drutta *Allium schoenoprasum sibiricum* is a BULB growing to 0.3 m (1ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy), medium (loamy) and

heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Leaves - raw, cooked or dried for later use. The leaves have a mild onion flavour and are an excellent addition to mixed salads, they can also be used as a flavouring in soups etc[90, 105]. This form has a stronger garlic flavour than common chives[183] The leaves are often available from late winter and can continue to produce leaves until early the following winter, especially if the plant is in a warm, sheltered position[K]. A good source of sulphur and iron[201]. The bulbs are rather small but can be used as spring onions[K]. They can be harvested with the leaves still attached and be used as spring onions[K]. They have a pleasant mild onion flavour. The flowers can be used as a garnish in salads etc[183]. The flowers of this species are rather dry and less desirable than the flowers of many other species[K].

tcanta Fungicide RepellentThe juice of the plant is used as an insect repellent, it also has fungicidal properties and is effective against scab, mildew etc[14, 18, 20]. The growing plant is said to repel insects and moles[14, 20].

dwatta Appetizer Digestive Hypotensive TonicThe whole plant has a beneficial effect on the digestive system and the blood circulation. It improves the appetite, is digestive, hypotensive and tonic[201]. It has similar properties to garlic (*A. sativum*), but in a much milder form, and it is rarely used medicinally[238].

propta Seed - sow spring in a cold frame. Germination is usually free and easy, pot up the seedlings as soon as they are large enough to handle easily and plant out in the following spring. Division can be carried out at almost any time of the year but is probably best done in spring. The clumps should be divided at least every 3 or 4 years in order to maintain vigour[200], the divisions can be planted out direct into their permanent positions.

nwatta An easily grown plant[203], it prefers a sunny position in a rich moist but well-drained soil[14, 37]. Succeeds in most soils[1, 37] and in light shade[203]. Grows well in heavy clay soils[203]. Tolerates a pH in the range 5.2 to 8.3. This is a more robust form of *A. schoenoprasum*, the chive. It is often grown in the garden for its edible leaves which are available from late winter to the beginning of the next winter[K]. The bulbs divide rapidly and large clumps are quickly formed. There are some named varieties[183]. Regular cutting of the leaves ensures a continuous supply of young leaves and prevents flowering[33]. Plants can be moved into a frame or other protected environment in the autumn and will then produce leaves throughout the winter[33]. Do not do this every year or it weakens the plants. The bulbs should be planted fairly deeply[1]. A good bee plant[24]. Grows well with most plants, especially roses, carrots, beet and chamomile, but it inhibits the growth of legumes[18, 20, 54]. Helps to reduce the incidence of scab when it is grown under apple trees[201]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 5.2.35 *Allium cepa*

Onion, Garden onion  
4 tlin 10 cyuc 5 kcaak 3 tcan 3 dwat 0.6 m hkuc  
htut cyutli tcup hwicli hrasljut hpa7tli flatprikhwisslip  
hpa7tmwatli xre7t hjonli

drutta *Allium cepa* is an evergreen Bulb growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves Root SeedEdible Uses: Bulb - raw or cooked. A very versatile food, the bulb can be 10cm or more in diameter and is widely used in most countries of the world. Eaten raw, it can be sliced up and used in salads, sandwich fillings etc, it can be baked or boiled as a vegetable in its own right and is also commonly used as

growth habit and does not spread aggressively. Used outside its native range for erosion control and in rehabilitation work. A food source for herbivores, including rabbits [1-8].

dwatta None Known  
propta Seed

nwatta A rhizomatous and stoloniferous attractive, relatively short perennial grass. Ranging from 10 to 70 cm high. Soil drainage: free or impeded. Soil reaction: acid, alkaline, neutral. Dominant on poor and acidic soils. Soil texture: light or medium [1-8]. Found on a wide range of soils both damp and dry and from neutral to acidic. A hardy grass forming short grazed turf on poor soils on hills and mountains. Common and widespread in both lowland and upland pasture, meadows, heaths, open woodlands, road verges and banks. Upper elevation limit = 945m. Lower elevation limit = 0m.

## 4.2.408 *Lycopodium obscurum*

Ground Pine, Rare clubmoss  
3 tlin 7 cyuc 0 kcaak 0 tcan 2 dwat 0.5 m hkuc  
pcimhmim cyutli tcup hwicli hrasljut hpa7tli flatprikhwis  
hpa7tmwatli hjonli

drutta *Lycopodium obscurum* is a FERN growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 3. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta None known

tcanta Miscellany Mordant WeavingThe following uses are for *L. clavatum*. They quite possibly also apply to this species[K]. The spores are water repellent and can be used as a dusting powder to stop things sticking together[106, 171]. They are also used as a talcum powder and for dressing moulds in iron foundries[74]. They can also be used as explosives in fireworks and for artificial lightning[46, 57, 102, 171, 213]. The plant can be used as a mordant in dyeing[172]. The stems are made into matting[46].

dwatta Analgesic Antispasmodic Diuretic Miscellany Styptic TonicThe plant is analgesic, antispasmodic, blood tonic, diuretic and tonic[218, 257]. A decoction has been used as a herbal stealm in the treatment of rheumatism[257]. The spores of this plant are dusted on wounds or inhaled to stop bleeding noses. They can also be used to absorb fluids from injured tissues[213, 218, 257]. The spores can be used as a dusting powder to prevent pills sticking together[213].

propta Spores - best sown as soon as they are ripe on the surface of a humus-rich sterilized soil. Keep the compost moist, preferably by putting a plastic bag over the pot. Pot on small clumps of plantlets as soon as they are large enough to handle and keep humid until they are well established. Do not plant outside until the ferns are at least 2 years old and then only in a very well sheltered position. The spores are generally produced in abundance but are difficult to grow successfully[200]. Layering of growing tips[200].

nwatta Thrives in a rough spongy peat in a shady position[1]. Requires a humid atmosphere[200]. Terrestrial members of this genus are hard to establish. The roots are delicate and liable to rot, most water being absorbed through the foliage[200]. Members of this genus are rarely if ever troubled by browsing deer[233]. Although looking more like a moss, this genus is closely related to the ferns[200].

## 4.2.409 *Erica tetralix*

Bog Heather, Crossleaf heath  
3 tlin 7 cyuc 0 kcaak 3 tcan 0 dwat 0.3 m hkuc  
htut cyutli tcuphja7n hwicli hyhshrasljut hpa7tli frusflatprik  
hpa7tmwatli fyifxre7t hjonli

drutta *Erica tetralix* is an evergreen Shrub growing to 0.3 m (1ft) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 3. It is in leaf all year, in flower from June to October, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils and can grow in very acid

soils. It cannot grow in the shade. It prefers moist or wet soil. The plant can tolerate strong winds but not maritime exposure.

kcakta None known  
tcanta Broom DyeStems are used for making brooms, brushes etc[109]. A yellow dye is obtained from the plant[46, 61]. Plants can be grown as a ground cover[208]. They should be clipped in the spring in order to encourage denser growth[208].

dwatta None known  
propta Seed - surface sow in a sandy compost in a cold frame in spring. Keep moist. Prick out the plants as soon as they are large enough to handle and plant them in their permanent positions when they are 5 - 8cm tall[11]. Cuttings of half-ripe wood, 3cm long taken from twiggly lateral growths near the base of the plant, July/August in a frame. Remove the leaves from the bottom part of the stem without causing any damage to the bark. The cuttings root in a few weeks if they are given some bottom heat. Plant out in spring[11]. Layering in spring or autumn. Plants can be 'dropped' and then dug up and divided about 6 - 12 months later. Dropping involves digging up the plant and then replanting it about 15 - 20cm deeper in the soil to encourage roots to form along the stems[78].

nwatta Requires a light lime-free loam[1]. A calcifuge plant, requiring a pH below 6[186]. Grows best in a poor soil[11]. Resents dry soils[1], doing well in boggy areas[186]. Prefers an open situation[1]. A good bee plant[108]. There are many named forms, selected for their ornamental value[188]. Plants in this genus are notably resistant to honey fungus[200]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

## 4.2.410 *Dicentra eximia*

Dwarf bleeding heart, turkey-corn  
3 tlin 9 cyuc 0 kcaak 4 tcan 0 dwat 0.4 m hkuc  
pcimhmim cyutli tcup hwicli hyhshrasljutnyik hpa7tli flatprik  
hpa7tmwatli hjonli

drutta *Dicentra eximia* is a PERENNIAL growing to 0.4 m (1ft 4in) by 0.4 m (1ft 4in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4. The flowers are pollinated by Birds, Bees, Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta None Known

tcanta Groundcover: A medium density moderately good groundcover for shade and semi-shade. Colonizes very slowly through rhizomes. Wildlife Food: The nectar is sought by hummingbirds. Wildlife Habitat: Provides cover for small wildlife. Insectory: Attracts beneficial insects [318-1]. Good companion plants include; Jacobs Ladder and Wild Columbine. Cut Flowers. Ornamental: Ornamental foliage and flowers. The foliage is deeply cut and fern-like, and does not die back like the common bleeding heart. Flowers are shades of pink and white and heart shaped [318-1].

dwatta None known  
propta  
nwatta An herbaceous perennial growing well in semi-shade. USDA Hardiness Zones: 3 - 9. Soil pH: 5.5 - 7.0. Life Span: Long-Lived Perennial. Stand Persistence: Long. Form: Upright. Texture: Fine. Sun: Partial Shade, Shade. Soil Type: Loamy, Silty. Soil Moisture: Moderate. Minimum Root Depth: 6 inches (15cm). Root Type: Rhizome, Fibrous Shallow. Fungal Types: Endomycorrhizal. Seasonal Interest: Summer. Will tolerate full sun if given sufficient moisture. Requires rich well-drained soil. Flowering may stop in areas with very hot weather. Will not go dormant in midsummer like the Common Bleeding Heart as long as the soil is kept moist. Tolerant of proximity to black walnut trees. Fruit Type: Capsule. Flower Color: Pink, Red, White. Drought: Sensitive. Flood: Intolerant. Salt: Intolerant. Soil Compaction: Sensitive. Mowing: Intolerant. Cold Injury:

Inrequent. Disease Issues: Minor. Insect/Pest Damage: Minor. Animal Damage: Deer, Rabbits. Growing Season: Cool. Bloom Time: Late Spring - Early Fall. Fruit Time: Fall - Winter [318-1]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2]. The root pattern is fibrous dividing into a large number of fine roots [1-2].

#### 4.2.411 *Lycopodium campanulatum*

3 tlin 9 cyuc 0 kcaak 0 tcan 1 dwat m hkuc  
pcimhmimht cyuti tcup hwicli hrasjlut hpa7tli flatprklwis hpa7tmwatli hjonli

drutta *Lycopodium campanulatum* is a FERN. See above for USDA hardiness. It is hardy to UK zone 3. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta None known

tcanta *Miscellany Mordant*The spores are water repellent and can be used as a dusting powder to stop things sticking together[106, 171]. They are also used as a talcum powder and for dressing moulds in iron foundries[74]. They can also be used as explosives in fireworks and for artificial lighting[46, 57, 102, 171]. The plant can be used as a mordant in dyeing[172].

dwatta *Hypnotic Miscellany*The plant is hypnotic[192]. Chewing three stems is said to induce mild intoxication whilst eight can cause unconsciousness[192, 213].

propta Spores - best sown as soon as they are ripe on the surface of a humus-rich sterilized soil. Keep the compost moist, preferably by putting a plastic bag over the pot. Pot on small clumps of plantlets as soon as they are large enough to handle and keep humid until they are well established. Do not plant outside until the ferns are at least 2 years old and then only in a very well sheltered position. The spores are generally produced in abundance but are difficult to grow successfully[200]. Layering of growing tips[200].

nwatta Thrives in a rough spongy peat in a shady position[1]. Requires a humid atmosphere[200]. Terrestrial members of this genus are hard to establish. The roots are delicate and liable to rot, most water being absorbed through the foliage[200]. There is some doubt as to the correct spelling of this species name. I have a feeling that it could be a miss-spelling of *L. complanatum*. Members of this genus are rarely if ever troubled by browsing deer[233]. Although looking more like a moss, this genus is closely related to the ferns[200].

#### 4.2.412 *Solidago flexicaulis*

Zigzag goldenrod

3 tlin 9 cyuc 0 kcaak 3 tcan 0 dwat 0.6 m hkuc  
pcimhmimht cyuti hgatyuctcup hwicli hrasjlutnyik hpa7tli frusflatprk hpa7tmwatli hjonli

drutta *Solidago flexicaulis* is a PERENNIAL growing to 0.6 m (2ft) by 0.6 m (2ft in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta Leaves used for tea [1-2]. Edible seed [1-2]. No further information available.

tcanta A good nurse plant for sites prone to drought. Erosion Control. Invertebrates shelter: beneficial for insects and other arthropods. Nectary: provides nectar or pollen for beneficial insects [1-2]. The flowerheads are pollinated by many kinds of insects, including long-tongued bees, small-tongued bees, wasps, flies, and butterflies. Several bees are oligoleges of *Solidago* spp. (Goldenrods). These species include: *Andrena hirticincta*, *Andrena nubicula*, *Andrena placata*, *Andrena simplex*, *Andrena solidaginis*, and *Colletes simulans armata*. Many insects feed on the leaves, flowers,

seeds, and roots of goldenrods. These insect feeders include plant bugs, stink bugs, aphids, leaf beetles, and the caterpillars of many moths. These insects are a source of food to many woodland songbirds and some upland gamebirds. White-tailed Deer readily browse on the foliage of Zigzag Goldenrod [1-6]. An interesting goldenrod for shady woodland areas [368-1].

dwatta Many species of *Solidago* have medicinal qualities although we have been unable to find information on *Solidago flexicaulis*.

propta Root Division , Seeds. Fresh seed or root division. Seed Collection: Seeds ripen soon after plant blooms.

nwatta A long-lived upright herbaceous perennial in the sunflower family (Compositae/Asteraceae). Prefers average, medium moisture, well-drained soils in full sun to part shade. This is a woodland species that perhaps does best in sun-dappled part shade, but will also grow in full shade. Established plants tolerate some dry soils [368-1]. Soil Type: Loamy, Silty. Tolerat ar clay or rocky soils. Soil Moisture: Moderate - mesic or dry soils. Minimum Root Depth: 20cm/8 inches. Root Type: Fibrous Shallow. Yellow flower; adds bright color to woodland gardens in fall. Bloom Time: July to September. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

#### 4.2.413 *Liatris spicata*

Gayfeather, Dense blazing star, Spiked Blazing Star, Button Snakevot, Gayfeather, Spiked Gayfeather,  
3 tlin 9 cyuc 0 kcaak 0 tcan 3 dwat 0.6 m hkuc  
hmimht cyuti hgattcuphja7n hwicli hrasjlut hpa7tli flatprklwis hpa7tmwatli xre7t hjonli

drutta *Liatris spicata* is a PERENNIAL growing to 0.6 m (2ft) by 0.3 m (1ft in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 3. It is in flower in September, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can tolerate drought.

kcakta None known

tcanta *Pot-pourri Repellent*The aromatic leaves and roots are added to pot-pourri[238]. The leaves and the roots are added to various insect-repellent herbal mixtures[238].

dwatta *Anodyne Antibacterial Astringent Carminative Diaphoretic Diuretic Emmenagogue Expectorant Stimulant Tonic VD*The leaves and root are anodyne, antibacterial, astringent, carminative, diaphoretic, diuretic, emmenagogue, expectorant, stimulant and tonic[4, 21, 106, 238, 257]. The plant is said to be extremely efficacious when used as a local application in the treatment of sore throats and gonorrhoea[4]. It is also used in treating kidney diseases[238]. The leaves are harvested in the summer, the roots in the autumn. Both can be used fresh or dried[238].

propta Seed - best sown as soon as it is ripe in autumn in a greenhouse[200]. Sow stored seed as soon as possible in the year in a greenhouse. Prick out the seedlings into individual pots when they are large enough to handle and grow the plants on in the greenhouse for their first year. Plant them out into their permanent positions in early summer. Division in spring[1]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring. Basal cuttings taken in spring as growth commences. Harvest the shoots when they are about 10cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta *Landscape Uses:Border, Foundation, Massing, Seashore, Specimen.* Grows well in a moderately good light soil[1]. Requires a moist to wet position[1, 200, 238]. Established plants are very drought tolerant so long as there

flavour, somewhat like a cross between garlic and chives[K]. They are delicious in salads[183]. The flavour is destroyed by lengthy cooking[238]. The leaves are available from early spring until late in the autumn[K]. They contain about 2.6% protein, 0.6% fat, 2.4% carbohydrate, 0.95% ash. They also contain small amounts of vitamins A, B1 and C[179]. The rather small bulbs are about 10mm in diameter and are produced in clusters on a short rhizome[200]. Flowers and flower buds - raw or cooked[52, 88, 183]. A delicious flavouring and pretty garnish for the autumn salad bowl[K]. Root - raw or cooked. An edible oil is obtained from the seed[183].

tcanta *Oil Repellent*The juice of the plant is used as a moth repellent. The whole plant is said to repel insects and moles[20].

dwatta *Antibacterial Cardiac Digestive Stomachic Tonic Urinary*The whole plant is antibacterial, cardiac, depurative, digestive, stimulant, stomachic and tonic[61, 174, 218]. It is an anti-emetic herb that improves kidney function[238]. It is used internally to treat urinary incontinence, kidney and bladder weaknesses etc[238]. The seed is carminative and stomachic[218]. They are used in India in the treatment of spermatorrhoea[240]. The leaves and the bulbs are applied to bites, cuts and wounds[218].

propta Seed - sow spring in a cold frame. The seed has a fairly short viability and should not be used when more than 1 year old[206]. Prick out the seedlings into individual pots when they are large enough to handle - if you want to produce clumps more quickly then put three plants in each pot. Plant out in late summer if the plants have developed sufficiently, otherwise plant them out the following spring. Division in early spring. Very easy, the plants divide successfully at almost any time of the year. The divisions can be planted straight out into their permanent positions if required.

nwatta *Landscape Uses:Border, Container, Ground cover, Rock garden.* An easily grown plant[203], it prefers a sunny position in a rich moist but well-drained soil[1, 88]. Tolerates most soils[52, 88], including clay[203, 206]. Tolerant of dry soils, established plants also resist drought[190]. Tolerates some shade, even in N.W. England[203]. The roots penetrate up to 50cm into the soil[206]. Tolerates a pH in the range 5.2 to 8.3. This plant succeeds in temperate and tropical climates[90]. It appears to be fully hardy in Britain[90]. Plants tolerate 40 degrees of frost in Manchuria (the report does not say if this is fahrenheit or centigrade)[206]. Plants remain green until temperatures fall below 4 - 5°C, they come into new growth in spring when temperatures go above 2 - 3°C[206]. Often cultivated for its edible leaves and bulb in the Orient, there are many named varieties[90, 183]. There are two main types of cultivar, one is grown for its leaves and the other for its flowering stem[200, 206]. This species is being increasingly grown as a garden vegetable in Britain[K]. A very ornamental plant, it grows well as an edging plant in the flower garden[K]. Closely related to *A. ramosum*[203]. The bulbs should be planted fairly deeply[1]. Grows well with most plants, especially roses, carrots, beet and chamomile, but it inhibits the growth of legumes[18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. Members of this genus are rarely if ever troubled by browsing deer[233]. **Special Features:** Edible, Fragrant foliage, Not North American native, Invasive, Suitable for cut flowers, Suitable for dried flowers, Fragrant flowers. The plant is heat tolerant in zones 9 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is a bulb.

#### 5.2.32 *Allium ursinum*

Wild Garlic

4 tlin 8 cyuc 5 kcaak 0 tcan 3 dwat 0.3 m hkuc

pcimhmimht cyuti tcup hwicli hrasjlut hpa7tli flatprklwis hpa7tmwatli xre7t hjonli

drutta *Allium ursinum* is a BULB growing to 0.3 m (1ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in leaf from February to June, in flower from May to June, and the seeds ripen from May to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta *Edible Parts: Flowers Leaves Root*Edible Uses: Leaves - raw or cooked[2, 5, 9, 12, 24]. Usually available from late January[K]. One report says that they have an overpowering garlic odour that dissipates on cooking[183], though our experience is that they are considerably milder than garlic[K]. The leaves make a very nice addition to salads, and are especially welcome as a vital and fresh green leaf in the middle of winter[K]. Flowers - raw or cooked. These are somewhat stronger than the leaves, in small quantities they make a decorative and very tasty addition to salads[K]. The flowering heads can still be eaten as the seed pods are forming, though the flavour gets even stronger as the seeds ripen[K]. Bulb - raw or cooked[2]. A fairly strong garlic flavour, though it is quite small and fiddly to harvest[K]. The bulbs can be harvested at any time the plant is dormant from early summer to early winter. Harvested in early summer, they will store for at least 6 months[K]. The bulbs can be up to 4cm long and 1cm in diameter[00]. The small green bulbs are used as a caper substitute[183].

tcanta *Companion Disinfectant Repellent*The juice of the plant is used as a moth repellent. The whole plant is said to repel insects and moles[20]. The juice of the plant has been used as a general household disinfectant[7].

dwatta *Anthelmintic Antiasthmatic Anticholesterolemic Antiseptic Antispasmodic Astringent Cholagogue Depurative Diaphoretic Disinfectant Diuretic Expectorant Febrifuge Hypotensive Rubefacient Stimulant Stomachic Tonic Vasodilator*Ramsons has most of the health benefits of the cultivated garlic, *A. sativum*[7, 238], though it is weaker in action[254]. It is therefore a very beneficial addition to the diet, promoting the general health of the body when used regularly. It is particularly effective in reducing high blood pressure and blood cholesterol levels[9]. It is recognised as having a good effect on fermentative dyspepsia[244]. All parts of the plant can be used, but the bulb is most active. The plant is anthelmintic, antiasthmatic, anticholesterolemic, antiseptic, antispasmodic, astringent, cholagogue, depurative, diaphoretic, diuretic, expectorant, febrifuge, hypotensive, rubefacient, stimulant, stomachic, tonic and vasodilator[7, 21]. Ramsons ease stomach pain and are tonic to the digestion, so they can be used in the treatment of diarrhoea, colic, wind, indigestion and loss of appetite[254]. The whole herb can be used in an infusion against threadworms, either ingested or given as an enema[254]. The herb is also beneficial in the treatment of asthma, bronchitis and emphysema[254]. The juice is used as an aid to weight loss and can also be applied externally to rheumatic and arthritic joints where its mild irritant action and stimulation to the local circulation can be of benefit[254].

propta Seed - best sown as soon as it is ripe either in situ or in a cold frame. It germinates quickly and can be grown on in the greenhouse for the first year, planting out the dormant bulbs in the late summer of the following year. Stored seed can be sown in spring in a greenhouse. Division in summer after the plants have died down. Very easy, the divisions can be planted out straight into their permanent positions.

nwatta Prefers woodland conditions in a moist well-drained soil[203]. Plants are often found in the wild growing in quite wet situations[K]. When growing in suitable conditions, wild garlic forms a dense carpet of growth in the spring and can be a very invasive plant[24, 203, K]. It dies down in early summer, however, allowing other plants to grow in the same space[K]. The bulbs should be planted fairly deeply[1]. The seeds are dispersed by ants[244]. Grows well with most plants, especially roses, carrots, beet and chamomile, but it inhibits the growth of legumes[18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. Members of this genus are rarely if ever troubled by browsing deer[233].

PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to July. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Flowers LeavesEdible Uses: Leaves and young shoots - cooked[105, 116, 177, 183]. They must be consumed when very young or else they become fibrous[K]. Flowers and flower buds - raw or cooked[105, 127, 177, 183]. The flowers are crisp and succulent with a delicious sweet flavour and no aftertaste[K]. The flowers can be dried and used as a thickener in soups etc. The flower buds contain about 43mg vitamin C per 100g, 983 IU vitamin A and 3.1% protein[205].

tcanta WeavingThe tough dried foliage is plaited into cord and used for making footwear[205]. Plants form a spreading clump and are suitable for ground cover when spaced about 45cm apart each way[208]. The dead leaves should be left on the ground in the winter to ensure effective cover[208]. (This report was for a plant labelled *H. mid-dendorfi*ana, which I have assumed is a mis-spelling of this species[K])

dwatta Antidote Diuretic Vitamin CThe juice of the roots is an effective antidote in cases of arsenic poisoning[205]. A tea made from the boiled roots is used as a diuretic[205].

propta Seed - sow in the middle of spring in a greenhouse. Germination is usually fairly rapid and good. Prick out the seedlings into individual pots when they are large enough to handle. Grow the plants on for their first winter in a greenhouse and plant out in late spring[K]. Division in spring or after flowering in late summer or autumn[200]. Division is very quick and easy, succeeding at almost any time of the year[K]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Succeeds in most soils[1], including dry ones, preferring a rich moist soil and a sunny position[111] but tolerating partial shade[88]. Plants flower less freely in a shady position though the flowers can last longer in such a position[205]. Grows well in heavy clay soils. Succeeds in short grass if the soil is moist[1]. Prefers a pH between 6 and 7[200]. Hybridizes freely with other members of this genus[200]. Individual flowers only live for one day[205]. Plants take a year or two to become established after being moved but then form large clumps[200, 187]. The roots are fibrous without any obvious swellings[205]. Plants seem to be immune to the predations of rabbits[233]. The plants are very susceptible to slug and snail damage, the young growth in spring is especially at risk[200].

### 5.2.30 Crataegus missouriensis

4 tlin 8 cyuc 5 kcak 0 tcan 2 dwat m hkuc hmimhtut cyutli hgattcuphja7n hwicli hrasjlutnyikfrip hpa7tli flatprikklwis hpa7tmwatli xre7t hjonli

drutta Crataegus missouriensis is a deciduous Tree growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. The seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Midges. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can tolerate drought. The plant can tolerates strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. The size of a large cherry, the flesh is sweet, soft and fairly juicy[K]. The fruit is only about 10mm thick according to another report[235]. The fruit ripens in mid to late September in southern Britain[K], it makes a delicious dessert fruit and can also be used in making pies, preserves etc[K]. The fruit can be dried for later use. There are up to five fairly large seeds in the centre of the fruit, these often stick together and so the effect is of eating a cherry-like fruit with a single seed[K].

tcanta Wood - heavy, hard, tough, close-grained. Useful for making tool handles, mallets and other small items[82].

dwatta Cardiotonic HypotensiveAlthough no specific mention has been seen for this species, the fruits and flowers of many hawthorns are well-known in herbal folk medicine as a heart tonic and modern research has borne out this use. The fruits and flowers have a hypotensive effect as well as acting as a direct and mild heart tonic[222]. They are especially indicated in the treatment of weak heart combined with high blood pressure[222]. Prolonged use is necessary for it to be efficacious[222]. It is normally used either as a tea or a tincture[222].

propta Seed - this is best sown as soon as it is ripe in the autumn in a cold frame, some of the seed will germinate in the spring, though most will probably take another year. Stored seed can be very slow and erratic to germinate, it should be warm stratified for 3 months at 15°C and then cold stratified for another 3 months at 4°C[164]. It may still take another 18 months to germinate[78]. Scarifying the seed before stratifying it might reduce this time[80]. Fermenting the seed for a few days in its own pulp may also speed up the germination process[K]. Another possibility is to harvest the seed 'green' (as soon as the embryo has fully developed but before the seedcoat hardens) and sow it immediately in a cold frame. If timed well, it can germinate in the spring[80]. If you are only growing small quantities of plants, it is best to pot up the seedlings as soon as they are large enough to handle and grow them on in individual pots for their first year, planting them out in late spring into nursery beds or their final positions. When growing larger quantities, it might be best to sow them directly outdoors in a seedbed, but with protection from mice and other seed-eating creatures. Grow them on in the seedbed until large enough to plant out, but undercut the roots if they are to be left undisturbed for more than two years.

nwatta A very easily grown plant, it prefers a well-drained moisture retentive loamy soil but is not at all fussy[11, 200]. Once established, it succeeds in excessively moist soils and also tolerates drought[200]. It grows well on a chalk soil and also in heavy clay soils[200]. A position in full sun is best when plants are being grown for their fruit, they also succeed in semi-shade though fruit yields and quality will be lower in such a position[11, 200]. Most members of this genus succeed in exposed positions, they also tolerate atmospheric pollution[200]. This species has a good potential as a fruit crop in Britain. It regularly produces heavy crops of high quality, the tree is very easily grown and is little troubled by pests or diseases. It also requires very little attention, once the trees are established virtually the only work needed is to harvest the fruit each year[K]. A plant growing at Hillier Arboretum was about 3 metres tall (with a trunk 2 metres long) and 3 metres wide, it was fruiting well in 1993 and 1994[K]. Hybridizes freely with other members of this genus[200]. Seedling trees take from 5 - 8 years before they start bearing fruit, though grafted trees will often flower heavily in their third year[K]. The flowers have a foetid smell somewhat like decaying fish. This attracts midges which are the main means of fertilization. When freshly open, the flowers have more pleasant scent with balsamic undertones[245]. Seedlings should not be left in a seedbed for more than 2 years without being transplanted[11].

### 5.2.31 Allium tuberosum

Garlic Chives, Chinese chives, Oriental Chives, 4 tlin 8 cyuc 5 kcak 3 tcan 2 dwat 0.3 m hkuc htut cyutli hgatkyuctup hwicli hrasjlutnyik hpa7tli flatprikkwisslip hpa7tmwatli xre7t hjonli

drutta Allium tuberosum is a BULB growing to 0.3 m (1ft) by 0.3 m (1ft in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from August to September, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Flowers Leaves Oil RootEdible Uses: OilLeaves - raw or cooked[1, 15, 46, 52, 88]. A mild

is plenty of humus in the soil[190]. Prefers a sunny position[108] but succeeds in shade[111]. Plants are hardy to about -25°C[187]. The plant has an agreeable odour, due to the presence of coumarins[4]. A good bee plant[1]. Rodents are very fond of the tubers so the plants may require some protection[200]. Slugs are fond of the young shoots in spring[238]. Special Features: Attracts birds, Attractive foliage, North American native, Attracts butterflies, Suitable for cut flowers, Suitable for dried flowers.

### 4.2.414 Echinops latifolius

3 tlin 7 cyuc 0 kcak 0 tcan 1 dwat 0.5 m hkuc htut cyutli hgatkyuctup hwicli hyishrasjlutnyik hpa7tli flatprikklwis hpa7tmwatli xre7t hjonli

drutta Echinops latifolius is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 3. It is in flower from July to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta None known

tcanta None known

dwatta Antiinflammatory GalactagogueThe root is anti-inflammatory and galactagogue[176]. It is used in the treatment of breast abscesses with inflammation, mastitis, lack of milk in nursing mothers and distension of the breast[176].

propta Seed - sow early spring in a cold frame[111]. The seed usually germinates in 3 - 9 weeks at 25°C[175]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. The seed can also be sown in an outdoor seedbed in mid spring and is then planted out into its permanent position in late summer or the autumn[111]. Division in autumn[111]. Root cuttings in the winter[200].

nwatta Succeeds in a sunny position in any well drained soil of low or medium fertility[200]. Established plants are drought tolerant[190]. The flowers are often used for dried flower displays[200]. If all the flowers are removed early in the season, the plant will often produce a second flush of bloom later in the summer[200].

