 218]. It is prescribed in the treatment of nervous diseases, numbness of the limbs, pains, rheumatism, renal diseases etc[218, 240]. The juice of the plant is valued in treating renal diseases[272].

propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring or autumn. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Succeeds in any moderately fertile retentive soil in a sunny position[200]. Tolerates a wide range of soil

types[200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233].

### 7.2.391 Dracocephalum parviflorum

American Dragonhead

6 tin 9 cyuc 1 kcaak 0 tcan 1 dwat 1 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwlissip hpa7tmwatli xre7t hjonli

drutta Dracocephalum parviflorum is a ANNUAL/BIENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: SeedEdible Uses: CondimentSeed[105, 161, 177, 257]. No more details. The leaves have been used as a flavouring[257].

tcanta None known

dwatta Febrifuge OphthalmicThe plant has been used to treat diarrhoea in children[257]. The leaves are febrifuge and ophthalmic[257]. A cold compound infusion has been used in the treatment of fevers and headaches[257]. Externally, it has been used as an eyewash[257].

propta Seed - sow early spring in situ. Pinch back the shoot tips in May in order to encourage bushy growth[200].

nwatta Succeeds in a sunny position in a fertile well-drained soil[200]. The plant is very fragrant[200]. It is useful for filling gaps in the summer border[200].

### 7.2.392 Paeonia lutea

Tree Peony, Dian mu dan

6 tin 9 cyuc 1 kcaak 0 tcan 3 dwat 1.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikrip hpa7tli flatprikwlissip hpa7tmwatli fyfxfre7t hjonli

drutta Paeonia lutea is a deciduous Shrub growing to 1.5 m (5ft) by 3 m (9ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower in June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: FlowersEdible Uses: The following use is for *P. suffruticosa*. It quite probably also applies to this closely-related species.[K - see 214]. Flowers - cooked[46, 61, 177]. The fallen flower petals are parboiled and sweetened for a teatime delicacy, or cooked in various dishes[183].

tcanta None known

dwatta Analgesic Antibacterial Antiinflammatory Antispasmodic Cholera DysenteryThe bark obtained from the root has an antimicrobial effect upon various bacteria, including Escherichia coli, typhoid, cholera, Staphylococcus aureus, streptococcus hemolyticus and Pneumococci[250]. The root is also anti-inflammatory and has been used with success in the treatment of arthritic joint swelling[250]. The root is also analgesic, sedative and anticonvulsant, it has a high success rate in the treatment of dysentery and can also be used to treat allergic rhinitis[250]. The plant is used internally in the treatment of fevers, boils, menstrual disorders, nosebleeds, ulcers, irritability and gastro-intestinal infections[238]. This remedy should only be used under the supervision of a qualified practitioner[238]. The herb acts as a synergist when used with liquorice (Glycyrrhiza spp)[218]. A tea made from the dried crushed petals of various peony species has been used as a cough remedy, and as a treatment for haemorrhoids and varicose veins[250].

propta Seed - best sown as soon as it is ripe in a cold frame[250]. When sown fresh, the seed produces a root about 6 weeks after sowing with shoots formed in the spring[200]. Stored seed is much slower, it should be sown as soon as possible in a cold frame but may take 18 months or more to germinate[200]. The roots are very sensitive to

is chiefly used to lower blood pressure and heart rate, ease anxiety and promote sleep. In low doses it can also relieve panic attacks and headaches, and also improves the ability to concentrate[254]. The plant's efficacy as an anticancer treatment has been subject to a significant amount of research - there is no doubt that certain constituents of the plant, especially the viscotoxins, exhibit an anticancer activity but the value of the whole plant in cancer treatment is not fully accepted[254]. It is said that the constituents of mistletoe vary according to the host plant it is growing on - that found on oak trees is said to be superior[238]. Because of the potential side effects, this plant should only be used internally under the guidance of a skilled practitioner. Using the plant internally can provoke intolerant reactions to certain substances[7]. The leaves and young twigs contain several medically active compounds[279]. They are antispasmodic, cardiac, cytotostatic, diuretic, hypotensive, narcotic, nervine, stimulant, tonic and vasodilator[4, 7, 19, 21, 46, 66, 165, 238, 279]. They are harvested just before the berries form and are dried for later use[4]. Mistletoe has a reputation for curing epilepsy and other convulsive nervous disorders[4]. The effect of the correct dosage is to lessen and temporarily numb the nervous activity that causes the spasms, but larger doses can produce the problem[4]. Mistletoe has also been employed in checking internal haemorrhages, in treating high blood pressure and in treating cancer of the stomach, lungs and ovaries[4, 9, 238, 279]. Externally, the plant has been used to treat arthritis, rheumatism, chilblains, leg ulcers and varicose veins[238]. A homeopathic remedy is made from equal quantities of the berries and leaves[4]. It is difficult to make because of the viscosity of the sap[4]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve *Viscum album* Mistletoe for rheumatism, tremor therapy as an adjuvant (see [302] for critics of commission E).

propta This is a parasitic plant that grows entirely on the host tree. To grow it you need to obtain berries and squash them onto the branches of host trees in late autumn and early winter[11]. This is best done on the lower side of the branch[1]. It is then simply a matter of waiting and hoping.

nwatta A parasitic plant, growing on the branches of several deciduous species of trees. It is not usually found on coniferous trees, though the subspecies *V. album abietis* is found on conifers, especially *Abies* spp, whilst *V. album austriacum* is found on pine and larch. The host tree must be at least 20 years old[200]. Although the host branch might eventually succumb, the host tree is seldom killed[200].

## 7.2.387 Vaccinium bracteatum

Sea Bilberry  
6 tin 9 cyuc 1 kcaak 0 tcan 1 dwat 1 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta *Vaccinium bracteatum* is an evergreen Shrub growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105, 177, 183]. The fruit is about 6mm in diameter[200].

tcanta None known

dwatta CancerThe plant has been used in the treatment of cancer[218].

propta Seed - sow late winter in a greenhouse in a lime-free potting mix and only just cover the seed[78]. Stored seed might require a period of up to 3 months cold stratification[113]. Another report says that it is best to sow the seed in a greenhouse as soon as it is ripe[200]. Once they are about 5cm tall, prick the seedlings out into individual pots and grow them on in a lightly shaded position in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5-8cm with a heel, August in a frame[78]. Slow and difficult. Layering in

late summer or early autumn[78]. Another report says that spring is the best time to layer[200]. Takes 18 months[78]. Division of suckers in spring or early autumn[113].

nwatta Requires a moist but freely-draining lime free soil, preferring one that is rich in peat or a light loamy soil with added leaf-mould[11, 200]. Prefers a very acid soil with a pH in the range of 4.5 to 6, plants soon become chlorotic when lime is present. Succeeds in full sun or light shade though it fruits better in a sunny position[200]. Requires shelter from strong winds[200]. Plants are hardy at Kew but they are better grown in milder areas[11]. Dislikes root disturbance, plants are best grown in pots until being planted out in their permanent positions[200]. Closely related to *V. sprengelii*[182]. Plants in this genus are notably resistant to honey fungus[200].

## 7.2.388 Eupatorium chinense

6 tin 9 cyuc 1 kcaak 0 tcan 2 dwat 1.8 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta *Eupatorium chinense* is a PERENNIAL growing to 1.8 m (6ft). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Edible Uses: CondimentThe young leaves are used as a flavouring[177].

tcanta The powdered plant is used in Nepal to prepare *marcha*, a fermenting cake from which liquor is distilled[272].

dwatta Anodyne Carminative Diuretic Nervine Vermifuge Women's complaintsThe leaves are anodyne, carminative, diuretic, nervine and vermifuge[218]. An infusion is used in the treatment of colds, diphtheria and rheumatoid arthritis[238]. The leaves and stems are harvested in the summer before the flower buds open, and are dried for later use[238]. The seed is prescribed in China for the '36 diseases of women' [218]. The root is considered to be beneficial to the circulation and a restorative to women after parturition[218]. The roots are harvested in the autumn and dried for later use[238]. The milky latex is applied to treat *goitre*[272].

propta Seed - sow spring in a cold frame and only just cover the seed. Prick out the seedlings into individual pots when they are large enough to handle and plant them out into their permanent positions in the summer. Division in spring or autumn[111]. Very easy, the clumps can be replanted direct into their permanent positions.

nwatta Succeeds in ordinary well-drained but moisture retentive garden soil in sun or part shade[200]. Plants seem to be immune to the predations of rabbits[233]. A polymorphic species[58].

## 7.2.389 Arisaema consanguineum

Tian Nan Xing  
6 tin 9 cyuc 1 kcaak 0 tcan 3 dwat 1 m hkuc  
pcimhmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

drutta *Arisaema consanguineum* is a PERENNIAL growing to 1 m (3ft 3in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from June to July. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Flies. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: LeavesEdible Uses: Leaves - boiled and used as a vegetable[272]. Some caution is advised, see the notes above on toxicity.

tcanta None known

1994, this is the first record of this species flowering in the northern hemisphere[214].

## 7.2.266 Petasites frigidus

Sweet Coltsfoot, Alrctic sweet coltsfoot, Arrowleaf sweet coltsfoot, Golden Palmc Sweet coltsfoot, Butterb  
6 tin 10 cyuc 2 kcaak 0 tcan 1 dwat 0.2 m hkuc  
pcimhmimhtut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

drutta *Petasites frigidus* is a PERENNIAL growing to 0.2 m (0ft 8in) by 1 m (3ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from April to May, and the seeds ripen from May to June. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcaakta Edible Parts: Flowers Leaves Root StemEdible Uses: SaltYoung leaves - raw or cooked[46, 61, 257]. They are mixed with other greens and used as a potherb[183, 257]. The leaves can also be made into a sauerkraut[257]. Young stalks and flower heads - cooked[183]. Roots - cooked[172, 183]. The burnt leaves are used as a salt substitute[172]. The stems and leaves, whilst still green, are rolled up into balls, dried and then placed on top of a very small fire on a rock and burned[207]. A very acceptable condiment for pineole[207].

tcanta Containers StuffingA good ground cover for the wilder areas of the garden[200]. The cotton-like seed heads have been used as a stuffing material for mattresses[257]. The leaves have sometimes been folded into conical containers for collecting fruit[257]. They have also been used to make a temporary funnel[257].

dwatta Antispasmodic Pectoral PouliticeAntispasmodic, poulitice[172]. An infusion of the dried leaves has been used in the treatment of colds, head and chest congestion[257].

propta Seed - we have no information on this species but suggest sowing the seed in a cold frame as soon as it is ripe or in early spring. Only just cover the seed and do not allow the compost to dry out. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division succeeds at almost any time of the year. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Landscape Uses:Seashore, Woodland garden. Succeeds in ordinary garden soil[1], but prefers a deep fertile humus-rich soil that is permanently moist but not stagnant, succeeding in shade, semi-shade or full sun[200]. Prefers partial shade[31]. Plants can be grown in quite coarse grass, which can be cut annually in the autumn[233]. A very invasive plant, too rampant for anything other than the wild garden[187, 200]. Dioecious, male and female plants must be grown if seed is required. Special Features:Attractive foliage, North American native, Invasive, Wetlands plant.

## 7.2.267 Solidago missouriensis

Prairie Goldenrod, Missouri goldenrod, Tolmie's goldenrod  
6 tin 9 cyuc 2 kcaak 1 tcan 1 dwat m hkuc  
hmimhtut cyutli kyucutcup hwicli hrasjlutnyikfrip hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Solidago missouriensis* is a PERENNIAL growing to 1.2 m (4ft) by 0.6 m (2ft in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcaakta Edible Parts: LeavesEdible Uses: TeaYoung leaves - raw or cooked[94, 155, 161]. They can be added to salads or used as a potherb[183]. A very good tea is made from the dried leaves and dried fully expanded flowers[183].

tcanta DyeMustard, orange and brown dyes can be obtained from the whole plant[168].

dwatta AntisepticAntiseptic. An infusion of the dried powdered herb can be used[168].

propta Seed - sow spring in a cold frame. Only just cover the seed and do not allow the compost to become dry. Prick out the seedlings into individual pots when they are large enough to handle, and grow them on for their first winter in pots. Plant them out into their permanent positions in spring or early summer. Division in spring or autumn. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Succeeds in any moderately fertile moisture retentive soil in sun or semi-shade[200]. Grows well in heavy clay soils. A rather greedy plant, it is apt to impoverish the soil[1]. The plant attracts various beneficial insects such as ladybirds, lacewings and hoverflies to the garden, these insects will help to control insect pests in the garden[201, 238]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

## 7.2.268 Gymnadenia conopsea

Fragrant Orchid  
6 tin 9 cyuc 2 kcaak 0 tcan 2 dwat 0.3 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Gymnadenia conopsea* is a BULB growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Moths. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: RootEdible Uses: Bulb - cooked. Very nutritious[4, 46, 61]. It is a source of 'salep', a fine white to yellowish-white powder that is obtained by drying the tuber and grinding it into a flour[2, 105, 177]. Salep is a starch-like substance with a sweetish taste and a faint somewhat unpleasant smell[4]. It is said to be very nutritious and is made into a drink or can be added to cereals and used in making bread etc[100, 183]. One ounce of salep is said to be enough to sustain a person for a day[100, 115].

tcanta None known

dwatta Demulcent NutritiveSalep (see above for more details) is very nutritive and demulcent[4]. It has been used as a diet of special value for children and convalescents, being boiled with water, flavoured and prepared in the same way as arrowroot[4]. Rich in mucilage, it forms a soothing and demulcent jelly that is used in the treatment of irritations of the gastro-intestinal canal[4]. One part of salep to fifty parts of water is sufficient to make a jelly[4]. The tuber, from which salep is prepared, should be harvested as the plant dies down after flowering and setting seed[4].

propta Seed - surface sow, preferably as soon as it is ripe, in the greenhouse and do not allow the compost to dry out. The seed of this species is extremely simple, it has a minute embryo surrounded by a single layer of protective cells. It contains very little food reserves and depends upon a symbiotic relationship with a species of soil-dwelling fungus. The fungal hyphae invade the seed and enter the cells of the embryo. The orchid soon begins to digest the fungal tissue and this acts as a food supply for the plant until it is able to obtain nutrients from decaying material in the soil[200]. It is best to use some of the soil that is growing around established plants in order to introduce the fungus, or to sow the seed around a plant of the same species and allow the

seedlings to grow on until they are large enough to move. Division in autumn. The plant is very intolerant of root disturbance, any moving or dividing should be attempted in the autumn, keep a large ball of soil around the plant[1]. Division of the tubers as the flowers fade[230]. This species produces a new tuber towards the end of its growing season. If this is removed from the plant as its flowers are fading, the shock to the plant can stimulate new tubers to be formed. The tuber should be treated as being dormant, whilst the remaining plant should be encouraged to continue in growth in order to give it time to produce new tubers[230]. Division can also be carried out when the plant has a fully developed rosette of leaves but before it comes into flower[230]. The entire new growth is removed from the old tuber from which it has arisen and is potted up, the cut being made towards the bottom of the stem but leaving one or two roots still attached to the old tuber. This can often be done without digging up the plant. The old tuber should develop one or two new growths, whilst the new rosette should continue in growth and flower normally[230].

nwatta Very easily grown in any good moist soil[42]. Requires a deep rich soil[1]. Orchids are, in general, shallow-rooting plants of well-drained low-fertility soils. Their symbiotic relationship with a fungus in the soil allows them to obtain sufficient nutrients and be able to compete successfully with other plants. They are very sensitive to the addition of fertilizers or fungicides since these can harm the symbiotic fungus and thus kill the orchid[230]. A polymorphic species[17], it also hybridizes readily with other members of the genus[230]. The flowers have a delicious perfume which is more pronounced at night in order to attract Night Hawk-moths for pollination[245]. The sub-species *G. conopsea densiflora* has larger, more strongly scented flowers[245]. This species is a colonizer of disturbed ground and bare soils, new colonies can spring up many kilometres from the plants nearest known locality[230]. They have been known to colonize sites such as waste heaps of clinker at power stations[230]. Plants are very impatient of root disturbance[1].

## 7.2.269 Carduus nutans

Musk Thistle, Nodding plumeless thistle  
6 tin 9 cyuc 2 kcaak 3 tcan 2 dwat 0.9 m hkuc  
htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Carduus nutans* is a BIENNIAL growing to 0.9 m (3ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to August, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Oil StemEdible Uses: Curdling agent OilPith of stem - boiled[61]. A pleasant taste[105], it is eaten like asparagus[177]. Said to be delicious[183]. The dried flowers are used as a curdling agent for plant milks etc[61, 183].

tcanta Oil PaperThe down of the plant is used to make paper[4]. The seed of all species of thistles yields a good oil by expression[4]. This species contains 41 - 44% oil[240]. The plant is very attractive to bees, hoverflies and butterflies[13, 245], it is a food plant for the caterpillars of many lepidoptera species[30]. Dynamic accumulator.

dwatta Blood purifier FebrifugeThe flowers are febrifuge and are used to purify the blood[145, 240]. The seeds contain a fixed oil that is rich in linoleic acid[240]. This has proved of benefit in the prevention of atherosclerosis[240].

propta Seed - sow spring in situ.

nwatta Succeeds in a sunny position in ordinary garden soil[1, 200]. The flowers, and indeed the whole plant, give off a pleasing musk-like perfume[245].

## 7.2.270 Ophrys fusca

Brown Bee Orchid  
6 tin 9 cyuc 2 kcaak 0 tcan 2 dwat 0.4 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Ophrys fusca* is a PERENNIAL growing to 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Root - cooked. It is a source of 'salep', a fine white to yellowish-white powder that is obtained by drying the tuber and grinding it into a powder[200]. Salep is said to be very nutritious and is made into a drink or added to other cereals and used in bread etc[183]. One ounce of salep is said to be enough to sustain a person for a day[100, 115]. The salep can also be made into a drink[100].

tcanta None known

dwatta Demulcent NutritiveSalep (see above for more details) is very nutritive and demulcent[4]. It has been used as a diet of special value for children and convalescents, being boiled with water, flavoured and prepared in the same way as arrowroot[4]. Rich in mucilage, it forms a soothing and demulcent jelly that is used in the treatment of irritations of the gastro-intestinal canal[4]. One part of salep to fifty parts of water is sufficient to make a jelly[4]. The tuber, from which salep is prepared, should be harvested as the plant dies down after flowering and setting seed[4].

propta Seed - surface sow, preferably as soon as it is ripe, in the greenhouse and do not allow the compost to dry out. The seed of this species is extremely simple, it has a minute embryo surrounded by a single layer of protective cells. It contains very little food reserves and depends upon a symbiotic relationship with a species of soil-dwelling fungus. The fungal hyphae invade the seed and enter the cells of the embryo. The orchid soon begins to digest the fungal tissue and this acts as a food supply for the plant until it is able to obtain nutrients from decaying material in the soil[200]. It is best to use some of the soil that is growing around established plants in order to introduce the fungus, or to sow the seed around a plant of the same species and allow the seedlings to grow on until they are large enough to move. This species only rarely forms new offsets and so division is seldom feasible, the following methods can be tried, however[230]. Division of the tubers as the flowers fade[230]. This species produces a new tuber towards the end of its growing season. If this is removed from the plant as its flowers are fading, the shock to the plant can stimulate new tubers to be formed. The tuber should be treated as being dormant, whilst the remaining plant should be encouraged to continue in growth in order to give it time to produce new tubers[230]. Division can also be carried out when the plant has a fully developed rosette of leaves but before it comes into flower[230]. The entire new growth is removed from the old tuber from which it has arisen and is potted up, the cut being made towards the bottom of the stem but leaving one or two roots still attached to the old tuber. This can often be done without digging up the plant. The old tuber should develop one or two new growths, whilst the new rosette should continue in growth and flower normally[230].

nwatta Plants can be grown in a lawn, but the lawn must not be cut until the plants have set seed[200]. Plants are best grown in the shade[188]. Orchids are, in general, shallow-rooting plants of well-drained low-fertility soils. Their symbiotic relationship with a fungus in the soil allows them to obtain sufficient nutrients and be able to compete successfully with other plants. They are very sensitive to the addition of fertilizers or fungicides since these can harm the symbiotic fungus and thus kill the orchid[230]. This symbiotic relationship makes them very difficult to cultivate, though they will sometimes appear uninvited in a garden and will then thrive. Transplanting can damage the relationship and plants might also thrive for a few years and then disappear, suggesting that they might be short-lived perennials[230]. The flowers resemble a female insect and also emit a scent similar to female pheromones, they are pollinated by a male insect of that species attempting to copulate with the flower[200]. Tubers should be planted out whilst they are dormant, this is probably best done in the autumn[200]. They should be planted at least 5cm below soil level[200].

tall. Cuttings of half-ripe wood in summer[200]. Grow on in cool, shaded humid conditions until well rooted[200].

nwatta Prefers a well-drained humus rich soil in partial shade in a position sheltered from cold drying winds[200]. We are not sure if this plant is hardy outdoors in Britain. One report says that it is hardy in zone 7 (tolerating temperatures down to between -10 and -15°C) but then goes on to suggest that it is best grown in pots or tubs outdoors and moved into a cold greenhouse in the winter[200]. There are some named varieties, selected for their ornamental value[200]. The plant has creeping rhizomes[266]. There has been some confusion between this species and *A. crenata*, the name *Ardisia cripisa* was misapplied by de Candolle to *Ardisia crenata*[266].

## 7.2.383 Cucubalus baccifer

Berry-Bearing Catchfly

6 tin 9 cyuc 1 kcaak 0 tcan 1 dwat 1 m hkuc  
hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Cucubalus baccifer* is a ANNUAL growing to 1 cm (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves and young plants - cooked[177, 179].

tcanta TanninThe plant is rich in tannin[179].

dwatta StypticA decoction of the plant is used in the treatment of haemorrhages[218, 240].

propta Seed - sow spring in situ.

nwatta See the plants native habitat for ideas on its cultivation needs. Plants are hardy to between -10 and -15°C[200].

## 7.2.384 Scirpus cyperinus

Woolly Grass Bulrush, Woolgrass

6 tin 9 cyuc 1 kcaak 0 tcan 0 dwat 1.5 m hkuc  
hmimhtut cyutli tcuphja7nhs6s hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Scirpus cyperinus* is a PERENNIAL growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from August to September, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can grow in water.

kcakta Edible Parts: SeedEdible Uses: Seed - cooked. Used as a rice substitute[178].

tcanta Stuffing WeavingThe stems are woven to make matting and ropes[178]. The small rushes have been used in making woven mats and storage bags[257]. The fruiting tops of the plant have been used as a resilient material for stuffing and making pillows[257].

dwatta None known

propta Seed - sow in a cold frame as soon as it is ripe in a pot standing in 3cm of water. Only just cover the seed with soil[200]. The seed usually germinates fairly quickly. Prick out the plants when large enough to handle and plant out in their permanent positions in early summer. Division in spring. Very easy, larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Succeeds in any wet to moisture retentive ground, pond margins and shallow water in full sun or shade[200]. A polymorphic species[60].

## 7.2.385 Skimmia laureola

6 tin 9 cyuc 1 kcaak 0 tcan 1 dwat 1.5 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

drutta *Skimmia laureola* is an evergreen Shrub growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower from April to June. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). . The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. It can tolerate atmospheric pollution.

kcakta Edible Parts: LeavesEdible Uses: CondimentLeaves - cooked. Used as a condiment[272]. The strongly aromatic leaves are used in curries or as a flavouring for other foods[146, 177, 183].

tcanta Essential Incense WoodAn essential oil in the leaves is used in scenting soap[61, 240, 272]. The dried leaves are used as an incense[61, 145, 211]. The fresh leaves are used to make garlands for weddings[211]. Plants can be grown as a ground cover when planted about 1 metre apart each way[208]. Wood - used to make handles of small farming implements such as hoes and axes[272].

dwatta The leaves are used in the treatment of small-pox[240]. The smoke produced by burning them is said to purify the air[240].

propta Seed - can be sown as soon as it is ripe in a cold frame[K]. It also succeeds when sown in early spring. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a shady position in the cold frame for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. If there is sufficient seed then it can be sown can be in an outdoor seedbed in early spring[200]. Grow the plants on in the seedbed for a couple of years before planting them out in late autumn or early spring. Cuttings of half-ripe wood, July/August in a cold frame[11]. Cuttings of nearly mature side shoots, 7 - 10cm with a heel, September in a cold frame. Slow to root, they should be left for 18 months before moving to their permanent positions. Good percentage[78]. Layering in autumn. Takes 18 months. Good to high percentage[78].

nwatta Succeeds in a well-drained open loam or in a peaty soil in a sunny position[1]. Probably flowers well in the shade[11]. Plants are very tolerant of atmospheric pollution, being unharmed by deposits of soot or a sulphur-laden atmosphere[245]. This species is not very frost-hardy and so is rather tender in much of Britain[1]. The flowers are sweetly scented[184]. The small yellow flowers are oppressively scented, giving a somewhat unpleasant smell near to, though agreeable at a distance[245]. The bruised leaves are strongly aromatic[245]. The plant is superficially similar to *Daphne cannabina* and is often mistaken for that species[211]. Dioecious. Male and female plants must be grown if seed is required.

## 7.2.386 Viscum album

Mistletoe, European mistletoe

6 tin 9 cyuc 1 kcaak 0 tcan 3 dwat 1 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

drutta *Viscum album* is an evergreen Shrub growing to 1 m (3ft 3in) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from February to April, and the seeds ripen from November to December. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). . The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: The ripe fruit is edible[272]. Some caution is advised, see notes above on toxicity[K].

tcanta None known

## 7.2.379 Hydrangea hirta

6 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 1 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli frusflatprik-  
wis hpa7tmwatli xre7t hjonli

drutta Hydrangea hirta is a deciduous Shrub growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower in July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: LeavesEdible Uses: Leaves - cooked[105]. Eaten with rice[177].

tcanta None known

dwatta None known

propta Seed - surface sow in a greenhouse in spring[113]. Cover the pot with paper until the seed germinates[78]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 8cm long, July/August in a frame. Overwinter in a greenhouse and plant out in late spring[78]. Cuttings of mature wood in late autumn in a frame[200]. Mound layering in spring. Takes 12 months[78]. Leaf-bud cuttings of the current seasons growth in a frame[200].

nwatta Tolerates most soils[200], thriving in a well-drained loamy soil[1], but resenting dryness at the roots[11, 200]. Succeeds in full sun or semi-shade[200], but if it is grown in a low rainfall area then it requires shade at the hottest part of the day[11]. It grows well on very acid soils with a pH around 4.5[200]. Although the dormant plant is quite hardy in Britain, the young growth in spring can be damaged by late frosts. Closely related to *H. scandens*[200]. This species is notably susceptible to honey fungus[200].

## 7.2.380 Onopordum illyricum

Cotton Thistle, Illyrian cottonthistle  
6 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 1.3 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwis  
hpa7tmwatli fyfjxre7t hjonli

drutta Onopordum illyricum is a BIENNIAL growing to 1.3 m (4ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FlowersEdible Uses: Flower buds - cooked. Used as a globe artichoke (*Cynara scolymus*) substitute[183], though they are even more fiddly than that plant[K].

tcanta None known

dwatta None known

propta Seed - sow spring in situ[200]. The seed can also be sown in situ in autumn[200]. If the seed is in short supply then it can be sown in a pot in the greenhouse in the spring. Prick out the seedlings into individual pots as soon as they are large enough to handle and plant them out into their permanent positions in early summer.

nwatta Succeeds in almost any ordinary garden soil. Requires a well-drained soil in full sun. Prefers a slightly alkaline soil. Plants are hardy to about -15°C. Often self-sows, sometimes to the point of nuisance, though the seedlings can easily be hoed out and can also be transplanted if they are moved whilst still small[200]. The flowers are very attractive to bees.

## 7.2.381 Cistus albidus

Rock Rose

6 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 1 m hkuc  
htut cyutli hgatkycutcup hwicli hyishrsjlut hpa7tli flatprik-  
wisslip hpa7tmwatli fyfjxre7t hjonli

drutta Cistus albidus is an evergreen Shrub growing to 1 m (3ft 3in) by 1 m (3ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower in June, and the seeds ripen in August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

kcakta Edible Parts: Edible Uses: Condiment TeaThe leaves are used as a tea substitute[177, 183]. The dried leaves are sometimes used as an adulterant for marjoram (*Origanum majorana*) [183].

tcanta None known

dwatta None known

propta Seed - gather when ripe and store dry[78]. Surface sow in late winter in a greenhouse[164]. The seed usually germinates in 1 - 4 weeks at 20°C[164]. Prick out the seedlings as soon as they are large enough to handle into individual pots. Grow them on in the greenhouse for their first winter and plant them out in the following spring or early summer, after the last expected frosts[164]. The seed stores for at least 3 years[K]. Cuttings of softish to half-ripe wood, 8cm long with a heel or at a node, June/August in a frame. Roots are formed within 3 weeks[78]. High percentage[78]. Cuttings of almost mature wood, 8 - 12cm with a heel or at a node, September/October in a frame. High percentage[78]. Lift and pot up in the spring, plant out when a good root system has formed[78]. Layering in spring.

nwatta Requires a sunny position in a well-drained light sandy soil[1, 182]. Prefers a calcareous soil[190]. Withstands drought once it is established[190]. Tolerates maritime exposure[188]. One of the hardiest species in this genus, tolerating temperatures down to about -15°C[184] and surviving all but the coldest winters in Britain[11], it is however apt to be short-lived[182]. Plants are somewhat hardier when grown in poor soils[182]. Individual flowers only last one day but there is a long succession of them[200]. Dislikes pruning or root disturbance[182, 200]. Plants should be pot grown and then planted out in their final positions whilst still small. Plants in this genus are notably resistant to honey fungus[200]. Hybridizes freely with other members of this genus[200].

## 7.2.382 Ardisia crispata

6 tlin 9 cyuc 1 kcaak 0 tcan 1 dwat 1.2 m hkuc  
hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwis  
hpa7tmwatli xre7t hjonli

drutta Ardisia crispata is an evergreen Shrub growing to 1.2 m (4ft) by 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from June to July, and the seeds ripen from September to December. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw. Used in salads[218].

tcanta None known

dwatta Antidote Diuretic PectoralThe root is antidiarrhoeal and diuretic[218]. An infusion is pectoral[218]. The plant is crushed and applied to scurf, it is also applied to the ears in the treatment of earache[218].

propta Seed - best harvested when it is ripe in the winter and sown immediately in a greenhouse[1]. Sow stored seed as early in the year as possible. When large enough to handle, prick the seedlings out into individual pots and grow them on in a shady part of the greenhouse for at least their first winter. Plant out into their permanent positions in late spring or early summer, once the plants are 20cm or more

## 7.2.271 Polygonum molle

6 tlin 9 cyuc 2 kcaak 0 tcan 1 dwat m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwis  
hpa7tmwatli xre7t hjonli

drutta Polygonum molle is a PERENNIAL growing to 2.5 m (8ft 2in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in July, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves SeedEdible Uses: Young shoots - raw or cooked as a vegetable[146, 177, 272]. Pleasantly acid, they are used like rhubarb[105]. Seed - raw or cooked. It is rather small and fiddly to utilize.

tcanta Soil stabilizationPlants are very fast growing and are used to reclothe and stabilize land slips[146]. They are best spaced about 1.2 metres apart each way[208].

dwatta AstringentThe whole plant is astringent[240]. propta Seed - sow spring in a cold frame. Germination is usually free and easy. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer if they have reached sufficient size. If not, overwinter them in a cold frame and plant them out the following spring after the last expected frosts. Division in spring or autumn. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Succeeds in an ordinary garden soil[1] but prefers a moisture retentive not too fertile soil in sun or part shade[200]. Repays generous treatment[1]. A very fast growing plant[146]. Plants seem to be immune to the predations of rabbits[233].

## 7.2.272 Podocarpus nubigenus

Chilean Podocarp

6 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 20 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik  
hpa7tmwatli nyanhjen hjonli

drutta Podocarpus nubigenus is an evergreen Tree growing to 20 m (65ft 7in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, and the seeds ripen in October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. About 8mm long[200]. We have seen no reports for this species but it is most likely that the fruit is edible.

tcanta WoodWood - straight grained, reddish, very durable lasting a long time in water, but it can be brittle. Used for construction work and cabinet making[1, 11, 46, 61, 128].

dwatta None known

propta The seed can be sown at any time of the year in a sandy soil in a warm greenhouse, though it is probably best sown as soon as it is ripe[1]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe terminal shoots, 5 - 10cm long, July/August in a frame[78].

nwatta Prefers a rich moist non-alkaline soil[167]. Shade tolerant, at least when young[200]. This species is hardy to about -25°C, but the plants grow best in humid areas with high rainfall, mild winters and cool summers[200]. They are not really happy in the drier eastern half of the country[11]. Closely related to *P. totara*[200]. A good plant for the rock garden[200]. Very tolerant of pruning[200]. Plants in

this genus are notably resistant to honey fungus[200]. Dioecious. Male and female plants must be grown if seed is required.

## 7.2.273 Picea sitchensis

Sitka Spruce

6 tlin 7 cyuc 2 kcaak 0 tcan 2 dwat 50 m hkuc  
htut cyutli tcuphja7n hwicli hyishrsjlutnyik hpa7tli frusflat-  
prik hpa7tmwatli hjonli

drutta Picea sitchensis is an evergreen Tree growing to 50 m (164ft) by 10 m (32ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower in May, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It cannot grow in the shade. It prefers moist or wet soil. The plant can tolerate maritime exposure. It cannot tolerate atmospheric pollution.

kcakta Edible Parts: Flowers Inner bark Seed Seedpoc Uses: Condiment Gum TeaYoung shoots - raw[118, 256]. Young male catkins - raw or cooked. Used as a flavouring[172]. Immature female cones - cooked. The central portion, when roasted, is sweet and syrupy[172]. The cones are 6 - 10cm long[82]. Inner bark - raw or cooked[256]. It can be dried, ground into a powder and then used as a thickener in soups etc or added to cereals when making bread[172]. The inner bark was usually harvested in the spring, though it was also sometimes taken in the summer[256]. An emergency food, it is only used when all else fails. Seed - raw[172]. The seed is about 2 - 4mm long[229]. It is rich in fats and has a pleasant slightly resinous flavour but is too small and fiddly to be worthwhile unless you are desperate[172, K]. A refreshing tea, rich in vitamin C, can be made from the young shoot tips[172]. A gum obtained from the bark is hardened in cold water and then used for chewing[118, 177, 256]. It should be aged for 3 days or more before using it. The best gum is obtained from the southern side of the tree.

tcanta Adhesive Basketry Fuel Gum Pitch String Varnish Waterproofing WoodThe tough and flexible root is used in basket making and as a string[118, 229]. The roots were burnt over an open fire to remove the bark, then they were dried and split to make hats, ropes etc[257]. The main body material of baskets was made from the roots. These were cut into lengths 75 - 90cm long and 12 - 25mm in diameter. Whilst still full of sap and soft, these were split into broad flat bands and these in turn were sub-divided by knife and teeth until the desired size was obtained - a little larger than coarse thread, about like small twine. The vertical rods were made of hazel (*Corylus* spp) and the overlay was bear grass (*Xerophyllum tenax*) [257]. The roots were used by several native North American Indian tribes to make tightly woven baskets that would hold water[226]. The limbs and roots can be pounded, shredded and used to make ropes[257]. A pitch is obtained from the tree and is used for caulking boats, waterproofing boxes etc[118, 257]. The rendered pitch has been used as a glue[257]. The pitch can be melted then used as a protective varnish-like coat on wood[257]. Wood - strong according to some reports[171, 229], not strong according to others[1, 11, 46]. The quality of the wood for aircraft construction is unsurpassed, it is remarkably strong yet light and its resistance - weight ratio is among the highest[226]. The wood is elastic, soft, light, straight grained. Equal in quality to *P. abies* but more quickly produced, the wood is used for shipbuilding, construction, packing cases, doors, posts etc[1, 11, 46, 226]. The wood is also valued for making musical instruments[226] and is widely used in the pulp industry to make paper[171]. The wood is a good fuel, knotted bits of wood would keep the fire burning all night[257].

dwatta Analgesic Antirheumatic Antitoxic Diuretic Laxative Ophthalmic Pectoral Poultice Salve Stomachic TB Vitamin CSitka spruce was widely employed medicinally by several native North American Indian tribes who used it especially for its antiseptic and pectoral qualities in the treatment of lung complaints, wounds, sores etc[257]. It is little, if at all, used in modern herbalism. The inner bark is laxative[256, 257]. It has been chewed in the treatment

of throat problems, coughs and colds[257]. A decoction of the branch tips and the bark has been used in the treatment of rheumatism, stomach pains, constipation and gonorrhoea[257]. A decoction of the cones has been taken in the treatment of pain[257]. The cones have also been used in steam baths to treat rheumatism[257]. A decoction of the bark has been used as a steam bath in the treatment of back aches[257]. The resin is antiseptic and diuretic[257]. A decoction has been used in the treatment of gonorrhoea[257]. A poultice of the resin has been used as a rub on rheumatic joints[257]. Combined with Indian Hellebore roots (*Veratrum viride*), it has been used as a poultice on rheumatic joints[257]. The resin has also been used as a dressing or poultice on cuts, broken skin, boils, wounds, infections and suppurating sores[257]. The resin has been chewed as a breath freshener and as a treatment for TB[257]. The gum from new shoots and small branches has been placed in the eyes as a treatment for snow blindness[257]. A decoction of the roots has been used in the treatment of diarrhoea[257].

Quercus marilandica

propta Seed - stratification will probably improve germination so sow fresh seed in the autumn in a cold frame if possible[80]. Sow stored seed as early in the year as possible in a cold frame[78]. A position in light shade is probably best[78]. Seed should not be allowed to dry out and should be stored in a cool place[80]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse or cold frame for their first winter. They can be planted out into their permanent positions in early summer of the following year, or be placed in an outdoor nursery bed for a year or so to increase in size. They might need protection from spring frosts. Cuttings of semi-ripe terminal shoots, 5 - 8cm long, August in a frame. Protect from frost. Forms roots in the spring[78]. Cuttings of mature terminal shoots, 5 - 10cm long, September/October in a cold frame. Takes 12 months[78]. Cuttings of soft to semi-ripe wood, early summer in a frame. Slow but sure.

Quercus marilandica

nwatta Landscape Uses:Screen, Specimen. Likes abundant moisture at the roots, if grown in drier areas it must be given a deep moist soil[11]. Tolerates poor peaty soils[200]. Succeeds in wet, cold, poor and shallow soils[81]. Trees have succeeded on pure chalk when on a north facing hollow deep in beech woods[200]. Prefers a pH between 4 to 6[200]. Dislikes shade[200]. Intolerant of atmospheric pollution[11]. Very tolerant of exposure[81], resisting salt laden gales[172], though trees are not very wind firm in shallow soils[1]. A long-lived tree, with specimens 700 - 800 years old being recorded[229]. It is slow growing for its first two or three years, though it soon becomes an extremely fast growing tree and is very widely planted for timber in Britain and other temperate areas[11, 17]. Even trees 30 metres tall are increasing in height by 1 metre a year[185]. New growth takes place from May to July or August and some very vigorous trees will produce a second flush of growth until September[185]. Although the dormant tree is very cold-hardy, growth can be severely checked if the trees are growing in a frost hollow, because the young shoots are very susceptible to damage by late frosts[125, 185]. In Britain the best stands are produced in the sheltered valleys of W. Scotland. Trees are unsurpassed for rapid volume wood production in cool wet mountain sites on blanket peat in W. Britain[200]. In areas with cool wet summers (1200mm of rain per year) it makes a huge specimen tree[200]. Trees should be planted into their permanent positions when they are quite small, between 30 and 90cm[1, 200]. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200]. In some upland areas, especially over granitic or other base-poor soils, growth rate and health have been seriously affected by aluminium poisoning induced by acid rain[200]. Plants are strongly outbreeding, self-fertilized seed usually grows poorly[200]. They hybridize freely with other members of this genus[200]. Many trees do not bear female flowers in most years. Subject to damage by the green spruce aphid[1], trees are also often attacked by a bark beetle and so should be kept away from more valuable plantings[125]. A biological control for the bark beetle is being introduced (1990)[125]. Special Features:North American native, Inconspicuous flowers or blooms.

### 7.2.274 Quercus marilandica

Blackjack Oak

6 tlin 9 cyuc 2 kcaak 0 tcan 2 dwat m hkuc hmimhtut cyutli kyuctup hwicli hysj[utnyik hpa7tli frusflat-priklwis hpa7tmwatli hjonli

drutta Quercus marilandica is a deciduous Tree growing to 10 m (32ft) by 7 m (23ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from April to May, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: SeedEdible Uses: CoffeeSeed - cooked[63, 105]. Used in times of scarcity[257]. The seed is about 2cm long[200], it can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread. The seed contains bitter tannins, these can be leached out by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute.

tcanta Charcoal Fuel Repellent Tannin WoodA mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth[20]. Oak galls are excrescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4]. Wood - heavy, hard, strong, close grained[82]. It weighs 46lb per cubic foot[227], but is too small to be of commercial value and is only used for fence posts, charcoal and fuel[82, 149, 229].

dwatta Astringent Birthing aid DysenteryAn infusion of the tree bark coal has been taken to ease childbirth, remove the afterbirth and ease cramps[257]. Any galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4].

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Landscape Uses:Specimen. Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Lime tolerant[188]. Young plants tolerate reasonable levels of side shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. Trees are tolerant of dry sandy sterile soils[229]. Prefers warmer summers than are usually experienced in Britain, trees often grow poorly in this country and fail to properly ripen their wood resulting in frost damage overwinter[200]. A slow-growing and short-lived tree[200, 229]. The tree flowers on new growth produced in spring, the seed taking two summers to ripen[229]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. Hybridizes freely with other members of the genus[200]. Plants in this genus are notably resistant to honey fungus[200]. Special Features:Attracts birds, North American native, Inconspicuous flowers or blooms.

kcakta Edible Parts: Edible Uses: ColouringA yellow dye is obtained from the flowers and used as a saffron substitute for colouring foods[61, 177, 183].

tcanta DyeNone known

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold greenhouse[1]. The seed usually germinates in 3 - 9 weeks at 20 - 25°C[164]. Stored seed can be sown in early spring in a greenhouse[164]. Sow the seed thinly so that the plants can be grown on undisturbed in their pot for the first year, but give the seedlings an occasional liquid feed to ensure they do not become nutrient deficient. Once the plants are dormant in the autumn, pot up the bulbs putting 2 - 3 bulbs in each pot. Grow them on for another year or two in the greenhouse before planting them out when they are dormant in the autumn. Division in spring as new growth commences[200]. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the summer or following spring.

nwatta A very easily grown plant, it succeeds in almost all soils other than very heavy clays or bogs[233], though it prefers a light rich sandy soil[1, 79] in full sun or light dappled shade[200, 233]. Another report says that it prefers a fairly shady position and plenty of moisture in the growing season[79]. The corms are hardy to about -10°C[200] but in cold areas it is wise to lift them when the plants die down in the autumn, store them in a cool frost-free place over the winter and plant them out in the spring[1]. Make sure the corms do not dry out[1]. It is best to avoid lifting the corms if at all possible since the new corms seem to derive some nutrition from the old corms that have flowered[200]. Plants can divide quite freely when growing in a suitable location[233]. Although the fresh flowers have no perfume, when dried and immersed in warm water they release a scent like that of the saffron crocus[245]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233].

## 7.2.377 Conyza canadensis

Canada Fleabane, Canadian horseweed

6 tlin 9 cyuc 1 kcaak 1 tcan 3 dwat 1 m hkuc hmimhtut cyutli hgatkyuctup hwicli hras[ut hpa7tli priklwis hpa7tmwatli hjonli

drutta Conyza canadensis is a ANNUAL growing to 1 m (3ft 3in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to October, and the seeds ripen from July to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Bees, flies. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: LeavesEdible Uses: CondimentYoung leaves and seedlings - cooked[105, 177]. Boiled, cooked in rice or dried for later use[183]. A nutritional analysis of the leaves is available[218]. The source of an essential oil that is used commercially for flavouring sweets, condiments and soft drinks[183]. The fresh leaves contain 0.2 - 0.66% essential oil[218].

tcanta EssentialThe plant contains small quantities of essential oil[7]. Since the plant is readily obtainable, extraction of the oil is feasible - it has a special quality that would make it suitable in the making of perfumes with unusual nuances[7, 240].

dwatta Astringent Diuretic Dysentery Emmenagogue Homeopathy Hypoglycaemic Styptic Tonic VD VermifugeIn traditional North American herbal medicine, Canada fleabane was boiled to make steam for sweat lodges, taken as a snuff to stimulate sneezing during the course of a cold and burned to create a smoke that warded off insects[254]. Nowadays it is valued most for its astringency, being used in the treatment of gastro-intestinal problems such as diarrhoea and dysentery[254]. It is said to be a very effective treatment for bleeding haemorrhoids[254]. The whole plant is anti-rheumatic, astringent, balsamic, diuretic, emmenagogue, styptic, tonic and vermifuge[4, 7, 9, 21, 222]. It can be harvested at any time that it is in flower and is best used when fresh[4, 207, 238]. The dried herb should not be stored

for more than a year[238]. The seeds can also be used[4]. An infusion of the plant has been used to treat diarrhoea and internal haemorrhages[213] or applied externally to treat gonorrhoea[213] and bleeding piles[7]. The leaves are experimentally hypoglycaemic[218]. The essential oil found in the leaves is used in the treatment of diarrhoea, dysentery and internal haemorrhages[4, 207, 218]. It is a uterine stimulant[213] and is also said to be valuable in the treatment of inflamed tonsils plus ulceration and inflammation of the throat[4]. A tea of the boiled roots is used to treat menstrual irregularities[213]. A homeopathic remedy is made from the plant[9]. It is used in the treatment of haemorrhoids and painful menstruation[9].

propta Seed - we have no information on this species but suggest sowing the seed in spring in situ. An autumn sowing in situ might also be worthwhile.

nkwalta Prefers a well-drained light or medium neutral to alkaline soil in a sunny position, though it tolerates most conditions[238]. Originally from N. America, Canada fleabane has become naturalized in many areas of the world and is considered to be a nuisance weed in many areas[268]. The plant is very adaptable to differing conditions and can vary dramatically in height, from only a few centimetres in poor soils to as much as 3 metres tall in rich soils[213]. The plant is used commercially as a food flavouring[183]. A good bee plant[200] but unfortunately it also harbours various insect pests such as the tarnished plant bug[1].

## 7.2.378 Eragrostis curvula

Weeping Love Grass

6 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 1.2 m hkuc htut cyutli tcup hwicli hras[utnyik hpa7tli flatpriklwis hpa7tmwatli fyikre7t hjonli

drutta Eragrostis curvula is an evergreen Perennial growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Apomictic (reproduce by seeds formed without sexual fusion), wind. The plant is self-ferile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: Seed - cooked[269]. Used as a grain[269].

tcanta Basketry Biomass Soil stabilizationA deep-rooted plant, it is considered excellent for protecting terraces and for grassing water channels and is valuable for erosion control[269]. In Lesotho, the plant is used to make baskets, brooms, hats, ropes, and candles[269].

dwatta None known

propta Seed - sow early spring in a greenhouse and only just cover the seed. Germination should take place within 2 weeks. When they are large enough to handle, prick the seedlings out into individual pots and plant them out after the last expected frosts. The seed can also be sown in situ in mid to late spring, though in a cool summer it may fail to ripen many seeds[162]. Division in spring.

nwatta Easily grown in most well-drained soils so long as the plant is in a hot, dry, sunny position[200]. Weeping love grass is reported to tolerate an annual precipitation of 31 to 163cm, an annual temperature range of 5.9 to 26.2°C and a pH in the range of 5.0 to 8.2[269]. It is adapted to semi-arid and desert areas and sandy soils, growing well on low fertility soils[269]. A very drought-resistant plant, but it lacks hardiness for more northern areas[269]. It grows well on a wide range of well-drained soils, especially sandy loams; moderately frost-resistant in southern areas[269]. Plants are hardy to about -5°C and succeed outdoors in the milder areas of Britain[200]. The roots contain pyrocatechol, suggesting an explanation for the plants resistance to nematodes[269]. The species and its varieties are apomictic (producing seed without fertilization) although sexual plants have occasionally been found[269].

does not really need much pruning apart from removing dead or diseased stems. It is, however, very tolerant of pruning and can be cut right back to ground level if it requires rejuvenation[200]. Strongly resents root disturbance, taking some time to recover after being divided[1]. Peony species are usually self-fertile, though they will also hybridise with other species if these flower nearby at the same time[250]. Plants take 4 - 5 years to flower from seed[200]. They generally breed true from seed[1]. Commonly cultivated in China as a medicinal plant, the cultivar 'Phoenix White' has especially vigorous roots and so is the favoured form for medicinal use[214].

### 7.2.373 *Scrophularia umbrosa*

Water Betony, Water figwort  
6 tlin 9 cyuc 1 kcaak 0 tcan 3 dwat 1.5 m hkuc  
hmmihtut cyutli tcuphja7n hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Scrophularia umbrosa* is a PERENNIAL growing to 1.5 m (5ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to September, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, wasps. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcaakta Edible Parts: RootEdible Uses: Root - cooked[2, 105]. There must be some doubts about the edibility of this root[K].

tcanta None known  
dwatta Detergent Eczema VulneraryThe leaves are detergent and vulnerary[4]. They are harvested as the plant comes into flower and can be used fresh or dried for later use[4]. The plant has a good reputation as a wound herb, either applied externally as a poultice or taken as a decoction[4]. Water betony is said to have similar medicinal properties to the knotted figwort, *S. nodosa*[254]. These properties are as follows:- Knotted figwort is a plant that supports detoxification of the body and it may be used as a treatment for various kinds of skin disorders[254]. The whole plant is alterative, anodyne, anti-inflammatory, diuretic, mildly purgative and stimulant[4, 9, 21, 165]. It is harvested as the plant comes into flower in the summer and can be dried for later use[4]. A decoction is applied externally to sprains, swellings, burns, inflammations etc, and is said to be useful in treating chronic skin diseases, scrofulous sores and gangrene[4, 254]. The leaves can also be applied fresh or be made into an ointment[4]. Internally, the plant is used in the treatment of chronic skin diseases (such as eczema, psoriasis and pruritis), mastitis, swollen lymph nodes and poor circulation[238]. It should not be prescribed for patients with heart conditions[238]. The root is anthelmintic[9].

propta Seed - sow spring or autumn in a cold frame[238]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. If you have sufficient seed then it can be sown outdoors in situ in the autumn or the spring. Division in spring. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Succeeds in most moist soils. A good bee plant[4].

### 7.2.374 *Carex paniculata*

6 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 1.5 m hkuc  
hmmihtut cyutli tcuphja7n hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta *Carex paniculata* is a PERENNIAL growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to June, and the seeds ripen from June to July. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH:

mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcaakta Edible Parts: Root SeedEdible Uses: Root - cooked[172]. Seed[172]. No further details are given, but the seed is small and fiddly to use[K].

tcanta BeddingThe straw is used for bedding[61].  
dwatta None known

propta Seed - sow in situ in the spring in a moist soil in light shade. If seed is in short supply it can be sown in a cold frame and be planted out in the summer. The seed usually germinates in 2 - 6 weeks at 15°c[138]. Division in spring[200]. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the summer or following spring.

nwatta Easily grown in a damp to wet soil in full sun or shade[162, 200]. Members of this genus are rarely if ever troubled by browsing deer[233].

### 7.2.375 *Ipomopsis aggregata*

Skyrocket, Scarlet gilia  
6 tlin 9 cyuc 1 kcaak 0 tcan 2 dwat 1 m hkuc  
htut cyutli kyuctcup hwicli hrasljut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Ipomopsis aggregata* is a BIENNIAL/PERENNIAL growing to 1 m (3ft 3in) by 0.3 m (1ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to July. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcaakta Edible Parts: NectarEdible Uses: TeaThe plant has been boiled up as a tea[257]. The nectar is sucked from the flowers by children[257].

tcanta Adhesive Disinfectant SoapThe plant is reported to contain saponins[212] and so could possibly be used as a soap substitute[K]. A decoction of the plant has been used as a face and hair wash by adolescent girls[257]. The whole plant has been boiled up to make a glue[257].

dwatta Cathartic Disinfectant Emetic Skin TonicThe whole plant is cathartic and emetic[61, 257]. The leaves are steeped in hot water until the water turns a bright green, this liquid is taken in small doses as a tonic for the blood[207, 257]. An infusion of the whole plant has been used to treat blood diseases[257]. A decoction has been used as a disinfectant wash on itchy skin[257]. A poultice of the whole plant has been applied to rheumatic joints[257]. An infusion of the roots is used as a laxative and in the treatment of high fevers, colds[257].

propta Seed - sow spring in situ[200].  
nwatta Requires a well-drained dry soil in sun or partial shade[187]. Requires a light very well drained fertile soil in full sun[200]. Plants are cold-hardy to about -15°c[187], but they are susceptible to rot in areas with wet winters[260]. It is best to cover the plants with a pane of glass in wet winter areas[260]. A slow-growing[188] and short-lived perennial or biennial species[187]. A polymorphic species[60]. The leaves have a musky scent[187]. The crushed leaves smell like a skunk[212].

### 7.2.376 *Crocsmia aurea*

Montbretia  
6 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 1 m hkuc  
hmmihtut cyutli tcup hwicli hrasljut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Crocsmia aurea* is a CORM growing to 1 m (3ft 3in) by 0.5 m (1ft 8in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

### 7.2.275 *Duchesnea chrysantha*

6 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 0.1 m hkuc  
htut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli fyfjxre7t hjonli

drutta *Duchesnea chrysantha* is a PERENNIAL growing to 0.1 m (0ft 4in) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to October, and the seeds ripen from July to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcaakta Edible Parts: Fruit LeavesEdible Uses: Fruit - raw or cooked[105]. The fruit is about 10mm in diameter[200] with the appearance and texture of a strawberry but very little flavour[K]. Leaves and young plant - cooked[105].

tcanta None known  
dwatta None known

propta Seed - sow spring in a sunny position in a greenhouse. Germination usually takes place within 1 - 6 weeks or more at 15°c. A period of cold stratification may speed up germination. When large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division of runners in spring or late summer. Very easy, they can be planted out straight into their permanent positions.

nwatta Prefers a moist but well-drained soil in a sunny position[175]. Grows well in a rock garden[11]. This species is hardy to about -15°c. Plants can be invasive, spreading freely by means of runners[187]. This species is sometimes considered to be no more than a form of *D. indica*[74].

### 7.2.276 *Achillea ageratum*

Mace, Sweet-nancy  
6 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 0.6 m hkuc  
htut cyutli hgatkyuctcup hwicli hyishrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Achillea ageratum* is a PERENNIAL growing to 0.6 m (2ft) by 0.6 m (2ft in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from July to September, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

kcaakta Edible Parts: LeavesEdible Uses: Condiment TeaLeaves - raw or cooked. The initial flavour is mild and pleasant, though it becomes stronger and aromatic when the leaves are chewed, and leaves a tingy sensation in the mouth[K]. They make an acceptable addition to mixed salads, the plant is very productive, though the leaves are rather small and fiddly to pick in quantity[K]. They are also used in soups, stews etc., and as a flavouring in potato salad etc[183]. The aromatic leaves are used as a tea substitute[183].

tcanta None known  
dwatta None known

propta Seed - sow spring or early autumn in a cold frame[133]. The seed usually germinates in 1 - 3 months[133]. When large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. If this species is a hybrid it might not breed true from seed. Division in spring or autumn. Very easy, the divisions can be planted direct into their permanent positions. Basal cuttings of new shoots in spring. Very easy, collect the shoots when they are about 10cm tall, potting them up individually in pots and keeping them in a warm but lightly shaded position. They should root within 3 weeks and will be ready to plant out in the summer.

nwatta Succeeds in most soils but prefers a well-drained soil in a sunny position[1, 200]. It also succeeds in partial shade[187]. Plants live longer in a poor soil[200]. Established plants are very drought tolerant, they can show

distress in very severe droughts but usually recover[190]. Plants succeed in maritime gardens[233]. Hardy to about -20°c[187]. An excellent plant to grow in a large pot, the long stems will tend to arch down and continue to flower for a long time[244]. The leaves have a pungent aroma, especially when the plant is grown in a hot sunny position[245]. The plant is intermediate between *A. millefolium* and *A. ptarmica* in its characteristics[233]. There is at least one named variety, selected for its ornamental value[233]. Hybridizes freely with other members of the genus[200].

### 7.2.277 *Paederia foetida*

Skunk Vine  
6 tlin 12 cyuc 2 kcaak 2 tcan 4 dwat 4 m hkuc  
hmmihtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwish-som hpa7tmwatli dyat hjonli

drutta *Paederia foetida* is a CLIMBER growing to 4 m (13ft) by 0.3 m (1ft in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. The flowers are pollinated by Bees, Butterflies. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in saline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Leaves StemEdible Uses: Leaves - raw or cooked[301 J]. Although they have a strong flavour, the leaves are sometimes mixed with grated coconut and spices, and then eaten raw as a side-dish with rice[301, 310 J]. The minced leaves are steamed and eaten; they can be added to soups; or are mixed with various vegetables and spices, then wrapped in a banana leaf and cooked over a fire[301 J]. Any offensive smell disappears as the leaves are cooked[301 J]. The leaves are valued more for their medicinal virtues than for their flavour[K J]. The sweet stem juice is sucked in Taiwan[177, 183 J].

tcanta Other Uses The stem yields a strong and silky fibre, but it is not commercially exploited[310 J]. An ethanolic extract of the leaves and stem has been shown to be significantly toxic against the aphid *Myzus persicae* infesting cabbage in India[310 J]

dwatta DysenteryThe leaves are widely used in Asia and South-East Asia, where they are especially valued for treating digestive problems[310 J]. Considerable research has been carried out into the medicinal benefits of the plants, with several active compounds having been recorded[310 J]. Several iridoid glucosides such as asperuloside, scandoside and paederoside have been isolated from the aerial parts of the plant[310 J]. These glucosides have displayed antitumor activity with paederoside displaying the highest degree of antitumor-promoting activity[310 J]. Scandoside has been shown to promote the growth of lettuce seedlings. Paederoside showed a similar inhibitory activity to that of asperuloside and daecetyl-asperulosidic acid in a plant growth inhibition test and in an antimicroorganism activity test[310 J]. The brewed aerial parts of the plant have the fetid odour of indole (methyl-mercaptopan). Damage to the tissue releases an enzyme which splits off this sulphur-containing group from paederoside, and is therefore responsible for the unpleasant odour. The most abundant sulphur-containing compound was dimethyl disulphide[310 J]. The presence of alkaloids and an essential oil have also been recorded[310 J]. Monoterpenes such as linalol constitute the major components in the oil[310 J]. In older investigations, decoctions of the plant showed significant anti-inflammatory action against arthritis[310 J]. The decoction also exhibited marked activity against degenerative osteo-arthritis[310 J]. The water soluble fraction of the aerial parts displayed anti-inflammatory activity in oedema[310 J]. It failed to exhibit any analgesic or antipyretic action and showed no ulcerogenic potential[310 J]. An ethanolic extract of the leaves has shown anticancer activity against human epidermoid carcinoma of the nasopharynx[310 J]. A methanol extract of the leaves has shown hepatoprotective potential, being effective in reversing 6 out of 12 common biochemical (enzymatic) parameters assessed[310 J]. Another study has shown that the plant has antiarthroal activity, acting by inhibiting intestinal motility - thus supporting its use in traditional medicine[360 J]. The leaves are anodyne, antirheumatic, antivenous, astringent, carminative, depurative, diuretic, restorative and ver-

mifuge[147 , 218 , 310 ]. They are commonly used for the treatment of intestinal complaints such as abdominal pain, colic, cramps, flatulence and dysentery; and are also used for treating rheumatism and gout[147 , 218 , 310 ]. The leaves are also used to treat infertility and paralysis[218 ]. The leaves and stems are also used as a diuretic for inflammation of the urethra[310 ]. For treating intestinal problems, the fresh leaves are pounded, water added, and the filtered infusion is drunk regularly till convalescence[310 ]. The plant is considered to have great restorative powers, and the leaves may thus be mixed with food, boiled and eaten - in India, they are often boiled in soup to lessen their smell[310 ]. Applied externally, the leaves are used to treat swellings and bruises in general, and are mashed then applied for earache, ulcerations of the nose and swollen eyes[272 , 310 ]. They are used as a poultice for treating a swollen belly, distension, herpes or ringworm; and are used in antihelmthic baths[310 ]. They are applied to the abdomen as a diuretic, and also as a solvent for vesical stones[310 ]. The juice of the leaves is considered astringent, and is used to treat diarrhoea in children[310 ]. The bark and the root are considered to be emetic[310 ]. The juice of the root is prescribed in cases of indigestion, piles, inflammation of the spleen, and pain in the chest and liver[272 , 310 ]. It may help to eliminate poisons collected in the system[310 ]. In some parts of India, the fruit is used to blacken teeth, and it is also considered a medicine to prevent and treat toothache[310 , 360 ].

propta Seed - despite its weediness, the plant germinates rather slowly, with tetraploids germinating quicker than hexaploids, in 5 - 22 days, or in 17 - 24 days, respectively[310 ]. Layering. Sometimes, shoots produce adventitious roots when they come in contact with the soil, and can thus be propagated[310 ]

nwatta Found in a range of environments from the warm temperate zone to the tropics. It is tolerant of at least some frost[413 ]. Succeeds in any fertile soil so long as it is well drained[182 , 219 ]. Plants have a wide ranging adaptability to different levels of light, types of soil, and salt conditions[413 ]. Requires a sunny sheltered position[219 ]. A very variable plant[58 ]. The plant has escaped from cultivation and become naturalised in many areas[310 ]. It has become a serious weed of young sugarcane[305 ]. The vines climb over shrubs and trees, weighing them down and impeding regeneration[413 ]. They also invade pastureland and are troublesome along roads and on power lines[413 ]. The seeds may be dispersed by birds and the plant is also spread by the transport of rooted fragments[413 ]. The plant can be found flowering and fruiting throughout the year in tropical and subtropical conditions; in other localities, it flowers during the rainy season, and fruits early in the dry season[310 ]. Individual flowers are short-lived, open early in the morning and fall off after 2 days; entire inflorescences, however, bear flowers for a long period of time[310 ]. Flowering Time: Mid Summer Late Summer/Early Fall. Bloom Color: Red White/Near White.

## 7.2.278 Thymus zygis

6 tin 9 cyuc 2 kcaak 0 tcan 2 dwat 0.3 m hkuc htut cyutli hgtakuyctcup hwicli hyishrasjlut hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

drutta Thymus zygis is an evergreen Shrub growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Edible Uses: CondimentThe leaves are used as a condiment[177, 183]. If the leaves are to be dried, the plants should be harvested in early and late summer just before the flowers open and the leaves should be dried quickly[200].

tcanta Deodorant Disinfectant EssentialThe essential oil obtained from the leaves is used in perfumery, as a mouth wash, medicinally etc[200]. This plant is the main commercial source of thyme oil[238].

dwatta Antiseptic Deodorant DisinfectantThe leaves, and especially the essential oil contained in them, are

strongly antiseptic, deodorant and disinfectant[200, 238]. The plant can be used fresh at any time of the year, or it can be harvested as it comes into flower and either be distilled for the oil or dried for later use[238].

propta Seed - sow spring in a cold frame. Seed can also be sown in autumn in a greenhouse. Surface sow or barely cover the seed. Germination can be erratic. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring or autumn[200]. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the summer or the following spring. Cuttings of young shoots, 5 - 8cm with a heel, May/June in a frame[200]. Cuttings of half-ripe wood, 5 - 8cm with a heel, July/August in a frame[200]. Layering.

nwatta Requires a light well-drained preferably calcareous soil in a sunny position[1, 200]. Succeeds in dry soils. Thymes dislike wet conditions, especially in the winter. A layer of gravel on the soil around them will help protect the foliage from wet soils[238]. Plants are hardy to about -10°C but are best given some protection in the winter, a pane of glass supported above the plant is usually adequate[1]. This species is harvested commercially for its essential oil[218]. The flowers are rich in nectar and are very attractive to honey bees[200]. This is a very difficult genus taxonomically, the species hybridize freely with each other and often intergrade into each other[200].