### 4.2.415 Mitella diphylla

Mitrewort, Twoleaf miterwort 3 tlin 7 cyuc 0 kcak 2 tcan 1 dwat 0.4 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikklwis hpa7tmwatli xre7t hjonli

drutta Mitella diphylla is an evergreen Perennial growing to 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 3. It is in leaf all year, in flower from May to June. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta None known

tcanta A good ground cover in moist woodland[200]. Plants form a carpet and should be spaced about 45cm apart each way[208].

dwatta Febrifuge OphthalmicAn infusion of the leaves is used to treat fevers[200]. The infusion can also be used as eye drops for sore eyes[257].

propta Seed - we have no information for this species but suggest sowing it as soon as it is ripe or in early spring in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts.

nwatta Succeeds in moist woodlands and in pockets in rock gardens[200]. Requires a moist humus-rich soil[208]. Self-sows when grown in a rich soil[200] and usually spreads quickly by this means[208]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern

is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

### 4.2.416 Anemone canadensis

Canadian Anemone 3 tlin 7 cyuc 0 kcak 0 tcan 2 dwat 0.6 m hkuc hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikklwis hpa7tmwatli fyfxre7t hjonli

drutta Anemone canadensis is a PERENNIAL growing to 0.6 m (2ft) by 0.3 m (1ft in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 3 and is not frost tender. It is in flower from May to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil. The plant can tolerate maritime exposure.

kcakta None known

tcanta None known

dwatta Anthelmintic Antiaphonic Antiseptic Astringent Ophthalmic StypticThe roots and leaves are astringent and styptic[222]. The root and leaves of this plant was one of the most highly esteemed medicines of the Omaha and Ponca Indians[207]. A decoction of the root was used as an anthelmintic and to treat pain in the lumbar region[257]. An infusion of the root was used as an eye wash to treat crossed eyes, twitches and eye poisoning[257]. A wash of the pounded boiled root or of the leaves was applied externally to wounds, nosebleeds, sores etc[213, 222, 257]. The root contains anemonin, which is said to be a potent anti-septic[213]. A tea of the roots was used in the treatment of headaches and dizziness[213]. The root was eaten to clear the throat so that a person could sing well[257].

propta Seed - best sown in a cold frame as soon as it is ripe in the summer[1]. Surface sow or only just cover the seed and keep the soil moist. Sow stored seed as soon as possible in late winter or early spring. The seed usually germinates in 1 - 6 months at 15°C[133]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least their first year. When the plants are large enough, plant them out in the spring. Division in late summer after the plant dies down.

nwatta Landscape Uses:Border, Woodland garden. Succeeds in ordinary garden soil but prefers a well-drained woodland soil and some shade[200]. An easily grown plant, preferring a sunny position[233]. Plants succeed in maritime gardens[233]. Hardy to at least -20°C[187]. This species is closely related to *A. virginiana*[200]. Plants seem to be immune to the predations of rabbits[233]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54]. A good woodland plant[1, 187]. Special Features:North American native, Naturalizing, Suitable for cut flowers.

# 5 4 tlin

## 5.1 bwon

### 5.1.1 Apios fortunei

Hodo, Hodoimo tfo2n 4 tlin 9 cyuc 5 kcak 3 tcan 1 dwat m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli frusflatprikklwis hpa7tmwatli xre7t hjonli

drutta Apios fortunei is a PERENNIAL. See above for USDA hardiness. It is hardy to UK zone 5. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Tuber - raw or cooked[105, 177]. It has a delicious flavour somewhat like sweet potatoes when roasted[179]. The tuber can also be dried and ground into a powder. The tuber contains about 4.2% protein, 0.2% fat, 18.3% starch, 6% other carbohydrate, 1.3% ash[179].

tcanta None known

dwatta TonicThe root is tonic[218].

propta Seed - pre-soak for 3 hours in tepid water and sow February/March in a cold frame. The seed usually germinates in 1 - 3 months at 15°C[134]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for their first winter, planting them out in late spring or early summer. Division can be carried out at almost any time of the year, though spring is probably the best time. Simply dig up the roots, harvest the tubers and replant them where you want the plants to grow. It is also possible to harvest the tuber in winter, store them in a cool fairly dry but frost-free place over the winter and then plant them out in the spring. The tubers lose moisture rapidly once they have been harvested, so make sure that you store them in a damp medium such as leafmold.

nwatta We have very little information on this species and do not know if it will be hardy in Britain, though judging by its native range it should succeed outdoors in many parts of this country. The following notes are based on the general needs of the genus. Prefers a light rich soil and a sunny position[1, 27]. Another report says that it prefers light dappled shade[200]. Tolerates acid soils[160]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. Growth habit is a single or multiple shooting vine from a crown [1-2]. Herbaceous. The root pattern is tuberous with swollen potato-like roots [1-2].

## 5.1.2 Hippophae rhamnoides turkestanica

Sea Buckthorn

tfo2n 4 tlin 7 cyuc 5 kcaak 5 tcan 5 dwat 6 m hkuc htut cyutli hgatkuyctucuphja7n hwicli hysihrasjnutnyik hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

drutta Hippophae rhamnoides turkestanica is a deciduous Shrub growing to 6 m (19ft) by 2.5 m (8ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 3. It is in flower in April, and the seeds ripen from September to October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry moist or wet soil and can tolerate drought. The plant can tolerate maritime exposure.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. Very rich in vitamin C (120mg per 100g)[74] and vitamin A[183], but too acid when raw for most peoples tastes[11, 158]. Used for making fruit juice, it is high in vitamins and has an attractive aroma[141]. It is being increasingly used in making fruit juices, especially when mixed with other fruits, because of its reputed health benefits[214]. The fruits of some species and cultivars (not specified) contain up to 9.2% oil[214]. The fruit is very freely borne along the stems[K] and is about 6 - 8mm in diameter[200]. The fruit becomes less acid after a frost or if cooked[74]. The fruit is ripe from late September and usually hangs on the plants all winter if not eaten by the birds. It is best used before any frosts since the taste and quality of frosted berries quickly deteriorates[214].

tcanta Charcoal Dye Fuel Soil stabilization WoodVery tolerant of maritime exposure[29, 49, 75, 182], it can be used as a shelter hedge. It dislikes much trimming[75]. A very

thorny plant, it quickly makes an impenetrable barrier. Sea buckthorn has an extensive root system and suckers vigorously and so has been used in soil conservation schemes, especially on sandy soils. The fibrous and suckering root system acts to bind the sand[186, 244]. Because the plant grows quickly, even in very exposed conditions, and also adds nitrogen to the soil, it can be used as a pioneer species to help the re-establishment of woodland in difficult areas. Because the plant is very light-demanding it will eventually be out-competed by the woodland trees and so will not out-stay its welcome[K]. The seeds contain 12 - 13% of a slow-drying oil[240]. The vitamin-rich fruit juice is used cosmetically in face-masks etc[9]. A yellow dye is obtained from the fruit[74]. A yellow dye is obtained from the stems, root and foliage[4]. A blackish-brown dye is obtained from the young leaves and shoots[74]. Wood - tough, hard, very durable, fine-grained. Used for fine carpentry, turning etc[46, 61, 74]. The wood is also used for fuel and charcoal[146].

dwatta Astringent Cancer Cardiac Eczema Poulitce Tonic Vermifuge Vitamin CThe twigs and leaves contain 4 - 5% tannin[240]. They are astringent and vermifuge[7, 100]. The tender branches and leaves contain bio-active substances which are used to produce an oil that is quite distinct from the oil produced from the fruit. This oil is used as an ointment for treating burns[214]. A high-quality medicinal oil is made from the fruit and used in the treatment of cardiac disorders, it is also said to be particularly effective when applied to the skin to heal burns, eczema and radiation injury, and is taken internally in the treatment of stomach and intestinal diseases[214]. The fruit is used as a tonic[9]. The freshly-pressed juice is used in the treatment of colds, febrile conditions, exhaustion etc[9]. The fruit is a very rich source of vitamins and minerals, especially in vitamins A, C and E, flavanoids and other bio-active compounds. It is also a fairly good source of essential fatty acids, which is fairly unusual for a fruit. It is being investigated as a food that is capable of reducing the incidence of cancer and also as a means of halting or reversing the growth of cancers[214].

propta Seed - sow spring in a sunny position in a cold frame[78]. Germination is usually quick and good although 3 months cold stratification may improve the germination rate. Alternatively the seed can be sown in a cold frame as soon as it is ripe in the autumn. Prick out the seedlings into individual pots when they are large enough to handle and grow on in a greenhouse for their first winter. Plant out in late spring into their permanent positions. Male seedlings, in spring, have very prominent axillary buds whilst females are clear and smooth at this time[78]. Cuttings of half-ripe wood, June/July in a frame[200]. Difficult[113]. This is the easiest method of vegetative propagation[214]. Cuttings of mature wood in autumn[200]. Difficult[113]. The cuttings should be taken at the end of autumn or very early in the spring before the buds burst. Store them in sand and peat until April, cut into 7 - 9cm lengths and plant them in a plastic tent with bottom heat[214]. Rooting should take place within 2 months and they can be put in their permanent positions in the autumn[214]. Division of suckers in the winter. They can be planted out direct into their permanent positions and usually establish well and quickly[K]. Layering in autumn[200].

nwatta Landscape Uses:Border, Seashore, Specimen. Succeeds in most soils[200], including poor ones[186], so long as they are not too dry[182, 200]. Grows well by water and in fairly wet soils[182]. Established plants are very drought resistant[186]. Requires a sunny position[3], seedlings failing to grow in a shady position and mature shrubs quickly dying if overshadowed by taller plants[186]. Does well in very sandy soils[1, 186]. Plants are very tolerant of maritime exposure[75], though they are fairly slow growing[75]. Although usually found near the coast in the wild, they thrive when grown inland[11] and are hardy to about -25°C[184]. A very ornamental plant[1, 11], it is occasionally cultivated, especially in N. Europe, for its edible fruit[183]. Members of this genus are attracting considerable interest from breeding institutes for their nutrient-rich fruits that can promote the general health of the body (see edible and medicinal uses below)[214]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[113, 186, 200]. Plants produce abundant suckers, especially when grown on sandy soils[186]. Dioecious. Male and female plants must

the seedlings out into individual pots and grow them on in a cold frame or sheltered place outdoors for their first winter. Plant them out into their permanent positions in late spring or early summer[K]. Layering in autumn. Easy, it takes about 6 months[78, 200]. Division of suckers in early spring. Very easy, they can be planted out straight into their permanent positions.

nwatta Management: Coppice Management: Standard Regional Crop Staple Crop: Protein-oilAn easily grown plant, it succeeds in most soils, but is in general more productive of seeds when grown on soils of moderate fertility[11, 200]. It does less well in rich heavy soils or poor ones[11, 63]. Does well in a loamy soil[11]. Very suitable for an alkaline soil[11], but it dislikes very acid soils[17]. Plants are fairly wild tolerant[1, 11]. A very hardy plant but the male flowers can be damaged by heavy frosts at flowering time[200]. The filbert is often cultivated for its edible seeds[50], there are many named varieties[63]. It has often been hybridized with C. avellana in breeding programmes[11]. Plants are self-fertile but a more certain crop is obtained if more than one cultivar is grown[200]. The main difference between cob nuts and filberts is that the husk of a filbert is longer than the seed and often completely encloses it, whilst the husk on a cob nut is shorter than the seed[200]. Squirrels are a major pest of this plant, often decimating the crop of nuts[200]. Members of this genus bear transplanting well and can be easily moved even when relatively large[11].

## 5.2.28 Daucus carota sativus

Carrot

4 tlin 10 cyuc 5 kcaak 4 tcan 3 dwat 1.2 m hkuc htut cyutli tcup hwicli hrasjnutnyik hpa7tli flatprikliwis hpa7tmwatli fyixfre7t hjonli

drutta Daucus carota sativus is a BIENNIAL growing to 1.2 m (4ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies, beetles. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: Leaves RootEdible Uses: Coffee Colouring CondimentRoot - raw or cooked[2, 7, 27]. The roots of well-grown plants are crisp, sweet and juicy, they are very nice raw and are also cooked as a vegetable or added to soups, stews etc[K]. The grated root is a tasty addition to the salad bowl[K]. The juice can be extracted from the root and used as a health-promoting drink[46]. The root is very rich in carotene, which is transformed by the body into vitamin A when it is eaten[7]. The root is sometimes ground into a powder and used in making cakes, bread etc[7, K]. The roasted root is a coffee substitute[21, 46]. Carotin, extracted from the roots, is used as an orange-yellow food dye[171]. Leaves - raw or cooked. A very strong flavour, they can be added in small quantities to mixed salads[K]. The leaves contain an oil that is rich in vitamin E, they are sometimes used as a flavouring in soups[7]. An essential oil from the seed is used as a food flavouring.

tcanta Alcohol Dye EssentialThe roots are fermented in order to produce alcohol[7]. An orange dye is obtained from the root[171]. An essential oil from the seed has a distinctive fragrance and is used in perfumery[7, 46].

dwatta Anthelmintic Carminative Deobstruent Diuretic Galactogogue Ophthalmic StimulantCultivated carrot roots are a rich source of beta-carotene, which is converted to vitamin A by the liver[254]. When used as a regular item in the diet the roots improve eyesight and skin health, and also have anti-cancer effects[238]. A wonderful cleansing medicine, it supports the liver and stimulates urine flow and the removal of waste by the kidneys[254]. The root is diuretic and ophthalmic[7]. The juice of organic carrots is a delicious drink and a valuable detoxifier[254]. The raw root, grated or mashed, is a safe treatment for threadworms, especially in children[254]. The seed is carminative, galactogogue, lithontripic and stimulant[7, 240]. They are useful in the treatment of kidney diseases, dropsy and to settle the digestive system[240, 254]. They stimulate menstruation and have been

used in folk medicine as a treatment for hangovers[254].

propta Seed - sow in situ in succession from early spring to early summer. Do not transplant the seedlings, since this will usually cause damage to the roots and a good crop will not be obtained. Carrot seed needs a well-made seed bed with a fine tilth if good germination is to be achieved. The earliest sowings can be made of an early maturing variety in a cold frame or greenhouse in January or February, this will provide edible roots in late spring. The first outdoor sowings are made as the soil warms up in the spring. Successional sowings can be made until early summer if required. A September sowing in mild areas can provide an early spring supply of young roots, though the plants will often require some protection.

nwatta Prefers a good light warm well-drained soil and plenty of moisture[16, 27, 37, 200]. Prefers a sandy or calcareous loam[132]. Plants are extremely sensitive to soil conditions, good roots can only be produced in a soil that permits easy penetration of the root[200]. Carrots are reported to tolerate an annual precipitation in the range of 31 to 410cm, an annual temperature range of 3.6 to 28.5°C and a pH of 4.2 to 8.7[269]. They prefer a pH in the range 6.5 to 7.5[200]. Carrots are widely cultivated in most areas of the world for their edible root, which can be available all year round from successional sowings[46]. There are many named varieties, with roots varying in size and shape from short and round to long and tapering[183, 200]. World-wide, the yields of roots averages about 24 tonnes per hectare, the world low production yield was 3,125 kg/ha in Zaire, whilst the world high production yield was 62,889 kg/ha in Belgium-Luxembourg[269]. Plants grow best at a mean temperature of 16 - 18°C. At temperatures above 28°C top growth is reduced and the roots become very strongly flavoured. At temperatures below 16°C the roots become long and tapered and are pale in colour[200]. The leaves are moderately susceptible to frost but the roots are much harder and can safely be left in the ground in the winter in most areas[200], so long as pests such as slugs or root fly are not a problem[K]. If dug up for storage, the roots can be kept for up to six months at 0 - 1°C and high relative humidity[200]. Carrots are very susceptible to a number of pests and diseases. The young seedlings are adored by slugs and so will generally need some protection. Carrot root fly is also a major problem. This creature lays its eggs near the young carrots. When they hatch, the larvae burrow into the soil and then eat their way into the root. In bad seasons almost all the crop can be heavily damaged. It is possible to reduce this damage by timing seed sowing to try and avoid the worst times of infestation, a June sowing of a fast-maturing cultivar will often be successful. There are also various companion plants that can help to reduce infestation. In general, these are strong-smelling plants such as garlic, onions and various aromatic plants such as wormwood. The idea is that these plants will mask the smell of the carrots and therefore the fly, which mainly uses scent to find the plants, will not be able to detect the smell of the carrots This method is most likely to fail when the fly comes close enough to the plants to see them and then no longer relies on scent. The most successful organic solution to date has been to erect barriers of clear polythene about 1 metre tall all around the bed of carrots. Since the fly generally flies below this height, it has proved to be quite effective, although any fly that does get in will then tend to stay inside the barrier and lay all of its eggs there. About 95% of carrot flowers are pollinated by insects, with the remaining 5% self-pollinating[269]. Carrots grow well with lettuce and chives[18] but dislike dill[20]. They also grow badly with potatoes, kohlrabi, fennel and cabbages[201]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is fleshy. Thick or swollen - fibrous or tap root [2-1].

## 5.2.29 Hemerocallis middendorffii esculenta

4 tlin 8 cyuc 5 kcaak 0 tcan 1 dwat m hkuc hmihtmut cyutli kyuctucup hwicli hrasjnutnyikrip hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Hemerocallis middendorffii esculenta is a

on wounds, thus speeding up the healing process, and has been used as a cosmetic to remove freckles[7].

propta Harvest bulbils in late summer and replant immediately or store them in a cool dry frost-free place and plant them out in late winter or early spring. Division of the bulbs after the leaves die down in late summer.

nwatta Prefers a sunny position in a light well-drained soil[1] but succeeds in most soils that are in good condition[16]. Tolerates a pH in the range 4.5 to 8.3. The bulbs should be planted fairly deeply[1]. Some modern works have moved this plant from *A. cepa*, seeing it as being of hybrid origin with *A. fistulosum* and therefore renaming in *A. x proliferum*. The tree onion is a genuinely perennial form of *A. cepa* that is sometimes grown in the herb garden for its edible bulbils. Plants rarely if ever produce seed, instead the flowering head is comprised of a number of small onions or bulbils[16, 33]. Plants are propagated by means of these bulbils or by dividing the main bulb that grows underground[K]. By no means a heavily productive plant, though the bulbils are very well flavoured and the plant is fairly easily grown[K]. Its main problem is that slugs seem to be attracted to it and can eat to death even well-established plants[K]. Grows well with most plants, especially roses, carrots, beet and chamomile, but it inhibits the growth of legumes[18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. Said to be immune to onion root fly[16]. Members of this genus are rarely if ever troubled by browsing deer[233]. The plant is heat tolerant in zones 12 through 2. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is a bulb.

## 5.2.26 Malva alcea

Vervain mallow, Hollyhock Mallow

4 tin 8 cyuc 5 kcaak 2 tcan 1 dwat 1.2 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikklwis hpa7tmwatli xre7t hjonli

drutta Malva alcea is a PERENNIAL growing to 1.2 m (4ft) by 0.8 m (2ft 7in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from July to October, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves Oil SeedEdible Uses: Oil OilLeaves - raw or cooked[74]. A mild pleasant flavour[K]. The leaves are mucilaginous and fairly bland, this is a very good perennial substitute for lettuce in a salad, producing fresh leaves from spring until the middle of summer, or until the autumn from self-sown plants[K]. Flowers - raw[K]. A very decorative addition to the salad bowl, they have a mild flavour and a texture similar to the leaves[K]. Seed - raw[74]. Best used before it is fully mature, the seed has a pleasant nutty taste but it is rather small and fiddly to harvest[K].

tcanta Dye Fibre Oil OilA fibre obtained from the stem is used for making cordage[74]. Cream, yellow and green dyes can be obtained from the plant and the seed heads[168]. The seed yields 15% oil[74]. The uses of this oil have not been given though it is almost certainly edible[K].

dwatta Demulcent MouthwashThe leaves are demulcent. They are also used as a mouthwash for inflammatory and catarrhal conditions[74].

propta Seed - best sown in early spring in a cold frame. The seed germinates quickly and easily. Prick out the seedlings into individual pots when they are large enough

to handle and plant them out in their permanent positions in the early summer[K]. If you have sufficient seed then it can be sown outdoors in situ in the middle to late spring. Basal cuttings in late spring. Harvest the shoots with plenty of underground stem when they are about 8 - 10cm above the ground. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Landscape Uses:Border, Container, Massing. A very easily grown plant, succeeding in ordinary garden soil[1], though it prefers a reasonably well-drained and moderately fertile soil in a sunny position[200]. A very ornamental and polymorphic plant[1, 50]. It tends to be quite short-lived in cultivation but usually self-sows when well-sited[233, K]. It is closely related to *M. excisa*[74]. If the plant is cut back to the ground as it comes into flower, then it will produce a fresh flush of leaves for salads[K]. Plants seem to be immune to the predations of rabbits[233] and are seldom bothered by slugs[K]. Plants are prone to infestation by rust fungus[200]. Special Features: Not North American native, Naturalizing, Extended bloom season in Zones 9A and above. The plant is heat tolerant in zones 8 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2].

## 5.2.27 Corylus maxima

Filbert, Giant filbert

4 tin 8 cyuc 5 kcaak 5 tcan 0 dwat m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikklwisslip hpa7tmwatli fyif hjonli

drutta Corylus maxima is a deciduous Shrub growing to 6 m (19ft) by 5 m (16ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from April to May, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: Oil Oil SeedEdible Uses: Milk Oil OilSeed - raw or cooked[22, 34, 46, 105]. It is rich in oil. Large and well flavoured, it can be eaten raw, cooked in cakes, pies, breads etc or used to make a plant milk[183]. The seed ripens in mid to late autumn and will probably need to be protected from squirrels[K]. When kept in a cool place, and not shelled, the seed should store for at least 12 months[K]. An edible oil is obtained from the seed.

tcanta Basketry Charcoal Hedge Oil Oil WoodThe seed contains up to 65% of a non-drying oil, used in paints, cosmetics etc[13, 46, 57, 132]. The whole seed can be used to polish and oil wood[6]. Very easy and effective[K]. Plants can be grown as a tall hedge[29]. They need to be left untrimmed or only lightly trimmed if seed is required. Wood - soft, easy to split, not very durable, beautifully veined. Used for inlay work, small items of furniture, hurdles, wattles, basketry, pea sticks etc[7, 13, 23, 46, 61, 63, 66, 125]. The twigs are used as dowling rods by water diviners[11]. The wood also yields a good quality charcoal, used by artists[63, 101].

dwatta None known

propta Seed - best sown as soon as it is harvested in autumn in a cold frame[164]. Germinates in late winter or spring. Stored seed should be pre-soaked in warm water for 48 hours and then given 2 weeks warm followed by 3 - 4 months cold stratification[164]. Germinates in 1 - 6 months at 20°C[164]. When large enough to handle, prick

be grown if seed is required. The sexes of plants cannot be distinguished before flowering, but on flowering plants the buds of male plants in winter are conical and conspicuous whilst female buds are smaller and rounded[11]. Plants in this genus are notably resistant to honey fungus[200]. Special Features:Not North American native, Naturalizing, Inconspicuous flowers or blooms.

## 5.1.3 Amphicarpaea bracteata

Hog Peanut, American hogpeanut

tfozn 4 tin 9 cyuc 5 kcaak 3 tcan 1 dwat 1.5 m hkuc  
pccimhmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikklwis hpa7tmwatli xre7t hjonli

drutta Amphicarpaea bracteata is a PERENNIAL CLIMBER growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in leaf from May to October, in flower from August to September, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: Root SeedEdible Uses: Seed - raw or cooked[2, 161]. Two types of seed are produced - flowers produced near the ground produce a pod that buries itself just below soil level. These pods contain a single seed are up to 15mm in diameter which can be used as a peanut substitute. They can be harvested throughout the winter and can be eaten raw or cooked[2, 63, 95, 161]. They are sweet and delicious raw with a taste that is more like shelled garden beans than peanuts[183]. Yields are rather low, and it can be a fiddle finding the seeds, but they do make a very pleasant and nutritious snack[K]. Other flowers higher up the plant produce seed pods that do not bury themselves. The seeds in these pods are much smaller and are usually cooked before being eaten[95, 183]. They can be used in all the same ways as lentils and are a good source of protein[K]. The overall crop of these seeds is rather low and they are also fiddly to harvest[K]. Root - cooked[177, 257]. The root is peeled, boiled and then eaten[257]. Fleshy and nutritious according to one report[200], whilst another says that the root is too small to be of much importance in the diet[257]. Our plants have only produced small and stringy roots[K].

tcanta Nitrogen Fixer:

dwatta An infusion of the root has been used in the treatment of diarrhoea[257]. Externally, the root has been applied to bites from rattlesnakes[257]. A poultice of the pulverized leaves has been applied with any salve to swellings[257].

propta Seed - pre-soak for 12 hours in warm water and then sow in spring in a semi-shaded position in a greenhouse. Germination usually takes place within a few weeks. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter, planting them out in late spring or early summer. Division. We have been unable to divide this plant because it only makes a small taproot. However, many of the seeds are produced under the ground and these can be harvested like tubers and potted up to make more plants.

nwatta Agroforestry Services: Nitrogen Agroforestry Services: Understory legume Historic Crop Management: Fodder Management: Standard Staple Crop: ProteinRequires a moist humus-rich soil in a shady position[200]. The young shoots in spring can be damaged by late frosts[K]. The hog peanut has occasionally been cultivated for its edible seed which has been used as a peanut substitute[183]. Yields at present, however, are rather low[K]. Two types of blossom are produced by the plant - those produced from the leaf axils mostly abort but a few seeds are produced[95]. Solitary, inconspicuous cleistogamous flowers are produced on thread-like stems near the root and, after flowering, the developing seedpods bury themselves into the soil in a manner similar to peanuts[95, 274]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc.

and size shown above) information on the habit and root pattern is also useful and given here if available. A self-seeding plant [1-2]. Growth habit is herbaceous. Growth habit is a single or multiple shooting vine from a crown [1-2]. The root pattern is fibrous dividing into a large number of fine roots [1-2].

## 5.1.4 Psoralea esculenta

Breadroot, Large Indian breadroot

tfozn 4 tin 8 cyuc 5 kcaak 3 tcan 1 dwat 0.3 m hkuc  
htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatprikklwis hpa7tmwatli xre7t hjonli

drutta Psoralea esculenta is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from May to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Oil RootEdible Uses: OilRoot - raw or cooked[2, 4, 46, 57, 161]. It can also be dried for later use[183]. The dried root can be ground into a powder and used with cereals in making cakes, porridges etc[183]. Starchy and glutinous, the raw root is said to have a sweetish turnip-like taste[183]. The plant is best harvested as the tops die down at the end of the growing season[85]. This food is a staple and also considered to be a luxury item by many native North American Indian tribes[2, 61]. The root contains about 70% starch, 9% protein and 5% sugars[95].

tcanta Oil Soil stabilizationThe plant is a good soil stabilizer in its natural environment[200].

dwatta Pectoral Poultice StomachicAn infusion of the dried roots has been used in the treatment of gastro-enteritis, sore throats and chest problems[257]. The roots have been chewed by children as a treatment for bowel complaints[257]. A poultice of the chewed roots has been applied to sprains and fractures[257].

propta Pre-soak the seed for 24 hours in warm water and then sow in early to mid spring in a greenhouse. Either sow the seed in individual pots or pot up the young seedlings as soon as possible in order to avoid root disturbance. Grow them on in the pots until planting out in their final positions. It is usually impossible to transplant this species without fatal damage to the root[200]. Division in spring. With great care since the plant resents root disturbance. It is virtually impossible to divide this species successfully[200].

nwatta Succeeds in an ordinary garden soil[1]. Requires a well-drained soil in a sunny position[200]. Plants are very intolerant of root disturbance, they are best planted out into their permanent positions whilst still small[200]. This plant has been recommended for improvement through breeding and selection for its edible root[183]. It was sent to Europe around the year 1800 as a potential food crop but was not well received[213]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is tuberous with swollen potato-like roots [1-2].

## 5.1.5 Elaeagnus orientalis

Trebizonid Date

tfozn 4 tin 8 cyuc 4 kcaak 2 tcan 2 dwat 12 m hkuc  
htut cyutli htakkyuctcup hwicli hyishrasjlutnyik hpa7tli flatprikklwis hpa7tmwatli xre7t hjonli

drutta Elaeagnus orientalis is a deciduous Shrub growing to 12 m (39ft) by 6 m (19ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower in June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It can fix Nitrogen. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils,

prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

**kcakta Edible Parts:** Fruit **SeedEdible Uses:** Fruit - raw or cooked[3, 105]. Sweet and mealy but of better quality than the closely related *E. angustifolia*[183]. Eaten fresh or made into sherbet and preserves. The fruit must be fully ripe before it can be enjoyed raw, if even slightly under-ripe it will be quite astringent[K]. The oval fruit is about 10mm long and contains a single large seed[K]. Seed - raw or cooked. It can be eaten with the fruit though the seed case is rather fibrous[K].

**tcanta Hedge HedgePlants** can be grown as a hedge in exposed positions, tolerating maritime exposure.

**dwatta Cancer**The fruit of many members of this genus is a very rich source of vitamins and minerals, especially in vitamins A, C and E, flavanoids and other bio-active compounds. It is also a fairly good source of essential fatty acids, which is fairly unusual for a fruit. It is being investigated as a food that is capable of reducing the incidence of cancer and also as a means of halting or reversing the growth of cancers[214].

**propta Seed** - best sown as soon as it is ripe in a cold frame[78]. It should germinate in late winter or early spring, though it may take 18 months[K]. Stored seed can be very slow to germinate, often taking more than 18 months. A warm stratification for 4 weeks followed by 12 weeks cold stratification can help[98]. The seed usually (eventually) germinates quite well[78]. Prick out the seedlings into individual pot as soon as they are large enough to handle and plant out when they are at least 15cm tall. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in a frame. Cuttings of mature wood of the current year's growth, 10 - 12cm with a heel, October/November in a frame[200]. The cuttings are rather slow and difficult to root, leave them for 12 months[113]. Layering in September/October. Takes 12 months[78].

**nwatta Succeeds** in most soils that are well-drained[11, 200]. Prefers a soil that is only moderately fertile, succeeding in very poor soils and in dry soils[11, 200]. Established plants are very drought resistant[1]. Prefers a light sandy loam and a sunny position[11, 200]. Dislikes shallow chalk soils[98]. Very closely related to *E. angustifolia* and often considered to be no more than a sub-species of it[183], it does not flower so freely in Britain as that species[11]. This species is notably resistant to honey fungus[88, 200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. An excellent companion plant, when grown in orchards it can increase yields from the fruit trees by up to 10%. The flowers are very fragrant and are rich in nectar[183], they are much visited by bees. Occasionally cultivated for its edible fruit, there are some named varieties[183]. The fruit used to be commonly sold in the markets of Iran and Turkey but is rarely found there nowadays[183].

## 5.1.6 Vicia faba major

Broad Bean, Fava Bean

tf0zn 4 tlin 10 cyuc 4 kcak 3 tcan 1 dwat m hkuc hmhmhtup cyutli hgattcup hwicli hrasjlutnykfrp hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

**drutta Vicia faba major** is a ANNUAL growing to 1 m (3ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from May to August, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure.

**kcakta Edible Parts:** Leaves **SeedEdible Uses:** Immature seed - raw or cooked. Broad bean seeds are very nutri-

tious and are frequently used as items of food. The seeds can be eaten raw when they are small and tender, as they grow older they can be cooked as a vegetable[2

, 7  
, 16  
, 132  
, 183

]. They have a very pleasant floury taste[K]  
]. There are some potential problems to the use of these seeds if they are consumed in large quantities[7  
] - see the notes above on toxicity.

Mature seeds can be eaten cooked as a vegetable or added to soups etc[2

, 7  
, 16  
, 183

]. They are best soaked for 12 - 24 hours prior to cooking in order to soften them and reduce the cooking time[K

]. They will also become more nutritious this way[K

]. The flavour is mild and pleasant with a floury texture[K

]. They can also be dried and ground into a flour for use in making bread etc with cereal flours[183

]. The seed can also be fermented to make tempeh[183

]. Made into a paste, they can be used as a sandwich filling[299

]. The seed can be sprouted before being cooked[183

]. Popped seeds can be salted and eaten as a snack or roasted like peanuts[183

].  
Young pods - cooked and eaten as a vegetable[183

]. They quickly become fibrous as they grow larger[183

], and also develop a hairy coating inside the pods that can become unpleasant as the pods get larger[K

].

Young leaves - cooked. They are very nutritious and can be used like spinach[105

, 183  
].