## 7.2.279 Dactylorhiza incarnata

Marsh Orchid

6 tin 9 cyuc 2 kcaak 0 tcan 2 dwat 0.3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

drutta Dactylorhiza incarnata is a BULB growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Bulb - cooked. Very nutritious[4, 46, 61]. It is a source of 'salep', a fine white to yellowish-white powder that is obtained by drying the tuber and grinding it into a powder[2, 105, 177]. Salep is a starch-like substance with a sweetish taste and a faint somewhat unpleasant smell[4]. It is said to be very nutritious and is made into a drink or can be added to cereals and used in making bread etc[100, 183]. One ounce of salep is said to be enough to sustain a person for a day[100, 115].

tcanta None known

dwatta Demulcent NutritiveSalep (see above for more details) is very nutritive and demulcent[4]. It has been used as a diet of special value for children and convalescents, being boiled with water, flavoured and prepared in the same way as arrowroot[4]. Rich in mucilage, it forms a soothing and demulcent jelly that is used in the treatment of irritations of the gastro-intestinal canal[4]. One part of salep to fifty parts of water is sufficient to make a jelly[4]. The tuber, from which salep is prepared, should be harvested as the plant dies down after flowering and setting seed[4].

propta Seed - surface sow, preferably as soon as it is ripe, in the greenhouse and do not allow the compost to dry out. The seed of this species is extremely simple, it has a minute embryo surrounded by a single layer of protective cells. It contains very little food reserves and depends upon a symbiotic relationship with a species of soil-dwelling fungus. The fungal hyphae invade the seed and enter the cells of the embryo. The orchid soon begins to digest the fungal tissue and this acts as a food supply for the plant until it is able to obtain nutrients from decaying material in the soil[200]. It is best to use some of the soil that is growing around established plants in order to introduce the fungus, or to sow the seed around a plant of the same species and allow the seedlings to grow on until they are large enough to move.

first winter, planting out after the last expected frosts. Suckers are sometimes produced at some distance from the parent plant. These suckers can be potted up in early spring, then grown on for a year before planting them out into their permanent positions.

nwatta Landscape Uses:Border, Foundation, Pest tolerant, Massing, Screen, Specimen, Woodland garden. Prefers a light, moist well-drained loam and a sheltered position[1, 11] Prefers a humus-rich lime-free soil[182, 200]. A plant of woodland shade in its native habitat, in the less sunny British climate it succeeds in sun or semi-shade[200, 260]. This species is not very cold-hardy, it tolerates temperatures down to between -5 and -10°C, only succeeding outdoors in the mildest areas of Britain[1, 11, 166]. A slow-growing tree[200], the whole plant is very aromatic[182]. The bruised leaves have a strong scent of aniseed, whilst the flowers have a powerful spicy odour[245]. Suckers can spring up at some distance from the parent plant[260]. Special Features:Attracts birds, Attractive foliage, North American native, Fragrant foliage, Wetlands plant, Suitable for cut flowers, Attractive flowers or blooms. The plant is heat tolerant in zones 9 through 7. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. An evergreen. A clumping plant, forming a colony from shoots away from the crown but with a limited spread [1-2]. The root pattern is suckering with new plants from underground runners away from the plant [1-2].

## 7.2.371 Gunnera tinctoria

Gunnera, Chilean gunnera

6 tin 9 cyuc 1 kcaak 0 tcan 1 dwat 2 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

drutta Gunnera tinctoria is a PERENNIAL growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from July to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: StemEdible Uses: Young leaf stalks - peeled and cooked as a vegetable or eaten raw[2, 177, 183]. Acid and refreshing[139].

tcanta Dye Roofing TanninA black dye is obtained from the root[139]. The root contains 9% tannin[46, 139]. Leaves are used as a roof covering[139].

dwatta AstringentThe whole plant is astringent[139].

propta Seed - best sown as soon as it is ripe in the autumn in a sandy mix in a cold frame. The seed can also be sown in a shady position in a greenhouse in the spring. Germination usually takes place within 2 - 8 weeks at 15°C. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division as new growth commences in the spring. The clumps can be planted out direct into their permanent positions.

nwatta Requires a damp humus rich soil in a sunny position or semi-shade, sheltered from strong winds. Plants can be grown in quite coarse grass, which can be cut annually in the autumn[233]. The rootstock is rather tender, surviving to -10°C and requiring some protection away from the milder parts of Britain. This can be achieved by piling either bracken or the plants drying leaves around the crown[187]. The top part of the inflorescence is male, the bottom is female and the middle is hermaphrodite. A very ornamental plant with huge leaves, it forms a slowly spreading dense

clump[187]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 7.2.372 Paeonia ostii

Tree Peony

6 tin 9 cyuc 1 kcaak 0 tcan 2 dwat 1.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprikkwissip hpa7tmwatli fixfure7t hjonli

drutta Paeonia ostii is a deciduous Shrub growing to 1.5 m (5ft) by 3 m (9ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FlowersEdible Uses: The following use is for P. suffruticosa. It quite probably also applies to this closely-related species.[K - see 214]. Flowers - cooked[46, 61, 177]. The fallen flower petals are parboiled and sweetened for a teatime delicacy, or cooked in various dishes[183].

tcanta None known

dwatta Analgesic Antibacterial Antiinflammatory AntispasmodicA tea made from the dried crushed petals of various peony species has been used as a cough remedy, and as a treatment for haemorrhoids and varicose veins[250]. The following uses are for P. suffruticosa. They quite probably also apply to this closely related species.[K - see 214]. The root and root bark is analgesic, antibacterial, anti-inflammatory, antipyretic, antispasmodic, emmenagogue, sedative, stypitic and tonic[46, 61, 174, 176, 178, 218]. An extract of the plant has antibacterial activity[218]. The plant is used internally in the treatment of fevers, boils, menstrual disorders, nosebleeds, ulcers, irritability and gastro-intestinal infections[238]. This remedy should only be used under the supervision of a qualified practitioner[238]. The herb acts as a synergist when used with liquorice (Glycyrrhiza spp)[218]. A tea made from the dried crushed petals of various peony species has been used as a cough remedy, and as a treatment for haemorrhoids and varicose veins[250].

propta Seed - best sown as soon as it is ripe in a cold frame[250]. When sown fresh, the seed produces a root about 6 weeks after sowing with shoots formed in the spring[200]. Stored seed is much slower, it should be sown as soon as possible in a cold frame but may take 18 months or more to germinate[200]. The roots are very sensitive to disturbance, so many growers allow the seedlings to remain in their pots for 2 growing seasons before potting them up. This allows a better root system to develop that is more resilient to disturbance[250]. If following this practice, make sure you sow the seed thinly, and give regular liquid feeds in the growing season to ensure the plants are well fed. We usually prick out the seedlings into individual pots as soon as they are large enough to handle, and then grow them on in a cold frame for at least two growing seasons before planting them out when they are in growth in the spring[K].

nwatta Requires a deep rich soil, preferably neutral or slightly alkaline[1], doing quite well in sun or light shade[1]. Prefers a limy soil and a sheltered position[200]. Plants are tolerant of a wide range of soil conditions, but will not survive if the soil becomes waterlogged or is too dry[250]. This species is lime tolerant[200]. Plants grown on sandy soils tend to produce more leaves and less flowers, whilst those growing on clay take longer to become established but produce better blooms[250]. Hardy to about -20°C[184], plants do better in the north of Britain than they do in the south and are generally best if given an open northerly aspect[11]. A very ornamental plant[1]. It grows best in areas with long hot summers[1] and requires an airy position because it is very subject to fungal attack[11]. Plants in this genus are notably susceptible to honey fungus[200]. Plants come into growth early in the year and are then subject to damage by late frosts, so are best sited in a position that is shaded from the early morning sun[11]. The branches are brittle and very subject to wind damage, especially when young[200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. A very greedy plant inhibiting the growth of nearby plants, especially legumes[54]. The plant

plant[1], it is closely related to *R. australe*[200]. Hybridizes freely with other members of this genus[200]. Cultivated as a medicinal plant in China[61]. Plants at the Cambridge Botanical Gardens in September 1993 were growing well in the shade of a woodland garden, though they were not succeeding when planted closely to the trees[K]. Plants in this genus seem to be immune to the predations of rabbits[233].

## 7.2.368 *Nandina domestica*

Sacred Bamboo, Heavenly Bamboo  
6 tlin 9 cyuc 1 kcaak 0 tcan 2 dwat 2.5 m hkuc  
htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Nandina domestica* is an evergreen Shrub growing to 2.5 m (8ft) by 2 m (6ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower from June to July. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcaakta Edible Parts: Fruit LeavesEdible Uses: Fruit[2]. No further details are given, but another report says that the fruit is poisonous[147]. The fruit is about 10mm in diameter[200]. Young leaves - boiled[177]. The water must be changed at least once during the cooking[105].

tcanta Hedge HedgePlants are used for hedging in warm temperate zones[200].

dwatta Antirheumatic Antitussive Astringent Febrifuge Stomachic TonicThe roots and stems are antitussive, astringent, febrifuge, stomachic and tonic[147, 174]. A decoction is used in the treatment of fever in influenza, acute bronchitis, whooping cough, indigestion, acute gastro-enteritis, tooth abscess, pain in the bones and muscles and traumatic injuries[147]. It is especially useful in the treatment of children's coughs[174]. There is a danger that an overdose can cause respiratory paralysis[174]. A decoction of the leaves is tonic[218]. The fruit is febrifuge and tonic[218]. Another report says that it is toxic, so great care should be employed if using it[147]. The root is antirheumatic[218]. Young shoots contain high concentrations of laetrile - up to 20% on a zero moisture basis[218].

propta Seed - best sown as soon as it is ripe in a greenhouse[113]. Stored seed should be sown as early in the year as possible in a greenhouse. Germination is often poor[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood 10 - 15cm long, July/August in a frame[78]. Pot up in the autumn and overwinter in a cold frame. Plant out in late spring. High percentage[78] but very slow[11]. Cuttings of mature wood, 10 - 15cm with a heel, November in a frame[78]. Plant out the following autumn[78, 200]. High percentage[78] but very slow[11].

nwatta Landscape Uses:Border, Container, Foundation, Massing, Rock garden, Screen, Specimen. Requires a deep rich moist soil in a sheltered sunny position[11, 200]. Prefers a cool but sunny position[200]. A very ornamental plant, it only successful outdoors in Britain in favoured localities[1]. Grows well in Cornwall[59]. Tender when young[11], the shoot tips of mature plants can be damaged by hard frosts[200]. A number of named forms have been developed for their ornamental value[182]. Untidy old stems on established plants can be pruned to the base in spring[188]. Cultivated for its fruit in China and Japan[2] (does this refer to medicinal usage?). It does not fruit freely in Britain[11]. Plants in this genus are notably resistant to honey fungus[200]. Special Features: Attracts birds, Attractive foliage, Not North American native, Invasive, Naturalizing, Attractive flowers or blooms.

## 7.2.369 *Eupatorium japonicum*

Pei Lan  
6 tlin 9 cyuc 1 kcaak 0 tcan 3 dwat 2 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Eupatorium japonicum* is a PERENNIAL growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Leaves RootEdible Uses: Young leaves - cooked. Boiled and well seasoned[177]. Root - cooked. It is sometimes eaten for food and is considered beneficial to the circulation[218].

tcanta None known  
dwatta Anodyne Antibacterial Antidandruff Antiviral Carminative Diaphoretic Diuretic Nervine Vermifuge Women's complaintsThe leaves and stems are anodyne, antibacterial, antiviral, carminative, diaphoretic, diuretic, nervine and vermifuge[176, 218]. They are taken internally in the treatment of indigestion, nausea, vomiting, diarrhoea, feverish colds etc[147, 176, 238]. In excess the plant causes irritation to the stomach[238]. The leaves and stems are harvested in the summer before the flower buds open, and are dried for later use[238]. The plant contains the essential oil thymol. In large doses this can cause various health problems such as headaches, tinnitus, vertigo, inhibition of respiration and the circulation[176]. Use with caution[176]. The seed is prescribed in China for the '36 diseases of women'[218]. The root is considered to be beneficial to the circulation and a restorative to women after parturition[218]. It is harvested in the autumn and dried for later use[238]. The herbage, soaked in oil, is applied to the hair as a treatment for dandruff[218].

propta Seed - sow spring in a cold frame and only just cover the seed. Prick out the seedlings into individual pots when they are large enough to handle and plant them out into their permanent positions in the summer. Division in spring or autumn[111]. Very easy, the clumps can be replanted direct into their permanent positions.

nwatta Succeeds in ordinary well-drained but moisture retentive garden soil in sun or part shade[200]. A very polymorphic species[58], it is closely related to *E. cannabinum*[1]. This species is a member of natural moist grassland flora on river banks in the Kanto District of Japan. Due to urbanization of this area, the habitat is now restricted to a very small area, and the species is endangered[275]. Plants seem to be immune to the predations of rabbits[233].

## 7.2.370 *Illicium floridanum*

Aniseed Tree, Florida anisetree, Purple Anise, Star Anise, Florida anise  
6 tlin 10 cyuc 1 kcaak 0 tcan 0 dwat 2 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta *Illicium floridanum* is an evergreen Shrub growing to 2 m (6ft) by 2 m (6ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower from May to June, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Edible Uses: CondimentSaid to be used as a spice[105, 177, 183]. No further details are given, but the leaves have a strong aroma of aniseed[245].

tcanta None known  
dwatta None known  
propta Seed - it does not require pre-treatment and can be sown in early spring in a greenhouse[113]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse for at least their first winter. Plant out in late spring or early summer, after the last expected frosts, and give some protection from the cold over the winter for the first year or two. Layering in early spring. Takes 18 months[78]. Cuttings of half-ripe wood, August in a frame[113]. Pot up the cuttings when they start to root and grow them on in the greenhouse for their

Division in autumn. The plant is very intolerant of root disturbance, any moving or dividing should be attempted in the autumn, keep a large ball of soil around the plant[1]. Division of the tubers as the flowers fade[230]. This species produces a new tuber towards the end of its growing season. If this is removed from the plant as its flowers are fading, the shock to the plant can stimulate new tubers to be formed. The tuber should be treated as being dormant, whilst the remaining plant should be encouraged to continue in growth in order to give it time to produce new tubers[230]. Division can also be carried out when the plant has a fully developed rosette of leaves but before it comes into flower[230]. The entire new growth is removed from the old tuber from which it has arisen and is potted up, the cut being made towards the bottom of the stem but leaving one or two roots still attached to the old tuber. This can often be done without digging up the plant. The old tuber should develop one or two new growths, whilst the new rosette should continue in growth and flower normally[230].

nwatta Very easily grown in any good moist soil[42]. Another report says that it requires a deep rich soil[1]. Orchids are, in general, shallow-rooting plants of well-drained low-fertility soils. Their symbiotic relationship with a fungus in the soil allows them to obtain sufficient nutrients and be able to compete successfully with other plants. They are very sensitive to the addition of fertilizers or fungicides since these can harm the symbiotic fungus and thus kill the orchid[230]. A polymorphic species[17], it also hybridizes readily with other members of the genus[230]. This species is a colonizer of disturbed ground and bare soils, new colonies can spring up many kilometres from the plants nearest known locality[230]. They have been known to colonize sites such as waste heaps of clinker at power stations[230]. Plants are very impatient of root disturbance[1].

## 7.2.280 *Cichorium spinosum*

6 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 0.2 m hkuc  
htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Cichorium spinosum* is a BIENNIAL/PERENNIAL growing to 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerate maritime exposure.

kcaakta Edible Parts: LeavesEdible Uses: Leaves - boiled[148].

tcanta None known  
dwatta None known  
propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts.

nwatta Succeeds in any moderately fertile well-drained soil[200]. Prefers a medium to light sandy or gravelly soil that is rich in humus[1]. Prefers a sunny position[200] but with light shade in the summer to prevent plants running to seed.

## 7.2.281 *Brassica rapa campestris*

Wild Turnip  
6 tlin 9 cyuc 2 kcaak 0 tcan 1 dwat 0.8 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprikliw hpa7tmwatli fyifxre7t hjonli

drutta *Brassica rapa campestris* is a ANNUAL growing to 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from May to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow

in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Leaves Oil OilEdible Uses: Oil OilLeaves - raw or cooked. A strong radish/cabbage flavour. An edible oil is obtained from the seed, it is best when cold pressed[171]. Some varieties are rich in erucic acid which can be harmful[K].

tcanta Oil OilThe seed contains up to 45% of a semi-drying oil. It is used as a lubricant, luminant and in soap making[1, 46, 57, 61, 74, 171].

dwatta Antiscorbatic Vitamin CThe tuberous roots and seeds are considered to be antiscorbatic[243]. A rather strange report, the leaves are much more likely to contain reasonable quantities of vitamin C than the roots or seeds[K].

propta Seed - sow spring or autumn in situ.  
nwatta Succeeds in full sun in a well-drained fertile preferably alkaline soil[16, 200]. Succeeds in any reasonable soil but prefers one on the heavy side[16]. Tolerates a pH in the range 4.8 to 8.3. This is the wild form of the turnip with a non-tuberous tap-root[17]. It is closely related to the cultivated forms that are grown for their edible oil-bearing seeds[17].

## 7.2.282 *Brassica rapa trilocularis*

Indian Colza  
6 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 0.9 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli fyifxre7t hjonli

drutta *Brassica rapa trilocularis* is a BIENNIAL growing to 0.9 m (3ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Leaves Oil OilEdible Uses: Oil OilLeaves - raw or cooked. Used as a vegetable or fermented and stored for winter use[272]. A bit on the coarse side, though the young leaves can be added in moderation to salads whilst older leaves make an acceptable vegetable[K]. An edible oil is obtained from the seeds. It is used for cooking[272].

tcanta Lighting Oil OilThe oil from the seed is used for lighting[272]. The seed husks are used in plastering house walls[272].

dwatta None known  
propta Seed - sow in situ April to September[206]. Some varieties can also be sown in a cold greenhouse in late autumn, winter or early spring to provide leaves overwinter and in late spring.

nwatta Succeeds in full sun in a well-drained fertile preferably alkaline soil[200]. Prefers a light sandy soil and dislikes a heavy soil[37]. Prefers cool moist growing conditions[16]. Succeeds in any reasonable soil. Tolerates a pH in the range 4.3 to 8.3. Indian colza is cultivated mainly in India and Nepal for its oil-rich seeds.

## 7.2.283 *Pleioblastus gramineus*

6 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 3 m hkuc  
hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Pleioblastus gramineus* is an evergreen Bamboo growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcaakta Edible Parts: StemEdible Uses: Young shoots - cooked[105, 177].

tcanta Plant supportCanes are thin-walled but strong and can be used as plant supports[25, 195].

dwatta None known

propta Seed - if possible, surface sow the seed as soon as it is ripe in a greenhouse at about 20°C. Stored seed should be sown as soon as it is received. Do not allow the compost to dry out. Germination usually takes place fairly quickly so long as the seed is of good quality, though it can take 3 - 6 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a lightly shaded place in the greenhouse or cold frame until they are large enough to plant out, which could be a number of years. The plants only flower at intervals of several years and so seed is rarely available. Division as the plant comes into growth in spring. Take divisions with at least three canes in the clump, trying to cause as little root disturbance to the main plant as possible. Grow them on in light shade in a greenhouse in pots of a high fertility sandy medium. Mist the foliage regularly until plants are established. Plant them out into their permanent positions when a good root system has developed, which can take a year or more[200].

nwatta Succeds in most soils but prefers a good loamy soil[1] in a sheltered position in semi-shade[25]. Dislikes drought[1]. Requires shelter from N. and N.E. winds[11]. Closely related to *P. hindisi*[1]. The rootstock is running and invasive[25]. New shoots are produced from late May[25]. This species is notably resistant to honey fungus[200]. Plants only flower at intervals of several years, they often produce fertile seed[122]. When they do come into flower most of the plants energies are directed into producing seed and consequently the plant is severely weakened. They occasionally die after flowering, but if left alone they will normally recover though they will look very poorly for a few years. If fed with artificial NPK fertilizers at this time the plants are more likely to die[122].

## 7.2.284 Santolina chamaecyparissus

Cotton Lavender

6 tlin 9 cyuc 2 kcaak 0 tcan 2 dwat 0.6 m hkuc htut cyutli hgatkyuctup hwicli hyshrasjlut hpa7tli flatprkl-wisslip hpa7tmwatli xre7t hjonli

drutta Santolina chamaecyparissus is an evergreen Shrub growing to 0.6 m (2ft) by 1 m (3ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritional poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

ckakta Edible Parts: Edible Uses: CondimentThe aromatic leaves are used as a flavouring for broths, sauces, grain dishes etc[15, 183].

tcanta Disinfectant Dye Essential Hedge Hedge Pot-pourri RepellentPlants can be grown as a low formal hedge and used as an edging plant[200]. The plant is very tolerant of shearing[200]. In less exposed areas the plants can be trimmed in the autumn, otherwise they need to be cut by early April if they are to be allowed to flower[245]. Plants can also be grown for ground cover[190]. They are best spaced about 60cm apart each way[208]. The leaves are strewn amongst clothes to repel moths etc[4, 15, 18, 20, 100]. The growing plant repels various insect pests, especially cabbage moths[201]. The dried leaves are used in pot-pourri[238]. An essential oil from the leaves is used in perfumery[4], the oil is also obtained from the flowers[168].

dwatta Antispasmodic Disinfectant Emmenagogue Stings VermifugeThe leaves and flowering tops are antispasmodic, disinfectant, emmenagogue, stimulant and vermifuge[4, 7, 11, 201]. Cotton lavender is rarely used medicinally[238], though it is sometimes used internally as a vermifuge for children and to treat poor digestion and menstrual problems[4, 238]. When finely ground and applied to insect stings or bites, the plant will immediately ease the pain[7]. Applied to surface wounds, it will hasten the healing process by encouraging the formation of scar tissue[7]. The leaves and flowering stems are harvested in the summer and dried for later use[238].

propta Seed - sow spring in a greenhouse. Does not require pre-treatment[113]. Prick out the seedlings into indi-

vidual pots when they are large enough to handle and grow them on in the greenhouse for their first winter. Plant them out in late spring or early summer of the following year. Cuttings of half-ripe side shoots, 5 - 8 cm long with a heel, July/August in a frame. Roots within 2 weeks. High percentage[78]. The heeled cuttings can also be placed direct into the open garden in early July and should be well-rooted by the winter[245]. Division in spring or autumn[111]. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer. Layering.

nwatta Landscape Uses:Border, Foundation, Ground cover, Massing, Rock garden, Seashore. An easy and undemanding plant that does not require a rich soil, though it strongly dislikes wet conditions around the roots[1, 11, 15, 200]. Prefers a light sandy fairly poor soil on a sunny slope[200]. Prefers a chalky soil[190]. Established plants are drought tolerant[190]. They succeed in a hot dry position[190]. Hardy to about -15°C when in a well-drained soil. A very wind hardy plant, it succeeds on the top of Cornish dry-stone walls[49]. A very ornamental plant[1], there are several named varieties[245]. Cotton lavender tolerates shearing so long as this is not done at times of low resistance (winter?) [200]. Plants can be cut back hard in spring to maintain their form[200, 208], though this will prevent them flowering[208]. A good companion plant for roses[201]. Flowers are produced on two year old wood[182]. The leaves are very aromatic[190]. The bruised leaves are pleasantly pungent, though the flowers have an unpleasant smell[245]. The form *S. chamaecyparissus nana* has a more pungent aroma than the type[245]. Plants in this genus are notably resistant to honey fungus[200]. Special Features: Attractive foliage, Fragrant foliage, Not North American native, Suitable for dried flowers.

## 7.2.285 Lavandula latifolia

Spike Lavender, Broadleaved lavender

6 tlin 9 cyuc 2 kcaak 5 tcan 2 dwat 0.4 m hkuc

htut cyutli hgatkyuctup hwicli hrasjlutnyk hpa7tli flatprkl-wishsom hpa7tmwatli xre7t hjonli

drutta Lavandula latifolia is an evergreen Shrub growing to 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in saline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

ckakta Edible Parts: Edible Uses: CondimentLeaves - raw[2, 15]. Used as a condiment in salads[177]. Very aromatic[7], they cannot be eaten in quantity[K]. An essential oil from the flowers is used as a food flavouring[183].

tcanta Essential Incense Pot-pourri RepellentAn essential oil is obtained from the flowers - used in soap making, perfumery, food flavouring, veterinary medicines, porcelain painting etc[46, 61]. This species yields up to three times the quantity of essential oil than is obtained from *L. angustifolia*, but the quality is inferior to that species[4, 11, 171]. When growing the plant for its essential oil content, it is best to harvest the flowering stems as soon as the flowers have faded[245]. The aromatic leaves and flowers are used as an insect repellent in the linen cupboard etc[46, 61]. They are also used in pot-pourri[245] and are said to repel mice[20]. The flowering stems, once the flowers have been removed for use in pot-pourri etc, can be tied in small bundles and burnt as incense sticks[245].

dwatta Abortifacient Antibacterial Antiseptic Antispasmodic Aromatherapy Carminative EmmenagogueSpike lavender has similar medicinal properties to common lavender (*L. angustifolia*). It yields more essential oil than that species but is of inferior quality[254]. The flowering stems, and the essential oil obtained from them, is abortifacient, antibacterial, antiseptic, antispasmodic, carminative and emmenagogue[46, 61, 254]. They can be used in all the ways that common lavender is used, externally to treat wounds,

## 7.2.365 Coprosma rugosa

6 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 3 m hkuc

hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprkl hpa7tmwatli nyshhjen hjonli

drutta Coprosma rugosa is an evergreen Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year; in flower from January to February, and the seeds ripen from August to October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

ckakta Edible Parts: FruitEdible Uses: CoffeeFruit - raw or cooked. Freely produced in Britain, it is sweet but with little flavour[225]. The fruit is white or blue and about 8mm long x 6mm wide[200, 225]. The roasted seed is an excellent coffee substitute[153].

tcanta Dye Hedge HedgeTolerant of heavy trimming, the plant makes a good hedge[225]. A yellow dye is obtained from the wood, it does not require a mordant[153].

dwatta None known

propta Seed - probably best sown as soon as it is ripe in a greenhouse or cold frame[K]. Sow stored seed in spring in a cold frame[200]. Germination can be slow, often taking more than 12 months even when fresh seed is used[K]. When the seedlings are large enough to handle, prick them out into individual pots. Grow on the plants for at least their first winter in a greenhouse and plant out in late spring or early summer. Give the plants some protection from the cold for their first winter outdoors[K]. Cuttings of mature wood of the current year's growth, autumn in a frame.

nwatta Requires a moist, very well-drained neutral to slightly acid soil in full sun or light shade[200]. Succeeds in moist soils[225]. Somewhat intolerant of frost, this species is only likely to succeed outdoors in the mildest areas of Britain[200]. Another report says that it is quite hardy in Britain[225]. Hybridizes freely with other members of this genus[200, 225]. Plants are tolerant of heavy clipping or pruning[225]. Plants are normally dioecious, though in some species the plants produce a few flowers of the opposite sex before the main flowering and a few hermaphrodite flowers are sometimes produced[225]. Male and female plants must usually be grown if seed is required.

## 7.2.366 Vaccinium sprengelii

6 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 3 m hkuc

hmimhtut cyutli tcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta Vaccinium sprengelii is an evergreen Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

ckakta Edible Parts: Fruit LeavesEdible Uses: Fruit - raw or cooked[177]. The fruit is about 5mm in diameter[200]. Leaves[177]. No more details are given.

tcanta None known

dwatta None known

propta Seed - sow late winter in a greenhouse in a lime-free potting mix and only just cover the seed[78]. Stored seed might require a period of up to 3 months cold stratification[113]. Another report says that it is best to sow the seed in a greenhouse as soon as it is ripe[200]. Once they are about 5cm tall, prick the seedlings out into individual pots and grow them on in a lightly shaded position in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 8cm with a heel, August in a frame[78]. Slow and difficult. Layering in late summer or early autumn[78]. Another report says that

spring is the best time to layer[200]. Takes 18 months[78]. Division of suckers in spring or early autumn[113].

nwatta Requires a moist but freely-draining lime free soil, preferring one that is rich in peat or a light loamy soil with added leaf-mould[11, 200]. Prefers a very acid soil with a pH in the range of 4.5 to 6, plants soon become chlorotic when lime is present. Succeeds in full sun or light shade though it fruits better in a sunny position[200]. Requires shelter from strong winds[200]. Dislikes root disturbance, plants are best grown in pots until being planted out in their permanent positions[200]. A polymorphic species[109], it is closely related to *V. dulcoulxii*[182]. Plants are deciduous in cold climates[200]. Plants in this genus are notably resistant to honey fungus[200].

## 7.2.367 Rheum officinale

Chinese Rhubarb

6 tlin 9 cyuc 1 kcaak 0 tcan 3 dwat 2 m hkuc

hmimhtut cyutli tcup hwicli jlutnykifrip hpa7tli flatprklwis hpa7tmwatli xre7t hjonli

drutta Rheum officinale is a PERENNIAL growing to 2 m (6ft) by 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to July, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

ckakta Edible Parts: StemEdible Uses: RutinLeaf stem - cooked or raw[177, 178]. Rather medicinal[105]. One report says that the plant contains 1.3% rutin[240]. It does not specify which part of the plant, though it is likely to be the leaves[K].

tcanta Plants can be grown for ground cover when spaced about 1.8 metres apart each way[208].

dwatta Anticholesterolemic Antiseptic Antispasmodic Antitumor Aperient Astringent Chologogue Diuretic Stomachic TonicRhubarb has a long and proven history of herbal usage, its main effect being a positive and balancing effect upon the whole digestive system. It is one of the most widely used herbs in Chinese medicine[218, 238]. The root is anticholesterolemic, antiseptic, antispasmodic, antitumor, aperient, astringent, chologogue, demulcent, diuretic, laxative, purgative, stomachic and tonic[4, 147, 171, 176, 218, 238]. The roots contain anthraquinones, which have a purgative effect, and also tannins and bitters, which have an opposite astringent effect[244]. When taken in small doses, it acts as an astringent tonic to the digestive system, whilst larger doses act as a mild laxative[232, 244]. The root is taken internally in the treatment of chronic constipation, diarrhoea, liver and gall bladder complaints, haemorrhoids, menstrual problems and skin eruptions due to an accumulation of toxins[238]. This remedy is not prescribed for pregnant or lactating women, nor for patients with intestinal obstruction[238]. Externally, the root is used in the treatment of burns[238]. The roots are harvested in October from plants that are at least six years old, they are then dried for later use[4]. A homeopathic remedy is prepared from the dried root[232]. This is used especially in the treatment of diarrhoea in teething children[232].

propta Seed - best sown in autumn in a shaded cold frame[200]. The seed can also be sown in spring in a cold frame. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse or cold frame for their first winter, planting them out in the spring. Division in early spring or autumn[1, 111]. Divide up the rootstock with a sharp spade or knife, making sure that there is at least one growth bud on each division. Larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Prefers a deep, fertile, moderately heavy, humus rich, moisture retentive, well-drained soil in sun or semi-shade[200]. Grows well in heavy clay soils. Plants can be grown in quite coarse grass, which can be cut annually in the autumn[233]. Hardy to about -20°C[200]. A very ornamental

plant is extremely vigorous and essentially disease and pest free[269]. Qing Hao is a determinate short-day plant. Non-juvenile plants are very responsive to photoperiodic stimulus and flower about two weeks after induction. The critical photoperiod seems to be about 13.5 hours, but there are likely to be photoperiod x temperature interactions. In Lafayette Indiana, USA (40°21'N) plants flower in early September with mature seeds produced in October. The plant is not adapted to the tropics because flowering will be induced when the plants are very small[269]. Most collections of artemisia derive from natural stands with highly variable artemisinin content, some as low of 0.01%. Selections from Chinese origin vary from 0.05 to 0.21%. Swiss researcher N. Delabays reports a clonal selection derived from Chinese material which produces 1.1% artemisin but is very late flowering; proprietary hybrids had been obtained with somewhat lower content but flower earlier[269]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 7.2.362 Ilex coriacea

Large Gallberry  
6 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 3 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikklwis hpa7tmwatli nyanhjen hjonli

drutta Ilex coriacea is an evergreen Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from April to May, and the seeds ripen in October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit[43]. No more details are given but I would have some doubts on the wholesomeness of the fruit[K].The fruit is about 6 - 10mm in diameter[200].

tcanta None known  
dwatta None known  
propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. It can take 18 months to germinate. Stored seed generally requires two winters and a summer before it will germinate and should be sown as soon as possible in a cold frame. Scarification, followed by a warm stratification and then a cold stratification may speed up the germination time[78, 80]. The seedlings are rather slow-growing. Pot them up into individual pots when they are large enough to handle and grow them on in light shade in a cold frame for their first year. It is possible to plant them out into a nursery bed in late spring of the following year, but they should not be left here for more than two years since they do not like being transplanted. Alternatively, grow them on in their pots for a second season and then plant them out into their permanent positions in late spring or early summer. Give them a good mulch and some protection for their first winter outdoors. Cuttings of almost ripe wood with a heel, August in a shaded position in a cold frame. Leave for 12 months before potting up. Layering in October. Takes 2 years.

nwatta Succeeds in most soils that are not water-logged[200]. Resents root disturbance, especially as the plants get older[11]. It is best to place the plants into their permanent positions as soon as possible, perhaps giving some winter protection for their first year or two[K]. This species is closely related to *I. glabra*[43]. Flowers are produced on the current year's growth[229]. Plants are very tolerant of pruning and can be cut right back into old wood if required[188]. Dioecious. Male and female plants must be grown if seed is required.

## 7.2.363 Lindera umbellata

6 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 3 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli frusflat hpa7tmwatli nyanhjen hjonli

drutta Lindera umbellata is a deciduous Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy

to UK zone 7. It is in flower from April to May. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: OilEdible Uses: Condiment OilThe decoction is poured over rice or millet and eaten[105, 177]. We have no more details.

tcanta OilAn oil obtained from the seed is used for lighting[61].

dwatta None known  
propta Seed - best sown as soon as it is ripe in the autumn in a greenhouse. The seed has a short viability and should not be allowed to dry out[200]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in early summer. Cuttings of half-ripe wood, July in a frame[200]. Layering.

nwatta Requires a lime-free rather moist soil[200]. Prefers partial shade or dappled sunlight in a fertile moisture-retentive soil enriched with leafmould[200]. Succeeds in full sun or semi-shade[182, 184]. Hardy to about -15°c[184]. Plants can be pruned right back to the base if required, though any drastic pruning is best spread over several seasons[200]. Plants in this genus are notably resistant to honey fungus[200]. Dioecious, male and female plants must be grown if seed is required.

## 7.2.364 Sasamorph borealis

6 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 3 m hkuc  
hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikklwis hpa7tmwatli xre7t hjonli

drutta Sasamorph borealis is an evergreen Bamboo growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: Seed - cooked. It is used as a cereal[177]. The seed is only produced at intervals of several years.

tcanta None known  
dwatta None known

propta Seed - if possible, surface sow the seed as soon as it is ripe in a greenhouse at about 20°c. Stored seed is best sown as soon as it is received. Do not allow the compost to dry out. Germination usually takes place fairly quickly so long as the seed is of good quality, though it can take 3 - 6 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a lightly shaded place in the greenhouse until large enough to plant out, which could be a few years. Plants only flower at intervals of several years and so seed is rarely available. Division in late spring as new growth commences. Take divisions with at least three canes in the clump, trying to cause as little root disturbance to the main plant as possible. Grow them on in light shade in a greenhouse in pots of a high fertility sandy medium. Mist the foliage regularly until plants are established. Plant them out into their permanent positions when a good root system has developed, which can take a year or more[200].

nwatta Requires a good humus rich loam with ample moisture in the growing season[200]. Prefers partial shade, growing well in thin woodland. This species is notably resistant to honey fungus[200]. Plants only flower at intervals of many years. When they do come into flower most of the plants energies are directed into producing seed and consequently the plant is severely weakened. They sometimes die after flowering, but if left alone they will usually recover though they will look very poorly for a few years. If fed with artificial NPK fertilizers at this time the plants are more likely to die[122]. The rhizome is gently running. This species is liable to be mistaken for *Pseudosasa japonica*[200].

burns, insect stings etc and internally to treat digestive disorders[254]. The essential oil is used in aromatherapy. Its keyword is 'Immune system'[210].

propta Seed - sow spring in a greenhouse and only just cover the seed[4]. It usually germinates in 1 - 3 months at 15°c. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse or cold frame for their first winter, planting them out in late spring after the last expected frosts. Cuttings of half-ripe wood 7 - 10cm with a heel, July/August in a frame. Usually very east, a high percentage will root within a few weeks[78]. Grow them on in the greenhouse for their first winter and plant them out in late spring after the last expected frosts. Cuttings 7cm with a heel succeed at almost any time of the year[1]. Layering.

nwatta Succeeds in almost any soil so long as it is well-drained and not too acid[1, 200]. Prefers a sunny position in a neutral to alkaline soil[14, 200]. Prefers a light warm dry soil[37]. When grown in rich soils the plants tend to produce more leaves but less essential oils[4]. Very tolerant of salt wind exposure. Established plants are drought tolerant[190]. When growing for maximum essential oil content, the plant must be given a very warm sunny position and will do best in a light sandy soil, the fragrance being especially pronounced in a chalky soil[245]. This species of lavender is cultivated for its essential oil in S. France and England[46, 61]. It is very closely related to *L. angustifolia* but perhaps not so hardy, tolerating temperatures down to about -10°c[11, 200]. Plants are not very long-lived and soon become straggly unless pruned. Any trimming of the plant is best done in spring and should not be done in the autumn since this can encourage new growth that will not be very cold-hardy[200]. A good bee plant[7, 24], also attracting butterflies and moths[30]. A good companion for most plants[54], growing well with cabbages[14].

## 7.2.286 Micromeria chamissonis

Yerba Buena  
6 tlin 9 cyuc 2 kcaak 2 tcan 2 dwat 0.1 m hkuc  
hmimhtut cyutli kyuctup hwicli hyishrasjlut hpa7tli flatprikklwis hpa7tmwatli xre7t hjonli

drutta Micromeria chamissonis is a PERENNIAL growing to 0.1 m (0ft 4in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Edible Uses: TeaThe dried leaves, steeped in boiling water, make a palatable mint-flavoured tea[183, 207, 256, 257]. The dried leafy spines are used according to other reports[161, 177].

tcanta EssentialThe leaves have been placed in clothing as a perfume[257]. A dynamic accumulator gathering minerals or nutrients from the soil and storing them in a more bioavailable form - used as fertilizer or to improve mulch.

dwatta Anthelmintic Aphrodisiac Blood purifier Digestive Febrifuge Kidney Sedative TonicThe whole plant is aphrodisiac, blood purifier, mildly digestive, febrifuge, sedative and tonic[207, 256, 257]. An infusion can be used in the treatment of insomnia, colic, upset stomachs, kidney problems, colds and fevers[257]. A decoction of the plant has been used to get rid of pinworms[271]. The decoction has also been used as an aphrodisiac[257]. A poultice of the warm leaves have been applied to the jaw, or the plant held in the mouth, as a treatment for toothache[257].

propta Seed - sow spring in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Basal cuttings in early summer. Harvest the shoots with plenty of underground stem when they are about 8 - 10cm above the ground. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer. Division of the rooted prostrate stems in the spring.

nwatta Prefers an open position in a well-drained soil[1]. Succeeds in poor soils[200]. Plants grow best and live longer when grown in an open sunny position and a dry sandy soil[245]. A prostrate plant, the stems forming roots at the leaf axils wherever they come into contact with the soil[245]. The bruised leaves release a most refreshing lemony scent resembling verbenal[245]. *Micromeria chamissonis* (Benth.) Greene is a synonym of *Micromeria douglasii* Benth. *Satureja douglasii* (Benth.) Briq. is a synonym of *Micromeria douglasii* Benth. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. An evergreen. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

## 7.2.287 Podocarpus lawrencei

6 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 10 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli nyanhjen hjonli

drutta Podocarpus lawrencei is an evergreen Tree growing to 10 m (32ft 10in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, and the seeds ripen in October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. It is rather small but has a pleasant slightly sweet flavour with a mucilaginous texture[K]. The fruit is about 6 x 5 mm[200].

tcanta None known  
dwatta None known

propta The seed can be sown at any time of the year in a sandy soil in a warm greenhouse, though it is probably best sown as soon as it is ripe[1]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe terminal shoots, 5 - 10cm long, July/August in a frame[78].

nwatta Prefers a rich moist non-alkaline soil[167]. Grows best in sheltered areas with a humid climate[200]. Plants in this genus are notably resistant to honey fungus[200]. There is some confusion over this species, the Flora of Australia says that it is endemic to Australia[286], whilst our other records say that it is a New Zealand plant[200]. Dioecious. Male and female plants must be grown if seed is required.

## 7.2.288 Lycoris squamigera

Resurrection Lily, Hardy Amaryllis, Magic Lily, Autumn Lycoris, Naked Lady  
6 tlin 10 cyuc 2 kcaak 0 tcan 0 dwat 0.7 m hkuc  
htut cyutli tcup hwicli hrasjlut hpa7tli flatprikklwis hpa7tmwatli xre7t hjonli

drutta Lycoris squamigera is a BULB growing to 0.7 m (2ft 4in) by 0.2 m (0ft 8in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from August to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Bulb - cooked. It is used as a source of starch[105, 177]. The bulb is 4cm in diameter[200]. Caution is advised, see the notes above on toxicity.

tcanta None known  
dwatta None known

propta The seed is best sown as soon as it is ripe in a greenhouse and should germinate in the spring[200]. Sow the seed thinly so that it does not need to be disturbed for

its first year of growth. Give an occasional liquid feed during the growing season to ensure the plants do not become nutrient deficient. Pot up the small bulbs when the plants become dormant, placing 2 bulbs in each pot. Grow them on for another 2 years in the greenhouse before planting them out when they are dormant. Division of offsets in the dormant season[200].

nwatta Landscape Uses:Border, Container, Foundation, Massing, Rock garden, Seashore, Specimen. Requires a deep well-drained sandy soil rich in organic matter in full sun[200]. The bulb should be planted quite shallowly so that it can ripen well after flowering[245]. Hardy to at least -15°C, the leaves are produced in early spring and persist until late summer[200]. Plants need a warm period in late summer in order to ripen the bulbs and induce flowering in the following year[188]. A very ornamental species, each bulb producing a number of flowering stems in mid to late summer[245]. The flowers are very sweetly scented, the scent pervading the whole garden[245]. Plants are attractive to slugs and need to be protected from them[200]. Very sensitive to root disturbance, the bulbs can take some years to become well established[200]. Special Features:Not North American native, Naturalizing, Suitable for cut flowers, Fragrant flowers, Attractive flowers or blooms.

## 7.2.289 Centaurea depressa

Iranian knapweed

6 tin 9 cyuc 2 kcaak 0 tcan 0 dwat 0.3 m hkuc htut cyutli hqatkyuctcup hwicli hyishrasjlutnyk hpa7tli flatprikhwisslip hpa7tmwatli wfyfkr7t hjonli

drutta Centaurea depressa is a ANNUAL/PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcaakta Edible Parts: RootEdible Uses: Root - cooked. An agreeable flavour[2, 105].

tcanta None known dwatta None known

propta Seed - sow April in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out into their permanent positions in the summer. The seed can also be sown as soon as it is ripe in the late summer in a greenhouse and planted out in the late spring. Division in autumn. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the summer or following spring. This should be done at least once every three years in order to maintain the vigour of the plants. Basal cuttings in spring. Harvest the shoots when they are about 10 - 15cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Succeeds in ordinary garden soil[1, 200]. Prefers a well-drained fertile soil and a sunny position[200]. Tolerates dry, low fertility and alkaline soils[200]. A very ornamental plant[1]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 7.2.290 Codonopsis ussuriensis

6 tin 9 cyuc 2 kcaak 0 tcan 0 dwat 0.3 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Codonopsis ussuriensis is a PERENNIAL growing to 0.3 m (1ft) by 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from June to October, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable

pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: RootEdible Uses: Root - raw or cooked[46, 61, 105]. Plants produce a stout, globose tuber[275]. The ones we grew were quite thin, but they have a reasonable flavour with a slight sweetness[K].

tcanta None known dwatta None known propta Seed - surface sow in spring to early summer in an ericaceous compost in a greenhouse. Do not allow the compost to dry out. The seed usually germinates in 1 - 6 weeks at 20°C[164]. Prick out the seedlings into individual pots as soon as they are large enough to handle and grow them on in a greenhouse for their first winter. Plant out in late spring or early summer and protect them from slugs until the plants are well established[K]. Division in spring, with care, since the plant resents root disturbance[200]. We have found it best to take small divisions that are teased out from the sides of the main clump so as to avoid the least possible disturbance to the plants and to avoid having to dig up the clump. These small divisions need to be potted up and placed in light shade in a greenhouse until they are rooting well. They can be planted out into their permanent positions in the summer if they are large enough, otherwise in the following spring[K].

nwatta Prefers a well-drained fertile light soil in full sun or semi shade[1, 200]. Only succeeds in full sun if the soil remains moist during the growing season[200]. Prefers a slightly acid soil[164]. Dormant plants are hardy to about -20°C[187]. The young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. This plant is considered to be a part of *C. lanceolata* by many botanists[200]. Plants resent root disturbance and should be planted out into their permanent position as soon as possible[164]. Plants are very susceptible to the ravages of slugs. The young shoots in spring are particularly at risk, though older growth is also eaten[K].

## 7.2.291 Passiflora x colvillii

Passion Flower

6 tin 9 cyuc 2 kcaak 0 tcan 0 dwat 10 m hkuc htut cyutli tcup hwicli hrasjlutnyk hpa7tli flatprikwiv hpa7tmwatli xre7t hjonli

drutta Passiflora x colvillii is an evergreen Climber growing to 10 m (32ft) by 10 m (32ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower from June to September, and the seeds ripen from September to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcaakta Fruit - raw or cooked[262].

tcanta None known dwatta None known

propta Pre-soak the seed for 12 hours in warm water and then sow late winter or early spring in a warm greenhouse. If sown in January and grown on fast it can flower and fruit in its first year[88]. The seed germinates in 1 - 12 months at 20°C. Prick out the seedlings into individual pots when they are large enough to handle. If you are intending to grow the plants outdoors, it is probably best to keep them in the greenhouse for their first winter and plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Mulch the roots well in late autumn to protect them from the cold. This species is a hybrid and, as such, will not breed true from seed. Cuttings of young shoots, 15cm with a heel, in spring[1]. Leaf bud cuttings in spring. Cuttings of fully mature wood in early summer. Takes 3 months. High percentage[3].

nwatta Requires a well-drained soil with plenty of moisture in the growing season, otherwise it is not fussy[1, 200]. Dislikes highly alkaline soils[202]. Hardy to about -15°C, if plants are cut down to the ground by frost they can regenerate from the base[200]. It is best to apply a good mulch to the roots each winter in order to protect them from the cold[262]. Very fast growing[111]. Roots of outdoor grown plants should be restricted to encourage fruiting[1]. Plants

Plants are often slow to get established. Plants can be susceptible to attacks by caterpillars[182] and are often damaged during the flowering season[11]. They are also a host of the sugar beet fly[49]. This species is notably resistant to honey fungus[200]. Special Features: Not North American native, Naturalizing, Inconspicuous flowers or blooms.

## 7.2.359 Cocculus orbiculatus

Queen coralbead

6 tin 9 cyuc 1 kcaak 0 tcan 2 dwat 4 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyk hpa7tli flatprikwiv hpa7tmwatli hjonli

drutta Cocculus orbiculatus is a deciduous Climber growing to 4 m (13ft 1in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in August, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Leaves RootEdible Uses: Leaves - cooked. An emergency food, it is used when all else fails[177]. One report says that the root might be edible[177].

tcanta Basketry InsecticideThe bleached tendrils are used as an ornamental infill in basket making[46, 61]. The plant contains cocculoidine which has insecticidal activity[218].

dwatta Anodyne Antiasthmatic Antiphlogistic Antirheumatic Carminative Depurative Diuretic VermifugeThe root is anodyne, antiphlogistic, antirheumatic, carminative, depurative, diuretic and vermifuge[147, 176, 218]. It is used in the treatment of rheumatic arthritis, oedema and oliguria[176]. It has also shown antibacterial and anti-amoebic activity[176]. A decoction of the stems is used in the treatment of asthma, bronchitis and paralysis[218].

propta Seed - we have no details for this species but suggest sowing the seed as soon as it is ripe in a greenhouse. Sow stored seed as soon as possible in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out in late spring or early summer, after the last expected frosts. Root cuttings in December in a greenhouse[200]. Division in the dormant season. Cuttings of half-ripe wood, July/August in a frame[200].

nwatta Easily cultivated in an ordinary garden soil[1], it prefers a well-drained moisture retentive fertile soil in full sun or semi-shade[200]. Plants only fruit well when grown in full sun[219]. This species is hardy to about -10°C[200]. Plants climb by means of twining around supports[219]. They do not normally require pruning[219]. Closely related to *C. carolinus*[200].

## 7.2.360 Alangium platanifolium

Alangium

6 tin 10 cyuc 1 kcaak 0 tcan 1 dwat 3 m hkuc htut cyutli tcup hwicli hrasjlutnyk hpa7tli flatprikwiv hpa7tmwatli xre7t hjonli

drutta Alangium platanifolium is a deciduous Shrub growing to 3 m (9ft) by 2 m (6ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from June to July. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcaakta Edible Parts: LeavesEdible Uses: Young leaves - cooked[177].

tcanta InsecticideThe leaves and the bark of the root are used as an insecticide[178]. The leaves and stem bark according to another report[218].

dwatta AntirheumaticThe root is used in the treatment of rheumatism and other bone diseases[218].

propta Seed - we have no details for this species but suggest sowing the seed in a greenhouse in the spring. When

large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out in early summer and consider giving them some protection from the cold for their first winter outdoors. Cuttings of half-ripe wood, July/August in sand in a frame[200]. Users feedback: I collected the seeds in late summer, stored them at a dark and dry location and followed a normal stratification procedure from November till January (November and January at around 2°C, December at around -12°C, all in my fridge). Germination appears to start at the earliest after three weeks, how long it usually takes I will know in a couple of weeks (it's just one early bird that broke through the surface today).

Luckily, no trickery is required: it's sufficient to clean them up, soak them in water before and after stratification and pop them into the moist soil. OW

nwatta Succeeds in any moderately fertile well-drained soil[200]. Requires full sun and a sheltered position[182, 200]. A fairly hardy plant[1], but it does not succeed outdoors at Kew, the soft pity shoots being cut back by winter cold[11]. It grows well in Gloucestershire[11, 182]. This species is closely related to *A. chinense*[200].

## 7.2.361 Artemisia annua

Qing Hao, Sweet sagewort

6 tin 9 cyuc 1 kcaak 2 tcan 4 dwat 3 m hkuc hmimhtut cyutli kyuctcup hwicli hyishrasjlut hpa7tli flatprikwiv hpa7tmwatli xre7t hjonli

drutta Artemisia annua is a ANNUAL growing to 3 m (9ft) by 1 m (3ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from August to September, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcaakta Edible Parts: Edible Uses: CondimentAn essential oil in the leaves is used as a flavouring in spirits such as vermouth[269].

tcanta Essential Herbicide MiscellanyThe plant is used in China as a medium for growing Aspergillus which is used in brewing wine. The substances mentioned above in the medicinal uses, used in the treatment of malaria, also show marked herbicidal activity[222]. The plant yields 0.3% essential oil[240]. This has an agreeable, refreshing and slightly balsamic odour and has been used in perfumery[240].

dwatta Antibacterial Antiperiodic Antiseptic Carminative Digestive Febrifuge Malaria MiscellanyQing Ho, better known in the West as sweet wormwood, is a traditional Chinese herbal medicine. An aromatic anti-bacterial plant, recent research has shown that it destroys malarial parasites, lowers fever and checks bleeding[238, 254, 279]. It is often used in the Tropics as an affordable and effective anti-malarial[254]. The leaves are antiperiodic, antiseptic, digestive, febrifuge[176, 178]. An infusion of the leaves is used internally to treat fevers, colds, diarrhoea etc[222, 254]. Externally, the leaves are poulticed onto nose bleeds, boils and abscesses[222, 238]. The leaves are harvested in the summer, before the plant comes into flower, and are dried for later use[254]. The plant contains arteeminin, this substance has proved to be a dramatically effective anti-malarial against multi-drug resistant Plasmodium spp[218, 238, 254, 269]. Clinical trials have shown it to be 90% effective and more successful than standard drugs[254]. In a trial of 2000 patients, all were cured of the disease[218]. The seeds are used in the treatment of flatulence, indigestion and night sweats[222].

propta Seed - sow spring in a cold frame and plant out in late spring or early summer. Alternatively, the seed can be sown late spring in situ.

nwatta An easily grown plant, succeeding in a well-drained circumneutral or slightly alkaline loamy soil, preferring a sunny position[1, 200]. Plants are longer lived, more hardy and more aromatic when they are grown in a poor dry soil[245]. A fast-growing annual plant, it is tall but neat in habit with a handsome fragrant foliage and is useful for filling gaps at the back of a border[238]. It has become a weed of waste places in many areas of the world[43]. The

(loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**kcakta Edible Parts:** Fruit Oil OilEdible Uses: Oil OilThis species has the same uses as the closely related *C. sanguinea*[74]. These uses are listed below. Fruit - raw or cooked[105]. A bitter flavour, it can also have an emetic effect on the body[1, 7, 11]. It is not worthwhile[115]. The fruit is about 5mm in diameter[200]. An oil is obtained from the seed[2], it is edible when refined[75].

**tcanta Basketry Charcoal Dye Fuel Hedge Hedge Oil Wood**This species has the same uses as the closely related *C. sanguinea*[74]. These uses are listed below:- The seed contains 45% of a non-drying oil[74], it is used in soap making and lighting[7, 13, 100, 115, 177]. A non-drying oil is also obtained from the pericarp, it is used for lighting[74]. The pericarp contains 19 - 35% oil[74]. A greenish-blue dye is obtained from the fruit[13, 74]. The young stems are very flexible and are used in basketry[7, 13, 74, 100]. Wood - tough, hard. Used for small items such as tool handles, turnery etc[11, 61, 115]. A good quality charcoal is obtained from the wood[115], the wood also makes an excellent fuel[115].

**dwatta None known**  
**propta Seed** - best sown as soon as it is ripe in a cold frame or in an outdoors seedbed if there is sufficient seed[80, 113]. The seed must be separated from the fruit flesh since this contains germination inhibitors[80, 164]. Stored seed should be cold stratified for 3 - 4 months and sown as early as possible in the year[164]. Scarification may also help as may a period of warm stratification before the cold stratification[80, 164]. Germination, especially of stored seed, can be very slow, taking 18 months or more[164]. Prick out the seedlings of cold-frame sown seeds into individual pots as soon as they are large enough to handle and grow the plants on for their first winter in a greenhouse, planting out in the spring after the last expected frosts. Cuttings of half-ripe side shoots, July/August in a frame. Cuttings of mature wood of the current year's growth, taken with a heel if possible, autumn in a cold frame. High percentage[78]. Layering of new growth in June/July. Takes 9 months[78].

**nwatta** An easily grown plant, it succeeds in any soil of good or moderate fertility[1], ranging from acid to shallow chalk[200]. Grows well in heavy clay soils. Succeeds in full sun or light shade[188]. This species is closely related to *C. sanguinea*[11]. Plants in this genus are notably resistant to honey fungus[200].

## 7.2.357 *Cornus poliophylla*

6 tin 9 cyuc 1 kcaak 0 tcan 2 dwat 4 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyikfrp hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

**drutta** *Cornus poliophylla* is a deciduous Shrub growing to 4 m (13ft 1in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**kcakta Edible Parts:** FruitEdible Uses: The following notes are for *C. macrophylla*, they quite probably also apply to this closely related species[K]. Fruit - raw or cooked[2, 105, 146, 158, 200, 218]. The fruit is about 6mm in diameter[200].

**tcanta Wood**The following notes are for *C. macrophylla*, they quite probably also apply to this closely related species[K]. Wood - hard, close grained, warps badly[158]. It makes a good charcoal[146, 158].

**dwatta Anodyne Astringent Dysentery Tonic**The following notes are for *C. macrophylla*, they quite probably also apply to this closely related species[K]. Anodyne, astringent, tonic[178]. The wood is anodyne and a uterosecative[218]. The stem bark is used in the treatment of dysentery[218].

**propta Seed** - best sown as soon as it is ripe in a cold frame or in an outdoors seedbed if there is sufficient seed[80, 113]. The seed must be separated from the fruit flesh since this contains germination inhibitors[80, 164]. Stored seed should be cold stratified for 3 - 4 months and sown as early

as possible in the year[164]. Scarification may also help as may a period of warm stratification before the cold stratification[80, 164]. Germination, especially of stored seed, can be very slow, taking 18 months or more[164]. Prick out the seedlings of cold-frame sown seeds into individual pots as soon as they are large enough to handle and grow the plants on for their first winter in a greenhouse, planting out in the spring after the last expected frosts. Cuttings of half-ripe side shoots, July/August in a frame. Cuttings of mature wood of the current year's growth, taken with a heel if possible, autumn in a cold frame. High percentage[78]. Layering of new growth in June/July. Takes 9 months[78].

**nwatta** An easily grown plant, it succeeds in any soil of good or moderate fertility[1], ranging from acid to shallow chalk[200]. Grows well in heavy clay soils. Succeeds in full sun or light shade[188]. This species is closely related to *C. monbeigii*[1, 200]. Plants in this genus are notably resistant to honey fungus[200].

## 7.2.358 *Euonymus japonicus*

Japanese Spindle Tree, Box-leaf Euonymus, Evergreen Euonymus, Japanese Euonymus

6 tin 9 cyuc 1 kcaak 0 tcan 1 dwat 4.5 m hkuc hmimhtut cyutli kyucutp hwicli hrasljutnyikfrp hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

**drutta** *Euonymus japonicus* is an evergreen Shrub growing to 4.5 m (14ft) by 2 m (6ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

**kcakta Edible Parts:** LeavesEdible Uses: ColouringY-oung leaves - boiled[2, 177, 183]. The old leaves are powdered and used to colour food[105, 177, 183]. These reports should be treated with some caution due to the report of toxicity - see above.

**tcanta Hedge Hedge LatexRoots** and stems yield up to 7% gutta-percha, a non elastic rubber used as an electrical insulator and in making plastics etc[61, 74, 103]. Can be grown as a hedge, it is very tolerant of trimming and succeeds in severe maritime exposure[11, 75, 200].

**dwatta Antirheumatic Diuretic Tonic Women's complaints**The stem bark is antirheumatic, diuretic and tonic[218]. The leaf is used in cases of difficult delivery[218].

**propta Seed** - best sown as soon as it is ripe in a cold frame[121]. Stored seed requires 3 months cold stratification, so should be sown as early in the year as possible in a cold frame[113]. Seed can take 18 months to germinate[74]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 7cm long taken at a node or with a heel, July/August in a frame. Very easy[200]. Cuttings of mature wood, October in a frame[78, 113]. Cuttings will root readily at any time of the year if given bottom heat[1]. Root cuttings in winter.

**nwatta Landscape Uses:**Border, Container, Foundation, Hedge, Massing, Screen, Specimen, Woodland garden. Thriving in almost any soil, including chalk and sandy soils, it is particularly suited to dry shaded areas[200]. Grows well in heavy clay soils. Shade tolerant but does not fruit well in such a position[11]. Prefers a well-drained loamy soil[11]. Plants are very tolerant of maritime exposure, succeeding even when grown on the sea shore[166], but they can be killed by cold drying winds[75, 184]. A very ornamental plant[1], there are a number of named varieties[184]. It is only hardy in S. England[11] tolerating temperatures down to about -10°C[184]. Plants are more likely to succumb to the cold if they are regularly trimmed (this exposes young growth to the cold), this regular trimming also leads to mildew especially when plants are growing in very dry ground[182]. The Japanese spindle tree is cultivated in Russia and Spain for the latex contained in the root. It is best grown in a dry soil and an open position when being grown for its latex[61, 74].

produce tendrils and climb by attaching these to other plants. If fruit is required, especially when the plant is grown indoors, it is best to hand pollinate using pollen from a flower that has been open for 12 hours to pollinate a newly opened flower before midday[88, 200]. The flowers open in sunny weather and do not open on dull cloudy days[219]. Plants are very tolerant of pruning and can be cut back to ground level if required to rejuvenate the plant[202]. Any pruning is best carried out in the spring[219]. Plants in this genus are notably resistant to honey fungus[200].

## 7.2.292 *Quercus myrsinaefolia*

6 tin 9 cyuc 2 kcaak 0 tcan 2 dwat m hkuc hmimhtut cyutli tcup hwicli jlutnyik hpa7tli flatprikliw hpa7tmwatli hjonli

**drutta** *Quercus myrsinaefolia* is an evergreen Tree growing to 15 m (49ft) by 8 m (26ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower in June, and the seeds ripen in November. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

**kcakta Edible Parts:** SeedEdible Uses: CoffeeSeed - cooked[105, 177]. The seed is up to 25mm long[200], it can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread. The seed contains bitter tannins, these can be leached out by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute.

**tcanta Repellent Tannin WoodA** mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth[20]. Oak galls are excrescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4].

**dwatta Astringent Dysentery**Any galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4].

**propta Seed** - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

**nwatta** Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Lime tolerant[188]. Young plants tolerate reasonable levels of side shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. Prefers warmer summers than are usually experienced in Britain, trees often grow poorly in this country and fail to properly ripen their wood resulting in frost damage overwinter[200]. The seed ripens in its first year[200]. Plants grown under this name in Britain are often *Q. bambusifolia*, *Q. glauca*, *Q. salicina* or *Q. stenophylla*[200]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. Hybridizes freely with other members of the genus[200]. Plants in this genus are notably resistant to honey fungus[200].

## 7.2.293 *Cyperus longus*

Galینگale  
6 tin 9 cyuc 2 kcaak 0 tcan 1 dwat 1.2 m hkuc hwit cyutli tcuphja7nh56s hwicli hrasljutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

**drutta** *Cyperus longus* is an evergreen Perennial growing to 1.2 m (4ft) by 2 m (6ft 7in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from August to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist or wet soil and can grow in water.

**kcakta Edible Parts:** RootEdible Uses: CondimentTuber - used as a spice in soups, pies and sweets[5, 183].

**tcanta Basketry Essential Paper Weaving**The leaves are used in basketry and for weaving hats, matting etc[100]. The root and stem have the scent of violets and are used in perfumery[4, 46, 61, 245]. The aroma becomes more pronounced when the root has been dried and left to age[245]. A fibre obtained from the plant is used in paper making[100].

**dwatta Aromatic Tonic**The root is an aromatic tonic[4]. It was at one time considered to be a good stomachic and useful in the first stages of dropsy, but it has now fallen into disuse[4, 238].

**propta Seed** - surface sow in the spring and keep the compost moist[164]. The seed usually germinates in 2 - 6 weeks at 18°C[164]. Prick out the seedlings into individual pots as soon as they are large enough to handle. Grow on for their first winter in a greenhouse and plant them out in late spring after the last expected frosts. Division in spring or autumn. Division is simple at almost any time of the year, so long as the roots are not allowed to become dry. Plant them out straight into their permanent positions.