**tcanta Fibre Soap makingAgroforestry Uses:** The stems and leaves are sometimes used as a green manure[299 ]. Broad beans grow well with carrots, cauliflower, beet, cucumber, cabbages, leeks, celeriac, corn and potatoes, but is inhibited by onions, garlic and shallots[18 , 20 ]. Other Uses: A fibre is obtained from the stems. The burnt stems are rich in potassium and can be used in making soap. The dried stems can be burnt as a fuel[299 ].

**dwatta Diuretic**The seedpods are diuretic and lithontriptic[7].

**propta Pre-soak** the seed for 24 hours in warm water and then sow in situ in succession from late winter until early summer. Germination should take place in about 7 - 10 days. The earlier sowings should be of suitably hardy varieties such as the 'Longpods' whilst later sowings can be of the tastier varieties such as the 'Windsors'. By making fresh sowings every 3 weeks you will have a continuous supply of fresh young seeds from early summer until early autumn. If you want to grow the beans to maturity then the seed needs to be sown by the middle of spring. You may need to protect the seed from the ravages of mice. Another sowing can be made in middle to late autumn. This has to be timed according to the area where the plants are being grown. The idea is that the plants will make some growth in the autumn and be perhaps 15 - 20cm tall by the time the colder part of winter sets in. As long as the winter is not too severe, the plants should stand well and will grow away rapidly in the spring to produce an earlier crop. The plants will also be less likely to be attacked by blackfly. Make sure you choose a suitably hardy variety for this sowing.

**nwatta** Broad beans originated in warm temperate areas and can be cultivated from the cold temperate zone to the subtropics, and also at higher elevations from 1,300 - 3,800 metres in the tropics. It may flower well in the lowland tropics, but usually does not produce pods[299

]. The ideal temperature range in the growing season is between 18 - 27°C, at higher temperatures the flowers are often aborted[200

]. The plant requires an annual rainfall of 700 - 1,000mm, of which more than 60% should occur during the growing period[299

]. Prefers a fairly heavy loam but succeeds in a sunny position in most soils that are well-drained[1

heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a running thicket former forming a colony from shoots away from the crown spreading indefinitely [1-2]. The root pattern is stoloniferous rooting from creeping stems above the ground [1-2].

## 5.2.24 Ribes uva

Gooseberry, European gooseberry

4 tlin 8 cyuc 5 kcak 2 tcan 1 dwat 1.2 m hkuc hmhmhtup cyutli tcup hwicli hrasjlutnyk hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

**drutta Ribes uva-crispa** is a deciduous Shrub growing to 1.2 m (4ft) by 1 m (3ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from March to May, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**kcakta Edible Parts:** Fruit **LeavesEdible Uses:** Fruit - raw or cooked[1, 2, 5, 7, 61]. The fruit is often picked when under-ripe and very firm, it has a very tart flavour at this time and is mainly used in making pies, jams etc. However, if the fruit is allowed to remain on the plant until it is fully ripe and soft it becomes quite sweet and is delicious for eating out of hand[K]. The fruit of the wild species is often less than 1cm in diameter, but named cultivars have considerably larger fruits up to 3cm in diameter[K]. Leaves- raw. The young and tender leaves can be eaten in salads[4]. Some caution is advised, see the notes above on toxicity.

**tcanta Cosmetic Miscellany**The fruit pulp is used cosmetically in face-masks for its cleansing effect on greasy skins[7].

**dwatta Astringent Dysentery Laxative Miscellany**The fruit is laxative[7]. Stewed unripe gooseberries are used as a spring tonic to cleanse the system[4]. The leaves have been used in the treatment of gravel[4]. An infusion taken before the monthly periods is said to be a useful tonic for growing girls[4]. The leaves contain tannin and have been used as an astringent to treat dysentery and wounds[7].

**propta Seed** - best sown as soon as it is ripe in the autumn in a cold frame. Stored seed requires 3 months cold stratification at between 0 and 5°C and should be sown as early in the year as possible[113, 164]. Under normal storage conditions the seed can remain viable for 17 years or more. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter, planting them out in late spring of the following year. Cuttings of half-ripe wood, 10 - 15cm with a heel, July/August in a frame[78, 113]. Cuttings of mature wood of the current year's growth, preferably with a heel of the previous year's growth, November to February in a cold frame or sheltered bed outdoors[78, 200].

**nwatta** Easily grown in a moisture retentive but well-drained loamy soil of at least moderate quality[11, 200]. Growth is often poor in light soils, whilst heavy soils encourage soft growth and excess vigour[200]. Prefers a pH in the range 6 to 6.5[200], though it can grow well in more acid or alkaline soils[K]. It is important to add plenty of humus to chalky soil[K]. Plants are quite tolerant of shade though do not fruit so well in such a position[11]. They can be grown against east or north facing walls[37]. The fruit of plants on north facing walls will ripen later, thus extending the fruiting season, though yields will be lower[K]. Plants dislike very hot weather[37]. Dormant plants are hardy to about -20°C[200], but the flowers and young fruits are susceptible to frost damage. Plants are very susceptible to potash deficiency[1], especially when grown on alkaline soils[K]. Gooseberries are commonly cultivated in temperate regions for their edible fruit, there are many named varieties[183, 200]. Birds love the fruit and so some protection is often required, especially if the fruit is being grown to full ripeness[K]. Plants grow best in cool moist climates such as N. Europe[200]. Plants fruit

best on one and two year old wood so any pruning should be to encourage vigorous new shoots[200]. Plants can harbour a stage of white pine blister rust, so should not be grown in the vicinity of pine trees[155]. Plants in this genus are notably susceptible to honey fungus[200]. The plant is heat tolerant in zones 9 through 2. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is multistemmed with multiple stems from the crown [1-2]. The root pattern is suckering with new plants from underground runners away from the plant [1-2].

## 5.2.25 Allium cepa proliferum

Tree Onion, Walking Onion

4 tlin 8 cyuc 5 kcak 3 tcan 3 dwat 1.2 m hkuc htut cyutli tcup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

**drutta Allium cepa proliferum** is a BULB growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

**kcakta Edible Parts:** Leaves **RootEdible Uses:** The plant forms small bulbs at the top of the flowering stem, these can be eaten raw or cooked[16, 33]. They have a strong onion flavour and are often used as pickled onions or added to salads[K]. As long as the bulbs are dried properly at harvest time, they store well[4]. Bulb - raw or cooked. The bulb can be up to 4cm in diameter and has a strong onion flavour[K]. Chopped into slices, it makes a good addition to salads and can also be used as a vegetable or as a flavouring in cooked foods[K]. Leaves - raw or cooked. A strong onion flavour, it makes a nice flavouring in salads though it should not be harvested in quantity because this would reduce the yield of bulbs[K]. The leaves are produced from late autumn, though we have found that harvesting them at this time will often encourage diseases such as mildew[K].

**tcanta Cosmetic Dye Hair Polish Repellent Rust**The juice of the plant is used as a moth repellent and can also be rubbed onto the skin to repel insects[7]. The plant juice can be used as a rust preventative on metals and as a polish for copper and glass[7]. A yellow-brown dye is obtained from the skins of the bulbs[141, 168]. Onion juice rubbed into the skin is said to promote the growth of hair and to be a remedy for baldness[7]. It is also used as a cosmetic to get rid of freckles[7]. The growing plant is said to repel insects and moles[201]. A spray made by pouring enough boiling water to cover 1kg of chopped unpeeled onions is said to increase the resistance of other plants to diseases and parasites[201].

**dwatta Anthelmintic Antiinflammatory Antiseptic Antispasmodic Carminative Diuretic Expectorant Febrifuge Hypoglycaemic Hypotensive Lithontriptic Skin Stomachic Tonic**Although rarely used specifically as a medicinal herb, the onion has a wide range of beneficial actions on the body and when eaten (especially raw) on a regular basis will promote the general health of the body. The bulb is anthelmintic, anti-inflammatory, antiseptic, antispasmodic, carminative, diuretic, expectorant, febrifuge, hypoglycaemic, hypotensive, lithontriptic, stomachic and tonic[4, 7, 21]. When used regularly in the diet it offsets tendencies towards angina, arteriosclerosis and heart attack[254]. It is also useful in preventing oral infection and tooth decay[254]. Baked onions can be used as a poultice to remove pus from sores[254]. Fresh onion juice is a very useful first aid treatment for bee and wasp stings, bites, grazes or fungal skin complaints[7, 201]. When warmed the juice can be dropped into the ear to treat earache[254]. It also aids the formation of scar tissue

one year old wood. Pruning usually consists of removing about a third of all the stems from just above ground level in the autumn. The oldest stems with least new growth are removed since these will be the poorest fruiterers. The plant is able to make new growth from the base of the removed stems and, if the plants are well fed, this growth is very vigorous and will fruit heavily the following year. The flowers can self-fertilize but many cultivars fruit better with insect pollination[200]. Plants can harbour a stage of 'white pine blister rust', so they should not be grown in the vicinity of pine trees[155]. Plants in this genus are notably susceptible to honey fungus[200]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is multistemmed with multiple stems from the crown [1-2]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out. The root pattern is suckering with new plants from underground runners away from the plant [2-1].

## 5.2.22 Hemerocallis middendorffii

Amur daylily, Middendorf, Daylily

4 tlin 8 cyuc 5 kcaak 2 tcan 1 dwat 1.5 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjltutnykfrp hpa7tli flat-prikliwis hpa7tmwatli xre7t hjonli

drutta Hemerocallis middendorffii is a PERENNIAL growing to 0.9 m (3ft) by 0.5 m (1ft 8in) at a medium rate. See above for USDA hardness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to July. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Flowers Leaves ShootsEdible Uses: Leaves and young shoots - cooked[105, 116, 177, 183]. They must be consumed when very young or else they become fibrous[K]. Flowers and flower buds - raw or cooked[105, 177, 183]. The flowers can be dried and used as a thickener in soups etc. The flower buds contain about 43mg vitamin C per 100g, 983 IU vitamin A and 3.1% protein[205].

tcanta WeavingThe tough dried foliage is plaited into cord and used for making footwear[205]. Plants form a spreading clump and are suitable for ground cover when spaced about 45cm apart each way[208]. The dead leaves should be left on the ground in the winter to ensure effective cover[208]. (This report was for a plant labelled H. middendorffiana, which I have assumed is a mis-spelling of this species[K]). Attractive flowers.

dwatta Antidote Diuretic Vitamin CThe juice of the roots is an effective antidote in cases of arsenic poisoning[205]. A tea made from the boiled roots is used as a diuretic[205].

propta Seed - sow in the middle of spring in a greenhouse. Germination is usually fairly rapid and good. Prick out the seedlings into individual pots when they are large enough to handle. Grow the plants on for their first winter in a greenhouse and plant out in late spring[K]. Division in spring or after flowering in late summer or autumn[200]. Division is very quick and easy, succeeding at almost any time of the year[K]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Landscape Uses:Border, Container, Ground cover, Massing, Seashore. Succeeds in most soils[1], including dry ones, preferring a rich moist soil and a sunny position[111] but tolerating partial shade[88]. Plants flower less freely in a shady position though the flowers can last longer in such a position[205]. Grows well in heavy clay soils. Succeeds in short grass if the soil is moist[1]. Prefers a pH between 6 and 7[200]. Hybridizes freely with other members of this genus[200]. Individual flowers are short-lived, but the plant produces a succession of blooms and also flowers again in late summer[205]. The plant has a fibrous root system

that does not extend far[205]. Plants take a year or two to become established after being moved but then form large clumps[200, 187]. Plants seem to be immune to the predations of rabbits[233]. The plants are very susceptible to slug and snail damage, the young growth in spring is especially at risk[200]. Special Features: Attractive foliage, Not North American native, Naturalizing, Attracts butterflies, Suitable for cut flowers, Fragrant flowers.

## 5.2.23 Amelanchier stolonifera

Quebec Berry, Running serviceberry

4 tlin 8 cyuc 5 kcaak 0 tcan 1 dwat 1.5 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjltutnykfrp hpa7tli frus-flatprik hpa7tmwatli fyfxc7t hjonli

drutta Amelanchier stolonifera is a deciduous Shrub growing to 1.5 m (5ft). See above for USDA hardness. It is hardy to UK zone 4 and is not frost tender. It is in flower in May, and the seeds ripen in July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: FruitEdible Uses: Edible fruit - raw or cooked[3, 101, 105]. Sweet and juicy with a good flavour that has a hint of apple[1, 11, 183, K]. The plant usually yields very well in Britain and the well-flavoured fruit means that it has excellent potential as a commercial crop[K] The fruit is rich in iron and copper[226].

tcanta None known dwatta TonicThe root bark has been used as a tonic[257].

propta Seed - it is best harvested 'green', when the seed is fully formed but before the seed coat has hardened, and then sown immediately in pots outdoors or in a cold frame. If stored seed is obtained early enough in the autumn, it can be given 4 weeks warm stratification before being left out in the winter and it should then germinate in the spring. Otherwise seed can be very slow to germinate, perhaps taking 18 months or more. When large enough to handle, prick the seedlings out into individual pots and grow them on in a sheltered outdoor position, planting them out once they are 20cm or more tall. If there is sufficient seed it is best to sow it thinly in an outdoor seedbed[78, 80]. Grow the seedlings on for two years in the seedbed before planting them out into their permanent positions during the winter. Layering in spring - takes 18 months[78]. Division of suckers in late winter. The suckers need to have been growing for 2 years before you dig them up, otherwise they will not have formed roots. They can be planted out straight into their permanent positions if required.

nwatta Dislikes calcareous soils[11]. Prefers a rich loamy soil in a sunny position or semi-shade[1, 200] but thrives in any soil that is not too water-logged[11]. Grows well in heavy clay soils. Tolerates dry soils[200]. All members of this genus have edible fruits and, whilst this is dry and uninteresting in some species, in many others it is sweet and juicy. Many of the species have potential for use in the garden as edible ornamentals. The main draw-back to this genus is that birds adore the fruit and will often completely strip a tree before it is fully ripe[K]. Produces suckers quite freely, the plant forms thickets. When propagated by these suckers, the new plants can begin producing a crop of fruit in their second year[K]. The sub-species A. stolonifera micropetala was seen growing in dappled shade at Hilliers Arboretum in early April 1999. It was about 2 metres tall, suckering freely with some suckers more than 50cm from the parent plant, and flowering freely[K]. Hybridizes with A. arborea, A. bartramiana, A. laevis and A. sanguinea. Grafting onto seedlings of A. lamarkii or Sorbus aucuparia is sometimes practised in order to avoid the potential problem of hybridizing[1]. The plant is heat tolerant in zones 8 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more

, 200  
1. Grows well in heavy clay soils. Dislikes dry conditions according to some reports[87

, 200  
1. whilst another says that it is drought tolerant once established[132

1. Prefers a pH in the range 5.5 to 7[200  
1. There are two main forms of this species - small seeded forms that are more commonly grown for feeding livestock and as a green manure, and larger seeded forms that are usually grown for human food. Of the larger seeded forms there are two main types: 'Longpod' beans are the more hardy and can be sown in the autumn in cool temperate areas. 'Windsor' beans, which are considered to be finer flavoured, are less tolerant of the cold and so are best sown in spring[132

1. Autumn sown varieties are more susceptible to 'chocolate spot' fungus, this problem can be alleviated by the addition of potash to the soil[87

1. Black fly can be a major problem. Autumn sown crops are less likely to be affected. Pinching out the soft tips of the plants, one they are tall enough and are beginning to flower, can reduce the problem since the blackfly always start on the soft shoots and then spread to the older stems. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200

1. When removing plant remains at the end of the growing season, it is best to only remove the aerial parts of the plant, leaving the roots in the ground to decay and release their nitrogen.

## 5.1.7 Caragana brevispina

Long-Stalked Pea-shrub

tfo2n 4 tlin 9 cyuc 4 kcaak 3 tcan 1 dwat 2.5 m hkuc htut cyutli hgatkyuctcup hwicli hyshrasjltut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Caragana brevispina is a deciduous Shrub growing to 2.5 m (8ft) by 1.8 m (6ft). See above for USDA hardness. It is hardy to UK zone 6. It is in flower in June, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: Leaves SeedEdible Uses: Seed - cooked[160]. Small but produced in abundance. The seed of a plant seen at the Royal Horticultural Gardens, Wisley in Surrey in September 1993 was about twice the size of C. arborescens but it had a distinctly bitter taste[K]. High in protein, it has been recommended as an emergency food for humans. Young buds - cooked as a green vegetable[272].

tcanta Hedge Hedge Soil stabilization WoodPlants can be grown as a hedge, they are very spiny and provide an impenetrable barrier. The extensive root system of this plant makes it useful for planting to control soil erosion. Wood - hard, close grained[146]. An important fuel wood for people living at high elevations[272].

dwatta A decoction of the plant is taken in the treatment of aching joints[272].

propta Seed - best sown as soon as it is ripe in a cold frame[200]. It usually germinates in 2 weeks[K]. Stored seed should be pre-soaked for 24 hours in warm water then sown in a cold frame[78, 113, 200]. If the seed has not swollen then scarify it and re-soak for another 12 hours before sowing[138]. Germination usually takes place within 2 - 3 weeks at 20°C[138]. Good percentage[11]. As soon as they are large enough to handle, prick the seedlings out into individual pots and grow them on in a greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in a frame[113]. Layering in spring.

nwatta Succeeds in most well-drained soils, but prefers full sun and a light sandy dry or well-drained soil[1, 11, 200]. Does not require a rich soil[11], succeeding on marginal

land[160]. Succeeds in acid or alkaline soils[160]. Established plants are drought resistant[160]. This species is hardy to at least -20°C[184], it prefers a continental climate with hot summers and cold winters so it does not grow so well in the milder western half of Britain[200]. Plants in this genus are notably resistant to honey fungus[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

## 5.1.8 Medicago sativa

Alfalfa, Yellow alfalfa

tfo2n 4 tlin 8 cyuc 4 kcaak 4 tcan 3 dwat 1 m hkuc htut cyutli hgatkyuctcup hwicli hyshrasjltutnyk hpa7tli flat-prikliwis hpa7tmwatli fyfxc7t hjonli

drutta Medicago sativa is a PERENNIAL growing to 1 m (3ft 3in) at a medium rate. See above for USDA hardness. It is hardy to UK zone 5. It is in flower from June to July, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). The plant is self-fertile. It can fix Nitrogen. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Leaves Oil SeedEdible Uses: Oil TeaLeaves and young shoots - raw or cooked[2, 8, 52, 145]. The leaves can also be dried for later use[55]. Very rich in vitamins[183], especially A, B and C[201], they are also a good source of protein[206]. The leaves are a rich source of vitamin K[213]. A very nutritious food in moderation, though it can trigger attacks in patients with systemic lupus erythematosus and large quantities can affect liver function and cause photosensitization[238]. A nutritional analysis is available[218]. The seed is commonly used as a sprouted seed which is added to salads[2, 20, 52], used in sandwiches etc or cooked in soups[183]. The seed is soaked in warm water for 12 hours, then kept moist in a container in a warm place to sprout. It is ready in about 4 - 6 days[244]. The seeds can also be ground into a powder and used as a mush, or mixed with cereal flours for making a nutritionally improved bread etc[183, 213, 244]. Seed yields average around 186 - 280 kilos per hectare[269]. An appetite-stimulating tea is made from the leaves[21, 55], it has a flavour somewhat reminiscent of boiled socks[144] and is slightly laxative[159].

tcanta Biomass Companion Dye Green manure Hedge Hedge Oil PaperOften grown as a green manure. It is a bit slow to establish in its first year so is generally only recommended for positions where it can remain for 2 or more years. Alfalfa is very vigorous from its second year, producing a huge bulk of material that can be cut down 2 or 3 times during the season[20, 87]. Plants are very deep rooting, descending 6 metres or more into the soil[200], and are able to fix large quantities of atmospheric nitrogen, this makes them one of the very best green manures. Plants are rather intolerant of competition from grass etc, however, and there is the drawback of needing to leave them in the soil for more than 2 years to fully achieve their potential[K]. Alfalfa is a potentially excellent source of biomass. It is possible to produce more than 2 tonnes of protein from the leaves (suitable for human use) per hectare per year. In addition, the plant residues remaining could be used to produce the equivalent of about 10 barrels of oil per year[269]. A yellow dye is obtained from the seed[269]. The fibre of the plant has been used in making paper[269]. The seed yields about 8.5 - 11% of a drying oil. It is used in paints, varnish etc[46, 57, 61, 269]. The plant can be grown as a low dividing hedge in the vegetable garden[52, 206]. A dynamic accumulator gathering minerals or nutrients from the soil and storing them in a more bioavailable form - used as fertilizer or to improve mulch.

dwatta Anodyne Antibacterial Antiscorbutic Aperient Diuretic Emetic Fibrifuge Haemostatic Hypoglycaemic Nutritive Stimulant TonicAlfalfa leaves, either fresh or dried, have traditionally been used as a nutritive tonic to stimulate the appetite and promote weight gain[222]. The plant has an oe-

strogenic action and could prove useful in treating problems related to menstruation and the menopause[254]. Some caution is advised in the use of this plant, however. It should not be prescribed to people with auto-immune diseases such as rheumatoid arthritis[238]. See also the notes above on toxicity. The plant is antiscorbatic, aperient, diuretic, oxyctic, haemostatic, nutritive, stimulant and tonic[55, 165, 218]. The expressed juice is emetic and is also anodyne in the treatment of gravel[218]. The plant is taken internally for debility in convalescence or anaemia, haemorrhage, menopausal complaints, pre-menstrual tension, fibroids etc[238]. A poultice of the heated leaves has been applied to the ear in the treatment of earache[257]. The leaves can be used fresh or dried[238]. The leaves are rich in vitamin K which is used medicinally to encourage the clotting of blood[213]. This is valuable in the treatment of jaundice[213]. The plant is grown commercially as a source of chlorophyll and carotene, both of which have proven health benefits[222]. The leaves also contain the anti-oxidant tricin[222]. The root is febrifuge and is also prescribed in cases of highly coloured urine[218]. Extracts of the plant are antibacterial[218]. Used for asthma, diabetes, gastrointestinal disorders (anti-ulcer) [301].

propta Pre-soak the seed for 12 hours in warm water and then sow in spring in situ. The seed can also be sown in situ in autumn[52]. Seed can be obtained that has been inoculated with Rhizobium bacteria, enabling the plant to succeed in soils where the bacteria is not already present.

nwatta Global Crop Management: Hay Staple Crop: ProteinAlfalfa is a very versatile plant that can adapt to a wide range of climatic conditions from cold temperate to warm sub-tropical.[269]. It succeeds on a wide variety of soils[52, 269], but thrives best on a rich, friable, well-drained loamy soil with loose topsoil supplied with lime[269]. It does not tolerate waterlogging and fails to grow on acid soils[269]. Grows well on light soils[206]. The plant has a deep taproot and, once established, tolerates drought and extremely dry conditions[52, 269]. Prefers a neutral fertile soil[87] but succeeds in relatively poor soils so long as the appropriate Rhizobium bacteria is present[200]. A good bee plant[46] and a food plant for many caterpillars[30]. Alfalfa is a very deep rooting plant, bringing up nutrients from deep in the soil and making them available for other plants with shallower root systems. It is a good companion plant for growing near fruit trees and grape vines so long as it is in a reasonably sunny position, but it does not grow well with onions or other members of the Allium genus[201]. Growing alfalfa encourages the growth of dandelions[201]. Alfalfa has long been cultivated for its edible seed, which can be sprouted and eaten in salads. It is also grown as a green manure and soil restorer. There are many named varieties[183]. Botanists divide the species into a number of sub-species - these are briefly described below: - *M. sativa caerulea* (Less. ex Ledeb.)Schmalh. This sub-species is likely to be of value in breeding programmes for giving cold tolerance, drought resistance and salt tolerance to alfalfa. *M. sativa falcata* (L.)Arcang. This sub-species is likely to be of value in breeding programmes for giving cold tolerance, drought and disease resistance plus salt and water-logging tolerance to alfalfa. *M. sativa sativa*. The commonly cultivated form of alfalfa. *M. sativa varia* (Martyn.)Arcang. This sub-species is likely to be of value in breeding programmes for giving cold tolerance, drought resistance and high yields to alfalfa. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. The plant is heat tolerant in zones 8 through 5. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is a tap root similar to a carrot going directly down [1-2].

## 5.1.9 Desmanthus illinoensis

Prairie Mimosa, Illinois bundleflower  
tfo2n 4 tlin 8 cyuc 4 kcaak 1 tcan 1 dwat 1.3 m hkuc  
htut cyutli tcup hwicli hrasjlutnykifrp hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Desmanthus illinoensis is a PERENNIAL growing to 1.3 m (4ft 3in). See above for USDA hardness. It is hardy to UK zone 4 and is not frost tender. It is in flower from May to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: Seed - cooked. Rich in protein but without much flavour[183]. The seed-pods are about 25mm long and contain 3 - 5 small seeds[235]. They are freely borne in the plants native environment, but will have to be very freely produced in this country if it is to be a worthwhile crop[K].

tcanta Root bark of *D. illinoensis* has been found to contain N,N-DMT, NMT, N-hydroxy-N-methyltryptamine, 2-hydroxy-N-methyltryptamine, and gramine (toxic). The root bark is mixed with a native source of beta-Carbolines to produce a hallucinogenic drink called prairiehuasca, which is an analog of the shamanic brew ayahuasca.

dwatta Antipruritic OphthalmicA leaf tea has been used in the treatment of itchy skin[222, 257]. Five seeds have been placed in the eye at night and washed out in the morning to treat trachoma[257].

propta Seed - pre-soak for 12 hours in warm water and then sow in a cold frame in the spring. Prick out the seedlings into individual pots as soon as they are large enough to handle and plant them out into their permanent positions in early summer. If you have sufficient seed then it is probably worthwhile sowing some in situ in mid to late spring.

nwatta Agroforestry Services: Nitrogen Management: Standard Staple Crop: Protein Under DevelopmentRequires a moist but well-drained soil in full sun[200]. Plants are often found growing in clay soils in the wild[274]. Suitable for the wild garden or other naturalistic plantings[200]. In favourable situations this plant can self-sow to the point of nuisance[200]. This plant is being evaluated by the Land Institute of Salina, Kansas, as an edible legume for growing with perennial grains in a non-tillage permaculture system[183]. It is certainly worthy of more attention in this country, though the small seed size mitigates against its use[K]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

## 5.1.10 Psoralea hypogaea

Small Indian Breadroot  
tfo2n 4 tlin 8 cyuc 4 kcaak 0 tcan 0 dwat 0.1 m hkuc  
htut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Psoralea hypogaea is a PERENNIAL growing to 0.1 m (0ft 4in). See above for USDA hardness. It is hardy to UK zone 4. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: RootEdible Uses: Root - raw or cooked[2, 62, 85, 161, 257]. Rich in starch[105]. The root can also be dried, ground into a powder and used in soups or with cereals for making bread etc[161]. The root is up to 60mm long and 15mm thick[60]. The root was an important food source fr the native North American Indians[274].

tcanta Soil stabilizationThe plant is a good soil stabilizer in its natural environment[200].

dwatta None known

propta Pre-soak the seed for 24 hours in warm water and then sow in early to mid spring in a greenhouse. Either sow the seed in individual pots or pot up the young seedlings

The plant growth habit is a running thicket former forming a colony from shoots away from the crown spreading indefinitely [1-2]. The root pattern is suckering with new plants from underground runners away from the plant [1-2]. Heat zone: 9-1.

## 5.2.20 Allium canadense mobilense

Canadian Garlic  
4 tlin 8 cyuc 5 kcaak 0 tcan 2 dwat m hkuc  
hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Allium canadense mobilense is a BULB growing to 0.5 m (1ft 8in) by 0.2 m (0ft 8in). See above for USDA hardness. It is hardy to UK zone 4 and is not frost tender. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Bulb - raw or cooked[46, 61, 62, 177]. It can be used as a vegetable, or as a flavouring in soups and stews, and can also be pickled[2]. The bulb is up to 30mm in diameter, it is crisp, mild and with a pleasant flavour[183]. Used as a leek substitute according to one report[22], it is a garlic substitute according to others[55, 159, K]. Leaves - raw or cooked[55, 62, 177]. A delicious mild flavour, they are available from early spring until the autumn[K]. They make a very acceptable salad and can also be used as a greens or as a flavouring in cooked foods[K]. Flowers - raw. A little bit stronger flavour than the leaves, especially as the seeds begin to form, they can be used as a flavouring and garnish on salads[K].

tcanta RepellentThe juice of the plant is used as a moth repellent. The whole plant is said to repel insects and moles[20].

dwatta Antiasthmatic Carminative Cathartic Diuretic Expectorant StimulantThe plant is antiasthmatic, carminative, cathartic, diuretic, expectorant and stimulant[257]. A tincture is used to prevent worms and colic in children, and also as a remedy for croup[257]. Although no other specific mention of medicinal uses has been seen for this species, members of this genus are in general very healthy additions to the diet. They contain sulphur compounds (which give them their onion flavour) and when added to the diet on a regular basis they help reduce blood cholesterol levels, act as a tonic to the digestive system and also tonify the circulatory system[K].

propta Seed - sow spring in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle - if you want to produce clumps more quickly then put three plants in each pot. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in spring once they are growing vigorously and are large enough. Division in spring. Very easy, the plants divide successfully at any time in the growing season and the divisions can be planted straight out into their permanent positions if required.

nwatta Prefers a sunny position in a light well-drained soil[1]. A moisture loving plant according to another report[42]. The bulbs should be planted fairly deeply[1]. Bulbs grow to a good size under cultivation[183]. Some forms of this species produce many bulbs and are considered to be a pernicious weed in some areas of America[159], there is some risk that they could spread aggressively in Britain. This subspecies, however, is a form that does not produce bulbs and is much better behaved[200]. Grows well with most plants, especially roses, carrots, beet and chamomile, but it inhibits the growth of legumes[18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 5.2.21 Ribes nigrum

Blackcurrant, European black currant  
4 tlin 8 cyuc 5 kcaak 2 tcan 3 dwat 1.8 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Ribes nigrum is a deciduous Shrub growing to 1.8 m (6ft). See above for USDA hardness. It is hardy to UK zone 5 and is not frost tender. It is in leaf from March to November, in flower from April to May, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Fruit LeavesEdible Uses: TeaFruit - raw or cooked. An excellent aromatic flavour[K]. The fully ripe fruit is very acceptable raw, though it is more often cooked and used to make pies, jams etc[1, 2, 5, 9, 34]. Very rich in vitamin C[244]. The fruit is about 10mm in diameter[200], though selected cultivars have larger fruits[K]. The leaves are used in soups[183]. The dried leaves are a tea substitute[74, 177, 183]. They are sometimes added to blended herb teas[238].

tcanta Cosmetic Dye Miscellany PreservativeThe oil from the seed is added to skin preparations and cosmetics. It is often combined with vitamin E to prevent oxidation[238]. A yellow dye is obtained from the leaves[100]. A blue or violet dye is obtained from the fruit[100]. The leaves are used for vegetable preservation[74]. No more details.

dwatta Antidiarrhoeal Antirheumatic Diaphoretic Diuretic Febrifuge Miscellany Vitamin CBlackcurrant fruits are a good source of minerals and vitamins, especially vitamin C. They have diuretic and diaphoretic actions, help to increase bodily resistance to infections and are a valuable remedy for treating colds and flu[4, 254]. The juice, especially when fresh or vacuum-sealed, helps to stem diarrhoea and calms indigestion[4, 254]. The leaves are cleansing, diaphoretic and diuretic[4, 9]. By encouraging the elimination of fluids they help to reduce blood volume and thereby lower blood pressure[254]. An infusion is used in the treatment of dropsy, rheumatic pain and whooping cough, and can also be used externally on slow-healing cuts and abscesses[9]. It can be used as a gargle for sore throats and mouth ulcers[254]. The leaves are harvested during the growing season and can be used fresh or dried[238]. It is believed that an infusion of the leaves increases the secretion of cortisol from the adrenal glands, and thus stimulates the activity of the sympathetic nervous system[254]. This action may prove useful in the treatment of stress-related conditions[254]. An infusion of the young roots is useful in the treatment of eruptive fevers[4]. A decoction of the bark has been found of use in the treatment of calculus, dropsy and haemorrhoidal tumours[4]. The seed is a source of gamma-linolenic acid, an unsaturated fatty acid which assists the production of hormone-like substances[238]. This process is commonly blocked in the body, causing disorders that affect the uterine muscles, nervous system and metabolism[238]. We have no records of the oil from this species being used medicinally, though it is used in cosmetic preparations[238, K].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. Stored seed requires 3 months cold stratification at between 0 and 5°C and should be sown as early in the year as possible[113, 164]. Under normal storage conditions the seed can remain viable for 17 years or more. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter, planting them out in late spring of the following year. Cuttings of half-ripe wood, 10 - 15cm with a heel, July/August in a frame[78, 113]. Cuttings of mature wood of the current year's growth, preferably with a heel of the previous year's growth, November to February in a cold frame or sheltered bed outdoors[78, 200].

nwatta Easily grown in a moisture retentive but well-drained loamy soil of at least moderate quality[11, 200]. Best grown on a deep sandy loam[11]. Dislikes very heavy clay, chalky soils and thin dry soils, but it can succeed on most soil types if plenty of organic matter is incorporated[1]. Plants require plenty of nitrogen if they are to do well[200]. Prefers a pH in the range 6.7 to 7 and is intolerant of acid soils[200]. Plants are quite tolerant of shade though do not fruit so well in such a position[11]. Plants fruit less freely when grown in windy sites[200]. The plant is hardy to about -20°C, though flowers are damaged at -1°C[200]. Blackcurrants are widely cultivated in temperate areas for their edible fruit, there are many named varieties[183, 200]. Most fruit is produced on

to do well in Britain[ 196 ]. Different cultivars take from 90 - 220 days from seed sowing to harvest[ 196 ]. Yields as high as 5 tonnes per hectare have been recorded in the Andes, which compares favourably with wheat in that area[ 196 ]. Young plants look remarkably like the common garden weed fat hen (*Chenopodium album*). Be careful not to weed the seedlings out in error! K J. The seed is not attacked by birds because it has a coating of bitter tasting saponins[ 141 , K J. These saponins are very easily removed by soaking the seed overnight and then thoroughly rinsing it until there is no sign of any soapiness in the water. The seed itself is very easy to harvest by hand on a small scale and is usually ripe in August. Cut down the plants when the first ripe seeds are falling easily from the flower head, lay out the stems on a sheet in a warm dry position for a few days and then simply beat the stems against a wall or some other surface, the seed will fall out easily if it is fully ripe and then merely requires winnowing to get rid of the chaff. Carbon Farming Solutions - Cultivation: hypothetical. Management: standard (Describes the non-destructive management systems that are used in cultivation) [1-1].

## 5.2.18 Rubus laciniatus

Oregon Cut-Leaf Blackberry, Cutleaf blackberry 4 tin 8 cyuc 5 kcaak 1 tcan 0 dwat 2.5 m hkcuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Rubus laciniatus is a deciduous Shrub growing to 2.5 m (8ft 2in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects, Apomictic (reproduce by seeds formed without sexual fusion). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[3, 34, 101, 257]. Large sweet and juicy with a fine flavour[11, 183]. The fruit is about 20mm in diameter[200].

tcanta DyeA purple to dull blue dye is obtained from the fruit[168].

dwatta None known

propta Seed - requires stratification and is best sown in early autumn in a cold frame. Stored seed requires one month stratification at about 3°C and is best sown as early as possible in the year. Prick out the seedlings when they are large enough to handle and grow on in a cold frame. Plant them out into their permanent positions in late spring of the following year. Cuttings of half-ripe wood, July/August in a frame[200]. Tip layering in July. Plant out in autumn. Division in early spring or just before leaf-fall in the autumn[200].

nwatta Easily grown in a good well-drained loamy soil in sun or semi-shade[1, 11, 200]. This species is a blackberry with biennial stems, it produces a number of new stems each year from the perennial rootstock, these stems fruit in their second year and then die[200]. The plant produces apomictic flowers, these produce fruit and viable seed without fertilization, each seedling is a genetic copy of the parent[200]. Sometimes cultivated for its edible fruit, it is a very vigorous and productive plant[3]. There is at least one named variety. 'Oregon Cutleaf Thornless' is high yielding with good flavoured fruits and no prickles on the stems, thus making it easier to harvest[17]. Plants in this genus are notably susceptible to honey fungus[200].

## 5.2.19 Rubus idaeus

Raspberry, American red raspberry, Grayleaf red raspberry 4 tin 8 cyuc 5 kcaak 3 tcan 3 dwat 2 m hkcuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliw hpa7tmwatli fyfxre7t hjonli

drutta Rubus idaeus is a deciduous Shrub growing to 2 m (6ft) by 1.5 m (5ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 3 and is not frost tender. It is in leaf from April to November, in flower from June to August, and the seeds ripen from July to September.

The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Fruit Root Shoots StemEdible Uses: Coffee TeaFruit - raw or cooked[2, 5, 7, 61]. Delicious when eaten out of hand, the fruit is also used in pies, preserves etc[183]. Root - cooked. The root, which should be neither too young nor too old, requires a lot of boiling[7]. Young shoots - peeled and eaten raw or cooked like asparagus[172]. They are harvested as they emerge through the ground in the spring and whilst they are still tender. A herb tea is made from the dried leaves[21, 46, 183]. Another report says that a type of tea made from raspberry and blackberry leaves is an excellent coffee substitute[7].

tcanta Cosmetic Dye PaperLandscape Uses:Erosion control, Foundation, Ground cover, Massing, Rock garden, Seashore. ts in this genus are notably susceptible to honey fungus[200]. Special Features: Not North American native, Attracts butterflies, Inconspicuous flowers or blooms. A purple to dull blue dye is obtained from the fruit[168]. A fibre obtained from the stems is used in making paper[189]. The stems are harvested in the summer after the fruit has been eaten, the leaves are removed and the stems are steamed until the fibres can be stripped. The fibres are cooked for 2 hours with lye and then hand beaten with mallets or ball milled for 3 hours. The paper is light brown in colour[189]. A decongestant face-mask made from the fruit is used cosmetically to soothe the reddened skin[7].

dwatta Antiinflammatory Astringent Birthing aid Cardiac Decongestant OxytoxicAntiemetic[13, 165]. The leaves and roots are anti-inflammatory, astringent, decongestant, ophthalmic, oxytotic and stimulant[4, 13, 165, 222, 254]. A tea made from them is used in the treatment of diarrhoea, as a tonic for the uterus to strengthen pregnant women, and as an aid in childbirth[4, 222, 257]. The tea has also been shown as effective in relieving painful menstrual cramps[222]. The active ingredients both stimulate and relax the uterus[222]. They can be used during the last three months of pregnancy and during childbirth, but should not be used earlier[238]. Externally, the leaves and roots are used as a gargle to treat tonsillitis and mouth inflammations, as a poultice and wash to treat sores, conjunctivitis, minor wounds, burns and varicose ulcers[238, 257]. The leaves are harvested in the summer and dried for later use[9]. The fruit is antiscorbutic and diuretic[7]. Fresh raspberry juice, mixed with a little honey, makes an excellent refrigerant beverage to be taken in the heat of a fever[21]. Made into a syrup, it is said to have a beneficial effect on the heart[21].

propta Seed - requires stratification and is best sown in early autumn in a cold frame. Stored seed requires one month stratification at about 3°C and is best sown as early as possible in the year. Prick out the seedlings when they are large enough to handle and grow on in a cold frame. Plant them out into their permanent positions in late spring of the following year. Cuttings of half-ripe wood, July/August in a frame[200]. Tip layering in July. Plant out in autumn. Division in early spring or just before leaf-fall in the autumn[200].

nwatta Prefers a good deep well-drained loamy soil on the acid side[1, 34]. Dislikes very heavy soils[1, 200], light soils[4] and alkaline soils[200]. Prefers an open position but tolerates some shade[1]. Plants crop less well when grown in the shade of trees though they do well in the open on a north-facing slope[200]. Requires a position sheltered from strong winds[200]. Prefers a pH between 6 and 6.5[200]. Raspberries are frequently cultivated in temperate regions of the world, both in the garden and commercially, for their edible fruit. There are many named varieties able to supply fresh fruit from mid-summer to the autumn[1, 200]. High costs of picking the fruit means that little is actually sold fresh, most of the commercially cultivated crops either being used for preserves or grown for the 'Pick Your Own' trade. All the cultivars are self-fertile[200]. This species has biennial stems, it produces a number of new stems each year from the perennial rootstock, these stems fruit in their second year and then die[200]. It is best not to grow raspberries near blackberries or potatoes[18]. PlanFor polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available.

as soon as possible in order to avoid root disturbance. Grow them on in the pots until planting out in their final positions. It is usually impossible to transplant this species without fatal damage to the root[200]. Division in spring. With great care since the plant resents root disturbance. It is virtually impossible to divide this species successfully[200].

nwatta Succeeds in an ordinary garden soil[1]. Requires a well-drained soil in a sunny position[200]. Plants are very intolerant of root disturbance, they are best planted out into their permanent positions whilst still small[200]. Some botanists have reclassified the plant and now call it *Pediomelum hypogaeum*[274]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

## 5.1.11 Hedysarum occidentale

Liquorice Root, Western sweetvetch tfo2n 4 tin 8 cyuc 4 kcaak 0 tcan 0 dwat 0.1 m hkcuc htut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Hedysarum occidentale is a PERENNIAL growing to 0.1 m (0ft 4in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Root - raw or cooked[212]. Long and sweet with a liquorice-like flavour[183]. Used in the spring it is crisp and juicy' but it becomes tough and woody as the season advances.

tcanta None known

dwatta None known

propta Seed - sow in a cold frame as soon as it is ripe or in the spring[200]. Stored seed should be pre-soaked for 24 hours in warm water. Prick out the seedlings into individual pots as soon as they are large enough to handle and plant them out into their permanent positions in the summer. Division in spring. Great care is needed since the plant dislikes root disturbance[200].

nwatta Easily grown in ordinary garden soil in a sunny position, preferring a deep well-drained sandy loam[1, 200]. Plants strongly resent root disturbance and should be placed in their permanent positions as soon as possible[1]. This species is closely related to *H. boreale*[212]. Does well in the rock garden or border[1]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

## 5.1.12 Robinia pseudoacacia

Black Locust, Yellow Locust

tfo2n 4 tin 9 cyuc 3 kcaak 4 tcan 2 dwat 25 m hkcuc htut cyutli hgatkyuctup hwicli hyishrasljutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Robinia pseudoacacia is a deciduous Tree growing to 25 m (82ft) by 15 m (49ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 3. It is in flower in June, and the seeds ripen from November to March. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It can fix Nitrogen. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. It can tolerate atmospheric pollution.

kcakta Edible Parts: Flowers Oil Seed SeedpodEdible Uses: Condiment Drink OilSeed - cooked[2, 55, 61]. Oily[161]. They are boiled and used like peas[183]. After boiling the seeds lose their acid taste[213]. The seed is about 4mm long and is produced in pods up to 10cm long

that contain 4 - 8 seeds[82]. A nutritional analysis is available[218]. Young seedpods - cooked[105]. The pods contain a sweetish pulp that is safe to eat and is relished by small children[201]. (This report is quite probably mistaken, having been confused with the honey locust, *Gleditsia spp*[K].) A strong, narcotic and intoxicating drink is made from the skin of the fruit[13]. Piperonal is extracted from the plant, it is used as a vanilla substitute[105]. No further details. All the above entries should be treated with some caution, see the notes at the top of the page regarding toxicity. Flowers - cooked. A fragrant aroma, they are used in making jams and pancakes[7, 183]. They can also be made into a pleasant drink[183].

tcanta Dye Essential Fibre Fodder Fuel Oil Soil stabilization WoodAgroforestry Uses: This species has been widely planted for shelterbelts and windbreaks, and is also used to produce woody biomass for energy production[1050 ]. It suckers freely, especially if coppiced, and can be used for stabilizing banks etc[200 , 226 ]. It is used in restoration and rehabilitation projects because its extensive root system holds and stabilizes the soil surface, it sprouts vigorously and prolifically, it increases soil fertility through nitrogen fixation, and it forms a leaf litter that protects the soil. Its main use has been in the rehabilitation of former surface mine sites and for erosion control, but it is also used to rehabilitate contaminated soils, depleted soils, gravel pits, and logged areas, and to stabilize railroad embankments and highway edges[1050 ]. The plant is often found as a pioneer on old fields, burned areas, and lands strip-mined for coal[418 ]. The leaves are rich in tannin and other substances which inhibit the growth of other plants[13 ]. The flowers are a rich source of nectar. Honey produced from this nectar is considered to be of high quality and fetches a price premium. Other Uses: A drying oil is obtained from the seed[2 , 7 ]. An essential oil is obtained from the flowers. Highly valued, it is used in perfumery[7 , 57 , 100 ]. A yellow dye is obtained from the bark[223 ]. Robinetin is a strong dyestuff yielding with different mordants different shades similar to those obtained with fisetin, quercetin, and myricetin; with aluminum mordant, it dyes cotton to a brown-orange shade[269 ]. The bark contains tannin, but not in sufficient quantity for utilization[223 ]. On a 10% moisture basis, the bark contains 7.2% tannin and the heartwood of young trees 5.7%[223 ]. The bark is used to make paper and is a substitute for silk and wool[13 ]. The wood is close-grained, exceedingly hard, heavy, very strong (due to a high lignin content), resists shock and is very durable in contact with the soil. It weighs 45lb per cubic foot. It does not shrink much when drying. The wood is used in shipbuilding and for making fence posts, tree nails, flooring, furniture, woodenware etc[4 , 7 , 11 , 13 , 46 , 61 , 82 , 149 , 171 , 227 , 418 , 1050 ]. The wood of *Robinia pseudoacacia* var. *rectissima*, the so called 'Long Island' or 'Shipmast' locust, has a greater resistance to decay and wood borers, outlasting other locust posts and stakes by 50 - 100%[269 ]. A very good fuel[82 , 418 ], but it should be used with caution because it flares up and projects sparks[226 ]. The wood is also used for making charcoal[418 ]. A dynamic accumulator gathering minerals or nutrients from the soil and storing them in a more bioavailable form - used as fertilizer or to improve mulch.

dwatta Antispasmodic Antiviral Aromatic Cancer Chologogue Diuretic Emetic Emollient Febrifuge Laxative Narcotic Purgative TonicFebrifuge[13, 46]. The flowers are antispasmodic, aromatic, diuretic, emollient and laxative[218]. They are cooked and eaten for the treatment of eye ailments[218]. The flower is said to contain the antitumor compound benzaldehyde[269]. The inner bark and the root bark are emetic, purgative and tonic[4, 7, 218, 257]. The root bark has been chewed to induce vomiting, or held in the mouth to allay toothache[222, 257], though it is rarely if ever prescribed as a therapeutic agent in Britain[4]. The fruit is narcotic[13]. This probably refers to the seedpod. The leaves are chologogue and emetic[7]. The leaf juice inhibits viruses[218].

propta Seed - pre-soak for 48 hours in warm water and sow the seed in late winter in a cold frame[80]. A short stratification improves germination rates and time[80]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in the following summer. Other reports say that the seed can be sown in an outdoor seedbed in spring[78, 98]. The seed stores for over 10 years[113]. Suckers taken during the dor-

mant season.

nwatta Agroforestry Services: Nitrogen Agroforestry Services: Windbreak Fodder: Bank Industrial Crop: Biomass Management: Coppice Management: Standard Minor Global Crop Other Systems: SRC/Landscape Uses:Erosion control, Firewood, Aggressive surface roots possible. Succeeds in any well-drained soil, preferring one that is not too rich[1, 200]. Succeeds in dry barren sites, tolerating drought and atmospheric pollution[60, 200]. Succeeds in a hot dry position. The plant is reported to tolerate an annual precipitation in the range of 61 to 191cm, an annual temperature in the range of 7.6 to 20.3°C and a pH of 6.0 to 7.0[269]. A fast-growing tree for the first 30 years of its life[188, 269], it can begin to flower when only 6 years old, though 10 - 12 years is more normal[229]. The flowers are a rich source of nectar and are very fragrant[82] with a vanilla-like scent[245]. The branches are brittle and very liable to wind damage[200]. When plants are grown in rich soils they produce coarse and rank growth which is even more liable to wind damage[11, 200]. The plants sucker freely and often form dense thickets, the suckers have vicious thorns[226]. There are some named varieties selected for their ornamental value[188], some of these are thornless[226]. Any pruning should be done in late summer in order to reduce the risk of bleeding[200]. The leaves are rich in tannin and other substances which inhibit the growth of other plants[13]. A very greedy tree, tending to impoverish the soil[13]. (Although a legume, I believe it does not fix atmospheric nitrogen[K]) A very good bee plant[7, 13, 20, 201]. This species is notably resistant to honey fungus[88, 200]. Special Features: North American native, Invasive, Naturalizing, All or parts of this plant are poisonous, Attracts butterflies, Fragrant flowers, Blooms are very showy. The plant is heat tolerant in zones 9 through 3. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. A sprouting standard sending up shoots from the base [1-2]. The root pattern is flat with shallow roots forming a plate near the soil surface [1-2]. The root pattern is suckering with new plants from underground runners away from the plant [1-2].

### 5.1.13 Lespedeza bicolor

Lespedeza, Shrub lespedeza

tfo2n 4 tlin 8 cyuc 3 kcaak 4 tcan 0 dwat 3 m hkuc hmimhtut cyutli kyuctup hwicli hrasjlut hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta Lespedeza bicolor is a deciduous Shrub growing to 3 m (9ft 10in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from August to September, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Flowers Leaves Oil Seed StemEdible Uses: Oil TeaYoung leaves and stems - cooked[105, 177, 179, 183]. Flowers - cooked[177, 183]. Seed - cooked[105, 177, 179]. Occasionally boiled and eaten with rice[183]. The leaves are used as a tea substitute[177, 183, 266].

tcanta Basketry Fodder Oil Shelterbelt Soil stabilization-The seed oil is used as a lubricant[266]. The branchlets are used for making baskets[266]. Because this species tolerates arid soils, it is grown as a windbreak, and for sand stabilization, and soil conservation[266].

dwatta None known

propta Pre-soak the seed for 24 hours in warm water and then sow it in spring in a greenhouse. When they are

large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in individual pots in a frame. It can be difficult to get the cuttings through their first winter, it is best to plunge the pots in a bed of ashes in a sheltered border outdoors[78].

nwatta Agroforestry Services: Nitrogen Fodder: Bank Industrial Crop: Biomass Management: Coppice Management: Fodder Minor Global CropEasily grown in a well-drained light loam in full sun[1, 182]. Succeeds in light shade and in dry soils[266]. The top growth is not very cold tolerant, although the rootstock is hardy to about -25°C. Plants are usually cut back to the ground in all but very mild winters, though they generally resprout well from the base in the following spring and flower in late summer[182]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. The plant is heat tolerant in zones 8 through 5. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is multistemmed with multiple stems from the crown [1-2].

### 5.1.14 Vicia sativa

Winter Tares, Garden vetch, Subterranean vetch

tfo2n 4 tlin 8 cyuc 3 kcaak 3 tcan 0 dwat 1.2 m hkuc hmimhtut cyutli tucp hwicli hrasjlutnyik hpa7tli flatprikwis hpa7tmwatli fyfxre7t hjonli

drutta Vicia sativa is a ANNUAL CLIMBER growing to 1.2 m (4ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from May to September, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). The plant is self-fertile. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves SeedEdible Uses: TeaSeed - cooked[22, 74]. Not very palatable nor very digestible but it is very nutritious[2, 115]. The seed can be dried, ground into a powder and mixed with cereal flour to make bread, biscuits, cakes etc[183]. The beans compliment the protein in the cereal making it more complete[K]. Some caution is advised, see the notes above on toxicity. Leaves, young shoots and young pods - cooked[105, 177, 183]. The leaves are a tea substitute[183].

tcanta Green manureA very valuable green manure crop, it can be sown in spring or as late as October. A deep rooted and fast growing plant, it is winter hardy, an effective weed suppresser, produces a good bulk and fixes a large amount of nitrogen[87]. Dynamic accumulator.

dwatta None known

propta Pre-soak the seed for 24 hours in warm water and sow in situ from late winter to early summer and again in the autumn.

nwatta Succeeds in any well-drained soil in a sunny position if the soil is reliably moist throughout the growing season, otherwise it is best grown in semi-shade[200]. The subspecies V. sativa leucosperma. Ser. is the form usually grown for food[74]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other

238]. It is taken internally in the treatment of diarrhoea, fevers, vomiting, coughs with thick dark phlegm, lung abscesses, urinary tract infections and food poisoning (especially from sea foods)[238, 257]. Externally, it is mixed with gypsum and used to treat halitosis and toothache[238]. The root is harvested in the autumn and juiced or dried for use in decoctions[238].

propta Seed - surface sow in spring in a light position. Keep the soil moist by emmersing the pot in 3cm of water. Germination usually takes place quite quickly. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in the summer. Division in spring. Very simple, any part of the root that has a growth bud will grow into a new plant. Larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Fodder: Bank Industrial Crop: Biomass Minor Global CropA very easily grown plant that thrives in deep moisture retentive soils such as marshes and swamps, whilst it also grows well along the sides of streams, lakes and ponds, in shallow water, ditches and wet wastelands[162, 200, 269]. Plants are tolerant of moderately saline water[169, 269]. The plant is reported to tolerate an annual precipitation in the range of 31 to 241cm, an annual temperature in the range of 6.6 to 26.6°C and a pH of 4.8 to 8.2[269]. Plants are hardy to about -20°C[200]. This species is very fast growing with a very vigorous and invasive running rootstock that can be 10 metres or more long, it can form very large stands in wetlands[200, 238, 260]. Difficult to eradicate once established, it is unsuitable for planting into small spaces[200, 238, 269]. The flowering heads are often used in dried flower arrangements[238]. There are some named forms, selected for their ornamental value[238].

### 5.2.16 Amelanchier confusa

4 tlin 8 cyuc 5 kcaak 0 tcan 0 dwat 3 m hkuc hmimhtut cyutli tucp hwicli hrasjlutnyikfrip hpa7tli flatprik hpa7tmwatli fyfxre7t hjonli

drutta Amelanchier confusa is a deciduous Shrub growing to 3 m (9ft) by 3 m (9ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in May, and the seeds ripen from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: We have no records for this species, but the fruit is almost certainly edible both raw and cooked[K]. It is 7 - 9mm in diameter[200]. The fruit is rich in iron and copper[226].

tcanta None known

dwatta None known

propta Seed - it is best harvested 'green', when the seed is fully formed but before the seed coat has hardened, and then sown immediately in pots outdoors or in a cold frame. If stored seed is obtained early enough in the autumn, it can be given 4 weeks warm stratification before being left out in the winter and it should then germinate in the spring. Otherwise seed can be very slow to germinate, perhaps taking 18 months or more. When large enough to handle, prick the seedlings out into individual pots and grow them on in a sheltered outdoor position, planting them out once they are 20cm or more tall. If there is sufficient seed it is best to sow it thinly in an outdoor seedbed[78, 80]. Grow the seedlings on for two years in the seedbed before planting them out into their permanent positions during the winter. Layering in spring - takes 18 months[78]. Division of suckers in late winter. The suckers need to have been growing for 2 years before you dig them up, otherwise they will not have formed roots. They can be planted out straight into their permanent positions if required.

nwatta Prefers a rich loamy soil in a sunny position or semi-shade[1, 200] but thrives in any soil that is not too dry or water-logged[11]. Grows well in heavy clay soils. Prefers an acid or neutral soil. All members of this genus have edible fruits and, whilst this is dry and uninteresting in some

species, in many others it is sweet and juicy. Many of the species have potential for use in the garden as edible ornamentals. The main draw-back to this genus is that birds adore the fruit and will often completely strip a tree before it is fully ripe[K]. A suckering plant, the suckers are formed very close to the original stem so the plant forms a gradually expanding clump[K]. Plants growing at Hilliers Arboretum in Hampshire were 4 metres tall in early April 1999, they were suckering quite freely in a tight clump and flowering very freely[K]. This species is closely related to *A. laevis*[11]. Hybridizes freely with other members of this genus[200]. Grafting onto seedlings of *A. lamarckii* or *Sorbus aucuparia* is sometimes practised in order to avoid the potential problem of hybridizing[1].

### 5.2.17 Chenopodium spp.

Perennial quinoa

4 tlin 10 cyuc 5 kcaak 2 tcan 3 dwat 2 m hkuc htut cyutli hgtakytucup hwicli hysrasjlutnyik hpa7tli frusflatprikwiissliphsom hpa7tmwatli hjonli

drutta Chenopodium spp. is a PERENNIAL growing to 2 m (6ft) by 0.3 m (1ft in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid, very alkaline and saline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: Leaves SeedEdible Uses: Edible portion: Leaves, Seeds, Vegetable. Seed - cooked[ 1 , 2 , 4 , 27 , 57 , 97 ]. A pleasant mild flavour, the seed can absorb the flavour of other foods that are cooked with it and so it can be used in a wide variety of ways[ K ]. The protein is good quality because of its amino acid balance. It has 2-6% more protein and better amino acid balance than wheat. It should be thoroughly soaked and rinsed to remove a coating of saponins on the seed surface. The seed can be used in all the ways that rice is used, as a savoury or sweet dish. It can also be ground into a powder and used as a porridge[ 37 , 183 ]. The seed can also be sprouted and used in salads[ 183 ] though many people find the sprouted seed unpleasant[ K ]. The seed contains a very high quality protein that is rich in the amino acids lysine, methionine and cystine, it has the same biological value as milk[ 196 ]. The seed contains about 38% carbohydrate, 19% protein, 5% fat, 5% sugar[ 171 ]. Leaves - raw or cooked[ 2 , 4 , 37 , 57 ]. The young leaves are cooked like spinach[ 183 ]. It is best not to eat large quantities of the raw leaves, see the notes above on toxicity.

tcanta Gold/green dyes can be obtained from the whole plant[ 168 ]. Saponins on the seed can be used as a bird and insect deterrent by spraying them on growing plants[ 141 ]. The saponins are obtained by saving the soak-water used when preparing the seed for eating. The spray remains effective for a few weeks or until washed off by rain[ K ].

dwatta Some medical properties. See individual plants for example: Chenopodium album, Chenopodium ambrosioides, Chenopodium ambrosioides anthelminticum

propta Seed - sow April in situ. The seed can either be sown broadcast or in rows about 25cm apart, thinning the plants to about every 10cm. Germination is rapid, even in fairly dry conditions. Be careful not to weed out the seedlings because they look very similar to some common garden weeds[ K ].

nwatta Hypothetical Crop Management: StandardClimate: cold temperate to subtropical, tropical highlands. Humidity: humid. A cultivated food crop. A plant of higher elevations in the tropics, it has also been successfully grown in the temperate and subtropical zones. Plants tolerate light frosts at any stage in their development except when flowering[ 57 , 196 ]. An easily grown plant, it requires a rich moist well-drained soil and a warm position if it is to do really well, but it also succeeds in less than optimum conditions[ 27 , 37 ]. Tolerates a pH range from 6 to 8.5 and moderate soil salinity[ 196 ]. Plants are quite wind resistant[ K ]. Plants are drought tolerant once they are established[ 196 ]. The plant is day-length sensitive and many varieties fail to flower properly away from equatorial regions, however those varieties coming from the south of its range in Chile are more likely

are large enough to handle and grow on in a greenhouse for their first year. Plant out in late spring as the plant comes into new growth. Basal stem cuttings in the summer[37]. Division in the dormant season, never when in growth[1]. The plant will often produce a number of shoots, the top 5 - 10 cm of the root below each shoot can be potted up to form a new plant whilst the lower part of the root can be eaten[K]. Tubercles (baby tubers) are formed in the leaf axils. These are harvested in late summer and early autumn when about the size of a pea and coming away easily from the plant. They should be potted up immediately in individual pots in an unheated greenhouse or cold frame, covering them with about 10mm of soil. Protect them from mice etc and keep the soil moist but not wet. They should come into growth in the spring, plant them out in early summer when in active growth[K].

**nwatta** Management: Standard Minor Global Crop Staple Crop: Basic StarchAn easily grown plant, succeeding in a fertile well-drained soil in a sunny position or light shade[27, 37, 200], though it is best in full sun[160]. Plants are hardy to at least -18°C[160]. This species of yam is much cultivated in China for its edible root which can be up to 1 metre long[1]. It has a great potential to be a commercial crop in Britain, though a satisfactory method of harvesting the root needs to be found[K]. Plants take 3 - 4 years to reach full maturity[160], though one year roots of well grown plants can weigh more than 500g. There are many cultivated forms with different root shapes in China and Japan[174]. The yam is a climbing plant that supports itself by twining around the branches of other plants[219]. It can be grown successfully into small bushes or, perhaps simpler when being grown as a root crop, it can be grown up a frame in a similar manner to growing runner beans[K]. Plants produce tubercles (small tubers that are formed in the leaf axils of the stems), and can be propagated by these means[K]. The small white flowers have a pleasant scent of cinnamon[219]. There is some confusion over the correct name for this species. One report says that *D. batatas* is an invalid name that is often erroneously applied to two distinct species *D. opposita* and *D. japonica*[218]. The Flora of China accepts *D. batatas* as a synonym for *D. polystachya*[266]. Dioecious. Male and female plants must be grown if seed is required. Carbon Farming - Cultivation: regional crop. Management: standard. The plant is heat tolerant in zones 10 through 6. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. Growth habit is a single or multiple shooting vine from a crown [1-2]. Herbaceous. The root pattern is a tap root similar to a carrot going directly down [1-2].

## 5.2.15 Phragmites australis

Common Reed, American common reed, Hybrid common reed, European common reed, Subtropical common re 4 tin 10 cyuc 5 kcaak 4 tcan 2 dwat 3.6 m hkuc hmimhtut cyutli tcuphja7nhs6s hwicli hrasjnutnyik hpa7tli flatprikwlwissiphsmo hpa7tmwatli xre7t hjonli

drutta Phragmites australis is a PERENNIAL growing to 3.6 m (11ft) by 3 m (9ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from July to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline and saline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can grow in water. The plant can tolerate maritime exposure.