**nwatta** Prefers a moist sandy loam[95, 117]. Succeeds in any good garden soil so long as it does not dry out[162], it also grows well in up to 30cm of water[200]. Plants are hardy to about -15°C[200]. A very ornamental plant[1], though it can spread freely at the roots when well-suit[233]. Galینگale was one of the favourite spices of the medieval kitchen and was an ingredient of 'pokerounce', a kind of medieval cinnamon toast[183]. It is rarely used at present. Both the root and the stem have a sweet moss-like perfume, resembling that of the violet but not so pure. The aroma becomes more fragrant with age[245].

## 7.2.294 *Pulmonaria officinalis*

Lungwort, Common lungwort, Jerusalem Sage, Jerusalem Cowslip

6 tin 9 cyuc 2 kcaak 0 tcan 3 dwat 0.3 m hkuc pcmhmm cyutli hgattcup hwicli hrasljutnyikfrp hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

**drutta** *Pulmonaria officinalis* is an evergreen Perennial growing to 0.3 m (1ft) by 0.3 m (1ft in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in leaf all year, in flower from March to May, and the seeds ripen from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil and can tolerate drought.

**kcakta Edible Parts:** LeavesEdible Uses: Leaves - raw or cooked[2, 7, 8, 9, 105]. They can be added to salads or used as a potherb[183]. A fairly bland flavour but the leaves are low in fibre and make an acceptable addition to mixed salads, though their mucilaginous and slightly hairy texture make them less acceptable when eaten on their own[K]. The young leaves make a palatable cooked vegetable[244], though we have found the texture to be somewhat slimy[K]. The plant is an ingredient of the drink Vermouth[244].

**tcanta** A tolerant and slow growing ground cover plant for open woodland and border edges[197, 200]. Plants should be spaced about 50cm apart each way[208].

**dwatta Astringent Demulcent Diaphoretic Diuretic Emollient Expectorant Homeopathy Ophthalmic Resol-**

ventLungwort has a high mucilage content and this makes it useful in the treatment of chest conditions, being of particular benefit in cases of chronic bronchitis[254]. It combines well with other herbs such as coltsfoot (Tussilago farfara) in the treatment of chronic coughs including whooping cough and can also be taken to treat asthma[254]. The leaves and flowering shoots are astringent, demulcent, diaphoretic, diuretic, emollient, mildly expectorant and resolvent[4, 7, 9, 21, 165]. They are often used for their healing effect in pulmonary complaints[4] and their mucilaginous nature makes them beneficial in treating sore throats[244]. The leaves can also be used externally to stop bleeding[254]. They are harvested in the spring and dried for later use[7]. A distilled water made from the plant is an effective eyewash for tired eyes[7]. A homeopathic remedy is made from the plant[9]. It is used in the treatment of bronchitis, coughs and diarrhoea[4].

propta Seed - sow spring in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring or autumn or after flowering in early summer if the soil is not too dry[200]. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Landscape Uses:Border, Container, Ground cover, Massing, Specimen, Woodland garden. Grows well in any moderately good soil including heavy clay soils[1, 31]. Prefers full to part shade in a moist humus rich soil[200]. Succeeds in the sunless shade of buildings[200]. Plants growing in shady positions tolerate drought if the soil is rich in humus[190]. The leaves tend to wilt in hot weather when the plant is grown in full sun[190]. Hardy to about -20°C[187]. Members of this genus are rarely if ever troubled by browsing deer and rabbits[233]. A valuable early nectar source for bees[200]. There are several named forms, selected for their ornamental value[233]. Hybridizes freely with other members of this genus[200]. Special Features: Not North American native, Extended bloom season in Zones 9A and above.

## 7.2.295 Cistus ladanifer

Labdanum, Common gum cistus

6 tlin 9 cyuc 2 kcaak 0 tcan 2 dwat 1.5 m hkuc hmit cyuti hgatkuyctcup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Cistus ladanifer is an evergreen Shrub growing to 1.5 m (5ft) by 1 m (3ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower in June, and the seeds ripen in August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

kcakta Edible Parts: Manna SeedEdible Uses: Conditment GumSeed - ground into a powder and used with cereal flours in making cakes and breads[177, 183]. An oleo-resin obtained from the leaves and stems is eaten raw or used as a commercial food flavouring in baked goods, ice cream, chewing gum etc2, 105, 177, 183, 238]. The plant is said to yield a sweet manna[183].This report is probably referring to the oleo-resin mentioned above[K].

tcanta Gum ResinThe glandular hairs on the leaves yield the oleo-resin 'ladanum', used medicinally and in soaps, perfumery, fumigation etc[4, 11, 46, 61, 64, 89, 100]. This resin is an acceptable substitute for ambergris (which is obtained from the sperm whale) and so is important in perfume manufacture[238]. The resin is collected by dragging a type of rake through the plant, the resin adhering to the teeth of the rake, or by boiling the twigs and skimming off the resin[64, 89]. Most resin is produced at the hottest time of the year[46].

dwatta Antibiotic Emmenagogue Expectorant StimulantLabdanum is an aromatic, expectorant, stimulant herb that controls bleeding and has antibiotic effects[4, 238]. It is used internally in the treatment of catarrh and diarrhoea[238] and as an emmenagogue[4]. The leaves are harvested in late spring and early summer and can be dried for later use, or the resin extracted from them[238].

propta Seed - gather when ripe and store dry[78]. Surface sow in late winter in a greenhouse[164]. The seed usually germinates in 1 - 4 weeks at 20°C[164]. Prick out the seedlings as soon as they are large enough to handle into individual pots. Grow them on in the greenhouse for their first winter and plant them out in the following spring or early summer, after the last expected frosts[164]. The seed stores for at least 3 years[K]. Cuttings of softish to half-ripe wood, 8cm long with a heel or at a node, June/August in a frame. Roots are formed within 3 weeks[78]. High percentage[78]. Cuttings of almost mature wood, 8 - 12cm with a heel or at a node, September/October in a frame. High percentage[78]. Lift and pot up in the spring, plant out when a good root system has formed[78]. Layering in spring.

nwatta Industrial Crop: Hydrocarbon Management: Coppice Regional CropRequires a sunny position in a well-drained light sandy soil[11, 182], growing well in poor soils[238]. Withstands drought once it is established[11, 190]. Plants are fairly wind resistant[166, K], tolerating maritime exposure[188]. Resents root disturbance[11]. Plants are hardy to about -10c[184], but they require protection in severe winters[11]. Plants are somewhat hardier when grown in poor soils[182]. Individual flowers only last one day but there is a long succession of them[11, 200]. Labdanum dislikes pruning, especially as it gets older and so any formative work should be restricted to removing dead, straggly or damaged growths[238]. The plant also resents root disturbance[200]. Plants should be pot grown and then planted out in their final positions whilst still small. Sometimes cultivated for its gum, which is known as 'Labdanum', this is exuded in such quantity in hot weather that the plant becomes very sticky[4, 61]. The leaves have glandular hairs which produce an aromatic gum. The sweet balsamic smell is most apparent in the summer in the early morning[245]. A very ornamental plant, it is very free-flowering and fast growing[49]. There are a number of named forms developed for their ornamental value[182]. An excellent nurse plant for sheltering young seedlings[49]. This species is notably resistant to honey fungus[88, 200]. The flowers are very attractive to bees[108]. Hybridizes freely with other members of this genus[200].

## 7.2.296 Sorbus species

6 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 10 m hkuc hmimhtut cyuti tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Sorbus species is a deciduous Tree growing to 10 m (32ft) by 7 m (23ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in May, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Fruit - raw or cooked[K]. Up to 15mm in diameter[11].

tcanta None known dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame[78, 80]. If you have sufficient seed it can be sown in an outdoor seedbed[78, 80]. Stored seed germinates better if given 2 weeks warm then 14 - 16 weeks cold stratification[98], so sow it as early in the year as possible. Prick out the seedlings into individual pots when they are large enough to handle. Seedlings are very slow to put on top-growth for their first year or two[11], but they are busy building up a good root system. It is best to keep them in pots in a cold frame for their first winter and then plant them out into their permanent positions in late spring. This is a hybrid and so is unlikely to breed true from seed.

Tonic VermifugeAlthough it has been used medicinally in the past as a sedative and to treat syphilis, box is very rarely used in modern herbalism[268]. The leaves and the bark are alterative, antirheumatic, cathartic, cholagogue, diaphoretic, febrifuge, oxytotic and vermifuge[4, 7, 9, 21, 178]. The leaves have been used as a quinine substitute in the treatment of malaria[7]. The leaves are harvested in the spring, before the plant comes into flower, and they are dried for later use[238]. The bark can be harvested at any time of the year and is dried for use in decoctions[238]. Use this remedy with caution and preferably only under the supervision of a qualified practitioner. The plant has not been fully tested for its toxic side effects[7, 21]. The wood is diaphoretic, in full dose it is narcotic and sedative, in overdose it is convulsant and emetico-cathartic[4]. A tincture of the wood has been used as a bitter tonic and antiperiodic, it has also had a reputation for curing leprosy[4]. A volatile oil distilled from the wood has been prescribed in cases of epilepsy[4]. An essential oil obtained from the plant is used in dentistry[7]. A homeopathic remedy is made from the plant[7]. It is extensively used in the treatment of rheumatism[7].

propta Seed - stratification is not necessary but can lead to more regular germination[113]. The seed is best sown in a cold frame as soon as it is ripe[138]. Sow stored seed as early in the year as possible in a cold frame. It usually germinates in 1 - 3 months at 15°C but stored seed can take longer[138]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter, planting them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of short side shoots with a heel, September in a frame[200]. High percentage[78]. Rather slow to root[K]. Nodal cuttings in spring in a frame. Fairly easy[200].

nwatta Landscape Uses:Container, Foundation, Screen, Woodland garden. Succeeds in almost any soil that is well-drained[11, 200], preferring light shade and chalky soils[9, 11, 28, 31]. Succeeds in dry shade[188]. Tolerates a pH range from 5.5 to 7.4[200]. A very hardy plant, tolerating temperatures down to at least -23°C, though it prefers milder winters[238]. A very polymorphic species, it is a very ornamental but slow growing plant[11] and there are many named varieties developed for their ornamental value[182]. This species is notably resistant to honey fungus[88, 200]. A good bee plant[108]. Plants are very tolerant of being trimmed, they can be cut right back to the base if required and will usually resprout freely[11, 29]. The foliage is pungently scented, especially when wet[245]. Special Features: Attractive foliage, Not North American native, All or parts of this plant are poisonous, Inconspicuous flowers or blooms.

## 7.2.354 Clematis apiifolia

6 tlin 9 cyuc 1 kcaak 0 tcan 2 dwat 5 m hkuc hmimhtut cyuti tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Clematis apiifolia is a deciduous Climber growing to 5 m (16ft) by 5 m (16ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from September to October, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: TeaYoung shoots - cooked and used as a vegetable[105, 177, 183]. Caution is advised, see the notes above on toxicity. The dried leaves are a tea substitute[105, 177]. The roasted leaves are used according to another report[183].

tcanta None known dwatta Carminative Digestive DysenteryAn infusion of the stems is used in the treatment of colic, dysentery, dyspepsia and sweating[218]. The plant is carminative and digestive[218]. It is also used in the treatment of dysentery[218].

propta Seed - best sown as soon as it is ripe in a cold frame[164, 200]. Sow stored seed as soon as it is obtained in a cold frame. Pre-soak the seed for 12 hours in warm water and remove as much of the tail and outer coat as pos-

sible[164]. A period of cold stratification is beneficial[164]. The seed germinates in 1 - 9 months or more at 20°C[164]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for the first winter. Plant out in late spring or early summer, after the last expected frosts. Internodal cuttings of soft to semi-ripe wood, late spring in sandy soil in a frame[200]. Layering of old stems in late winter or early spring[200]. Layering of current seasons growth in early summer[200].

nwatta Prefers a deep moist soil with its roots in the shade and its shoots growing up to the light[164]. Dislikes poorly-drained heavy clay soils, but grows well in clay if grit is added for drainage[11, 200]. Dislikes light sandy soils[11]. Does well on chalk[11]. Succeeds in acid as well as alkaline soils[200]. A twining plant[182], it is fast-growing and is possibly best in the wild garden[202]. The leafstalks wrap themselves around twigs and branches for support. When a side of the stalk touches an object, the growth on that side slows down whilst the other side grows at its normal rate - this causes the leaf stalk to entwine the object it is touching[212]. When planting out, in order to avoid the disease 'clematis wilt', it is best to plant the rootball about 8cm deeper in the soil. This will also serve to build up a good root crown of growth buds[200]. Plants in this genus are notably resistant to honey fungus[200]. Plants seem to be immune to the predations of rabbits[233]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

## 7.2.355 Weigela hortensis

6 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 5 m hkuc hmimhtut cyuti tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Weigela hortensis is a deciduous Shrub growing to 5 m (16ft 5in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to June, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. It can tolerate atmospheric pollution.

kcakta Edible Parts: LeavesEdible Uses: TeaYoung leaves - cooked[105, 177]. A famine food, they are only used when all else fails. A tea is made from the leaves[177].

tcanta None known dwatta None known

propta Seed - we have no information for this species but suggest sowing the seed in a cold frame as soon as it is ripe if this is possible, otherwise in late winter or early spring. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant them out in late spring or early summer. Softwood basal cuttings, 10 - 12cm long, in a sandy soil in a cold frame in early summer[200]. Cuttings of half-ripe wood, 8 - 10 cm with a heel, July/August in a frame[200]. Cuttings of mature wood of the current seasons growth. 20 cm long, November in a sheltered outdoor nursery bed[200].

nwatta An easily grown plant, succeeding in most fertile soils[11, 200]. Prefers a moist well-drained soil in sun or partial shade[200]. Tolerates atmospheric pollution[200]. Plants are very floriferous and can exhaust themselves, literally flowering themselves to death. The flowers are borne in the leaf nodes of the previous years growth and any pruning is therefore best done as soon as the plant has finished flowering[182]. The flowers have a soft sweet perfume[245]. Closely related to *W. japonica*[11]. Plants in this genus are notably resistant to honey fungus[200].

## 7.2.356 Cornus australis

6 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 4 m hkuc hmimhtut cyuti tcup hwicli hrasjlutnyikrip hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Cornus australis is a deciduous Shrub growing to 4 m (13ft 1in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium

the plant for 2 - 3 years, falling just before the appearance of new leaves in the spring[82]. Flowers are produced on the current year's growth[29]. Resents root disturbance, especially as the plants get older[11]. It is best to place the plants into their permanent positions as soon as possible, perhaps giving some winter protection for their first year or two[K]. Dioecious. Male and female plants must be grown if seed is required.

## 7.2.351 Tamarix anglica

English Tree

6 tlin 9 cyuc 1 kcaak 0 tcan 1 dwat 5 m hkuc  
hmtut cyutli kyuctcup hwicli hrasljutnykfrp hpa7tli flatprklwissliphom hpa7tmwatli xre7t hjonli

drutta Tamarix anglica is a deciduous Shrub growing to 5 m (16ft 5in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline and saline soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: MannaEdible Uses: A manna is produced by the plants in response to insect damage to the stems[2, 105]. It is sweet and mucilaginous[105].

tcanta Fuel Hedge Hedge Soil stabilization WoodVery tolerant of maritime exposure, it makes a good shelter hedge in coastal gardens[7, 11, 49, 75]. Dislikes being trimmed[75]. The extensive root system of this plant makes it suitable for use in erosion control in sandy soils[149]. Wood - fairly hard, not strong, close grained, takes a high polish. Used for general construction, poles, turnery[61, 149]. It makes a good fuel, burning well even when green due to the wax content of the wood[74].

dwatta Astringent DiureticAstringent, diuretic[7].

propta Seed - sow spring in a cold frame and only just cover the seed. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame. Very easy[200]. Cuttings of mature wood of the current seasons growth, 15 - 25cm long, planted outdoors in late autumn in a nursery bed or straight into their permanent position. High percentage[11, 200].

nwatta An easily grown plant, succeeding in most soils and tolerant of saline conditions[11]. Grows well in heavy clay soils as well as in sands and even shingle[182]. Usually found near the coast, it succeeds inland if given a fairly good deep loam and a sunny position[11, 200]. Tolerant of maritime winds and dry soils when grown near the coast[11], plants require a moister soil and shelter from cold drying winds when they are grown inland in non-saline soils because they use the soil salts that are found in saline soils to help them reduce transpiration[200]. Growth can be restricted by cutting back the plants in spring, hedges are also best trimmed at this time[188]. This species is very closely related to *T. gallica* and is considered to be no more than a part of that species by many botanists[11, 200]. Plants in this genus are notably resistant to honey fungus[200].

## 7.2.352 Ilex crenata

Japanese Holly, Box Leaved Holly

6 tlin 8 cyuc 1 kcaak 0 tcan 0 dwat 5 m hkuc  
hmimhtut cyutli tcup hwicli hrasljutnyk hpa7tli flatprklwis hpa7tmwatli nyanhjen hjonli

drutta Ilex crenata is an evergreen Shrub growing to 5 m (16ft) by 3 m (9ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from May to June, and the seeds ripen from September to October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and

basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit[105, 177]. No further details are given, but some caution is advised[K].The fruit is about 5mm in diameter[200].

tcanta Hedge HedgeVery amenable to trimming, this species is often grown as a hedge in N. America and Japan. It can also be used in topiary[182].

dwatta None known

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. It can take 18 months to germinate. Stored seed generally requires two winters and a summer before it will germinate and should be sown as soon as possible in a cold frame. Scarification, followed by a warm stratification and then a cold stratification may speed up the germination time[78, 80]. The seedlings are rather slow-growing. Pot them up into individual pots when they are large enough to handle and grow them on in light shade in a cold frame for their first year. It is possible to plant them out into a nursery bed in late spring of the following year, but they should not be left here for more than two years since they do not like being transplanted. Alternatively, grow them on in their pots for a second season and then plant them out into their permanent positions in late spring or early summer. Give them a good mulch and some protection for their first winter outdoors. Cuttings of almost ripe wood with a heel, August in a shaded position in a cold frame. Leave for 12 months before potting up. Layering in October. Takes 2 years.

nwatta Landscape Uses:Border, Espalier, Foundation, Hedge, Massing, Seashore, Superior hedge. Succeeds in most soils so long as they are not water-logged[200]. Prefers a moist loamy soil[1]. Fairly slow growing. Plants are hardy to about -20°C[184]. A number of named varieties have been selected for their ornamental value[182]. Resents root disturbance, especially as the plants get older[11]. It is best to place the plants into their permanent positions as soon as possible, perhaps giving some winter protection for their first year or two[K]. Any transplanting is best done in May or, preferably, in September. Dioecious. Male and female plants must be grown if fruit and seed is required. Special Features:Not North American native, Inconspicuous flowers or blooms.

## 7.2.353 Buxus sempervirens

Box, Common box, American Boxwood

6 tlin 8 cyuc 1 kcaak 0 tcan 2 dwat 5 m hkuc  
hmimhtut cyutli kyuctcup hwicli hrasljutnykfrp hpa7tli flatprklwissliphpa7tmwatli hjonli

drutta Buxus sempervirens is an evergreen Shrub growing to 5 m (16ft) by 5 m (16ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf all year, in flower from April to May, and the seeds ripen in September. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Bees, flies. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Edible Uses: CondimentThe leaves have been used in France as a substitute for hops (*Humulus lupulus*) in making beer[7]. They cannot be very wholesome, and would probably prove to be injurious[2].

tcanta Dye Hedge Hedge WoodBox makes an excellent hedge from 45cm to 4.5 metres tall according to the variety grown[11, 29]. It is quite slow growing but very tolerant of cutting and is often used in topiary, where the hedge is trimmed into different forms for ornamental effect[182]. The leaves and sawdust, boiled in lye, have been used to dye hair an auburn colour[4]. Wood - hard, close grained, heavy. Although the wood is rather small, it is highly valued on account of its hardness - it is twice as hard as oak (*Quercus* species)[4, 268]. It is used for engraving, printing blocks, bowls, combs etc[4, 7, 11, 46, 100, 115, 178]. The root especially is much liked by turners and cabinet makers[7].

dwatta Alternative Antiperiodic Antirheumatic Cathartic Cholagogue Diaphoretic Epilepsy Febrifuge Homeopathy Leprosy Malaria Narcotic Odontalgic Oxytoxic Sedative

nwatta This record is to cover a series of hybrids of garden origin that belong to the whitebeam section of the genus but have not been placed in a distinct species. The following notes are based on the general needs of this group of plants[K]. Succeeds in most reasonably good soils in an open sunny position[11]. Tolerates light shade[188], though it fruits better in a sunny position[K]. Plants are susceptible to fireblight[188]. A very ornamental tree[11]. Plants are apt to die back without any warning[11].

## 7.2.297 Campanula medium

Canterbury Bells, Cup and Saucer, Canterbury Bells

6 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat m hkuc  
hmimhtut cyutli tcup hwicli hrasljut hpa7tli prklwissliphpa7tmwatli fyifxre7t hjonli

drutta Campanula medium is an evergreen Biennial growing to 1.2 m (4ft) by 0.3 m (1ft in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower in July, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Young shoots - raw or cooked[177]. Root - cooked[177].

tcanta DyeGreen and pale blue dyes are obtained from the flowers[168].

dwatta None known

propta Seed - best sown in an outdoor seedbed in May, the seedlings are transplanted when large enough and then placed in their final positions in the autumn[221]. The seed usually germinates in 2 - 4 weeks at 18°C[138].

nwatta Landscape Uses: Border, Container, Ground cover. Succeeds in most fertile well-drained soils[233], though it prefers a moist but well-drained rich sandy loam and a neutral or alkaline soil in sun or partial shade[1, 200]. A very ornamental plant, it is often grown in the flower garden and there are many named varieties[17]. The species in this genus do not often hybridize and so seed can generally be relied upon to come true[221]. The plants are self-fertile[221]. Plants usually self-sow in British gardens[221]. Members of this genus are rarely if ever troubled by browsing deer[233]. Special Features: Not North American native, Suitable for cut flowers.

## 7.2.298 Mimulus luteus

Monkey Musk, Yellow monkey-flower

6 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 0.3 m hkuc  
hmimhtut cyutli tcuphja7n hwicli hrasljutnykfrp hpa7tli flatprklwis hpa7tmwatli hjonli

drutta Mimulus luteus is a PERENNIAL growing to 0.3 m (1ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked[105, 257]. Eaten as greens[257].

tcanta None known

dwatta None known

propta Seed - sow spring in a greenhouse and only lightly cover the seed[200]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. If you have sufficient seed it can also be sown in situ in late spring after the last expected frosts[200]. Division in spring[200]. Very easy, large divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer. Cuttings of softwood, 5cm long in spring or summer[200].

nwatta Prefers rather moist places such as damp borders, margins of streams and boggy spots[1]. Grows well in heavy clay soils. Thrives in full sun so long as the soil does not dry out[200]. Hardy to about -20°C[187]. There is some confusion over the naming of this plant, the entry on edibility may refer to *M. guttatus*, which is closely related to this species[161, 200]. Hybridizes with *M. guttatus*[187].

## 7.2.299 Scirpus validus creber

Soft-Stem Bulrush

6 tlin 9 cyuc 2 kcaak 0 tcan 1 dwat 1.5 m hkuc  
hmimhtut cyutli tcuphja7nhs6s hwicli hrasljutnyk hpa7tli flatprklwis hpa7tmwatli xre7t hjonli

drutta Scirpus validus creber is a PERENNIAL growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can grow in water.

kcakta Edible Parts: Leaves Pollen Root SeedEdible Uses: Root - raw or cooked[159, 161, 172, 183]. Rich in starch. The bruised young roots, when boiled in water, furnish a sweet syrup[183]. The rhizomes are 3 - 10mm in diameter[270]. Young shoots - cooked[55, 62, 85, 183]. The tender base of the stem is eaten raw in salads[183]. The pollen is used in soups or mixed with flour and used in making bread[177, 183]. It is rich in protein. Seed[62, 85, 159, 183]. No further details are given but it is probably ground into a powder and used in making bread etc. Small and rather fiddly to harvest and utilize.

tcanta Basketry WeavingThe stems are used in weaving and basket making[189, 257]. They are used to make good quality mats for use on the floor, for sleeping on and for making temporary partitions[257]. The stems are pulled off the plant rather than cut to ensure the maximum length of stem[257].

dwatta Astringent DiureticThe root is astringent and diuretic[152].

propta Seed - sow in a cold frame as soon as it is ripe in a pot standing in 3cm of water. Only just cover the seed with soil[200]. The seed usually germinates fairly quickly. Prick out the plants when large enough to handle and plant out in their permanent positions in early summer. Division in spring. Very easy, larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta We have very little information on this species and do not know if it will be hardy in Britain. However, judging by its native range, it is likely to succeed outdoors at least in the milder areas of the country. The following notes are based on the general needs of the genus. This species may be no more than a synonym for *Schoenoplectus tabernaemontani*[270]. Succeeds in any wet to moisture retentive ground, pond margins and shallow water in full sun or shade[200].

## 7.2.300 Viburnum erosum

Viburnum

6 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 1.8 m hkuc  
hmimhtut cyutli tcup hwicli hrasljutnyk hpa7tli flatprklwis hpa7tmwatli dyatxre7t hjonli

drutta Viburnum erosum is a deciduous Shrub growing to 1.8 m (6ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105, 177]. The ovoid fruit is about 8mm long and contains a single large seed[200].

tcanta None known

dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe. Germination can be slow, sometimes taking more than 18 months. If the seed is harvested 'green' (when it has fully developed but before it has fully ripened) and sown immediately in a cold frame, it should germinate in the spring[80]. Stored seed will require 2 months warm then 3 months cold stratification and can still take 18 months to germinate[113]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame or greenhouse. Plant out into their permanent positions in late spring or early summer of the following year. Cuttings of soft-wood, early summer in a frame[200]. Pot up into individual pots once they start to root and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, 5 - 8 cm long with a heel if possible, July/August in a frame[78, 113]. Plant them into individual pots as soon as they start to root. These cuttings can be difficult to overwinter, it is best to keep them in a greenhouse or cold frame until the following spring before planting them out[113]. Cuttings of mature wood, winter in a frame. They should root in early spring - pot them up when large enough to handle and plant them out in the summer if sufficient new growth is made, otherwise keep them in a cold frame for the next winter and then plant them out in the spring. Layering of current seasons growth in July/August. Takes 15 months[78].

nwatta Landscape Uses:Border, Foundation, Massing, Specimen. An easily grown plant, it succeeds in most soils but is ill-adapted for poor soils and for dry situations[1]. It prefers a deep rich loamy soil in sun or semi-shade[11, 200]. Best if given shade from the early morning sun in spring[200]. This species is perhaps not perfectly hardy in Britain[11]. Another report says that it succeeds in climatic zone 6, which means that it should be hardy in almost all of Britain[200]. Plants are self-incompatible and need to grow close to a genetically distinct plant in the same species in order to produce fruit and fertile seed[11, 200]. Closely related to *V. ichangense*[1]. Special Features: Not North American native, Attractive flowers or blooms.

## 7.2.301 *Cardiocrinum cordatum*

6 tin 9 cyuc 2 kcaak 0 tcan 0 dwat 1.8 m hkuc hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Cardiocrinum cordatum* is a BULB growing to 1.8 m (6ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower in August, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcaakta Edible Parts: Leaves RootEdible Uses: An edible starch is obtained from the bulb[46, 61, 105]. Young leaves - cooked. This use will considerably weaken the plant and is not to be recommended in normal situations[46, 61].

tcanta None known  
dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame in the autumn. The plant has delayed epigeal germination and will often germinate in the spring but can take up to 2 years especially if the seed is stored prior to being sown[134]. An alternative is to mix the seed with some moist leafmould and seal it in a plastic bag. Keep this at a temperature of 20°C for 3 weeks then pot up any seed that germinates and place the rest in a fridge for 4 - 5 weeks at 3 - 5°C before sowing in a warm place[138]. Seedlings should be grown on in pots in a shaded position in a cold frame or greenhouse for 3 - 4 years before planting them out in their permanent positions[138]. Bulblets are obtained from the base of the old plant after flowering. Pot up and plant out when well established.

nwatta Prefers a moist well-drained position in shade and a soil that is rich in leafmould[47, 200]. Requires a deep, very fertile humus-laden soil[233]. Prefers growing in woodland conditions[42, 200]. The dormant plant is in general hardy to about -10°C but it comes into growth very early in the year, sometimes in February, and the young growth is

susceptible to frost damage[90, 200]. A monocarpic plant, the bulb takes about 7 years to reach flowering size but then dies after flowering. However, it produces a number of new bulblets at the base and can be propagated by these[47, 200]. These bulblets take 3 - 5 years to flower[200]. The flowers are sweetly scented[245]. When planting, only just cover the bulb with leafmould[47]. The bulb is very attractive to slugs, mice and voles and may require protection[200]. Plants seem to be immune to the predations of rabbits[233].

## 7.2.302 *Ehretia acuminata*

Koda Tree

6 tin 9 cyuc 2 kcaak 0 tcan 1 dwat 9 m hkuc htut cyutli tcup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Ehretia acuminata* is a deciduous Tree growing to 9 m (29ft 6in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from July to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcaakta Edible Parts: FruitEdible Uses: Fruit - raw[105, 144, 146, 158, 177]. About the size of a pea, it is insipidly sweet when fully ripe[2, 183]. The fruit is about 4mm in diameter[200]. The unripe fruit is sometimes used as a pickle[2, 183].

tcanta WoodWood - light, tough, soft and easily worked. Used for carrying poles[46, 61, 158].

dwatta FebrifugeThe juice of the bark is used in the treatment of fevers[272].

propta Seed - we have no information on this species but suggest sowing it as soon as it is ripe in a greenhouse. Sow stored seed in late winter or early spring. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame.

nwatta Prefers a moderately fertile well-drained sandy loam in a sunny position[200]. Tolerates calcareous soils[200]. Requires a sheltered position[200]. Plants are shade tolerant in continental climates but they require more sun in maritime areas in order to ripen the wood[200]. Rich fertile soils encourage soft sappy growth which is then more susceptible to winter damage[200]. The young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. A tree at Kew was 6 metres tall in 1989[K]. This species is much confused with *E. ovalifolia*[1].

## 7.2.303 *Acer circinatum*

Vine Maple

6 tin 9 cyuc 2 kcaak 0 tcan 1 dwat 12 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta *Acer circinatum* is a deciduous Tree growing to 12 m (39ft) by 8 m (26ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in April, and the seeds ripen from October to November. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: SapEdible Uses: SweetenerThe sap contains a certain amount of sugar and can either be used as a drink, or can be concentrated into a syrup by boiling off the water[183]. The syrup is used as a sweetener on many foods. The concentration of sugar is considerably lower than in the sugar maples (*A. saccharum*). The tree trunk is tapped in the early spring, the sap flowing better on warm sunny days following a frost. The best sap production comes from cold-winter areas with continental climates.

tcanta Basketry Fuel Paint Preservative WoodThe leaves are packed around apples, rootcrops etc to help preserve them[18, 20]. The young shoots are quite pliable and are

year's growth, November to February in a sheltered outdoor bed or planted straight into their permanent position and given a good weed-suppressing mulch. Very easy. Plant into their permanent positions in the autumn. Cuttings of half-ripe wood, June to August in a frame. Very easy.

nwatta Succeeds in most soils, including wet, ill-drained or intermittently flooded soils[1, 11], but prefers a damp, heavy soil in a sunny position[200]. Hybridizes freely with other members of this genus[200]. Although the flowers are produced in catkins early in the year, they are pollinated by bees and other insects rather than by the wind[11]. Plants in this genus are notably susceptible to honey fungus[200]. Dioecious. Male and female plants must be grown if seed is required.

## 7.2.348 *Ilex integra*

Mochi Tree

6 tin 9 cyuc 1 kcaak 0 tcan 0 dwat 6 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Ilex integra* is an evergreen Tree growing to 6 m (19ft) by 5 m (16ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower in April, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: LeavesEdible Uses: Young leaves - cooked. A famine food, it is only used when all else fails[177].

tcanta None known  
dwatta None known

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. It can take 18 months to germinate. Stored seed generally requires two winters and a summer before it will germinate and should be sown as soon as possible in a cold frame. Scarification, followed by a warm stratification and then a cold stratification may speed up the germination time[78, 80]. The seedlings are rather slow-growing. Pot them up into individual pots when they are large enough to handle and grow them on in light shade in a cold frame for their first year. It is possible to plant them out into a nursery bed in late spring of the following year, but they should not be left here for more than two years since they do not like being transplanted. Alternatively, grow them on in their pots for a second season and then plant them out into their permanent positions in late spring or early summer. Give them a good mulch and some protection for their first winter outdoors. Cuttings of almost ripe wood with a heel, August in a shaded position in a cold frame. Leave for 12 months before potting up. Layering in October. Takes 2 years.

nwatta Succeeds in most soils so long as they are not water-logged[200]. Somewhat tender for its first two or three years from seed[11, 182], this species is hardy to about -10°C[184] when it gets older. Resents root disturbance, especially as the plant grows older[1, 11]. It is best to place the plants into their permanent positions as soon as possible, perhaps giving some winter protection for their first year or two[K]. Plants are very tolerant of pruning and can be cut right back into old wood if required[188]. Dioecious. Male and female plants must be grown if seed is required.

## 7.2.349 *Eleutherococcus innovans*

Taka-No-Tsume

6 tin 9 cyuc 1 kcaak 0 tcan 0 dwat 6 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Eleutherococcus innovans* is a deciduous Tree growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in June. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil. It can tolerate atmospheric pollution.

kcaakta Edible Parts: LeavesEdible Uses: Young leaves - cooked. A famine food, it is only used in times of scarcity[177].

tcanta None known  
dwatta None known

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame or greenhouse[200]. Sow stored seed in late winter in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame[200]. Root cuttings in late winter in a greenhouse[200]. Division of suckers in the dormant season[200].

nwatta Prefers a humus-rich well-drained soil in full sun[200]. Tolerates poor soils and atmospheric pollution[200]. Requires shelter from cold north and east winds[200]. Plants are hardy to between -10 and -15°C[200].

## 7.2.350 *Ilex vomitoria*

Yaupon Holly,

6 tin 9 cyuc 1 kcaak 0 tcan 1 dwat 6 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

drutta *Ilex vomitoria* is an evergreen Shrub growing to 6 m (19ft 8in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from April to May, and the seeds ripen from October to December. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Edible Uses: Condiment TeaA mildly stimulating beverage containing caffeine is made from the dried and roasted leaves[43, 171, 183]. The tea is stimulating and intoxicating[161]. The leaves are first steeped in cold and then in boiling water[183]. They are also used to flavour ice cream and soft drinks[183].

tcanta Hedge Hedge WoodThis species is occasionally used for hedging in the southern states of America[82]. Wood - hard, heavy, strong, close grained. It weighs 46lb per cubic foot. Too small for commercial exploitation, the wood is used locally for turnery, inlay work, woodenware etc[82, 149, 227, 229].

dwatta EmeticA decoction of the leaves is emetic[4, 11, 171]. The plant was used ritually by several N. American Indian tribes. The leaves were toasted over a fire and then boiled for several hours. The resulting thick black liquid was then drunk and this was followed by immediate vomiting[213]. This was often used as a purification rite prior to hunting[213].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. It can take 18 months to germinate. Stored seed generally requires two winters and a summer before it will germinate and should be sown as soon as possible in a cold frame. Scarification, followed by a warm stratification and then a cold stratification may speed up the germination time[78, 80]. The seedlings are rather slow-growing. Pot them up into individual pots when they are large enough to handle and grow them on in light shade in a cold frame for their first year. It is possible to plant them out into a nursery bed in late spring of the following year, but they should not be left here for more than two years since they do not like being transplanted. Alternatively, grow them on in their pots for a second season and then plant them out into their permanent positions in late spring or early summer. Give them a good mulch and some protection for their first winter outdoors. Cuttings of almost ripe wood with a heel, August in a shaded position in a cold frame. Leave for 12 months before potting up. Layering in October. Takes 2 years[78].

nwatta Succeeds in most soils so long as they are not water-logged[200]. This species is not fully hardy in Britain, the plants are incapable of withstanding our hardest winters[11]. A slow-growing species in the wild, often forming dense thickets from root suckers[229]. The leaves remain on

and hypotensive[147]. A decoction is used in the treatment of rheumatoid arthritis and hypertension[147]. The pounded seed is used to kill lice[218].

propta Seed - best sown as soon as possible in a greenhouse. Germination can be erratic but usually takes place within 20 - 60 days at 20°c[164]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out in late spring or early summer after the last expected frosts. Root cuttings, 6 - 8cm long, December in a greenhouse. High percentage[78]. Division of suckers in the dormant season. Very easy, they can be planted out direct into their permanent positions if required.

nwatta Landscape Uses:Espalier; Standard, Specimen. Succeeds in a sunny position in ordinary garden soil but prefers a fertile humus-rich well-drained loam[164, 200]. The soil must not be allowed to dry out in the growing season[1]. Requires a position sheltered from cold drying winds[1, 200]. Plants are generally hardy to about -15°c[184, 200], they succeed outdoors at Kew though the branches are pithy and are apt to die back in winter[11]. The sub-species *C. trichotomum fargesii*. (Dode.)Rehder. is somewhat hardier, tolerating temperatures down to about -20°c[184]. Plants produce the occasional sucker[182]. The leaves have a heavy unpleasant odour when crushed[11, 182]. Flowers are produced on the current seasons growth and are sweetly scented[200]. Special Features:Not North American native, Attractive flowers or blooms.

## 7.2.345 *Salix chaenomeloides*

Japanese Pussy Willow

6 tlin 8 cyuc 1 kca3 3 tcan 2 dwat 6 m hkuc  
htut cyutli tcuphja7n hwicli hrasjlutnykfrif hpa7tli flatprik hpa7tmwatli nyanhjen hjonli

drutta *Salix chaenomeloides* is a deciduous Tree growing to 6 m (19ft 8in) at a fast rate. It is not frost tender. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required) and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers moist or wet soil.

kcakta Edible Parts: Inner bark LeavesEdible Uses: Inner bark - raw or cooked. It can be dried, ground into a powder and then added to cereal flour for use in making bread etc. A very bitter flavour, it is a famine food that is only used when all else fails[172]. Young shoots - raw or cooked. They are not very palatable[172].

tcanta Landscape Uses:Border, Massing, Specimen, Winter interest. Special Features: Not North American native, Attractive flowers or blooms. Dynamic accumulator.

dwatta Anodyne FebrifugeThe fresh bark of all members of this genus contains salicin[226], which probably decomposes into salicylic acid (closely related to aspirin) in the human body[213]. This is used as an anodyne and febrifuge[226].

propta Seed - must be surface sown as soon as it is ripe in late spring. It has a very short viability, perhaps as little as a few days. Cuttings of mature wood of the current year's growth, November to February in a sheltered outdoor bed or planted straight into their permanent position and given a good weed-suppressing mulch. Very easy. Plant into their permanent positions in the autumn. Cuttings of half-ripe wood, June to August in a frame. Very easy.

nwatta Succeeds in most soils, including wet, ill-drained or intermittently flooded soils[1, 11], but prefers a damp, heavy soil in a sunny position[200]. Rarely thrives on chalk[200]. Hybridizes freely with other members of this genus[200]. Although the flowers are produced in catkins early in the year, they are pollinated by bees and other insects rather than by the wind[11]. Plants in this genus are notably susceptible to honey fungus[200]. Dioecious. Male and female plants must be grown if seed is required.

## 7.2.346 *Eleutherococcus trifoliatus*

6 tlin 9 cyuc 1 kcaok 0 tcan 1 dwat 6 m hkuc  
hmimhtut cyutli tcup hwicli hyishrasjlutnyk hpa7tli flatprik-wis hpa7tmwatli xre7t hjonli

drutta *Eleutherococcus trifoliatus* is a deciduous Shrub growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. It can tolerate atmospheric pollution.

kcakta Edible Parts: LeavesEdible Uses: Young leaves - cooked[111, 177].

tcanta None known

dwatta Antirheumatic Infertility Nervine TonicThe root bark and stem bark contain triterpenoid saponinsand oleonic acid[283].They are used in the treatment of rheumatism, lumbago, ostealgia and impotence[283]. The bark is also considered to be a stimulant and tonic for the central nervous system and to improve the memory[283]. The bark is collected in the summer and autumn, wrapped to bring out the aroma and then thoroughly dried[283]. The plant is used in the treatment of colds, coughs, neuralgia, rheumatism and water on the knee[218].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame[200]. It can be slow to germinate. Stored seed requires 6 months warm followed by 3 months cold stratification[113] and can be very slow to germinate[133]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in a cold frame or greenhouse for at least the first winter. Plant out in late spring or early summer. Cuttings of half-ripe wood, July/August in a frame[113, 200]. Cuttings of ripe wood of the current season's growth, 15 - 30cm long in a cold frame[238]. Root cuttings in late winter[200]. Division of suckers in the dormant season[200].

nwatta Prefers a light warm open loamy humus-rich soil and a position sheltered from north and east winds.[1, 11, 200] Prefers a well-drained soil and full sun[200]. Tolerates urban pollution and poor soils[200]. All parts of the plant are particularly fragrant[283]. Plants are hardy to between -10 and -15°c if they are sheltered from cold winds[200].

## 7.2.347 *Salix appendiculata*

6 tlin 9 cyuc 1 kcaok 3 tcan 2 dwat 6 m hkuc  
htut cyutli tcuphja7n hwicli hrasjlutnykfrif hpa7tli flatprik-wis hpa7tmwatli nyanhjen hjonli

drutta *Salix appendiculata* is a deciduous Shrub growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from April to May. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Bees. The plant is not self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist or wet soil.

kcakta Edible Parts: Inner bark LeavesEdible Uses: Inner bark - raw or cooked. It can be dried, ground into a powder and then added to cereal flour for use in making bread etc. A very bitter flavour, it is a famine food that is only used when all else fails[172]. Young shoots - not very palatable[172].

tcanta Soil reclamationA pioneer plant for difficult sites[200]. It is often found in the wild as a pioneer on landslides etc, especially on calcareous formations[11]. Dynamic accumulator.

dwatta Anodyne FebrifugeThe fresh bark of all members of this genus contains salicin[226], which probably decomposes into salicylic acid (closely related to aspirin) in the human body[213]. This is used as an anodyne and febrifuge[226].

propta Seed - must be surface sown as soon as it is ripe in late spring. It has a very short viability, perhaps as little as a few days. Cuttings of mature wood of the current

used in basket making[118]. Straight shoots can be used to make open-work baskets[257]. A charcoal made from the wood can be mixed with oil and used as a black paint[257]. Wood - hard, heavy, durable, close-grained, strong according to some reports, but not strong according to others. Too small to be commercially important, the wood is used for cart shafts, tool handles, small boxes etc[46, 61, 82, 118, 226, 229, 257]. One report says that the wood is quite pliable and was used for making bows, snowshoe frames etc, whilst young saplings could be used as swings for baby cradles[257]. The wood is almost impossible to burn when green and has served as a cauldron hook over the fire[226].

dwatta Astringent DysenteryThe wood was burnt to charcoal and mixed with water and brown sugar then used in the treatment of dysentery and polio[257].

propta Seed is usually of good quality when produced in gardens. It is best sown as soon as it is ripe in a cold frame, it usually germinates in the following spring. Pre-soak stored seed for 24 hours and then stratify for 2 - 4 months at 1 - 8°c. It can be slow or very poor to germinate, especially if it has been dried. The seed can be harvested 'green' (when it has fully developed but before it has dried and produced any germination inhibitors) and sown immediately. It should germinate in late winter. If the seed is harvested too soon it will produce very weak plants or no plants at all[80, 113]. When large enough to handle, prick the seedlings out into individual pots and grow them on until they are 20cm or more tall before planting them out in their permanent positions. This tree often self-layers and can be propagated by this means. Cuttings of young shoots in June or July. The cuttings should have 2 - 3 pairs of leaves, plus one pair of buds at the base. Remove a very thin slice of bark at the base of the cutting, rooting is improved if a rooting hormone is used. The rooted cuttings must show new growth during the summer before being potted up otherwise they are unlikely to survive the winter. Cultivars of this species can be grafted onto *A. palmatum*, which makes a better rootstock than this species.

nwatta Landscape Uses:Specimen. Of easy cultivation, it succeeds in most good soils[111], preferring a good moist well-drained soil on the acid side[182]. Prefers a sunny position but tolerates some shade[11, 200]. Grows well in heavy clay soils. Plants are hardy to about -20°c[184]. Chlorosis can sometimes develop as a result of iron deficiency when the plants are grown in alkaline soils, but in general maples are not fussy as to soil pH. A very ornamental tree[1], a number of varieties are in cultivation[11, 200]. The branches tend to coil around other trees in much the same way as vines[226]. (A strange report because vines do not coil but climb by means of tendrils formed in the leaf axils[K].) The tree sends out long slender arching branches in the wild. These form roots when they touch the ground and the plant thereby forms large impenetrable thickets often several hectares in extent[82]. Most maples are bad companion plants, inhibiting the growth of nearby plants[18, 20]. Special Features:North American native, Inconspicuous flowers or blooms.

## 7.2.304 *Arctostaphylos columbiana*

Hairy Manzanita

6 tlin 9 cyuc 2 kcaok 0 tcan 1 dwat 1.5 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli fyifxre7t hjonli

drutta *Arctostaphylos columbiana* is an evergreen Shrub growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from March to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[3, 177]. The fruit is best harvested when slightly under-ripe since the fully mature pulp is mealy[183]. The fruit is about 8mm in diameter[200].

tcanta Dye Fuel WoodA yellowish-brown dye is obtained from the leaves, it does not require a mordant[168]. The wood burns with a bright light and so was used at dances and ceremonials by the native North American Indians[257].

The wood is hard and is used for making tools and awl handles[257].

dwatta AstringentA decoction of the bark is used in the treatment of diarrhoea[257].

propta Seed - best sown in a greenhouse as soon as it is ripe. Pre-soak dried seed in boiling water for 10 - 20 seconds or burn some straw on top of them and then stratify at 2 - 5°c for 2 months[11, 200]. The seed usually germinates in 2 - 3 months at 15°c[134]. When large enough to handle, prick the seedlings out into individual pots and grow them on in a greenhouse or cold frame for at least their first winter. Plant out in late spring or early summer. Cuttings of side shoots of the current season's growth, 5 - 8cm with a heel, August to December in a frame. Takes one year[1, 78]. Division in early spring. Take care because the plant resents root disturbance. Pot the divisions up and keep them in a lightly shaded position in a cold frame or greenhouse until they are growing away actively. Layering in spring[200]. Layering in spring[200].

nwatta Requires a deep moist well-drained light or medium lime-free loam in sun or semi-shade[11, 134, 200] but plants produce less fruit when they are grown in the shade[200]. Plants resent root disturbance and should be placed in their final positions as soon as possible[134]. This species is very closely related to *A. tomentosa*, but with a more northerly range[11].

## 7.2.305 *Podocarpus alpinus*

Tasmanian Podocarp

6 tlin 9 cyuc 2 kcaok 0 tcan 0 dwat 2 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyk hpa7tli flatprik hpa7tmwatli nyanhjen hjonli

drutta *Podocarpus alpinus* is an evergreen Shrub growing to 2 m (6ft) by 2.5 m (8ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, and the seeds ripen in October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. The fruit is about 6mm x 5mm in size with a single seed[11, 200]. Although we have seen no specific reports of edibility for this fruit, it is closely related to other species with edible fruits and is very unlikely to be poisonous - we have indeed eaten it on a number of occasions and it has a mucilaginous texture with a slightly sweet flavour[K].

tcanta WoodWood.

dwatta None known

propta The seed can be sown at any time of the year in a sandy soil in a warm greenhouse, though it is probably best sown as soon as it is ripe[1]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe terminal shoots, 5 - 10cm long, July/August in a frame[78].

nwatta Prefers a rich moist non-alkaline soil[167]. Plants are shade tolerant, at least when young[200]. Hardy to about -25°c, but plants grow best in humid areas with high rainfall and mild winters[200]. Plants often fruit freely in Britain[200]. There is some doubt over the correct name for this species - the Flora of Australia says that it is a synonym of *P. lawrencei*[286], a species which, according to our records, only occurs in New Zealand[200]. A very slow growing plant, reaching 1.5 metres tall in 50 years at Kew Gardens[11]. It is a good plant for the rock garden[200]. Plants are very tolerant of pruning[200]. Plants in this genus are notably resistant to honey fungus[200]. Dioecious. Male and female plants must be grown if seed is required. Occasional plants are monoecious[286].

## 7.2.306 *Angelica acutiloba*

Dong Dang Gui

6 tlin 9 cyuc 2 kcaak 0 tcan 1 dwat 0.7 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyfxre7t hjonli

drutta *Angelica acutiloba* is a PERENNIAL growing to 0.7 m (2ft 4in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from September to October, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young leaves - cooked[177].

tcanta None known

dwatta Emmenagogue Oxytoxic Sedative Tonic Women's complaintsThe root is emmenagogue, oxytoxic, sedative and tonic. It is used in the treatment of women's complaints[61, 174, 218] and also eases dizziness[61].

propta Seed - best sown in a cold frame as soon as it is ripe since the seed only has a short viability[200]. Seed can also be sown in the spring, though germination rates will be lower. It requires light for germination[200]. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for their first winter, planting them out into their permanent positions in the spring. The seed can also be sown in situ as soon as it is ripe.

nwatta Requires a deep moist fertile soil in dappled shade or full sun[200]. Plants are reliably perennial if they are prevented from setting seed[200]. Cultivated as a medicinal plant in Japan[58, 275].

## 7.2.307 *Quercus pungens*

Sandpaper Oak, Pungent oak

6 tlin 9 cyuc 2 kcaak 0 tcan 2 dwat 2 m hkuc hmimhtut cyutli tcup hwicli jlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta *Quercus pungens* is an evergreen Shrub growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from April to May. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: SeedEdible Uses: Coffee GumSeed - cooked[161, 177]. The seed is small, up to 1cm long[200]. Up to 22mm according to another report[229]. It can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread. The seed contains bitter tannins, these can be leached out by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute. A gum obtained from the bark can be used for chewing[257].

tcanta Dye Gum Repellent TanninA mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth[20]. Oak galls are excrecences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4]. A tan-coloured dye is obtained from the bark[257].

dwatta Astringent DysenteryAny galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4].

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Young plants tolerate reasonable levels of side shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. Prefers warmer summers than are usually experienced in Britain, trees often grow poorly in this country and fail to properly ripen their wood resulting in frost damage overwinter[200]. The tree flowers on new growth produced in spring, the seed ripening in its first year[200, 229]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. Hybridizes freely with other members of the genus[200]. Plants in this genus are notably resistant to honey fungus[200].

## 7.2.308 *Ehretia dicksonii*

6 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 10 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprikwislip hpa7tmwatli xre7t hjonli

drutta *Ehretia dicksonii* is a deciduous Tree growing to 10 m (32ft) by 10 m (32ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit[105, 177]. No further details. The fruit is about 2cm in diameter[200].

tcanta WoodWood - light and tough. Used for carrying poles[46, 109].

dwatta None known

propta Seed - we have no information on this species but suggest sowing it as soon as it is ripe in a greenhouse. Sow stored seed in late winter or early spring. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame.

nwatta Prefers a moderately fertile well-drained sandy loam in a sunny position[200]. Requires a sheltered position[200]. Plants are shade tolerant in continental climates but they require more sun in maritime areas in order to ripen the wood[200]. Rich fertile soils tend to encourage soft sappy growth which is then subject to frost damage over winter[200]. Succeeds on chalky soils[200]. Mature plants are frost hardy, though young plants are often cut back by the frost[200]. The young growth in spring is also susceptible to frost-damage[K]. A tree was 6 metres tall at Kew in 1989[K]. This species closely resembles *Ehretia macrophylla* Wall. of the E. Himalaya, but the latter has the thin chartaceous, narrower leaves without scabrous on the upper surface and with sparse pubescent hairs on the lower surface, and smaller drupes, ca. 8 mm in diam[275]. The flowers, which are borne on the ripened wood of the previous season's growth, emit a powerful spicy fragrance[245].

## 7.2.309 *Nyssa aquatica*

Water Tupelo

6 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 30 m hkuc hmimhtut cyutli tcuphja7nhs6s hwicli hrasjlutnyik hpa7tli priklwis hpa7tmwatli xre7t hjonli

means smooth but the young shoots of this species are hairy whilst the young shoots of *L. edulis* are smooth[11].

## 7.2.342 *Clematis buchananiana*

6 tlin 9 cyuc 1 kcaak 0 tcan 2 dwat 6 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta *Clematis buchananiana* is a deciduous Climber growing to 6 m (19ft 8in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: DrinkTender young leaves - coked as a vegetable[272]. Some caution is advised, see the notes above on toxicity[K]. The plant is used in Nepal to make marcha, a fermented cake from which an alcoholic beverage is distilled[272].

tcanta None known

dwatta Analgesic Odontalgic Poultice Stomachic VulneraryA paste of the roots is used as a poultice to treat swellings caused by inflammation[272]. The juice of the root is used in the treatment of peptic ulcers[272]. The juice is also inhaled to get rid of coughs and colds[272]. A paste of the stem or root bark is kept pressed against the teeth for about 15 minutes to relieve toothache[272]. The juice of the plant is applied externally to cuts and wounds[272]. It is also taken internally in the treatment of indigestion[272]. The leaf juice is taken internally, and is also applied externally to the forehead, in the treatment of coughs and colds[272]. It is also warmed and placed inside the nose when treating sinusitis[272].

propta Seed - best sown as soon as it is ripe in a cold frame[164, 200]. Sow stored seed as soon as it is obtained in a cold frame. Pre-soak the seed for 12 hours in warm water and remove as much of the tail and outer coat as possible[164]. A period of cold stratification is beneficial[164]. The seed germinates in 1 - 9 months or more at 20°C[164]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for the first winter. Plant out in late spring or early summer, after the last expected frosts. Intermodal cuttings of soft to semi-ripe wood, late spring in sandy soil in a frame[200]. Layering of old stems in late winter or early spring[200]. Layering of current seasons growth in early summer[200].

nwatta Prefers a deep moist soil with its roots in the shade and its shoots growing up to the light[164]. Dislikes poorly-drained heavy clay soils, but grows well in clay if grit is added for drainage[11, 200]. Dislikes light sandy soils[11]. Succeeds in acid as well as alkaline soils[200]. A very variable species, it varies considerably in hardness according to the region from which the plant was first obtained - those obtained from the higher limits of its range being more cold-tolerant[273]. It grows best in the milder or sub-tropical areas where its late-flowering habit can be fully appreciated. In colder areas the flowers are often badly damaged by frost[273]. A vigorous plant, capable of putting out new shoots up to 4 metres long in a season[273]. A twining plant, the leafstalks wrap themselves around twigs and branches for support. When a side of the stalk touches an object, the growth on that side slows down whilst the other side grows at its normal rate - this causes the leaf stalk to entwine the object it is touching[212]. Plants flower on the current seasons growth. They usually require no pruning, especially if left to clamber into large shrubs and trees. Weak or dead stems can be removed in the winter and, where pruning may be required to reduce the size of the plant, shoots can be cut back by up to two thirds in the winter[273]. When planting out, in order to avoid the disease 'clematis wilt', it is best to plant the rootball about 8cm deeper in the soil. This will also serve to build up a good root crown of growth buds[200]. Plants in this genus are notably resistant to honey fungus[200]. Plants seem to be immune to the predations of rabbits[233]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

## 7.2.343 *Coprosma propinqua*

6 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 6 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli nyanhjen hjonli

drutta *Coprosma propinqua* is an evergreen Shrub growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from February to March, and the seeds ripen from August to September. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: CoffeeFruit - raw or cooked[173]. Sweet, but with little flavour[225]. The pale to deep violet-blue fruit is about 8mm wide[200, 225]. The roasted seed is an excellent coffee substitute[153].

tcanta Dye Hedge HedgeTolerant of pruning, it makes a good dense hedging plant[225]. A yellow dye is obtained from the wood, it does not require a mordant[153].

dwatta None known

propta Seed - probably best sown as soon as it is ripe in a greenhouse or cold frame[K]. Sow stored seed in spring in a cold frame[200]. Germination can be slow, often taking more than 12 months even when fresh seed is used[K]. When the seedlings are large enough to handle, prick them out into individual pots. Grow on the plants for at least their first winter in a greenhouse and plant out in late spring or early summer. Give the plants some protection from the cold for their first winter outdoors[K]. Cuttings of mature wood of the current year's growth, autumn in a frame.

nwatta Requires a moist, very well-drained neutral to slightly acid soil in full sun or light shade[200]. An easily grown plant, it succeeds in moist soils[225]. Somewhat intolerant of frost, this species is only likely to succeed outdoors in the milder areas of Britain[11, 200]. Another report says that it is fully hardy in Britain[225]. It flowers freely in Britain, fruiting heavily if pollinated[225]. A polymorphic species, it hybridizes freely with other members of this genus[200, 225]. Plants are tolerant of heavy clipping or pruning[225]. Plants are normally dioecious, though in some species the plants produce a few flowers of the opposite sex before the main flowering and a few hermaphrodite flowers are sometimes produced[225]. Male and female plants must usually be grown if seed is required.

## 7.2.344 *Clerodendrum trichotomum*

Chou Wu Tong, Harlequin glorybower, Ferruginous clerodendrum, Harlequin Glory Bower

6 tlin 11 cyuc 1 kcaak 0 tcan 3 dwat 6 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta *Clerodendrum trichotomum* is a deciduous Tree growing to 6 m (19ft) by 3 m (9ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young sprouts and leaves - cooked[105, 177].

tcanta ParasiticideNone known

dwatta Analgesic Antipruritic Antirheumatic Hypotensive Parasiticide SedativeThe leaves are mildly analgesic, antipruritic, hypotensive and sedative[176, 218, 254]. They are used externally in the treatment of dermatitis and internally for the treatment of hypertension, rheumatoid arthritis, joint pain, numbness and paralysis[176, 218, 254]. When used in a clinical trial of 171 people, the blood pressure of 81% of the people dropped significantly - this effect was reversed when the treatment was stopped[254]. The plant is normally used in conjunction with *Bidens bipinnata*[218]. When used with the herb *Siegesbeckia pubescens* it is anti-inflammatory[254]. The roots and leaves are antirheumatic

Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Edible Uses: Coffee TeaThe leaves are used as a tea substitute[177, 183]. The roasted seed is used as a coffee substitute[177, 183].

tcanta None known

dwatta None known

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. It can take 18 months to germinate. Stored seed generally requires two winters and a summer before it will germinate and should be sown as soon as possible in a cold frame. Scarification, followed by a warm stratification and then a cold stratification may speed up the germination time[78, 80]. The seedlings are rather slow-growing. Pot them up into individual pots when they are large enough to handle and grow them on in light shade in a cold frame for their first year. It is possible to plant them out into a nursery bed in late spring of the following year, but they should not be left here for more than two years since they do not like being transplanted. Alternatively, grow them on in their pots for a second season and then plant them out into their permanent positions in late spring or early summer. Give them a good mulch and some protection for their first winter outdoors. Cuttings of almost ripe wood with a heel, August in a shaded position in a cold frame. Leave for 12 months before potting up. Layering in October. Takes 2 years.

nwatta Succeeds in most soils so long as they are not water-logged[200]. One report says that this species is hardy to about -15°c[184], another that it is hardy to about -5°c[260], whilst others say that it is not fully hardy in many parts of Britain and is best grown in the milder areas of the country[188, 200]. Plants succeed but they do not thrive outdoors at Kew, though they thrive just a few miles south of there[11]. Resents root disturbance, especially as the plant grows older[1, 11]. It is best to place the plants into their permanent positions as soon as possible, perhaps giving some winter protection for their first year or two[K]. Plants are very tolerant of pruning and can be cut right back into old wood if required[188]. Dioecious. Male and female plants must be grown if seed is required.

## 7.2.339 Lithocarpus edulis

6 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 9 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Lithocarpus edulis is an evergreen Tree growing to 9 m (29ft 6in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: Seed - raw or cooked[123, 177, 183]. Not of a good taste[105]. The poor taste is probably due, at least in part, to the presence of tannins. These can be removed by soaking the seed in water for a few days, changing the soak water regularly. The process can be speeded up by grinding the seed into a powder prior to soaking[K]. The seed is an acorn about 25mm long and 8mm wide[K].

tcanta None known

dwatta None known

propta The seed is best sown as soon as it is ripe in the autumn in a cold frame[200]. It needs to be protected from mice, squirrels and other seed eaters. The seed has a short viability but can be stored for a few months if kept cool and slightly damp - the salad compartment of a fridge is a good storage place. Germination takes place in the winter or early spring. When they are large enough to handle, prick the seedlings out into individual pots. If the plants are 15cm or more tall by the summer they can be planted out into their permanent positions. Give them a good weed-excluding mulch and some protection from the cold for their first couple of years outdoors. If growth is not sufficient then grow them on in the greenhouse for their first winter and plant them out into their permanent positions in late spring or early summer, after the last expected frosts.

nwatta Prefers a deep fertile soil with medium drainage[200]. This species is only hardy in the southern half of England[11]. A tree growing in deep shade did not produce seed at Kew in the very hot summer of 1989[K]. A tree at Hilliers produced lots of seed in 1994, but they were not fertile and did not contain endosperm[K]. Plants are often confused with *L. glabra*[1].

## 7.2.340 Euptelea polyandra

Euptelea

6 tlin 7 cyuc 1 kcaak 0 tcan 0 dwat 8 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Euptelea polyandra is a deciduous Tree growing to 8 m (26ft) by 6 m (19ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in May. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves - cooked. A famine food, used when all else fails[179].

tcanta None known

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Layering.

nwatta Landscape Uses:Border, Hedge, Screen, Standard, Specimen. Prefers an open moderately rich free soil[1] and full sun[200]. Grows well in an open situation in a woodland garden or shrub border[200]. Special Features:Attractive foliage, Not North American native, Inconspicuous flowers or blooms.

## 7.2.341 Lithocarpus glaber

Japanese Oak

6 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 7 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Lithocarpus glaber is an evergreen Tree growing to 7 m (23ft). See above for USDA hardiness. It is hardy to UK zone 7. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: Seed - cooked[177]. The seed probably contains bitter-tasting tannins. These can be removed by soaking the seed in water for a few days, changing the soak water regularly. The process can be speeded up by grinding the seed into a powder prior to soaking[K].

tcanta None known

dwatta None known

propta The seed is best sown as soon as it is ripe in the autumn in a cold frame[200]. It needs to be protected from mice, squirrels and other seed eaters. The seed has a short viability but can be stored for a few months if kept cool and slightly damp - the salad compartment of a fridge is a good storage place. Germination takes place in the winter or early spring. When they are large enough to handle, prick the seedlings out into individual pots. If the plants are 15cm or more tall by the summer they can be planted out into their permanent positions. Give them a good weed-excluding mulch and some protection from the cold for their first couple of years outdoors. If growth is not sufficient then grow them on in the greenhouse for their first winter and plant them out into their permanent positions in late spring or early summer, after the last expected frosts.

nwatta Prefers a deep fertile soil with medium drainage[200]. Plants are often confused with *L. edulis*[11]. The botanical name of this species is confusing - glaber

drutta Nyssa aquatica is a deciduous Tree growing to 30 m (98ft 5in) at a medium rate. It is in flower from April to May, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can grow in water.

kcakta Edible Parts: FruitEdible Uses: Fruit - occasionally eaten raw but more often used in preserves[177, 183]. The fruit is up to 4cm long, it has a thick, tough skin with a thin acid flesh surrounding a large seed[82, 229].

tcanta Cork Dye WoodThe wood of the roots is sometimes used for making floats instead of cork[82]. A red dye can be obtained from the burnt bark mixed with water and the ash of red oak (*Quercus rubra*)[257]. Wood - light, close-grained, soft, difficult to split[82, 229, 235]. Tough according to one report[235], weak according to another[229]. It has an intricately contorted and twisted grain[82]. It weighs 29lb per cubic foot[235], and is used for various things such as panelling, broom handles, woodenware and crates[82, 229]. It is sometimes exploited commercially[229].

dwatta None known

propta The seed can be sown in late winter in a cold frame[78] but would probably benefit from an earlier sowing if the seed can be obtained any sooner. Three months stratification at 5°c improves germination[200]. Germination rates are variable[78]. As soon as they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame. Layering.

nwatta Landscape Uses:Specimen, Woodland garden. Although this is a plant of swamps and other wet soils in the wild, once established it can succeed in Britain when growing in an ordinary good loamy soil in sun or semi-shade[1]. This plant probably requires a very wet soil, it is very difficult to establish in Britain, though it should be hardy at least in the milder parts of the country. It prefers a neutral to alkaline soil[200]. Plants are fast-growing in well-drained bottomlands in the wild, but slower in swampy sites[229]. They are long-lived trees, commencing to bear seeds when about 30 years old and usually producing heavy crops each year[229]. The seed is mainly distributed by water[229]. Resents root disturbance[1]. Plants in this genus are notably resistant to honey fungus[200]. Special Features: North American native, Wetlands plant, Attracts butterflies, Inconspicuous flowers or blooms.