**kcakta** Edible Parts: Leaves Root Seed Shoots StemEdible Uses: Condiment Drink SweetenerRoot - raw or cooked

like potatoes[2, 13, 74, 102, 106, 183]. It contains up to 5% sugar. The flavour and texture are best when the root is young and still growing[144]. It can be dried, ground coarsely and used as a porridge[12, 46, 62]. In Russia they are harvested and processed into starch[269]. Young shoots - raw or cooked[61, 62, 102, 179]. They are best if used before the leaves form, when they are really delicious[144]. They can be used like bamboo shoots[183]. The partly unfolded leaves can be used as a potherb and the Japanese dry young leaves, grind them into a powder and mix them with cereal flour when making dumplings[183]. The stems are reported to contain 4.8 g protein, 0.8 g fat, 90.0 g total carbohydrate, 41.2 g fiber, and 4.4 g ash[269]. Seed - raw or cooked[257]. It can be ground into a powder and used as a flour[57, 62, 102, 106]. The seed is rather small and difficult to remove from the husk but it is said to be very nutritious[183]. A sugar is extracted from the stalks or wounded stems[2, 5, 62, 95]. A sweet liquorice-like taste[95], it can be eaten raw or cooked[62]. The stems can be boiled in water and then the water boiled off in order to obtain the sugar[178]. A sugary gum that exudes from the stems can be rolled into balls and eaten as sweets[183]. A powder extracted from the dried stems can be moistened and roasted like marshmallow[62, 95, 102, 183].

tcanta Alcohol Basketry Biomass Broom Cork Dye Fencing Fertilizer Fibre Fodder Fuel Furniture Green manure Insulation Miscellany Paper Pencil Soil stabilization String Teeth Thatching WeavingThe common reed can provide a large quantity of biomass and this is used in a wide variety of ways as listed below. Annual yields of 40 - 63 tonnes per hectare have been reported[269]. The plant is also converted into alcohol (for use as a fuel), is burnt as a fuel and is made into fertilizer[238]. The plant is rich in pentosans and may be used for the production of furfural - the nodes and sheaths yield 6.6% whilst the underground parts over 13% of furfural[269]. The pentosan content increases throughout the growing period and is maximum in the mature reed[269]. The reed can be used also for the preparation of absolute alcohol, feed yeast and lactic acid[269]. The stems are useful in the production of homogeneous boards[269]. They can also be processed into a fine fibrous material suitable as a filler in upholstery[269]. The stems have many uses. They are used for thatching roofs[1, 46, 74, 106]. It can last for 100 years[169]. The stems and leaves are also used for building dwellings, lattices, fences, arrows by Indians, and for weaving mats, carrying nets, basket making, insulation, fuel, as a cork substitute etc[13, 74, 99, 102, 115, 257, 269]. The stem contains over 50 percent cellulose and is useful in the manufacture of pulps for rayon and paper[269]. The fibre from the leaves and stems is used for making paper[189]. The fibre is 0.8 - 3.0 mm long and 5.0 - 30.5µm in diameter. The stems and leaves are harvested in the summer, cut into usable pieces and soaked for 24 hours in clear water. They are then cooked for 2 hours with lye and beaten in a blender. The fibre makes a khaki paper[189]. A fibre obtained from the plant is used for making string[95, 106]. The flowering stalks yield a fibre suitable for rope making[269]. The leaves are used in basket making and for weaving mats etc[169, 238]. A light green dye is obtained from the flowers[6, 115]. Freshly cut shoots are a good green manure[74] (Does this man as a soil mulch?[K]). The inflorescences are used as brooms[74]. The plant can be used as a cork substitute[74]. No further details. The plant is mixed with mud to make a plaster for walls[145]. Pens for writing on parchment were cut and fashioned from the thin stems of this reed[269], whilst the stems were also used as a linear measuring device[269]. The plant has a very vigorous and running rootstock, it is useful for binding the soil along the sides of streams etc[115]. It is planted for flood control since it stabilizes the banks and gradually builds up soil depth, thus raising the level of the bank.

dwatta Antiasthmatic Antidiarrhoeal Antidote Antiemetic Antipyretic Antitussive Cholera Depurative Diuretic Febrifuge Fibrifuge Lithotropic Miscellany Odontalgic Refrigerant Sedative Sialogogue Skin Stomachic Stypitic UrinaryThe leaves are used in the treatment of bronchitis and cholera, the ash of the leaves is applied to foul sores[218]. A decoction of the flowers is used in the treatment of cholera and food poisoning[218]. The ashes are stypitic[218]. The stem is antidote, antiemetic, antipyretic and refrigerant[218]. The root is antiasthmatic, antiemetic, antipyretic, antitussive, depurative, diuretic, febrifuge, lithotropic, sedative, sialogogue and stomachic[147, 176, 218,

plants growing nearby[200].

## 5.1.15 Comptonia peregrina asplenifolia

Sweet Fern tfo2n 4 tin 8 cyuc 3 kcaak 3 tcan 3 dwat 1.2 m hkuc hmimhtut cyutli hgatkyuctcup hwicli hyhshrasjlut hpa7tli frusflat hpa7tmwatli hjonli

drutta Comptonia peregrina asplenifolia is a deciduous Shrub growing to 1.2 m (4ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from March to April. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

**kcakta** Edible Parts: FruitEdible Uses: Condiment TeaThe young fruits are eaten as a pleasant nibble[55, 62, 183]. The aromatic leaves, fresh or dried, are used to make a palatable tea[55, 62, 102, 183]. The leaves are also used as a seasoning[183].

tcanta Incense Lining Parasiticide RepellentThe leaves are used as a lining in baskets etc in order to preserve the fruit[55]. The crushed leaves repel insects[102]. They can be thrown onto a camp fire to keep mosquitoes away[257]. The dried leaves have been burnt as an incense[257].

dwatta Astringent Blood purifier Expectorant Febrifuge Odontalgic Parasiticide Poultice TonicSweet fern was employed medicinally by several native North American Indian tribes who used it especially as a poultice to treat a variety of complaints[257]. It is still used for most of the same purposes in modern herbalism. The leaves are astringent, blood purifier, expectorant and tonic[21, 62, 222, 257]. A tea made from the leaves and flowering tops is used as a remedy for diarrhoea, headache, fevers, catarrh, vomiting of blood, rheumatism etc[213, 222, 257]. The infusion has also been used to treat ringworm[257]. The leaves have also been used as a poultice for toothaches, sprains etc[238, 257]. A cold water infusion of the leaves has been used externally to counter the effect of poison ivy[213, 222, 257] and to bathe stings, minor haemorrhages etc[238]. The leaves are harvested in early summer and dried for later use[238].

propta Seed - it has a very tough seed coat and also contains germination inhibitors and so is very difficult to germinate[113]. It is probably best to harvest the seed 'green' (after the seed has fully developed but before it dries on the plant) and sow immediately in a cold frame. If the seed has been stored then soaking in hot water for 24 hours will leach out some of the inhibitors and also help to soften the seed coat. Scarification will also help as will a period of cold stratification. Prick out the seedlings into individual pots as soon as they are large enough to handle. Grow them on in a greenhouse or cold frame for their first winter and plant them out into their permanent positions in late spring or early summer[K]. Root cuttings, 4cm long December in a frame[78, 113]. Plant the root horizontally. High percentage[78]. Suckers removed in the dormant season and potted up or planted into their permanent positions[200]. Plants can be difficult to move successfully[238]. Layering in spring[238].

nwatta Requires a peaty or light loam lime-free soil[11, 182, 200]. Requires an acid well-drained soil of low to medium fertility in partial shade but tolerates full sun if the soil does not dry out in the summer[200]. Tolerates dry sandy soils when grown in the shade[200]. A very ornamental plant[1], it is hardy to at least -25°C[184, 200]. This form is probably no more than a phenotypic variant of the species that is found growing in harsh conditions[200]. The crushed leaves are very aromatic[182], their scent is most noticeable in the early morning and the evening[238]. The scent increases when the leaves are dried[245]. This species is somewhat intolerant of root disturbance and should be planted out into its permanent position whilst small[238]. Suckering freely[184], this plant is well suited to clothing banks on soils of low fertility[200]. It has a symbiotic relationship with certain soil micro-organisms, these form nodules on the roots

of the plants and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

## 5.1.16 Vicia sativa leucosperma

Winter Tares tfo2n 4 tin 8 cyuc 3 kcaak 3 tcan 0 dwat 1.2 m hkuc hmimhtut cyutli tcup hwicli hrasjnutnyik hpa7tli flatprikwlwis hpa7tmwatli fyifxre7t hjonli

drutta Vicia sativa leucosperma is a ANNUAL CLIMBER growing to 1.2 m (4ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from May to September, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). The plant is self-fertile. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**kcakta** Edible Parts: Leaves SeedEdible Uses: TeaSeed - cooked[22, 74]. Not very palatable nor very digestible but it is very nutritious[2, 115]. The seed can be dried, ground into a powder and mixed with cereal flour to make bread, biscuits, cakes etc[183]. The beans compliment the protein in the cereal making it more complete[K]. Some caution is advised, see the notes above on toxicity. Leaves, young shoots and young pods - cooked[105, 177, 183]. The leaves are a tea substitute[183].

tcanta Green manureA very valuable green manure crop, it can be sown in spring or as late as October. A deep rooted and fast growing plant, it is winter hardy, an effective weed suppresser, produces a good bulk and fixes a large amount of nitrogen[87].

dwatta None known propta Pre-soak the seed for 24 hours in warm water and sow in situ from late winter to early summer and again in the autumn.

nwatta Succeeds in any well-drained soil in a sunny position if the soil is reliably moist throughout the growing season, otherwise it is best grown in semi-shade[200]. This subspecies is the form usually grown for food[74]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

## 5.1.17 Ceanothus americanus

New Jersey Tea, Wild Snowball tfo2n 4 tin 9 cyuc 3 kcaak 3 tcan 3 dwat 1.2 m hkuc hmimhtut cyutli kyuctcup hwicli hyhshrasjlut hpa7tli flatprikwlwis hpa7tmwatli xre7t hjonli

drutta Ceanothus americanus is a deciduous Shrub growing to 1.2 m (4ft) by 1 m (3ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from June to August, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs). It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

**kcakta** Edible Parts: Edible Uses: TeaA refreshing and stimulating tea is made from the dried leaves, it is a good substitute for china tea though it does not contain caffeine[2, 21, 43, 46, 95, 159, 161, 183]. The leaves are gathered when the plant is in full bloom and are dried in the shade[183].

tcanta Dye SoapA green dye is obtained from the flowers[168]. A cinnamon-coloured dye is obtained from the whole plant[4]. A red dye is obtained from the root[95, 159]. The flowers are rich in saponins, when crushed and mixed with water they produce an excellent lather which is an effective and gentle soap[168, 169]. They can be used as a body wash (simply rub the wet blossoms over the body) or to clean clothes[K]. The flowers were much used by the North American Indians as a body wash, especially by the women

in preparation for marriage, and they leave the skin smelling fragrantly of the flowers[K].

dwatta Antispasmodic Astringent Dysentery Expecto- rant Haemostatic Hypotensive Sedative VDThe roots and root bark of New Jersey tea was used extensively by the North American Indians to treat fevers and problems of the mucous membranes such as catarrh and sore throats[254]. Current day usage of the roots concentrates on their astringent, expectorant and antispasmodic actions and they are employed in the treatment of complaints such as asthma, bronchitis and coughs[254]. The roots and root-bark are antispasmodic, antispasmodic, strongly astringent (they contain 8% tannin), expectorant, haemostatic and sedative[21, 222]. They have a stimulatory effect on the lymphatic system[238], whilst an alkaloid in the roots is mildly hypoten- sive[222]. The plant is used internally in the treatment of bronchial complaints including asthma and whooping cough, dysentery, sore throats, tonsillitis, haemorrhoids etc[4, 222, 238]. A decoction of the bark is used as a skin wash for cancer and venereal sores[213]. The powdered bark has been used to dust the sores[213]. The roots are unearthed and partially harvested in the autumn or spring when their red colour is at its deepest. They are dried for later use[238].

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed should be pre-soaked for 12 hours in warm water and then given 1 - 3 months stratification at 1°C[138, 200]. Germination usually takes place in 1 - 2 months at 20°C[138]. One report says that the seed is best given boiling water treatment, or heated in 4 times its volume of sand at 90 - 120°C for 4 - 5 minutes and then soaked in warm water for 12 hours before sowing it[214]. The seed exhibits considerable longevity, when stored for 15 years in an air-tight dry container at 1 - 5°C it has shown little deterioration in viability[214]. The seed is ejected from its capsule with some force when fully ripe, timing the collection of seed can be difficult because unless collected just prior to dehiscence the seed is difficult to extract and rarely germinates satisfactorily[214]. Prick out the seedlings into individual pots as soon as they are large enough to handle. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in late spring or early summer. Cuttings of half-ripe wood, taken at a node[200], July/August in a frame[11]. Cuttings of mature wood of the current year's growth, 7 - 12 cm with a heel, October in a cold frame[78]. The roots are quite brittle and it is best to pot up the callused cuttings in spring, just before the roots break[78]. Good percentage.

nwatta Landscape Uses:Border, Erosion control, Ground cover, Hedge, Massing, Rock garden. Prefers a warm sunny position but tolerates light shade[11, 200]. Tolerates some lime, but will not succeed on shallow chalk[200]. Another report says that it dislikes alkaline soils, though succeeds in poor dry conditions[238]. Plants dislike root disturbance, they should be planted out into their permanent positions whilst still small[182]. Dislikes heavy pruning, it is best not to cut out any wood thicker than a pencil[182]. Any pruning is best carried out in the spring[219]. Fast growing, it flowers well when young, often in its second year from seed[11]. Hybridizes freely with other members of this genus[200]. Some members of this genus have a symbiotic relationship with certain soil micro-organisms, these form nodules on the roots of the plants and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200, 212]. Special Features:North American native, Naturalizing, Attracts butterflies, Attractive flowers or blooms. The plant is heat tolerant in zones 8 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (120 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is multistemmed with multiple stems from the crown [1-2]. The root pattern is flat with shallow roots forming a plate near the soil surface [1-2].

## 5.1.18 Vicia faba equina

Horsebean

tfo2n 4 tlin 8 cyuc 3 kcaak 3 tcan 0 dwat 1 m hkuc hmimhntu cyutli tcup hwicli hrasljutnykrip hpa7tli flatprik- wis hpa7tmwatli fyfjxre7t hjonli

drutta Vicia faba equina is a ANNUAL growing to 1 m (3ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from May to August, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kckahta Edible Parts: Leaves SeedEdible Uses: Seed - raw or cooked[27, 61]. It can be eaten before it is fully ripe in the same way as broad beans, the fully ripe seed requires overnight soaking to soften it before it is cooked. Leaves - cooked[105]. Used like spinach.

tcanta Fibre Green manure Soap makingA good green manure crop, sown in autumn or spring. Relatively fast growing, producing a good bulk and fixing nitrogen[87]. The upright growth is not a very good weed suppresser though. A fibre is obtained from the stems. The burnt stems are rich in potassium and can be used in making soap.

dwatta None known

propta Pre-soak the seed for 24 hours in warm water and then sow in situ in spring or autumn.

nwatta Prefers a fairly heavy loam but succeeds in a sunny position in most soils that are well-drained[1]. Grows well in heavy clay soils. Dislikes dry conditions[57]. Sometimes cultivated for its edible seed, more commonly as a green manure crop[87]. There are 2 main types, 'daffa' beans are the more hardy and can be sown in the autumn, whilst 'tic' beans are best sown in spring. The autumn sown varieties are more susceptible to 'chocolate spot' fungus (which can be remedied by the addition of potash to the soil) but are more likely to escape damage from aphids[87]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. When removing plant remains at the end of the growing season, it is best to only remove the aerial parts of the plant, leaving the roots in the ground to decay and release their nitrogen.

## 5.1.19 Lupinus perennis

Sundial Lupine

tfo2n 4 tlin 8 cyuc 3 kcaak 3 tcan 1 dwat 0.6 m hkuc htut cyutli kyuctup hwicli hyishrasljut hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Lupinus perennis is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers dry or moist soil.

kckahta Edible Parts: Seed SeedpodEdible Uses: Seed - cooked[105]. Used as a protein-rich vegetable or savoury dish in any of the ways that cooked beans are used, they can also be roasted or ground into a powder. The seed has a bitter flavour due to the presence of toxic alkaloids, it should be thoroughly leached before being cooked[2, 105]. Seedpods - cooked[105].

tcanta Nitrogen fixer. A dynamic accumulator gathering minerals or nutrients from the soil and storing them in a more bioavailable form - used as fertilizer or to improve mulch.

dwatta Antiemetic HaemostaticA cold tea made from the leaves has been used to treat nausea and internal haemorrhages[222, 257].

permanent positions during the winter. Layering in spring - takes 18 months[78]. Division of suckers in late winter. The suckers need to have been growing for 2 years before you dig them up, otherwise they will not have formed roots. They can be planted out straight into their permanent positions if required.

nwatta Prefers a rich loamy soil in a sunny position or semi-shade[1, 200] but thrives in any soil that is not too dry or water-logged[11]. Plants are fairly lime tolerant[200], they also grow well in heavy clay soils. Hardy to about -20°C according to one report[184], whilst another suggests that this species is hardy to about -50°C[11]. All members of this genus have edible fruits and, whilst this is dry and uninteresting in some species, in many others it is sweet and juicy. Many of the species have potential for use in the garden as edible ornamentals. This species is particularly interesting because it is quite compact and produces an excellent quality quite large fruit[K]. The main draw-back to this genus is that birds adore the fruit and will often completely strip a tree before it is fully ripe[K]. A very variable species, ranging from a thicket-forming shrub to a small tree in the wild[229]. It is occasionally cultivated for its edible fruit, there are several named varieties[183]. A stoloniferous species, spreading by suckers to form a thicket[11]. Hybridizes freely with other members of this genus[200]. Grafting onto seedlings of *A. lamarckii* or *Sorbus aucuparia* is sometimes practised in order to avoid the potential problem of hybridizing[1]. Special Features:North American native, Blooms are very showy. The plant is heat tolerant in zones 8 through 3. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (120 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is multistemmed with multiple stems from the crown [1-2]. The root pattern is stoloniferous rooting from creeping stems above the ground [1-2].

## 5.2.13 Rubus phoenicolasius

Japanese Wineberry, Wine raspberry

4 tlin 8 cyuc 5 kcaak 1 tcan 0 dwat 3 m hkuc hmimhntu cyutli tcup hwicli hrasljutnyk hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

drutta Rubus phoenicolasius is a deciduous Shrub growing to 3 m (9ft) by 1 m (3ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to July, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by In- sects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kckahta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[1, 2, 3, 34]. Sweet and juicy[11]. A raspberry-type fruit, it is smaller than a raspberry, contains rather a lot of seeds and is not quite such a flavourful fruit, but it makes very nice eating all the same[K]. After flowering, the fruit is enclosed in its calyx until just before it is ripe, this prevents maggots etc getting into the fruit[K]. The fruit is about 20mm in diameter[200].

tcanta DyeA purple to dull blue dye is obtained from the fruit[168].

dwatta None known

propta Seed - requires stratification, is best sown in early autumn in a cold frame. Sow stored seed as early as possible in the year in a cold frame and stratify for a month at 3°C if sowing later than February. Prick out the seedlings when they are large enough to handle and grow on in a cold frame. Plant them out into their permanent positions in late spring of the following year. Tip layering in July. Plant out in autumn. Division in early spring.

nwatta Easily grown in a good well-drained loamy soil in sun or semi-shade[1, 11, 200], preferring light shade[202]. Plants are not too happy when grown in windy situations[K]. Hardy to about -18°C[202]. Some damage may be caused at this temperature but plants usually recover well[202]. A very ornamental plant, its red stems adding colour to the winter garden[1], it is sometimes cultivated for its edible fruit[1, 61]. There is at least one named variety, 'Bella di Tokyo' has small tasty red fruits[183]. This species is a raspberry with biennial stems, it produces a number of new stems each year from the perennial rootstock, these stems fruit in their second year and then die[200]. Plants in this genus are notably susceptible to honey fungus[200]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out. The root pattern is suckering with new plants from underground runners away from the plant [2-1].

## 5.2.14 Dioscorea batatas

Chinese Yam

4 tlin 11 cyuc 5 kcaak 3 tcan 5 dwat 3 m hkuc hmimhntu cyutli tcup hwicli hrasljutnyk hpa7tli flatprikkwis hpa7tmwatli nyanhjen hjonli

drutta Dioscorea batatas is a PERENNIAL growing to 3 m (9ft) by 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from September to October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kckahta Edible Parts: Fruit RootEdible Uses: Tuber - cooked[1, 46, 61, 105]. A floury texture[27] with a very pleasant flavour that is rather like a potato[K]. The tubers can be boiled, baked, fried, mashed, grated and added to soups[183]. They store well and for a long time[27, 37] and can also be left in the ground and harvested as required in the winter[K]. This is a top quality root crop, very suitable for use as a staple food[K]. An arrowroot can be extracted from the root[46], though this is not as good at binding other foods as the starch from *D. japonica*[183]. The root contains about 20% starch. 75% water, 0.1% vitamin B1, 10 - 15 mg% vitamin C[174]. Fruit. A starchy flavour, it is said to be very good for the health[206]. We wonder if this report is referring to the tubercles[K]. We've heard the aerial tubers can be eaten and are very tasty. Carbon Farming - Staple Crop: basic starch.

tcanta MiscellanyNone known

dwatta Anthelmintic Antidote Contraceptive Digestive Miscellany Vitamin CThe Chinese yam, called Shan Yao in Chinese herbalism, is a sweet soothing herb that stimulates the stomach and spleen and has a tonic effect on the lungs and kidneys[238]. The tuber contains allantoin, a cell-proliferant that speeds the healing process[238]. The root is an ingredient of "The herb of eight ingredients", traditionally prescribed in Chinese herbalism to treat hyperthyroidism, nephritis and diabetes[254]. The tuber is anthelmintic, digestive and gently tonic[116, 147, 218, 254]. It is used internally in the treatment of tiredness, weight loss, poor appetite, poor digestion, chronic diarrhoea, asthma, dry coughs, frequent or uncontrollable urination, diabetes and emotional instability[238]. It is applied externally to ulcers, boils and abscesses[218, 238]. The tubers are harvested in the autumn and can be used raw or baked[238]. The leaf juice is used to treat snakebites and scorpion stings[218]. The roots of most, if not all, members of this genus, contains diosgenin[222, 240]. This is widely used in modern medicine in order to manufacture progesterone and other steroid drugs. These are used as contraceptives and in the treatment of various disorders of the genitary organs as well as in a host of other diseases such as asthma and arthritis[222].

propta Seed - sow March to April in a sunny position in a warm greenhouse and only just cover. It germinates in 1 - 3 weeks at 20°C[175]. Prick out the seedlings as soon as they

map is based on the number of “heat days” experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. A clumping plant, forming a colony from shoots away from the crown but with a limited spread [1-2]. The root pattern is suckering with new plants from underground runners away from the plant [1-2].

## 5.2.11 Pyrus communis sativa

Pear  
4 tin 8 cyuc 5 kcaak 3 tcan 0 dwat 5 m hkuc  
hmmihtut cyulit hgattcup hwicli hrasjlutnykfrip hpa7tli flatprklwis hpa7tmwatli dyatxre7t hjonli

drutta Pyrus communis sativa is a deciduous Tree growing to 5 m (16ft 5in). See above for USDA Hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil and can tolerate drought. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. The flavour ranges from rather harsh and astringent (cultivars used for making alcoholic drinks) through to soft, sweet and very juicy. The best dessert fruits have an exquisite sweet flavour, usually with a very soft flesh, whilst cooking varieties have harder less sweet flesh[K].

tcanta Dye WoodA yellow-tan dye is obtained from the leaves[106, 115]. Wood - heavy, tough, durable, fine grained, hard. Used by cabinet and instrument makers[11, 61, 100, 149]. When covered with black varnish it is an excellent ebony substitute[74].

dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe in the autumn, it will then usually germinate in mid to late winter. Stored seed requires 8 - 10 weeks cold stratification at 1°C and should be sown as early in the year as possible[200]. Temperatures over 15 - 20°C induce a secondary dormancy in the seed[200]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in a cold frame or greenhouse for their first year. Plant them out in late spring or early summer of the following year. The seed of pear cultivars will not usually breed true to type.

nwatta Prefers a good well-drained loam in full sun[200]. Grows well in heavy clay soils[200]. Tolerates light shade but does not fruit so well in such a position. Tolerates atmospheric pollution, excessive moisture and a range of soil types if they are moderately fertile, though plants can become chlorotic on very alkaline soils[200]. Established plants are drought tolerant[200]. Very hardy, tolerating temperatures down to below -15°C[200]. Widely cultivated for its edible fruit in temperate areas, there are many named varieties that can provide fruit from late July to April or May of the following year. This is the collective name for all the pear cultivars that have been derived from *P. communis*, probably through hybridization with *P. cordata* and *P. nivalis*. Where space is at a premium, or at the limits of their climatic range, pears can be grown against a wall. Most cultivars will grow well against a sunny south or west facing wall but, because of their relatively early flowering, they are not really suitable for north or east facing walls[219]. Most cultivars are not self-fertile and a number of cultivars have incompatible pollen, so care must be taken to ensure the provision of a suitable pollen partner[200]. Trees grow less well in grass, root secretions from the grass inhibiting the root growth of the pear[201]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern

is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

## 5.2.12 Amelanchier alnifolia

Saskatoon, Saskatoon serviceberry, Serviceberry  
4 tin 6 cyuc 5 kcaak 3 tcan 2 dwat 4 m hkuc  
hmmihtut cyulit tcup hwicli hrasjlutnykfrip hpa7tli flatprklwis hpa7tmwatli fyfkrxre7t hjonli

drutta Amelanchier alnifolia is a deciduous Shrub growing to 4 m (13ft) by 3 m (9ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 2 and is not frost tender. It is in flower in May, and the seeds ripen from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: TeaEdible fruit - raw or cooked[3, 11, 46, 62, 101]. The fruit ripens in mid summer (early July in southern Britain) it is soft and juicy with a few small seeds in the centre. A very nice sweet flavour that is enjoyed by almost everyone who tries it, there is a hint of apple in the taste[K]. About the size of a black-currant, the fruit is produced in small clusters and the best wild forms can be 15mm in diameter[200, 212]. The fruit can also be dried and used as raisins or made into pemmican[101, 183]. The fruit is rich in iron and copper[226]. The leaves are a tea substitute[161, 257].

tcanta Shelterbelt Soil stabilizationPlants have a spreading, suckering root system and are used in windbreaks for erosion control[200]. Young branches can be twisted to make a rope[257]. Wood - hard, straight grained, tough. Used for tool handles etc. The wood can be made even harder by heating it over a fire and it is easily moulded whilst still hot[99]. The young stems are used to make rims, handles and as a stiffening in basket making[257]. Landscape Uses: Erosion control, Massing, Woodland garden. Hedging and Screens, Architectural City and Courtyard Gardens Cottage and Informal Garden, Wildlife Gardens (RHS).

dwatta Appetizer Birthing aid Contraceptive Diaphoretic Febrifuge Laxative Ophthalmic StomachicSaskatoon was quite widely employed as a medicinal herb by the North American Indians, who used it to treat a wide range of minor complaints[257]. It is little used in modern herbalism. An infusion of the inner bark is used as a treatment for snow-blindness[172]. A decoction of the fruit juice is mildly laxative. It has been used in the treatment of upset stomachs, to restore the appetite in children, it is also applied externally as ear and eye drops[257]. A decoction of the roots has been used in the treatment of colds[257]. It has also been used as a treatment for too frequent menstruation[257]. A decoction of the stems, combined with the stems of snow-berry (*Symphoricarpos* spp) is diaphoretic. It has been used to induce sweating in the treatment of fevers, flu etc and also in the treatment of chest pains and lung infections[257]. A decoction of the plant, together with bitter cherry (*Prunus emarginata*) has been used as a contraceptive[257]. Other recipes involving this plant have also been used as contraceptives including a decoction of the ashes of the plant combined with the ashes of pine branches or buds[257]. A strong decoction of the bark was taken immediately after childbirth to hasten the dropping of the placenta. It was said to help clean out and help heal the woman’s insides and also to stop her menstrual periods after the birth, thus acting as a form of birth control[257].

propta Seed - it is best harvested ‘green’, when the seed is fully formed but before the seed coat has hardened, and then sown immediately in pots outdoors or in a cold frame. If stored seed is obtained early enough in the autumn, it can be given 4 weeks warm stratification before being left out in the winter and it should then germinate in the spring. Otherwise seed can be very slow to germinate, perhaps taking 18 months or more. When large enough to handle, prick the seedlings out into individual pots and grow them on in a sheltered outdoor position, planting them out once they are 20cm or more tall. If there is sufficient seed it is best to sow it thinly in an outdoor seedbed[78, 80]. Grow the seedlings on for two years in the seedbed before planting them out into their

propta Pre-soak the seed for 24 hours in warm water and then sow in early spring in a greenhouse. Germination should take place within a couple of weeks. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in early summer. It should also be possible to sow the seed outdoors in situ in the middle of spring. It might be necessary to protect this sowing from mice. Division in early March[1]. Difficult. Basal cuttings in April[1]. Harvest the shoots when they are about 10cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta An easily grown plant, succeeding in any moderately good soil in a sunny position[200]. Grows well in a poor sandy soil[187]. Requires an acid to neutral soil[200]. Plants are hardy to about -25°C[187]. This species is very susceptible to slug damage. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. The plant is heat tolerant in zones 9 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of “heat days” experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is flat with shallow roots forming a plate near the soil surface [1-2].

## 5.1.20 Vicia faba minuta

Tick Bean

hf02n 4 tin 8 cyuc 3 kcaak 3 tcan 0 dwat m hkuc  
hmmihtut cyulit tcup hwicli hrasjlutnykfrip hpa7tli flatprklwis hpa7tmwatli fyfkrxre7t hjonli

drutta Vicia faba minuta is a ANNUAL growing to 1 m (3ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from May to August, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: SeedEdible Uses: Seed - raw or cooked[27, 61]. It can be eaten before it is fully ripe in the same way as broad beans, the fully ripe seed requires overnight soaking to soften it before it is cooked. Leaves - cooked[105]. Used like spinach.

tcanta Fibre Green manure Soap makingA good green manure crop, it is best sown in the spring. Relatively fast growing, producing a good bulk and fixing nitrogen[87]. The upright growth is not a very good weed suppresser though. A fibre is obtained from the stems. The burnt stems are rich in potassium and can be used in making soap.

dwatta None known

propta Pre-soak the seed for 24 hours in warm water and then sow in situ in spring or autumn.

nwatta Prefers a fairly heavy loam but succeeds in a sunny position in most soils that are well-drained[1]. Grows well in heavy clay soils. Dislikes dry conditions[57]. Sometimes cultivated for its edible seed, though more commonly as a green manure crop[87]. Tick beans are not as winter-hardy as other forms of this species and so are best sown in the spring. The autumn sown varieties are more susceptible to ‘chocolate spot’ fungus (which can be remedied by the addition of potash to the soil) but are more likely to escape damage from aphids[87]. This species has a symbiotic

relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. When removing plant remains at the end of the growing season, it is best to only remove the aerial parts of the plant, leaving the roots in the ground to decay and release their nitrogen.

## 5.1.21 Trifolium repens

White Clover, Dutch Clover, Purple Dutch Clover, Shamrock, White Clover

ht02n 4 tin 8 cyuc 3 kcaak 4 tcan 2 dwat 0.1 m hkuc  
htut cyulit tcup hwicli hyhisrasjlutnykfrip hpa7tli flatprklwisslip hpa7tmwatli xre7t hjonli

drutta Trifolium repens is an evergreen Perennial growing to 0.1 m (0ft 4in) by 1 m (3ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in leaf all year, in flower from June to September, and the seeds ripen from July to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Condiment TeaLeaves - raw or cooked as a potherb[13, 94, 183]. The young leaves are harvested before the plant comes into flower and are used in salads, soups etc[9]. They can also be used as a vegetable, cooked like spinach[9]. The leaves are best cooked[172]. Flowers and seed pods are dried, ground into powder and used as a flour or sprinkled on cooked foods such as boiled rice[183]. Very wholesome and nutritious[115]. The young flowers can also be used in salads[144, 172, 183]. Root - cooked[172, 177]. The dried leaves impart a vanilla flavour to cakes etc[172]. Dried flowering heads are a tea substitute.

tcanta Fodder Green manureThe plant makes a good green manure, it is useful for over-wintering, especially in a mixture with *Lolium perenne*[87]. Produces a good bulk. It is a host to ‘clover rot’ however, so should not be used too frequently[87]. It can be undersown with cereals or with tomatoes in a greenhouse (sow the seed before planting the tomatoes)[87]. Fairly deep rooting but not very fast growing[87]. A good fast ground-cover plant for a sunny position[87]. Nectary. A dynamic accumulator gathering minerals or nutrients from the soil and storing them in a more bioavailable form - used as fertilizer or to improve mulch.

dwatta Antirheumatic Antiscrophulatic Depurative Detergent Ophthalmic TonicThe plant is antirheumatic, antiscrophulatic, depurative, detergent and tonic[218]. An infusion has been used in the treatment of coughs, colds, fevers and leucorrhoea[257]. A tincture of the leaves is applied as an ointment to gout[218]. An infusion of the flowers has been used as an eyewash[257].

propta Pre-soak the seed for 12 hours in warm water and then sow in spring in situ. If the seed is in short supply it might be better to sow it in pots in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in late spring. Division in spring[238].

nwatta Agroforestry Services: Nitrogen Agroforestry Services: Understory legume Fodder: Pasture Global Crop Management: Fodder Management: Hay Staple Crop: ProteinLandscape Uses: Ground cover. Succeeds in a moist, well-drained circum-neutral soil in full sun, preferring a sweet calcareous clay soil. Succeeds in poor soils. A very important food plant for the caterpillars of many butterfly and moth species[30] it is also a good bee plant[54]. A good companion plant in the lawn, tolerating trampling[18, 54], but it dislikes growing with henbane or members of the buttercup family[18]. It grows well in an apple orchard, the trees will produce tastier fruit that stores better[201]. It should not be grown with camellias or gooseberries because it harbours a mite that can cause fruit drop in the gooseberries and premature budding in the camellias[201]. Polymorphic, there are many subspecies and varieties. Some varieties have also been selected for use in lawn mixes[183]. This species has a symbiotic relationship with certain soil

bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. Buttercups growing nearby depress the growth of the nitrogen bacteria by means of a root exudate[201]. Special Features:Not North American native, Invasive. The plant is heat tolerant in zones 8 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zones. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is stoloniferous rooting from creeping stems above the ground [1-2].