## 7.2.310 Aciphylla colensoi

Wild Spaniard

6 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 0.9 m hkuc htut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Aciphylla colensoi is an evergreen Perennial growing to 0.9 m (3ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Gum-Root - cooked. Aromatic[173]. The plant yields a resin that is used as a chewing gum[173]. Shoots[173]. No further details.

tcanta GumNone known

dwatta None known

propta Seed - best sown in a greenhouse as soon as it is ripe[200]. Stored seed should be sown in a greenhouse in late winter or early spring. Germination can be very slow. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter before planting them out in late spring or early summer, after the last expected frosts.

nwatta Requires a perfectly drained gritty soil in full sun[233]. Prefers a climate with rather damp air[233]. Plants are hardy to about -10°c and are succeeding outdoors in a mild garden in N. Ireland[233]. Dioecious. Female plants sometimes have a few male flowers but usually male and female plants must be grown if seed is required[200].

## 7.2.311 Chrysolepis chrysophylla

Golden Chinquapin, Giant chinquapin

6 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 20 m hkuc hmim cyutli tcup hwicli hrasjlut hpa7tli frusflatprik hpa7tmwatli hjonli

drutta Chrysolepis chrysophylla is an evergreen Tree growing to 20 m (65ft 7in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower in July. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind, midges. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: Seed - raw or cooked[22, 46]. Very sweet and much appreciated[63, 71, 82, 105, 183]. The seed can also be dried, ground into a powder and used as a thickening in soups, mixed with cereals when making bread etc[257]. The seed is about 1cm long and has a hard shell[183].

tcanta WoodWood - fine-grained, light, soft, not strong. Occasionally used for making ploughs and other agricultural implements, and also as a fuel[46, 61, 82, 229].

dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe, the seed must be protected from mice etc[200]. The seed has a short viability and should not be allowed to dry out. If stored overwinter it should be kept cool and moist. As soon as they are large enough to handle, prick the seedlings out into individual pots and grow them on in a greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts, and consider giving them some protection from the cold for their first winter outdoors.

nwatta Requires a lime-free soil[1]. Prefers a sheltered semi-shaded position and a light deep moist soil[1, 11]. A very ornamental tree[183], it is slow to moderate growing and can live 400 - 500 years in the wild[229]. One report says that this species only succeeds in Oceanic and Mediterranean climates[200]. This species has a very wide natural range in N. America, seeds should be tried from various provenances to find more suitable selections for Britain[11]. Another report says that the plant is only found in a small area of California and Oregon, but that it grows on a wide range of soil types[229]. There are trees 16 metres tall in Surrey and Buckinghamshire[11], it also fruits in Cornwall[59] and fruits well in addition to self-sowing at Edinburgh botanical gardens[11]. Flowers are produced on the current years growth, the seed taking two summers to mature[229]. The catkins have an unpleasant hawthorn-like smell to attract midges for their pollination[245]. This species resists chestnut blight[200].

## 7.2.312 Gaultheria pumila leucocarpa

6 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 0.2 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli nyanhjen hjonli

drutta Gaultheria pumila leucocarpa is an evergreen Shrub growing to 0.2 m (0ft 8in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from April to May. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). . The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[11, 177]. The fruit is about 17 - 22mm in diameter. tcanta A useful ground cover for sun or light shade, it spreads rapidly.

dwatta None known  
propta The seed requires a period of cold stratification. Pre-chill for 4 - 10 weeks and then surface sow in a lime-free compost in a shady part of the greenhouse and keep the compost moist[78]. The seed usually germinates well, usually within 1 - 2 months at 20°C, but the seedlings are liable to damp off. It is important to water them with care and to ensure that they get plenty of ventilation. Watering them with a garlic infusion can also help to prevent damping off[K]. Prick out the seedlings into individual pots when they are about 25mm tall and grow them on in light shade in the greenhouse for at least their first winter[K]. Plant them out in late spring or early summer. The seedlings are susceptible to spring frosts so might need some protection for their first few years outdoors. The leaves remain very small for the first few years[11]. Cuttings of half-ripe wood 3 - 6cm long, July/August in a frame in a shady position. They form roots in late summer or spring[78]. A good percentage usually take. Division in spring just before new growth begins. 'Drop' the plants 12 months earlier by digging them up and replanting them deeper in the soil so that the branches are buried and can form roots. This works best in a sandy soil[78]. It is best to pot up the divisions and grow them on in a lightly shaded position in a greenhouse until they are established. Plant them out in the summer. Layering in September/October. Takes 12 months[78].

nwatta Requires a light well-drained lime-free soil[200]. Spreading rapidly[1, 49], this species can be invasive[182]. The plant can make a good nesting place for mice, these mice then eat the bark of the stems in winter causing die-back. Dioecious. Male and female plants must be grown if seed is required. Plants in this genus are notably resistant to honey fungus[200].

## 7.2.313 Thymus mastichina

Mastic Thyme  
6 tlin 9 cyuc 2 kcaak 0 tcan 2 dwat m hkuc  
htut cyutli hgatkuyctcup hwicli hrasljut hpa7tli flatprikklwis hpa7tmwatli xre7t hjonli

drutta Thymus mastichina is an evergreen Shrub growing to 0.3 m (1ft) by 0.6 m (2ft in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Edible Uses: CondimentThe leaves are used as a seasoning[183]. They have a pungent eucalyptus-like aroma[238]. If the leaves are to be dried, the plants should be harvested in early and late summer just before the flowers open and the leaves should be dried quickly[200]. The plant is also the source of an essential oil, called 'oil of marjoram', that is used extensively as a flavouring for soups etc[4, 61, 177, 183, 238].

tcanta Deodorant Disinfectant EssentialThe essential oil obtained from the leaves is also used in perfumery, as a mouth wash, medicinally etc[200].

dwatta Antiseptic Deodorant DisinfectantThe leaves, and especially the essential oil contained in them, are strongly antiseptic, deodorant and disinfectant[4, 200, 238]. The plant can be used fresh at any time of the year, or it can be harvested as it comes into flower and either be distilled for the oil or dried for later use[238].

propta Seed - sow spring in a cold frame. Seed can also be sown in autumn in a greenhouse. Surface sow or barely cover the seed. Germination can be erratic. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring or autumn[200]. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are

growing away well. Plant them out in the summer or the following spring. Cuttings of young shoots, 5 - 8cm with a heel, May/June in a frame[200]. Cuttings of half-ripe wood, 5 - 8cm with a heel, July/August in a frame[200]. Layering.

nwatta Requires a light well-drained preferably calcareous soil in a sunny position[1, 200]. Succeeds in dry soils. Thymes dislike wet conditions, especially in the winter. A layer of gravel on the soil around them will help protect the foliage from wet soils[238]. Plants are hardy to about -10°C[200], but are best given some protection in the winter - a pane of glass supported over the plant is usually sufficient[1]. The flowers are rich in nectar and are very attractive to honey bees[200]. The bruised leaves are powerfully aromatic[245]. This is a very difficult genus taxonomically, the species hybridize freely with each other and often intergrade into each other[1].

## 7.2.314 Arisaema flavum

6 tlin 9 cyuc 2 kcaak 0 tcan 1 dwat 0.4 m hkuc  
pcimhmimhtut cyutli hgattcup hwicli hrasljut hpa7tli flatprikklwis hpa7tmwatli dyat hjonli

drutta Arisaema flavum is a PERENNIAL growing to 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to July, and the seeds ripen from June to July. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Flies. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil and can tolerate drought.

kcakta Edible Parts: LeavesEdible Uses: Young leaves - cooked and used as a vegetable[272]. Some caution is advised, see the notes above on toxicity.

tcanta InsecticideUsed as a pesticide[91]. No further details are given, but the report might be referring to the tubers.

dwatta Antispasmodic Epilepsy ExpectorantExpectorant. It is used in the treatment of chronic tracheitis, bronchiectasis, tetanus and epilepsy[91].

propta Seed - best sown as soon as it is ripe in a shady position in a cold frame[134]. Stored seed remains viable for at least a year and can be sown in spring in the greenhouse but it will probably require a period of cold stratification. Germination usually takes place in 1 - 6 months at 15°C[134]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least a couple of years until the corms are more than 20mm in diameter. Plant out into their permanent positions whilst they are dormant. Division of tubers when the plant dies down in late summer.

nwatta Prefers a cool moist peaty soil in the bog, woodland garden or a sheltered border in semi-shade[134, 200]. Prefers a loamy or peaty soil[1] and will tolerate a sunny position if the soil is moist but not water-logged and the position is not too exposed[1, 200]. This species is the most drought tolerant member of the genus. Plants are nearly hardy in Britain, they normally succeed outdoors in the milder areas of the country[1]. Only plant out full sized tubers and mulch them with organic matter in the winter[200]. Plants need protection from slugs[200]. Most species in this genus are dioecious, but they are sometimes monoecious and can also change sex from year to year. The flowers of this species are usually either monoecious or all male[266].

## 7.2.315 Carex arenaria

Sand Sedge  
6 tlin 9 cyuc 2 kcaak 0 tcan 2 dwat 0.5 m hkuc  
hmimhtut cyutli kyuctcup hwicli hyishrasljut hpa7tli flatprikklwis hpa7tmwatli hjonli

drutta Carex arenaria is a PERENNIAL growing to 0.5 m (1ft 8in) by 2 m (6ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to July, and the seeds ripen from July to August. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy) and medium (loamy) soils

## 7.2.335 Sorbus vestita

6 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 10 m hkuc  
hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikklwis hpa7tmwatli xre7t hjonli

drutta Sorbus vestita is a deciduous Tree growing to 10 m (32ft 10in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105, 146, 272]. The fruits are up to 2cm across[200].

tcanta None known  
dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame[78, 80]. If you have sufficient seed it can be sown in an outdoor seedbed[78, 80]. Stored seed germinates better if given 2 weeks warm then 14 - 16 weeks cold stratification[98], so sow it as early in the year as possible. Prick out the seedlings into individual pots when they are large enough to handle. Seedlings are very slow to put on top-growth for their first year or two[11], but they are busy building up a good root system. It is best to keep them in pots in a cold frame for their first winter and then plant them out into their permanent positions in late spring.

nwatta Succeeds in most reasonably good soils in an open sunny position[11]. Tolerates light shade[188], though it fruits better in a sunny position[K]. Plants are susceptible to fireblight[188]. A very ornamental tree[11], unfortunately the fruit is not freely borne in Britain[11]. Plants are apt to die back without any warning[11].

## 7.2.336 Cornus nuttallii

Mountain Dogwood, Pacific dogwood, Western Dogwood  
6 tlin 8 cyuc 1 kcaak 0 tcan 2 dwat 10 m hkuc  
hmimhtut cyutli kyuctcup hwicli hyishrasljutnyikfrip hpa7tli flatprikklwis hpa7tmwatli xre7t hjonli

drutta Cornus nuttallii is a deciduous Tree growing to 10 m (32ft) by 7 m (23ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in May, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: FruitEdible Uses: The fruit is possibly edible[177]. The fruit is about 10mm in diameter[200] and has a thin, mealy flesh[82].

tcanta Basketry Dye Tannin WoodAn intense brown dye is obtained by boiling the bark[257]. The bark is rich in tannin and has been used as a preservative[257]. The long slender branches have been used in making baby baskets[257]. Wood - exceedingly hard, heavy, strong, close grained. It is used for tool handles, cabinet making etc[46, 61, 82, 118].

dwatta Antiperiodic Febrifuge Laxative Malaria Tonic-The bark is antiperiodic, cathartic, febrifuge, laxative and tonic[46, 61, 118, 257]. An infusion is used as a quinine substitute in the treatment of malaria[46, 118, 226]. The infusion has also been used in the treatment of stomach complaints[257]. Externally, it is used to treat ulcers[257].

propta Seed - best sown as soon as it is ripe in a cold frame or in an outdoors seedbed if there is sufficient seed[80, 113]. The seed must be separated from the fruit flesh since this contains germination inhibitors[80, 164]. Sown seed should be cold stratified for 3 - 4 months and stored as possible in the year[164]. Scarification may also help as may a period of about 3 days warm stratification at 15°C before the cold stratification[80, 164]. Germination, especially of stored seed, can be very slow, taking 18 months or more[164]. Prick out the seedlings of cold-frame sown seeds into individual pots as soon as they are large enough to handle and grow the plants on for their first winter in

a greenhouse, planting out in the spring after the last expected frosts. Cuttings of half-ripe side shoots, July/August in a frame. Cuttings of mature wood of the current year's growth, taken with a heel if possible, autumn in a cold frame. High percentage[78]. Layering of new growth in June/July. Takes 9 months[78].

nwatta Landscape Uses:Border, Specimen, Woodland garden. An easily grown plant, it succeeds in any soil of good or moderate fertility[1], ranging from acid to shallow chalk[200]. Another report says that it does not thrive in poor chalky soils[182]. Grows well in heavy clay soils. Succeeds in full sun or light shade[188]. Plants are hardy to about -15°C[184], but they require long hot humid summers in order to promote good growth[200]. A very ornamental tree[1], but it is usually short-lived in Britain and does not do well in the north of this country[11]. There is some evidence to suggest that trees grow better on poor soils and can be killed by too much kindness. A very good tree has been seen on a poor gravel soil[182]. Closely related to C. florida[226]. This species is the floral emblem of British Columbia[226]. A number of named varieties have been developed for their ornamental value[182]. Plants in this genus are notably resistant to honey fungus[200]. Special Features:Attracts birds, North American native, Blooms are very showy.

## 7.2.337 Euphorbia tetragona

Naboom  
6 tlin 9 cyuc 1 kcaak 2 tcan 1 dwat 10 m hkuc  
hmimhtut cyutli kyuctcup hwicli hrasljutnyik hpa7tli flatprikklwis hpa7tmwatli xre7t hjonli

drutta Euphorbia tetragona is an evergreen Tree growing to 10 m (32ft 10in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: NectarEdible Uses: The flowers are rich in nectar and this is sometimes used in confectionery[183].

tcanta MiscellanyWildlife - The flowers are rich in nectar. Dynamic accumulator.

dwatta MiscellanyOne report says that this species also supplies the drug, though it fails to say what the drug is or its medicinal actions[4].

propta Seed - sow spring in a shaded position in a greenhouse[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts.

nwatta Prefers a light well-drained moderately rich loam in an open position[200]. Succeeds in dry soils[1]. According to [200] this species is hardy to climatic zone 7 (tolerating temperatures down to about -10°C). This statement must be viewed with some scepticism, the plant is unlikely to be at all frost-tolerant. Hybridizes with other members of this genus[200]. The ripe seed is released explosively from the seed capsules[200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. This genus has been singled out as a potential source of latex (for making rubber) for the temperate zone, although no individual species has been singled out[141].

## 7.2.338 Ilex latifolia

Tarajo  
6 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 10 m hkuc  
hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikklwis hpa7tmwatli nyanhjen hjonli

drutta Ilex latifolia is an evergreen Tree growing to 10 m (32ft) by 5 m (16ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from May to June, and the seeds ripen in October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). . Suitable for: light (sandy), medium (loamy) and heavy (clay) soils.

seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out to their permanent positions in late spring or early summer, after the last expected frosts. Consider giving the plants some protection from the cold for at least their first winter outdoors. Layering[200].

nwatta Requires a deep moist humus-rich loam and a sunny sheltered position[200]. Trees are hardy to about -12°C in Britain[200], but they are not usually a success in our climate[1], preferring a warm dry continental climate[200]. A tree in Hampshire is growing and fruiting well[11]. A tree at Kew flowered heavily in the hot summer of 1989[K].

## 7.2.333 Rhododendron arboreum

6 tin 9 cyuc 1 kcaok 0 tcan 2 dwat 12 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta Rhododendron arboreum is an evergreen Shrub growing to 12 m (39ft) by 3 m (9ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kckaeta Edible Parts: Flowers LeavesEdible Uses: The tender leaves are used as a cooked vegetable[105, 158, 183]. Caution is advised, see the notes above on toxicity. Flowers - raw or cooked[272]. A sweet-sour taste, they are said to make a good sub-acid jelly[183]. Th flowers are sometimes simply pickled by adding salt and chili[272]. Caution is advised, large quantities can cause intoxication[2, 183].

tcanta Charcoal Fuel Repellent WoodThe juice of the leaves is spread over cots and beds to get rid of bed lice[272]. Wood - soft, even grained, seasons badly. Used in turnery, it can also be used to make charcoal and for fuel[51, 158]. Th wood is much employed in Nepal where it is used for making household implements, building small houses and fences[272]. Planks of the wood are carved to make boxes, cupboards and other furniture[272]. It is a very good fuel, burning well with a long-lasting heat - overcollection of the wood for fuel, and also for making charcoal, has become a cause for conservation concern[272].

dwatta Astringent Dysentery Poulitce StomachicThe young leaves are astringent and poultice[158]. They are made into a pasteand then applied to the forehead in the treatment of headaches[240, 272]. The juice of the bark is used in the treatment of coughs, diarrhoea and dysentery[272]. A decoction of the flowers is used to check a tendency to vomit, especially if there is also a loss of appetite[272]. The juice of the flowers is used in the treatment of menstrual disorders[272]. The petals are eaten to assist the removal of any animal bones that have become stuck in the throat[262].

propta Seed - best sown in a greenhouse as soon as it is ripe in the autumn and given artificial light. Alternatively sow the seed in a lightly shaded part of the warm greenhouse in late winter or in a cold greenhouse in April. Surface-sow the seed and do not allow the compost to become dry[200]. Pot up the seedlings when they are large enough to handle and grow on in a greenhouse for at least the first winter. Layering in late July. Takes 15 - 24 months[78]. Cuttings of half-ripe wood, August in a frame. Difficult[78].

nwatta Succeeds in most humus rich lime free soils except those of a dry arid nature or heavy or clayey[1]. Prefers a peaty or well-drained sandy loam[1]. Succeeds in sun or shade, the warmer the climate the more shade a plant requires[200]. Requires a pH between 4.5 and 5.5[200]. Hardy to between -10 and -15°C, the pink flowered form is hardier than the red[184]. Succeeds in a woodland though, because of its surface-rooting habit[200], it does not compete well with surface-rooting trees[1]. Plants need to be kept well weeded, they dislike other plants growing over or into their root system, in particular they grow badly with ground cover plants, herbaceous plants and heathers[200]. There are many named varieties selected for their ornamental value[200]. Plants form a root ball and are very tolerant of being transplanted, even when quite large, so long as the root ball is kept intact[200]. This plant is the national flower

of Nepal[51]. The flowers are sold in local markets and used as offerings to the Gods and Goddesses[272]. A very ornamental plant[1], it is not very hardy outdoors in much of Britain, but grows well in the milder areas of the country[1]. Plants in this genus are notably susceptible to honey fungus[200].

## 7.2.334 Salix babylonica

Weeping Willow, Babylon Weeping Willow  
6 tin 9 cyuc 1 kcaok 4 tcan 3 dwat 12 m hkuc htut cyutli tcuphja7n hwicli hrasjlutnykifrip hpa7tli flatprik hpa7tmwatli nyanhjen hjonli

drutta Salix babylonica is a deciduous Tree growing to 12 m (39ft) by 12 m (39ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in April, and the seeds ripen in May. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers moist or wet soil.

kckaeta Edible Parts: Inner bark Leaves MannaEdible Uses: TeaInner bark - raw or cooked. It can be dried, ground into a powder and then added to cereal flour for use in making bread etc. A very bitter flavour, it is a famine food that is only used when all else fails[172]. Young shoots and flower buds - cooked[105, 177, 183]. Not very palatable[172]. Older leaves are used to adulterate tea[183]. A source of a manna-like substance[183].

tcanta Basketry Hair Soil stabilizationLandscape Uses: Erosion control, Aggressive surface roots possible, Pollard, Specimen. The stems are very flexible and are used in basket making[146, 272]. The plant is usually coppiced annually when grown for basket making, though it is possible to coppice it every two years if thick poles are required as uprights. The extensive root system makes this species useful for binding soils[146, 272]. A decoction or infusion of the bark has been used as a wash to make the hair grow[257]. Dynamic accumulator.

dwatta Anodyne Antirheumatic Astringent Febrifuge Poulitce SkinThe leaves and bark are antirheumatic, astringent and tonic[178, 240]. A decoction of the leaves is used in the treatment of abscesses, carbuncle, fever, rheumatism, skin diseases, ulcers etc[218]. An infusion of the bark has been used to treat diarrhoea and fevers[257]. The bark can be used as a poultice[257]. The stem bark is used in the treatment of skin eruptions due to parasites[218]. The root bark is used in a bath for the treatment of parasitic skin diseases[218]. A gum from the stems is used in the treatment of foul sores[218]. The down of the seeds is used in the treatment of fevers, haemorrhages, jaundice, rheumatism etc[218]. The fresh bark of all members of this genus contains salicin[226], which probably decomposes into salicylic acid (closely related to aspirin) in the human body[213]. This is used as an anodyne and febrifuge[226].

propta Seed - must be surface sown as soon as it is ripe in late spring. It has a very short viability, perhaps as little as a few days. Cuttings of mature wood of the current year's growth, November to February in a sheltered outdoor bed or planted straight into their permanent position and given a good weed-suppressing mulch. Very easy. Plant into their permanent positions in the autumn. Cuttings of half-ripe wood, June to August in a frame. Very easy.

nwatta Succeeds in most soils, including wet, ill-drained or intermittently flooded soils[1, 11], but prefers a damp, heavy soil in a sunny position[200]. Rarely thrives on chalk[200]. This species rarely thrives in Britain[11], it is very subject to canker and has been largely replaced in cultivation by S. 'Chrysocoma'[188]. The root system is rather aggressive and can cause problems with drains[200]. Hybridizes freely with other members of this genus[200]. Although the flowers are produced in catkins early in the year, they are pollinated by bees and other insects rather than by the wind[11]. Plants in this genus are notably susceptible to honey fungus[200]. Dioecious. Male and female plants must be grown if seed is required. Special Features: Not North American native, Wetlands plant, Inconspicuous flowers or blooms.

and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kckaeta Edible Parts: Root SeedEdible Uses: Root - cooked[172]. Seed[172]. No further details are given, but the seed is small and fiddly to use[K].

tcanta Soil stabilizationThe long creeping rootstock is valuable for binding sandy soils[1, 4, 115].

dwatta Antiflatulent Antirheumatic Diaphoretic Diuretic Eczema Hypoglycaemic TBThe root is diaphoretic and diuretic[4, 7, 9, 21, 61]. An infusion has been used in the treatment of bronchitis and catarrhs, abdominal and stomach disorders, liver complaints, arthritis and rheumatism and skin conditions such as eczema and pruritus[9]. It has been used as a substitute for the tropical plant sarsaparilla[4]. The root is harvested in the spring and dried for later use[9].

propta Seed - sow in situ in the spring in a moist soil in light shade. If seed is in short supply it can be sown in a cold frame and be planted out in the summer. The seed usually germinates in 2 - 6 weeks at 15°C[138]. Division in spring[200]. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the summer or following spring.

nwatta Best grown in a sandy soil in a sunny position[200]. Tolerates maritime exposure[17]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 7.2.316 Schisandra sphenanthera

6 tin 9 cyuc 2 kcaok 0 tcan 5 dwat 7 m hkuc pcmhmim cyutli tcup hwicli hrasjlutnyk hpa7tli flatprikwis hpa7tmwatli nyanhjen hjonli

drutta Schisandra sphenanthera is a deciduous Climber growing to 7 m (23ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from April to May, and the seeds ripen from July to September. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required) . The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kckaeta Fruit - raw or cooked. We have no specific information on this species, but the fruit is quite probably edible[K].

tcanta None known

dwatta Antirheumatic Antitussive Aphrodisiac Astringent Cancer Cardiotoxic Cholagogue Dysentery Expectorant Hepatic Lenitive Nerve Pectoral Sedative Stimulant Tonic UrinaryThe following report is for S. chinensis. This species is used for similar purposes in southern China[238]. Wu Wei Zi is commonly used in Chinese herbalism, where it is considered to be one of the 50 fundamental herbs[218]. It is an excellent tonic and restorative, helping in stressful times and increasing zest for life[254]. It is considered to be a substitute for ginseng and is said to be a tonic for both the male and the female sex organs[238]. The fruit is antitussive, aphrodisiac, hepatic, astringent, cardiotoxic, cholagogue, expectorant, hypotensive, lenitive, nervine, pectoral, sedative, stimulant and tonic[174, 176, 178, 218]. Low doses of the fruit are said to stimulate the central nervous system whilst large doses depress it[218]. The fruit also regulates the cardiovascular system[218]. It is taken internally in the treatment of dry coughs, asthma, night sweats, urinary disorders, involuntary ejaculation, chronic diarrhoea, palpitations, insomnia, poor memory, hyperacidity, hepatitis and diabetes[238]. Externally, it is used to treat irritating and allergic skin conditions[238]. The fruit is harvested after the first frosts and sun-dried for later use[238]. The fruit contains lignans[254]. These have a pronounced protective action on the liver. In one clinical trial there was a 76% success rate in treating patients with hepatitis, no side effects were noticed[254]. The seed is used in the treatment of cancer[218]. The plant is antirheumatic[218]. A mucilaginous decoction obtained from

the branches is useful in the treatment of coughs, dysentery and gonorrhoea[218].

propta Seed - best sown in the autumn in a cold frame[200, 238]. Pre-soak stored seed for 12 hours in warm water and sow in a greenhouse in the spring[238]. Germination can be slow and erratic. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in the greenhouse for their first 2 years. Plant them out into their permanent positions in early summer. Cuttings of half-ripe wood, 5 - 8cm with a heel, August in a frame. Overwinter in the greenhouse and plant out in late spring[11, 78]. Good percentage[78]. Layering of long shoots in the autumn[200].

nwatta Prefers a rich well-drained moisture retentive soil[11, 200]. Prefers a slightly acid soil but tolerates some alkalinity if plenty of organic matter is added to the soil[200]. Requires some protection from the most intense sunlight[200]. Plants are intolerant of drought[K]. This species is hardy to about -7°C[200]. It will succeed outdoors in the milder areas of Britain if given the protection of a woodland or a south or west-facing wall[200]. The young growth in spring can be damaged by late frosts. Plants climb by twining around supports. Any pruning is best carried out in the spring[219]. Dioecious. Male and female plants must be grown if seed is required.

## 7.2.317 Angelica pubescens

Du Huo  
6 tin 9 cyuc 2 kcaok 0 tcan 3 dwat 1.8 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyk hpa7tli flatprikwis hpa7tmwatli fyfjxre7t hjonli

drutta Angelica pubescens is a PERENNIAL growing to 1.8 m (6ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kckaeta Edible Parts: LeavesEdible Uses: Leaves - cooked[105, 177].

tcanta None known

dwatta Anodyne Antiinflammatory Antirheumatic Carminative Emmenagogue Nervine VasodilatorThe roots and rhizomes are anodyne, anti-inflammatory, antirheumatic, carminative, nervine and vasodilator[147, 176]. A decoction is used to promote menstruation[218], to treat rheumatoid arthritis, rheumatism, headache, toothache and abscesses[147]. This herb is used medicinally in the same ways as A. dahurica (Bai Zhi)[254]. These uses are as follows: - Bai Zhi has been used for thousands of years in Chinese herbal medicine where it is used as a sweat-inducing herb to counter harmful external influences[254]. Bai Zhi is contraindicated for pregnant women[254]. The root is analgesic, anodyne, antibacterial, antidote, carminative, diaphoretic, diuretic, poultice and stimulant[176, 178, 218]. It is used in the treatment of frontal headache, rhinitis, boils, carbuncles and skin diseases[176]. It appears to be of value in treating the facial pain of trigeminal neuralgia[254]. Small quantities of angelicotoxin, one of the active ingredients in the root, have an excitatory effect on the respiratory centre, central nervous system and vasculomotor centre. It increases the rate of respiration, increases blood pressure, decreases the pulse, increases the secretion of saliva and induces vomiting[176]. In large doses it can cause convulsions and generalized paralysis[176].

propta Seed - best sown in a cold frame as soon as it is ripe since the seed only has a short viability[200]. Seed can also be sown in the spring, though germination rates will be lower. It requires light for germination[200]. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for their first winter, planting them out into their permanent positions in the spring. The seed can also be sown in situ as soon as it is ripe.

nwatta Requires a deep moist fertile soil in dappled shade or full sun[200]. Plants are reliably perennial if they are prevented from setting seed[200]. A polymorphic species[58].

## 7.2.318 *Ulmus alata*

Winged Elm

6 tlin 9 cyuc 2 kcaak 0 tcan 0 dwat 15 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta *Ulmus alata* is a deciduous Tree growing to 15 m (49ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower in May, and the seeds ripen in June. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked.

tcanta String WoodThe inner bark is very fibrous and can be used as a string[46, 61, 82, 149]. Wood - close-grained, heavy, hard, not strong, brittle, difficult to split. It weighs about 46lb per cubic foot, is not considered to be as strong as other elms, but is used for tool handles, wheel hubs etc[46, 61, 82, 149, 227, 229].

dwatta None known

propta Seed - if sown in a cold frame as soon as it is ripe, it usually germinates within a few days[200]. Stored seed does not germinate so well and should be sown in early spring[200]. The seed can also be harvested 'green' (when it has fully developed but before it dries on the tree) and sown immediately in a cold frame. It should germinate very quickly and will produce a larger plant by the end of the growing season[80]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Plants should not be allowed to grow for more than two years in a nursery bed since they form a tap root and will then move badly. Layering of suckers or coppiced shoots[200].

nwatta Landscape Uses:Specimen, Street tree. Prefers a fertile soil in full sun[188], but can be grown in any soil at least moderate quality so long as it is well drained[1]. A fast-growing tree in its native range[227], but this species does not thrive in Britain[1]. Closely related to *U. thomasi*[11]. Susceptible to 'Dutch elm disease', a disease that has destroyed the greater part of all the elm trees growing in Britain. The disease is spread by means of beetles. Mature trees killed back by the disease will often regrow from suckers, but these too will succumb when they get larger. There is no effective cure (1992) for the problem, but most E. Asian, though not Himalayan, species are resistant (though not immune) to the disease so the potential exists to use these resistant species to develop new resistant hybrids with the native species[200]. The various species of this genus hybridize freely with each other and pollen is easily saved, so even those species with different flowering times can be hybridized[200]. Special Features: Attracts birds, North American native, Inconspicuous flowers or blooms.

## 7.2.319 *Physalis virginiana*

Virginia Ground Cherry

6 tlin 9 cyuc 2 kcaak 0 tcan 1 dwat 0.6 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta *Physalis virginiana* is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[46, 105, 170]. The fruit is best after it has been touched by a frost[257]. The plant conveniently wraps up each fruit in its own 'paper bag' (botanically, the calyx) to protect it from pests and the elements. This calyx is toxic and should not be eaten.

tcanta MiscellanyNone known

dwatta Cancer MiscellanyExtracts from the plant have shown anticancer activity[218]. An infusion of the whole plant has been used in the treatment of dizziness[257].

propta Seed - sow March/April in a greenhouse only just covering the seed. Germination usually takes place quickly and freely. Prick out the seedlings into individual pots of fairly rich soil when they are large enough to handle and plant them out after the last expected frosts. Consider giving them some protection such as a cloche until they are growing away well. Diurnal temperature fluctuations assist germination[170]. Division in spring[111]. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer. Basal cuttings in early summer[111]. Harvest the shoots with plenty of underground stem when they are about 8 - 10cm above the ground. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Succeeds in any well-drained soil in full sun or light shade[200]. This plant has been growing successfully with us in Cornwall since 1990, though it is not setting fruit[K].

## 7.2.320 *Leymus condensatus*

Giant Wild Rye

6 tlin 9 cyuc 2 kcaak 0 tcan 1 dwat 2 m hkuc htut cyutli hgatkuyctup hwicli hyishrasjlutnyik hpa7tli flatpriklwissliphsom hpa7tmwatli xre7t hjonli

drutta *Leymus condensatus* is a PERENNIAL growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to July, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline and saline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

kcakta Edible Parts: SeedEdible Uses: Seed - cooked[22, 46, 105, 161]. It can be ground into a flour and used to make bread[61, 95, 177]. The seed is rather small and rather difficult to extract[K].

tcanta Brush Thatching WeavingThe leaves are used for making mats, rope, paper etc. The stems are used for thatching roofs etc[257]. The roots can be tied together and used as a hair comb[257].

dwatta OphthalmicA decoction or infusion of the leaves has been used as a wash for sore eyes[257]. The dried leaves have been used to scrape pimples from the underside of the eyelid[257].

propta Seed - sow mid spring in situ and only just cover the seed[162]. Germination should take place within 2 weeks. If the supply of seed is limited, it can also be sown in mid spring in a cold frame. Only just cover the seed. When large enough to handle, prick the seedlings out into individual pots and plant them out in summer[K] Division in spring or summer[162]. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Succeeds in most soils, preferring a sandy soil and a sunny position[1, 162]. Established plants are drought resistant[61]. Plants are tolerant of saline and alkaline soils[61]. A very variable species[1], it is possibly suitable for cultivation as a perennial cereal[95].

## 7.2.321 *Rosa laevigata*

Cherokee Rose

6 tlin 9 cyuc 2 kcaak 0 tcan 3 dwat 6 m hkuc htut cyutli tcup hwicli hrasjlutnyikfrp hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta *Rosa laevigata* is an evergreen Shrub growing to 6 m (19ft 8in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower

tcanta WoodWood - light, soft, coarse grained, not very durable. Used for construction, pulp, etc[61].

dwatta None known

propta Seed - sow early February in a greenhouse or outdoors in March[78]. Germination is often poor, usually taking about 6 - 8 weeks[78]. Stratification is said to produce a more even germination so it is probably best to sow the seed in a cold frame as soon as it is ripe in the autumn[80, 113]. The seed remains viable for up to 5 years if it is well stored[113]. When large enough to handle, prick the seedlings out into individual pots and grow them on for at least their first winter in pots. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Alternatively, if you have sufficient seed, it is possible to sow in an outdoor seedbed. One report says that it is best to grow the seedlings on in the shade at a density of about 550 plants per square metre[78] whilst another report says that they are best grown on in a sunny position[80].

nwatta Landscape Uses:Christmas tree, Pest tolerant, Screen, Specimen. Prefers a good moist but not water-logged soil[1]. Grows well in heavy clay soils. Plants are very shade tolerant, especially when young, but growth is slower in dense shade[81]. Intolerant of atmospheric pollution[1]. Prefers slightly acid conditions, down to a pH of about 5[200]. Prefers growing on a north-facing slope[200]. New growth of the side shoots starts in April and this is very susceptible to damage by late frosts[11, 185]. The terminal buds do not open until mid-May and usually escape damage[185]. Trees are fairly fast growing when young, sending up new growth of 60cm a year from the age of about 6 years[185]. Side shoots grow with equal vigour, however and the tree often loses apical dominance[185]. Trees grow best in the Perthshire valleys of Scotland[11]. Trees should be planted into their permanent positions when they are quite small, between 30 and 90cm in height. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200]. The flowers are produced in axils of the previous year's shoots[275]. Plants are strongly outbreeding, self-fertilized seed usually grows poorly[200]. They hybridize freely with other members of this genus[200]. Special Features:Not North American native, There are no flowers or blooms.

## 7.2.330 *Aphananthe aspera*

6 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 20 m hkuc hmimhtut cyutli kyuctup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta *Aphananthe aspera* is a deciduous Tree growing to 20 m (65ft 7in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from April to May, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit[105, 177]. The fruit is about 6 - 8mm in diameter[200].

tcanta Fibre Paper Sandpaper WoodThe leaves, gathered in autumn, are used as a sandpaper on wood[46, 61]. The fibre from the bark is used for manufacturing ropes and staple rayon[266]. The wood is fine and strong[266].

dwatta None known

propta Seed - it probably requires 2 - 3 months stratification. It is best to sow the seed as soon as it is ripe in a cold frame, otherwise sow as soon as possible in the year. Remove any pulp from the seed before sowing it[200]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter before planting them out in late spring or early summer, after the last expected frosts.

nwatta Succeeds in most soils, including dry gravels, but prefers a deep fertile soil[200]. Plants are frost tender when young but they are able to regrow from the base if cut back[11]. A tree growing outdoors at Kew Botanical Gardens has reached a height of 8 metres[111].

## 7.2.331 *Juniperus recurva*

Himalayan Juniper

6 tlin 9 cyuc 1 kcaak 0 tcan 1 dwat 12 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwisslip hpa7tmwatli nyanhjen hjonli

drutta *Juniperus recurva* is an evergreen Tree growing to 12 m (39ft) by 6 m (19ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, and the seeds ripen in October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. The cones are up to 11mm long and 6mm wide[200].

tcanta Essential IncenseThe wood and leaves are used as an incense[272]. The resinous twigs are burnt as an incense[2, 146]. The leaves contain about 1.7% essential oil[272].

dwatta EmeticSmoke from the green wood is emetic and produces long-continued vomiting[240].

propta The seed requires a period of cold stratification. The seed has a hard seedcoat and can be very slow to germinate, requiring a cold period followed by a warm period and then another cold spell, each of 2 - 3 months duration[78, 81]. Soaking the seed for 3 - 6 seconds in boiling water may speed up the germination process[11]. The seed is best sown as soon as it is ripe in a cold frame. Some might germinate in the following spring, though most will take another year. Another possibility is to harvest the seed 'green' (when the embryo has fully formed but before the seedcoat has hardened). The seedlings can be potted up into individual pots when they are large enough to handle. Grow on in pots until large enough, then plant out in early summer. When stored dry, the seed can remain viable for several years[1]. Cuttings of mature wood, 5 - 10cm with a heel, September/October in a cold frame. Plant out in the following autumn[1, 78]. Layering in September/October. Takes 12 months[78].

nwatta Succeeds in most soils if they are well drained, preferring a neutral or slightly alkaline soil[1, 11] and succeeding on chalk[200]. Prefers a humid sheltered site, doing well in areas with high rainfall[200]. Does not succeed in dry areas[200]. Unlike most members of the genus, this species grows better in the wetter western part of Britain[11]. A very ornamental plant[1] but slow growing in Britain, even young trees fail to average 25cm a year[185]. Plants are resistant to honey fungus[88]. Dioecious. Male and female plants must be grown if seed is required.

## 7.2.332 *Platycarya strobilacea*

6 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 12 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta *Platycarya strobilacea* is a deciduous Tree growing to 12 m (39ft) by 12 m (39ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to August. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young leaves - cooked[177]. A famine food, only used when all else fails[179].

tcanta Dye Fuel IncenseA black dye is obtained from the fruits. It is used for dyeing cloth[46, 61, 109]. A black dye is obtained from the bark. It is used for dyeing nets[46, 61]. (It quite possibly contains tannin which will also help to preserve the nets[K].) The root is very fragrant when it is burnt. It is used in baths[178]. The wood is a good fuel[178].

dwatta None known

propta The seed is best sown as soon as it is ripe in a cold frame. Stored seed requires a period of cold stratification[200]. When they are large enough to handle, prick the

March to May, and the seeds ripen from October to February. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

**kcakta Edible Parts:** Edible Uses: CondimentA vanilla flavouring is obtained as a by-product of other resins that are released from the pulpwood[200].

**tcanta Dye Herbicide Resin WoodA** tan or green dye is obtained from the needles[168]. The needles contain a substance called terpene, this is released when rain washes over the needles and it has a negative effect on the germination of some plants, including wheat[201]. This tree is a source of resin but it is not exploited commercially[64]. The flow of resin checks too quickly and labour costs are too high[227]. Oleo-resins are present in the tissues of all species of pines, but these are often not present in sufficient quantity to make their extraction economically worthwhile[64]. The resins are obtained by tapping the trunk, or by destructive distillation of the wood[4, 64]. In general, trees from warmer areas of distribution give the higher yields[64]. Turpentine consists of an average of 20% of the oleo-resin[64] and is separated by distillation[4, 64]. Turpentine has a wide range of uses including as a solvent for waxes etc, for making varnish, medicinal etc[4]. Rosin is the substance left after turpentine is removed. This is used by violinists on their bows and also in making sealing wax, varnish etc[4]. Pitch can also be obtained from the resin and is used for waterproofing, as a wood preservative etc. Wood - weak, brittle, coarse grained, resinous, not durable[61, 82, 171, 229]. The wood weighs 34lb per cubic foot[227]. Used for lumber, cooperage, crates, the interior of buildings, pulp etc[61, 82, 171, 229].

**dwatta** The turpentine obtained from the resin of all pine trees is antiseptic, diuretic, rubefacient and vermifuge[4]. It is a valuable remedy used internally in the treatment of kidney and bladder complaints and is used both internally and as a rub and steam bath in the treatment of rheumatic affections[4]. It is also very beneficial to the respiratory system and so is useful in treating diseases of the mucous membranes and respiratory complaints such as coughs, colds, influenza and TB[4]. Externally it is a very beneficial treatment for a variety of skin complaints, wounds, sores, burns, boils etc and is used in the form of liniment plasters, poultices, herbal steam baths and inhalers[4].

**propta** It is best to sow the seed in individual pots in a cold frame as soon as it is ripe if this is possible otherwise in late winter. A short stratification of 6 weeks at 4°C can improve the germination of stored seed[80]. Plant seedlings out into their permanent positions as soon as possible and protect them for their first winter or two[11]. Plants have a very sparse root system and the sooner they are planted into their permanent positions the better they will grow[K]. Trees should be planted into their permanent positions when they are quite small, between 30 and 90cm[200]. We actually plant them out when they are about 5 - 10cm tall. So long as they are given a very good weed-excluding mulch they establish very well[K]. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200]. Cuttings. This method only works when taken from very young trees less than 10 years old. Use single leaf fascicles with the base of the short shoot. Disbudding the shoots some weeks before taking the cuttings can help. Cuttings are normally slow to grow away[81].

**nwatta Agroforestry Services:** Windbreak Industrial Crop: Hydrocarbon Management: Standard Regional TimberLandscape Uses: Pest tolerant, Aggressive surface roots possible, Specimen. Thrives in a light well-drained sandy or gravelly loam[1, 11]. Dislikes poorly drained moorland soils[1]. Established plants tolerate drought[200]. This species comes from an area with long hot summers and mild winters[229]. It is fast growing and is cultivated as a timber tree on a small scale in Europe[50]. It does not grow well in Britain, however[1]. The trees are fully hardy in this country except when they are young[81]. Rarely found in Britain, the few trees that have been planted are all found in southern England and are all growing well[185]. It is proving to be a fairly vigorous tree here, averaging 30cm annual

increase in height for at least the first 50 years[185]. Trees can produce cones when only 10 years old, though 30 - 40 years is more usual[229]. Good crops are produced most years in the wild[229]. The cones are 5- 15cm long, they open and shed their seed whilst still attached to the tree and usually persist on the tree for a further year[82, 226]. Plants are strongly outbreeding, self-fertilized seed usually grows poorly[200]. They hybridize freely with other members of this genus[200]. Leaf secretions inhibit the germination of seeds, thereby reducing the amount of plants that can grow under the trees[18]. Plants in this genus are notably susceptible to honey fungus[200]. **Special Features:** Attracts birds, North American native, Inconspicuous flowers or blooms.

## 7.2.328 Pterocarya fraxinifolia

**Caucasian Wingnut**  
6 tin 9 cyuc 1 kcaak 0 tcan 1 dwat 30 m hkuc  
htut cyutli tcup hwicli jlutnyik hpa7tli flatprikwis hpa7tmwatli hjonli

**drutta** Pterocarya fraxinifolia is a deciduous Tree growing to 30 m (98ft) by 20 m (65ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower in June, and the seeds ripen from October to December. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

**kcakta Edible Parts:** SeedEdible Uses: Seed[2, 105]. No more details are given but the seed is very small and would be very fiddly to use[K].

**tcanta Weaving WoodThe** bast from the bark is used for weaving hats etc[74]. Wood - soft, hard to split. Used for matches, shoes etc[46, 61].

**dwatta DiaphoreticDiaphoretic**[74].

**propta Seed** - best sown as soon as it is ripe in a cold frame[80, 113]. Pre-soak stored seed for 24 hours in warm water[80] then cold stratify for 2 - 3 months[98, 113]. Prick out the seedlings into individual pots as soon as they are large enough to handle and grow them on in the greenhouse for their first winter. Plant them out in late spring or early summer of the following year[240]. Cuttings of half-ripe wood, July/August in a frame[113]. Cuttings of mature shoots, November in a frame. Only use vigorous shoots[113]. Layering. Division of suckers in the dormant season[188].

**nwatta** Prefers a sunny position in a rich strong loam with abundant moisture at the roots[11, 200]. Grows well by water[11]. Succeeds in areas that do not experience prolonged winter temperatures below about -12°C[200], but young plants and the young shoots of older trees can be cut back by winter frosts[11]. A very ornamental tree[1], it fruits freely in Britain[11]. The leaves are sweetly resinous[245]. The deeply furrowed bark is aromatic[245]. Produces suckers profusely[98]. Plants in this genus are notably resistant to honey fungus[200].

## 7.2.329 Abies firma

**Momi Fir Japanese Fir**  
6 tin 9 cyuc 1 kcaak 0 tcan 0 dwat 30 m hkuc  
pcimhmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprik hpa7tmwatli hjonli

**drutta** Abies firma is an evergreen Tree growing to 30 m (98ft 5in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in leaf all year, in flower from April to May, and the seeds ripen from October to November. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid and neutral soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

**kcakta Edible Parts:** SeedEdible Uses: Seed - roasted[105, 177]. No more details are given, but the seed is very small and fiddly to utilize[K].

from June to July, and the seeds ripen from August to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

**kcakta Edible Parts:** Fruit SeedEdible Uses: Fruit - raw or cooked[177]. The pear-shaped fruit is up to 4cm long[200], but there is only a thin layer of flesh surrounding the many seeds[K]. Sugar can be extracted from the fruit, it is also used to ferment rose wine[266]. Some care has to be taken when eating this fruit, see the notes above on known hazards. The seed is a good source of vitamin E, it can be ground and mixed with flour or added to other foods as a supplement[102, 183]. Be sure to remove the seed hairs[102].

**tcanta Tannin**The root bark contains tannin[266].

**dwatta** Antibacterial Anticholesterolemic Astringent Cancer Carminative Depurative Diuretic Dysentery Emmenagogue Infertility Kidney Stomachic Urinary VulneryThe leaves are a famous vulnery[218]. The fruits, root and leaves are emmenagogue and depurative[147]. Their use stabilizes the kidneys[147]. A decoction is used in the treatment of chronic dysentery, urinary tract infections, wet dreams, prolapse of the uterus, menstrual irregularities and traumatic injuries[147]. The root bark is astringent and used in the treatment of diarrhoea and menorrhagia[218]. The dried fruits are antibacterial, anticholesterolemic, astringent, carminative, diuretic and stomachic[176, 178, 218, 238]. They are used internally in the treatment of urinary dysfunction, infertility, seminal emissions, urorrhoea, leucorrhoea and chronic diarrhoea[238]. The root is used in the treatment of uteral prolapse[218]. The flowers are used in the treatment of dysentery and to restore hair cover[218]. The fruit of many members of this genus is a very rich source of vitamins and minerals, especially in vitamins A, C and E, flavanoids and other bio-active compounds. It is also a fairly good source of essential fatty acids, which is fairly unusual for a fruit. It is being investigated as a food that is capable of reducing the incidence of cancer and also as a means of halting or reversing the growth of cancers[214].

**propta Seed.** Rose seed often takes two years to germinate. This is because it may need a warm spell of weather after a cold spell in order to mature the embryo and reduce the seedcoat[80]. One possible way to reduce this time is to scarify the seed and then place it for 2 - 3 weeks in damp peat at a temperature of 27 - 32°C (by which time the seed should have imbibed). It is then kept at 3°C for the next 4 months by which time it should be starting to germinate[80]. Alternatively, it is possible that seed harvested 'green' (when it is fully developed but before it has dried on the plant) and sown immediately will germinate in the late winter. This method has not as yet(1988) been fully tested[80]. Seed sown as soon as it is ripe in a cold frame sometimes germinates in spring though it may take 18 months. Stored seed can be sown as early in the year as possible and stratified for 6 weeks at 5°C[200]. It may take 2 years to germinate[200]. Prick out the seedlings into individual pots when they are large enough to handle. Plant out in the summer if the plants are more than 25cm tall, otherwise grow on in a cold frame for the winter and plant out in late spring. Cuttings of half-ripe wood with a heel, July in a shaded frame. Overwinter the plants in the frame and plant out in late spring[78]. High percentage[78]. Cuttings of mature wood of the current seasons growth. Select pencil thick shoots in early autumn that are about 20 - 25cm long and plant them in a sheltered position outdoors or in a cold frame[78, 200]. The cuttings can take 12 months to establish but a high percentage of them normally succeed[78]. Division of suckers in the dormant season. Plant them out direct into their permanent positions. Layering. Takes 12 months[11].

**nwatta** Succeeds in most soils[11], preferring a circum-neutral soil and a sunny position[200]. Grows well in heavy clay soils. Dislikes water-logged soils[200]. A very ornamental plant[1], but it is not very hardy in Britain and only succeeds outside in the warmer parts of the country[11]. It can be cut back to the ground even in southern England in cold winters, though it will usually resprout from the base[260]. It is the state flower of Georgia[219] and is also the parent of several modern garden cultivars[219]. The flowers have a clove-like fragrance[245]. If any pruning is necessary then this should be carried out immediately after the plant has

finished flowering[219]. Grows well with alliums, parsley, mignonette and lupins[18, 20]. Garlic planted nearby can help protect the plant from disease and insect predation[18, 20]. Grows badly with boxwood[18]. Hybridizes freely with other members of this genus[80]. Plants in this genus are notably susceptible to honey fungus[200].

## 7.2.322 Dianthus caryophyllus

**Carnation, Clove Pink, Border Carnation**  
6 tin 8 cyuc 2 kcaak 0 tcan 2 dwat 1 m hkuc  
htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatprikli-wissliphos hpa7tmwatli fyifkre7t hjonli

**drutta** Dianthus caryophyllus is a PERENNIAL growing to 1 m (3ft 3in) by 0.5 m (1ft 8in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8 and is not frost tender. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Lepidoptera (Moths and Butterflies). The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline and saline soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure. It can tolerate atmospheric pollution.

**kcakta Edible Parts:** FlowersEdible Uses: Condiment-The flower petals have a strong smell of cloves and are candied, used as a garnish in salads, for flavouring fruit, fruit salads etc. They can also be used as a substitute for rose petals in making a syrup[183, 238]. The petals should be removed from the calyx and their bitter white base should be removed[183].

**tcanta Essential SoapAn** essential oil is obtained from the flowers[46, 171]. It is used in perfumery. 500kg of flowers produce 100g of oil[61]. The flowers are harvested when they are fully open in the morning, preferably after 3 hours exposure to sunlight[238]. The flower heads are dried and used in pot-pourri, scented sachets and cosmetic products[238, 268]. The plant is quite rich in saponins. The leaves can be simmered in water and this water can then be used as a soap for cleaning the skin, clothes etc[201].

**dwatta Antispasmodic Cardiotonic Diaphoretic** Febrifuge Nerve StimulantCarnation flowers are an aromatic, stimulant herb that has been used in tonic cordials in the past to treat fevers, though this use is now obsolete[238]. It is traditionally prescribed in European herbal medicine to treat coronary and nervous disorders[254]. The flowers are considered to be alexiteric, antispasmodic, cardiotonic, diaphoretic and nerve[240]. The plant has been used as a vermifuge in China[240].

**propta Seed** - sow spring in slight heat in a greenhouse[1]. The seed usually germinates in 2 - 3 weeks at 15°C. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Layering in July[1]. Cuttings of non-flowering basal shoots, June/July in a frame[200]. Harvest the shoots when they are about 10cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

**nwatta Landscape Uses:**Border, Container, Rock garden, Seashore, Specimen. Succeeds in a sunny position in most good soils[11, 200] tolerating a pH range from 6 to 8 but disliking acid soils[200]. A very tolerant plant, succeeding in the salt laden air and strong winds of the coast as well as in the sulphur polluted air of cities[200]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to about -10°C[200]. A very ornamental plant[1], the carnation is widely cultivated in the flower garden and is grown commercially in France for its essential oil[46]. There are many named varieties[200]. The flowers of the species have a rich clove-like perfume, though almost no scent is present in the orange and yellow-flowering cultivars[245]. The flowers are very attractive to butterflies and moths[17]. Plants are prone to mildew or leaf spot in humid climates[201]. **Special Features:**Edible, Not North American native, Suitable for cut flowers, Fragrant flowers.

## 7.2.323 *Rosa banksiae*

Banksia Rose

6 tlin 9 cyuc 2 kcaak 0 tcan 1 dwat 10 m hkuc htut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Rosa banksiae* is a deciduous Shrub growing to 10 m (32ft) by 12 m (39ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Fruit SeedEdible Uses: Fruit - raw or cooked. The fruit is about 7mm in diameter[200], but there is only a thin layer of flesh surrounding the many seeds[K]. Some care has to be taken when eating this fruit, see the notes above on known hazards. The seed is a good source of vitamin E, it can be ground and mixed with flour or added to other foods as a supplement[102, 183]. Be sure to remove the seed hairs[102].

tcanta Dye Preservative TanninTannin obtained from the root bark is used as a brown dye for rope and also to preserve and strengthen rope that is to be immersed in water[46, 61, 109].

dwatta Anthelmintic Astringent Bitter Cancer Tonic VulneraryThe plant is rich in tannins and is used as an astringent[218]. The root is anthelmintic, astringent, bitter and tonic[240]. The leaves are said to be a good vulnerary[240]. The fruit of many members of this genus is a very rich source of vitamins and minerals, especially in vitamins A, C and E, flavanoids and other bio-active compounds. It is also a fairly good source of essential fatty acids, which is fairly unusual for a fruit. It is being investigated as a food that is capable of reducing the incidence of cancer and also as a means of halting or reversing the growth of cancers[214].

propta Seed. Rose seed often takes two years to germinate. This is because it may need a warm spell of weather after a cold spell in order to mature the embryo and reduce the seedcoat[80]. One possible way to reduce this time is to scarify the seed and then place it for 2 - 3 weeks in damp peat at a temperature of 27 - 32°C (by which time the seed should have imbeded). It is then kept at 3°C for the next 4 months by which time it should be starting to germinate[80]. Alternatively, it is possible that seed harvested 'green' (when it is fully developed but before it has dried on the plant) and sown immediately will germinate in the late winter. This method has not as yet(1988) been fully tested[80]. Seed sown as soon as it is ripe in a cold frame sometimes germinates in spring though it may take 18 months. Stored seed can be sown as early in the year as possible and stratified for 6 weeks at 5°C[200]. It may take 2 years to germinate[200]. Prick out the seedlings into individual pots when they are large enough to handle. Plant out in the summer if the plants are more than 25cm tall, otherwise grow on in a cold frame for the winter and plant out in late spring. Cuttings of half-ripe wood with a heel, July in a shaded frame. Overwinter the plants in the frame and plant out in late spring[78]. High percentage[78]. Cuttings of mature wood of the current seasons growth. Select pencil thick shoots in early autumn that are about 20 - 25cm long and plant them in a sheltered position outdoors or in a cold frame[78, 200]. The cuttings can take 12 months to establish but a high percentage of them normally succeed[78]. Division of suckers in the dormant season. Plant them out direct into their permanent positions. Layering. Takes 12 months[11].

nwatta Succeeds in most soils[11], preferring a circum-neutral soil[200]. Grows well in heavy clay soils. Dislikes water-logged soils[200]. Requires a very sunny position if it s to flower well[11, 245]. This species does not thrive in the cooler moister parts of Britain, growing best in the south-east of the country[11]. It is best given a position on a sunny sheltered wall[219]. A very ornamental plant[1]. After planting out, it takes a few years to settle down and commence flowering[219]. Flowers are produced mainly on wood that is 2 - 3 years old[219]. The flowers have a violet-like perfume[245]. Grows well with alliums, parsley, hignonette and lupins[18, 20]. Garlic planted nearby can help protect the plant from disease and insect predation[18, 20]. Grows badly with boxwood[18]. Hybridizes freely with other members of

this genus[80]. Plants in this genus are notably susceptible to honey fungus[200].

## 7.2.324 *Ephedra viridis*

Mormon Tea, Brigham Tea, Long Leaf Ephedra, Mountain Joint Fir, Mormon Tea, Ephedra

6 tlin 11 cyuc 2 kcaak 0 tcan 3 dwat 1.8 m hkuc htut cyutli hgatkyuctcup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

drutta *Ephedra viridis* is an evergreen Shrub growing to 1.8 m (6ft). See above for USDA hardiness. It is hardy to UK zone 9. It is in leaf all year, in flower from April to May. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Fruit SeedEdible Uses: TeaFruit - raw. A sweet flavour. Seed - cooked. A bitter flavour; it is roasted and ground into a powder and used to make a bread or mush[183]. A delicious tea is made by steeping the green or dried twigs in boiling water[183, 257]. The flavour is said to be improved if the stems are roasted first[183].

tcanta DyeThe twigs, boiled with alum, produce a light tan dye[257].

dwatta Blood purifier Diuretic Kidney Poultice Stomachic Tonic VDThis plant has a wide reputation as a cure for syphilis[216]. A strong decoction of the stems was drunk and a poultice of the pulverized or boiled stems applied to the sores[257]. The stems are blood purifier, diuretic and tonic[257]. An infusion has been used in the treatment of coughs and colds, anaemia, rheumatism, stomach ulcers and other disorders, kidney problems[257]. The dried, powdered stems are used as a dressing on sores and burns[257]. The stems of most members of this genus contain the alkaloid ephedrine and are valuable in the treatment of asthma and many other complaints of the respiratory system[K]. The whole plant can be used at much lower concentrations than the isolated constituents - unlike using the isolated ephedrine, using the whole plant rarely gives rise to side-effects[254]. Ephedra does not cure asthma but in many cases it is very effective in treating the symptoms and thus making life somewhat easier for the sufferer. The stems can be used fresh or dried and are usually made into a tea, though they can also be eaten raw[K]. The young stems are best if eating them raw, though older stems can be used if a tea is made[K]. The stems can be harvested at any time of the year and are dried for later use[238].

propta Seed - best sown as soon as it is ripe in the autumn in a greenhouse[200]. It can also be sown in spring in a greenhouse in a sandy compost[K]. Prick out the seedlings into individual pots as soon as they are large enough to handle and grow them on for at least their first winter in a greenhouse. Plant out in the spring or early summer after the last expected frosts and give some protection in their first winter[K]. Division in spring or autumn[238]. Layering.

nwatta Landscape Uses:Erosion control, Ground cover, Massing, Rock garden. Requires a well-drained loamy soil and a sunny position[11]. Established plants are drought resistant and are also lime tolerant[200]. This species is not very hardy in Britain, it succeeds well in a cold greenhouse but is often killed outdoors by a combination of cold and wet conditions[200]. Dioecious, male and female plants must be grown if fruit and seed is required.Special Features:Attractive foliage, North American native.

## 7.2.325 *Tsuga heterophylla*

Western Hemlock

6 tlin 7 cyuc 1 kcaak 0 tcan 2 dwat 70 m hkuc pcmhmmhtut cyutli tcup hwicli hrasjlutnyik hpa7tli frusflat-prikliwis hpa7tmwatli hjonli

drutta *Tsuga heterophylla* is an evergreen Tree growing to 70 m (229ft) by 15 m (49ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from April to May, and the seeds ripen from

October to November. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Inner barkEdible Uses: Condition Gum TeaInner bark - raw or cooked[213, 257]. It can be dried, ground into a powder and then used as a thickening in soups etc or mixed with cereals when making bread[161]. It has also been used as a sweetener for other foods[257]. The inner bark was often cooked and then dried for use in the winter[256]. At its best in spring[172], it was one of the staple foods of the Alaskan Indians[82]. An emergency food, it is only used when all else fails[183]. The leaves and twigs yield 'spruce oil', used commercially to flavour chewing gum, soft drinks, ice cream etc[183]. Pitch, obtained from crevices in the bark, has been chewed as a gum[257]. The leaves and young shoots have been chewed as an emergency food to keep one alive when lost in the woods[257]. A herbal tea is made from the leaves and shoot tips[172, 183]. These tips are also an ingredient of 'spruce beer'[183].

tcanta Dye Fuel Gum Hedge Hedge Parasiticide Resin Rust Tannin WoodYields a resin similar to *Abies balsamea*, it is gathered by incisions in the trunk or by boiling the wood[46, 61, 64]. The bark contains 8 - 18% tannin and is a major source of tannin in America[46, 82, 171, 226]. A reddish-brown dye is obtained from the bark[21, 46, 257]. A decoction of the bark has been used to clean rust off iron and steel[257]. A pitch (called hemlock pitch), is obtained by distillation of the young branches[46]. The pitch is rubbed on the hair to get rid of head lice[257]. Tolerant of light trimming, plants can be grown as a hedge[81]. This species makes a good hedge in Britain[124, 200]. Wood - light, hard, tough, easy to work. Commercially superior to other members of this genus, it is an important tree for construction, the outside of buildings etc and for carving into spoons etc[46, 61, 82, 171, 226, 229]. It is also a major source of pulp[226]. The wood makes a slow-burning fuel and so can be used to bank up a fire to keep it burning overnight[257].

dwatta Astringent Diaphoretic Diuretic Parasiticide Poultice SkinWestern hemlock was commonly employed medicinally by several native North American Indian tribes who used it to treat a variety of complaints[257]. It is little, if at all, used in modern herbalism. The bark is astringent, diaphoretic and diuretic[21]. A decoction of the pounded bark has been used in the treatment of haemorrhages, tuberculosis and syphilis[257]. The boiled bark, combined with liquorice fern (*Polypodium glycyrrhiza*), has been used in the treatment of haemorrhages[257]. An infusion of the inner bark or twigs is helpful in the treatment of kidney or bladder problems[21]. It can also be used as a good enema for treating diarrhoea and as a gargle or mouthwash for mouth and throat problems[21]. Externally, it can be used as a wash on sores and ulcers[21, 257]. A poultice of the plant has been applied to bleeding wounds[257]. A moxa of the twigs has been used to get rid of warts[257]. The powdered bark can be put into shoes for tender or sweaty feet or for foot odour[21]. The gum obtained from the trunk has been applied to cuts[257]. It has been applied to the skin to prevent chapping and sunburn[257]. A poultice of the chewed leaves has been used in the treatment of burns[257].

propta Seed - it germinates better if given a short cold stratification[80, 113] and so is best sown in a cold frame in autumn to late winter. It can also be sown in early spring, though it might not germinate until after the next winter. If there is sufficient seed, an outdoor sowing can be made in spring[78]. Pot-grown seedlings are best potted up into individual pots once they are large enough to handle - grow them on in a cold frame and plant them out in early summer of the following year. Trees transplant well when they are up to 80cm tall, but they are best put in their final positions when they are about 30 - 45 cm or less tall, this is usually when they are about 5 - 8 years old[200]. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200].

nwatta Landscape Uses:Hedge, Aggressive surface roots possible, Screen, Specimen, Woodland garden. An easily grown plant, it thrives best when growing in a deep well-drained soil in the western parts of Britain where it appreci-

ates the higher rainfall[11]. However, it succeeds in most soils and positions, being especially good on acidic sandy soils[81] but also tolerating some lime[11] so long as there is plenty of humus in the soil[208]. Plants are very shade tolerant when young, but need more sunlight as they grow older[81, 200]. Plants are thin and poor when grown in dry or exposed places[200]. Occasionally cultivated for its timber in Britain, it can grow 60 - 150cm per year[11, 185]. New growth takes place from mid-May to mid-September, at first it hangs downwards but begins to straighten towards the end of the season[185]. There are trees more than 50 metres tall in Britain[200]. Trees live for several centuries in the wild and often produce large quantities of seed[229]. Plants often form pure stands and cast a dense shade, thus preventing the regeneration of other trees whilst being able to reproduce itself[226]. Plants in this genus are notably resistant to honey fungus[200]. Special Features:North American native, Inconspicuous flowers or blooms.