### 5.1.22 Hedysarum hedysaroides

Alpine French Honeysuckle

tfo2n 4 tlin 8 cyuc 3 kcaak 0 tcan 0 dwat 0.4 m hkuc htut cyutli tcup hwicli hrasljutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Hedysarum hedysaroides is a PERENNIAL growing to 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 4. The species is hermaphrodite (has both male and female organs) and is pollinated by insects. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Root - raw or cooked. Sweet and highly nutritious. Harvested from late autumn to spring, it is sweetened by frost[172].

tcanta None known  
dwatta None known

propta Seed - sow in a cold frame as soon as it is ripe or in the spring[200]. Stored seed should be pre-soaked for 24 hours in warm water. Prick out the seedlings into individual pots as soon as they are large enough to handle and plant them out into their permanent positions in the summer. Division in spring. Great care is needed since the plant dislikes root disturbance[200].

nwatta Easily grown in ordinary garden soil that is moist in summer[187] and a sunny position[1], preferring a deep well-drained sandy loam[1, 200]. This species is hardy to about -20°C[187]. Plants strongly resent root disturbance and should be placed in their permanent positions as soon as possible[1]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

### 5.1.23 Lupinus nootkatensis

Blue Lupine, Nootka lupine

tfo2n 4 tlin 8 cyuc 3 kcaak 3 tcan 0 dwat 0.7 m hkuc htut cyutli tcup hwicli hrasljutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Lupinus nootkatensis is a PERENNIAL growing to 0.7 m (2ft 4in). See above for USDA hardiness. It is hardy to UK zone 4. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Root Seed SeedpodEdible Uses: Seed - cooked[105]. Used as a protein-rich vegetable or savoury dish in any of the ways that cooked beans are used, they can also be roasted or ground into a powder. If the seed is bitter this is due to the presence of toxic alkaloids and the seed should be thoroughly leached before being cooked[2,

105]. Root - raw or cooked[256, 257]. Peeled and then eaten raw or boiled[257]. The roots are harvested in the spring and are then roasted before being eaten[256]. The roasted root can be dried, ground into a flour and then stored for later use. The raw root should not be eaten since they contain toxic alkaloids and will cause a drunken-like state if eaten in excess, but the cooked root is safe to eat[256, 257]. Seed-pods - cooked[105].

tcanta Ornamental. Nitrogen fixer. Dynamic accumulator.

dwatta None known

propta Pre-soak the seed for 24 hours in warm water and then sow in early spring in a greenhouse. Germination should take place within a couple of weeks. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in early summer. It should also be possible to sow the seed outdoors in situ in the middle of spring. It might be necessary to protect this sowing from mice. Division in early March[1]. Difficult. Basal cuttings in April[1]. Harvest the shoots when they are about 10cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta An easily grown plant, succeeding in any moderately good soil in a sunny position[200]. This species is very susceptible to slug damage, the plant has been cultivated as an ornamental, but has virtually died out in the garden though it grows well in the wild in Scotland[187]. Closely related to *L. perennis*[200] and possibly no more than a subspecies of it[50], the uses listed below are for *L. perennis* but it is assumed that they also apply to this species[K]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

### 5.1.24 Hedysarum alpinum

Alpine Sweetvetch

tfo2n 4 tlin 8 cyuc 3 kcaak 0 tcan 0 dwat 0.6 m hkuc htut cyutli tcup hwicli hrasljutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Hedysarum alpinum is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower in June, and the seeds ripen in August. The species is hermaphrodite (has both male and female organs) and is pollinated by insects. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Root - raw or cooked[61, 177]. A carrot-like flavour[105]. The root can be harvested from autumn until spring, it tastes best after some frosts[172]. Possibly toxic. \*\* Please read The New Yorker link in the Reader Comments below

tcanta None known

dwatta None known

propta Seed - sow in a cold frame as soon as it is ripe or in the spring[200]. Stored seed should be pre-soaked for 24 hours in warm water. Prick out the seedlings into individual pots as soon as they are large enough to handle and plant them out into their permanent positions in the summer. Division in spring. nwatta Easily grown in ordinary garden soil in a sunny position, preferring a deep well-drained sandy loam[1, 200]. Plants strongly resent root disturbance and should be placed in their permanent positions as soon as possible[1]. The var. *H. alpinum americanum*. Michx. is used for food[61, 177]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

### 5.2.9 Amelanchier x grandiflora

Apple Serviceberry

4 tlin 7 cyuc 5 kcaak 0 tcan 0 dwat 6 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyikfrp hpa7tli flatprikl hpa7tmwatli fyfxre7t hjonli

drutta Amelanchier x grandiflora is a deciduous Shrub growing to 6 m (19ft) by 4 m (13ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower in April, and the seeds ripen from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Edible fruit - raw or cooked[200]. Sweet and succulent with a flavour of apples[K], they can also be dried for later use[183]. The fruit is rich in iron and copper[226]. It is up to 10mm in diameter[200].

tcanta None known

dwatta None known

propta Seed - it is best harvested 'green', when the seed is fully formed but before the seed coat has hardened, and then sown immediately in pots outdoors or in a cold frame. If stored seed is obtained early enough in the autumn, it can be given 4 weeks warm stratification before being left out in the winter and it should then germinate in the spring. Otherwise seed can be very slow to germinate, perhaps taking 18 months or more. When large enough to handle, prick the seedlings out into individual pots and grow them on in a sheltered outdoor position, planting them out once they are 20cm or more tall. If there is sufficient seed it is best to sow it thinly in an outdoor seedbed[78, 80]. Grow the seedlings on for two years in the seedbed before planting them out into their permanent positions during the winter. Layering in spring - takes 18 months[78]. Division of suckers in late winter. The suckers need to have been growing for 2 years before you dig them up, otherwise they will not have formed roots. They can be planted out straight into their permanent positions if required.

nwatta Landscape Uses: Firewood, Specimen, Woodland garden. Prefers a rich loamy soil in a sunny position or semi-shade[1, 200] but thrives in any soil that is not too dry or water-logged[11]. Grows well in heavy clay soils. Prefers an acid or neutral soil. Plants are hardy to about -25°C[184]. This species does not produce suckers[184]. All members of this genus have edible fruits and, whilst this is dry and uninteresting in some species, in many others it is sweet and juicy. Many of the species have potential for use in the garden as edible ornamentals. The main draw-back to this genus is that birds adore the fruit and will often completely strip a tree before it is fully ripe[K]. This species is occasionally cultivated for its edible fruits, there are some named varieties[200]. The fruit is freely produced in Britain[184]. Considerable confusion has existed between this species, *A. arborea*, *A. canadensis*, *A. lamarckii* and *A. laevis*, see [11 and 200] for the latest (1991) classification. Hybridizes freely with other members of this genus[200]. Grafting onto seedlings of *A. lamarckii* or *Sorbus aucuparia* is sometimes practised in order to avoid the potential problem of hybridizing[1]. Special Features:Not North American native, Attracts butterflies, Blooms are very showy.

### 5.2.10 Corylus avellana

Common Hazel, Common filbert, European Filbert, Harry Lauder's Walking Stick, Corkscrew Hazel, Hazel  
4 tlin 8 cyuc 5 kcaak 5 tcan 2 dwat 6 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli frusflatpriklwisslip hpa7tmwatli dyat hjonli

drutta Corylus avellana is a deciduous Tree growing to 6 m (19ft) by 3 m (9ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from January to April, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is not self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay)

soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: Oil Oil SeedEdible Uses: Milk Oil OilSeed - raw or roasted and used in breads, cakes, biscuits, sweets etc[2, 5, 9, 12, 13, 34, 183]. An excellent nut for raw eating[K]. They can also be liquidized and used as a plant milk[183]. Rich in oil. The seed ripens in mid to late autumn and will probably need to be protected from squirrels[K]. When kept in a cool place, and not shelled, the seed should store for at least 12 months[K]. A clear yellow edible oil is obtained from the seed[7, 9, 183]. It is used in salad dressings, baking etc.

tcanta Basketry Charcoal Cosmetic Hedge Hedge Miscellany Oil Oil Plant support Polish Tannin WoodThe seed contains up to 65% of a non-drying oil, used in paints, cosmetics etc[13, 46, 57, 132]. The whole seed can be used to polish and oil wood[6]. It is very easy to apply and produces a nice finish[K]. The finely ground seeds are used as an ingredient of face masks in cosmetics[7]. Plants can be grown as a tall hedge[29]. They need to be left untrimmed or only lightly trimmed if seed is required[29]. The bark and leaves are a source of tannin[7]. Wood - soft, easy to split, not very durable, beautifully veined. Used for inlay work, small items of furniture, hurdles, wattles, basketry, pea sticks etc[7, 13, 23, 46, 61, 63, 66, 125]. The twigs are used as dowling rods by water diviners[11]. The wood also yields a good quality charcoal, used by artists[63, 101].

dwatta Antihelmintic Astringent Diaphoretic Febrifuge Miscellany Nutritive Stomachic TonicThe bark, leaves, catkins and fruits are sometimes used medicinally[7]. They are astringent, diaphoretic, febrifuge, nutritive and odontalgic[7]. The seed is stomachic and tonic[240]. The oil has a very gentle but constant and effective action in cases of infection with threadworm or pinworm in babies and young children[7].

propta Seed - best sown as soon as it is harvested in autumn in a cold frame[164]. Germinates in late winter or spring. Stored seed should be pre-soaked in warm water for 48 hours and then given 2 weeks warm followed by 3 - 4 months cold stratification[164]. Germinates in 1 - 6 months at 20°C[164]. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame or sheltered place outdoors for their first winter. Plant them out into their permanent positions in late spring or early summer[K]. Layering in autumn. Easy, it takes about 6 months[78, 200]. Division of suckers in early spring. Very easy, they can be planted out straight into their permanent positions.

nwatta Global Crop Industrial Crop: Biomass Managen Coppice Management: Standard Staple Crop: Protein-oilLandscape Uses:Container, Standard, Specimen. An easily grown plant, it succeeds in most soils, but is in general more productive of seeds when grown on soils of moderate fertility[11, 200]. It does less well in rich heavy soils or poor ones[11, 63]. Does well in a loamy soil[11]. Very suitable for an alkaline soil[11], but it dislikes very acid soils[17]. Succeeds in a pH range 4.5 to 8.5, but prefers a range of 5 to 7[200]. Plants are fairly wind tolerant[1, 11]. A very hardy plant, succeeding in all areas of Britain[200]. The flowers, however, are produced in late winter and early spring and can be damaged by heavy frosts at this time[200]. A parent, together with *C. maxima*, of many cultivated forms of filberts and cob nuts. There are many named varieties[11]. Plants are self-fertile but a more certain crop is obtained if more than one cultivar is grown[200]. The main difference between cob nuts and filberts is that the husk of a filbert is longer than the seed and often completely encloses it, whilst the husk on a cob nut is shorter than the seed[200]. Squirrels are a major pest of this plant, often decimating the crop of nuts[200]. Often grown as a coppiced shrub in woodlands, the stems have a variety of uses[23, 67, 186]. Members of this genus bear transplanting well and can be easily moved even when relatively large[11]. A food plant for the caterpillars of many lepidoptera species[30]. Special Features:Not North American native, Attractive flowers or blooms. The plant is heat tolerant in zones 9 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone

damaged[238]. Plants in this genus are notably susceptible to honey fungus[200]. The plant is heat tolerant in zones 8 through 3. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. A sprouting standard sending up shoots from the base [1-2]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is flat with shallow roots spreading near the soil surface. The root pattern is suckering with new plants from runners away from the plant [2-1].

## 5.2.7 Rubus procerus

Himalayan Giant Blackberry

4 tin 8 cyuc 5 kcaak 1 tcan 0 dwat 10 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliw hpa7tmwatli fyfxre7t hjonli

drutta Rubus procerus is a deciduous Shrub growing to 10 m (32ft 10in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked in pies, cakes etc[3, 105, 183]. The fruit can also be dried for later use[183]. Very large for a blackberry[50, 183] with a very pleasant rich flavour when fully ripe[K].

tcanta DyeA purple to dull blue dye is obtained from the fruit[168].

dwatta None known

propta Seed - requires stratification and is best sown in early autumn in a cold frame. Stored seed requires one month stratification at about 3°C and is best sown as early as possible in the year. Prick out the seedlings when they are large enough to handle and grow on in a cold frame. Plant them out into their permanent positions in late spring of the following year. Cuttings of half-ripe wood, July/August in a frame[200]. Tip layering in July. Plant out in autumn. Division in early spring or just before leaf-fall in the autumn[200].

nwatta Easily grown in a good well-drained loamy soil in sun or semi-shade[1, 11, 200]. A form of this species, known as 'Himalayan giant', is commonly cultivated in temperate zones for its edible fruit[50]. Although a blackberry, the stems are often perennial and can fruit for more than one year[50]. This name may be wrongly applied. According to the new RHS Dictionary of Gardening, the correct name for the 'Himalayan Giant' blackberry is *R. procerus*. P.J.Muell., the name *R. discolor* is misspelled. Plants in this genus are notably susceptible to honey fungus[200].

## 5.2.8 Crataegus pedicellata

Scarlet Haw, Scarlet hawthorn

4 tin 8 cyuc 5 kcaak 2 tcan 2 dwat 7 m hkuc hmimhtut cyutli hgattcuphja7n hwicli hrasljutnyikfrip hpa7tli flatprikliwslip hpa7tmwatli xre7t hjonli

drutta Crataegus pedicellata is a deciduous Shrub growing to 7 m (23ft) by 7 m (23ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from April to May, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Midges. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy

clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcaakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[K]. A very variable species, especially in its fruit which ranges considerable in size and quality[K]. Up to 10mm long and pear shaped, the flesh is sweet but dry and mealy[200]. Another report says that the fruit is up to 20mm in diameter[235] and we have often seen fruits this size, or even a bit larger[K]. We find the fruits of the best forms to have an excellent flavour and juicy texture when fully ripe, but with a hint of bitterness before then[K]. They are one of the later members of this genus to ripen their fruit[K]. The fruit can be used in making pies, preserves, etc. and can also be dried for later use. There are up to five fairly large seeds in the centre of the fruit, these often stick together and so the effect is of eating a cherry-like fruit with a single seed[K].

tcanta Wood - heavy, hard, tough, close-grained. Useful for making tool handles, mallets and other small items[82].

dwatta Cardiotonic HypotensiveAlthough no specific mention has been seen for this species, the fruits and flowers of many hawthorns are well-known in herbal folk medicine as a heart tonic and modern research has borne out this use. The fruits and flowers have a hypotensive effect as well as acting as a direct and mild heart tonic[222]. They are especially indicated in the treatment of weak heart combined with high blood pressure[222]. Prolonged use is necessary for it to be efficacious[222]. It is normally used either as a tea or a tincture[222].

propta Seed - this is best sown as soon as it is ripe in the autumn in a cold frame, some of the seed will germinate in the spring, though most will probably take another year. Stored seed can be very slow and erratic to germinate, it should be warm stratified for 3 months at 15°C and then cold stratified for another 3 months at 4°C[164]. It may still take another 18 months to germinate[78]. Scarifying the seed before stratifying it might reduce this time[80]. Fermenting the seed for a few days in its own pulp may also speed up the germination process[K]. Another possibility is to harvest the seed 'green' (as soon as the embryo has fully developed but before the seedcoat hardens) and sow it immediately in a cold frame. If timed well, it can germinate in the spring[80]. If you are only growing small quantities of plants, it is best to pot up the seedlings as soon as they are large enough to handle and grow them on in individual pots for their first year, planting them out in late spring into nursery beds or their final positions. When growing larger quantities, it might be best to sow them directly outdoors in a seedbed, but with protection from mice and other seed-eating creatures. Grow them on in the seedbed until large enough to plant out, but undercut the roots if they are to be left undisturbed for more than two years.

nwatta A very easily grown plant, it prefers a well-drained moisture retentive loamy soil but is not at all fussy[11, 200]. Once established, it succeeds in excessively moist soils and also tolerates drought[200]. It grows well on a chalk soil and also in heavy clay soils[200]. A position in full sun is best when plants are being grown for their fruit, they also succeed in semi-shade though fruit yields and quality will be lower in such a position[11, 200]. Most members of this genus succeed in exposed positions, they also tolerate atmospheric pollution[200]. Plants are hardy to at least -18°C[202]. A very variable species, it has been divided up into several different species by some botanists[82]. The sub-species *C. pedicellata gloriosa*. Sarg. has larger fruits than the type[11]. Hybridizes freely with other members of this genus[200]. Seedling trees take from 5 - 8 years before they start bearing fruit, though grafted trees will often flower heavily in their third year[K]. The flowers have a foetid smell somewhat like decaying fish. This attracts midges which are the main means of fertilization. When freshly open, the flowers have more pleasant scent with balsamic undertones[245]. Seedlings should not be left in a seedbed for more than 2 years without being transplanted[11]. A user in Poland says that *Crataegus pedicellata* exists in the wild in Eastern Poland and can support winter temperatures at least until -30C.

## 5.1.25 Sophora japonica

Japanese Pagoda Tree, Scholar Tree

tfo2n 4 tin 9 cyuc 2 kcaak 2 tcan 3 dwat 20 m hkuc htut cyutli hgattcup hwicli hyshrasljutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Sophora japonica is a deciduous Tree growing to 20 m (65ft) by 20 m (65ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in September, and the seeds ripen in November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil and can tolerate drought. It can tolerate atmospheric pollution.

kcaakta Edible Parts: Flowers LeavesEdible Uses: Rutin TeaYoung leaves and flowers - cooked[177, 183]. The leaves need to be cooked in three lots of water in order to remove the bitterness[179]. This will also remove most of the vitamins and minerals[K]. The leaves are a rich source of rutin, they contain much more than the usual commercial source, buckwheat (*Fagopyrum esculentum*)[174]. The ovaries, before the flowers open, contain up to 40% rutin[218]. A tea can be made from the young leaves and flowers[183]. An edible starch is obtained from the seed[183].

tcanta Dye WoodA yellow dye is obtained from the seed-pods and the flowers[46, 61, 109, 178]. It is green when mixed with indigo[151]. Wood - tough, light, strong, of superior quality. Used in carpentry[109, 174].

dwatta Abortifacient Antibacterial Anticholesterolemic Anti diarrhoeal Antinflammatory Antispasmodic Diuretic Emetic Emollient Epilepsy Febrifuge Hypotensive Purgative Skin Styptic TonicThis species is commonly used in Chinese medicine and is considered to be one of the 50 fundamental herbs[218]. It came second in a study of 250 potential antifertility agents[218]. Diuretic, emollient, febrifuge, tonic[11, 147, 174, 178]. The flowers and flower buds are antibacterial, anticholesterolemic, anti-inflammatory, antispasmodic, haemostatic and hypotensive[11, 147, 174, 176, 178, 218, 238, 279]. The ovaries, especially just before the plant flowers, are a rich source of rutin and this is a valuable hypotensive agent[218]. The buds, flowers and pods are concocted and used in the treatment of a variety of ailments[218] including internal haemorrhages, poor peripheral circulation, internal worms etc[238]. This remedy should not be prescribed for pregnant women[238]. The seedpods are abortifacient[218]. The seed is emetic and haemostatic[218]. It is used in the treatment of haemorrhoids, haematuria, uterine bleeding, constipation, stuffy sensation in the chest, dizziness, red eyes, headache and hypertension[176]. It should be used with caution since it is toxic[218]. The leaves are laxative[218]. They are used in the treatment of epilepsy and convulsions[218]. A decoction of the stems is used in the treatment of piles, sore eyes and skin problems[218].

propta Seed - best sown as soon as it is ripe in a greenhouse[200]. Pre-soak stored seed for 12 hours in hot (not boiling) water and sow in late winter in a greenhouse[78]. Prick out the seedlings as soon as they are large enough to handle into individual pots in the greenhouse, and grow them on for 2 years under protected conditions. Plant them out into their permanent positions in early summer of their third year. Cuttings of young shoots with a heel, July/August in a frame[11]. Air-layering[200].

nwatta Landscape Uses:Firewood, Pest tolerant, Specimen, Street tree. Succeeds in a well-drained moderately fertile soil in full sun[200]. Tolerates poor soils, atmospheric pollution, heat and, once established, drought[200]. Hardy to about -25° when mature, but it can be damaged by severe frosts when it is young[200]. A very ornamental[1] and fast growing tree[200], it grows best in hot summers[188]. It grows best in the warmer areas of the country where the wood will be more readily ripened and better able to withstand winter cold[219]. Trees take 30 years to come into flower from seed.[200], but they do not often ripen their seed in Britain[11]. Cultivated in China for the rutin contained in its leaves and ovaries[218]. Plants should be container-grown and planted out whilst young, older plants do not transplant well[219]. Plants in this genus are notably re-

sistant to honey fungus[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. Special Features: Not North American native, Attractive flowers or blooms. The plant is heat tolerant in zones 9 through 5. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2].

## 5.1.26 Ceanothus fendleri

Fendler's Ceanothus

tfo2n 4 tin 8 cyuc 2 kcaak 0 tcan 1 dwat 2 m hkuc hmimhtut cyutli kyuctcup hwicli hrasljut hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Ceanothus fendleri is a deciduous Shrub growing to 2 m (6ft 7in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from June to August, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcaakta Edible Parts: Fruit Inner barkEdible Uses: TeaFruit[105, 155, 161, 177]. Used for food in New Mexico[183]. The berries are sweetened with sugar and used as food[257]. The fruit is about 5mm wide[200]. Strips of the inner bark can be eaten in the summer[257]. The leaves are used as a substitute for tea[183].

tcanta Dye SoapA green dye is obtained from the flowers[168]. All parts of the plant are rich in saponins - when crushed and mixed with water they produce a good lather which is an effective and gentle soap[155, 168, 169]. This soap is very good at removing dirt, though it does not remove oils very well. This means that when used on the skin it will not remove the natural body oils, but nor will it remove engine oil etc[K] The flowers are a very good source, when used as a body soap they leave behind a pleasant perfume on the skin[K]. The developing seed cases are also a very good source of saponins[K].

dwatta SedativeThe plant is sedative[155]. An infusion has been used to treat nervousness and a poultice of the plants also used for this purpose[257]. The leaves have been chewed to treat a sore mouth[257].

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed should be pre-soaked for 12 hours in warm water and then given 1 - 3 months stratification at 1°C[138, 200]. Germination usually takes place in 1 - 2 months at 20°C[138]. One report says that the seed is best given boiling water treatment, or heated in 4 times its volume of sand at 90 - 120°C for 4 - 5 minutes and then soaked in warm water for 12 hours before sowing it[214]. The seed exhibits considerable longevity, when stored for 15 years in an air-tight dry container at 1 - 5°C it has shown little deterioration in viability[214]. The seed is ejected from its capsule with some force when fully ripe, timing the collection of seed can be difficult because unless collected just prior to dehiscence the seed is difficult to extract and rarely germinates satisfactorily[214]. Prick out the seedlings into individual pots as soon as they are large enough to handle. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in late spring or early summer. Cuttings of half-ripe wood, taken at a node[200], July/August in a frame[11]. Cuttings of mature wood of the current year's growth, 7 - 12 cm with a heel, October in a cold frame[78]. The roots are quite brittle and it is best to

pot up the callused cuttings in spring, just before the roots break[78]. Good percentage.

nwatta Prefers a warm sunny position but tolerates light shade[11, 200]. Tolerates some lime, but will not succeed on shallow chalk[200]. One of the hardiest members of this genus, it succeeds outdoors in many areas of the country[11]. Plants dislike root disturbance, they should be planted out into their permanent positions whilst still small[182]. Dislikes heavy pruning, it is best not to cut out any wood thicker than a pencil[182]. Any pruning is best carried out in the spring[219]. Fast growing, it flowers well when young, often in its second year from seed[11]. Hybridizes freely with other members of this genus[200]. Some members of this genus have a symbiotic relationship with certain soil micro-organisms, these form nodules on the roots of the plants and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200, 212].

### 5.1.27 Ceanothus sanguineus

Oregon Tea Tree, Redstem ceanothus  
tfo2n 4 tlin 8 cyuc 2 kcaak 0 tcan 1 dwat 2 m hkuc  
hmmihmtut cyutli kyuctcup hwicli hrasljut hpa7tli flatpricklwis hpa7tmwatli xre7t hjonli

drutta Ceanothus sanguineus is a deciduous Shrub growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcaakta Edible Parts: Edible Uses: TeaA tea is made from the leaves[177, 183].

tcanta Dye SoapA green dye is obtained from the flowers[168]. All parts of the plant are rich in saponins - when crushed and mixed with water they produce a good lather which is an effective and gentle soap[168, 169]. This soap is very good at removing dirt, though it does not remove oils very well. This means that when used on the skin it will not remove the natural body oils, but nor will it remove engine oil etc[K] The flowers are a very good source, when used as a body soap they leave behind a pleasant perfume on the skin[K]. The developing seed cases are also a very good source of saponins[K].

dwatta PoulitceA poultice of the dried, powdered bark has been applied to burns, sores and wounds[257].

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed should be pre-soaked for 12 hours in warm water and then given 1 - 3 months stratification at 1°C[138, 200]. Germination usually takes place within 1 - 2 months at 20°C[138]. One report says that the stored seed is best given boiling water treatment, or heated in 4 times its volume of sand at 90 - 120°C for 4 - 5 minutes and then soaked in warm water for 12 hours before sowing it[214]. It then requires a period of chilling below 5°C for up to 84 days before it will germinate[214]. The seed exhibits considerable longevity, when stored for 15 years in an air-tight dry container at 1 - 5°C it has shown little deterioration in viability[214]. The seed is ejected from its capsule with some force when fully ripe, timing the collection of seed can be difficult because unless collected just prior to dehiscence the seed is difficult to extract and rarely germinates satisfactorily[214]. Prick out the seedlings into individual pots as soon as they are large enough to handle. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in late spring or early summer. Cuttings of half-ripe wood, taken at a node[200], July/August in a frame[11]. Cuttings of mature wood of the current year's growth, 7 - 12 cm with a heel, October in a cold frame[78]. The roots are quite brittle and it is best to pot up the callused cuttings in spring, just before the roots break[78]. Good percentage.

nwatta Prefers a warm sunny position but tolerates light shade[11, 200]. Tolerates some lime, but will not succeed on shallow chalk[200]. Plants dislike root disturbance, they should be planted out into their permanent positions whilst still small[182]. Dislikes heavy pruning, it is best not to cut out any wood thicker than a pencil[182]. Any pruning is best

carried out in the spring[219]. Fast growing, it flowers well when young, often in its second year from seed[11]. Hybridizes freely with other members of this genus[200]. Some members of this genus have a symbiotic relationship with certain soil micro-organisms, these form nodules on the roots of the plants and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200, 212].

### 5.1.28 Ceanothus velutinus

Sticky Laurel, Snowbrush ceanothus, Hooker's ceanothus  
tfo2n 4 tlin 8 cyuc 2 kcaak 0 tcan 2 dwat 2.5 m hkuc  
hmmihmtut cyutli kyuctcup hwicli hrasljut hpa7tli flatpricklwis hpa7tmwatli xre7t hjonli

drutta Ceanothus velutinus is an evergreen Shrub growing to 2.5 m (8ft 2in). See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf all year, in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcaakta Edible Parts: Edible Uses: TeaThe leaves are used as a tea substitute[177, 183].

tcanta Baby care Dye Insecticide SoapA green dye is obtained from the flowers[168]. A poultice of the dried powdered leaves has been used as a baby powder for treating nappy rash etc[257]. Smoke from burning the plant has been used as an insecticide to kill bedbugs[257]. All parts of the plant are rich in saponins - when crushed and mixed with water they produce a good lather which is an effective and gentle soap[168, 169, 212]. This soap is very good at removing dirt, though it does not remove oils very well. This means that when used on the skin it will not remove the natural body oils, but nor will it remove engine oil etc[K] The flowers are a very good source, when used as a body soap they leave behind a pleasant perfume on the skin[K]. The developing seed cases are also a very good source of saponins[K].

dwatta Analgesic Antirheumatic Eczema Febrifuge Poulitce SkinThe leaves are febrifuge[257]. An infusion has been used in the treatment of coughs and fevers[257]. A decoction of the leaves and stems has been used both internally and externally in the treatment of dull pains, rheumatism etc[257]. The leaves contain saponins and have been used as a skin wash that is also deodorant and can destroy some parasites[257, K]. The wash is beneficial in treating sores, eczema, nappy rash etc[257].

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed should be pre-soaked for 12 hours in warm water and then given 1 - 3 months stratification at 1°C[138, 200]. Germination usually takes place within 1 - 2 months at 20°C[138]. One report says that the seed is best given boiling water treatment, or heated in 4 times its volume of sand at 90 - 120°C for 4 - 5 minutes and then soaked in warm water for 12 hours before sowing it[214]. It then requires a period of chilling below 5°C for up to 84 days before it will germinate[214]. Seeds have considerable longevity, some that have been in the soil for 200 years or more have germinated[214]. The seed is ejected from its capsule with some force when fully ripe, timing the collection of seed can be difficult because unless collected just prior to dehiscence the seed is difficult to extract and rarely germinates satisfactorily[214]. Prick out the seedlings into individual pots as soon as they are large enough to handle. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in late spring or early summer. Cuttings of half-ripe wood, taken at a node[200], July/August in a frame[11]. Cuttings of mature wood of the current year's growth, 7 - 12 cm with a heel, October in a cold frame[78]. The roots are quite brittle and it is best to pot up the callused cuttings in spring, just before the roots break[78]. Good percentage.

nwatta Prefers a warm sunny position but tolerates light shade[11, 200]. Tolerates some lime, but will not succeed on shallow chalk[200]. One report says that this species is hardy to zone 5 (tolerating temperatures down to about -20°C)[200] whilst another says that it needs the protection of a wall when grown outdoors in Britain[1]. Plants dislike root disturbance, they should be planted out into their permanent posi-

October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Bees, insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Fruit SapEdible Uses: Fruit - raw, cooked or dried for later use[1, 3, 61, 105]. Sweeter than A. deliciosa, the kiwi fruit[183], the skin is smooth and can be eaten with the fruit[K]. The fruit contains up to 5 times the vitamin C content of blackcurrants[74]. Highly esteemed according to one report[151] whilst another says that they are insipid[11]. The fruits are greenish-yellow or purple-red when mature and are about 2 to 3cm long[198, 266]. They contain a number of small seeds, but these are easily eaten with the fruit[K]. The plant is rich in sap and this can be tapped and drunk in the spring[105, 177, 183].

tcanta None known

dwatta Vitamin CNone known

propta Seed - sow spring in a greenhouse[133]. It is probably best if the seed is given 3 months stratification[113], either sow it in a cold frame as soon as it is ripe in November or as soon as it is received. Fresh seed germinates in 2 - 3 months at 10°C, stored seed can take longer[133]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least their first winter. When the plants are 30cm or more tall, plant them out into their permanent positions in late spring or early summer, after the last expected frosts[K]. Most seedlings are male[126]. The seedlings are subject to damping off, so they must be kept well ventilated[113]. Cuttings of softwood as soon as ready in spring in a frame[K]. Cuttings of half-ripe wood, July/August in a frame. Very high percentage[113]. Cuttings of ripe wood, October/November in a frame.

nwatta Prefers a sound loamy neutral soil[1, 200]. Tolerates acid and moderately alkaline soils[202]. Succeeds in semi-shade but full sun is best for fruit production[200]. Prefers a sheltered position[200]. A very hardy plant, tolerating temperatures down to -30°C or more, but the young spring growth is susceptible to frost damage[160]. Some cultivars are said to tolerate temperatures down to about -50°C when fully dormant[160]. This species is often cultivated for its edible fruit and it is increasingly being seen as having potential in Britain. There are some named varieties[183]. Plants are usually dioecious but the cultivar 'Is-sai' is self-fertile[200]. A polymorphic species[74]. Fruits are formed on second year wood and also on fruit spurs on older wood[126], any pruning is best carried out in the winter[219]. Plants only flower when grown in warm climates[202]. This species flowers well in gardens in the south and west of Britain[219], the small flowers being sweetly scented[245]. This is a climbing plant, supporting itself by twining around branches etc[200]. Male and female plants must usually be grown if seed is required. Plants in this genus are notably resistant to honey fungus[200]. The plant is heat tolerant in zones 8 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. Woody. Growth habit is a single or multiple shooting vine from a crown [1-2]. The root pattern is a heart root, dividing from the crown into several primary roots going down and out [1-2].