## 7.2.326 *Nothofagus pumilio*

Lenga

6 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 40 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli hjonli

drutta *Nothofagus pumilio* is a deciduous Tree growing to 40 m (131ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Inner bark SapEdible Uses: The sap and scrapings are eaten in spring[69]. The term scrapings probably refers to the inner bark. Inner bark is often dried, ground into a powder and then used as a thickener in soups etc or added to cereals when making bread.

tcanta Lighting WoodUsed for making torches[69]. This is probably a reference to the bark, since this is the part used in *N. betuloides*. Wood - useful[11]. No further details are given.

dwatta None known

propta The seed is best sown as soon as it is ripe in a cool greenhouse or cold frame. Spring-sown seed requires 2 - 3 months stratification at 1 - 5°C[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a lightly shaded position in the cold frame for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. The seed must not be allowed to dry out according to one report[80] whilst another says that the seed can be stored dry at 2°C for long periods[200]. Cuttings of half-ripe wood, 6 - 10cm with a heel, July/August in a frame[78]. Layering.

nwatta Prefers an open well-drained loamy soil in a sunny position[1, 200]. Succeeds on most soils but dislikes calcareous soils[11]. Prefers a pH between 5 and 7, but dislikes acid peats[200]. Prefers cool wet summers in temperate maritime zones[200]. This species is closely related to *N. antarctica*[11]. Trees have poor wind resistance in Britain, probably because they grow so fast[11]. Plants at Crarae in western Scotland are very hardy but fairly slow growing[191]. Trees up to 4 metres tall can be successfully established, though the optimum size for transplanting is about 30 - 80cm. The roots are very sensitive to desiccation and extreme care should be taken when transplanting them[200]. Plants in this genus are notably resistant to honey fungus[200].

## 7.2.327 *Pinus taeda*

Loblolly Pine

6 tlin 9 cyuc 1 kcaak 0 tcan 2 dwat 40 m hkuc htut cyutli hgatkyuctcup hwicli hyishrasjlut hpa7tli flatprik hpa7tmwatli dyat hjonli

drutta *Pinus taeda* is an evergreen Tree growing to 40 m (131ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from

drutta Iberis amara is a ANNUAL growing to 0.3 m (1ft) by 0.2 m (0ft 8in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Edible Uses: CondimentThe seeds are sometimes used as a source of mustard[61, 177, 183]. Pungency of mustard develops when cold water is added to the ground-up seed - an enzyme (myrosin) acts on a glycoside (sinigrin) to produce a sulphur compound. The reaction takes 10 - 15 minutes. Mixing with hot water or vinegar, or adding salt, inhibits the enzyme and produces a mild bitter mustard[238].

tcanta None known

dwatta Antiarrhythmic Antiasthmatic Antirheumatic Antiscorbutic HomeopathyLittle used in modern herbalism, rocket candytuft is a bitter-tasting tonic, aiding digestion and relieving wind and bloating[254]. It is traditionally taken to treat gout, rheumatism and arthritis[254]. All parts of the plant are antirheumatic and antiscorbutic[61]. The seeds are considered very useful in the treatment of asthma, bronchitis and dropsy[4, 240]. The plant is gathered in the summer and can be dried for later use[254]. The seeds are harvested when fully ripe[254]. A common homeopathic remedy is made from the seeds[4].

propta Seed - sow spring in situ for summer flowering or late summer in situ for a spring flowering[200]. The seed germinates within 3 weeks.

nwatta Easily grown in a good, well-drained ordinary garden soil in a sunny position[1]. Prefers a calcareous soil but tolerates mildly acid soils[1]. Succeeds in poor soils[200] and on dry walls[1]. A very ornamental plant[1]. A fast growing plant[188], do not grow the plants too close together[1]. The flowers are sweetly scented[245].

## 7.2.410 Ilex macropoda

6 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Ilex macropoda is a deciduous Tree growing to 13 m (42ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in June, and the seeds ripen from October to November. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). . Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Edible Uses: TeaA tea is made from the leaves[177].

tcanta None known

dwatta None known

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. It can take 18 months to germinate. Stored seed generally requires two winters and a summer before it will germinate and should be sown as soon as possible in a cold frame. Scarification, followed by a warm stratification and then a cold stratification may speed up the germination time[78, 80]. The seedlings are rather slow-growing. Pot them up into individual pots when they are large enough to handle and grow them on in light shade in a cold frame for their first year. It is possible to plant them out into a nursery bed in late spring of the following year, but they should not be left here for more than two years since they do not like being transplanted. Alternatively, grow them on in their pots for a second season and then plant them out into their permanent positions in late spring or early summer. Give them a good mulch and some protection for their first winter outdoors. Cuttings of almost ripe wood with a heel, August in a shaded position in a cold frame. Leave for 12 months before potting up. Layering in October. Takes 2 years.

nwatta Succeeds in most soils so long as they are not water-logged[200]. This species is closely related to I. mon-

tana[200]. Resents root disturbance, especially as the plant grows older[1, 11]. It is best to place the plants into their permanent positions as soon as possible, perhaps giving some winter protection for their first year or two[K]. Dioecious. Male and female plants must be grown if seed is required.

## 7.2.411 Paeonia potaninii

Tree Peony

6 tlin 9 cyuc 1 kcaak 0 tcan 2 dwat 0.6 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikrip hpa7tli flatpriklwisslip hpa7tmwatli fyfixre7t hjonli

drutta Paeonia potaninii is a deciduous Shrub growing to 0.6 m (2ft) by 1.5 m (5ft in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FlowersEdible Uses: The following use is for P. suffruticosa. It quite probably also applies to this closely-related species.[K - see 214]. Flowers - cooked[46, 61, 177]. The fallen flower petals are parboiled and sweetened for a teatime delicacy, or cooked in various dishes[183].

tcanta None known

dwatta Analgesic Antibacterial Antiinflammatory Antispasmodic Cholera DysenteryThe bark obtained from the root has an antimicrobial effect upon various bacteria, including Escherichia coli, typhoid, cholera, Staphylococcus aureus, streptococcus hemolyticus and Pneumococci[250]. The root is also anti-inflammatory and has been used with success in the treatment of arthritic joint swelling[250]. The root is also analgesic, sedative and anticonvulsant, it has a high success rate in the treatment of dysentery and can also be used to treat allergic rhinitis[250]. The plant is used internally in the treatment of fevers, boils, menstrual disorders, nosebleeds, ulcers, irritability and gastro-intestinal infections[238]. This remedy should only be used under the supervision of a qualified practitioner[238]. The herb acts as a synergist when used with liquorice (Glycyrrhiza spp)[218]. A tea made from the dried crushed petals of various peony species has been used as a cough remedy, and as a treatment for haemorrhoids and varicose veins[250].

propta Seed - best sown as soon as it is ripe in a cold frame[250]. When sown fresh, the seed produces a root about 6 weeks after sowing with shoots formed in the spring[200]. Stored seed is much slower, it should be sown as soon as possible in a cold frame but may take 18 months or more to germinate[200]. The roots are very sensitive to disturbance, so many growers allow the seedlings to remain in their pots for 2 growing seasons before potting them up. This allows a better root system to develop that is more resilient to disturbance[250]. If following this practice, make sure you sow the seed thinly, and give regular liquid feeds in the growing season to ensure the plants are well fed. We usually prick out the seedlings into individual pots as soon as they are large enough to handle, and then grow them on in a cold frame for at least two growing seasons before planting them out when they are in growth in the spring[K]. Division of suckers in the dormant season. They are probably best potted up and grown on in light shade in a greenhouse until they are established.

nwatta Requires a deep rich soil, preferably neutral or slightly alkaline[1], doing quite well in sun or light shade[1]. Prefers a limy soil and a sheltered position[200]. Plants are tolerant of a wide range of soil conditions, but will not survive if the soil becomes waterlogged or is too dry[250]. This species is lime tolerant[200]. Plants grown on sandy soils tend to produce more leaves and less flowers, whilst those growing on clay take longer to become established but produce better blooms[250]. Hardy to about -20°C[184], plants do better in the north of Britain than they do in the south and are generally best if given an open northerly aspect[11]. Closely related to P. delavayi, differing mainly in the size of the flowers, its more dissected leaves and its suckering habit[11]. This species is not recognised by Chinese botanists, who hold that it is no more than a form of P. delavayi[214]. A very ornamental plant[1]. It grows best in

areas with long hot summers[1] and requires an airy position because it is very subject to fungal attack[11]. Plants in this genus are notably susceptible to honey fungus[200]. Plants come into growth early in the year and are then subject to damage by late frosts, they are therefore best sited in a position that is shaded from the early morning sun[11]. The branches are brittle and very subject to wind damage, especially when young[200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. A very greedy plant inhibiting the growth of nearby plants, especially legumes[54]. The plant does not really need much pruning apart from removing dead or diseased stems. It is, however, very tolerant of pruning and can be cut right back to ground level if it requires rejuvenation[200]. Strongly resents root disturbance, taking some time to recover after being divided[1]. Peony species are usually self-fertile, though they will also hybridise with other species if these flower nearby at the same time[250]. Plants take 4 - 5 years to flower from seed[200]. They generally breed true from seed[1]. Cultivated in China as a medicinal plant[214].

### 7.2.412 *Micromeria juliana*

Savory

6 tlin 9 cyuc 1 kcak 0 tcan 1 dwat 0.3 m hkuc  
htut cyutli kyuctcup hwicli hyishrasjlut hpa7tli flatprikliwis  
hpa7tmwatli xre7t hjonli

drutta *Micromeria juliana* is a deciduous Shrub growing to 0.3 m (1ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Edible Uses: CondimentLeaves are used as a food flavouring[183], a substitute for savory (*Satureia* spp.).

tcanta None known

dwatta Diuretic KidneyUsed in the treatment of kidney and bladder ailments[148].

propta Seed - sow spring in a greenhouse[188]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood with a heel, July/August in a frame[188].

nwatta Prefers an open position in a well-drained soil[1]. Succeeds in poor soils[200]. Requires a sunny position[188].

### 7.2.413 *Sedum rupestre*

Crooked Yellow Stonecrop

6 tlin 9 cyuc 1 kcak 2 tcan 0 dwat 0.1 m hkuc  
hmimhtut cyutli hqatkyuctcup hwicli hrasjlutnyik hpa7tli  
prikliwis hpa7tmwatli fyifxre7t hjonli

drutta *Sedum rupestre* is an evergreen Perennial growing to 0.1 m (0ft 4in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked[4, 52, 115, 183]. A slightly astringent sour taste makes this plant a useful addition to a green tossed salad and it can also be added to soups or used as a vegetable[9, 183]. Used in salads, it has a fine relish[2].

tcanta Agroforestry Uses: A good ground cover plant for a sunny position[188 ]. The somewhat open growth habit makes it suitable for growing with larger bulbs such as some

lilies[K ]. Place starter plants 20 - 30cm apart in order to obtain rapid massing as a ground cover[352 ]. The plant is used on 'green roof' and 'green wall' systems in Korea. These systems are incorporated into the structure of the building, providing habitats for wildlife as well as insulating the building and helping to improve the environment. The cultivar 'Blue Spruce' has been specifically mentioned[1240 , 1241 ]

dwatta None known

propta Seed - surface sow in spring in well-drained soil in a sunny position in a greenhouse. Do not allow the soil to dry out. Prick out the seedlings into individual pots when they are large enough to handle. If sufficient growth is made, it is possible to plant them out during the summer, otherwise keep them in a cold-frame or greenhouse for their first winter and plant them out in early summer of the following year[K]. Division is very easy and can be carried out at almost any time in the growing season, though is probably best done in spring or early summer. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Succeeds in most soils[188] but prefers a fertile well-drained soil[200]. Requires a sunny position[188, 200]. The plant flowers best when grown in a sunny position, though it also succeeds in semi-shade[219]. Established plants are very drought tolerant[200], they grow well in dry soils and can also be grown in a crevice on a wall[200, 219]. This species is hardy to about -15°C[200]. A mat forming plant, it spreads rapidly and it is not suitable for the rockery[83]. All members of this genus are said to have edible leaves, though those species, such as this one, that have yellow flowers can cause stomach upsets if they are eaten in quantity[62, 85]. Plants in this genus seem to be immune to the predations of rabbits[233]. The plant is heat tolerant in zones 9 through 6. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. An evergreen. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2].

### 7.2.414 *Orychophragmus violaceus*

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 0.3 m hkuc

drutta *Orychophragmus violaceus* is a ANNUAL/BIENNIAL growing to 0.3 m (1ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves - cooked[200].

tcanta None known

dwatta None known

propta Seed - sow in situ in spring or early summer.

nwatta Succeeds in a fertile well-drained soil in a sunny position[200]. Plants are not very cold-tolerant[188], but they can be overwintered outdoors in areas where winter temperatures do not fall below about -5°C[200]. This species is cultivated as a vegetable in China[200].

### 7.2.415 *Chionographis japonica*

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 0.3 m hkuc  
hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis

hpa7tmwatli xre7t hjonli

drutta Chionographis japonica is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from April to May. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves and young plants[177]. No more details are given.

tcanta None known

dwatta None known

propta Seed - we have no details for this species but suggest sowing the seed in a greenhouse as soon as it is ripe if possible otherwise in early spring. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring or after flowering in the summer.

nwatta Prefers a moisture-retentive but well-drained humus-rich loamy soil and a position in light dappled shade[1, 200]. It is well suited to the woodland garden[200]. Plants are hardy to about -15°C but they often require some protection in the winter, especially in areas where cold temperatures are prolonged[200].

### 7.2.416 Paeonia brownii

Brown's Peony

6 tlin 9 cyuc 1 kcak 0 tcan 2 dwat 0.5 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyikfrp hpa7tli flatprik-wis hpa7tmwatli fyifxre7t hjonli

drutta Paeonia brownii is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Root. A liquorice flavour[105, 161].

tcanta BeadsThe seeds can be used as beads in necklaces etc[257].

dwatta Antitussive Cardiac Febrifuge Laxative Pectoral Poulitce TBThe root is cardiac, febrifuge, laxative and pectoral[257]. A decoction has been used by some native North American Indian tribes in the treatment of pneumonia, tuberculosis, VD, nausea, indigestion, coughs, diarrhoea and kidney troubles[207, 257]. A decoction of the sun-dried roots has been used to help people put on weight[257]. A decoction of the root has been used as a liniment on swellings[257]. An infusion of the root has been used as a wash for sore eyes[257]. A powder of the dried and ground root can be used as a dressing on cuts, wounds, burns and sores[257]. A poultice of the crushed roots has been used to treat boils, deep cuts and wounds[257]. A cold infusion of the seeds has been used as a cough medicine[257]. A tea made from the dried crushed petals of various peony species has been used as a cough remedy, and as a treatment for haemorrhoids and varicose veins[250].

propta Seed - best sown as soon as it is ripe in a cold frame[250]. When sown fresh, the seed produces a root about 6 weeks after sowing with shoots formed in the spring[200]. Stored seed is much slower, it should be sown as soon as possible in a cold frame but may take 18 months or more to germinate[200]. The roots are very sensitive to disturbance, so many growers allow the seedlings to remain in their pots for 2 growing seasons before potting them up. This allows a better root system to develop that is more resilient to disturbance[250]. If following this practice, make sure you sow the seed thinly, and give regular liquid feeds in the growing season to ensure the plants are well fed. We usually prick out the seedlings into individual pots as soon as they are large enough to handle, and then grow them on in a cold frame for at least two growing seasons before planting them out when they are in growth in the spring[K]. Division with great care in spring or autumn. Each portion must have

a leaf bud. If the lifted root is stood in shade for several hours it becomes less brittle and easier to divide[200]. Divisions that have several buds will usually flower in the second year, but those that only have one or two buds will take a number of years before they have grown sufficiently to flower[250].

nwatta Requires a deep rich soil, preferably neutral or slightly alkaline[1], doing quite well in sun or light shade[1, 200]. Plants are tolerant of a wide range of soil conditions, but will not survive if the soil becomes waterlogged or is too dry[250]. This species requires an extremely well-drained soil[250]. This species is lime tolerant[200]. Plants grown on sandy soils tend to produce more leaves and less flowers, whilst those growing on clay take longer to become established but produce better blooms[250]. A very cold-hardy plant, tolerating temperatures down to about -30°C[250]. A long-lived plant, specimens can survive in the garden for at least 50 years[200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. A very greedy plant inhibiting the growth of nearby plants, especially legumes[54]. Strongly resents root disturbance, taking some time to recover after being divided[1]. Peony species are usually self-fertile, though they will also hybridise with other species if these flower nearby at the same time[250]. Plants take 4 - 5 years to flower from seed[200]. They generally breed true from seed[1].

### 7.2.417 Geranium viscosissimum

Sticky Geranium, Sticky purple geranium

6 tlin 9 cyuc 1 kcak 0 tcan 2 dwat 0.8 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik-wis hpa7tmwatli xre7t hjonli

drutta Geranium viscosissimum is a PERENNIAL growing to 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers LeavesEdible Uses: Flowers - added to salads or used as a garnish[172, 183]. Leaves - raw or cooked. Not choice[172].

tcanta None known

dwatta Astringent Salve StypticThe whole plant is astringent, salve and styptic[176]. An infusion of the leaves, plus a sweat bath with the leaves, is used as a treatment for colds[257]. It is used as a gargle in the treatment of sore throats[176]. An infusion of the leaves or the roots is used as a wash for sore eyes[257]. A poultice of the leaves or roots has been applied to cuts, sores etc[257].

propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring or autumn. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Succeeds in any good soil in sun or partial shade[187]. Plants are hardy to about -25°C[187]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. This species is closely related to *G. nervosum*[200].

### 7.2.418 Polypodium glycyrrhiza

Licorice Fern

6 tlin 9 cyuc 1 kcak 0 tcan 2 dwat 0.5 m hkuc

hmimhtut cyutli hgattcup hwicli hrasjlutnyik hpa7tli flatprik-wis hpa7tmwatli hjonli

drutta Polypodium glycyrrhiza is a FERN growing to 0.5 m (1ft 8in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. The seeds ripen from November to March. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil and can tolerate drought.

kcakta Edible Parts: RootEdible Uses: Root - raw or cooked[257] The root is sweetly liquorice-flavoured but is

thin and fibrous and virtually inedible[200]. The root was commonly chewed for its very pleasant flavour by many native North American Indian tribes[256, 257]. It was often used as an appetiser, especially for children who would not eat[256]. Apart from its used as a pleasantly flavoured chew, it was seen as a famine food and was only used when there was a shortage of better foods[177, 257].

tcanta None known

dwatta Alterative Carminative Haemostatic PectoralLiquorice fern was employed medicinally by several native North American Indian tribes who used it especially as a treatment for a variety of chest complaints[257]. It is little, if at all, used in modern herbalism. The rhizomes are alterative, carminative, haemostatic and pectoral[257]. The raw rhizomes have been eaten, or an infusion has been used, in the treatment of coughs and colds, chest pains, shortness of breath and VD[257]. The roots have been chewed, and the juice swallowed, as a treatment for sore throats and the spitting or vomiting of blood[257]. A tea of the pounded boiled rhizomes, mixed with fir needles, has been used to treat measles[213]. Coughs have been treated by chewing and slowly swallowing the juice of the roasted rhizome[213]. The roots have been used in the treatment of colds and sore throats[256].

propta Spores - best sown as soon as ripe on the surface of a humus-rich sterilized soil. Keep the compost moist, preferably by putting a plastic bag over the pot. Pot on small clumps of plantlets as soon as they are large enough to handle and keep humid until they are well established. Do not plant outside until the ferns are at least 2 years old and then only in a very well sheltered position. Division in spring[200].

nwatta Tolerates short periods of drought and direct sunlight, but it prefers bright filtered light[200]. Plants can be grown on a drystone wall[200]. Members of this genus are rarely if ever troubled by browsing deer[233]. There are several named varieties selected for their ornamental value[200]. Polypodium glycyrrhiza hybridizes with *P. calirhiza* and with *P. hesperium* to produce sterile triploids with misshapen spores[270]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. An evergreen. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

## 7.2.419 *Carthamus lanatus*

Distaff Thistle

6 tlin 10 cyuc 1 kcaak 1 tcan 1 dwat 0.6 m hkuc  
htut cyutli kyuctcup hwicli hyishrasjlut hpa7tli flatprikwis  
hpa7tmwatli xre7t hjonli

drutta *Carthamus lanatus* is a ANNUAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcaakta An edible oil is obtained from the seed[105, 183].

tcanta An oil is obtained from the seed[240], though the report gives no more details[K].

dwatta The plant is anthelmintic, diaphoretic and febrifuge[240].

propta Seed - sow spring in gentle heat in a greenhouse. Germination usually takes place within 2 - 4 weeks at 15°C[138]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out into their permanent positions in late spring or early summer. The seed can also be sown in situ in April/May[138] but plants may not then mature their seed.

nwatta Succeeds in ordinary garden soil[1]. Requires a position in full sun[138]. This species is a potentially serious pest plant in N. America[274].

## 7.2.420 *Corydalis incisa*

Incised fumewort

6 tlin 10 cyuc 1 kcaak 0 tcan 1 dwat 0.3 m hkuc

hmim cyutli tcup hwicli hrasjlut hpa7tli flatprikwis  
hpa7tmwatli xre7t hjonli

drutta *Corydalis incisa* is a ANNUAL/BIENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcaakta Edible Parts: LeavesEdible Uses: Young plant - cooked in spring[177, 178, 179]. Slightly deleterious[178].

tcanta MiscellanyNone known

dwatta MiscellanyThe dried and powdered flowers are used in the treatment of rectal collapse[218]. An aqueous decoction of the plant is used in the treatment of abscesses[218]. Used in China and Japan in folk medicine to treat inflammation, headaches, skin diseases, and other ailments [1-7].

propta Seed - best sown as soon as it is ripe, the seed rapidly loses viability if it is allowed to become dry[129]. Surface sow and keep moist, it usually germinates in 1 - 3 months at 15°C[164]. Germinates in spring according to another report[129]. Two months warm, then a cold stratification improves the germination of stored seed[134, 164]. Seedlings only produce one leaf in their first year of growth[175] and are very prone to damping off[129]. This species is a biennial and probably germinates more easily than the perennial species.

nwatta Can be invasive outside its natural range. *Corydalis incisa* is an annual or biennial, spring-ephemeral herb. Seeds germinate in the spring and develop small rosettes, which wither during the summer. They emerge again as rosettes throughout the winter and produce compact flowering racemes the following spring [1-7]. In its native range in Asia, *C. incisa* occurs along stream valleys, irrigation channels, and forest margins; in wastelands, roadsides, and forestlands; and on rock walls. In the United States, it grows in mesic and alluvial forest habitats. Under horticultural conditions, *C. incisa* prefers cooler exposures [1-7]. The known distribution globally has Plant Hardiness Zones 6-10, areas with 20-100+ inches of annual precipitation, and the following Köppen-Geiger climate classes: humid subtropical, marine west coast, humid continental with warm summers, and humid continental with cool summers. There is no evidence that *C. incisa* occurs in Mediterranean climates. It is potentially suitable because the plants usually are dormant during the summer when conditions are driest in Mediterranean climates [1-7]. The following notes are based on the general needs of the genus. Prefers a moist, well-drained rather light soil, thriving in semi-shade[1]. Grows well in a woodland garden or peat bed. Plants seem to be immune to the predations of rabbits[233].

## 7.2.421 *Meconopsis aculeata*

6 tlin 9 cyuc 1 kcaak 0 tcan 2 dwat 0.6 m hkuc  
hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik  
hpa7tmwatli xre7t hjonli

drutta *Meconopsis aculeata* is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcaakta Edible Parts: LeavesEdible Uses: The plant is said to be edible[145] but no further details are known, not even which part of the plant can be eaten.

tcanta None known

dwatta Analgesic Febrifuge NarcoticThe root contains narcotic principles[211, 240]. The entire plant is used in Tibetan medicine, where it is considered to have a bitter taste and a cooling potency[241]. Analgesic and febrifuge, it is used to help heal broken bones, to treat inflammation from fractures and pain in the upper bodily region, especially around the ribs[241].

propta Seed - best sown in a cold frame as soon as it is ripe in late summer. Spring sown seed is slower to germinate[200]. When they are large enough to handle, prick the

seedlings out into individual pots and plant them out in the summer.

nwatta Grows best in a woodland soil in partial shade[1, 200]. The soil should be lime-free, moist, well-drained and moderately rich[200]. Dislikes full sun and windy positions[200]. Monocarpic, the plants living for a number of years before flowering but then dying once they flower[200].

### 7.2.422 *Mimulus moschatus*

Musk Monkey Flower, Muskflower

6 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat m hkuc  
hmimhtut cyutli tcuphja7n hwicli hrasjlutnyikfrp hpa7tli flat-prikklwis hpa7tmwatli hjonli

drutta *Mimulus moschatus* is a PERENNIAL growing to 0.3 m (1ft) by 0.6 m (2ft in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcaakta Young plant - boiled and used for food[257].

tcanta None known

dwatta None known

propta Seed - sow spring in a greenhouse and only lightly cover the seed[200]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. If you have sufficient seed it can also be sown in situ in late spring after the last expected frosts[200]. Division in spring[200]. Very easy, large divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer. Cuttings of softwood, 5cm long in spring or summer[200].

nwatta Prefers rather moist places such as damp borders, margins of streams and boggy spots[1, 111]. Grows well in heavy clay soils. Thrives in full sun so long as the soil does not dry out[200], otherwise it is best grown in partial shade[187]. Grows well in shallow water, but it can be invasive[200]. Hardy to at least -15°C[200]. There are some named varieties, selected for their ornamental value[200]. All parts of the plant have a musky scent, though the form naturalized in Britain, and most cultivars, appear to be scentless[17, 200].

### 7.2.423 *Sedum album*

Small Houseleek, White stonecrop, Sedum, Stonecrop

6 tlin 8 cyuc 1 kcaak 3 tcan 1 dwat 0.1 m hkuc  
htut cyutli hgatkyuctcup hwicli hyishrasjlutnyik hpa7tli flat-prikklwis hpa7tmwatli fyifxre7t hjonli

drutta *Sedum album* is an evergreen Perennial growing to 0.1 m (0ft 4in) by 0.5 m (1ft 8in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in leaf all year, in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

kcaakta Edible Parts: Leaves Edible Uses: Leaves - raw or cooked[2, 46, 52, 100]. Usually eaten as a pickle[4], though it can also be added to salads or cooked with other leafy vegetables[244].

tcanta Agroforestry Uses: The plant spreads aggressively and can be used for ground cover in a sunny position amongst plants tall enough not to be overrun by it. It is best planted about 45cm apart each way[208]. Strong growing bulbs such as some lilies will grow happily through this ground cover[K]. The plant can grow in very low moisture levels and has been used as a green covering on roofs[372]. Green roofs are incorporated into the structure of the building, providing habitats for wildlife as well as insulating the

building and helping to improve the environment. The subspecies *minima* and the cultivars 'Athorum' and 'Coral Carpet' have been specifically mentioned in this respect.

dwatta Antinflammatory Poultice The leaves and stems are applied externally as a poultice to inflammations and are especially recommended for treating painful haemorrhoids[4, 244].

propta Seed - surface sow in spring in well-drained soil in a sunny position in a greenhouse. Do not allow the soil to dry out. Prick out the seedlings into individual pots when they are large enough to handle. If sufficient growth is made, it is possible to plant them out during the summer, otherwise keep them in a cold-frame or greenhouse for their first winter and plant them out in early summer of the following year[K]. Division is very easy and can be carried out at almost any time in the growing season, though is probably best done in spring or early summer. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Landscape Uses: Alpine garden, Border, Container, Ground cover, Rock garden, Specimen. A very easily grown plant, it succeeds in most soils[188] but prefers a fertile well-drained soil[200]. Established plants are drought tolerant[190, 200], they grow well in dry soils and succeed on a wall[190]. Requires a sunny position[188]. Plants spread rapidly and aggressively at the roots[190]. If clearing the plant from an area it is quite important to try and remove every part of the plant since even a leaf or a small part of the stem, if left on the ground, can form roots and develop into a new plant[200]. This species has white flowers. All members of this genus are said to have edible leaves, though those species that have yellow flowers can cause stomach upsets if they are eaten in quantity[62, 85]. Plants in this genus seem to be immune to the predations of rabbits[233]. Special Features: Attractive foliage, Not North American native, Invasive. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. An evergreen. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2].

### 7.2.424 *Farfugium japonicum*

Leopard Plant

6 tlin 10 cyuc 1 kcaak 0 tcan 1 dwat 0.8 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flat-prikklwis hpa7tmwatli xre7t hjonli

drutta *Farfugium japonicum* is an evergreen Perennial growing to 0.8 m (2ft 7in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from November to December. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Stem Edible Uses: Leaf stems - cooked[46, 61, 177]. The leaf stems are boiled in water to remove a bitter taste, the outer peel is removed and they are then added to salads, soups etc[183].

tcanta None known

dwatta Antidote Poultice The leaves are antidote[218]. They are taken internally to treat fish poisoning and externally to treat lacquer poisoning[218]. They are also applied to suppurating abscesses and pox[218].

propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring.

nwatta Landscape Uses: Border, Foundation, Massing, Specimen, Woodland garden. Prefers a deep moist fertile humus-rich soil[200]. Requires a sheltered position[166]. Plants often wilt on bright sunny days if they are growing in a sunny position[200]. This species is not very hardy, tolerating temperatures down to between -5 to -10°C[200] and

succeeding outdoors in a woodland garden in the milder areas of Britain[166]. A good plant for growing in a window[1]. There is possibly some confusion, in the references quoted, between this species and *Ligularia japonica*[K]. Special Features: Attractive foliage, Attracts butterflies.

### 7.2.425 *Anemone rivularis*

Cao Yu Mei  
6 tlin 9 cyuc 1 kcak 0 tcan 2 dwat 0.6 m hkuc  
pcimhmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprikwis hpa7tmwatli fyfxre7t hjonli

drutta *Anemone rivularis* is a PERENNIAL growing to 0.6 m (2ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from April to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: Seeds - roasted and pickled[272].

tcanta None known

dwatta Analgesic Antidote Antiemetic VermifugeThe plant is said to be antiemetic and vermifuge[91]. It is said to warm the stomach and stop vomiting. A paste made from the plant is used in Nepal to treat coughs and fevers[272]. The juice of the leaf, mixed with water, is inhaled through each nostril to treat sinusitis[272]. The seeds are used in Tibetan medicine, they are said to have a bitter and acrid taste with a heating potency[241]. Analgesic and antidote, they are used in the treatment of rotting tissues, snake poisoning and stomach/intestinal pain from worm infestation[241]. A decoction of the root is applied externally to cuts and wounds[272].

propta Seed - best sown in a cold frame as soon as it is ripe in the summer[1]. Surface sow or only just cover the seed and keep the soil moist. Sow stored seed as soon as possible in late winter or early spring, it requires 3 - 5 weeks cold stratification. The seed usually germinates in 1 - 6 months at 20°C[133]. When large enough to handle, prick the seedlings out into individual pots and grow them on for at least their first year in a lightly shaded place in a greenhouse. When large enough, plant them out into their permanent positions in the spring. Division in late summer after the plant dies down.

nwatta Easily grown in a moist well-drained soil in sun or semi-shade[187]. Succeeds in ordinary garden soil but prefers a rich sandy loam[1]. Requires a damp soil, doing well by water[1, 111]. A very ornamental plant[1], it is hardy to about -20°C[187]. This species is closely related to *A. narcissiflora*[233]. Plants seem to be immune to the predations of rabbits[233]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

### 7.2.426 *Coprosma pumila*

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 0.1 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli nyanhjen hjonli

drutta *Coprosma pumila* is an evergreen Shrub growing to 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: CoffeeFruit - raw or cooked. Sweet, but with little flavour[225]. The orange-red fleshy fruit is about 7mm in diameter, though forms with fruits up to 13mm have been seen[225]. The roasted seed is an excellent coffee substitute[153].

tcanta DyeA yellow dye is obtained from the wood, it does not require a mordant[153].

dwatta None known

propta Seed - probably best sown as soon as it is ripe in a greenhouse or cold frame[K]. Sow stored seed in spring

in a cold frame[200]. Germination can be slow, often taking more than 12 months even when fresh seed is used[K]. When the seedlings are large enough to handle, prick them out into individual pots. Grow on the plants for at least their first winter in a greenhouse and plant out in late spring or early summer. Give the plants some protection from the cold for their first winter outdoors[K]. Cuttings of mature wood of the current year's growth, autumn in a frame.

nwatta Requires a moist, very well-drained neutral to slightly acid soil in full sun or light shade[200]. Prefers a permanent moist and peaty soil, but it is not an easy plant to grow in Britain[225]. Somewhat intolerant of frost, this species is only likely to succeed outdoors in the milder areas of Britain[200]. Another report says that it is fully hardy in Britain[225]. Closely related to *C. atropurpurea* and often confused with that species[225]. It is a very variable plant, hybridizing freely with other members of this genus[200, 225]. Plants are normally dioecious, though in some species the plants produce a few flowers of the opposite sex before the main flowering and a few hermaphrodite flowers are sometimes produced[225]. Male and female plants must usually be grown if seed is required. There is some confusion over the correct name of this species, it could be a part of *C. petriei*[200].

### 7.2.427 *Aletris farinosa*

Unicorn Root - Colic Root, White colicroot  
6 tlin 9 cyuc 1 kcak 0 tcan 3 dwat 0.6 m hkuc  
htut cyutli tcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta *Aletris farinosa* is a PERENNIAL growing to 0.6 m (2ft) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Bulb - cooked[105, 161, 177]. Intensely bitter[2]. A bitter-sweet soapy taste[238].

tcanta None known

dwatta Antiflatulent Antiinflammatory Appetite Stimulants Appetizer Bitter Diuretic Dysentery Narcotic TonicThe greatest value of unicorn root is its tonic influence on the female generative organs, proving to be of great use in treating cases of habitual miscarriages[4]. Used for gynaecological disorders or 'female complaints' in the US including dysmenorrhoea, amenorrhoea and prolapsed vagina complaints [301]. It also promotes the appetite and is used in the treatment of diarrhoea, rheumatism and jaundice[222]. The root is bitter, diuretic, narcotic and tonic[1, 21, 46, 213]. Only use the dried rootstock[21], in large doses the fresh root is somewhat narcotic, emetic and cathartic[4]. A decoction of the root is a bitter tonic and has been used for expelling flatulence and for various uterine disorders[207, 222]. It is used in the treatment of colic, though small doses, especially of the fresh root[4], can cause hypogastric colic[222]. The root is harvested in late summer after flowering and dried for later use[238]. The root contains diosgenin, which has both anti-inflammatory and oestrogenic properties[222]. A tea of the leaves has been used in the treatment of colic, stomach disorders, dysentery and bloody dysentery[213, 257].

propta Seed - we have no details for this species but suggest sowing the seed in a greenhouse in early spring. Sow the seed thinly to allow the seedlings to be grown on for their first year without potting them up, but give a liquid feed from time to time to ensure that they do not become nutrient deficient. Prick the young plants out into individual pots the following spring and grow them on in the greenhouse for the next winter. Plant them out into their permanent positions in early summer. Division in spring.

nwatta Prefers a damp sunny position in peat, leafmold and sand[1]. Requires a sunny position[200]. Plants are hardy to between -10 and -15°C[200].

### 7.2.428 *Lysimachia fortunei*

6 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 0.5 m hkuc  
hmimhtut cyutli tcuphja7nhs6s hwicli hrasjlutnyikfrip  
hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta *Lysimachia fortunei* is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can grow in water.

kcakta Edible Parts: Leaves Edible Uses: Condiment The young plant is edible[177, 179]. No more details are given. The leaves are also used as a condiment[46, 61, 177].

tcanta None known  
dwatta None known

propta Seed - sow autumn in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring or autumn[200]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta An easily grown plant, succeeding in a moist loamy soil[1]. Judging by its native habitat, it should succeed in shallow water. Grows well in heavy clay soils. Most species in this genus seem to be immune to the predations of rabbits[233].

### 7.2.429 *Artemisia maritima*

Sea Wormwood  
6 tlin 9 cyuc 1 kcaak 0 tcan 2 dwat m hkuc  
htut cyutli hgatkuyctcup hwicli hyishrasjlut hpa7tli flatprikliwshsom hpa7tmwatli xre7t hjonli

drutta *Artemisia maritima* is a deciduous Shrub growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in saline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

kcakta Edible Parts: Edible Uses: Condiment The leaves are occasionally used as a flavouring[183]. Some caution is advised, see the notes above on toxicity.

tcanta Repellent Strewing The growing shoots are said to repel insects and mice[6, 18, 20], they have also been used as a strewing herb[4, 14]. An infusion is said to discourage slugs and insects[14, 18].

dwatta Anthelmintic Antiseptic Antispasmodic Carminative Cholagogue Emmenagogue Febrifuge Stimulant Stomachic Tonic Vermifuge Sea wormwood is not much used in herbal medicine, though it is often used domestically. Its medicinal virtues are similar to wormwood, *A. absinthum*, though milder in their action. It is used mainly as a tonic to the digestive system, in treating intermittent fevers and as a vermifuge[4]. The leaves and flowering shoots are anthelmintic, antiseptic, antispasmodic, carminative, cholagogue, emmenagogue, febrifuge, stimulant, stomachic, tonic and vermifuge[4, 145]. The plant is harvested as it comes into flower and is dried for later use[4]. The unexpanded floral heads contain the vermicide 'santonin'[218].

propta Seed - surface sow from late winter to early summer in a greenhouse, making sure that the compost does not dry out[200]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant out in late spring or early summer. Cuttings of half-ripe wood, July/August in a frame. Division in spring or autumn[200].

nwatta Succeeds in any soil but prefers a poor dry soil with a warm aspect[37]. Easily grown in a well-drained circumneutral or slightly alkaline loamy soil, preferring a sunny position[1, 200]. Plants are longer lived, more hardy and

more aromatic when they are grown in a poor dry soil[245]. Tolerates a pH in the range 6.0 to 7.6. Dislikes shade. Established plants are very drought tolerant[190, 200]. Tolerates maritime exposure[190]. The whole plant has a sweet aromatic smell[245]. Plants in this genus are notably resistant to honey fungus[200]. Members of this genus are rarely if ever troubled by browsing deer[233].

### 7.2.430 *Carduus crispus*

Wetted Thistle, Curly plumeless thistle

htut cyutli hgattcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Carduus crispus* is a BIENNIAL growing to 0.9 m (3ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to August, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil and can tolerate drought.

kcakta Edible Parts: Leaves Oil Edible Uses: Oil Young leaves - cooked[105]. An emergency food, used when all else fails[177].

tcanta Oil The seed of all species of thistles yields a good oil by expression[4]. No details of potential yields etc are given[K]. A favorite foodplant of caterpillars of the Painted Lady butterfly (*Vanessa cardui*).

dwatta Alterative Anodyne The root is alterative and anodyne[178, 218].

propta Seed - sow spring in situ.

nwatta Succeeds in a sunny position in ordinary garden soil[1, 200]. This species is closely related to *C. acanthoides*[17].

### 7.2.431 *Scabiosa japonica*

6 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 0.3 m hkuc  
htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwslip hpa7tmwatli xre7t hjonli

drutta *Scabiosa japonica* is a BIENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to September, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Leaves Root Edible Uses: Leaves - cooked. Eaten boiled[105, 177]. Root[105, 177, 179]. No more details are given.

tcanta None known  
dwatta None known

propta Seed - sow spring in a cold frame. The seedlings are subject to damping off[1] so water with care and make sure to give adequate ventilation. Prick out the seedlings into individual pots once they are large enough to handle and plant them out into their permanent positions in the summer.

nwatta Prefers a neutral or alkaline soil and a sunny position[200]. Succeeds in ordinary garden soil[1]. Requires a well-drained soil[200]. Members of this genus are rarely if ever troubled by browsing deer[233].

### 7.2.432 *Conradina verticillata*

Cumberland Rosemary  
6 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 0.3 m hkuc  
htut cyutli tcup hwicli hras hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Conradina verticillata* is a deciduous Shrub growing to 0.3 m (1ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic

(mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

**kcakta** Edible Parts: Edible Uses: CondimentThe leaves have a strong pleasant scent, reminiscent of rosemary, and are used as a rosemary substitute as a flavouring in cooking[183].

**tcanta** None known

**dwatta** None known

**propta** Seed - sow spring in a greenhouse[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out in late spring or early summer, after the last expected frosts. Cuttings of new shoots in spring in a frame[200].

**nwatta** Requires a light soil and a very sunny position[200]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°C[200]. This is an endangered species in the wild[183].

### 7.2.433 *Ranunculus californicus*

California Buttercup

6 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 0.6 m hkuc  
hmimhtut cyutli tcup hwicli hrasjltutnyik hpa7tli flatprikwis  
hpa7tmwatli xre7t hjonli

**drutta** *Ranunculus californicus* is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

**kcakta** Edible Parts: SeedEdible Uses: Seed - cooked[257]. It is usually ground into a powder and can then be used as a mush with water, a flavouring in soups, or mixed with cereals when making bread etc[105, 161, 257].

**tcanta** None known

**dwatta** None known

**propta** Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring. Larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

**nwatta** Prefers a moist loamy soil[1]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

### 7.2.434 *Coprosma atropurpurea*

6 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 0.1 m hkuc  
hmimhtut cyutli tcup hwicli hrasjltut hpa7tli flatprik  
hpa7tmwatli nyanhjen hjonli

**drutta** *Coprosma atropurpurea* is an evergreen Shrub growing to 0.1 m (0ft 4in) by 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from July to August. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**kcakta** Edible Parts: FruitEdible Uses: CoffeeFruit - raw[173]. Sweet, but with little flavour[225, K]. The wine-red fruit is about 8 - 12mm in diameter[200, 225]. The roasted seed is an excellent coffee substitute[153].

**tcanta** DyeA yellow dye is obtained from the wood, it does not require a mordant[153].

**dwatta** None known

**propta** Seed - probably best sown as soon as it is ripe in a greenhouse or cold frame[K]. Sow stored seed in spring in a cold frame[200]. Germination can be slow, often taking more than 12 months even when fresh seed is used[K]. When the seedlings are large enough to handle, prick them out into individual pots. Grow on the plants for at least their

first winter in a greenhouse and plant out in late spring or early summer. Give the plants some protection from the cold for their first winter outdoors[K]. Cuttings of mature wood of the current year's growth, autumn in a frame. Division of suckers[225].

**nwatta** Requires a moist, very well-drained neutral to slightly acid soil in full sun or light shade[200]. Succeeds in most soils, so long as they are well-drained[225]. Somewhat intolerant of frost, this species is only likely to succeed outdoors in the milder areas of Britain[200]. Another report says that it is quite hardy in Britain[225]. Closely related to *C. pumila*, and often confused with that species[225]. It hybridizes freely with other members of this genus[200, 225]. This species is often confused with *C. petriei*[11, 44], though it is quite distinct and does not hybridise with that species[225]. Plants are normally dioecious, though in some species the plants produce a few flowers of the opposite sex before the main flowering and a few hermaphrodite flowers are sometimes produced[225]. Male and female plants must usually be grown if seed is required.

### 7.2.435 *Xanthium strumarium*

Cocklebur, Rough cocklebur, Canada cocklebur

6 tlin 9 cyuc 1 kcaak 0 tcan 3 dwat 0.8 m hkuc  
htut cyutli kyuctcup hwicli hyishrasjltutnyik hpa7tli flatprik-  
wis hpa7tmwatli fyif hjonli

**drutta** *Xanthium strumarium* is a ANNUAL growing to 0.8 m (2ft 7in) by 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to October, and the seeds ripen from August to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

**kcakta** Edible Parts: Leaves SeedEdible Uses: Leaves and young plants - cooked[2, 105, 177]. They must be thoroughly boiled and then washed[179]. Caution is advised, the plant is probably poisonous[218]. Seed - raw or cooked[212]. It can be used as a piñole[257]. The seed can be ground into a powder and mixed with flour for making bread, cakes etc[105, 257]. The seed contains about 36.7% protein, 38.6% fat, 5.2% ash[179]. It also contains a glycoside[179] and is probably poisonous.

**tcanta** Dye Essential Repellent TanninThe dried leaves are a source of tannin[145]. A yellow dye is obtained from the leaves[178]. The seed powder has been used as a blue body paint[257]. The dried plant repels weevils from stored wheat grain[178]. The seed contains an essential oil[272].

**dwatta** Anodyne Antibacterial Antifungal Antiperiodic Antirheumatic Antispasmodic Antitussive Appetizer Cytotoxic Diaphoretic Diuretic Emollient Febrifuge Hypoglycaemic Laxative Leprosy Malaria Sedative StomachicThe leaves and root are anodyne, antirheumatic, appetizer, diaphoretic, diuretic, emollient, laxative and sedative[61, 147, 178, 222]. The plant is considered to be useful in treating long-standing cases of malaria[240] and is used as an adulterant for *Datura stramonium*[61]. An infusion of the plant has been used in the treatment of rheumatism, diseased kidneys and tuberculosis[257]. It has also been used as a liniment on the armpits to reduce perspiration[257]. The fruits contain a number of medically active compounds including glycosides and phytosterols[279]. They are anodyne, antibacterial, antifungal, antimalarial, antirheumatic, antispasmodic, antitussive, cytotoxic, hypoglycaemic and stomachic[238, 279]. They are used internally in the treatment of allergic rhinitis, sinusitis, catarrh, rheumatism, rheumatoid arthritis, constipation, diarrhoea, lumbago, leprosy and pruritis[238, 257]. They are also used externally to treat pruritis[238]. The fruits are harvested when ripe and dried for later use[238]. The root is a bitter tonic and febrifuge[240]. It has historically been used in the treatment of scrofulous tumours[222]. A decoction of the root has been used in the treatment of high fevers and to help a woman expel the afterbirth[257]. A decoction of the seeds has been used in the treatment of bladder complaints[257]. A poultice of the powdered seed has been applied as a salve on open sores[257].

propta Seed - sow spring or autumn in situ[238]. The seed requires plenty of moisture in order to germinate.

nwatta Requires a sunny position, succeeding in most soils. Prefers a poor dry soil[238]. Hardy to about -15°C[238]. Plants often self sow and in some parts of the world have become noxious weeds[238].

### 7.2.436 *Grindelia robusta*

Great Valley Gumweed

6 tlin 9 cyuc 1 kcaak 0 tcan 2 dwat 0.6 m hkuc  
htut cyutli hgatkyuctcup hwicli hyishrasjlut hpa7tli flatprikli-wishsom hpa7tmwatli xre7t hjonli

drutta *Grindelia robusta* is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in saline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Leaves Edible Uses: Leaves - raw[257].

tcanta Dye Hair Parasiticide Yellow and green dyes are obtained from the flowering heads and pods[168]. Aromatic. A decoction of the roots has been used as a hair shampoo to kill lice[257].

dwatta Antispasmodic Blood purifier Demulcent Expecto- rant Parasiticide Sedative Stomachic The leaves and flowering tops are antiphlogistic, antispasmodic, balsamic, demulcent, expectorant, sedative, stomachic and a vascular tonic[4, 7, 21, 46, 61, 207, 213]. Blood purifier[4]. The plant is applied externally as a compress on inflamed or irritated areas of the skin[7, 257]. Used internally, it slows down the heartbeat and reduces the stimulation of the nerve endings in the air passages that causes coughing - it is therefore extremely effective as a calming agent in the treatment of asthma[7]. The fluid extract is prepared by placing the freshly gathered leaves and flowers in a small quantity of simmering water for about 15 minutes[213]. The plant is used to treat people affected by poison-ivy[213].

propta Seed - sow autumn or spring in a cool greenhouse and only just cover the seed. Prick out the plants into individual pots when they are large enough to handle and plant them out into their permanent positions in early summer.

nwatta Succeeds in any well-drained soil in full sun[200]. Does well on dry sandy banks and in poor soils[200]. Plants tend to concentrate selenium in the leaves and stems, this is especially noticeable on soils that are relatively rich in that element[21]. Some authorities class this species as a synonym of *G. camporum*.

### 7.2.437 *Sedum lineare*

Needle stonecrop

6 tlin 9 cyuc 1 kcaak 0 tcan 1 dwat 0.3 m hkuc  
htut cyutli hgatkyuctcup hwicli hrasjlutnyik hpa7tli flatprikli-wis hpa7tmwatli xre7t hjonli

drutta *Sedum lineare* is an evergreen Perennial growing to 0.3 m (1ft) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Leaves Edible Uses: Leaves - raw or cooked[179]. Some caution is advised[218].

tcanta None known

dwatta Poultice The fresh plant is crushed and applied externally to burns and scalds[218].

propta Seed - surface sow in spring in well-drained soil in a sunny position in a greenhouse. Do not allow the soil to dry out. Prick out the seedlings into individual pots when they are large enough to handle. If sufficient growth is made, it is possible to plant them out during the summer, otherwise keep them in a cold-frame or greenhouse for their first winter

and plant them out in early summer of the following year[K]. Division is very easy and can be carried out at almost any time in the growing season, though is probably best done in spring or early summer. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Succeeds in most soils[188] but prefers a fertile well-drained soil in a sunny position[200]. Established plants are drought tolerant[200]. Succeeds on a wall[200]. All members of this genus are said to have edible leaves, though those species, such as this one, that have yellow flowers can cause stomach upsets if they are eaten in quantity[62, 85]. Plants in this genus seem to be immune to the predations of rabbits[233].

### 7.2.438 *Swertia bimaculata*

6 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 0.6 m hkuc  
hmmihtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikli-wis hpa7tmwatli xre7t hjonli

drutta *Swertia bimaculata* is a ANNUAL/BIENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Root Edible Uses: Root - cooked[105, 177, 179].

tcanta None known

dwatta None known

propta Seed - sow spring in a cold frame at 10°C or less[200]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer.

nwatta We have no details for this species but suggest growing it in a moist well-drained soil in a sunny position.

### 7.2.439 *Salvia moorcroftiana*

6 tlin 9 cyuc 1 kcaak 0 tcan 1 dwat m hkuc  
htut cyutli kyuctcup hwicli hrasjlut hpa7tli flatprikli-wis hpa7tmwatli xre7t hjonli

drutta *Salvia moorcroftiana* is a PERENNIAL growing to 0.9 m (3ft) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Stem Edible Uses: Stems - peeled[105, 177]. They are occasionally eaten[183].

tcanta None known

dwatta Astringent Dysentery Emetic Poultice The roots are used in the treatment of colds and coughs[240]. The seed is emetic[240]. It is used in the treatment of dysentery, haemorrhoids, colic and, externally, boils[240]. A poultice of the leaves is used as a dressing for wounds and is also applied to itchy skin[240].

propta Seed - sow March/April in a greenhouse[200]. Germination usually takes place within 2 weeks. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in early summer. In areas where the plant is towards the limits of its hardiness, it is best to grow the plants on in a greenhouse for their first winter and plant them out in late spring of the following year. Cuttings of half-ripe wood succeed at almost any time in the growing season[200].

nwatta Requires a very well-drained light sandy soil in a sunny position[200]. Prefers a rich soil[1]. Plants can be killed by excessive winter wet[200]. Closely related to *S. argentea*[1]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 7.2.440 *Geranium thunbergii*

Thunberg's geranium

6 tlin 9 cyuc 1 kcaak 0 tcan 1 dwat 0.3 m hkuc  
htut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikklwis  
hpa7tmwatli xre7t hjonli

drutta *Geranium thunbergii* is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcaakta Edible Parts: LeavesEdible Uses: TeaYoung leaves[183]. No further details are given. Old leaves, when the plant is at the peak of its growth, are used as a tea substitute[183].

tcanta None known

dwatta AstringentThe whole plant is astringent[105].

propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring or autumn. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Succeeds in any moderately fertile retentive soil in a sunny position[200]. Tolerates a wide range of soil types[200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233].

## 7.2.441 *Dracocephalum moldavica*

Moldavian Balm, Moldavian dragonhead

6 tlin 9 cyuc 1 kcaak 0 tcan 1 dwat m hkuc  
hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikklwis  
hpa7tmwatli xre7t hjonli

drutta *Dracocephalum moldavica* is an ANNUAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: LeavesEdible Uses: TeaThe lemon-scented leaves are used to make a tea[183]. Young shoots[183]. No further details are given.

tcanta EssentialThe plant contains an essential oil, this is a possible source of citral[240].

dwatta Astringent Carminative Tonic VulneraryThe seeds are astringent, carminative and tonic[240]. They are used as a demulcent in the treatment of fevers[240]. The plant is astringent, tonic and vulnerary[240].

propta Seed - sow early spring in situ. Pinch back the shoot tips in May in order to encourage bushy growth[200].

nwatta Succeeds in a sunny position in a fertile well-drained soil[200]. The plant is sometimes cultivated for its essential oil[266]. The plant is very fragrant[200], with both the leaves and the flowers emitting a most refreshing scent of lemons[245]. The flowers remain fragrant and fresh for several weeks[245]. It is a useful plant for filling gaps in the summer border[200].

## 7.2.442 *Pachyphragma macrophylla*

6 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat m hkuc

pcimhmim cyutli hgatkyuctcup hwicli hrasljutnyikfrip hpa7tli flatprikklwis hpa7tmwatli xre7t hjonli

drutta *Pachyphragma macrophylla* is an evergreen Perennial growing to 0.3 m (1ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from March to April. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers dry or moist soil and can tolerate drought.

kcaakta Edible Parts: LeavesEdible Uses: It would be worthwhile trying out the leaves of this species for edibility. They are almost certainly not poisonous[K].

tcanta An excellent weed-smothering ground cover plant for shady areas[200]. The plants have persistent basal rosettes but only achieve full ground cover from mid or late spring until early winter each year[200].

dwatta None known

propta Seed - sow autumn in a greenhouse[200]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring[200]. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer. Basal cuttings in late spring[200]. Harvest the shoots with plenty of underground stem when they are about 8 - 10cm above the ground. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Requires a leafy soil and a damp shady position[187, 200]. Another report says that it succeeds in dry soils and, once established, tolerates drought[190]. Succeeds in heavy clays[200]. Very shade tolerant[200]. Succeeds in full sun or partial shade[188]. Possibly hardy to about -15°C[187, 200]. Plants have persistent basal rosettes[200].

## 7.2.443 *Salvia carnosia*

Purple Sage

6 tlin 9 cyuc 1 kcaak 0 tcan 2 dwat 0.8 m hkuc

htut cyutli kyuctcup hwicli hrasljut hpa7tli flatprikklwis  
hpa7tmwatli xre7t hjonli

drutta *Salvia carnosia* is an evergreen Shrub growing to 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcaakta Edible Parts: SeedEdible Uses: Seed - cooked. Ground into a powder and used to thicken soups etc or added to cereal flours when making bread etc[105].

tcanta None known

dwatta Analgesic Antispasmodic Febrifuge Pectoral StomachicA decoction of the seeds and stems is used to treat colds[61]. A decoction or infusion of the leaves has been used in the treatment of fevers, coughs, colds and stomach aches[257]. A poultice of the crushed leaves has been applied to the chest to treat congestion[257]. A decoction of the leaves and stems can be drunk, used as a wash or as a steam bath in the treatment of headaches[257]. A decoction of the flowering stems has been used as a poultice and a wash to treat swollen leg veins[257]. The plant is much valued as a treatment for an epileptic or faint person, either administered as a drink or prepared like tobacco and the smoke blown into the patients face[216, 257].

propta Seed - sow March/April in a greenhouse[200]. Germination usually takes place within 2 weeks. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in early summer. In areas where the plant is towards the limits of its hardiness, it is best to grow the plants on in a greenhouse for their first winter and plant them out in late spring of the following year. Cuttings of half-ripe wood succeed at almost any time in the growing season[200].

nwatta Requires a very well-drained light sandy soil in a sunny position[200]. Prefers a rich soil[1]. Soils rich in nitrogen encourage excessive leaf growth at the expense of flowering[11]. Plants can be killed by excessive winter wet[200]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 7.2.444 *Gunnera magellanica*

6 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat m hkuc

hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikklwis

soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta None known

tcanta None known

dwatta Alternative Antiscrophulatic Astringent Cancer TonicThe dried leaves are alterative, antiscrofulatic, astringent and tonic[4, 21, 46, 207]. A tea made from the leaves is used in the treatment of kidney ailments and sore throats[222, 257]. A strong leaf tea has been used in the treatment of scrofula[222]. It is applied externally to skin diseases and eye infections[222]. It is said that an oil helpful in

the treatment of cancer has been obtained from the plant[4]. Some caution is advised since an overdose can cause nausea and vomiting[4].

propta Seed - sow spring in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 6 - 8cm with a heel, late summer in a sandy soil in a frame[200].

nwatta Requires a light well-drained soil in a sunny open position[200]. Tolerates a pH range from 5.5 to 8[200].

hpa7tmwatli nyanhjen hjonli

drutta Gunnera magellanica is a PERENNIAL. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: One report says that the fruit might be edible[177]. The fruit is about 5mm in diameter[200].

tcanta A carpeting plant that roots as it spreads, it is suitable for ground cover when spaced about 45cm apart each way[208].

dwatta None known

propta Seed - best sown as soon as soon as it is ripe in the autumn in a sandy mix in a cold frame[200]. The seed can also be sown in the spring[188]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division as new growth commences in the spring[200]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Requires a damp humus rich soil in a sunny position or semi-shade[1, 200]. Prefers a cool moist position[208]. Plants are hardy to at least -10°C[187]. The plant has a creeping root and spreads to form extensive patches[187]. The top part of the inflorescence is male, the bottom is female and the middle is hermaphrodite according to one report whilst another says that the flowers are unisexual without saying if the two sexes are on the same plant[200]. Male and female flowers are on separate plants[188]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 7.2.445 *Potentilla glandulosa*

Gland Cinquefoil, Sticky cinquefoil, Arizona cinquefoil, Ashland cinquefoil, Ewan's cinquefoil, Hans

6 tlin 9 cyuc 1 kcaak 0 tcan 1 dwat 0.6 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatpriklwis hpa7tmwatli fyixre7t hjonli

drutta *Potentilla glandulosa* is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Edible Uses: TeaA tea-like beverage is made by boiling the leaves or the whole plant in water[61, 11, 177, 183].

tcanta None known

dwatta Astringent Stimulant TonicAll parts of the plant are astringent[257]. An infusion has been drunk, and a poultice of the plant applied externally in the treatment of swollen parts[257]. An infusion of the plant has been used as a stimulant and tonic[257].

propta Seed - sow early spring or autumn in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring. Larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Easily grown in a well-drained loam, preferring a position in full sun but tolerating shade[1]. Prefers an al-

kaline soil but tolerates a slightly acid soil[200]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 7.2.446 *Buglossoides arvensis*

Field Gromwell, Corn gromwell

6 tlin 10 cyuc 1 kcaak 0 tcan 1 dwat 0.5 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta *Buglossoides arvensis* is an ANNUAL growing to 0.5 m (1ft 8in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to July, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta The European Union has granted the refined oil of the seed of *Buglossoides arvensis* novel food status (a type of food that does not have a significant history of consumption or is produced by a method that has not previously been used for food) and some farmers are growing it.

tcanta None known

dwatta DiureticAn infusion of the leaves is used as a diuretic[240].

propta Seed - sow spring in situ. Germination should take place within a few weeks.

nwatta 207189 Prefers a moderately fertile well-drained soil[200].

## 7.2.447 *Echinops spinosissimus*

6 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 0.8 m hkuc htut cyutli hgatyuctcup hwicli hyishrasljutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta *Echinops spinosissimus* is a PERENNIAL growing to 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Edible Uses: GumYields a gum that is used for chewing[46, 61, 177].

tcanta GumNone known

dwatta None known

propta Seed - sow early spring in a cold frame[111]. The seed usually germinates in 3 - 9 weeks at 25°C[175]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. The seed can also be sown in an outdoor seedbed in mid spring and is then planted out into its permanent position in late summer or the autumn[111]. Division in autumn[111]. Root cuttings in the winter[200].

nwatta Succeeds in a sunny position in any well drained soil of low or medium fertility[175, 200]. Established plants are drought tolerant[190].

## 7.2.448 *Saxifraga fortunei*

Saxifrage

6 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 0.4 m hkuc hmim cyutli tcup hwicli hrasljutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta *Saxifraga fortunei* is a PERENNIAL growing to 0.4 m (1ft 4in) by 0.4 m (1ft 4in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from September to October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young leaves - cooked[105]. They are added to soups or cooked with rice[177].

tcanta None known  
dwatta None known  
propta Seed - we have no information for this species but suggest sowing the seed in a cold frame in the spring. Surface sow, or only just cover the seed, and make sure that the compost does not dry out. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse or cold frame for their first winter. Plant them out in late spring after the last expected frosts. Division in spring. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Landscape Uses:Alpine garden, Container, Ground cover, Massing, Rock garden, Woodland garden. Prefers a cool position in a moist humus-rich soil[1]. Prefers an acid soil[200]. Grows well in light woodland[200] or in a shady position in a rock garden. The plant is hardy to at least -15°C[187], the leaves and the flowers, however, are liable to be damaged by autumn frosts[200]. A polymorphic species[58], there are several named forms selected for their ornamental value[187]. Special Features:Attractive foliage, Naturalizing.

## 7.2.449 Sedum sarmentosum

stringy stoncrop  
6 tlin 9 cyuc 1 ckak 0 tcan 1 dwat 0.1 m hkuc  
htut cyutli ghtakuyctcup hwicli hrsajlutyrik hpa7tli flatprikliw hpa7tmwatli fyixre7t hjonli

drutta Sedum sarmentosum is an evergreen Perennial growing to 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower in July, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

ckakta Edible Parts: LeavesEdible Uses: Young leaves and stems - raw or cooked[105, 177]. Used as a vegetable[266].

tcanta None known  
dwatta Used medicinally[266]. No further information is given[266].

propta Seed - surface sow in spring in well-drained soil in a sunny position in a greenhouse. Do not allow the soil to dry out. Prick out the seedlings into individual pots when they are large enough to handle. If sufficient growth is made, it is possible to plant them out during the summer, otherwise keep them in a cold-frame or greenhouse for their first winter and plant them out in early summer of the following year[K]. Division is very easy and can be carried out at almost any time in the growing season, though is probably best done in spring or early summer. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Succeeds in most soils[188] but prefers a fertile well-drained soil in a sunny position[200]. Established plants are drought tolerant[200]. All members of this genus are said to have edible leaves, though those species, such as this one, that have yellow flowers can cause stomach upsets if they are eaten in quantity[62, 85]. Plants in this genus seem to be immune to the predations of rabbits[233].

## 7.2.450 Inula britannica chinensis

Xuan Fu Hua  
6 tlin 9 cyuc 1 ckak 0 tcan 3 dwat 0.6 m hkuc  
hmimhtut cyutli tcup hwicli hrsajlutyrik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Inula britannica chinensis is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium

(loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

ckakta Edible Parts: LeavesEdible Uses: Leaves - cooked[179]. An emergency food, it is only used when better foods are not available[177].

tcanta None known  
dwatta Alterative Carminative Cholagogue Deobstruent Expectorant Laxative Nervine Stomachic Tonic VulneraryXuan Fu Hua is used in Chinese herbalism as a mildly warming expectorant remedy and it is especially suitable where phlegm has accumulated in the chest[254]. It has been used as an adulterant of arnica (*Arnica montana*) [4]. The flowers are more commonly used, but the leaves are also used, generally for less serious conditions[254]. The leaf is discutient and vulnerary[218]. The flowers are alterative, antibacterial, carminative, cholagogue, deobstruent, depurative, diuretic, expectorant, laxative, nervine, stomachic, tonic and vulnerary[147, 176, 178, 218, 279]. They are used internally in the treatment of bronchial complaints with profuse phlegm, nausea and vomiting, hiccups and flatulence[176, 238]. The flowers have an antibacterial action, but this can be destroyed by proteins in the body[176]. The plant is harvested when in flower and can be dried for later use[254]. The root is discutient, resolvent and vulnerary[218]. The plant has been mentioned as a possible treatment for cancer of the oesophagus[218].

propta Seed - sow spring or autumn in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. If you have sufficient seed, it is worthwhile trying a sowing in situ in the spring or the autumn. Division in spring or autumn[111].

nwatta Succeeds in a sunny position in any moderately fertile well-drained soil[200]. Grows well in heavy clay soils. Plants are hardy to at least -15°C[238]. This sub-species is the form that is most used medicinally, it is cultivated as a medicinal plant in China[178].

## 7.2.451 Geranium dissectum

Cut-Leafed Cranesbill, Cutleaf geranium  
6 tlin 9 cyuc 1 ckak 0 tcan 2 dwat 0.6 m hkuc  
htut cyutli tcup hwicli hrsajlutyrik hpa7tli flatprikliw hpa7tmwatli fyixre7t hjonli

drutta Geranium dissectum is an ANNUAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from May to August. The species is hermaphrodite (has both male and female organs). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

ckakta Edible Parts: RootEdible Uses: Root - cooked. A famine food, used when all else fails[177].

tcanta Dye TanninA brown dye is obtained from the dry flowers[168]. The leaves and roots are rich in tannin[4].

dwatta Antiseptic Astringent Cholera Dysentery Syptic TonicThe whole plant, but especially the roots, is rich in tannin[4]. It is antiseptic, highly astringent, syptic and tonic[4]. An infusion of the whole plant, or of the roots alone, is used in the treatment of diarrhoea (especially for children and the elderly), dysentery, cholera, gastro-enteritis, internal bleeding, excessive menstruation etc[4]. Externally, it is used in the treatment of prurulent wounds, haemorrhoids, thrush, vaginal discharges, inflammations of the mouth etc[238]. It is best to harvest the roots as the plant comes into flower since they are then at their most active medicinally[4]. The leaves should be harvested before the plant sets seed[4]. Both are dried for later use[238].

propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer.

nwatta Succeeds in any moderately fertile retentive soil in a sunny position[200]. Tolerates a range of soil types[200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233].

propta Seed - best sown as soon as it is ripe in a cold frame[133, 134]. Fresh seed germinates in 3 - 6 weeks[133]. Pre-soak stored seed for 24 hours in warm water, sow shallowly and keep in a shady position at 15°C[124]. Germination may be slow and erratic[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a shady position in the greenhouse for at least their first winter. Plant them out into their permanent positions in the summer. Division in April/May. Very easy, the larger tubers can be planted out straight into their permanent positions whilst it is best to pot up the smaller ones and grow them on for a season before planting them out.

nwatta Landscape Uses:Border, Container, Rock garden. Prefers a cool habitat and a well-drained humus rich soil[13]. Easily grown in a stony leafy soil in sun or shade[90]. Thrives in the light shade of trees. Tolerates a pH between 5.5 and 8[200]. This species is hardy to about -18°C[200]. A very ornamental plant[1]. Plants seem to be immune to the predations of rabbits[233]. Special Features:Attractive foliage, Not North American native, Suitable for cut flowers.

## 7.2.555 Arnebia benthamii

6 tlin 9 cyuc 0 ckak 0 tcan 1 dwat 0.9 m hkuc  
htut cyutli kyuctup hwicli hyishraas hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Arnebia benthamii is a PERENNIAL growing to 0.9 m (3ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

ckakta None known  
tcanta MiscellanyNone known  
dwatta Cardiac Febrifuge MiscellanyCardiac and febrifuge. The plant is considered to be useful in the treatment of diseases of the tongue and throat[145, 240].

propta Seed - sow spring in a greenhouse. Germination usually takes place within 2 - 8 weeks at 20°C[134]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant out in late spring or early summer, after the last expected frosts. It is best to harvest the seed when it is slightly under-ripe, since it is quickly dispersed when ripe[200]. Cuttings with a heel in the autumn in sand in a cold frame[1]. Root cuttings in sand in a frame during the winter[1].

nwatta Requires a well-drained gritty soil and a sunny position in the rock garden or on a dry wall[1]. 211075

## 7.2.556 Erysimum cheiri

Wallflower, Aegean wallflower  
6 tlin 9 cyuc 0 ckak 0 tcan 2 dwat 0.5 m hkuc  
htut cyutli kyuctup hwicli hyishrasjlutyrik hpa7tli priklwisslip hpa7tmwatli xre7t hjonli

drutta Erysimum cheiri is an evergreen Perennial growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from April to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

ckakta None known  
tcanta EssentialThe flowers contain 0.06% essential oil[240]. It has a pleasing aroma if diluted and is used in perfumery[46, 61, 114, 244]. The seed contains about 20% fixed oil[240], but no details of any uses are given[K].

dwatta Antirheumatic Antispasmodic Aphrodisiac Cardiotonic Diuretic Emmenagogue Expectorant Nervine Ophthalmic Purgative Resolvent Stomachic TonicWallflower was formerly used mainly as a diuretic and emmenagogue but recent research has shown that it is more valuable for its effect

on the heart[254]. In small doses it is a cardiotonic, supporting a failing heart in a similar manner to foxglove (*Digitalis purpurea*) [254]. In more than small doses, however, it is toxic and so is seldom used in herbal medicine[254]. The flowers and stems are antirheumatic, antispasmodic, cardiotonic, emmenagogue, nervine, purgative and resolvent[4, 7, 46, 61, 240]. They are used in the treatment of impotence and paralysis[240]. The essential oil is normally used[4]. This should be used with caution because large doses are toxic[7]. The plant contains the chemical compound cheiranthin which has a stronger cardiotonic action than digitalis (obtained from *Digitalis* species). If taken in large doses this is very poisonous and so this plant should not be used medicinally without expert supervision[244]. The seeds are aphrodisiac, diuretic, expectorant, stomachic and tonic[240]. They are used in the treatment of dry bronchitis, fevers and injuries to the eyes[240].

propta Seed - sow spring in an outdoor seedbed. Germination should take place within 3 weeks. Plant the seedlings into their permanent positions when they are large enough to handle. If seed is in short supply, it can be sown in spring in pots in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in early summer.

nwatta Prefers a position in full sun in a circumneutral soil[1, 111, 200]. Succeeds in ordinary garden soils[1], tolerating hot and limey soils[187]. Plants are liable to die out if the soil is too rich[111]. Wallflowers are perennial, though they are usually grown as biennials in the flower garden for spring and early summer bedding[1]. There are some named varieties[187]. A very ornamental plant[7], it is liable to die out after flowering, probably because it exhausts itself by producing so many flowers. Plants require a very well-drained dry soil if they are to survive a second winter[187]. They grow well on dry stone walls[201] and also on old mortared walls where they usually self-sow[219]. A good butterfly and moth plant[17, 30]. A good companion for apple trees[18, 20, 201].

## 7.2.557 Phlox nivalis

Pine phlox, Trailing phlox  
6 tlin 9 cyuc 0 ckak 3 tcan 0 dwat 0.3 m hkuc  
hmimhtut cyutli ghtakuyctcup hwicli hrsajlut hpa7tli flatprik hpa7tmwatli hjonli

drutta Phlox nivalis is a PERENNIAL growing to 0.3 m (1ft) by 0.5 m (1ft 8in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

ckakta None known  
tcanta A medium density groundcover that can be grown in semi-shade. Good for woodland gardening.

dwatta None known  
propta Division or by cuttings.

nwatta Low growing, evergreen, mound-forming shrub or semi-woody perennial. Prefers full sun to semi-shade, dry to moist well-drained soil. USDA Hardiness Zone: 4 to 9. It's natural distribution is on sandhills, dry pinelands, dry deciduous woods, open slopes and flats in sandy ground. The root pattern is fibrous dividing into a large number of fine roots [1-2].

## 7.2.558 Helianthemum canadense

Frostweed, Longbranch frostweed  
6 tlin 9 cyuc 0 ckak 0 tcan 2 dwat 0.4 m hkuc  
htut cyutli kyuctup hwicli hrsajlut hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Helianthemum canadense is a PERENNIAL growing to 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects, cleistogamy. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained

herbal use should only be undertaken under the supervision of a qualified practitioner. See also the notes above on toxicity. A fluid extract of the fresh leaves is irritant, narcotic, rubefacient and stimulant[4]. It has been used with some success in the treatment of paralysis, obstinate hepatic eruptions, palsy and in various forms of chronic and obstinate eruptive diseases[4]. A mash of the leaves has been used to treat ringworm[213]. An external application has also been used in the treatment of herpes sores[213]. A poultice of the plant has been used to treat infectious sores on the lips[257]. The root has been used to make a poultice and salve in the treatment of chronic sores and swollen glands[257]. A homeopathic remedy is made from the fresh leaves[232]. These should be harvested of a night-time, during damp weather and before the plant flowers[232]. This remedy has a wide range of applications and is one of the main treatments for mumps[232], it is also used in a wide range of skin disorders[4].

propta Seed - best sown in a cold frame as soon as it is ripe. Pre-soak the seed for 24 hours in hot water (starting at a temperature of 80 - 90c and allowing it to cool) prior to sowing in order to leach out any germination inhibitors[200]. The stored seed also needs hot water treatment and can be sown in early spring in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 10cm with a heel, July/August in a frame[200]. Root cuttings 4cm long taken in December and potted up vertically in a greenhouse. Good percentage[78, 200]. Suckers in late autumn to winter[200].

nwatta Succeeds in a well-drained fertile soil in full sun[11, 200]. Judging by the plants natural habitat, it should also succeed in poor acid soils and dry soils[K]. The young growth in spring can be damaged by late frosts. Plants have brittle branches and these can be broken off in strong winds[200]. Plants are also susceptible to coral spot fungus[11]. Plants in this genus are notably resistant to honey fungus[200]. This species is a small suckering shrub, it can spread freely in suitable conditions[K]. There is some confusion over the correct name of this species. It is united with *R. radicans* (under that name) by some botanists whilst others split this species off into another genus, *Toxicodendron*, and unite it with *R. radicans* as *Toxicodendron radicans*[200]. Many of the species in this genus, including this one, are highly toxic and can also cause severe irritation to the skin of some people, whilst other species are not poisonous. It is relatively simple to distinguish which is which, the poisonous species have axillary panicles and smooth fruits whilst non-poisonous species have compound terminal panicles and fruits covered with acid crimson hairs[1, 4]. The toxic species are sometimes separated into their own genus, *Toxicodendron*, by some botanists[200]. Dioecious. Male and female plants must be grown if seed is required.

### 7.2.552 Arisaema ringens

6 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 0.3 m hkuc pcmhmmhtut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Arisaema ringens is a PERENNIAL growing to 0.3 m (1ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from April to May. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Flies. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known
tcanta None known
dwatta Alternative FebrifugeAlternative, febrifuge[178].
propta Seed - best sown as soon as it is ripe in a shady position in a cold frame[134]. Stored seed remains viable for at least a year and can be sown in spring in the greenhouse but it will probably require a period of cold stratification. Germination usually takes place in 1 - 6 months at 15°c[134]. When

large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least a coupe of years until the corms are more than 20mm in diameter. Plant out into their permanent positions whilst they are dormant. Division of tubers when the plant dies down in late summer.

nwatta Prefers a cool moist peaty soil in the bog, woodland garden or a sheltered border in semi-shade[134, 200]. Prefers a loamy or peaty soil[1] and will tolerate a sunny position if the soil is moist but not water-logged and the position is not too exposed[1, 200]. This is probably one of the hardiest members of the genus and should succeed outdoors in a suitable position in many parts of Britain[90]. Tubers should be planted about 10cm deep[233]. Only plant out full sized tubers and mulch them with organic matter in the winter[200]. Plants need protection from slugs[200]. Most species in this genus are dioecious, but they are sometimes monoecious and can also change sex from year to year.

### 7.2.553 Diphylleia cymosa

Umbrella Leaf, American umbrellaleaf
6 tlin 9 cyuc 0 kcaak 0 tcan 2 dwat 0.7 m hkuc hmim cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Diphylleia cymosa is a PERENNIAL growing to 0.7 m (2ft 4in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to July. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta None known
tcanta None known
dwatta Antiseptic Cancer Diaphoretic DiureticA tea made from the roots is antiseptic, diaphoretic and diuretic[222, 257]. An infusion has been used in the treatment of smallpox[257]. This is a very rare plant in the wild, so little research has been carried out into its medicinal virtues. However, it is believed that the root might contain podophyllin, an effective anti-cancer agent[222].

propta Seed - best sown in a cold frame as soon as it is ripe[175]. The seed is very slow to germinate, usually taking a year or more[175]. Sow stored seed as soon as possible in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring.

nwatta Prefers a moist humus-rich soil and semi-shade, growing well in a woodland garden[1, 130, 200]. The leaves are very large and can be up to 60cm across[233].

### 7.2.554 Cyclamen hederifolium

Cyclamen, Alpine Violet, Persian Violet
6 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 0.1 m hkuc pcmhmmhtut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Cyclamen hederifolium is a PERENNIAL growing to 0.1 m (0ft 4in) by 0.2 m (0ft 8in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in leaf from October to June, in flower from July to November, and the seeds ripen from June to July. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known
tcanta Plants can be used as a ground cover, though they will need to be given a mulch of leaf mould in order to keep the weeds at bay when they are dormant in the summer[208].

dwatta Homeopathy PurgativeThe fresh rootstock is a drastic purgative. It should be used with extreme caution[4, 21, 46]. A homeopathic remedy is made from the fresh root[4]. It is applied externally to the bowels to cause purging[4].

### 7.2.452 Eragrostis pilosa

Soft Love Grass, Indian lovegrass
6 tlin 9 cyuc 1 kcaak 0 tcan 1 dwat 0.6 m hkuc htut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Eragrostis pilosa is a ANNUAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: Seed - ground into a flour and used as a cereal[105]. It is generally seen as a famine food, but is used regularly in some areas[177]. The seed is very small and fiddly to utilize[K].

tcanta None known
dwatta VulneraryThe plant is said to be an effective cure for contusions[218].

propta Seed - sow early spring in a greenhouse and only just cover the seed. Germination should take place within 2 weeks. When they are large enough to handle, prick the seedlings out into individual pots and plant them out after the last expected frosts. The seed can also be sown in situ in mid to late spring, though in a cool summer it may fail to ripen many seeds[162].

nwatta Succeeds in any good loam or humus-rich soil in a sunny position[162]. Prefers a light soil[1]. Plants are harvested (from the wild?[K]) on a regular basis in E. Africa for their edible seed[177].

### 7.2.453 Coprosma petriei

6 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 0.1 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli nyanhjen hjonli

drutta Coprosma petriei is an evergreen Shrub growing to 0.1 m (0ft 4in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, and the seeds ripen in August. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: CoffeeFruit - raw or cooked. Sweet, but without much flavour[225]. The fruits vary in colour from white to blue or sea-green[225]. The fruit is seldom borne in Britain[208]. The fruit is about 12mm wide[200]. The roasted seed is an excellent coffee substitute[153].

tcanta DyeA yellow dye is obtained from the wood, it does not require a mordant[153]. A dense carpeting plant, it can be planted about 25cm apart to form a ground cover[208]. The cultivar 'Violet Drops' is much more vigorous than the type, forming compact mats up to 2 metres across and making a very good ground cover[225].

dwatta None known
propta Seed - probably best sown as soon as it is ripe in a greenhouse or cold frame[K]. Sow stored seed in spring in a cold frame[200]. Germination can be slow, often taking more than 12 months even when fresh seed is used[K]. When the seedlings are large enough to handle, prick them out into individual pots. Grow on the plants for at least their first winter in a greenhouse and plant out in late spring or early summer. Give the plants some protection from the cold for their first winter outdoors[K]. Cuttings of mature wood of the current year's growth, autumn in a frame.

nwatta Requires a moist, very well-drained neutral to slightly acid soil in full sun or light shade[201]. Succeeds in most soils, so long as they are well-drained[225]. This plant has survived very dry conditions with us and appears to be very drought tolerant[K]. One of the hardiest members of this genus, it succeeds outdoors in the rock garden in many parts of the country[1]. Hybridizes freely with other members of this genus[200, 225], though it does not seem to cross with *C. pumila*, *C. atropurpurea* or any red-fruited species[225].

There are several named forms selected for their ornamental value[225]. Plants are normally dioecious, though in some species the plants produce a few flowers of the opposite sex before the main flowering and a few hermaphrodite flowers are sometimes produced[225]. Male and female plants must usually be grown if seed is required.

### 7.2.454 Navarretia squarrosa

Skunk Weed, Skunkbush
6 tlin 9 cyuc 1 kcaak 2 tcan 0 dwat 0.3 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Navarretia squarrosa is a ANNUAL growing to 0.3 m (1ft). See above for USDA hardness. It is hardy to UK zone 7. It is in flower in August, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: SeedEdible Uses: Seed - parched, ground into a powder and eaten dry[94]. It is very small and fiddly to use[K].

tcanta Dynamic accumulator.
dwatta None known
propta Seed - sow early spring in situ[200].
nwatta Requires a very sunny position in a very well-drained dry to moist light or medium fertile soil[200].

### 7.2.455 Thymus cilicicus

Cilician Thyme
6 tlin 9 cyuc 1 kcaak 0 tcan 2 dwat 0.2 m hkuc htut cyutli kyuctcup hwicli hrasjlut hpa7tli priklwis hpa7tmwatli xre7t hjonli

drutta Thymus cilicicus is an evergreen Shrub growing to 0.2 m (0ft 8in) by 0.4 m (1ft 4in). See above for USDA hardness. It is hardy to UK zone 7. It is in leaf all year, in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Edible Uses: CondimentThe leaves have a lemon scent and are used as a flavouring in food[238].
tcanta Deodorant Disinfectant EssentialAn essential oil is obtained from the leaves.

dwatta Antiseptic Deodorant DisinfectantThe leaves, and especially the essential oil contained in them, are strongly antiseptic, deodorant and disinfectant[200, 238]. The plant can be used fresh at any time of the year, or it can be harvested as it comes into flower and either be distilled for the oil or dried for later use[238].

propta Seed - sow spring in a cold frame. Seed can also be sown in autumn in a greenhouse. Surface sow or barely cover the seed. Germination can be erratic. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring or autumn[200]. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the summer or the following spring. Cuttings of young shoots, 5 - 8cm with a heel, May/June in a frame[200]. Cuttings of half-ripe wood, 5 - 8cm with a heel, July/August in a frame[200]. Layering.

nwatta Prefers a light, well-drained calcareous soil and a sunny position[200]. This species thrives in stony situations[238]. Plants tolerate occasional walking on and can be grown in cracks in paths, they also succeed on walls[200]. Thymes dislike wet conditions, especially in the winter. A layer of gravel on the soil around them will help protect the foliage from wet soils[238]. Plants are hardy to at least - 10°c[238]. The flowers are rich in nectar and are very attractive to honey bees[200]. This is a very difficult genus

taxonomically, the species hybridize freely with each other and often intergrade into each other[200].

## 7.2.456 Chimaphila maculata

Spotted Wintergreen, Striped prince's pine, Pipsisewa  
6 tlin 9 cyuc 1 kcaak 2 tcan 3 dwat m hkc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis  
hpa7tmwatli xre7t hjonli

drutta Chimaphila maculata is an evergreen Shrub growing to 0.3 m (1ft) by 0.5 m (1ft 8in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from June to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves Edible Uses: Tea The leaves are used as a snack, being nibbled for their refreshing qualities[183, 257]. In Mexico the herb is used as a catalyst in the preparation of 'tesguino', an alcoholic beverage produced from sprouted maize[183].

tcanta The plants stoloniferous root system, and dwarf spreading habit make it a god ground cover, though it is a difficult plant to establish and grow well[245].

dwatta Analgesic Antibacterial Antisepic Rubefacient Astrigent Cancer Diaphoretic Diuretic Febrifuge Rubefacient Skin Stimulant Tonic Urinary The plant is analgesic, antibacterial, astringent, diaphoretic, diuretic, febrifuge, rubefacient, stimulant and tonic[4, 207, 222, 257]. The plant has an anti-septic influence on the urinary system and is sometimes used in the treatment of cystitis[4]. An infusion of the plant has been drunk in the treatment of rheumatism and colds[257]. A poultice of the root has been used to treat pain[257] whilst the plant has also been used as a wash on ulcers, scrofula and cancers[257]. All parts of the plant can be used, though only the leaves are officinal[4]. The plant is loaded with the biologically active compounds arbutin, sitosterol and ursolic acid[222]. Arbutin hydrolyzes to the toxic urinary antiseptic hydroquinone[222].

propta Seed - very difficult to germinate, see the notes in cultivation details. It is best sown on moist sphagnum peat. As soon as they are large enough to handle, prick the seedlings out into individual pots and grow them on in a shady position in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division. Rather difficult because the plant is very sensitive to root disturbance. It is best attempted in the spring as the plant comes into growth[200]. Cuttings of softwood, June in a frame. Use some soil from around an established plant[14].

nwatta Landscape Uses: Ground cover, Woodland garden. Requires a light moist but well-drained lime-free soil and shade from direct sunlight[1]. This species is difficult to propagate and grow in cultivation, mainly because it has certain mycorrhizal associations in the wild and these are necessary if the plant is to thrive[200]. It is best to use some soil collected from around an established plant when sowing seed or planting out into a new position[200]. The plant has wide-spreading fibrous feeding roots and will often die or fail to increase in size if these are disturbed. The flowers are deliciously scented[245]. Special Features: North American native. The plant is heat tolerant in zones 8 through 5. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. An evergreen. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

## 7.2.457 Sedum spathulifolium

Broadleaf Stonecrop, Purdy's stonecrop, Yosemite stonecrop, Stonecrop, Blood Leaf Sedum  
6 tlin 10 cyuc 1 kcaak 0 tcan 1 dwat 0.1 m hkc  
hmimhtut cyutli hqatkyuctcup hwicli hyishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Sedum spathulifolium is an evergreen Perennial growing to 0.1 m (0ft 4in) by 0.5 m (1ft 8in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower from June to July, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Leaves Edible Uses: Leaves - raw or cooked. They are best used before the plant flowers[172].

tcanta Can be used as a ground cover plant in a sunny position[197]. It requires weeding for the first year or so[197]. Plants are best spaced about 30cm apart each way[208].

dwatta Antihæmorrhoidal Birthing aid Galactogogue Haemostatic Laxative Salve Sedative The leaves are anti-hæmorrhoidal, galactogogue and haemostatic[257]. The leaves can be eaten, or a poultice of the warmed leaves applied to the breasts, in order to stimulate the milk flow of a nursing mother[257]. The juice of the leaves and stems has been rubbed over bleeding wounds to stop the bleeding[257]. A decoction of the stems has been drunk by a woman in the ninth month of her pregnancy in order to ease childbirth[257]. A decoction of the whole plant has been given to children as a treatment for constipation and has been used as a wash to soothe nervous and irritable babies[257]. The plant is used as a treatment for sore gums[257].

propta Seed - surface sow in spring in well-drained soil in a sunny position in a greenhouse. Do not allow the soil to dry out. Prick out the seedlings into individual pots when they are large enough to handle. If sufficient growth is made, it is possible to plant them out during the summer, otherwise keep them in a cold-frame or greenhouse for their first winter and plant them out in early summer of the following year[K]. Division is very easy and can be carried out at almost any time in the growing season, though is probably best done in spring or early summer. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Landscape Uses: Alpine garden, Container, Ground cover, Rock garden, Seashore. A very easily grown plant, it succeeds in most soils[188] but prefers a fertile well-drained soil in a sunny position[200]. Tolerates some shade[188]. Established plants are drought tolerant[200]. Succeeds in poor soils and on walls[200]. Hardy to at least -15°C[200]. All members of this genus are said to have edible leaves, though those species, such as this one, that have yellow flowers can cause stomach upsets if they are eaten in quantity[62, 85]. Plants in this genus seem to be immune to the predations of rabbits[233]. Special Features: Attractive foliage, North American native.

## 7.2.458 Arabis serrata

6 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 0.3 m hkc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis  
hpa7tmwatli xre7t hjonli

drutta Arabis serrata is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

(individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta None known  
tcanta Miscellany/None known  
dwatta Emetic Miscellany Styptic The whole plant is an active styptic for both local and general application[4]. It is said to be a valuable and sure specific in the treatment of hydrophobia[4]. The plant is also diaphoretic, diuretic and sedative[61]. An infusion of the root has been used as an emetic[257].

propta Seed - sow spring in situ. The seed requires plenty of moisture in order to germinate.

nwatta An easily grown plant, it succeeds in most soils but requires a sunny position. Plants often self sow.

## 7.2.548 Coronilla scorpioides

Annual Scorpion Vetch, Yellow crownvetch  
6 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 0.4 m hkc  
htut cyutli tcup hwicli hras hpa7tli flatpriklwis hpa7tmwatli  
xre7t hjonli

drutta Coronilla scorpioides is a ANNUAL growing to 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta None known  
tcanta Dye/Blue dye like indigo can be obtained by fermentation of the leaves[4].

dwatta Cardiac Cathartic Diuretic Laxative The twigs and leaves have a similar action to the common broom, Cytisus scoparia[4]. They are collected as the plant comes into flower and can be stored for later use. They are diuretic, cardiac, cathartic and laxative[4].

propta Seed - sow early spring in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in late spring.

nwatta Requires a light well-drained soil in full sun[200].

## 7.2.549 Geranium lucidum

Shining geranium  
6 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 0.5 m hkc  
htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli lwis  
hpa7tmwatli xre7t hjonli

drutta Geranium lucidum is a ANNUAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta None known  
tcanta None known  
dwatta Astringent Diuretic The plant is diuretic and astringent[240].

propta Seed - sow spring in situ.  
nwatta Succeeds in any moderately fertile retentive soil in a sunny position[200]. Most members of this genus tolerate a wide range of soil types[200], though this species is said to require a calcareous soil[17]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233].

## 7.2.550 Erica x darleyensis

Darley Dale Heath, Cape Heath, Molten Silver Heath, Heather

6 tlin 9 cyuc 0 kcaak 2 tcan 0 dwat 0.6 m hkc  
htut cyutli tcup hwicli hyishrasjlut hpa7tli flatpriklwis  
hpa7tmwatli fyifxre7t hjonli

drutta Erica x darleyensis is an evergreen Shrub growing to 0.6 m (2ft) by 1 m (3ft 3in) at a slow rate. See above for UK hardiness. It is hardy to UK zone 6. It is in leaf

all year, in flower from November to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta None known  
tcanta Hedge Hedge An admirable dense ground cover plant[182, 208], though it might need weeding for the first year[197]. It can be clipped in spring to give denser growth[197, 208]. Plants should be spaced about 60cm apart each way[208]. Plants can be grown as a low hedge, the cultivar 'Furzey' is often used[29].

dwatta None known  
propta Seed - surface sow in a sandy compost in a cold frame in spring. Keep moist. Prick out the plants as soon as they are large enough to handle and plant them in their permanent positions when they are 5 - 8cm tall[11]. This species is a hybrid and will not breed true from seed. Cuttings of half-ripe wood, 3cm long taken from twiggy lateral growths near the base of the plant, July/August in a frame. Remove the leaves from the bottom part of the stem without causing any damage to the bark. The cuttings root in a few weeks if they are given some bottom heat. Plant out in spring[11]. Layering in spring or autumn. Plants can be 'dropped' and then dug up and divided about 6 - 12 months later. Dropping involves digging up the plant and then replanting it about 15 - 20cm deeper in the soil to encourage roots to form along the stems[78].

nwatta Landscape Uses: Border, Container, Massing, Rock garden, Seashore, Specimen. Requires a light loam[11]. This species tolerates lime in the soil[182, 188] so long as there is plenty of humus[208]. Grows best in a poor soil. Resents dry soils. Prefers an open situation. A very ornamental plant[1], there are many named varieties[182]. Plants are quite fast growing[1]. Plants in this genus are notably resistant to honey fungus[200]. Special Features: Not North American native, All or parts of this plant are poisonous, Extended bloom season in Zones 9A and above. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

## 7.2.551 Rhus toxicodendron

Eastern Poison Oak  
6 tlin 9 cyuc 0 kcaak 0 tcan 2 dwat 0.6 m hkc  
htut cyutli kyuctcup hwicli hyishrasjlutnyik hpa7tli flatpriklwis  
hpa7tmwatli nyanhjen hjonli

drutta Rhus toxicodendron is a deciduous Shrub growing to 0.6 m (2ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from May to June, and the seeds ripen from September to November. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Oil Edible Uses: Oil None known  
tcanta Dye Ink Mordant Oil Parasiticide Tannin Varnish The leaves are rich in tannin. They can be collected as they fall in the autumn and used as a brown dye or as a mordant[169]. An oil is extracted from the seeds[4]. It attains a tallow-like consistency on standing and is used to make candles. These burn brilliantly, though they emit a pungent smoke[4]. The milky juice makes an excellent indelible marking ink for linen etc[4, 11]. It is also used as a varnish for boots and shoes[4].

dwatta Antirheumatic Homeopathy Irritant Narcotic Parasiticide Rubefacient Salve Stimulant Poison oak has occasionally been used medicinally, though it is an extremely poisonous plant and great caution should be exercised. Any

prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Divide in early spring.

nwatta Succeeds in most soils[1], preferring one that is rich in humus and a position in semi-shade[233]. An attractive shade tolerant ground cover plant for neutral or acidic soils[200]. Plants seldom flower well in areas such as Britain with cool summers, they need warm dry conditions in late summer in order to ripen well and initiate flower production[200].

### 7.2.543 Asarum blumei

6 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 0.2 m hkuc pcmhmm cyutli tcup hwicli hrasljutnyik hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Asarum blumei is an evergreen Perennial growing to 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta None known  
tcanta None known

dwatta Analgesic Antitussive Carminative Expectorant A decoction of the root is analgesic, antitussive, carminative, expectorant and antitussive[147, 174, 218]. It is used in the treatment of sore throats[174].

propta Seed - best sown in a cold frame as soon as it is ripe in the summer[134]. Stored seed will require 3 weeks cold stratification and should be sown in late winter[134]. The seed usually germinates in the spring in 1 - 4 or more weeks at 18°c[134]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least their first winter. Plant them out when large enough in late spring. Division in spring or autumn. Plants are slow to increase[200]. It is best to pot the divisions up and keep them in light shade in the greenhouse until they are growing away strongly.

nwatta Prefers a rich moist neutral to acid soil in woodland or a shady position in the rock garden[1, 200]. Plants are hardy to at least -15°c[200]. The flowers are malodorous and are pollinated by flies[200]. Plants often self-sow when growing in a suitable position[200].

### 7.2.544 Geranium wallichianum

6 tlin 9 cyuc 0 kcaak 0 tcan 2 dwat 0.3 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikhwis hpa7tmwatli xre7t hjonli

drutta Geranium wallichianum is a PERENNIAL growing to 0.3 m (1ft) by 1.5 m (5ft in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known  
tcanta Dye TanninThe root contains 30% tannin, it is used as a dye[61]. A good dense ground cover plant[197, 200]. Plants should be spaced about 60cm apart each way[208].

dwatta Astringent Odontalgic Poultrice StomachicThe plant has astringent properties[211]. A decoction of the root, mixed with the bark of Prunus cerasoides, is used in the treatment of peptic ulcers[272]. It has been used as a cure for toothache and has been applied externally to the eyes[145, 240]. The juice of the plant is applied to fresh cuts to stem the bleeding[272]. A paste of the plant is used as a poultice to relieve joint pains[272].

propta Seed - sow spring in a cold frame. Division in spring or autumn. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up

smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Succeeds in any moderately fertile retentive soil in a sunny position[200]. Tolerates a wide range of soil types[200]. Prefers a position that is cool and moist in the summer but is not heavily shaded[187]. Plants are hardy to at least -20°c[187]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. Some named forms have been selected for their ornamental value[187].

### 7.2.545 Halenia elliptica

Spurred Gentian

6 tlin 9 cyuc 0 kcaak 0 tcan 2 dwat 0.6 m hkuc hmim cyutli tcup hwicli hrasljutnyik hpa7tli frusflat hpa7tmwatli fyifxre7t hjonli

drutta Halenia elliptica is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from July to August. The species is hermaphrodite (has both male and female organs). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta None known  
tcanta None known  
dwatta The entire plant is used in Tibetan medicine, it is considered to have a bitter taste and a cooling potency[241]. It is cholagogue and febrifuge[241]. It is used in the treatment of liver inflammations, stomach complaints and fevers from contagious diseases[241].

propta Seed - best sown in early spring in a cool greenhouse[200]. Only just cover the seed. Prick out into individual pots once the plants are large enough to handle and plant out in late spring after the last expected frosts.

nwatta Requires a cool, damp soil with a pH of 5 - 6, and a position in light shade with protection from strong winds[200]. Plants are not very hardy outdoors in this country and are best treated as frost-tender annuals[200].

### 7.2.546 Papaver dubium

Long-Head Poppy, Blindeyes

6 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 0.5 m hkuc htut cyutli tcup hwicli hyihrasljutnyik hpa7tli flatprikhwis hpa7tmwatli fyifxre7t hjonli

drutta Papaver dubium is a ANNUAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to July, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta None known  
tcanta None known  
dwatta DiaphoreticThe plant is sudorific[240].  
propta Seed - sow spring in situ[200].

nwatta Prefers a well-drained sandy loam in a sunny position[1, 200]. Does not do well on wet clay soils but succeeds in most other soils[115]. This species is possibly more tolerant of poor soils than P. rhoeas[17]. Plants usually self-sow freely when growing in suitable conditions so long as the soil surface is disturbed[238]. When growing in cereal fields, poppies decrease the yields of nearby cereal plants[18, 20]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233].

### 7.2.547 Xanthium spinosum

Spiny Cocklebur

6 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 0.5 m hkuc htut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikhwis hpa7tmwatli fyif hjonli

drutta Xanthium spinosum is a ANNUAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to October, and the seeds ripen from August to October. The species is monoecious

kcakta Edible Parts: LeavesEdible Uses: Young leaves - cooked[177].

tcanta None known  
dwatta None known  
propta Seed - it is best to surface sow the seed as soon as it is ripe in a light position in a cold frame[134]. Seed can also be sown in spring. It usually germinates in 2 - 3 weeks at 21°c[134]. When large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division after flowering[111]. Very easy, the divisions can be planted out straight into their permanent positions if required. Cuttings in a shady border in summer[1].

nwatta Easily grown in ordinary well-drained soil[1]. A polymorphic species[58]. Plants are stoloniferous[1].

### 7.2.459 Caulophyllum thalictroides

Papoose Root, Blue cohosh

6 tlin 9 cyuc 1 kcaak 0 tcan 3 dwat 0.5 m hkuc pcmhmm cyutli tcup hwicli hrasljut hpa7tli flatprikhwis hpa7tmwatli xre7t hjonli

drutta Caulophyllum thalictroides is a PERENNIAL growing to 0.5 m (1ft 8in) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in April, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: Edible Uses: CoffeeThe roasted seed is a coffee substitute[4, 102, 105, 177]. The seeds are about the size of large peas, but are not produced in abundance[232].

tcanta None known  
dwatta Anthelmintic Antispasmodic Birthing aid Diaphoretic Diuretic Emmenagogue Oxytotoxic SedativePapoose root is a traditional herb of many North American Indian tribes and was used extensively by them to facilitate child birth[207]. Modern herbalists still consider it to be a woman's herb and it is commonly used to treat various gynaecological conditions[254]. An acrid, bitter, warming herb, it stimulates the uterus, reduces inflammation, expels intestinal worms and has diuretic effects[238]. The root is anthelmintic, antispasmodic, diaphoretic, diuretic, emmenagogue, oxytotoxic and sedative[4, 21, 46, 165, 207]. An infusion of the root in warm water is taken for about 2 weeks before the expected birth date in order to ease the birth[207, 213]. This infusion can also be used as an emmenagogue and a uterine stimulant[213]. Papoose root should therefore be used with some caution by women who are in an earlier stage of pregnancy since it can induce a miscarriage or early delivery[222]. The plant is also taken internally in the treatment of pelvic inflammatory disease, rheumatism and gout[238]. It should not be prescribed for people with hypertension and heart diseases[238]. The powdered root can have an irritant action on the mucous membranes, therefore any use of this plant is best under the supervision of a qualified practitioner[238, 268]. The roots are normally harvested in the autumn, because they are at their richest at this time[213], and are dried for later use. The root is harvested in early spring as new growth is beginning and is used to make a homeopathic remedy[232]. It is used especially in childbirth and in some forms of rheumatism[232].

propta Seed - best sown as soon as it is ripe in a shady part of a cold frame[200]. If stored seed is used, it should be sown as soon as it is received. Germination can be erratic. Prick out the seedlings as soon as they are large enough to handle and grow them on in a shady part of a greenhouse or cold frame for at least their first winter. Plant them out into their permanent positions during autumn or early winter. Division in spring or just after flowering[200]. Plants are slow to increase[187].

nwatta Easily grown in a damp light humus-rich woodland soil preferring a position in deep shade[1, 200]. One report says that it is best in a peat garden. Plants are hardy to at least -20°c[187]. The plant only produces one large leaf each year[233]. The seeds rupture the ovary before they are fully ripe and continue to expand naked, they are bright blue when fully ripe[130].

### 7.2.460 Sedum forsterianum

Stonecrop

6 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 0.2 m hkuc htut cyutli hगत्युक्तुप hwicli hrasljutnyik hpa7tli flatprikhwis hpa7tmwatli fyifxre7t hjonli

drutta Sedum forsterianum is an evergreen Perennial growing to 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from June to July, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked[2, 46, 105, 115].

tcanta None known  
dwatta None known  
propta Seed - surface sow in spring in well-drained soil in a sunny position in a greenhouse. Do not allow the soil to dry out. Prick out the seedlings into individual pots when they are large enough to handle. If sufficient growth is made, it is possible to plant them out during the summer, otherwise keep them in a cold-frame or greenhouse for their first winter and plant them out in early summer of the following year[K]. Division is very easy and can be carried out at almost any time in the growing season, though is probably best done in spring or early summer. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Succeeds in most soils[188] but prefers a fertile well-drained soil in a sunny position[200]. Established plants are drought tolerant[200]. Can be grown on a wall[200]. Requires a sunny position[188]. Hardy to about -15°c[200]. This species is closely related to S. reflexum. All members of this genus are said to have edible leaves, though those species, such as this one, that have yellow flowers can cause stomach upsets if they are eaten in quantity[62, 85]. Plants in this genus seem to be immune to the predations of rabbits[233].

### 7.2.461 Hibiscus moscheutos

Swamp Rose Mallow, Crimsoneyed rosemallow, Wild Cotton, Common Rosemallow, Eastern Rosemallow, Swamp  
6 tlin 9 cyuc 1 kcaak 0 tcan 2 dwat m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikhwis hpa7tmwatli xre7t hjonli

drutta Hibiscus moscheutos is a PERENNIAL growing to 2.5 m (8ft) by 2 m (6ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Although there are no reports of edibility for this species, most of the plants in this family have edible leaves and flowers[K]. The flowers are about 15cm in diameter[233], though in some cultivars they are up to 25cm in diameter[260]. They have a mild flavour and somewhat mucilaginous texture with a slight bitterness in the aftertaste[K]. The leaves are rather bland and are also mucilaginous, but have a slight hairiness to them which detracts a little from the pleasure of eating them[K].

tcanta None known  
dwatta Demulcent Dysentery Emollient UrinaryThe leaves and roots abound in mucilage[222]. Like many other plants in this family, they are demulcent and emollient and are used in the treatment of dysentery, lung ailments and urinary ailments[222]. An infusion of the dried stalks has been used in the treatment of inflammation of the bladder[257].

propta Seed - sow early spring in a greenhouse. Germination is usually rapid. Prick out the seedlings when they are

large enough to handle and plant them out into their permanent positions in early summer. Some reports say that the seed can be sown in situ outside and that it gives a good rate of germination[78, 80, 113].

nwatta Landscape Uses:Border, Container, Foundation, Specimen. Prefers a well-drained humus rich fertile soil in a sheltered position in full sun[200]. Well-sited to a water-side planting[200]. One report says that the plants are hardy in zone 5 (tolerating winter temperatures down to about -25°C), this same report also says that the plant succeeds outdoors in Britain only in those areas where winter temperatures do not fall below about -5°C[200]. Another report says that it needs to be grown in a warm garden in the warmer areas of Britain[233]. Plants of the cultivar 'Southern Belle' have been seen growing outdoors at Ken Gardens, they are situated on a south-east facing wall of the Temperate House and have been there for at least 3 years as of 2000[K]. A very ornamental plant[1], there are many named varieties[200]. Special Features:North American native, Wetlands plant, Attracts butterflies.

## 7.2.462 Carex kobomugi

Japanese sedge

6 tlin 8 cyuc 1 kcaak 2 tcan 0 dwat 0.2 m hkuc hmimhtut cyutli tcuphja7n hwicli hrasljutnyik hpa7tli flatprklwis hpa7tmwatli hjonli

drutta Carex kobomugi is a PERENNIAL growing to 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 6. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: Root SeedEdible Uses: Root - cooked[172]. Seed[172]. An emergency food, used when all else fails[177]. The seed is very small and would be fiddly to use[K].

tcanta Environmental Uses: Land reclamation; Landscape improvement; Soil conservation. Possible benefits in using *C. kobomugi* for dune stabilization in its native range, but there are considerable doubts raised about its relative effectiveness compared to native species outside of this range. dwatta None known

propta Seed - sow in situ in the spring in a moist soil in light shade. If seed is in short supply it can be sown in a cold frame and be planted out in the summer. The seed usually germinates in 2 - 6 weeks at 15°C[138]. Division in spring[200]. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the summer or following spring.

nwatta We have very little information on this species and do not know if it will be hardy in Britain, though judging by its native range it should succeed outdoors in most parts of this country. It is likely to tolerate maritime exposure[K]. The following notes are based on the general needs of the genus. Easily grown in a damp to wet soil in full sun or shade[162, 200]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 7.2.463 Solidago spectabilis

Nevada Goldenrod

6 tlin 9 cyuc 1 kcaak 0 tcan 1 dwat 0.5 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyikfrp hpa7tli flatprklwissip hpa7tmwatli xre7t hjonli

drutta Solidago spectabilis is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: Seed[46, 61, 105, 161, 257]. No more details are given.

tcanta DyeMustard, orange and brown dyes can be obtained from the whole plant[168].

dwatta AntisepticThe leaves and flowering stems are antiseptic. An infusion of the dried powdered herb can be used[168].

propta Seed - sow spring in a cold frame. Only just cover the seed and do not allow the compost to become dry. Prick out the seedlings into individual pots when they are large enough to handle, and grow them on for their first winter in pots. Plant them out into their permanent positions in spring or early summer. Division in spring or autumn. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Succeeds in any moderately fertile moisture retentive soil in sun or semi-shade[200]. Grows well in heavy clay soils. A rather greedy plant, it is apt to impoverish the soil[1]. There is some confusion over the correct identity of this plant. According to [200] it is a native of Western N. America and grows 50cm tall. According to [72] it is a native of South-eastern N. America and grows 120cm tall. [105] lists this species as a synonym of *S. odora*. It is quite possible that two species are involved, one of which is a synonym for *S. odora*. The plant attracts various beneficial insects such as ladybirds, lacewings and hoverflies to the garden, these insects will help to control insect pests in the garden[201, 238].

## 7.2.464 Bergenia ciliata

6 tlin 9 cyuc 1 kcaak 0 tcan 2 dwat 0.3 m hkuc hmimhtut cyutli tcup hwicli hyishrasljutnyikfrp hpa7tli flatprklwis hpa7tmwatli xre7t hjonli

drutta Bergenia ciliata is an evergreen Perennial growing to 0.3 m (1ft) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower from March to May. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta The flowers are boiled and then pickled[272]. tcanta TanninThe root contains 14 - 16% tannin[272]. A good ground cover plant[188], forming a slowly spreading clump[208, 233].

dwatta Lithontripic Ophthalmic Poultice Tonic UrinaryA juice or powder of the whole plant is used to treat urinary troubles in Nepal[272]. The juice of the leaves is used as drops to relieve earaches[272]. The root is used as a tonic in the treatment of fevers, diarrhoea and pulmonary affections[218, 240, 243]. The root juice is used to treat coughs and colds, haemorrhoids, asthma and urinary problems[272]. Externally, the root is bruised and applied as a poultice to boils and ophthalmia, it is also considered helpful in relieving backache[243, 272]. The root of this plant has a high reputation in indigenous systems of medicine for dissolving stones in the kidneys[240].

propta Seed - surface sow in a greenhouse. Make sure that the compost does not dry out. Two weeks cold stratification can speed up germination which usually takes 1 - 6 months at 15°C[134]. Fresh seed, sown as soon as it is ripe in late spring is liable to germinate better than stored seed. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in late spring after flowering[188] or in autumn[200]. Very easy, larger divisions can be planted straight into their permanent positions whilst smaller clumps are best potted up and kept in a cold frame until they are growing away well.

nwatta Succeeds in full sun or light shade in most soils[200] but prefers a deep fertile soil that does not dry out fully[134]. Grows well in heavy clay soils. Plants are at their best in a medium-heavy soil[208]. Succeeds in shade

htut cyutli kyuctcup hwicli hyishrasljutnyik hpa7tli flatprklwis hpa7tmwatli xre7t hjonli

drutta *Macromeria viridiflora* is a PERENNIAL growing to 0.9 m (3ft). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta None known tcanta Miscellany MiscellanyThe plant was collected by the Hopi Indians, dried and mixed with wild tobacco and used in rain-making ceremonies[187].

dwatta Miscellany MiscellanyThe dried plant, combined with mullein (*Verbascum* species) has been smoked in the treatment of craziness and fits[257].

propta Seed - sow spring in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts

nwatta Requires a well-drained soil and a position in full sun[187]. Plants are hardy to about -15°C[187].

## 7.2.540 Lysimachia paridiformis

6 tlin 9 cyuc 0 kcaak 0 tcan 2 dwat 0.3 m hkuc hmimhtut cyutli tcuphja7nhs6s hwicli hrasljutnyikfrp hpa7tli flatprklwis hpa7tmwatli fyfexre7t hjonli

drutta *Lysimachia paridiformis* is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can grow in water.

kcakta None known

tcanta None known

dwatta Anodyne Antitussive Blood tonic Carminative ExpectoantThe flowering tops, simmered in water, are carminative and diaphoretic[147, 218]. The whole plant is anodyne, antitussive, blood tonic, carminative and expectoant[147, 218]. A decoction is used in the treatment of pulmonary tuberculosis, 'wind-cold' coughing, rheumatoid arthritis, traumatic injuries, stomach ache, enteritis, snake bites and abscess swelling[147]. The fresh herb is also crushed and applied externally as a poultice[147].

propta Seed - sow spring or autumn in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring or autumn[200]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta An easily grown plant, succeeding in a moist loamy soil[1]. Judging by its native habitat, it should succeed in shallow water. Grows well in heavy clay soils. Most species in this genus seem to be immune to the predations of rabbits[233].

## 7.2.541 Scutellaria lateriflora

Virginian Skullcap, Blue skullcap

6 tlin 9 cyuc 0 kcaak 2 tcan 3 dwat 0.6 m hkuc htut cyutli tcup hwicli hrasljutnyik hpa7tli flatprklwis hpa7tmwatli xre7t hjonli

drutta *Scutellaria lateriflora* is a PERENNIAL growing to 0.6 m (2ft) by 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from June to August, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for:

light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta None known

tcanta MiscellanyNone known

dwatta Anticonvulsant Antispasmodic Astringent Diuretic Emmenagogue Epilepsy Miscellany Nervine Sedative TonicA commonly used herbal medicine, Virginian skullcap is a very effective nerve that has traditionally been used in the treatment of a wide range of nervous conditions. Its tonic and restorative properties help to support and nourish the nervous system, calming and relieving stress and anxiety[222, 238, 244, 254]. Very little research has been carried out on this species, despite its long use in American and British herbal medicine[244]. Research is sorely needed, and may reveal more uses for this valuable herb[254]. The leaves are antispasmodic, slightly astringent, diuretic, nerve, sedative and strongly tonic[4, 21, 46, 165]. They are harvested in early summer and dried for later use[4]. It is used in the treatment of various problems of the nervous system including epilepsy, insomnia, anxiety, delirium tremens, withdrawal from barbiturates and tranquilisers, and neuralgia[222, 238, 244]. An infusion of the plant has been used to promote suppressed menstruation, relieve breast pain and encourage expulsion of the placenta[213, 254], it should not be given to pregnant women since it can induce a miscarriage[238]. This plant should be used with some caution since in excess it causes giddiness, stupor, confusion and twitching[238]. The plant was once believed of use in the treatment of rabies, though there is no evidence to support this[207, 213].

propta Seed - sow in situ outdoors in late spring. If there is only a small quantity of seed it is better to sow it in a pot in a cold frame in early spring. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the spring. Division in spring just before new growth begins. Very easy, larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer. Basal cuttings in early summer in a frame. Very easy. Harvest the shoots with plenty of underground stem when they are about 8 - 10cm above the ground. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Succeeds in a sunny position in any ordinary garden soil that does not dry out during the growing season[200]. Plants are not so long-lived when grown in rich soils[4]. Many of the plants grown under this name in gardens are in fact *S. altissima*[238]. It is important to ensure you have the correct plant if using it medicinally[238]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is fleshy. Thick or swollen - fibrous or tap root [2-1].

## 7.2.542 Reineckia carnea

6 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 0.1 m hkuc pcmimhm cyutli tcup hwicli hrasljutnyik hpa7tli flatprklwis hpa7tmwatli xre7t hjonli

drutta *Reineckia carnea* is an evergreen Perennial growing to 0.1 m (0ft 4in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower in April. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid and neutral soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta None known

tcanta A good ground cover for shady positions[200].

dwatta Appetizer Cardiotonic VulneraryThe root is appetizer, cardiotonic and vulnerary[178, 218]. Strengthens the memory[178, 218].

propta Seed - we have no information on this species but suggest sowing the seed as soon as it is ripe in a cold frame if this is possible. Stored seed is likely to be slow to germinate and might take a year or more. Sow it in a cold frame as soon as it is received. When they are large enough to handle,

can be very slow, taking up to 18 months at 15°C[164]. It is best to sow the seed thinly so that it is not necessary to transplant the seedlings for their first year of growth. Apply a liquid fertilizer during their first summer, however, to ensure they get sufficient nourishment. Prick out the seedlings once they are dormant, putting perhaps 2 plants per pot, and grow them on in a greenhouse or frame for at least a couple of years. Plant them out into their permanent positions when they are dormant[K]. The seedlings take 4 - 5 years to reach flowering size[1]. Division of the bulbs in June/July when the leaves have died down[1]. Larger bulbs can be planted out direct into their permanent positions, though it is best to pot up the smaller bulbs and grow them on in a cold frame for a year before planting them out. The plant can be divided every other year if a quick increase is required[1].

nwatta Prefers a rich well-drained loam that does not dry out rapidly in summer[1]. Requires a very sunny position[90]. This species is hardy to at least -15°C[200]. Plants can take 4 - 5 years to flower when grown from seed[164]. Plants seem to be immune to the predations of rabbits[233].

## 7.2.536 *Inula britannica*

Xuan Fu Hua, British yellowhead

6 tlin 9 cyuc 0 kcaak 0 tcan 3 dwat 0.8 m hkuc htut cyutli tcuphja7n hwicli hrasjlutnyikfrip hpa7tli flatprikwis hpa7tmwatli fyifxre7t hjonli

drutta *Inula britannica* is a PERENNIAL growing to 0.8 m (2ft 7in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from August to October, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist or wet soil.

kcakta None known

tcanta None known

dwatta Antibacterial Antiemetic Cancer Carminative Cholagogue Deobstruent Depurative Diuretic Expectorant Laxative Resolvent Stomachic Tonic VulneraryXuan Fu Hua is used in Chinese herbalism as a mildly warming expectorant remedy and it is especially suitable where phlegm has accumulated in the chest[254]. The flowers are more commonly used, but the leaves are also used, generally for less serious conditions[254]. The leaf is discutient and vulnerary[218]. The flowers are antibacterial, carminative, cholagogue, deobstruent, depurative, diuretic, expectorant, laxative, stomachic and tonic[218]. They are used internally in the treatment of bronchial complaints with profuse phlegm, nausea and vomiting, hiccups and flatulence[176, 238]. The flowers have an antibacterial action, but this can be destroyed by proteins in the body[176]. The plant is harvested when in flower and can be dried for later use[254]. The root is discutient, resolvent and vulnerary[218]. The plant has been mentioned as a possible treatment for cancer of the oesophagus[218].

propta Seed - sow spring or autumn in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. If you have sufficient seed, it is worthwhile trying a sowing in situ in the spring or the autumn. Division in spring or autumn[111].

nwatta Succeeds in a sunny position in any moderately fertile well-drained soil[200]. Grows well in heavy clay soils. Plants are hardy to at least -15°C[238]. The sub-species *I. britannica chinensis* is the form used medicinally[238].

## 7.2.537 *Geranium rotundifolium*

Roundleaf geranium

6 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 0.4 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwis hpa7tmwatli fyifxre7t hjonli

drutta *Geranium rotundifolium* is a ANNUAL growing to 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for:

light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta None known

tcanta None known

dwatta Astringent DiureticThe plant is used as an astringent and diuretic[240].

propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring or autumn. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta We have very little information on this species and do not know if it will be hardy in Britain, though judging by its native range it should succeed outdoors in many parts of this country. The following notes are based on the general needs of the genus. Succeeds in any moderately fertile retentive soil in a sunny position[200]. Tolerates a wide range of soil types[200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233].

## 7.2.538 *Thymus camphoratus*

Camphor Thyme

6 tlin 9 cyuc 0 kcaak 0 tcan 2 dwat 0.4 m hkuc htut cyutli hgatyuctup hwicli hyishrasjlut hpa7tli prikklwis hpa7tmwatli xre7t hjonli

drutta *Thymus camphoratus* is an evergreen Shrub growing to 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta None known

tcanta Deodorant Disinfectant EssentialThe essential oil obtained from the leaves is also used in perfumery, as a mouth wash, medicinally etc[200].

dwatta Antiseptic Deodorant DisinfectantAn essential oil obtained from the plant contains thymol, which is strongly antiseptic, deodorant and disinfectant[200]. The plant can be used fresh at any time of the year, or it can be harvested as it comes into flower and either be distilled for the oil or dried for later use[238].

propta Seed - sow spring in a cold frame. Seed can also be sown in autumn in a greenhouse. Surface sow or barely cover the seed. Germination can be erratic. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring or autumn[200]. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the summer or the following spring. Cuttings of young shoots, 5 - 8cm with a heel, May/June in a frame[200]. Cuttings of half-ripe wood, 5 - 8cm with a heel, July/August in a frame[200]. Layering.

nwatta Prefers a light, well-drained calcareous soil and a sunny position[200]. Plants tolerate occasional walking on and can be grown in cracks in paths, they also succeed on walls[200]. Thymes dislike wet conditions, especially in the winter. A layer of gravel on the soil around them will help protect the foliage from wet soils[238]. The flowers are rich in nectar and are very attractive to honey bees[200]. This is a very difficult genus taxonomically, the species hybridize freely with each other and often intergrade into each other[200].

## 7.2.539 *Macromeria viridiflora*

Giant Trumpets, Thurber's giant-trumpets

6 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 0.9 m hkuc

or semi-shade[187]. The leaf colour is best when plants are grown in a poor soil in a sunny position[188]. Dislikes cold winds[197]. The plant is hardy to about -20°C, but the flowers and young leaves are rather sensitive to frost[187] so it is best to choose a position with shade from the early morning sun. This species is only hardy in sheltered gardens of south and west Britain[208]. If the leaves are cut back by frost then they are soon replaced by fresh leaves in the spring[188]. The roots of this plant are commonly collected from the wild for medicinal purposes. Overcollection in many areas of its range are a cause for conservation concern[272]. Plants seem to be immune to the predations of rabbits[233]. The different species of this genus will hybridise freely when grown near each other[233].

## 7.2.465 *Eschscholzia californica*

Californian Poppy

6 tlin 11 cyuc 1 kcaak 2 tcan 3 dwat 0.3 m hkuc htut cyutli kyuctup hwicli hyishrasjlutnyik hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta *Eschscholzia californica* is a PERENNIAL growing to 0.3 m (1ft) by 0.2 m (0ft 8in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to September, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: LeavesEdible Uses: Leaves - cooked[46, 61, 161]. This plant is in a family that contains many poisonous plants so some caution is advised in using it. tcanta Perennial groundcover for zone 2 firebreaks. The US government has created a system of firebreaks for areas prone to wildfires, these are separated into concentric zones surrounding buildings. Zone 2 is the second away from the house. These low-level groundcovers provide little fuel.

dwatta Anodyne Antianxiety Antidepressant Antispasmodic Diaphoretic Diuretic Galactofuge OdontalgicThe Californian poppy is a bitter sedative herb that acts as a diuretic, relieves pain, relaxes spasms and promotes perspiration[238]. The whole plant is harvested when in flower and dried for use in tinctures and infusions[238]. It is taken internally in the treatment of nervous tension, anxiety, insomnia and incontinence (especially in children)[238]. The watery sap is mildly narcotic and has been used to relieve toothache[238]. It is similar in its effect to the opium poppy (Papaver somniferum) but is much milder in its action and does not depress the central nervous system[238]. Another report says that it has a markedly different effect upon the central nervous system, that it is not a narcotic but tends to normalize psychological function[254]. Its gently antispasmodic, sedative and analgesic actions make it a valuable herbal medicine for treating physical and psychological problems in children[254]. It may also prove beneficial in attempts to overcome bedwetting, difficulty in sleeping and nervous tension and anxiety[254]. An extract of the root is used as a wash on the breasts to suppress the flow of milk in lactating females[207, 257].

propta Seed - sow in mid spring or late summer to early autumn in a sunny border outdoors and only just cover the seed[200]. Autumn sown plants may require protection from frosts in cold winters[200]. The seed usually germinates in 2 - 3 weeks.

nwatta Landscape Uses:Border, Container, Foundation, Massing, Rock garden. Prefers a poor sandy soil and a sunny position[108, 200] but is easily grown in an ordinary garden soil[1]. Succeeds in a hot dry position. Plants grow well in maritime climates[200]. A very ornamental plant, it is commonly grown in the flower garden and there are many named varieties[200]. This plant is the state flower of California[207]. Although a perennial it is usually quite short-lived and is more often grown as an annual in this country[187, 238]. It can tolerate temperatures down to about -10°C, however, and often survives mild winters[187]. If the dead flowers are removed before they set seed the plant

will continue flowering for a longer period[188]. A polymorphic species[71]. Plants resent root disturbance and should be sown in situ[200]. The flowers are very attractive to bees[108]. They close during wet or overcast weather[238]. Plants often self-sow if the soil is disturbed by some means such as hoeing[200]. Special Features: Attractive foliage, North American native, Naturalizing, Suitable for cut flowers, Extended bloom season in Zones 9A and above. Heat Zone: 9-2.

## 7.2.466 *Artemisia capillaris*

Yin Chen Hao

6 tlin 9 cyuc 1 kcaak 0 tcan 3 dwat 0.5 m hkuc hmimhtut cyutli hgatyuctup hwicli hrasjlut hpa7tli prikklwis hpa7tmwatli xre7t hjonli

drutta *Artemisia capillaris* is a deciduous Shrub growing to 0.5 m (1ft 8in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from August to October, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: LeavesEdible Uses: Leaves and stems - soaked and boiled[177].

tcanta None known

dwatta Antibacterial Anticholesterolemic Antiviral Cholagogue Diuretic Febrifuge Hepatic VasodilatorYin Chen Hao has been used in Chinese herbal medicine for over 2,000 years. It is considered to be a bitter and cooling herb, clearing "damp heat" from the liver and gall ducts and relieving fevers[254]. It is an effective remedy for liver problems, being specifically helpful in treating hepatitis with jaundice[254]. Modern research has confirmed that the plant has a tonic and strengthening effect upon the liver, gallbladder and digestive system[254]. The leaves and young shoots are antibacterial, anticholesterolemic, antiviral, cholagogue, diuretic, febrifuge and vasodilator[147, 176, 178, 218]. An infusion is used internally in the treatment of jaundice, hepatitis, gall bladder complaints and feverish illnesses[238]. Externally it has been applied in the form of a plaster for treating headaches[254]. The plant is harvested in late spring and can be dried for later use[238]. Yin Chen Hao is contraindicated for pregnant women[254].

propta Seed - surface sow from late winter to early summer in a greenhouse[200]. When large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Cuttings of half-ripe wood, July/August in a frame. Division in spring or autumn.

nwatta An easily grown plant, succeeding in a well-drained circumneutral or slightly alkaline loamy soil, preferring a sunny position[1, 200]. Established plants are drought tolerant[200]. Plants are longer lived, more hardy and more aromatic when they are grown in a poor dry soil[245]. This species is probably not hardy in all parts of Britain, it tolerates temperatures down to at least -5°C[238]. Plants in this genus are notably resistant to honey fungus[200]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 7.2.467 *Athyrium yokoscense*

6 tlin 9 cyuc 1 kcaak 0 tcan 0 dwat 0.3 m hkuc pcmhmm cyutli tcuphja7n hwicli hrasjlutnyikfrip hpa7tli frusflatprikwis hpa7tmwatli hjonli

drutta *Athyrium yokoscense* is a FERN growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist or wet soil.

kcakta Edible Parts: LeavesEdible Uses: Very young fronds (croziers) - boiled[177]. Some caution is advised. See the notes above on toxicity.

tcanta None known  
dwatta None known  
propta Spores - surface sow in a pot of sterile compost in a shady part of the greenhouse and keep moist, this is most easily done by putting the pot in a plastic bag. Pot up small clumps of the plants when they are large enough to handle and keep them moist until they are established. Plant out in late spring of the following year. Division in spring as plants come into growth. Larger divisions can be planted straight into their permanent positions whilst smaller clumps are best potted up and kept in a cold frame until they are growing away well.

nwatta An easily grown plant, it is calcifuge and prefers an acid soil with a pH from 4.5 to 6.5, but it tolerates alkaline soils if plenty of leaf mould is added[200]. Grows well in heavy clay soils. Prefers a moist sheltered site with moderately high atmospheric humidity[200]. Succeeds in a semi-shaded bog-garden or in damp woodland, also in garden borders in full or part shade[200]. This species is very variable, partly according to altitudes and habitats[275]. Plants growing on sunny rocks and in high mountains look like *Athyrium rupestre* and may be distinguished as var. *alpicola*[275]. Lowland plants with deeply tripinnatifid leaves may be called var. *dilatatum*[275]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 7.2.468 *Deinanthe bifida*

6 tin 9 cyuc 1 kcaak 0 tcan 0 dwat 0.4 m hkuc  
pcimhmim cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta *Deinanthe bifida* is a PERENNIAL growing to 0.4 m (1ft 4in) by 0.3 m (1ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from August to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcaakta Edible Parts: Leaves RootEdible Uses: Young leaves - cooked[105, 177]. Root - cooked[105, 177].

tcanta None known  
dwatta None known  
propta Seed - best surface sown as soon as it is ripe in a greenhouse[200]. Do not allow the compost to dry out. Germination usually takes place within 1 - 2 months at 18°C[175]. Surface sow stored seed in early spring. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. When large enough, plant them out in early autumn or in spring. Division in spring[188].

nwatta Requires a cool rich well-drained peaty soil with shelter from the wind[1, 175]. Intolerant of drought[1]. Requires shade, at least from the morning sun, in spring and autumn[175]. A slow-growing plant[188], it does well in a rock garden[188].