### 5.2.6 Prunus domestica

Plum, European plum  
4 tlin 9 cyuc 5 kcaak 3 tcan 2 dwat 12 m hkuc

hmmihmtut cyutli tcup hwicli hrasljutnykriqip hpa7tli flatpricklwis hpa7tmwatli fyfikre7t hjonli

drutta Prunus domestica is a deciduous Tree growing to 12 m (39ft) by 10 m (32ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in April, and the seeds ripen from July to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Flowers Fruit Oil Seed Edible Uses: Gum Oil Oil TeaFruit - raw or cooked[1, 2, 7, 46]. The fruit varies considerably from cultivar to cultivar, but it is generally somewhat mealy, soft and juicy with a delicious flavour ranging from very sweet to acid[K]. The more acid fruits are usually only used for cooking purposes[K]. The fruit varies widely in size according to cultivar but can be 8cm long and contains a single large seed[200]. Seed - raw or cooked. Do not eat the seed if it is too bitter - see the notes above on toxicity. An edible gum is obtained from points of damage on the trunk[64]. The seed contains about 20% of an edible semi-drying oil[4, 57]. It has an agreeable almond smell and flavour[4]. The flowers are eaten. They are used as a garnish for salads and ice cream or brewed into a tea[183].

tcanta Adhesive Dye Gum Oil Oil WoodA green dye can be obtained from the leaves[168]. A dark grey to green dye can be obtained from the fruit[168]. A yellow dye is obtained from the bark[115]. A gum obtained from points of damage along the stem can be used as an adhesive[64]. The ground up seeds are used cosmetically in the production of face-masks for dry skin[7]. A semi-drying oil is obtained from the seed[64]. No details of its uses. Wood - hard, compact. Used for musical instruments[115].

dwatta Febrifuge Laxative StomachicThe dried fruit, known as prunes, is a safe and effective laxative and is also stomachic[4, 7, 21, 238]. The bark is sometimes used as a febrifuge[7]. Although no specific mention has been seen for this species, all members of the genus contain amygdalin and prunasin, substances which break down in water to form hydrocyanic acid (cyanide or prussic acid). In small amounts this exceedingly poisonous compound stimulates respiration, improves digestion and gives a sense of well-being[238].

propta Seed - requires 2 - 3 months cold stratification and is best sown in a cold frame as soon as it is ripe[200]. Sow stored seed in a cold frame as early in the year as possible[200]. Protect the seed from mice etc. The seed can be rather slow, sometimes taking 18 months to germinate[113]. Prick out the seedlings into individual pots when they are large enough to handle. Grow them on in a greenhouse or cold frame for their first winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood with a heel, July/August in a frame[11, 200]. Softwood cuttings from strongly growing plants in spring to early summer in a frame[200]. Layering in spring.

nwatta Requires a well-drained moisture retentive soil[1, 11] and a sheltered position[200]. Succeeds in light shade but fruits better in a sunny position[11, 200]. Thrives in a loamy soil, doing well on limestone[11]. Grows well in heavy clay soils. Prefers some chalk in the soil but it is apt to become chlorotic if too much is present[1]. Prefers a pH between 6 and 6.5[200]. The plum is widely cultivated for its edible fruit in temperate zones, there are many named varieties able to supply fresh fruits from late July to November or December[183]. Many cultivars are fully self-fertile, though some are partially self-sterile and others require cross-pollination[200]. Where space is at a premium, or at the limits of their climatic range, plums can be grown against a wall. Most cultivars will grow well against a sunny south or west facing wall, whilst an east facing wall will suit some of the tougher cultivars, a north facing wall is not really suitable[219]. This species is probably a hybrid of ancient origin between *P. spinosa* and *P. cerasifera*, coupled with chromosome doubling[17]. It does not cross-pollinate with the Japanese plum, *P. salicina*[200]. Prefers growing in a continental climate, mild winters tend to encourage earlier flowering with a greater risk of frost damage to the blossom. In Britain the best fruits are produced away from the western side of the country. Most members of this genus are shallow-rooted and will produce suckers if the roots are

## 5.2.3 *Corylus hybrids*

Hybrid and Neohybrids, Hazel, Filbert

4 tlin 9 cyuc 5 kcaak 5 tcan 2 dwat 25 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli frusflatprikli-wisslip hpa7tmwatli hjonli

drutta *Corylus hybrids* is a deciduous Shrub growing to 25 m (82ft) by 20 m (65ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure.

kcakta Carbon Farming Solutions - Staple Crop: protein-oil (The term staple crop typically refers to a food that is eaten routinely and accounts for a dominant part of people's diets in a particular region of the world). Hazelnuts are among the best perennial protein and oil staple crops for temperate and boreal climates. Hybrids and neohybrid hazels are of increasing importance [1-1].

tcanta Carbon Farming Solutions - Other Systems: woody agriculture. See individual species.

dwatta See individual species.

propta Seed - best sown as soon as it is harvested in autumn in a cold frame[164]. Germinates in late winter or spring. Stored seed should be pre-soaked in warm water for 48 hours and then given 2 weeks warm followed by 3 - 4 months cold stratification[164]. Germinates in 1 - 6 months at 20°c[164]. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame or sheltered place outdoors for their first winter. Plant them out into their permanent positions in late spring or early summer[K]. Layering in autumn. Easy, it takes about 6 months[78, 200]. Division of suckers in early spring. Very easy, they can be planted out straight into their permanent positions.

nwatta Climate: boreal to warm temperate, Mediterranean. Humidity: semi-arid to humid. Carbon Farming Solutions - Cultivation: new crop. Management: standard, coppice (Describes the non-destructive management systems that are used in cultivation) [1-1].

## 5.2.4 *Diospyros virginiana*

American Persimmon, Common persimmon, Persimmon

4 tlin 8 cyuc 5 kcaak 3 tcan 1 dwat 20 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

drutta *Diospyros virginiana* is a deciduous Tree growing to 20 m (65ft 7in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower in June, and the seeds ripen from October to November. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Insects, wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Fruit OilEdible Uses: Coffee Oil Sweetener TeaFruit - raw, cooked or dried and used in breads, cakes, pies, puddings etc[46, 183]. About the size of a plum, the fruit has an exquisitely rich flavour when it is fully ripe (and almost at the point of going bad) but it is very harsh and astringent before then[2, 3, 171, K]. The fruit may not ripen properly in a cool summer, though if it is frosted it normally develops a very good flavour[K]. The fruit can also be harvested in the autumn, preferably after a frost, and bletted. (This is a process where the fruit is kept in a cool place and only eaten when it is very soft and almost at the point of going rotten). Much of the fruit on trees in a relatively sunny position at Kew after a relatively warm summer in 1996 was still not fully ripe, though it was very nearly so and ripened well off the tree[K]. The fruit can also be dried and used in bread, cakes etc. The fruit is up to 4.5cm in diameter[200]. Molasses can be made from the fruit pulp[183]. An oil obtained from the seeds is said to taste like peanut oil[222]. A

tea is made from the dried leaves[102]. It is high in vitamin C and has a pleasant flavour somewhat like saffrafras[21, 183]. The roasted seed is used as a coffee substitute[177, 183].

tcanta Oil Soil stabilization WoodCan be used as a rootstock for D. kaki[46]. Wood - strong, hard, heavy, fine-grained, elastic, resistant to wear. A valuable wood, it is used for making wooden ware, turnery etc[46, 82, 149, 171]. It is used especially for making handles for golf clubs[149].

dwatta Antiscorbutic Astringent Vitamin C WartsA decoction of the boiled fruit was used to treat bloody stools[213]. (This probably refers to the unripe fruit, which is very astringent[K]). The leaves are rich in vitamin C and are used as an antiscorbutic[213]. A decoction of the inner-bark is highly astringent[149, 222]. It has been used as a mouth rinse in the treatment of thrush and sore throats[213, 222]. Used externally as a wash for warts or cancers[222].

propta Seed - best sown in a cold frame as soon as it is ripe[113, 200]. Stored seed requires cold-stratification and should be sown as early in the year as possible[78]. It usually germinates in 1 - 6 months at 15°c[175]. Pot up the young seedlings as soon as they are large enough to handle into fairly deep pots and plant them out in early summer. Give the plants some protection from winter cold for their first winter or two outdoors. Cuttings of half-ripe wood, July/August in a frame[200]. Layering in spring[200].

nwatta Requires a good deep loamy soil in sun or light shade[200]. If being grown for its fruit, the tree requires a warm, sunny, sheltered position[K]. It dislikes very acid or wet and poorly drained soils[200]. Plants are somewhat tender when young[11], though dormant mature trees are hardy to about -35°c[160]. The young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. Dioecious, but the female tree can produce seedless fruits in the absence of a pollinator[1]. It is likely that unfertilized fruits are more astringent than fertilized fruits since this is the case with D. kaki[K]. Trees can start producing fruit when only a few years old, a specimen seen at Kew Botanical gardens in autumn 1996 was only 1.5 metres tall and was bearing a very large crop of fruit[K]. This species is occasionally cultivated for its edible fruit, there are several named varieties[82, 183]. 'Dooley' grows well near the northern limits of persimmon culture[183]. 'Geneva Red' also grows well at the northern limits of persimmon culture. The fruit is medium to large[183]. 'Meader' grows well in cooler areas, it is self-fertile[183]. Plants have a long tap root and are difficult to transplant[149, 200], it is best to plant them out in their permanent position as soon as possible and to give protection overwinter for the first year or two[K]. The ssp. D. virginiana platycarpa has sweet succulent flesh, it grows wild from Missouri to Arkansas[82]. Special Features: Attracts birds, North American native, Attracts butterflies, Inconspicuous flowers or blooms. The plant is heat tolerant in zones 9 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. A sprouting standard sending up shoots from the base [1-2]. The root pattern is a tap root similar to a carrot going directly down [1-2]. The root pattern is suckering with new plants from underground runners away from the plant [1-2].

## 5.2.5 *Actinidia arguta*

Tara Vine

4 tlin 8 cyuc 5 kcaak 2 tcan 0 dwat 15 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

drutta *Actinidia arguta* is a deciduous Climber growing to 15 m (49ft 3in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in leaf from May to November, in flower from June to July, and the seeds ripen in

tions whilst still small[182]. Dislikes heavy pruning, it is best not to cut out any wood thicker than a pencil[182]. Plants flower on the previous year's growth, if any pruning is necessary it is best carried out immediately after flowering has finished[200, 219]. Constant pruning to keep a plant small can shorten its life[200]. Fast growing, it flowers well when young, often in its second year from seed[11]. Hybridizes freely with other members of this genus[200]. The leaves have a strong scent of balsam[200]. Some members of this genus have a symbiotic relationship with certain soil microorganisms, these form nodules on the roots of the plants and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200, 212].

## 5.1.29 *Vicia gigantea*

Giant Vetch

tfo2n 4 tlin 8 cyuc 2 kcaak 3 tcan 1 dwat 1 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyfxre7t hjonli

drutta *Vicia gigantea* is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 5. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: Young seed - raw or cooked[256]. The seeds are produced in pods 2 - 5cm long, each pod containing 3 - 4 round seeds the size of small peas[256]. They are eaten, when young, like green peas[2, 105, 118, 161], the flavour even of young seeds is rather strong, like old garden peas[256]. Some native North American Indian tribes regarded the seeds as poisonous, though other tribes would eat them as a snack. The pods were harvested when green and then roasted in an open fire until the pods started to split open. The seeds were then removed and eaten[256].

tcanta HairAn infusion of the roots has been used as a tonic hair wash and anti-dandruff treatment[257]. Nitrogen fixer. Dynamic accumulator.

dwatta Antidandruff LaxativeThe roots are laxative[257]. An infusion of the roots has been used as a tonic hair wash and anti-dandruff treatment[257].

propta Pre-soak the seed for 24 hours in warm water and then sow in situ in spring or autumn.

nwatta We have very little information on this species and do not know if it will be hardy in Britain, though judging by its native range it should succeed outdoors in many parts of the country. The following notes are based on the general needs of the genus. Prefers a fairly heavy loam but succeeds in a sunny position in most soils that are well-drained[200]. Grows well in heavy clay soils.

## 5.1.30 *Galega officinalis*

Goat's Rue, Professor-weed

tfo2n 4 tlin 8 cyuc 2 kcaak 0 tcan 3 dwat 1.2 m hkuc hmimhtut cyutli tcup hwicli hyishrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Galega officinalis* is a PERENNIAL growing to 1.2 m (4ft) by 0.8 m (2ft 7in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from June to July, and the seeds ripen in August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Curdling agentLeaves - cooked[2]. Used like spinach[177, 183]. Some caution is advised due to reports of possible toxicity. The herb is used as a substitute for rennet in curdling plant milks etc[183].

tcanta Cosmetic Green manureA fast-growing plant, it makes a good green manure crop, enriching the soil with or-

ganic matter and also fixing atmospheric nitrogen[7]. The plant is used cosmetically in hand and foot baths[7].

dwatta Diaphoretic Diuretic Galactogogue HypoglycaemicGoat's rue was once important in the treatment of plague, fevers and infectious diseases[238]. It is still used in modern herbalism, though mainly for its effect in promoting milk-flow in lactating mothers (it has been shown to increase the flow of milk in cows and goats by 35 - 50%[4, 7, 238]) and for its positive effect on the digestive system[238]. The plant contains galegine, an alkaloid that strongly reduces blood sugar levels which make it useful in the treatment of diabetes[254]. The leaves and flowering tops are diaphoretic, diuretic, galactogogue and hypoglycaemic[4, 7, 21, 165]. It has also been used in the treatment of fevers[4, 7]. It is taken internally to treat insufficient lactation, late-onset diabetes, pancreatitis and digestive problems, especially chronic constipation caused by a lack of digestive enzymes[238]. The plant is harvested as it is just coming into flower and is dried for later use[4]. Some caution is advised, see notes above on toxicity.

propta Seed - pre-soak for 12 hours in warm water and then sow the seed in spring or autumn in a cold frame[111, 200]. Spring-sown seed can be slow to germinate, a period of cold stratification may improve the germination time. When they are large enough to handle, prick the seedlings out into individual pots and plant them out into their permanent positions in the summer. If you have sufficient seed, then it is possible to sow outdoors in situ in mid to late spring. Division in spring or autumn[111]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Succeeds in most soils but repays generous treatment[1, 200]. Prefers full sun and a deep moist soil[1, 4] but it also succeeds in light shade[200]. Grows well even in poor soils[233]. Plants are very tolerant of neglect and can be grown in quite coarse grass, which can be cut annually in the autumn[233, 238]. A long-lived plant[1], it can be invasive in good growing conditions[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

## 5.1.31 *Ceanothus ovatus*

Smaller Red-Root

tfo2n 4 tlin 8 cyuc 2 kcaak 0 tcan 1 dwat 1 m hkuc hmimhtut cyutli kyucctcup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Ceanothus ovatus* is a deciduous Shrub growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Edible Uses: TeaThe young leaves and flowers are steeped in boiling water for about 5 minutes. The resulting liquid is yellowish in colour and tastes similar to Oriental tea but is considered milder and sweeter[183].

tcanta Dye Miscellany SoapA green dye is obtained from the flowers[168]. All parts of the plant are rich in saponins - when crushed and mixed with water they produce a good lather which is an effective and gentle soap[168, 169]. This soap is very good at removing dirt, though it does not remove oils very well. This means that when used on the skin it will not remove the natural body oils, but nor will it remove engine oil etc[K] The flowers are a very good source, when used as a body soap they leave behind a pleasant perfume on the skin[K]. The developing seed cases are also a very good source of saponins[K].

dwatta MiscellanyA decoction of the roots has been used as a cough remedy[257].

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed should be pre-soaked for 12 hours in warm water and then given 1 - 3 months stratification at 1°c[138, 200]. Germination usually takes place within 1 - 2 months at 20°c[138]. One report says that the seed is best

given boiling water treatment, or heated in 4 times its volume of sand at 90 - 120°C for 4 - 5 minutes and then soaked in warm water for 12 hours before sowing it[214]. The seed exhibits considerable longevity, when stored for 15 years in an air-tight dry container at 1 - 5°C it has shown little deterioration in viability[214]. The seed is ejected from its capsule with some force when fully ripe, timing the collection of seed can be difficult because unless collected just prior to dehiscence the seed is difficult to extract and rarely germinates satisfactorily[214]. Prick out the seedlings into individual pots as soon as they are large enough to handle. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in late spring or early summer. Cuttings of half-ripe wood, taken at a node[200], July/August in a frame[11]. Cuttings of mature wood of the current year's growth, 7 - 12 cm with a heel, October in a cold frame[78]. The roots are quite brittle and it is best to pot up the callused cuttings in spring, just before the roots break[78]. Good percentage.

nwatta Prefers a warm sunny position but tolerates light shade[11, 200]. Tolerates some lime, but will not succeed on shallow chalk[200]. Plants dislike root disturbance, they should be planted out into their permanent positions whilst still small[182]. Dislikes heavy pruning, it is best not to cut out any wood thicker than a pencil[182]. Any pruning is best carried out in the spring[219]. Fast growing, it flowers well when young, often in its second year from seed[11]. Closely related to *C. americanus*[235]. It hybridizes freely with other members of this genus[200]. Some members of this genus have a symbiotic relationship with certain soil micro-organisms, these form nodules on the roots of the plants and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200, 212].

### 5.1.32 *Vicia americana*

American Vetch, Mat vetch

tf02n 4 tin 7 cyuc 2 kcaak 4 tcan 1 dwat 1 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyfixre7t hjonli

drutta *Vicia americana* is a PERENNIAL growing to 1 m (3ft 3in) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves Seed Seedpod ShootsEdible Uses: Young shoots - cooked[105, 155, 161]. The tender seeds are eaten by the N. American Indians[212]. Both the mature seeds and the immature seedpods can be used[257]. The pod is about 3cm long and contains 4 - 7 seeds[235].

tcanta StringThe stout roots have been used for tying[257]. A dynamic accumulator gathering minerals or nutrients from the soil and storing them in a more bioavailable form - used as fertilizer or to improve mulch. Nitrogen Fixer.

dwatta Ophthalmic Salve StingsThe leaves have been rubbed in the hands and applied to spider bites[257]. An infusion of the crushed leaves have been used as a bath for treating soreness[257]. An infusion of the plant has been used as an eyewash[257]. An infusion of the leaves has been used by women as a love medicine[257].

propta Pre-soak the seed for 24 hours in warm water and then sow in situ in spring or autumn.

nwatta We have very little information on this species and do not know if it will be hardy in Britain, though judging by its native range it should succeed outdoors in many parts of the country. The following notes are based on the general needs of the genus. Succeeds in any well-drained soil in a sunny position if the soil is reliably moist throughout the growing season, otherwise it is best grown in semi-shade[200]. A climbing plant, attaching itself to supports by means of tendrils[212]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also

be used by other plants growing nearby[200]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. Growth habit is a single or multiple shooting vine from a crown [1-2]. Herbaceous. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

### 5.1.33 *Medicago lupulina*

Black Medick

tf02n 4 tin 8 cyuc 2 kcaak 4 tcan 1 dwat 0.5 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyfixre7t hjonli

drutta *Medicago lupulina* is a ANNUAL/PERENNIAL growing to 0.5 m (1ft 8in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from April to August, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). The plant is self-fertile. It can fix Nitrogen. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Leaves SeedEdible Uses: Leaves - cooked[105]. Used as a potherb[183]. A nutritional analysis is available[218]. Seed - cooked[2, 105, 161]. Parched and eaten or ground into a powder[183]. The seed is said to contain trypsin inhibitors[218]. These can interfere with certain enzymes that help in the digestion of proteins, but are normally destroyed if the seed is sprouted first.

tcanta Green manureA good green manure plant, it is fairly deep rooted, has good resistance to 'Clover rot' but it is not very fast growing[87]. It can be undersown with cereals, succeeding even in a wet season[87].

dwatta Antibacterial LentiveAqueous extracts of the plant have antibacterial properties against micro-organisms[218, 240]. The plant is lenitive[218, 240]. One of our users has sent the following information 'Trypsin inhibitors can be inactivated by the application of heat, for example, boiling for 9 minutes. (Trypsin inhibitors are found in soy). L-canavanine can be destroyed by heat as well. Major saponins in alfalfa but also black medick, known as medicagenic acid and its derivatives, have major antifungal/antimycotic activity that could lend to better medical applications than existing antimycotic drugs that are limited in number and abilities. Medical applications meaning mycoses, which is a consequence of widespread use of immunosuppressive drugs used in transplants, cytotoxic chemotherapy in cancer treatments, broad spectrum antibiotics, recurring mycotic infections in those suffering of AIDS, and a recent hazard of previously agricultural niche saprophyte fungi that are becoming etiological agents and are relatively resistant to conventional therapies.'

propta Pre-soak the seed for 12 hours in warm water and then sow in spring in situ[200]. The seed can also be sown in situ in autumn. Green manure crops can be sown in situ from early spring until early autumn[87]. (the later sowings are for an over-wintering crop)

nwatta Dislikes acid soils[87]. (This conflicts with the notes on its habitat above.) Dislikes shade. A good food plant for many caterpillars[30]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is suckering with new plants from runners away from the plant [2-1].

### 5.1.34 *Vicia hirsuta*

Hairy Tare, Tiny vetch

tf02n 4 tin 9 cyuc 2 kcaak 3 tcan 0 dwat 0.5 m hkuc

and often sold in health shops etc[226]. Lime flowers are said to develop narcotic properties as they age and so they should only be harvested when freshly opened[238]. A charcoal made from the wood is used in the treatment of gastric or dyspeptic disturbances and is also made into a powder then applied to burns or sore places[4]. It is also quite an effective vasodilator[7].

propta Seed - much of the seed produced in Britain is not viable, cut a few seedcases open to see if there is a seed inside[80]. If possible, obtain fresh seed that is ripe but has not as yet developed a hard seed coat and sow it immediately in a cold frame. It may germinate in the following spring though it could take 18 months[80]. Stored seed can be very slow to germinate. It has a hard seed coat, embryo dormancy and a hard coat on the pericarp. All these factors mean that the seed may take up to 8 years to germinate[80]. One way of shortening this time is to stratify the seed for 5 months at high temperatures (10°C at night, up to 30°C by day) and then 5 months cold stratification[80]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Layering in spring just before the leaves unfurl. Takes 1 - 3 years[78]. Suckers, when formed, can be removed with as much root as possible during the dormant season and replanted immediately[200].

nwatta Landscape Uses:Espalier, Pollard, Screen, Specimen. Prefers a good moist loamy alkaline to neutral soil but succeeds on slightly acid soils[11, 200]. Grows poorly on any very dry or very wet soils[200]. Succeeds in sun or semi-shade[188]. Plants can be transplanted quite easily, even when quite large, trees up to 60 years old have been moved successfully[1, 74]. Lime trees are very long-lived[7] and are amenable to coppicing or pollarding. This species does not produce many suckers[98, 200]. Grows well in Britain, it is the only species that reliably produces viable seed in areas with cool summers[200]. Lime trees tend to hybridise freely if other members of the genus are growing nearby[238]. If growing plants from seed it is important to ensure the seed came from a wild source or from an isolated clump of the single species[K]. Grows best in a woodland situation, young plants tolerate a reasonable level of shade[200]. Mature trees cast a dense shade[186]. A very valuable bee plant, producing an abundance of nectar[7, 11, 125]. A valuable tree for wildlife, there are 31 species of insects associated with this tree[24]. A food plant for the caterpillars of many butterfly and moth species[30]. Trees are usually attacked by aphids which cover the ground and the leaves with a sticky honeydew[188]. There are some named varieties selected for their ornamental value[188]. Plants in this genus are notably resistant to honey fungus[200]. Special Features:Not North American native, Fragrant flowers, Attractive flowers or blooms.

### 5.2.2 *Quercus ilex*

Holly Oak, Evergreen Oak

4 tin 10 cyuc 5 kcaak 3 tcan 2 dwat 25 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfrp hpa7tli flatprikliwisliphosm hpa7tmwatli hjonli

drutta *Quercus ilex* is an evergreen Tree growing to 25 m (82ft) by 20 m (65ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from May to June, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline and saline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: Oil SeedEdible Uses: Coffee OilSeed - raw or cooked[1, 2, 46, 61]. It can be sweet or bitter[K]. The seed is up to 3cm long[200], it can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread. The seed from some trees contains bitter tannins, these can be leached out by thoroughly washing the seed in running water though many

minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute. An edible oil is obtained from the seed[183]. One reader noted the *Q. suber* population of the Mamora forest in Morocco contains only sweet acorns and can be eaten raw, it has a similar taste to raw chestnuts. The skin removes quite easily *Quercus ilex* also exists with tannin-free acorns in the Moroccan forests, the locals say around 20 percent are sweet.

tcanta Fodder Fuel Hedge Hedge Oil Repellent Shelterbelt Tannin WoodLandscape Uses: Specimen, Street tree. A much of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth[20]. Oak galls are excrescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4]. Very tolerant of maritime exposure and of trimming, it can be grown as a shelterbelt tree or hedge in maritime areas[11, 29, 49, 75]. Wood - strong, hard, durable. Used for furniture[46, 61, 89]. It makes a good charcoal[89] and a good fuel, burning well even if green[146]. The bark is a source of tannin[146]. Heat Zone: 9-2.

dwatta Astringent DysenteryAny galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4].

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Fodder: Mast Industrial Crop: Tannin Management: Standard Other Systems: Dehesa Regional Crop Staple Crop: Balanced carbPrefers a good deep fertile loam which can be on the stiff side[11]. Thrives on shallow chalky soils[188]. Succeeds in all soils except those that are cold and poorly drained[98]. Grows well in sandy soils[188]. Young plants tolerate reasonable levels of side shade[200]. Very resistant to maritime exposure[11, 49, 75]. A very ornamental tree[1] but it is quite slow-growing[75]. Transplants badly unless moved regularly and this should be done as growth commences in late May or in September[11]. Fruits very freely in Britain[K]. The seed ripens in its first year[200]. The sub-species *Q. ilex* ballota is cultivated for its sweet-tasting edible seed in Portugal and Spain[K]. Hybridizes freely with other members of the genus[200]. This species is notably resistant to honey fungus[88, 200]. Special Features: Not North American native, Inconspicuous flowers or blooms. The plant is heat tolerant in zones 9 through 2. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2].

### 5.1.66 *Alnus maximowiczii*

tf02n 4 tlin 8 cyuc 0 kcak 0 tcan 0 dwat m hkuc hmimhtut cyutli tcuphja7n hwicli hysijlutnykfrp hpa7tli flat-prikliws hpa7tmwatli hjonli

drutta *Alnus maximowiczii* is a deciduous Tree growing to 9 m (29ft 6in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from March to April. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. It can fix Nitrogen. Suitable for: medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

ckakta None known

tcanta Charcoal Dye WoodA dye is obtained from the bark[46, 61]. No more details are given. Wood - close grained. Used for turnery, charcoal[46, 61].

dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe and only just covered[200]. Spring sown seed should also germinate successfully so long as it is not covered[200, K]. The seed should germinate in the spring as the weather warms up. When large enough to handle, prick the seedlings out into individual pots. If growth is sufficient, it is possible to plant them out into their permanent positions in the summer, otherwise keep them in pots outdoors and plant them out in the spring. If you have sufficient quantity of seed, it can be sown thinly in an outdoor seed bed in the spring[78]. The seedlings can either be planted out into their permanent positions in the autumn/winter, or they can be allowed to grow on in the seed bed for a further season before planting them. Cuttings of mature wood, taken as soon as the leaves fall in autumn, outdoors in sandy soil.

nwatta Prefers a heavy soil and a damp situation[1, 11]. Grows well in heavy clay soils[11]. Tolerates very infertile sites[200]. A polymorphic species[58], it is closely related to *A. viridis*[200]. This species has a symbiotic relationship with certain soil micro-organisms, these form nodules on the roots of the plants and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

### 5.1.67 *Senna marilandica*

Wild Senna, Maryland senna

tf02n 4 tlin 8 cyuc 0 kcak 0 tcan 3 dwat m hkuc hmimhtut cyutli hgatkuyctcup hwicli hrasjlutnyk hpa7tli flat-prikliws hpa7tmwatli xre7t hjonli

drutta *Senna marilandica* is a deciduous Shrub growing to 1.5 m (5ft) by 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from July to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

ckakta None known

tcanta None known

dwatta Cardiac Cathartic Diuretic Diuretic Febrifuge Poulrice VermifugeThe leaves and seedpods are cathartic, diuretic and vermifuge[1, 11, 21, 46]. The leaves are harvested before and during flowering, the pods are harvested when fully ripe in the autumn. Both are dried for later use[238]. The leaves are a safe and effective cathartic[207, 213]. They are best used with *Foeniculum vulgare* seeds in order to counteract a tendency to cause gripe[207, 213]. The seedpods can also be used and are milder but slower in their action[222]. The seeds have been soaked in water until they are mucilaginous and then swallowed as a treatment for sore throats[213, 257]. The root is cardiac and febrifuge[257]. An infusion

has been used in the treatment of fevers and heart problems[257]. A poultice of the root has been used in treating sores[257].

propta Seed - scarify and then pre-soak the seed for 2 - 3 hours in warm water before sowing it from early spring to early summer in a warm greenhouse[138]. The seed usually germinates in 1 - 12 weeks at 23°C[138]. Prick out the seedlings into individual pots once they are large enough to handle and grow them on in the greenhouse. Do not plant them out until the following spring[138]. Division as growth commences in spring[11]. Cuttings of moderately ripe wood, July in a frame[1].

nwatta Succeeds in most well-drained soils but prefers an open sandy loam in a sunny sheltered position[1, 11, 200]. Established plants are drought tolerant[200]. Succeeds in light shade, but the plant is much less vigorous when grown in dry shade[200]. Although fairly cold-tolerant, plants can be killed in very severe weather, so it is best to mulch the roots of mature plants in bad winters[11]. Younger plants should be mulched each winter until they are well established[200]. Slugs are very attracted to this plant[K]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

## 5.2 mran

### 5.2.1 *Tilia platyphyllos*

Large Leaved Lime, Largeleaf linden, Bigleaf Linden

4 tlin 6 cyuc 5 kcak 4 tcan 3 dwat 30 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyk hpa7tli flatprikliws hpa7tmwatli xre7t hjonli

drutta *Tilia platyphyllos* is a deciduous Tree growing to 30 m (98ft) by 20 m (65ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to July, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

ckakta Edible Parts: Leaves SapEdible Uses: Chocolate TeaYoung leaves - raw. A delicious addition to salads and sandwiches, the young leaves are mild and tender with a somewhat mucilaginous texture[K]. A very acceptable chocolate substitute can be made from a paste of the ground-up flowers and immature fruit. Trials on marketing the product failed because the paste is very apt to decompose[2, 115]. A popular herb tea is made from the flowers, it has a sweet, fragrant pleasant flavour. Some caution is advised, see notes above on toxicity. Sap - harvested in the spring, it is sweet and can be used as a drink or concentrated into a syrup[4].

tcanta Charcoal Fibre Paper WoodA fibre from the inner bark is used to make mats, shoes, baskets, ropes etc[1, 13, 14, 46, 61, 100]. It is also suitable for cloth[115]. It is harvested from trunks that are 15 - 30cm in diameter[115]. The fibre can also be used for making paper[189]. The stems are harvested in spring or summer, the leaves are removed and the stems steamed until the fibres can be stripped. The outer bark is removed from the inner bark by peeling or scraping. The fibres are cooked for 2 hours with lye and then beaten in a ball mill. The paper is beige in colour[189]. Wood - soft, white, easily carved. It is very suitable for carving domestic items and small non-durable items[4, 13, 46, 61, 115]. A charcoal made from the wood is used for drawing and has medicinal properties[7, 46, 61, 115].

dwatta Antispasmodic Diaphoretic Diuretic Expectorant Hypotensive Laxative SedativeLime flowers are a popular domestic remedy for a number of ailments, especially in the treatment of colds and other ailments where sweating is desirable[9]. A tea made from the fresh or dried flowers is antispasmodic, diaphoretic, expectorant, hypotensive, laxative and sedative[4, 9, 13, 226, 238]. Lime flower tea is also used internally in the treatment of indigestion, hypertension, hardening of the arteries, hysteria, nervous vomiting or palpitation[4, 238]. The flowers are harvested commercially

hmimhtut cyutli tcup hwicli hrasjlutnyk hpa7tli flatprikliws hpa7tmwatli fyifxre7t hjonli

drutta *Vicia hirsuta* is a ANNUAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from May to August, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). The plant is self-fertile. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

ckakta Edible Parts: Leaves SeedEdible Uses: Seed - cooked[2, 105, 177]. Used like lentils[2], the seed can be eaten as a staple food[178]. Leaves and stems - cooked[105, 177, 178]. Used as a vegetable[272]

tcanta General insect (especially bees) nectar plant. Shelter plant for beneficial insects including lacewings, parasitic Wasps, beetles and spiders. Pioneer Species - helps reestablish overused or damaged land. Nitrogen Fixing Plant - this plant creates its own nitrogen through a symbiotic relationship with microorganisms (bacteria) in its roots. Dynamic Accumulator Species - Potassium, Phosphorus, Nitrogen.

dwatta None known

propta Pre-soak the seed for 24 hours in warm water and then sow in situ in spring or autumn.

nwatta Succeeds in any well-drained soil in a sunny position if the soil is reliably moist throughout the growing season, otherwise it is best grown in semi-shade[200]. Occasionally cultivated for its edible seed which is used as a lentil substitute[2]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. When removing plant remains at the end of the growing season, it is best to only remove the aerial parts of the plant, leaving the roots in the ground to decay and release their nitrogen.