## 7.2.469 *Rhododendron anthopogon*

6 tin 9 cyuc 1 kcaak 0 tcan 2 dwat 0.6 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta *Rhododendron anthopogon* is an evergreen Shrub growing to 0.6 m (2ft) by 0.6 m (2ft in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from April to May, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Edible Uses: TeaThe flowers are used as a tea substitute[272].

tcanta IncenseThe dried leaves are used as incense[272].

dwatta Antitussive Diaphoretic Digestive Febrifuge TonicThe stems and leaves of the sub-species *R. anthopogon hypenanthum* are used in Tibetan herbalism[241]. They

have a sweet, bitter and astringent taste and they promote heat[241]. They are antitussive, diaphoretic and digestive and are used to treat lack of appetite, coughing and various skin disorders[241]. In Nepal, the leaves are boiled and the vapour inhaled to treat coughs and colds[272]. The flowers of the sub-species *R. anthopogon hypenanthum* are also used in Tibetan medicine, having a sweet taste and neutral potency[241]. They are antitussive, febrifuge and tonic, being used in the treatment of inflammations, lung disorders and general weakening of the body[241]. They are also used when water and locality are not agreeable due to a change of environment[241].

propta Seed - best sown in a greenhouse as soon as it is ripe in the autumn and given artificial light. Alternatively sow the seed in a lightly shaded part of the warm greenhouse in late winter or in a cold greenhouse in April. Surface-sow the seed and do not allow the compost to become dry[200]. Pot up the seedlings when they are large enough to handle and grow on in a greenhouse for at least the first winter. Layering in late July. Takes 15 - 24 months[78]. Cuttings of half-ripe wood, August in a frame. Difficult[78].

nwatta Succeeds in a most humus-rich lime-free soils except those of a dry arid nature or those that are heavy or clayey[1]. Prefers a peaty or well-drained sandy loam[1]. Succeeds in sun or shade, the warmer the climate the more shade a plant requires[200]. A pH between 4.5 and 5.5 is ideal[1]. Succeeds in a woodland though, because of its surface-rooting habit[200], it does not compete well with surface-rooting trees[1]. Plants need to be kept well weeded, they dislike other plants growing over or into their root system, in particular they grow badly with ground cover plants, herbaceous plants and heathers[200]. Plants form a root ball and are very tolerant of being transplanted, even when quite large, so long as the root ball is kept intact[200]. The whole plant is strongly aromatic with a slightly acrid odour, especially when crushed[11]. Plants in this genus are notably susceptible to honey fungus[200].

## 7.2.470 *Arthromeris wallichiana*

6 tin 9 cyuc 1 kcaak 0 tcan 1 dwat 0.6 m hkuc  
pcimhmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta *Arthromeris wallichiana* is a FERN growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcaakta Edible Parts: LeavesEdible Uses: Tender young fronds - cooked. Used as a vegetable[272].

tcanta None known  
dwatta AntisepticThe root is antiseptic. A paste of the roots is applied as a poultice to wounds and boils[272].

propta Spores - best sown as soon as ripe on the surface of a humus-rich sterilized soil. Keep the compost moist, preferably by putting a plastic bag over the pot. Pot on small clumps of plantlets as soon as they are large enough to handle and keep humid until they are well established. Do not plant outside until the ferns are at least 2 years old and then only in a very well sheltered position. Division in spring[200].

nwatta Tolerates short periods of drought and direct sunlight, but it prefers bright filtered light[200]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 7.2.471 *Ruscus aculeatus*

Butcher's Broom - Knee Holly  
6 tin 9 cyuc 1 kcaak 0 tcan 3 dwat 0.8 m hkuc  
pcimhmim cyutli hgatkuyuctcup hwicli hyishrasjlutnyikfrip hpa7tli flatpriklwisslip hpa7tmwatli nyanhjen hjonli

drutta *Ruscus aculeatus* is an evergreen Shrub growing to 0.8 m (2ft 7in) by 1 m (3ft 3in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from January to April, and the seeds ripen from August to March. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown

TonicThis species is one of several that are the source of the medicinal gentian root[46, 61], the following notes are based on the general uses of *G. lutea* which is the most commonly used species in the West[K]. Gentian root has a long history of use as a herbal bitter in the treatment of digestive disorders and is an ingredient of many proprietary medicines. It contains some of the most bitter compounds known and is used as a scientific basis for measuring bitterness[238]. It is especially useful in states of exhaustion from chronic disease and in all cases of debility, weakness of the digestive system and lack of appetite[4]. It is one of the best strengtheners of the human system, stimulating the liver, gall bladder and digestive system[238], and is an excellent tonic to combine with a purgative in order to prevent its debilitating effects[4]. The root is anthelmintic, anti-inflammatory, antiseptic, bitter tonic, cholagogue, emmenagogue, febrifuge, refrigerant, stomachic[4, 7, 9, 14, 21, 165, 238]. It is taken internally in the treatment of liver complaints, indigestion, gastric infections and anorexia[238]. It should not be prescribed for patients with gastric or duodenal ulcers[238]. The root is harvested in the autumn and dried for later use[4]. It is quite likely that the roots of plants that have not flowered are the richest in medicinal properties[4].

propta Seed - best sown as soon as it is ripe in a light position in a cold frame[200]. It can also be sown in late winter or early spring but the seed germinates best if given a period of cold stratification and quickly loses viability when stored, with older seed germinating slowly and erratically[200, 239]. It is advantageous to keep the seed at about 10°C for a few days after sowing, to enable the seed to imbibe moisture[239]. Following this with a period of at least 5 - 6 weeks with temperatures falling to between 0 and -5°C will usually produce reasonable germination[239]. It is best to use clay pots, since plastic ones do not drain so freely and the moister conditions encourage the growth of moss, which will prevent germination of the seed[239]. The seed should be surface-sown, or only covered with a very light dressing of compost. The seed requires dark for germination, so the pots should be covered with something like newspaper or be kept in the dark[239]. Pot up the seedlings into individual pots as soon as they are large enough to handle and grow on in light shade in the greenhouse for at least their first winter. The seedlings grow on very slowly, taking 2 - 7 years to reach flowering size[239]. When the plants are of sufficient size, place them out into their permanent positions in late spring or early summer. Division in March[111]. Most members of this genus have either a single tap-root, or a compact root system united in a single root head, and are thus unsuitable for division[239]. Cuttings of basal shoots in late spring[238].

nwatta In general, gentians require a moist well-drained soil in a sheltered position, a certain minimum of atmospheric humidity, high light intensity but a site where temperatures are not too high[239]. They are therefore more difficult to grow in areas with hot summers and in such a region they appreciate some protection from the strongest sunlight[200, 239]. Most species will grow well in the rock garden[200]. This species requires a stony soil with perfect drainage[239]. It is best given some protection from winter wet[239]. This plant has a reputation for not being hardy in Britain[239], though this is more likely to be connected to excess moisture than to low temperatures. Plants are intolerant of root disturbance[200].

## 7.2.533 *Delphinium caeruleum*

6 tin 9 cyuc 0 kcaak 0 tcan 1 dwat 0.3 m hkuc  
htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta *Delphinium caeruleum* is a PERENNIAL growing to 0.3 m (1ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcaakta None known  
tcanta Parasiticide ParasiticideA parasiticide is obtained from the leaves and roots[51, 61]. It is quite toxic and so is for external use only.

dwatta Parasiticide ParasiticideThe roots have been used to kill maggots in the wounds of goats[240].

propta Seed - sow March/April in a cold frame or May outdoors[111]. Keep moist and in a shady position until germination takes place[175]. The seed has a limited viability so it should be stored in a sealed container at about 3°C[200]. Temperatures above 15°C inhibit germination[175]. The seed usually germinates in 2 - 9 weeks at 15°C[175]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out into their permanent positions in the summer. Cuttings of basal shoots in April/May, taken before they become hollow at the base, and planted in a cold frame[111]. Division in spring[111] or early autumn[200].

nwatta Prefers a rich well-drained soil that stays moist in the summer[111, 187]. Dislikes water-logged soils[200], it is liable to die out in heavy soils over winter[111]. Requires an open sunny position[188]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

## 7.2.534 *Swertia petiolata*

6 tin 9 cyuc 0 kcaak 0 tcan 2 dwat 0.6 m hkuc

drutta *Swertia petiolata* is a PERENNIAL growing to 0.6 m (2ft) by 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist or wet soil.

kcaakta None known  
tcanta None known

dwatta Antiinflammatory Febrifuge HepaticThe entire plant is used in Tibetan medicine, it is considered to have a bitter taste and extremely cooling potency[241]. It is anti-inflammatory, febrifuge and liver tonic[241]. It is used in the treatment of scleritis, inflammation of the liver and high blood pressure, inflammation of the stomach and liver[241].

propta Seed - sow spring in temperatures not exceeding 10°C in a humus-rich medium[200]. When they are large enough to handle, prick the seedlings out into individual pots and plant them Tu in early summer.

nwatta Succeeds in a moist humus-rich soil in damp light woodlands, stream-sides or the bog garden[200]. Grows best in areas with cool summers[200].

## 7.2.535 *Colchicum luteum*

6 tin 9 cyuc 0 kcaak 0 tcan 2 dwat 0.1 m hkuc  
htut cyutli tcup hwicli jlut hpa7tli flatpriklwis hpa7tmwatli fyfxre7t hjonli

drutta *Colchicum luteum* is a BULB growing to 0.1 m (0ft 4in) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf from March to June, in flower from May to July, and the seeds ripen from April to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. Suitable for: medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcaakta None known  
tcanta The following notes are for *C. autumnale*. Since this plant also contains colchicine it can be assumed that it has the same uses[K]. The poisonous alkaloid 'colchicine' is extracted from this plant and used to alter the genetic make-up of plants in an attempt to find new, improved varieties[148]. It works by doubling the chromosome number[89].

dwatta Alterative Anodyne Aphrodisiac Carminative LaxativeThe corms are alterative, aphrodisiac, carminative and laxative[240]. They are used in India to treat gout, rheumatism and diseases of the liver and spleen[240]. They contain the toxic alkaloid 'colchicine' which is used externally to relieve pain[211, 240]. The dried corms contain around 0.25% colchicine and the seed about 0.4%[240].

propta Seed - best sown as soon as it is ripe in early summer in a seed bed or a cold frame[1, 164]. Germination

## 7.2.530 Hyoscyamus albus

White Henbane

6 tin 9 cyuc 0 kcak 0 tcan 4 dwat 0.9 m hkuc  
htut cyutli kyuctup hwicli hrasljutnyik hpa7tli flatprikli-wisslip hpa7tmwatli xre7t hjonli

drutta Hyoscyamus albus is a ANNUAL/BIENNIAL growing to 0.9 m (3ft). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta None known

tcanta None known

dwatta Anodyne Antispasmodic Diuretic Epilepsy Hallucinogenic Hypnotic Mydriatic Narcotic Sedative Urinary-Henbane has a very long history of use as a medicinal herb, and has been widely cultivated to meet the demand for its use[4]. It is used extensively as a sedative and pain killer and is specifically used for pain affecting the urinary tract, especially when due to kidney stones[254]. Its sedative and antispasmodic effect makes it a valuable treatment for the symptoms of Parkinson's disease, relieving tremor and rigidity during the early stages of the disease[254]. This species is generally considered the best for internal use, whilst the black henbane (*H. niger*) is the form most used externally[4]. All parts of the plant, but especially the leaves and the seeds, can be used - they are anodyne, antispasmodic, mildly diuretic, hallucinogenic, hypnotic, mydriatic, narcotic and sedative[4, 9, 13, 21, 100, 165, 192, 218]. The plant is used internally in the treatment of asthma, whooping cough, motion sickness, Meniere's syndrome, tremor in senility or paralysis and as a pre-operative medication[238]. Henbane reduces mucous secretions, as well as saliva and other digestive juices[254]. Externally, it is used as an oil to relieve painful conditions such as neuralgia, dental and rheumatic pains[238, 254].The leaves should be harvested when the plant is in full flower and they can then be dried for later use[4]. This is a very poisonous plant that should be used with great caution, and only under the supervision of a qualified practitioner[21, 238]. See the notes above on toxicity. The seed is used in the treatment of asthma, cough, epilepsy, myalgia and toothache[218].

propta Seed - best sown as soon as it is ripe, older seed rapidly loses viability[200]. Either sow in situ or pot up the seedlings whilst still small because plants produce a long taproot and older plants resent root disturbance[200].

nwatta Prefers a hot dry position[200] in a wall or rock crevice[187]. Succeeds in a well-drained fertile soil, preferably of an alkaline nature, in full sun[200]. Grows well in maritime areas[200]. Plants are possibly hardy to about -10°C[187], they are unlikely to succeed in the colder areas of Britain. Self-sows freely, it can be grown in wild informal areas of the garden[200].

## 7.2.531 Atropa bella

Deadly Nightshade, Belladonna

6 tin 9 cyuc 0 kcak 0 tcan 3 dwat 0.9 m hkuc  
pcimhmihhut cyutli tcup hwicli hrasljut hpa7tli flatprikli-wisslip hpa7tmwatli xre7t hjonli

drutta Atropa bella-donna is a PERENNIAL growing to 0.9 m (3ft) by 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to August, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta Soil reclamationThis species has been found to be effective in removing PCB's from the soil and detoxifying them[248]. The plant is more effective in doing this if it is infected with the bacterial parasite *Agrobacterium tumefaciens*[248].

dwatta Analgesic Antidote Antispasmodic Diuretic Hallucinogenic Homeopathy Mydriatic Narcotic Sedative UrinaryAlthough it is poisonous, deadly nightshade has a long history of medicinal use and has a wide range of applications, in particular it is used to dilate the pupils in eye operations, to relieve intestinal colic and to treat peptic ulcers[254]. The plant can be used to treat the symptoms of Parkinson's disease, reducing tremors and rigidity whilst improving speech and mobility[254]. It has also been used as an antidote in cases of mushroom or toadstool poisoning[7]. This is a very poisonous plant, it should be used with extreme caution and only under the supervision of a qualified practitioner[238]. See also the notes above on toxicity. All parts of the plant are analgesic, antidote, antispasmodic, diuretic, hallucinogenic, mydriatic, narcotic and sedative[4, 7, 9, 21, 46, 165, 171, 192, 240]. The root is the most active part of the plant, it is harvested in the autumn and can be 1 - 3 years old, though the older roots are very large and difficult to dig up[4, 7]. The leaves are harvested in late spring and dried for later use[7]. All parts of the plant contain tropane alkaloids[254]. The leaves contain on average 0.4% active alkaloids, whilst the root contains around 0.6%[240]. The alkaloid content also varies according to the development of the plant, being low when the plant is flowering and very high when bearing green berries[240]. These alkaloids inhibit the parasympathetic nervous system which controls involuntary body activities. This reduces saliva, gastric, intestinal and bronchial secretions, as well as the activity of the urinary tubules, bladder and intestines[254]. An extract of the plant has been used as eyedrops. It has the effect of dilating the pupils thus making it easier to perform eye operations[4, 232]. In the past women used to put the drops in their eyes in order to make them look larger and thus 'more beautiful'[4, 232]. The entire plant, harvested when coming into flower; is used to make a homeopathic remedy[232]. This is used especially in cases where there is localised and painful inflammation that radiates heat[232]. It is also used to treat sunstroke and painful menstruation[238].

propta Seed - best sown as soon as it is ripe in a cold frame. Germination of stored seed is slow and erratic, usually taking 1 - 6 months at 10°C[134, 200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of softwood terminal shoots in spring[200]. Root cuttings in winter[200].

nwatta Succeeds in any well-drained moisture retentive soil[200] in sun or partial shade[238]. Prefers a calcareous soil[1, 4, 9, 13]. When grown as a medicinal plant, the highest levels of the medically active alkaloids are obtained from plants growing on a light, permeable chalky soil, especially when on a south-west facing slope[4]. The highest concentrations are also formed when the plant is growing in a sunny position and in hot summers[238]. The northerly limits of cultivation are about 50 - 55° north and at an altitude between 100 - 200 metres[4]. This species is widely cultivated, especially in eastern Europe, for the medically active compounds it contains. These are used in the drugs industry to produce a range of medicines[238]. Plants tend to be short-lived[200]. Slugs are very fond of this plant and have been known to completely remove the outer bark from the stems[K].

## 7.2.532 Gentiana kurroo

6 tin 9 cyuc 0 kcak 0 tcan 3 dwat 0.2 m hkuc  
hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Gentiana kurroo is a PERENNIAL growing to 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bumblebees, butterflies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta None known

dwatta Anthelmintic Antiinflammatory Antiseptic Bitter Cholagogue Emmenagogue Febrifuge Refrigerant Stomachic

if seed is required). and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: StemEdible Uses: CoffeeYoung shoots - cooked[1, 2, 4, 5, 8, 11]. They are harvested in the spring as they grow through the soil and used as an asparagus substitute[7, 183]. The taste is pungent and rather bitter[132, 183]. The roasted seed is a coffee substitute[1, 105, 183].

tcanta Broom ScourerMature shoots are bound into bunches and used as scourers or as besoms[4, 6, 8, 11, 100, 182].

dwatta Antipruritic Aperient Deobstruent Depurative Diaphoretic Diuretic VasoconstrictorButcher's broom is little used in modern herbalism but, in view of its positive effect upon varicose veins and haemorrhoids, it could be due for a revival[254]. The root is aperient, deobstruent, depurative, diaphoretic, diuretic and vasoconstrictor[4, 7, 238]. It has been taken internally in the past in the treatment of jaundice, gout, and kidney and bladder stones, at the present time it is used to treat venous insufficiency and haemorrhoids[238]. It should not be prescribed for patients with hypertension[238]. It is also applied externally in the treatment of haemorrhoids[238]. The root is harvested in the autumn and dried for later use[4]. The whole plant is also sometimes used[4]. This remedy should not be given to people with high blood pressure[254]. The plant contains saponin glycosides, including ruscogenin and neuroscogenin. These substances are anti-inflammatory and cause the contraction of blood vessels, especially veins[254]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve *Ruscus aculeatus* for haemorrhoids (piles) and venous conditions (see [302] for critics of commission E) [301].

propta Seed - sow the seed thinly in early spring in a cold frame in light shade. The seed germinates better if it is given a period of cold stratification. Germination can be rather slow, sometimes taking 12 months or more. Grow the seedlings on in the pot in light shade in the greenhouse for their first growing season, giving occasional liquid feeds to ensure they do not suffer nutrient deficiencies. Prick them out into individual pots in the following spring and grow them on for at least another year in the pots before planting them out in early summer. Be very sure to protect the seedlings from slugs[K]. Division as the plant comes into growth in early spring[186]. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Tolerant of most soils[11], including chalky and heavy clay soils[200]. Prefers a shady position[1, 31], tolerating dense dry shade and bad growing conditions[186], including the drip-line of trees[182]. Dislikes much wetness at the roots[186]. Established plants are drought resistant[186]. A very hardy plant, when fully dormant it can tolerate temperatures down to about -25°C[187]. Plants have a slowly creeping tough rootstock and eventually form large clumps[187]. Plants in this genus are notably resistant to honey fungus[200]. Plants are unusual in that the flowers are produced from the middle of the leaf[4]. Although normally dioecious, some hermaphrodite forms are known[200]. One of these is called 'Sparkler'. Male and female plants must usually be grown if seed is required.

## 7.2.472 Mandragora officinarum

Mandrake

6 tin 9 cyuc 1 kcak 0 tcan 2 dwat 0.1 m hkuc  
hmimhtut cyutli kyuctup hwicli hrasljut hpa7tli flatprik hpa7tmwatli fyixre7t hjonli

drutta Mandragora officinarum is a PERENNIAL growing to 0.1 m (0ft 4in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf from March to July, in flower from March to April, and the seeds ripen from July to August. The species is

hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. A delicacy[89]. The fruit is about the size of a small apple, with a strong apple-like scent[4]. Caution is advised in the use of this fruit, it is quite possibly poisonous[K].

tcanta None known

dwatta Cathartic Emetic Hallucinogenic NarcoticMandrake has a long history of medicinal use, though superstition has played a large part in the uses it has been applied to. It is rarely prescribed in modern herbalism[238], though it contains hyoscyne which is the standard pre-operative medication given to soothe patients and reduce bronchial secretions[244]. It is also used to treat travel sickness[244]. The fresh or dried root contains highly poisonous alkaloids and is cathartic, strongly emetic, hallucinogenic and narcotic[4, 21, 46, 192, 244]. In sufficient quantities it induces a state of oblivion and was used as an anaesthetic for operations in early surgery[238]. It was much used in the past for its anodyne and soporific properties[4]. In the past, juice from the finely grated root was applied externally to relieve rheumatic pains, ulcers and scrofulous tumours[244]. It was also used internally to treat melancholy, convulsions and mania[244]. When taken internally in large doses, however, it is said to excite delirium and madness[4]. The root should be used with caution, and only under the supervision of a qualified practitioner[21, 238]. See the notes above on toxicity. The leaves are harmless and cooling. They have been used for ointments and other external applications to ulcers etc[4].

propta Seed - best sown in a cold frame in the autumn[188]. The seed can also be sown in spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Root cuttings in winter[200]. Division. This can be rather difficult since the plants resent root disturbance.

nwatta Prefers a deep humus-rich light soil and a sheltered position in full sun[238]. It also tolerates some shade[200]. Prefers a circumneutral soil[200] and dislikes chalk or gravel[4]. Plants are liable to rot in wet or ill-draining soils[4]. Plants are hardy to about -15°C[187]. The roots are somewhat carrot-shaped and can be up to 1.2 metres long[4]. Plants are intolerant of root disturbance and should be put out into their permanent positions as soon as possible[188]. The root often divides into two and is vaguely suggestive of the human body. In the past it was frequently made into amulets which were believed to bring good fortune, cure sterility etc[244]. There is a superstition that if a person pulls up this root they will be condemned to hell[244]. Therefore in the past people have tied the roots to the bodies of animals and then used these animals in order to pull the roots out of the soil.

## 7.2.473 Abies spectabilis

Himalayan Fir

6 tin 9 cyuc 0 kcak 0 tcan 2 dwat 30 m hkuc  
pcimhmihhut cyutli tcup hwicli hrasljutnyikrip hpa7tli flatprik hpa7tmwatli hjonli

drutta *Abies spectabilis* is an evergreen Tree growing to 30 m (98ft 5in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, and the seeds ripen from October to November. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid and neutral soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta Essential Fuel Incense WoodAn essential oil is obtained from the plant, though the report does not give yields or uses[240]. The dried leaves, mixed with other ingredients, are used in making incense[272]. The wood is used

for construction and thatching roofs[272]. It is also used for fuel[272].

dwatta Antiperiodic Astringent Carminative Expecto- rant Stomachic TonicThe leaves are astringent, carminative, expectorant, stomachic and tonic[240]. The leaf juice used in the treatment of asthma, bronchitis etc[240, 243, 272]. An essential oil obtained from the leaves is used to treat colds, rheumatism and nasal congestion[272]. The leaf juice is antiperiodic[240, 243].

propta Seed - sow early February in a greenhouse or outdoors in March[78]. Germination is often poor, usually taking about 6 - 8 weeks[78]. Stratification is said to produce a more even germination so it is probably best to sow the seed in a cold frame as soon as it is ripe in the autumn[80, 113]. The seed remains viable for up to 5 years if it is well stored[113]. When large enough to handle, prick the seedlings out into individual pots and grow them on for at least their first winter in pots. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Alternatively, if you have sufficient seed, it is possible to sow in an outdoor seedbed. One report says that it is best to grow the seedlings on in the shade at a density of about 550 plants per square metre[78] whilst another report says that they are best grown on in a sunny position[80].

nwatta Prefers a good moist but not water-logged soil[1]. Grows well in heavy clay soils. Plants are very shade tolerant, especially when young, but growth is slower in dense shade[81]. Intolerant of atmospheric pollution[1]. Prefers slightly acid conditions down to a pH of about 5[200]. Prefers growing on a north-facing slope[200]. This species is unsatisfactory in south-eastern Britain due to damage by late frosts, trees rarely live more than 40 years and have a poor thin crown[185]. Trees grow far better in the milder and moister western side of the country[11]. Young trees are very slow to establish because they are often damaged by late frosts, it is best to grow the young trees in high shade to get them through this time[1, 185]. Trees should be planted into their permanent positions when they are quite small, between 30 and 90cm in height. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200]. Plants are strongly outbreeding, self-fertilized seed usually grows poorly[200]. They hybridize freely with other members of this genus[200].

## 7.2.474 Platanus orientalis

Oriental Plane, Oriental planetree

6 tlin 9 cyuc 0 kcaak 0 tcan 2 dwat 30 m hkuc htut cyutli hgattcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta Platanus orientalis is a deciduous Tree growing to 30 m (98ft) by 30 m (98ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in May, and the seeds ripen from October to February. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta None known

tcanta Dye WoodA fabric dye is obtained from the branches and roots[7]. The colour is not given[K]. Wood - tough, difficult to split, not durable. It is not esteemed for carpentry, but has certain advantages in cabinet making[7], it is also used for inlay work and wood pulp[46, 61, 89].

dwatta Astringent Dysentery Ophthalmic VulneraryThe leaves are astringent and vulnerary[7]. The fresh leaves are bruised and applied to the eyes in the treatment of ophthalmia[240]. A decoction is used to treat dysentery and a cream made from the leaves is used to heal wounds and chilblains[7]. The leaves are harvested in the spring and summer and can be dried for later use[7]. The bark is boiled in vinegar and then used in the treatment of diarrhoea, dysentery, hernias and toothache[240].

propta Seed - two months cold stratification improves germination[113]. Sow spring in a cold frame in light shade[78, 98]. Home grown seed is often of poor quality and low viability. It is best to harvest the seed in late winter or

spring and then sow it immediately in a cold frame[80]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of mature wood of the current years growth, 20 - 30 cm with a heel, autumn in a cold frame[1]. Easy[200]. Layering of stools in spring or autumn. Takes 12 months[78].

nwatta Requires a sunny position in a deep fertile well-drained soil[188]. A fast growing species, established plants are drought tolerant[200]. Tolerates atmospheric pollution and compacted soils[200]. This species is hardy in most areas of Britain but the trees do not do well in northern parts of the country, requiring hotter summers than are normally experienced there[98]. A very ornamental and very long lived tree[1]. It is immune to 'Plane tree wilt' fungus[11]. Very tolerant of root disturbance, trees up to 5 metres tall can be moved quite easily[200].

## 7.2.475 Ilex rotunda

Kurogane holly

6 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 20 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

drutta Ilex rotunda is an evergreen Tree growing to 20 m (65ft 7in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year; in flower in April, and the seeds ripen from October to December. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta None known

dwatta DepurativeThe stem bark is detoxicant[218]. The plant is used in a mixture with other herbs for its haemostatic action[218].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. It can take 18 months to germinate. Stored seed generally requires two winters and a summer before it will germinate and should be sown as soon as possible in a cold frame. Scarification, followed by a warm stratification and then a cold stratification may speed up the germination time[78, 80]. The seedlings are rather slow-growing. Pot them up into individual pots when they are large enough to handle and grow them on in light shade in a cold frame for their first year. It is possible to plant them out into a nursery bed in late spring of the following year, but they should not be left here for more than two years since they do not like being transplanted. Alternatively, grow them on in their pots for a second season and then plant them out into their permanent positions in late spring or early summer. Give them a good mulch and some protection for their first winter outdoors. Cuttings of almost ripe wood with a heel, August in a shaded position in a cold frame. Leave for 12 months before potting up. Layering in October. Takes 2 years[78].

nwatta Succeeds in most soils so long as they are not water-logged[200]. This species should be hardy in many areas of Britain, especially if provenances from the northern end of its range in Japan are obtained[11]. Resents root disturbance, especially as the plants get older[11]. It is best to place the plants into their permanent positions as soon as possible, perhaps giving some winter protection for their first year or two[K]. Plants are very tolerant of pruning and can be cut right back into old wood if required[188]. Dioecious. Male and female plants must be grown if seed is required.

## 7.2.476 Pterocarya stenoptera

Chinese wingnut

6 tlin 9 cyuc 0 kcaak 0 tcan 2 dwat 20 m hkuc htut cyutli tcup hwicli jlutnyik hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta Pterocarya stenoptera is a deciduous Tree growing to 20 m (65ft) by 15 m (49ft). See above for USDA har-

dwatta A very toxic plant that is considered to be useful for reducing blood pressure in various conditions of hypertension[213]. The root contains the alkaloids nervine, pseudo-nervine and veratridine[213]. It is best to harvest the root in the autumn and dry it for later use[213]. This species has similar medicinal properties to the black hellebore, *H. niger*[4]. These properties are:- Black hellebore is a very poisonous plant that is toxic when taken in all but the smallest doses. As such it should not be taken except under professional supervision. The plant contains cardiac glycosides which have a similar action to the foxglove (*Digitalis spp*) and it has been used as a heart stimulant for the elderly, though this treatment is no longer recommended[254]. The root is anthelmintic, cardiac, cathartic, diuretic, emetic, emmenagogue, irritant, violently narcotic and a drastic purgative[4, 9, 21, 46, 240]. It is harvested in the autumn and dried for later use[4]. It has been used in the treatment of dropsy, amenorrhoea, nervous disorders and hysteria, but it is very poisonous and great care must be taken over the dosage[4]. The root is also applied externally as a local irritant[4], but even this should be done with care, see notes above on toxicity. A homeopathic remedy is made from the roots[9]. It is used in the treatment of headaches, psychic disorders, enteritis and spasms[9].

propta Seed - best sown as soon as it is ripe in a cold frame[1, 134]. Sow stored seed as early in the year as possible[1], it usually germinates in the autumn to spring. Seed can take 18 months to germinate. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a lightly shaded position in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. This species produces flowering plants in 2 - 3 years from seed[200]. It is not possible to divide this species, but it is possible to take basal cuttings of young vegetative shoots[200]. Harvest the shoots when they are about 10cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Landscape Uses:Container, Massing, Rock garden, Woodland garden. Succeeds in any good garden soil[1], preferring a moist well-drained rich loam in a sheltered position in partial shade[1, 4, 31, 111]. Plants are suitable for naturalizing in a woodland garden[200] and also succeed in the shade of a north-facing wall[233]. They do not object to lime[1]. Grow well in heavy clay soils[200]. Dislikes drought. The stems live for one or two years, dying after flowering[200]. Slugs are very fond of this plant and it will probably require some protection from them[187]. The various species in this genus hybridize freely[95]. There are some named forms, selected for their ornamental value[200]. The whole plant, especially when bruised, gives off an unpleasant smell that is similar to decaying meat[245]. Plants resent root disturbance and should be placed in their permanent positions whilst still small[200]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54]. Special Features: Attractive foliage, Not North American native, Naturalizing, All or parts of this plant are poisonous, Suitable for cut flowers, Flowers have an unpleasant odor.

## 7.2.528 Agapanthus campanulatus

6 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 0.6 m hkuc hmimhtut cyutli hgattcup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Agapanthus campanulatus is an evergreen Bulb growing to 0.6 m (2ft) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil and can tolerate drought. The plant can tolerate maritime exposure.

kcakta None known

tcanta None known

dwatta Cardiac StomachicCardiac, stomachic[61].

propta Seed - best sown in a greenhouse as soon as it is ripe[200], it can also be sown in a greenhouse in March/April[133]. The seed usually germinates in 1 - 3 months at 18°C[133], do not sow it too thickly so that it is possible to grow the seedlings on in their pot without disturbing them for their first year of growth. Give occasional liquid feeds to make sure they do not become nutrient deficient. Divide the seedlings up into individual pots in the spring following germination, grow them on for a further year in the greenhouse and then plant them out into their permanent positions in late spring or early summer. Seedlings take 2 - 3 years to flower[133]. Division of offsets in April/May. Do not move plants between October and March[175]. Division is very easy in the growing season, the divisions can be planted straight out into their permanent positions if required.

nwatta Succeeds in most soils[175] but it prefers a light very well-drained porous soil with plenty of leaf-mould[200]. Requires plenty of moisture during the growing season but it needs to be kept dry in the winter[1, 200]. Another report says that it is drought resistant when established[190]. It only flowers freely when growing in a very sunny position[175]. Plants succeed in maritime gardens[233]. The rhizomes are best planted only just below soil level - a mulch of gravel or stone chips will help to keep the crown of the plant free from excess moisture[282]. Plants are probably hardy to about -15°C[187], but are best if given a good mulch should temperatures lower than -5°C occur[200]. Some plants growing in Essex have their leaves killed by the first frosts of the autumn but the clumps are unharmed[190]. Hybridizes very freely with other members of this genus - some botanists say there is only one very variable species of *Agapanthus*[200]. A number of named varieties have been selected for their ornamental value[187]. Plants seem to be immune to the predations of rabbits[233]. The flowering stems lean towards the sun[175].

## 7.2.529 Onosma echioides

Onosma

6 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 0.3 m hkuc htut cyutli hgatyuctcup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Onosma echioides is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta None known

tcanta DyeA red dye is obtained from the root. It is an alkanna substitute[46, 61].

dwatta Alternative Laxative Poulitce StimulantThe leaves are alterative[240]. They are made into a powder and given to children as a purgative[240]. The flowers are used as a cordial and stimulant in the treatment of rheumatism and palpitations of the heart[240]. The root is bruised and used as an external application to skin eruptions[240].

propta Seed - we have no information on this species but suggest sowing the seed in a greenhouse in early spring. Prick out the seedlings into individual pots as soon as they are large enough to handle and grow them on in the greenhouse for at least their first winter. Plant them out in early summer. Cuttings in a frame in the summer. Shade them for the first 10 - 12 days[1].

nwatta Requires a well-drained soil in full sun[1, 187]. Prefers a deep rather rich sandy loam[1]. Best grown in a crevice in a rock garden or on a wall[1, 187]. Tolerates hot dry conditions and also drought once it is established, but disliking winter wet[190]. Plants also dislike wet summers[200]. Hardy to about -15°C[187]. There is some confusion over this species. It is given as a part of *O. frutescens* in some reports but [200] gives it specific status. A very ornamental plant[1].

possible in late winter or early spring. The seed usually germinates in 1 - 6 months at 15°c[133]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least their first year. When the plants are large enough, plant them out in the spring. Division in late summer after the plant dies down.

nwatta Succeeds in ordinary garden soil but prefers a moist well-drained woodland soil[1, 200]. Prefers a moist peaty soil in some shade[187]. Tolerates drought during its summer dormancy[200]. Hardy to at least -20°c[187]. This species is very closely related to *A . grayi* , *A . lancifolia* , *A . lyallii* , *A . oregana* , and *A . Piperi*. This species complex also shares close morphologic affinities with both European species such as *A . nemorosa* and Asian species such as *A . Altaica*[270] Plants seem to be immune to the predations of rabbits[233]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54]. A good woodland plant[1, 187].

## 7.2.525 Colchicum autumnale

Autumn Crocus, Meadow Saffron,

6 tlin 9 cyuc 0 kcaak 0 tcan 3 dwat 0.2 m hkuc  
pchimhim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwis  
hpa7tmwatli fyfxre7t hjonli

drutta Colchicum autumnale is a BULB growing to 0.2 m (0ft 8in) by 0.2 m (0ft 8in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in leaf from February to July, in flower from August to October, and the seeds ripen from April to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known  
tcanta Plant breedingThe poisonous alkaloid 'colchicine' is extracted from this plant and used to alter the genetic make-up of plants in an attempt to find new, improved varieties[9, 13, 19, 46, 100, 171]. It works by doubling the chromosome number[89].

dwatta Analgesic Antirheumatic Cathartic Emetic HomeopathyThough known since at least the time of the ancient Greeks, autumn crocus was considered too poisonous to use medicinally and it was not until research in the Eighteenth century that the plant was discovered to be of value in the treatment of gout[268]. In modern herbalism it is still used to relieve the pain and inflammation of acute gout and rheumatism, although frequent use has been known to encourage more frequent attacks of the complaint[232, 268]. Both the corm and the seeds are analgesic, antirheumatic, cathartic and emetic[4, 7, 13, 21, 235]. They are used mainly in the treatment of gouty and rheumatic complaints, usually accompanied with an alkaline diuretic[4]. Leukaemia has been successfully treated with autumn crocus, and the plant has also been used with some success to treat Bechet's syndrome, a chronic disease marked by recurring ulcers and leukaemia[254]. A very toxic plant, it should not be prescribed for pregnant women or patients with kidney disease, and should only be used under the supervision of a qualified practitioner[238]. See also the notes above on toxicity. The seeds are harvested in early summer, the corms in mid to late summer when the plant has fully died down. They are dried for later use[238]. The fresh bulb is used to make a homeopathic remedy[232]. It is used in the treatment of nausea, diarrhoea and rheumatism[232].

propta Seed - best sown as soon as it is ripe in early summer in a seed bed or a cold frame[1, 164]. Germination can be very slow, taking up to 18 months at 15°c[164]. It is best to sow the seed thinly so that it is not necessary to transplant the seedlings for their first year of growth. Apply a liquid fertilizer during their first summer, however, to ensure they get sufficient nourishment. Prick out the seedlings once they are dormant, putting perhaps 2 plants per pot, and grow them on in a greenhouse or frame for at least a couple of years. Plant them out into their permanent positions when they are dormant[K]. The seedlings take 4 - 5 years to reach flowering size[1]. Division of the bulbs in June/July when the

leaves have died down[1]. Larger bulbs can be planted out direct into their permanent positions, though it is best to pot up the smaller bulbs and grow them on in a cold frame for a year before planting them out. The plant can be divided every other year if a quick increase is required[1].

nwatta Landscape Uses:Alpine garden, Border, Foundation, Massing, Rock garden, Specimen. Prefers a rich well-drained loam in a sunny position[1, 188]. Tolerates partial shade but dislikes dry soils[1]. Tolerates a pH in the range 4.5 to 7.5. Plants are hardy to about -20°c[200]. The dormant bulbs are fairly hardy and will withstand soil temperatures down to at least -5°c[214]. The autumn crocus is easily grown in grass[90] and can be naturalized there[200]. It also grows well amongst shrubs and by woodland edges[28]. Plant the corms about 7 - 10cm deep in July[1]. Plants seem to be immune to the predations of rabbits[233], though slugs may attack the corms[238]. The flowers are very attractive to bees and butterflies[201]. Special Features:Not North American native, Naturalizing, Suitable for cut flowers.

## 7.2.526 Asarum arifolium

6 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 0.2 m hkuc  
pchimhim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik  
hpa7tmwatli xre7t hjonli

drutta Asarum arifolium is an evergreen Perennial growing to 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta None known  
tcanta EssentialAn essential oil obtained from the plant has the odour of sassafras[4].

dwatta StomachicThe root is stomachic[61].  
propta Seed - best sown in a cold frame as soon as it is ripe in the summer[134]. Stored seed will require 3 weeks cold stratification and should be sown in late winter[134]. The seed usually germinates in the spring in 1 - 4 or more weeks at 18°c[134]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least their first winter. Plant them out when large enough in late spring. Division in spring or autumn. Plants are slow to increase[200]. It is best to pot the divisions up and keep them in light shade in the greenhouse until they are growing away strongly.

nwatta Prefers a rich moist neutral to acid soil in woodland or a shady position in the rock garden[1, 200]. Plants are hardy to at least -15°c[200]. The flowers are malodorous and are pollinated by flies[200]. The root has a pungent, aromatic smell like mild pepper and ginger mixed, but more strongly aromatic[245]. Plants often self-sow when growing in a suitable position[200].

## 7.2.527 Helleborus foetidus

Stinking Hellebore, Setterwort, Bear's Foot, Bearsfoot, Setterwort, Stinkwort, Stinking Hellebore

6 tlin 9 cyuc 0 kcaak 0 tcan 2 dwat 0.8 m hkuc  
hmim cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprikli-  
wisslip hpa7tmwatli xre7t hjonli

drutta Helleborus foetidus is an evergreen Perennial growing to 0.8 m (2ft 7in) by 0.3 m (1ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from February to April, and the seeds ripen from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta None known  
tcanta A decoction of the roots is used as a parasiticide against body lice, fleas etc[76, 213]. This use is somewhat dangerous, see the notes above on toxicity.

diness. It is hardy to UK zone 7 and is not frost tender. It is in flower in June, and the seeds ripen from October to December. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta None known  
tcanta InsecticideThe leaves have insecticidal properties[218].

dwatta Anthelmintic Astringent Eczema Febrifuge Skin StomachicAnthelmintic, astringent, febrifuge, stomachic[61, 178]. The leaves are used in the treatment of abscesses, eczema and scabies[218]. The stem bark is anthelmintic and carminative[218].

propta Seed - best sown as soon as it is ripe in a cold frame[80, 113]. Pre-soak stored seed for 24 hours in warm water[80] then cold stratify for 2 - 3 months[98, 113]. Prick out the seedlings into individual pots as soon as they are large enough to handle and grow them on in the greenhouse for their first winter. Plant them out in late spring or early summer of the following year[240]. Cuttings of half-ripe wood, July/August in a frame[113]. Cuttings of mature shoots, November in a frame. Only use vigorous shoots[113]. Layering. Division of suckers in the dormant season[188].

nwatta Prefers a sunny position in a rich strong loam with abundant moisture at the roots[11, 200]. Succeeds in areas that do not experience prolonged winter temperatures below about -12°c[200], but young plants and the young shoots of older trees can be cut back by winter frosts[11]. Plants are tolerant of compacted soils[200]. The leaves are resinous to the touch and emit a resinous aroma[245]. The root system of this tree is too invasive for small gardens[200]. Plants in this genus are notably resistant to honey fungus[200].

## 7.2.477 Cunninghamia lanceolata

Chinese Fir

6 tlin 9 cyuc 0 kcaak 4 tcan 2 dwat 15 m hkuc  
htut cyutli tcup hwicli hrasjlutnyik hpa7tli frusflatprikwis  
hpa7tmwatli hjonli

drutta Cunninghamia lanceolata is an evergreen Tree growing to 15 m (49ft) by 6 m (19ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from January to May, and the seeds ripen from August to September. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It cannot grow in the shade. It prefers moist soil.

kcakta None known at this time  
tcanta Charcoal Miscellany WoodAgroforestry Uses: The tree is suitable for reforestation schemes in subtropical evergreen, coniferous and mixed broad-leaved forests[ 303 , 329 ]. It is a suitable species for agroforestry systems in China as it is usually intercropped with a number of crops such as maize, beans, wheat, Chinese sorghum, buckwheat, potato, 'ground chestnut' (Arachis hypogaea), tobacco and upland rice; or with other tree species such as the tung oil tree (Aleurites fordii), tea and Litsea cubeba. The interplanting is important not only to increase the income of farmers during early stages of plantations but also to avoid the land degradation that results from continuous cropping of this tree[ 303 ]. Other Uses The bark is a source of tannins[ 303 ]. The branches produce an essential oil that is used in the perfume industry. Cedrol, pinene, phellandrene, citrene, terpinol, thujenol, cadinol and borneol are the main constituents of the oil[ 303 ]. The pale yellow to white, fragrant wood is uniform-textured; straight-grained; light in weight; and durable, though it rots easily if it is continually wet. It is easily worked and resists insect and termite damage. It is used in construction, ship building etc wherever great strength is required. Older and larger branches are used in turnery[ 1 , 46 , 61 , 178 , 303 ]. A good quality fuel and a charcoal can be made from the wood[ 178 , 303 ].

dwatta Antidote Carminative Miscellany SkinCarminative. A decoction of the wood is used internally in the treat-

ment of varnish poisoning (from species of Rhus), chronic ulcers, hernia etc[ 178 , 218 , 303 ]. The decoction of the wood is used as a bath for smelly feet[ 303 ]. An essential oil from the plant is used to treat bruises, pain, rheumatism and wounds[ 218 , 303 ]. The ash of the bark is used to treat burns, scalds and wounds[ 218 , 303 ]. A decoction of the cone is used in the treatment of coughs[ 218 , 303 ].

propta Seed - they have no dormancy and pre-treatment is not necessary. Germination can be improved by soaking the seeds in warm water for a few hours prior to sowing[ 325 ]. Seeds are sown in seed beds, germination begins after 7 days and is terminated after 20 days[ 325 ]. As soon as they are large enough to handle, the seedlings are pricked out into polytubes. Seedlings are normally ready for transplanting into the field in 4 - 5 months later, when they are 35 - 40cm tall[ 325 ]. Vegetative propagation of this species is relatively easy, and at one time most planting stock was produced from coppices from basal stumps after felling[ 325 ]. Nursery seedlings, however, have faster early growth and better survival than coppice sprouts. Since the 1980s, techniques have been developed to produce planting stock from root cuttings[ 325 ]. The cuttings are collected from the root collar when they reach a height of about 10 cm and placed in rooting beds. These cuttings have a survival rate of 90 - 95% and the quality is similar to that of seedling stocks[ 325 ]. Cuttings from lateral shoots are not suitable[ 325 ].

nwatta Landscape Uses:Pest tolerant, Specimen. A plant mainly of the warm temperate to subtropical zones, just entering into the tropics. It is found at elevations from near sea level to 2,600 metres[ 325 ]. It grows best in areas where the mean annual temperature is in the range 16 - 19°c and is fairly frost resistant - mature plants can tolerate temperatures down to about -15°c[ 418 ]. It prefers a mean annual rainfall in the range 900 - 2,350mm[ 325 ]. Requires a rich warm soil and a sheltered sunny position[ 1 , 164 ]. Best growth is obtained on well-drained loamy soils[ 325 ]. Prefers a pH in the range 5.5 - 6.5, tolerating 5 - 7.5[ 325 ]. Dislikes soil with free lime otherwise the pH is unimportant[ 200 ]. Young trees can make quite rapid growth in height, up to 60cm a year once they have attained more than 1 metre in height[ 185 ]. Before reaching the height of 1 metre, however, they are liable to be killed by frost[ 185 ]. Trees commence coning and producing viable seeds when they are around 6 - 8 years old[ 303 , 325 ]. This is the main re-forestation tree in China[ 46 , 61 ]. The most important fast-growing timber tree of the warm regions south of the Chang Jiang valley of China[ 266 ]. Unlike most conifers, this species can be coppiced, and it also resprouts from the roots if cut down[ 1 , 303 ]. The bruised foliage emits a delicious resinous aroma[ 245 ]. This species is notably resistant to honey fungus[ 200 ]. Special Features:Attractive foliage, Not North American native, Inconspicuous flowers or blooms.

## 7.2.478 Liquidambar formosana

Formosan Gum, Chinese Sweet Gum, Formosa Sweet Gum  
6 tlin 9 cyuc 0 kcaak 0 tcan 3 dwat 12 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik  
hpa7tmwatli hjonli

drutta Liquidambar formosana is a deciduous Tree growing to 12 m (39ft) by 10 m (32ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower in May, and the seeds ripen from October to November. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known  
tcanta Resin WoodAn aromatic resin is obtained from the trunk of this tree[4]. It forms in cavities of the bark and is harvested in autumn. It is used medicinally[178]. Wood. Used to make tea chests for higher grade teas[1, 46, 61].

dwatta Anodyne Antiphlogistic Antirheumatic Astringent Balsamic Cancer Haemostatic Odontalgic SkinThe leaves are used in the treatment of cancerous growths[218]. The stem is anodyne, antiphlogistic, astringent, balsamic and haemostatic[178, 218]. The resin from the stems is mixed with Rhamnus crenata fruits and used as a suppository for

constipation[218]. The stem bark is used in the treatment of fluxes and skin diseases[176]. The fruits are antirheumatic, diuretic and galactagogue[176]. They are used in the treatment of arthritis, lumbago, oedema, oliguria, decreased milk production and skin diseases[176, 218]. The root is used in the treatment of cancerous growths[218]. The resin from the stems is used to treat bleeding boils, carbuncles, toothache and tuberculosis[218].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. Harvest the seed capsules at the end of October or November, dry in a warm place and extract the seed by shaking the capsule. Stored seed requires 1 - 3 months stratification and sometimes takes 2 years to germinate. Sow it as early in the year as possible. Germination rates are often poor. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame or greenhouse for their first winter. Since they resent root disturbance, it is best to plant them out into their permanent positions in early summer of their second year and give them some protection from cold for their first winter outdoors[K]. Cuttings of half-ripe wood, July/August in a frame. Suckers in early spring. Layering in October/November. Takes 12 months.

nwatta Landscape Uses:Aggressive surface roots possible, Specimen. Prefers a moist but not swampy loam in a sunny sheltered position[1, 200]. Succeeds in light shade[188]. Requires a deep fertile soil[200]. Prefers a neutral to acid soil, growing poorly on shallow soils overlying chalk[188]. Not all introductions of this species are hardy[11]. The Monticola group, which comes from western Hubei and north-eastern Sichuan, tolerates temperatures lower than -5°C[200, 260]. Young plants are susceptible to frost damage and should be protected for their first few years[200]. This species resents root disturbance, young plants should be pot-grown and be placed in their permanent positions as soon as possible[200]. Special Features:Attractive foliage, Not North American native, Inconspicuous flowers or blooms.

## 7.2.479 Schizophragma integrifolium

6 tlin 9 cyuc 0 kcaak 0 tcan 2 dwat 12 m hkuc pcmhmmihtut cyutli tcup hwicli hrasljutnyik hpa7tli flat-prikliwis hpa7tmwatli xre7t hjonli

drutta Schizophragma integrifolium is a deciduous Climber growing to 12 m (39ft 4in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta None known  
tcanta Plants can be allowed to sprawl and are then used as a ground cover for a shady position[208].

dwatta Carminative RefrigerantThe root and the climbing stem are carminative and refrigerant[147, 218]. Activates blood circulation, strengthens muscles and bones[147].

propta Seed - sow late winter to early spring in a greenhouse. Germination is usually fair to very good[78]. Prick out the seedlings into individual pots once they are large enough to handle and grow them on in light shade in the greenhouse for their first winter, planting them out in late spring or early summer. Layering in spring directly into pots. A fair to good percentage[78]. Cuttings of half-ripe wood, 4 - 5cm with a heel, July in a frame[1, 78]. Keep the cuttings moist[78].

nwatta Requires a moist leafy soil and some shade at the roots. An easily grown plant[1], it prefers a good loamy soil and plenty of moisture[11] but is not fussy[219]. Plants succeed in sun or shade[182], they flower better in a sunny position but will also succeed on a north-facing wall[188, 219]. In the hotter parts of Britain they prefer shade from the midday sun[219]. Tolerating temperatures down to about -10 to -15°C, this species is not reliably hardy in the coldest parts of the country[219]. Plants do not normally require pruning, though any unwanted growth can be removed in the winter[219]. Plants have a similar growth habit to ivy (*Hedera helix*) climbing trees by means of aerial roots or growing

along the woodland floor[1, 182]. Plants might need some help to become attached in their early years[182].

## 7.2.480 Cotoneaster frigidus

6 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 10 m hkuc pcmhmmihtut cyutli kyuctcup hwicli hyishrsajlutnyikfrip hpa7tli flatprikliwsslip hpa7tmwatli xre7t hjonli

drutta Cotoneaster frigidus is a deciduous Shrub growing to 10 m (32ft) by 10 m (32ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in June, and the seeds ripen from September to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies, midges. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil. It can tolerate atmospheric pollution.

kcaakta None known  
tcanta Basketry Dye Hedge HedgeA rose-tan dye is obtained from the fruit[168]. The branches are used in basketry and for making twig bridges in the Himalayas[145]. Can be grown as an informal hedge[200].

dwatta Blood tonicThe fruits are eaten to replenish the blood in cases of deficiency[272].

propta Seed. Members of this genus hybridize freely so, if you require seed that breeds true, it is important to obtain it from a known wild source or from a controlled fertilization of garden plants. The seed is best sown as soon as it is ripe in the autumn in a cold frame, when it will usually germinate in the spring[11, 200]. Stored seed germinates faster if given 3 months warm stratification at 15°C and then 3 months cold stratification at 4°C[164]. The seed usually germinates within 1 - 18 months at 15°C but it can take 2 years[164]. Pot the seedlings up as soon as they are large enough to handle and plant them out into nursery beds or into their permanent positions when they are more than 10cm tall. Cuttings of half-ripe wood with a heel, July/August in a frame[11, 200].

nwatta An easily grown plant, it prefers a good soil but also does well in poor soils[1, 11, 200]. It thrives in lime and is also happy in peaty soils[1]. It succeeds in any soil that is not marshy or waterlogged[11, 200]. Succeeds in dry soils[188]. Grows well in heavy clay soils. Succeeds in full sun or semi-shade but does not fruit so freely in a shady position[11, 200]. Plants also succeed in quite deep shade[219]. Tolerates atmospheric pollution[200]. A fast-growing plant[219]. The flowers, when inhaled near to, have an unpleasant smell like decaying fish[245]. They are very attractive to bees whilst the fruit is a good winter food source for many species of birds[200]. Hybridizes freely with other members of this genus, especially those species in the 'Salicifolia' group of this genus[182]. Trees are notably susceptible to honey fungus[200].

## 7.2.481 Ampelopsis japonica

6 tlin 9 cyuc 0 kcaak 0 tcan 2 dwat 10 m hkuc hmihmtut cyutli tcup hwicli jlut hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta Ampelopsis japonica is a deciduous Climber growing to 10 m (32ft 10in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from July to August, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Insects. Suitable for: medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta None known  
tcanta None known  
dwatta Anodyne Antibacterial Antifungal Depurative Febrifuge VulneraryThe roots are anodyne, antibacterial, anticonvulsive, antifungal, bitter, cooling, depurative, expectorant, febrifuge and vulnerary[147, 176, 218]. A decoction of the roots is used in the treatment of tuberculous cervical nodes, bleeding from haemorrhoids and burn injuries[147].

well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcaakta None known  
tcanta None known  
dwatta Antidote Febrifuge Haemostatic TonicThis plant is said to have medicinal properties, but no details were given in the report[145]. The flowers are used in Tibetan medicine, they are said to have a bitter taste and a cooling potency[241]. Antidote, febrifuge, haemostatic and tonic, they are used in the treatment of infectious fevers, influenza, nose bleeds, poisoning, sores from environmental poisoning and an inability to stretch or contract the limbs[241].

propta Seed - surface sow in spring in a cold frame. Do not allow the compost to become dry. Pre-chilling the seed for two weeks can improve germination rates[134]. Germination usually takes place within 2 weeks at 20°C[134]. When large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring or autumn[200].

nwatta Succeeds in most good garden soils[1], preferring one that is well-drained and moisture retentive[200]. Prefers a sunny position[200]. A very ornamental plant[1], it grows well in a rock garden[1]. Most species in this genus seem to be immune to the predations of rabbits[233]. Hybridizes freely with other members of this genus[200].

## 7.2.522 Lycoris aurea

Golden Spider Lily  
6 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 0.6 m hkuc htut cyutli tcup hwicli hrasljut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Lycoris aurea is a BULB growing to 0.6 m (2ft) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to July. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcaakta None known  
tcanta None known  
dwatta Cytotoxic PoulticeThe crushed bulb is used as a poultice for treating burns, scalds and ulcers[218]. The bulb contains lycorine, which is cytotoxic[218].

propta The seed is best sown as soon as it is ripe in a greenhouse and should germinate in the spring[200]. Sow the seed thinly so that it does not need to be disturbed for its first year of growth. Give an occasional liquid feed during the growing season to ensure the plants do not become nutrient deficient. Pot up the small bulbs when the plants become dormant, placing 2 bulbs in each pot. Grow them on for another 2 years in the greenhouse before planting them out when they are dormant. Division of offsets in the dormant season[200].

nwatta Requires a deep well-drained sandy soil rich in organic matter in full sun[200]. Plants require a dry period when they become dormant in the summer and they also dislike winter wet[218]. Hardy to at least -15°C[200]. Plants are attractive to slugs and need to be protected from them[200]. Very sensitive to root disturbance, the bulbs can take some years to become well established[200].

## 7.2.523 Paeonia obovata

6 tlin 9 cyuc 0 kcaak 0 tcan 3 dwat 0.5 m hkuc hmihmtut cyutli tcup hwicli hrasljutnyikfrip hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Paeonia obovata is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta None known  
tcanta None known

dwatta Analgesic Antibacterial Antiinflammatory Antispasmodic Diuretic Febrifuge SedativeThe root is analgesic, antibacterial, anti-inflammatory, antispasmodic, diuretic, febrifuge and sedative[174]. The Chinese herb Chi Shao Yao is made from the whole root of a number of peony species, especially *P. lactiflora*, but also occasionally this species[250]. The most important ingredient medicinally in the root is paeoniflorin, which has been shown to have a strong antispasmodic effect on mammalian intestines, it also reduces blood pressure, reduces body temperature caused by fever and protects against stress ulcers[250]. A tea made from the dried crushed petals of various peony species has been used as a cough remedy, and as a treatment for haemorrhoids and varicose veins[250].

propta Seed - best sown as soon as it is ripe in a cold frame[250]. When sown fresh, the seed produces a root about 6 weeks after sowing with shoots formed in the spring[200]. Stored seed is much slower, it should be sown as soon as possible in a cold frame but may take 18 months or more to germinate[200]. The roots are very sensitive to disturbance, so many growers allow the seedlings to remain in their pots for 2 growing seasons before potting them up. This allows a better root system to develop that is more resilient to disturbance[250]. If following this practice, make sure you sow the seed thinly, and give regular liquid feeds in the growing season to ensure the plants are well fed. We usually prick out the seedlings into individual pots as soon as they are large enough to handle, and then grow them on in a cold frame for at least two growing seasons before planting them out when they are in growth in the spring[K]. Division with great care in spring or autumn. Each portion must have a leaf bud. If the lifted root is stood in shade for several hours it becomes less brittle and easier to divide[200]. Divisions that have several buds will usually flower in the second year, but those that only have one or two buds will take a number of years before they have grown sufficiently to flower[250].

nwatta Requires a deep rich soil, preferably neutral or slightly alkaline[1], doing quite well in sun or light shade[200]. Plants are tolerant of a wide range of soil conditions, but will not survive if the soil becomes waterlogged or is too dry[250]. This species is lime tolerant[200]. Plants grown on sandy soils tend to produce more leaves and less flowers, whilst those growing on clay take longer to become established but produce better blooms[250]. Dislikes cold winds[233]. Grows well in light woodland[233]. Plants are hardy to about -20°C[187]. A very long-lived plant, living for 50 years or more in the garden[200]. This species is closely related to *P. japonica*[200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54]. Strongly resents root disturbance, taking some time to recover after being divided[1]. Peony species are usually self-fertile, though they will also hybridise with other species if these flower nearby at the same time[250]. Plants take 4 - 5 years to flower from seed[200]. They generally breed true from seed[1].

## 7.2.524 Anemone quinquefolia

Wind Flower, Wood anemone, Twoleaf anemone, Nightcups  
6 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 0.3 m hkuc pcmhmmihtut cyutli hgattcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Anemone quinquefolia is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil and can tolerate drought.

kcaakta None known  
tcanta None known  
dwatta Rubefacient VesicantEmployed as a rubefacient in the treatment of rheumatism, gout and fevers, it is also used as a vesicant in the removal of corns[207].

propta Seed - best sown in a cold frame as soon as it is ripe in the summer[1]. Surface sow or only just cover the seed and keep the soil moist. Sow stored seed as soon as

the top is then cut off obliquely about 5cm below the point where the stalks spring forth. The exuding juice is collected, which gradually hardens[4]. This resin is a drastic cathartic and hydrogogue and should be used with great caution[4, 46, 61]. The roots contain about 8% resin[240].

propta Seed - sow spring in a greenhouse[164]. Germination can be slow and erratic, a period of cold stratification might help reduce the germination period. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out in late spring or early summer, after the last expected frosts. Division in spring. Cuttings of young shoots, August in a frame in sand[1].

nwatta Prefers a light basic sharply drained soil of low to medium fertility[4, 200]. Prefers a sunny sheltered position. Thrives in dry soils[4] and succeeds in ordinary garden soils. The root can be up to 1.2 metres long, so for best results a deep soil is required[4].

## 7.2.518 Chaenactis douglasii

Morning Brides, Douglas' dustymaiden, Alpine dustymaiden 6 tlin 9 cyuc 0 kcaak 0 tcan 2 dwat 0.4 m hkuc htut cyutli kyuctcup hwicli hyishras hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Chaenactis douglasii is a BIENNIAL/PERENNIAL growing to 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta None known  
tcanta None known

dwatta Cardiac Poultice StomachicMorning brides was employed medicinally by a number of native North American Indian tribes who used it to treat a variety of complaints, but especially to treat skin problems[257]. It is not generally used in modern herbalism. An infusion of the whole plant has been given to children in order to slow their heart rates[257]. It is also used in the treatment of stomach complaints, coughs and colds[257]. The fresh plant, or sometimes just the leaves, are crushed and applied as a poultice to swellings, sores and aches[207, 257]. An infusion is used as a wash for a variety of skin problems including pimples, chapped hands, boils and insect bites[257].

propta Seed - surface sow in spring in a greenhouse[207]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out into their permanent positions in the summer.

nwatta Requires a deep well-drained gritty or gravelly soil, preferably of low fertility and a sunny position[207]. Grows well in the rock garden[207]. The plant is a biennial or short-lived perennial[207].

## 7.2.519 Goodyera pubescens

Downy Rattlesnake Plantain

6 tlin 10 cyuc 0 kcaak 0 tcan 2 dwat 0.4 m hkuc hmimhtut cyutli kyuctcup hwicli hrasljut hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Goodyera pubescens is an evergreen Perennial growing to 0.4 m (1ft 4in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta None known  
tcanta MiscellanyNone known

dwatta Appetizer Miscellany Odontalgic Ophthalmic PoulticeA tea made from the roots is used in the treatment of pleurisy and snakebites[222]. A tea made from the leaves is taken to improve the appetite, as a treatment for colds,

kidney ailments, rheumatism and toothaches[222, 257]. Externally, a poultice of the wilted leaves is used to cool burns, treat skin ulcers and relieve rheumatic joints[222, 257]. An ooze from the plant (this probably means the sap or the juice of the bulb[K]) has been used as eye drops to treat sore eyes[257].

propta Seed - surface sow, preferably as soon as it is ripe, in the greenhouse and do not allow the compost to dry out. The seed of this species is extremely simple, it has a minute embryo surrounded by a single layer of protective cells. It contains very little food reserves and depends upon a symbiotic relationship with a species of soil-dwelling fungus. The fungal hyphae invade the seed and enter the cells of the embryo. The orchid soon begins to digest the fungal tissue and this acts as a food supply for the plant until it is able to obtain nutrients from decaying material in the soil[200]. It is best to use some of the soil that is growing around established plants in order to introduce the fungus, or to sow the seed around a plant of the same species and allow the seedlings to grow on until they are large enough to move.

nwatta Landscape Uses:Border, Ground cover, Massing. Requires a somewhat shady site and a well-drained compost of peat, leafmold and sand[1]. Does well in the woodland garden[42, 230]. Orchids are, in general, shallow-rooting plants of well-drained low-fertility soils. Their symbiotic relationship with a fungus in the soil allows them to obtain sufficient nutrients and be able to compete successfully with other plants. They are very sensitive to the addition of fertilizers or fungicides since these can harm the symbiotic fungus and thus kill the orchid[230]. This species is closely related to the British native species, *G. repens*[230]. This plant is too rare in the wild to be harvested[222]. Special Features:Attractive foliage, North American native, Attractive flowers or blooms.

## 7.2.520 Clinopodium umbrosum

6 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 0.6 m hkuc hmimhtut cyutli tcup hwicli hrasljut hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Clinopodium umbrosum is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from August to October, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known  
tcanta EssentialYields an essential oil[145]. No more details are given.

dwatta VulneraryThe juice of the leaves is applied to cuts and wounds[272].

propta Seed - sow spring in a cold frame. Only just cover the seed. Germination usually takes place within 2 weeks at 21 °c. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse. Plant them out in the summer if they have made sufficient growth, otherwise plant them out in late spring or early summer of the following year. Division in spring. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the summer or following spring. Cuttings of soft wood in May or June.

nwatta Succeeds in almost any well-drained soil[1].

## 7.2.521 Aster diplostephioides

6 tlin 9 cyuc 0 kcaak 0 tcan 2 dwat 0.5 m hkuc htut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliw hpa7tmwatli fyifxre7t hjonli

drutta Aster diplostephioides is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers

propta Seed - sow in pots in a cold frame in the autumn or stratify for 6 weeks at 5 °c and sow in the spring[200]. Germination can be quite slow, sometimes taking more than a year. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. When they are more than 20cm tall, they can be planted out into their permanent positions, preferably in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm long, July/August in a frame[78]. Cuttings or eyes in late autumn or winter. Either place them in the ground in a greenhouse or cold frame, or put them in pots. An eye cutting is where you have just one bud at the top and a short length of stem with a small part of the bark removed. These normally root well and grow away vigorously, being ready to plant into their permanent positions the following autumn. Layering into pots in late summer. Partially sever the stem in spring and then lift the new plants in the autumn[78].

nwatta Prefers a deep rich loam in a warm sheltered position in sun or semi-shade[11, 200]. Requires plenty of root room[11]. The young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. Plants rarely produce fruit in Britain except after a long hot summer[200]. Plants are occasionally cultivated in Japan for medicinal purposes[58]. The shoots have sticky pads and are self-supporting on walls[11]. Another report says that plants climb by means of coiling tendrils but large plants often need tying in to support the weight of foliage[200].

## 7.2.482 Campsis grandiflora

Trumpet Creeper

6 tlin 9 cyuc 0 kcaak 0 tcan 2 dwat 9 m hkuc htut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Campsis grandiflora is a deciduous Climber growing to 9 m (29ft 6in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf from June to October, in flower from August to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerate maritime exposure.

kcakta None known  
tcanta Plants can be allowed to scramble on the ground and will form an effective ground cover, rooting at intervals along the branches[208]. They should be planted about 2.5 metres apart each way[208].

dwatta Blood tonic Carminative Diuretic Febrifuge Women's complaintsThe flowers and the whole plant are blood tonic, carminative, depurative diuretic and febrifuge[147, 178, 218]. They are used in the treatment of women's complaints[147, 178]. A decoction of the flowers is used to correct menstrual disorders, rheumatoid pains, traumatic injuries, difficult urination, pruritis and oozing dermatoses[147, 218].

propta Seed - sow spring in a greenhouse at 10 °c. Two months stratification at 5 °c assists germination[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of almost ripe wood, 7 - 10cm long, July/August in a frame. Slow to root but a fair percentage[78, 200]. Root cuttings 5cm long in December. Fair to good percentage[78]. Division of suckers in the dormant season[202]. Layering in winter[188]. Plants often self-layer[260].

nwatta Succeeds in a good well-drained loam[11, 200] and a very sunny position[166] or light shade[200]. Tolerates moderately alkaline or moderately acid soils[202]. Dormant plants are hardy to about -10 °c[200], though they require a sunny sheltered wall or hot summers if they are to flower well[11, 166]. The fresh young growth in spring is often damaged by late frosts[208]. Plants can take some years to settle down before they start to flower[202]. They climb by means of aerial roots but need to be supported[11, 166]. Another report says that this species does not produce aerial roots[219]. Plants can be pruned like grapes (*Vitis* spp.)[11]

and any pruning is best done in the spring[188]. The subspecies *C. grandiflora thunbergii* tolerates saline winds[200]. Hybridizes freely with other members of this genus[200].

## 7.2.483 Photinia serratifolia

Taiwanese photinia , Chinese Photinia

6 tlin 10 cyuc 0 kcaak 0 tcan 1 dwat 8 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Photinia serratifolia is an evergreen Shrub growing to 8 m (26ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower in April, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known  
tcanta WoodThe wood is hard and heavy, suitable for making furniture and other small articles[266].

dwatta Anodyne Aphrodisiac Diuretic Febrifuge Stimulant TonicThe leaves are diuretic, febrifuge, stimulant and tonic[218]. A tincture of the wood is ingested as a tonic and anodyne[218]. The plant is said to have excessive aphrodisiac properties[218].

propta Seed - best sown in a cold frame as soon as it is ripe in the autumn. Stored seed will probably require stratification and should be sown as early in the year as possible[78]. Germination is usually good[78]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Basal cuttings in a frame[200]. Harvest the shoots with plenty of underground stem when they are about 8 - 10cm above the ground. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in a frame[11, 78]. They take about 2 months to root and should be overwintered in a greenhouse, planting out in late spring[78]. Fair to good percentage[78]. Cuttings of almost ripe side shoots, 7 - 12cm with a heel, October/November in a cold frame[78]. Lift the following autumn and plant in their permanent positions[78]. Layering in autumn. Partially sever the layer about 12 months later and lift in the following spring. High percentage[200].

nwatta Landscape Uses:Pest tolerant, Screen, Standard, Specimen, Street tree. Requires a well-drained fertile soil in a sheltered position in sun or light shade[1, 200]. Prefers a warm soil that is not too heavy or close[11]. Tolerates calcareous soils[11, 200]. Dislikes windy sites[11]. Plants are hardy to between -7 and -12 °c[200]. Hardy at Kew Gardens in all but exceptionally cold winters, this species is at its best in the milder areas of the country where specimens up to 15 metres tall exist[11]. There are some named forms, selected for their ornamental value[200]. The flowers have a delicate scent[245]. Plants are susceptible to fireblight[200]. Plants in this genus are notably resistant to honey fungus[200]. Special Features:Attractive foliage, Not North American native, Blooms are very showy.

## 7.2.484 Eucalyptus pauciflora niphophila

Snow Gum

6 tlin 9 cyuc 0 kcaak 0 tcan 3 dwat 6 m hkuc htut cyutli hgatkyuctcuphja7n hwicli hyishrasljutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Eucalyptus pauciflora niphophila is an evergreen Tree growing to 6 m (19ft) by 3.5 m (11ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from May to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils,

prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry moist or wet soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure.

kcakta None known

tcanta Essential Fuel ShelterbeltThe leaves yield between 0.7 and 0.8% essential oil. It is a good antiseptic[154]. Fairly tolerant of maritime exposure, it can be grown as part of a shelterbelt in maritime areas[75]. Wood is a good source of fuel[154].

dwatta AntisepticEucalyptus leaves are a traditional Aboriginal herbal remedy. The essential oil found in the leaves is a powerful antiseptic and is used all over the world for relieving coughs and colds, sore throats and other infections[254]. The essential oil is a common ingredient in many over-the-counter cold remedies[254]. An essential oil obtained from the leaves is antiseptic[154]. The essential oil from various species of eucalyptus is a very powerful antiseptic, especially when it is old, because ozone is formed in it on exposure to air. It has a decided disinfectant action, destroying the lower forms of life[4]. The oil can be used externally, applied to cuts, skin infections etc, it can also be inhaled for treating blocked nasal passages, it can be gargled for sore throat and can also be taken internally for a wide range of complaints[4]. Some caution is advised, however, because like all essential oils, it can have a deleterious effect on the body in larger doses[4].

propta Seed - surface sow February/March in a sunny position in a greenhouse[11, 78, 134]. Species that come from high altitudes appreciate 6 - 8 weeks cold stratification at 2°C[200]. Pot up the seedlings into individual pots as soon as the second set of seed leaves has developed, if left longer than this they might not move well. Plant out into their permanent positions in early summer and give them some protection from the cold in their first winter. The seed can also be sown in June, the young trees being planted in their final positions in late spring of the following year. The seed has a long viability[200].

nwatta Prefers a sunny position in a moderately fertile well-drained moisture retentive circum-neutral soil[200]. Succeeds in most soils but dislikes chalk or clay soils[98]. Tolerates poor soils, especially those low in mineral elements[200]. Tolerant of drought, dry soils[200] and exposed positions[75]. This is perhaps the hardiest species in this genus, it tolerates long periods down to -14°C and short periods as low as -20°C[107, 200]. Eucalyptus species have not adopted a deciduous habit and continue to grow until it is too cold for them to do so. This makes them more susceptible to damage from sudden cold snaps. If temperature fluctuations are more gradual, as in a woodland for example, the plants have the opportunity to stop growing and become dormant, thus making them more cold resistant. A deep mulch around the roots to prevent the soil from freezing also helps the trees to survive cold conditions. The members of this genus are remarkably adaptable however, there can be a dramatic increase in the hardiness of subsequent generations from the seed of survivors growing in temperate zones[200]. Eucalyptus monocultures are an environmental disaster; they are voracious, allelopathic and encourage the worst possible attitudes to land use and conservation[200]. A very ornamental tree[1], it grows very slowly in its first 2 or 3 years but is then capable of growing 1 metre or more a year[11]. Plants self-sow in Devon[1]. Plants are shallow-rooting and, especially in windy areas, should be planted out into their permanent positions when small to ensure that they do not suffer from wind-rock[245]. They strongly resent root disturbance and should be container grown before planting out into their permanent position[11]. In Australia this species usually regenerates from the base after forest fires[167]. The flowers are rich in nectar and are a good bee crop[200].

## 7.2.485 Buddleia globosa

Orange Ball Tree

6 tlin 9 cyuc 0 kcak 0 tcan 1 dwat 5 m hkuc htut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta Buddleia globosa is an evergreen Shrub growing to 5 m (16ft) by 5 m (16ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from June

to July. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerate maritime exposure.

kcakta None known

tcanta MiscellanyNone known

dwatta MiscellanyOne report says that it is cultivated as a medicinal plant in S. America but gives no more details[184].

propta Seed - cold stratify for 4 weeks at 4°C[138] and surface sow the seed in February/March in a greenhouse[78, 113]. Germination usually takes place within 3 - 4 weeks at 21°C[138]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter, planting them out into their permanent positions in late spring or early summer, after the last expected frosts. Seedlings are inclined to damp off and so should be watered with care and kept well-ventilated[78]. Cuttings of half-ripe wood, July/August in a frame[11, 113]. Use short side-shoots[78]. Very high percentage[113]. Cuttings of mature wood of the current season's growth, 15 - 20cm long, October/November in a frame[200].

nwatta Requires a sunny position[11, 182]. Prefers a rich loamy well-drained soil[11, 200]. Very tolerant of alkaline soils[200]. Grows well by the sea, tolerating maritime exposure[184, 200]. Plants are hardy to about -15°C if they are sheltered from cold winds[184, 200]. They respout freely from the base if cut back by cold weather[200] and are deciduous in cold winters[188]. Plants flower on the previous year's growth[200]. The flowers scent the air for a considerable distance with their sweet honey-like fragrance[245].

## 7.2.486 Rhododendron ponticum

Rhododendron

6 tlin 9 cyuc 0 kcak 0 tcan 1 dwat 5 m hkuc hmim cyutli tcup hwicli hrasljut hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta Rhododendron ponticum is an evergreen Shrub growing to 5 m (16ft 5in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta None known

tcanta Hedge HedgePlants are being grown as a hedge at the RHS gardens in Wisley, Surrey[29]. It tolerates quite hard clipping[200].

dwatta Antirheumatic CardiacA medicine made from the plant is used to treat heart and circulation malfunctions, but it should not be used without expert supervision[9].

propta Seed - best sown in a greenhouse as soon as it is ripe in the autumn and given artificial light. Alternatively sow the seed in a lightly shaded part of the warm greenhouse in late winter or in a cold greenhouse in April. Surface-sow the seed and do not allow the compost to become dry[200]. Pot up the seedlings when they are large enough to handle and grow on in a greenhouse for at least the first winter. Layering in late July. Takes 15 - 24 months[78]. Cuttings of half-ripe wood, August in a frame. Difficult[78].

nwatta Succeeds in a most humus-rich lime-free soils except those of a dry arid nature or those that are heavy or clayey[1]. Prefers a peaty or well-drained sandy loam[1]. A pH between 4.5 and 5.5 is ideal[1]. Succeeds in sun or shade, the warmer the climate the more shade a plant requires[184, 200]. Hardy to about -15°C[184]. Plants are self-sowing aggressively in British woodlands and are often out-competing native trees by filling the understorey and preventing natural regeneration. They are considered to be a pernicious weed by many environmentalists. Succeeds in a woodland though, because of its surface-rooting habit[200], it does not compete well with surface-rooting trees[1]. Plants need to be kept well weeded, they dislike other plants growing over or into their root system, in particular they grow badly with

well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta Hedge Hedge WoodPlants are sometimes grown as a hedge[146]. Wood - close grained, moderately hard[146].

dwatta Aromatic StimulantThe seeds are aromatic and stimulant[240].

propta Seed - sow spring in a greenhouse and only just cover the seed. Germination usually takes place within 1 - 3 months at 10°C. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood 10 - 12 cm with a heel, July/August in a frame. Plant out in the following spring[200]. Cuttings of mature wood, 12 - 17cm with a heel, October/November in a sheltered position outdoors. Plants root by the spring. Good percentage[78].

nwatta Landscape Uses:Container, Ground cover, Massing, Rock garden. Easily grown in any reasonably good well-drained but moisture retentive soil[1]. Succeeds in sun or semi-shade but flowers better in a sunny position[200]. This species is only hardy to about -5°C but plants can respout from the base if they are cut back by cold[184]. Plants in this genus are notably resistant to honey fungus[200]. Special Features: Attractive foliage, Not North American native, Attractive flowers or blooms.

## 7.2.514 Nicotiana glauca

Tobacco, Jasmine tobacco, Nicotiana, Jasmine Tobacco, Ornamental Tobacco, Flowering Tobacco  
6 tlin 9 cyuc 0 kcak 3 tcan 0 dwat 0.6 m hkuc htut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Nicotiana glauca is a PERENNIAL growing to 0.6 m (2ft) by 0.3 m (1ft in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from July to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta None known

tcanta InsecticideAll parts of the plant contain nicotine, this has been extracted and used as an insecticide. Landscape Uses: Border, Container, Massing, Specimen. Dynamic accumulator.

dwatta None known

propta Seed - surface sow in a warm greenhouse about 10 weeks before the last expected spring frosts. The seed usually germinates in 10 - 20 days at 20°C. Keep the soil moist and pot up as soon as the plants are big enough to handle, planting them out after the last expected frosts.

nwatta Prefers a well-drained deep rich moist soil in a sunny position[1, 108]. Hardy to about -5°C[200], this plant is usually grown as an annual in Britain, flowering well in its first year, but it does survive mild winters outdoors[1]. A very ornamental plant[1], it has sweetly scented flowers that release most of their scent in the evening and attract moths[30]. Plant requires more than 14 hours daylight per day to induce flowering[169]. Special Features:Attracts birds, Not North American native, Naturalizing, All or parts of this plant are poisonous, Attracts butterflies, Suitable for cut flowers, Fragrant flowers, Attractive flowers or blooms.

## 7.2.515 Clinopodium glabellum

Glade calamint

6 tlin 7 cyuc 0 kcak 3 tcan 0 dwat 0.6 m hkuc hmimhtut cyutli tcuphja7n hwicli hrasljutnyik hpa7tli flat hpa7tmwatli hjonli

drutta Clinopodium glabellum is an evergreen Perennial growing to 0.6 m (2ft) by 1.5 m (5ft in) at a fast rate. See

above for USDA hardiness. It is hardy to UK zone 7. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta None known

tcanta Bog gardens. A good fast growing, medium density ground cover. Can withstand some foot-traffic. An aromatic pest confuser that may confuse pests reducing their ability to find and eat crops [1-2].

dwatta None known

propta Seed

nwatta An herbaceous perennial with showy flowers. Flower Color:Lavender. Bloom Size: 1"-2". Suitable Locations: Bog gardening. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. An evergreen. The root pattern is fibrous dividing into a large number of fine roots [1-2].

## 7.2.516 Coptis japonica

6 tlin 9 cyuc 0 kcak 0 tcan 2 dwat 0.2 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flat hpa7tmwatli xre7t hjonli

drutta Coptis japonica is an evergreen Perennial growing to 0.2 m (0ft 8in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower in May. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta Can be grown as a ground cover plant in the peat garden[200].

dwatta Antibacterial Antiinflammatory Dysentery StomachicThe root is a pungent, very bitter, cooling herb that controls bacterial and viral infections, relaxes spasms, lowers fevers and stimulates the circulation[238]. It is locally analgesic and anaesthetic[238] and is also anti-inflammatory and stomachic. It is used in the treatment of intestinal catarrh[4, 61, 174], dysentery, enteritis, high fevers, inflamed mouth and tongue, conjunctivitis etc[238]. The root is harvested in the autumn and can be used fresh or dried[238].

propta Seed - best sown in a greenhouse as soon as it is ripe in an ericaceous compost[164]. Seal the pot in a polythene bag until germination takes place, which is usually within 1 - 6 months at 10°C[164]. Stored seed should be sown as early in the year as possible. Four weeks cold stratification may be beneficial[164]. Prick out the seedlings into individual pots when they are large enough to handle and grow on in a shady part of the greenhouse for at least their first winter. Plant them out in mid-autumn or in spring. Division in spring[200].

nwatta Requires a light moist humus-rich slightly acidic soil with a northerly aspect or light shade[1, 200].

## 7.2.517 Convolvulus scammonia

Scammony

6 tlin 9 cyuc 0 kcak 0 tcan 2 dwat 0.8 m hkuc htut cyutli kyuctcup hwicli hyishrasljut hpa7tli prikliwis hpa7tmwatli fyifxre7t hjonli

drutta Convolvulus scammonia is a PERENNIAL growing to 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in July, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta None known

tcanta None known

dwatta Cathartic HydrogogueA resin is obtained from the root. The earth is cleared away from the top of the root,

excellent remedy for a weak stomach, especially when this gives rise to nausea, indigestion and bloating, and it has also been shown to protect the liver[254]. It is perhaps best known in India as the main ingredient in mahasudarshana churna, a remedy containing more than 50 herbs[254]. The plant has an interesting chemistry, similar in many respects to *Gentiana lutea*, a widely used restorative tonic of the digestive system[238]. It also contains xanthones, which are reputedly effective against malaria and tuberculosis, and also amarogentin, a glycoside that may protect the liver against carbon tetrachloride poisoning[238]. The whole plant is an extremely bitter tonic digestive herb that lowers fevers and is stimulant[165, 238]. The herb has a beneficial effect on the liver, promoting the flow of bile, it also cures constipation and is useful for treating dyspepsia[4, 238]. The plant is harvested when the seed is setting and then dried for later use[4].

propta Seed - sow spring in temperatures not exceeding 10°C in a humus-rich medium[200]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in early summer.

nwatta Succeeds in a moist humus-rich soil in damp light woodlands, streambeds or the bog garden[200]. Grows best in areas with cool summers[200]. Succeeds in full sun or partial shade[238]. Plants are hardy to at least -15°C[238].

## 7.2.511 Delphinium denudatum

6 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 1 m hkuc htut cyutli kyuctcup hwicli hrasljutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Delphinium denudatum* is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardness. It is hardy to UK zone 7. It is in flower from July to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta None known  
tcanta ParasiticideA parasiticide is obtained from the leaves[172]. It is quite toxic and so is for external use only.  
dwatta Alternative Bitter Odontalgic Parasiticide Stimulant TonicThe roots are alterative, bitter, stimulant and tonic[240]. A paste of the rot is used in the treatment of toothache, and also as an adulterant for aconite (from *Aconitum* spp.)[240, 272].

propta Seed - sow March/April in a cold frame or May outdoors[111]. Keep moist and in a shady position until germination takes place[175]. The seed has a limited viability so it should be stored in a sealed container at about 3°C[200]. Temperatures above 15°C inhibit germination[175]. The seed usually germinates in 2 - 9 weeks at 15°C[175]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out into their permanent positions in the summer. Cuttings of basal shoots in April/May, taken before they become hollow at the base, and planted in a cold frame[111]. Division in spring[111] or early autumn[200].

nwatta Succeeds in most soils so long as they are rich and well-drained[200]. Intolerant of winter-wet soils[200]. Requires an open sunny position[188]. This plant is adored by slugs[175]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

## 7.2.512 Datura stramonium

Thorn Apple, Jimsonweed, Jamestown Weed  
6 tlin 9 cyuc 0 kcaak 1 tcan 4 dwat 1.5 m hkuc htut cyutli kyuctcup hwicli hrasljut hpa7tli prikliw hpa7tmwatli xre7t hjonli

drutta *Datura stramonium* is an ANNUAL growing to 1.5 m (5ft) by 1 m (3ft 3in) at a medium rate. See above for USDA hardness. It is hardy to UK zone 7 and is not frost tender. It is in flower from July to October, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Moths. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta None known  
tcanta Hair RepellentThe growing plant is said to protect neighbouring plants from insects[18, 20]. The juice of the fruits is applied to the scalp to cure dandruff and falling hair[243]. There has also been considerable interest in the use of extracts of *Datura* species as botanical pesticides. D. metel, for example, appears to suppress a number of nematode species of economic importance. Landscape Uses: Border, Container, Foundation, Specimen.

dwatta Anodyne Anthelmintic Antiasthmatic Antidandruff Antiinflammatory Antispasmodic Hallucinogenic Hypnotic Mydriatic NarcoticThe thornapple is a bitter narcotic plant that relieves pain and encourages healing[238]. It has a long history of use as a herbal medicine, though it is very poisonous and should be used with extreme caution. The leaves, flowering tops and seeds are anodyne, antiasthmatic, antispasmodic, hallucinogenic, hypnotic, mydriatic and narcotic[1, 4, 7, 9, 13, 21, 46, 165, 238, 240]. The seeds are the most active medicinally[4]. The plant is used internally in the treatment of asthma and Parkinson's disease, excess causes giddiness, dry mouth, hallucinations and coma[238]. Externally, it is used as a poultice or wash in the treatment of fistulas, abscesses wounds and severe neuralgia[238, 257]. The use of this plant is subject to legal restrictions in some countries[238]. It should be used with extreme caution and only under the supervision of a qualified practitioner since all parts of the plant are very poisonous and the difference between a medicinal dose and a toxic dose is very small[21, 213, 238]. The leaves should be harvested when the plant is in full flower, they are then dried for later use[4]. The leaves can be used as a very powerful mind-altering drug, they contain hyoscyamine and atropine[213]. There are also traces of scopolamine, a potent cholinergic-blocking hallucinogen, which has been used to calm schizoid patients[213]. Atropine dilates the pupils and is used in eye surgery[222]. The leaves have been smoked as an antispasmodic in the treatment for asthma, though this practice is extremely dangerous[213, 222]. The seeds are used in Tibetan medicine, they are said to have a bitter and acrid taste with a cooling and very poisonous potency[241]. Analgesic, anthelmintic and anti-inflammatory, they are used in the treatment of stomach and intestinal pain due to worm infestation, toothache and fever from inflammations[241]. The juice of the fruit is applied to the scalp to treat dandruff[243].

propta Sow the seed in individual pots in early spring in a greenhouse[200]. Put 3 or 4 seeds in each pot and thin if necessary to the best plant. The seed usually germinates in 3 - 6 weeks at 15°C. Plant out in late spring or early summer, after the last expected frosts. Especially in areas with hot summers, it is worthwhile trying a sowing outdoors in situ in mid to late spring.

nwatta Landscape Uses: Border, Container, Foundation, Specimen. Succeeds in most moderately good soils but prefers a rich light sandy soil or a calcareous loam, and an open sunny position[1, 4, 200]. Plants often self-sow when well sited[1]. The thornapple is cultivated commercially as a medicinal plant[57]. It can become a weed in suitable conditions and is subject to statutory control in some countries[238]. This species is extremely susceptible to the various viruses that afflict the potato family (Solanaceae), it can act as a centre of infection so should not be grown near potatoes or tomatoes[200]. Grows well with pumpkins[20]. The whole plant gives off a nauseating stench[245]. Special Features: North American native, Naturalizing, All or parts of this plant are poisonous, Fragrant flowers, Attractive flowers or blooms.

## 7.2.513 Hypericum patulum

Goldencup St. Johnswort  
6 tlin 7 cyuc 0 kcaak 0 tcan 1 dwat 1 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliw hpa7tmwatli fyifxre7t hjonli

drutta *Hypericum patulum* is an evergreen Shrub growing to 1 m (3ft 3in) by 1 m (3ft 3in) at a medium rate. See above for USDA hardness. It is hardy to UK zone 6. It is in leaf all year, in flower from August to October, and the seeds ripen from September to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers

ground cover plants, herbaceous plants and heathers[200]. Plants form a root ball and are very tolerant of being transplanted, even when quite large, so long as the root ball is kept intact[200]. Plants in this genus are notably susceptible to honey fungus[200].

## 7.2.487 Hebe salicifolia

6 tlin 9 cyuc 0 kcaak 3 tcan 1 dwat 4.5 m hkuc htut cyutli tcup hwicli hyihrasljut hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Hebe salicifolia* is an evergreen Shrub growing to 4.5 m (14ft) by 3 m (9ft). See above for USDA hardness. It is hardy to UK zone 7. It is in leaf all year, in flower from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerate maritime exposure. It can tolerate atmospheric pollution.

kcakta None known  
tcanta Hedge HedgeA very wind resistant shrub, it can be grown as a shelter hedge in exposed maritime positions. Attractive flowers.

dwatta Antispasmodic DysenteryTreats dysentery, having an antiperistaltic action[153].

propta Seed - we have no information on this species but suggest sowing the seed in a greenhouse in spring. Only just cover the seed and do not allow the compost to dry out. Prick out the seedlings into individual pots when they are large enough to handle. Grow on the young plants for at least their first winter in a greenhouse and plant out in late spring or early summer after the last expected frosts. It would probably be worthwhile giving some protection to the plant for its first winter outdoors. Cuttings of half ripe wood, 3 - 5cm with a heel, July/August in a frame. Pot up when roots are forming and keep in a frame or greenhouse for its first winter before planting out in late spring. Cuttings of mature wood, late autumn or winter in a frame.

nwatta Succeeds in most soils so long as they are not boggy or too dry[182]. Prefers a light well-drained soil[1, 166] and a sunny position[200]. Prefers a moist rich soil[166] but plants are probably harder in a soil that is on the poor side[1]. Lime tolerant[11]. Intolerant of drought[166]. Tolerates atmospheric pollution[200]. Very wind resistant, withstanding maritime exposure[166]. A polymorphic species[200], it hybridizes freely with other members of this genus. Plants in this genus are notably resistant to honey fungus[200]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is clumping, giving the plant a clumping habit. The predictable growth behaviour makes it easier to maintain without having to apply containment methods[2-1].

## 7.2.488 Tamarix chinensis

Chinese Tamarisk, Five-stamen tamarisk  
6 tlin 9 cyuc 0 kcaak 0 tcan 2 dwat 4.5 m hkuc htut cyutli kyuctcup hwicli hrasljutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Tamarix chinensis* is a deciduous Shrub growing to 4.5 m (14ft 9in) at a medium rate. See above for USDA hardness. It is hardy to UK zone 7. It is in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline and saline soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcakta None known  
tcanta Hedge HedgeVery tolerant of maritime exposure, it makes a good shelter hedge in coastal gardens.

dwatta Analgesic Antivinous Carminative Depurative Diuretic Febrifuge VulneryThe leaves are analgesic, antipyretic, antivinous, carminative, depurative, diuretic, febrifuge[147, 218]. Aids measles rash surfacing[147]. The wood is used in the treatment of anthrax-like sores[218] A manna from the plant is vulnerary[18].

propta Seed - sow spring in a cold frame and only just cover the seed. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame. Very easy[200]. Cuttings of mature wood of the current seasons growth, 15 - 25cm long, planted outdoors in late autumn in a nursery bed or straight into their permanent position. High percentage[11, 200].

nwatta An easily grown plant, succeeding in most soils and tolerant of saline conditions[11]. Grows well in heavy clay soils as well as in sands and even shingle[182]. Usually found near the coast, it succeeds inland if given a fairly good deep loam and a sunny position[11, 200]. Tolerant of maritime winds and dry soils when grown near the coast[11], plants require a moister soil and shelter from cold drying winds when they are grown inland in non-saline soils because they use the soil salts that are found in saline soils to help them reduce transpiration[200]. This species flowers on the current year's growth[227]. Any pruning is best carried out in spring, hedges are also best trimmed at this time[188]. Plants are tolerant of severe pruning, sprouting freely from old wood[K]. Very closely related to *T. ramosissima*[11]. This plant is often mis-identified as *T. gallica*[50] or *T. indica*[200]. Plants in this genus are notably resistant to honey fungus[200].

## 7.2.489 Jasminum nudiflorum

Winter-Flowering Jasmin, Winter jasmine  
6 tlin 11 cyuc 0 kcaak 0 tcan 1 dwat 3.6 m hkuc pcmhimmhut cyutli tcup hwicli hrasljutnyik hpa7tli frusflatprikliw hpa7tmwatli xre7t hjonli

drutta *Jasminum nudiflorum* is a deciduous Shrub growing to 3.6 m (11ft) by 4.5 m (14ft) at a medium rate. See above for USDA hardness. It is hardy to UK zone 6. It is in flower from December to March. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and very alkaline soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil. It can tolerate atmospheric pollution.

kcakta None known  
tcanta Soil stabilizationA good soil stabilizer for steep banks, succeeding in shady positions[200]. The sprawling branches make this a good plant for ground cover, the plants should be spaced about 1.8 metres apart each way[208].

dwatta DiaphoreticDiaphoretic[178].  
propta Seed - best sown as soon as it is ripe in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame. Very easy. Cuttings of mature wood in November. Layering.

nwatta Landscape Uses:Arbor, Cascades, Erosion control, Foundation, Ground cover, Massing, Screen, Standard. Succeeds in a good well-drained loam[1]. Grows well in heavy clay soils. Prefers a good soil and a sunny position but succeeds in shade[11, 28, 49], including on a north facing wall[200]. Tolerates very poor soils, whether acid or alkaline[202]. Tolerates urban pollution[200]. A very ornamental plant[1], it is hardy to about -15°C[184]. Some winter die-back can be experienced and flowers can be damaged in severe winters but new flowers are usually produced when the weather warms up[202]. A winter-flowering plant, flowering mainly on wood that was produced the previous summer[219]. Pruning can be carried out in early to mid spring once flowering has finished[202, 219]. Removing one third of the oldest growth down to ground level rejuvenates the plant

and encourages greater flowering[202]. Unpruned plants tend to become woody and matted with dead stems[219]. The flowers have a delicate mossy perfume[245]. This species does not set seed in British gardens. This might be because all the plants in cultivation stem from one original importation[182]. An ideal plant for growing on shady walls and banks[28, 49]. Plants in this genus are notably resistant to honey fungus[200]. Special Features: Not North American native, Attractive flowers or blooms.

## 7.2.490 Clematis mandschurica

6 tlin 9 cyuc 0 kcaak 0 tcan 2 dwat m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Clematis mandschurica is a PERENNIAL growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta None known  
tcanta None known

dwatta Analgesic Antibacterial Antifungal Dysentery Emmenagogue HypotensiveThe root is analgesic, antibacterial, antidiuretic, antifungal, emmenagogue and hypotensive[279]. It contains several medically active constituents including clematosides, hederagenin and anemonin[279]. It is used in Korea in the treatment of leucorrhoea, dysentery, neuralgia, menostasis and delayed menstruation[279].

propta Seed - best sown as soon as it is ripe in a cold frame[164, 200]. Sow stored seed as soon as it is obtained in a cold frame. Pre-soak the seed for 12 hours in warm water and remove as much of the tail and outer coat as possible[164]. A period of cold stratification is beneficial[164]. The seed germinates in 1 - 9 months or more at 20°C[164]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant out in late spring or early summer, after the last expected frosts. Internodal cuttings of soft to semi-ripe wood, late spring in sandy soil in a frame[200]. Layering of old stems in late winter or early spring[200]. Layering of current seasons growth in early summer[200].

nwatta Prefers a deep moist soil with its roots in the shade[11, 200]. Dislikes poorly-drained heavy clay soils, but grows well in clay if grit is added for drainage[11, 200]. Dislikes light sandy soils[11]. Does well on chalk[11]. Succeeds in acid as well as alkaline soils[200]. This species is closely related to *C. terniflora*, and is included in that species by some botanists[273]. When planting out, in order to avoid the disease 'clematis wilt', it is best to plant the rootball about 8cm deeper in the soil. This will also serve to build up a good root crown of growth buds[200]. The plant flowers on the current season's growth, so any pruning is best carried out in late winter or early spring[273]. A twining plant[182]. The leaf stalks wrap themselves around twigs and branches for support. When a side of the stalk touches an object, the growth on that side slows down whilst the other side grows at its normal rate - this causes the leaf stalk to entwine the object it is touching[212]. Plants seem to be immune to the predations of rabbits[233]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

## 7.2.491 Centaurea melitensis

Maltese Star Thistle

6 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat m hkuc htut cyutli hgatyuctcup hwicli hyhisrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyfxtre7t hjonli

drutta Centaurea melitensis is a ANNUAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to September, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and

can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcaakta None known  
tcanta None known

dwatta The plant is used in the treatment of the kidneys[257].

propta Seed - sow April in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out into their permanent positions in the summer. If you have sufficient seed it can be sown in situ in the spring, and an autumn swing in situ might also be worth trying.

nwatta We do not have information on this species, but the following notes are based on the closely related *C. solstitialis*. Succeeds in ordinary garden soil[1, 200]. Prefers a well-drained fertile soil and a sunny position[200]. Tolerates dry, low fertility and alkaline soils[200]. A good bee and butterfly plant the flowers are rich in nectar[171]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 7.2.492 Asarum maximum

6 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat m hkuc pcmhmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Asarum maximum is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcaakta None known  
tcanta None known

dwatta Analgesic ExpectoantThe dried plant is used medicinally in Vietnam[283]. The leaves are used in the treatment of dyspepsia and colic whilst the flowers and roots are used as a reconstituent[283]. Analgesic, expectoant. Used as a gargle for sore throats etc[174].

propta Seed - best sown in a cold frame as soon as it is ripe in the summer[134]. Stored seed will require 3 weeks cold stratification and should be sown in late winter[134]. The seed usually germinates in the spring in 1 - 4 or more weeks at 18°C[134]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least their first winter. Plant them out when large enough in late spring. Division in spring or autumn. Plants are slow to increase[200]. It is best to pot the divisions up and keep them in light shade in the greenhouse until they are growing away strongly.

nwatta Prefers a rich moist neutral to acid soil in woodland or a shady position in the rock garden[1, 200]. Plants are hardy to at least -15°C[200]. The flowers are malodorous and are pollinated by flies[200]. Plants often self-sow when growing in a suitable position[200].

## 7.2.493 Garrya fremontii

Fever Bush, Bearbrush

6 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 3 m hkuc pcmhmimhtut cyutli hgatyuctcup hwicli hyhisrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

drutta Garrya fremontii is an evergreen Shrub growing to 3 m (9ft) by 3 m (9ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from April to May. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). . The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure. It can tolerate atmospheric pollution.

used in the treatment of traumatic pain, haematemesis, gonorrhoea, post-partum vaginal discharge, amenorrhoea and snakebites[147].

propta Seed - surface sow in a greenhouse and keep the compost moist in a light position. The seed can be very slow to germinate, sometimes taking a year or more[134]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division. Basal cuttings from tubers in spring. Bulblets, formed in the leaf axils. Harvest in the autumn and store overwinter in a cool frost-free place, plant out in spring[200].

nwatta Landscape Uses:Border, Container, Foundation, Massing, Specimen, Woodland garden. Requires a well-drained soil[200]. Does not require high light intensities[200], succeeding in full sun or partial shade[233]. Prefers a pH between 6 and 7[200]. Plants tolerate temperatures down to about -5°C, and can be grown outdoors in the milder areas of the country if given the shelter of a wall[200]. This same report gives the plant a hardiness zone rating of 6 (tolerating temperatures down to about -20°C)[200]. Grows well outdoors in Cornwall amongst trees and shrubs[166]. There are some named varieties selected for their ornamental value[200]. Special Features: Attractive foliage, Naturalizing, Fragrant flowers.

## 7.2.507 Argemone albiflora

White Prickly Poppy, Bluestem pricklypoppy  
6 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 1.5 m hkuc htut cyutli hgatyuctcup hwicli hyhisras hpa7tli flatprikliwis hpa7tmwatli fyfxtre7t hjonli

drutta Argemone albiflora is a ANNUAL growing to 1.5 m (5ft) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to August, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs). The plant is self-fertile. Suitable for: light (sandy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcaakta None known  
tcanta None known

dwatta Demulcent Emetic Purgative SkinA tea made from the leaves is demulcent, emetic and purgative[222]. Caution is advised, the seed oil can cause glaucoma and an oedema[222]. An infusion of the plant is used in the treatment of jaundice, skin ailments, colds, colic and wounds[222].

propta Seed - sow April in situ[200]. The seed usually germinates in 3 - 4 weeks at 15°C[134].

nwatta Easily grown in ordinary light soil in a sunny position[200]. Does best in a poor well-drained soil, often self-sowing on stony and sandy sites[200]. Plants resent root disturbance and are best sown in situ[134].

## 7.2.508 Ceratostigma willmottianum

Chinese Plumbago, Chinese Leadwort

6 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 1 m hkuc htut cyutli kyuctcup hwicli hyhisrasjlut hpa7tli flatprikliwissip hpa7tmwatli xre7t hjonli

drutta Ceratostigma willmottianum is a deciduous Shrub growing to 1 m (3ft 3in) by 1 m (3ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil.

kcaakta None known  
tcanta None known

dwatta BachThe plant is used in Bach flower remedies - the keywords for prescribing it are 'Distrust of self', 'Doubt of one's ability' and 'Foolishness'[209].

propta Seed - we have no details for this species but suggest sowing the seed in a greenhouse in the spring. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division of rooted suckers in the spring[200]. Layering in the spring. Plants often self-layer[200]. Cuttings of half-ripe wood in a closed frame[200]. Plants should be overwintered in a frost-free frame or greenhouse for their first winter[200].

nwatta Landscape Uses:Border, Foundation. Prefers a light moderately fertile and retentive soil with good drainage, though it tolerates poor dry soils[200] and grows well on chalk[11]. Requires a sunny position[11, 200]. Plants are not fully hardy in Britain, especially if treated as shrubs, but if treated as herbaceous perennials they succeed outdoors in areas where winter temperatures do not fall below about -10 to -15°C[200]. When the woody stems survive the winter it is best to prune them hard in the spring in order to obtain better flowering[11]. Plants flower best on the current years growth[200]. Most, if not all the plants in cultivation in Britain, derive from an original two plants raised from seed in 1908[11]. Plants in this genus are notably resistant to honey fungus[200]. Members of this genus are rarely if ever troubled by browsing deer[233]. Special Features: Blooms are very showy.

## 7.2.509 Ferula persica

6 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat 1 m hkuc htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyfxtre7t hjonli

drutta Ferula persica is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcaakta Edible Parts: Edible Uses: GumNone known  
tcanta GumThe gum 'Sagapenum' is obtained from the plant (from the root?). It is used in the treatment of rheumatism and lumbago[46, 61, 64].

dwatta AntirheumaticAntirheumatic[46, 61, 64]. It is used in the treatment of rheumatism and backache[254].

propta Seed - best sown as soon as the seed is ripe in a greenhouse in autumn[1]. Otherwise sow in April in a greenhouse. Prick out the seedlings into individual pots as soon as they are large enough to handle. Plant them out into their permanent positions whilst still small because the plants dislike root disturbance[1]. Give the plants a protective mulch for at least their first winter outdoors. Division in autumn. This may be inadvisable due to the plants dislike of root disturbance.

nwatta Succeeds in most soils[1]. Requires a deep fertile soil in a sunny position[200]. Plants have a long taproot and are intolerant of root disturbance[200]. They should be planted into their final positions as soon as possible.

## 7.2.510 Swertia chirayita

Chiretta

6 tlin 9 cyuc 0 kcaak 0 tcan 3 dwat 1 m hkuc hmim cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Swertia chirayita is a ANNUAL growing to 1 m (3ft 3in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from September to October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist or wet soil.

kcaakta None known  
tcanta None known

dwatta Digestive Hepatic Malaria StimulantChiretta is a traditional Ayurvedic herb. A strongly bitter tonic it is an

both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta None known

tcanta MusicalA kind of flute is made from the hollow stems[272].

dwatta PouliticeThe leaves are used as an external cooling application to alleviate the pains of wounds and bruises[240]. A paste of the root is applied as a poultice to treat dislocated bones[272].

propta Seed - best sown as soon as it is ripe in a cold frame in the autumn. The plant has delayed epigeal germination and will often germinate in the spring but can take up to 2 years especially if the seed is stored prior to being sown[134]. An alternative is to mix the seed with some moist leafmould and seal it in a plastic bag. Keep this at a temperature of 20°c for 3 weeks then pot up any seed that germinates and place the rest in a fridge for 4 - 5 weeks at 3 - 5°c before sowing in a warm place[138]. Seedlings should be grown on in pots in a shaded position in a cold frame or greenhouse for 3 - 4 years before planting them out in their permanent positions[138]. Bulblets are obtained from the base of the old plant after flowering. Pot up and plant out when well established.

nwatta Prefers a moist well-drained position in shade and a soil that is rich in leafmould[47, 200]. Requires a deep, very fertile humus-laden soil[233]. Prefers growing in woodland conditions[42, 200]. A monocarpic plant, the bulb takes about 7 years to reach flowering size but then dies after flowering. However, it produces a number of new bulblets at the base and can be propagated by these[47, 200]. These bulblets take 3 - 5 years to flower[200]. The flowers scent the surrounding area with their rich sweet perfume[245]. When planting, only just cover the bulb with leafmould[47]. The bulb is very attractive to slugs, mice and voles and may require protection[200]. Plants seem to be immune to the predations of rabbits[233].

### 7.2.504 *Thalictrum simplex galioides*

6 tlin 9 cyuc 0 kcak 0 tcan 1 dwat 1 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

The species is hermaphrodite (has both male and female organs) and is pollinated by Insects, wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta None known

dwatta DiureticDiuretic[61].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame[K]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. The seed can also be sown in an outdoor seedbed in spring[111]. Plant them into their permanent positions the following spring. Division in spring as new growth commences or in the autumn[111]. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the summer or the following spring.

nwatta Succeeds in most fairly good soils in sun or semi-shaded[1, 111]. Members of this genus are rarely if ever troubled by browsing deer[233]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54]. This species is closely related to *T. lucidum*[200].

### 7.2.505 *Codonopsis tubulosa*

6 tlin 9 cyuc 0 kcak 0 tcan 3 dwat 1.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta *Codonopsis tubulosa* is a PERENNIAL CLIMBER growing to 1.5 m (5ft). See above for USDA hardness. It is hardy to UK zone 7 and is not frost tender. It is in flower from June to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta None known

dwatta Adaptogen Aphrodisiac TonicThis species is an important herb in Chinese medicine, the root is widely used as a substitute for ginseng[238]. It is a sweet, warm, soothing herb that is taken as an energy tonic[238]. It acts mainly on the spleen, lungs and stomach, raising secretion of body fluids and blood sugar levels, lowering the blood pressure and stimulating the immune system[238]. It is taken internally in the treatment of low energy, poor appetite and digestion, anaemia, shallow breathing and debility after illness[238]. It is often cooked with rice until it is glutinous as a tonic food[238]. The roots of plants at least three years old are harvested in the autumn and can be used fresh or dried[238].

propta Seed - surface sow in spring to early summer in an ericaceous compost in a greenhouse. Do not allow the compost to dry out. The seed usually germinates in 1 - 6 weeks at 20°c[164]. Prick out the seedlings into individual pots as soon as they are large enough to handle and grow them on in a greenhouse for their first winter. Plant out in late spring or early summer and protect them from slugs until the plants are well established[K]. Division in spring, with care, since the plant resents root disturbance[200]. We have found it best to take small divisions that are teased out from the sides of the main clump so as to cause the least possible disturbance to the plants and to avoid having to dig up the clump. These small divisions need to be potted up and placed in light shade in a greenhouse until they are rooting well. They can be planted out into their permanent positions in the summer if they are large enough, otherwise in the following spring[K].

nwatta Prefers a well-drained fertile light soil in full sun or semi shade[1, 200]. It only succeeds in full sun if the soil remains moist during the growing season[200]. Prefers a slightly acid soil[164]. Quite cold-hardy when dormant, the young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. An important herb in Chinese medicine, it is widely cultivated there and is used as a ginseng substitute[238]. A climbing plant, supporting itself by twining and scrambling over other plants[219]. Plants resent root disturbance and should be planted out into their permanent position as soon as possible[164]. Plants are very susceptible to the ravages of slugs. The young shoots in spring are particularly at risk, though older growth is also eaten[K].

#### 7.2.506 *Begonia grandis evansiana*

Hardy Begonia

6 tlin 9 cyuc 0 kcak 0 tcan 2 dwat 1 m hkuc hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta *Begonia grandis evansiana* is a PERENNIAL growing to 1 m (3ft 3in) at a medium rate. See above for USDA hardness. It is hardy to UK zone 6. It is in flower from July to August, and the seeds ripen from August to September. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta None known

tcanta This species can be grown as a ground cover in a sunny position sheltered by shrubs. The plants form spreading clumps[208].

dwatta Anodyne Antiphlogistic AntispasmodicThe tuberous roots and fruits are anodyne, antiphlogistic and antispasmodic. Stimulates blood circulation[147]. A decoction is

kcakta None known

tcanta None known

dwatta Antiperiodic TonicThe leaves are intensely bitter and are used as an antiperiodic and tonic[4]. They can be used as a quinine substitute[4].

propta Seed - best sown as soon as it is ripe in a cold frame. Very slow, the seed can take 2 or more years to germinate. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood 10cm with a heel, August in a frame[200]. Cuttings of mature wood 10 - 12 cm with a heel, December/January in a frame[200].

nwatta Prefers a sunny position succeeding in most well-drained fertile soils[182, 200, 202]. Succeeds in a hot dry position. Succeeds in light shade[202], the plants are also tolerant of quite deep shade[219]. Does not require a rich soil or abundant moisture[11], if the soil is too fertile the flowering will be delayed[200]. Resistant to urban pollution and maritime exposure but are subject to wind scorch from cold drying winds in colder areas[200]. Hardy to about -15°c[184], it is best on a sunny wall in most parts of the country but does very well as a free standing shrub in Devon and Cornwall[11]. In cold winters and springs the previous year's leaves may fall before the new leaves are produced[202]. The plant strongly resents root disturbance[1, 11] and should be placed in its permanent position as soon as possible. The plant flowers on wood produced the previous summer[200]. All pruning should be carried out in spring before new growth starts but after flowering has ended[1]. Dioecious. Male and female plants must be grown if seed is required.

#### 7.2.494 *Rhododendron molle*

Chinese Azalea

6 tlin 9 cyuc 0 kcak 0 tcan 1 dwat m hkuc hmim cyutli tcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta *Rhododendron molle* is a deciduous Shrub growing to 2.5 m (8ft 2in). See above for USDA hardness. It is hardy to UK zone 7. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta None known

tcanta InsecticideThe powdered flowers have a mild insecticidal effect[57].

dwatta Anaesthetic Analgesic SedativeThe flowers are analgesic, anaesthetic and sedative[218]. They are applied externally in the treatment of arthritis, caries, itch, maggots and traumatic injuries[218]. The root is used in the treatment of arthritis, rheumatism and traumatic injuries[218].

propta Seed - best sown in a greenhouse as soon as it is ripe in the autumn and given artificial light. Alternatively sow the seed in a lightly shaded part of the warm greenhouse in late winter or in a cold greenhouse in April. Surface-sow the seed and do not allow the compost to become dry[200]. Pot up the seedlings when they are large enough to handle and grow on in a greenhouse for at least the first winter. Layering in late July. Takes 15 - 24 months[78]. Cuttings of half-ripe wood, August in a frame. Difficult[78].

nwatta Succeeds in a most humus-rich lime-free soils except those of a dry arid nature or those that are heavy or clayey[1]. Prefers a peaty or well-drained sandy loam[1]. Succeeds in sun or shade, though it prefers a shady position[1]. A pH between 4.5 and 5.5 is ideal[1]. Succeeds in a woodland though, because of its surface-rooting habit[200], it does not compete well with surface-rooting trees[1]. Plants need to be kept well weeded, they dislike other plants growing over or into their root system, in particular they grow badly with ground cover plants, herbaceous plants and heathers[200]. Plants form a root ball and are very tolerant of being transplanted, even when quite large, so long as the root ball is kept intact[200]. A very ornamental plant[1], it is the parent of many cultivars[11]. Plants in this genus are notably susceptible to honey fungus[200].

### 7.2.495 *Skimmia japonica*

Japanese Skimmia

6 tlin 7 cyuc 0 kcak 0 tcan 1 dwat 2 m hkuc pcmimhmhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flat-priklwis hpa7tmwatli nyanhjen hjonli

drutta *Skimmia japonica* is an evergreen Shrub growing to 2 m (6ft) by 2 m (6ft) at a slow rate. See above for USDA hardness. It is hardy to UK zone 7. It is in leaf all year, in flower from April to May, and the seeds ripen from October to December. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil. It can tolerate atmospheric pollution.

kcakta None known

tcanta Plants can be grown as a ground cover when planted about 1 metre apart each way[208].

dwatta Carminative Restorative TonicThe poisonous stems are carminative, restorative and tonic[178, 218].

propta Seed - can be sown as soon as it is ripe in a cold frame[K]. It also succeeds when sown in early spring. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a shady position in the cold frame for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. If there is sufficient seed then it can be sown can be in an outdoor seedbed in early spring[200]. Grow the plants on in the seedbed for a couple of years before planting them out in late autumn or early spring. Cuttings of half-ripe wood, July/August in a cold frame[11]. Cuttings of nearly mature side shoots, 7 - 10cm with a heel, September in a cold frame. Slow to root, they should be left for 18 months before moving to their permanent positions. Good percentage[78]. Layering in autumn. Takes 18 months. Good to high percentage[78].

nwatta Landscape Uses:Border, Container, Foundation, Pest tolerant, Massing, Woodland garden. Succeeds in a well-drained open loam or in a peaty soil[11, 200] preferring a rich slightly acid soil[184]. Thrives in moderately shady positions[11, 200] but also succeeds in full sun where the leaves may be rather yellow but the plant will flower and fruit better[200]. Plants are very tolerant of atmospheric pollution[184], being unharmed by deposits of soot or a sulphur-laden atmosphere[245]. Plants are hardy to about -15°c[184]. Often cultivated in the ornamental garden, there are many named varieties. The flowers have a sweet perfume[245]. Those of male forms are more aromatic than females[1], whilst the variety 'Fragrans' has a stronger scent like lily of the valley[245]. The bruised leaves are pleasantly aromatic[245]. The fruit is seldom eaten by birds, usually hanging on the plant until it flowers the following year[182]. A polymorphic species, it is usually dioecious but some forms are hermaphrodite, especially in ssp. reevesiana. (Fortune.)N.P.Taylor. and Airey Shaw[200]. This sub-species is intolerant of chalky soils[182] and is also much taller than the type. Another report says that it is smaller and weaker-growing than the type species[188]. Special Features:Not North American native, Fragrant flowers, Attractive flowers or blooms.

### 7.2.496 *Ipomoea purpurea*

Common Morning Glory, Tall morning-glory

6 tlin 9 cyuc 0 kcak 0 tcan 2 dwat 2.5 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta *Ipomoea purpurea* is a ANNUAL CLIMBER growing to 2.5 m (8ft 2in) at a fast rate. See above for USDA hardness. It is hardy to UK zone 7 and is not frost tender. It is in flower from July to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta None known

tcanta None known  
dwatta Anthelmintic Diuretic Hallucinogenic LaxativeThe seed is anthelmintic, diuretic and laxative[176]. It is used in the treatment of oedema, oliguria, ascariasis and constipation[176]. The seed contains small quantities of the hallucinogen LSD[200, 219]. This has been used medicinally in the treatment of various mental disorders.

propta Pre-soak the seed for 12 hours in warm water, or scarify the seed, and sow in individual pots in a greenhouse in early spring. The seed usually germinates in 1 - 3 weeks at 22°C. Plants are extremely resentful of root disturbance, even when they are quite small, and should be potted up almost as soon as they germinate[219]. Grow them on fast in the greenhouse and plant them out into their permanent positions after the last expected frosts. Consider giving them some protection such as a cloche until they are growing away actively.

nwatta Landscape Uses:Arbor, Container, Specimen. Requires a fertile well-drained loam in a sunny position[200]. The plant is not very frost hardy, but it can be grown outdoors as a tender annual in temperate zones[200]. A very ornamental plant, there are several named varieties[200]. The flowers are blue, but they turn more pink later in the day[260]. Special Features: Not North American native, Wetlands plant, Attractive flowers or blooms.

## 7.2.497 *Inula racemosa*

6 tin 9 cyuc 0 kcaak 0 tcan 2 dwat 2 m hkuc  
htut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprikwils hpa7tmwatli fyifxre7t hjonli

drutta *Inula racemosa* is a PERENNIAL growing to 2 m (6ft) by 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta None known  
tcanta None known  
dwatta AnalgesicThe rhizome is used in Tibetan medicine, it is said to have a sweet, bitter and acrid taste with a neutral potency[241]. It is used in the treatment of contagious fevers that have not fully ripened and pain in the upper body, especially between the neck and the shoulders[241].

propta Seed - sow spring or autumn in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring or autumn[111].

nwatta Succeeds in a sunny position in ordinary garden soil[1]. Requires a moist well-drained soil in sun or partial shade[187]. Grows well in heavy clay soils. A vigorous plant, it can be naturalised in the wild garden or other informal positions[200]. Plants take some years to become fully established[233].

## 7.2.498 *Eupatorium lindleyanum*

6 tin 9 cyuc 0 kcaak 0 tcan 2 dwat 1 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwils hpa7tmwatli xre7t hjonli

drutta *Eupatorium lindleyanum* is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from September to October, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known  
tcanta HairUsed as a hair tonic[178]. The leaves, added to a hair pomade, promote the growth of the hair[218].

dwatta Anthelmintic Antidote Antitussive Diuretic Dysentery Restorative Women's complaintsThe whole plant

is anthelmintic, antidote, antitussive, diuretic and restorative[178, 218]. It is used internally in the treatment of bronchitis and dysentery[238]. Externally, it is applied to swellings and wounds and is also important in the treatment of women's complaints, especially before and after parturition[218]. It is also used in the treatment of parasitic worms[218]. The leaves and stems are harvested in the summer before the flower buds open, and are dried for later use[238].

propta Seed - sow spring in a cold frame and only just cover the seed. Prick out the seedlings into individual pots when they are large enough to handle and plant them out into their permanent positions in the summer. Division in spring or autumn[111]. Very easy, the clumps can be replanted direct into their permanent positions.

nwatta Requires a sunny position, succeeding in most well-drained but moisture retentive fertile soils[1]. Plants seem to be immune to the predations of rabbits[233]. There are both diploid and polyploid forms of this species. Whilst the diploids reproduce sexually, the polyploids, which are widespread, produce their seeds without sexual fertilization[275].

## 7.2.499 *Geranium pusillum*

Small geranium  
6 tin 9 cyuc 0 kcaak 0 tcan 1 dwat 1 m hkuc  
htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatprikwils hpa7tmwatli fyifxre7t hjonli

drutta *Geranium pusillum* is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta None known  
tcanta None known  
dwatta Anodyne Astringent VulneraryThe plant is used as an anodyne, astringent and vulnerary[240].

propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring or autumn. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta We have very little information on this species and do not know if it will be hardy in Britain, though judging by its native range it should succeed outdoors in many parts of this country. The following notes are based on the general needs of the genus. Succeeds in any moderately fertile retentive soil in a sunny position[200]. Tolerates a wide range of soil types[200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233].

## 7.2.500 *Hebe speciosa*

New Zealand hebe  
6 tin 9 cyuc 0 kcaak 2 tcan 0 dwat 1.5 m hkuc  
htut cyutli tcup hwicli hyishrasjlut hpa7tli flatprikwils hpa7tmwatli xre7t hjonli

drutta *Hebe speciosa* is an evergreen Shrub growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerate maritime exposure. It can tolerate atmospheric pollution.

kcakta None known  
tcanta Hedge HedgeSucceeds as an untrimmed hedge in maritime areas, tolerating maritime exposure[75, 200]. Attractive flowers.

dwatta None known

propta Seed - we have no information on this species but suggest sowing the seed in a greenhouse in spring. Only just cover the seed and do not allow the compost to dry out. Prick out the seedlings into individual pots when they are large enough to handle. Grow on the young plants for at least their first winter in a greenhouse and plant out in late spring or early summer after the last expected frosts. It would probably be worthwhile giving some protection to the plant for its first winter outdoors. Cuttings of half ripe wood, 3 - 5cm with a heel, July/August in a frame. Pot up when roots are forming and keep in a frame or greenhouse for its first winter before planting out in late spring. Cuttings of mature wood, late autumn or winter in a frame.

nwatta Succeeds in most soils so long as they are not boggy or too dry[182]. Prefers a light well-drained soil[1, 166] and a sunny position[200]. Prefers a moist rich soil[166] but plants are probably harder in a soil that is on the poor side[1]. Lime tolerant[11]. Intolerant of drought[166]. Tolerates atmospheric pollution[200]. Very wind resistant, withstanding maritime exposure[166]. Very ornamental[1]. A good butterfly plant[30]. A polymorphic species[200], it hybridizes freely with other members of this genus. Plants in this genus are notably resistant to honey fungus[200]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is clumping, giving the plant a clumping habit. The predictable growth behaviour makes it easier to maintain without having to apply containment methods[2-1].

## 7.2.501 *Angelic sinensis*

Dang Gui - Dong Quai - Chinese Angelica  
6 tin 9 cyuc 0 kcaak 0 tcan 5 dwat 1 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwils hpa7tmwatli fyifxre7t hjonli

drutta *Angelic sinensis* is a PERENNIAL growing to 1 m (3ft 3in) by 0.7 m (2ft 4in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from August to September, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known  
tcanta This plant is said to contain vitamin B12[176].

dwatta Alterative Analgesic Anticholesterolemic Anti-inflammatory Antispasmodic Cholera Deobstruent Emollient Hepatic Laxative Malaria Sedative Vasodilator Women's complaintsDang Gui is a well-known Chinese herb that has been used in the treatment of female ailments for thousands of years. Its reputation is perhaps second only to ginseng (*Panax ginseng*) and it is particularly noted for its 'blood tonic' effects on women[218]. The root has a sweet pungent aroma that is very distinctive and it is often used in cooking, which is the best way to take it as a blood tonic[254]. One report says that the root contains vitamin B12 and can be used in the treatment of pernicious anaemia[176]. The root is alternative, analgesic, anticholesterolemic, anti-inflammatory, antispasmodic, deobstruent, emmenagogue, emollient, hepatic, laxative, sedative and peripheral vasodilator[165, 176, 218]. It is commonly used in the treatment of a wide range of women's complaints where it regulates the menstrual cycle and relieves period pain[218, 238, 254] and also to ensure a healthy pregnancy and easy delivery[218]. However conflicting information suggests it should not be used during pregnancy [301] and should not be used if menstrual flow is heavy or during menstruation [301]. It is an ideal tonic for women with heavy menstruation who risk becoming anaemic[254]. The water-soluble and non-volatile elements of the root increase the contraction of the uterus whilst the volatile elements can relax the muscle of the uterus[176]. Its use prevents the decrease of liver glycogen and protects the liver[176]. Used for menopausal symptoms (hot flushes) [301]. It has an antibacterial action, inhibiting the growth of various bacteria including *Bacillus dysenteriae*, *Bacillus typhi*, *B. comma*, *B. cholerae* and haemolytic streptococci[176]. The root is an ingredient of 'Four Things Soup',

the most widely used woman's tonic in China[254]. The other species used are *Rehmannia glutinosa*, *Ligusticum wallichii* and *Paeonia lactiflora*[254]. The root is harvested in the autumn or winter and dried for later use[254, 283]. It has been used to treat pulmonary hypertension in combination with the allopathic medication nifedipine [301]. Other uses include: constipation (a laxative), trauma injuries, ulcers, rheumatism and malaria [301].

propta Seed - best sown in a cold frame as soon as it is ripe since the seed only has a short viability[200]. Seed can also be sown in the spring, though germination rates will be lower. It requires light for germination[200]. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for their first winter, planting them out into their permanent positions in the spring. The seed can also be sown in situ as soon as it is ripe.

nwatta Requires a deep moist fertile soil in dappled shade or full sun[200]. This species is not fully hardy in the colder areas of the country, tolerating temperatures down to at least -5°C[238]. Plants are reliably perennial if they are prevented from setting seed[200].

## 7.2.502 *Daphne laureola*

Spurge Laurel  
6 tin 9 cyuc 0 kcaak 0 tcan 1 dwat 1 m hkuc  
pcimhmm cyutli kyuctcup hwicli jlutnyik hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta *Daphne laureola* is an evergreen Shrub growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from February to April. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). Suitable for: medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers dry or moist soil.

kcakta None known  
tcanta None known  
dwatta Abortifacient Cancer Emetic Emmenagogue PurgativeThe leaves have been used as an emmenagogue, though they can cause purging and vomiting[4]. Both the leaves and the bark have been used to procure abortions[4]. The plant contains various toxic compounds and these are currently being investigated (1995) for anti-leukaemia effects[238].

propta Seed - best sown in a greenhouse as soon as it is ripe with the pot sealed in a polythene bag to hold in the moisture. Remove this bag as soon as germination takes place[164]. The seed usually germinates better if it is harvested 'green' (when it has fully developed but before it dries on the plant) and sown immediately. Germination should normally take place by spring, though it sometimes takes a further year. Stored seed is more problematic. It should be warm stratified for 8 - 12 weeks at 20°C followed by 12 - 14 weeks at 3°C. Germination may still take another 12 months or more at 15°C[164]. Prick out the seedlings into individual pots as soon as they are large enough to handle. Grow the plants on in the greenhouse for their first winter and then plant out in spring after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame.

nwatta Prefers a moist soil and a position in semi-shade, growing well in woodlands[11]. Plants are often found growing in dense shade in the wild[245]. A good sandy loam suits most members of this genus[11]. Flowers are produced towards the ends of the previous year's growth[11]. They are sweetly scented[245]. Plants are resentful of root disturbance and should be planted into their permanent positions as soon as possible[188].

## 7.2.503 *Cardiocrinum giganteum*

6 tin 9 cyuc 0 kcaak 0 tcan 1 dwat 1.8 m hkuc  
hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwils hpa7tmwatli xre7t hjonli

drutta *Cardiocrinum giganteum* is a BULB growing to 1.8 m (6ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in August, and the seeds ripen in September. The species is hermaphrodite (has