### 5.1.35 *Wisteria frutescens*

American Wisteria

tf02n 4 tlin 8 cyuc 1 kcak 3 tcan 0 dwat 12 m hkuc htut cyutli tcup hwicli hrasjlutnyk hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta *Wisteria frutescens* is a deciduous Climber growing to 12 m (39ft 4in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers moist soil.

ckakta Edible Parts: FlowersEdible Uses: The fresh flowers are eaten in tossed green salads[183]. They are said to be excellent when dipped in batter and fried in oil as fritters[183].

tcanta Nitrogen fixer.

dwatta None known

propta The seed does not exhibit any dormancy habits. It can be sown as soon as it is ripe in a cold frame and should germinate in the spring. Pre-soak stored seed for 24 hours in warm water and then sow in a greenhouse in early spring. The seed can also be sown in an outdoor seedbed in late spring[126]. Germination should take place in the first spring, though it can sometimes be delayed for another 12 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant them out in late spring or early summer. Plants are very slow from seed and can take up to 20 years to come into flower[200]. Basal cuttings of side-shoots in early to mid summer in a frame[200]. Take the cuttings as soon as the new growth has hardened sufficiently, each cutting should have 2 - 3 leaves[249]. It can also help to remove a shallow slice of bark from the bottom 15mm of the cutting to expose extra cambium, since this will encourage more callusing and better rooting[249]. When kept in a mist frame with a bottom heat of 27 - 30°C, they will root within 4 weeks and produce well-established plants by the

autumn[249]. Layering in spring. Simply lay any convenient long shoot along the ground and cover it with a shallow layer of soil. The shoot will readily produce roots at intervals along the stem. When these are well formed, the shoot can be divided up into a number of plants. These should be potted up and kept in a lightly shaded position in a greenhouse until well established and can then be planted out as required.

nwatta Prefers a good loamy soil in a sunny south or south-west facing position, sheltered from cold winds and from early morning sun on frosty mornings[11, 200]. Plants can become chlorotic on alkaline soils[200]. A soil that is too rich results in excessive foliage at the expense of flowering[200]. Plants can take a few years to settle down after planting out[219]. Too much shade or too rich a soil are normally the culprits, some form of root restriction can be beneficial[219]. A number of named forms have been selected for their ornamental value[200]. Any drastic pruning is best carried out in the spring, immediately after flowering[249]. Plants are very tolerant of even the most drastic pruning and will re-grow even if cut right back to the base[249]. Plants in this genus are notably susceptible to honey fungus[200]. A climbing plant, twining in an anticlockwise direction around the stems of other plants[249]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. The plants also form a symbiotic relationship with a mycorrhizal fungus which makes more water, phosphorus and other minerals available to the plants[249]. *Wisteria macrostachya* (Torr. and A.Gray) Robinson and Fer is a synonym of *Wisteria frutescens* (L.) Poir. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. Woody. Growth habit is a single or multiple shooting vine from a crown [1-2].

### 5.1.36 *Wisteria venusta*

Silky Wisteria

tf02n 4 tlin 8 cyuc 1 kcak 0 tcan 2 dwat 10 m hkuc htut cyutli tcup hwicli hrasjlutnyk hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta *Wisteria venusta* is a deciduous Climber growing to 10 m (32ft) by 10 m (32ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers moist soil.

ckakta Edible Parts: Leaves SeedEdible Uses: Seed - cooked[105]. Some caution is advised, see notes on toxicity at the top of the page. Young leaves - cooked[61, 105].

tcanta FibreA fibre obtained from the bark is used for making cloth and thread[46, 61, 249].

dwatta Antiinflammatory AntitumorGalls that develop on the plant as a result of infection by the bacterium *Erwinia milletiae* are used in Japanese folk medicine as an anti-inflammatory agent[249]. Recent research has shown that substances in these galls can be used in the treatment of gastric cancer and can also inhibit kin tumour promotion by the Epstein-Barr virus[249].

propta The seed does not exhibit any dormancy habits. It can be sown as soon as it is ripe in a cold frame and should germinate in the spring. Pre-soak stored seed for 24 hours in warm water and then sow in a greenhouse in early spring. The seed can also be sown in an outdoor seedbed in late spring[126]. Germination should take place in the first spring, though it can sometimes be delayed for another 12 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant them out in late spring or early summer. Plants are very slow from seed and can take up to 20 years to come into flower[200]. Basal cuttings of side-shoots in early to mid summer in a frame[200]. Take the cuttings as soon as the new growth has hardened sufficiently, each cutting should have 2 - 3 leaves[249]. It can also help to remove a shallow slice of bark from the bottom 15mm of the cutting to expose extra cambium, since this will encourage more callusing and better rooting[249]. When kept in

a mist frame with a bottom heat of 27 - 30°C, they will root within 4 weeks and produce well-established plants by the autumn[249]. Layering in spring. Simply lay any convenient long shoot along the ground and cover it with a shallow layer of soil. The shoot will readily produce roots at intervals along the stem. When these are well formed, the shoot can be divided up into a number of plants. These should be potted up and kept in a lightly shaded position in a greenhouse until well established and can then be planted out as required.

nwatta Prefers a good loamy soil in a sunny south or south-west facing position, sheltered from cold winds and from early morning sun on frosty mornings[11, 200]. Plants can become chlorotic on alkaline soils[200]. A soil that is too rich results in excessive foliage at the expense of flowering[200]. Hardy to about -20°C[184, 200]. Plants can take a few years to settle down after planting out[219]. Too much shade or too rich a soil are normally the culprits, some form of root restriction can be beneficial[219]. The name for this species was originally based on the cultivated garden form with white flowers. The true wild form is known as *W. venusta violacea*. Rehd[200]. Cultivated as a fibre plant in Japan[61]. There are several named varieties, deleted for their ornamental value[249]. The flowers are scented, the smell can be either sweet or musky according to the variety being grown[249]. The plants flower mainly on short spurs so, if removing unwanted side-branches, it is best to cut them back to 2 - 3 leaves rather than removing them completely since this will encourage the formation of flowering spurs[249]. Any drastic pruning is best carried out in the spring, immediately after flowering[249]. Plants are very tolerant of even the most drastic pruning and will re-grow even if cut right back to the base[249]. A vigorous climbing plant supporting itself by twining around other plants, the shoots twine in an anticlockwise direction[184, 249]. Plants in this genus are notably susceptible to honey fungus[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. The plants also form a symbiotic relationship with a mycorrhizal fungus which makes more water, phosphorus and other minerals available to the plants[249].

### 5.1.37 Robinia luxurians

New Mexico locust

tfo2n 4 tlin 8 cyuc 1 kcaak 0 tcan 0 dwat 8 m hkuc hmimhtut cyutli hgatkuyctcup hwicli hyhisrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Robinia luxurians is a deciduous Tree growing to 8 m (26ft 3in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to August. The species is hermaphrodite (has both male and female organs). It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought. It can tolerate atmospheric pollution.

kcaakta Edible Parts: FlowersEdible Uses: Flowers - raw[105].

tcanta Soil stabilization WoodPlants succeed in dry barren sites, their suckering habit making them suitable for stabilizing banks[200]. Wood - heavy, exceedingly hard, strong, close-grained[82].

dwatta None known

propta Seed - pre-soak for 48 hours in warm water and sow the seed in late winter in a cold frame[80]. A short stratification improves germination rates and time[80]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in the following summer. The seed stores for over 10 years[113]. Suckers taken during the dormant season.

nwatta Succeeds in any soil, preferring one that is not too rich[1, 200]. Requires a well-drained soil, succeeding on dry barren sites[200]. Plants are tolerant of drought and atmospheric pollution[200]. Succeeds in a hot dry position. The branches are brittle and very liable to wind damage[200]. When plants are grown in rich soils they produce coarse and rank growth which is even more liable to wind

damage[11, 200]. Any pruning should be done in late summer in order to reduce the risk of bleeding[200]. Plants in this genus are notably resistant to honey fungus[200]. The flowers are fragrant[245]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

### 5.1.38 Maackia amurensis

Chinese Yellow Wood, Amur maackia

tfo2n 4 tlin 7 cyuc 1 kcaak 4 tcan 0 dwat 6 m hkuc htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Maackia amurensis is a deciduous Shrub growing to 6 m (19ft) by 6 m (19ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from July to August, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcaakta Edible Parts: LeavesEdible Uses: Young leaves - cooked[105, 177].

tcanta WoodWood - heavy, strong, very hard. Used for the interior of houses, utensils, tool handles etc[46, 61]. Nitrogen Fixer.

dwatta None known

propta Pre-soak the seed for 24 hours in hot water and then sow it in a cold frame in the autumn[200]. The seed can also be pre-soaked and sown in late winter in a greenhouse[78]. Variable germination. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Root cuttings 4cm long in December. Good percentage[78].

nwatta Landscape Uses:Pest tolerant, Specimen, Street tree. Succeeds in most soils and situations, including deep soils over chalk and dry soils[1, 200]. Prefers a good soil in a sunny position[1]. Prefers a well-drained sandy soil[245]. A very hardy plant, tolerating temperatures down to about -25°C[200]. A polymorphic species[58]. It is closely related to the genus *Cladrastis*[200], and sometimes included in that genus[245]. Plants flower when quite young[200]. The flowers have a powerful scent of vanilla[245]. Transplants readily, even when fairly large[200], but the mature plants resent pruning[200]. Plants in this genus are notably resistant to honey fungus[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. Special Features:Not North American native, Attractive flowers or blooms. The plant is heat tolerant in zones 7 through 5. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2].

### 5.1.39 Amorpha fruticosa

False Indigo, False indigo bush

tfo2n 4 tlin 8 cyuc 1 kcaak 3 tcan 2 dwat 4.5 m hkuc hmimhtut cyutli hgatkuyctcup hwicli hyhisrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Amorpha fruticosa is a deciduous Shrub growing to 4.5 m (14ft 9in) at a medium rate. See above for USDA har-

frame until they are rooting well. Plant them out in the summer or following spring.

nwatta Landscape Uses:Erosion control, Ground cover. Prefers an open well-drained calcareous soil in a sunny position[1, 13, 111]. Tolerates poor soils[200]. Tolerates a pH in the range 4.8 to 7.2. A food plant for the caterpillars of many lepidoptera species[30]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. Special Features:Attractive foliage, Invasive, Naturalizing.

### 5.1.63 Amorpha nana

Dwarf Indigobush, Dwarf false indigo, Dwarf Indigo

tfo2n 4 tlin 8 cyuc 0 kcaak 2 tcan 1 dwat 0.6 m hkuc hmimhtut cyutli hgatkuyctcup hwicli hyhisrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Amorpha nana is a deciduous Shrub growing to 0.6 m (2ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from July to August. The species is hermaphrodite (has both male and female organs). It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcaakta None known

tcanta Insecticide Soil stabilizationThe resinous pustules on some species yield the insecticide 'amorpha'[200]. The plant has a strong spreading root system and this makes it useful for controlling soil erosion[200].

dwatta ExpectorantThe plant has been used as a snuff in the treatment of catarrh[257].

propta Seed - pre-soak for 12 hours in warm water and sow early spring in a greenhouse[78, 133]. The seed usually germinates in 1 - 2 months at 20°C[133]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, June/July in a frame. High percentage[78]. Cuttings of mature wood of the current seasons growth, autumn, in a sheltered position outdoors. Takes 12 months[78]. Suckers in spring just before new growth begins[200]. Layering in spring .

nwatta Landscape Uses:Erosion control. Prefers a light well-drained sandy soil in sun or light shade[200]. Fairly wind-resistant[200]. A very hardy plant, tolerating temperatures down to about -25c[200]. Plants resent root disturbance, they should be planted out into their final positions whilst small[133]. Plants are said to be immune to insect pests[200]. Flowers are produced on the current season's growth[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. Special Features:Invasive, Naturalizing, Attractive flowers or blooms. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is multistemmed with multiple stems from the crown [1-2].

### 5.1.64 Lespedeza maximowiczii

tfo2n 4 tlin 8 cyuc 0 kcaak 3 tcan 0 dwat m hkuc

htut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Lespedeza maximowiczii is a deciduous Shrub growing to 3.5 m (11ft 6in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in August, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic

(mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcaakta None known  
tcanta BroomThe twigs are used in making brooms[151]. Nitrogen Fixer.

dwatta None known

propta Pre-soak the seed for 24 hours in warm water and then sow it in spring in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in individual pots in a frame. It can be difficult to get the cuttings through their first winter, it is best to plunge the pots in a bed of ashes in a sheltered border outdoors[78].

nwatta Easily grown in a light loam in full sun[11]. The top growth is not very cold tolerant, although the rootstock is considerably hardier. Plants are usually cut back to the ground in all but very mild winters, though they generally resprout well from the base in the following spring and flower in late summer[182]. Closely related to *L. buergeri*[58]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

### 5.1.65 Baptisia bracteata

Plains Wild Indigo, Longbract wild indigo, False Indigo, Cream Wild Indigo

tfo2n 4 tlin 9 cyuc 0 kcaak 0 tcan 2 dwat 0.7 m hkuc htut cyutli kyuctcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Baptisia bracteata is a PERENNIAL growing to 0.7 m (2ft 4in) by 0.6 m (2ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from May to June, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs). It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers dry or moist soil.

kcaakta None known

tcanta None known

dwatta Alterative AstringentAn ointment made from the ground seeds is applied to the stomach in the treatment of colic[222]. A tea made from the roots is used in the treatment of typhoid and scarlet fever[222]. The leaves are astringent and are applied externally to wounds etc[222]. Recent research suggests that the plant can stimulate the immune system[222].

propta Seed - best sown as soon as it is ripe in a cold frame[200]. Stored seed should be pre-soaked for 24 hours in warm water and then sown in a cold frame in late winter or early spring. Prick out the seedlings into individual pots as soon as they are large enough to handle and plant them out into their permanent positions in the summer or following spring. Division in spring[188]. Larger divisions can be planted straight into their permanent positions whilst smaller clumps are best potted up and kept in a cold frame until they are growing away well.

nwatta Landscape Uses:Border, Ground cover, Seashore. Prefers a deep, well-drained neutral to slightly acid soil in full sun[188, 200]. Grows freely in a loamy soil[1]. Succeeds in a hot dry position. Succeeds in a rich moist soil in sun or light shade[187]. Hardy to about -20°C[187]. Plants have a very deep root system and dislike root disturbance, they should be left alone once they are established[188, 233]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. Special Features:Attractive foliage, North American native, Naturalizing, Attractive flowers or blooms.

heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta None Known  
tcanta Nitrogen fixer. Invertebrates shelter: beneficial for insects and other arthropods [1-2]. The foliage is highly palatable to hoofed mammalian herbivores (Banta and Thro, 1995).

dwatta None known  
propta Seed  
nwatta Prefers full or partial sun, mesic (environment or habitat containing a moderate amount of moisture) to dry conditions, and a somewhat acidic infertile soil where there is reduced competition from other kinds of ground vegetation [1-6]. Bloom Color: Yellow. Bloom Time: May to Sep. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2].

## 5.1.60 Genista germanica

tfo2n 4 tlin 8 cyuc 0 kcak 0 tcan 1 dwat 0.6 m hkuc  
htut cyutli hgatkycutcup hwicli hyishrasjlut hpa7tli frusflat-prikwiisslip hpa7tmwatli xre7t hjonli

drutta Genista germanica is a deciduous Shrub growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta None known  
tcanta Dye MiscellanyA yellow dye is obtained from the plant[61].

dwatta MiscellanyFormerly cultivated as a medicinal plant[1]. No further details.

propta The seed requires a period of cold stratification and is best sown autumn in a cold frame. Pre-soak stored seed for 24 hours in warm water and sow February in a cold frame. Good germination[78]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Cuttings of half-ripe wood, 5-10 cm with a heel, July/August in a frame. Roots are formed in the spring[11]. Cuttings of ripe wood, 5-10 cm with a heel, September/October in a frame. Good percentage. Plant out the following autumn[78].

nwatta Easily grown in a light well-drained soil in a sunny position[1]. Plants grow very rank in rich soils[11]. Prefers a rather dry soil[11]. Succeeds in acid or basic soils[200]. Plants resent root disturbance and should be placed in their permanent positions as soon as possible[11]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

## 5.1.61 Caragana microphylla

Littleleaf Peashrub  
tfo2n 4 tlin 9 cyuc 0 kcak 3 tcan 0 dwat m hkuc  
htut cyutli tcup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta Caragana microphylla is a deciduous Shrub growing to 2 m (6ft) by 3 m (9ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4. The flowers are pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta None known  
tcanta Fodder Hedge Shelterbelt Soil stabilization StrawThis species is planted for dune stabilization and for

soil and water conservation[266]. Carbon Farming - Agroforestry Services: nitrogen, contour hedgerow, windbreak. Fodder: bank.

dwatta None known  
propta Seed - best sown as soon as it is ripe in a cold frame[200 ]. It usually germinates in 2 weeks[K J]. Stored seed should be pre-soaked for 24 hours in warm water then sown in a cold frame[78 , 113 , 200 ]. If the seed has not swollen then scarify it and re-soak for another 12 hours before sowing[138 J]. Germination usually takes place within 2 - 3 weeks at 20°c[138 J]. Good percentage[11 ]. As soon as they are large enough to handle, prick the seedlings out into individual pots and grow them on in a greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm with a heel, mid summer in a frame[113 ]. Layering in spring.

nwatta Agroforestry Services: Contour hedgerow Agroforestry Services: Nitrogen Agroforestry Services: Windbreak Fodder: Bank Management: Coppice Management: Standard Regional CropCaragana microphylla prefers a continental climate with its hot summers, cold winters and usually a clear movement from one season to another. The dormant plant can tolerate temperatures down to at least -30°c, but in more maritime climates it is often tempted to come into growth early and this new growth can easily be damaged by late spring frosts[200 ]. Prefers full sun and a light sandy dry or well-drained soil[1 , 11 , 200 ]. Dislikes damp conditions[1 ]. Does not require a rich soil, succeeding on marginal land[11 ]. Caragana microphylla is a polymorphic species and in some cases with transitional forms[266 ]. Hybrids between this species and Caragana korshinskii may occur where these species are sympatric[266 ]. Plants in this genus are notably resistant to honey fungus[200 ]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200 ]. Climate: boreal to warm temperate. Humidity: arid to semi-arid. Carbon Farming - Cultivation: regional crop. Management: standard, coppice.

## 5.1.62 Coronilla varia

Crown Vetch  
tfo2n 4 tlin 9 cyuc 0 kcak 0 tcan 1 dwat 0.3 m hkuc  
htut cyutli kyuctcup hwicli hyishrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Coronilla varia is a PERENNIAL growing to 0.3 m (1ft) by 1 m (3ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to November, and the seeds ripen from August to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It can fix Nitrogen. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: OilEdible Uses: OilNone known  
tcanta Insecticide Oil Soil stabilizationCan be used as an insecticide[153]. No more details are given. A good ground cover and soil stabilizer for sunny banks and slopes[200, 208]. It grows rampantly and should not be grown with plants less than 1.8 metres tall[208].

dwatta Cardiotonic Emetic SalveThe whole plant, used either fresh or dried is a cardiotonic[9, 13]. It should be used with extreme caution, see the notes above on toxicity[9]. A decoction of the bark has been used as an emetic[257]. The crushed plant has been rubbed on rheumatic joints and cramps[257].

propta Seed - best sown in situ as soon as it is ripe. The seed usually germinates in the autumn. Stored seed can be pre-soaked for 12 hours in warm water and then sown in situ in April[111]. Cuttings of half-ripe shoots with a heel, June/July in a frame. Can also be taken in spring[111]. Division in March[111]. Very easy, larger clumps can be re-planted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold

diness. It is hardy to UK zone 4. It is in flower in July. The species is hermaphrodite (has both male and female organs). It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: OilEdible Uses: Condiment OilThe crushed fruit is used as a condiment[105, 177, 183].

tcanta Bedding Dye Fodder Insecticide Oil Repellent Shelterbelt Soil stabilizationPlants have an extensive root system and are also fairly wind tolerant, they can be planted as a windbreak and also to prevent soil erosion[200]. Resinous pustules on the plant contain 'amorpha', a contact and stomachic insecticide that also acts as an insect repellent[57, 200]. The stems are used as bedding[61]. The plant contains some indigo pigment and can be used to make a blue dye[169]. Unfortunately, the pigment is only present in very small quantities, there is not enough to harvest commercially[169].

dwatta EczemaA user has recently sent us an article in www.frontiersin.org Amorpha fruticosa - A Noxious Invasive Alien Plant in Europe or a Medicinal Plant against Metabolic Disease? which states "Native Americans of the Great Plains employed several of the more common Amorpha species for a variety of uses. Amorpha fruticosa was used for bedding material, horse feed, arrow shafts, the stems were arranged on the ground to create a clean surface on which to put butchered meat, and name "false indigo" is related to the application of the plant as a blue dye (Hoffman, 1891; Gilmore, 1913, 1919; Smith, 1928; Vestal and Schultes, 1939; Munson, 1981; Kindscher and Noguera, 2002; Austin, 2004; Straub, 2010). For medicinal purposes such as stomach pain, intestinal worms, eczema, neuralgia, and rheumatism, the related species A. canescens was used and its powdered leaves were applied to wounds (Hoffman, 1891; Gilmore, 1913, 1919; Smith, 1928, Straub, 2010). Moreover, reports for medicinal use of Amorpha fruticosa are also available: The Semeioles used infusion from leaves and stems as a general tonic and also against rheumatism and chronic sickness together with other plants; the Omaha used the plant to cure wounds (Munson, 1981; Austin, 2004)." We will research and update this section soon.

propta Seed - pre-soak for 12 hours in warm water and then sow early spring in a greenhouse[78, 133]. The seed usually germinates in 1 - 2 months at 20°c[133]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, June/July in a frame. High percentage[78]. Cuttings of mature wood of the current seasons growth, autumn, in a sheltered position outdoors. Takes 12 months[78]. Suckers in spring just before new growth begins[200]. Layering in spring .

nwatta Agroforestry Services: Alley crop Agroforestry Services: Contour hedgerow Agroforestry Services: Nitrogen Agroforestry Services: Windbreak Fodder: Bank Industrial Crop: Pesticide Management: Coppice Minor Global CropPrefers a light well-drained sandy soil in sun or light shade[184, 200]. Plants are fairly wind-resistant[200]. A very hardy plant, tolerating temperatures down to about -25c[184, 200]. A polymorphic species, there are many named forms[43]. The flowers have a vanilla perfume[245]. Plants resent root disturbance, they should be planted out into their final positions whilst small[133]. Trees only ripen their seed in fine autumns[80]. Plants are said to be immune to insect pests[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. The plant is heat tolerant in zones 8 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates

that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is multistemmed with multiple stems from the crown [1-2]. The root pattern is flat with shallow roots forming a plate near the soil surface [1-2]. The root pattern is suckering with new plants from underground runners away from the plant [1-2].

## 5.1.40 Trifolium macrocephalum

Bighead Clover, Largehead clover  
tfo2n 4 tlin 8 cyuc 1 kcak 3 tcan 0 dwat m hkuc  
htut cyutli tcup hwicli hyishrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Trifolium macrocephalum is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 4. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves - cooked and used as a greens[212].

tcanta Dynamic accumulator.  
dwatta None known  
propta Pre-soak the seed for 12 hours in warm water and then sow in spring in situ. If the seed is in short supply it might be better to sow it in pots in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in late spring. Division in spring.

nwatta Succeeds in a moist, well-drained circum-neutral soil in full sun[200]. Succeeds in poor soils. It grows well in an apple orchard, the trees will produce tastier fruit that stores better[201]. It should not be grown with camellias or gooseberries because it harbours a mite that can cause fruit drop in the gooseberries and premature budding in the camellias[201]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. Buttercups growing nearby depress the growth of the nitrogen bacteria by means of a root exudate[201].

## 5.1.41 Alnus viridis crispa

American Green Alder  
tfo2n 4 tlin 8 cyuc 1 kcak 3 tcan 2 dwat 3 m hkuc  
hmimhtut cyutli tcuphja7n hwicli hysjlutnyikrip hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta Alnus viridis crispa is a deciduous Shrub growing to 3 m (9ft) by 3 m (9ft). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from April to May. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. It can fix Nitrogen. Suitable for: medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta Edible Parts: FlowersEdible Uses: Catkins - raw or cooked. A bitter taste[172].

tcanta Dye TeethAn orange-red to brown dye can be obtained from the bark[257]. Nitrogen fixer.

dwatta Abortifacient Appetizer Astringent Emetic Emmenagogue Haemostatic Poultice Skin Stomachic Tonic-The bark is astringent, emetic, haemostatic, stomachic and tonic[172]. The bark was burnt as an inhalant in the treatment of rheumatism[257]. The ashes were also used as a tooth cleaner[257]. A decoction of the inner bark has been used as a carminative to reduce gas in the stomach and as a febrifuge[257]. A decoction of the plant has been used in a steam treatment to bring about menstruation - it has been used as an abortifacient[257]. A poultice of the leaves has

been used to treat infected wounds or sores[257]. The poultice was left in place over the wound until the leaves stuck to it and was then pulled off, removing the 'poison' with it[257]. An infusion of the plant tops was given to children with poor appetites[257].

propta Seed - best sown in a cold frame as soon as it is ripe and only just covered[200]. Spring sown seed should also germinate successfully so long as it is not covered[200, K]. The seed should germinate in the spring as the weather warms up. When large enough to handle, prick the seedlings out into individual pots. If growth is sufficient, it is possible to plant them out into their permanent positions in the summer, otherwise keep them in pots outdoors and plant them out in the spring. If you have sufficient quantity of seed, it can be sown thinly in an outdoor seed bed in the spring[78]. The seedlings can either be planted out into their permanent positions in the autumn/winter, or they can be allowed to grow on in the seed bed for a further season before planting them. Cuttings of mature wood, taken as soon as the leaves fall in autumn, outdoors in sandy soil.

nwatta Prefers a heavy soil and a damp situation[1, 11]. Grows well in heavy clay soils. A useful plant for cold damp places[11]. Tolerates lime and very infertile sites[11, 200]. This species has a symbiotic relationship with certain soil micro-organisms, these form nodules on the roots of the plants and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

### 5.1.42 Robinia neomexicana

New Mexico Locust, Rusby’s locust, Locust tfo2n 4 tlin 8 cyuc 1 kcaak 0 tcan 1 dwat 2 m hkuc hmimhtut cyutli hgatkyuctcup hwicli hyishrasjlutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Robinia neomexicana is a deciduous Tree growing to 2 m (6ft 7in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to August. The species is hermaphrodite (has both male and female organs). It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought. It can tolerate atmospheric pollution.

kcaakta Edible Parts: Flowers Seed SeedpodEdible Uses: Flowers - raw or cooked[105, 155, 161, 183, 257]. They can be used as a flavouring in cooked dishes[257]. The flowers can be boiled, then dried and stored for later use[257]. Seedpods - raw or cooked[229, 257]. They are gathered in the fall and eaten when fresh[229]. The pods can also be cooked then dried and stored for later use[257]. Seed - cooked[229, 257].

tcanta Fodder Soil stabilization WoodPlants succeed in dry barren sites, their suckering habit making them suitable for stabilizing banks[200, 229]. Wood - tough, elastic and durable[155, 257]. Used for fence posts etc[155].

dwatta Antirheumatic EmeticAntirheumatic[149, 216]. An emetic, it is used to clear the stomach[216, 257].

propta Seed - pre-soak for 48 hours in warm water and sow the seed in late winter in a cold frame[80]. A short stratification improves germination rates and time[80]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in the following summer. The seed stores for over 10 years[113]. Suckers taken during the dormant season.

nwatta Agroforestry Services: Nitrogen Fodder: Bank Industrial Crop: Biomass Management: Coppice Regional CropLandscape Uses:Specimen. Succeeds in a hot dry position. Succeeds in any soil, preferring one that is not too rich[1, 200]. Requires a well-drained soil, succeeding on dry barren sites[200]. Plants are tolerant of drought and atmospheric pollution[200]. The branches are brittle and very liable to wind damage[200]. When plants

are grown in rich soils they produce coarse and rank growth which is even more liable to wind damage[11, 200]. Plants can be coppiced[155]. Any pruning should be done in late summer in order to reduce the risk of bleeding[200]. Plants in this genus are notably resistant to honey fungus[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. Special Features: North American native, Naturalizing, Attractive flowers or blooms.

### 5.1.43 Lathyrus palustris

Slenderstem Peavine, Marsh pea tfo2n 4 tlin 8 cyuc 1 kcaak 0 tcan 0 dwat 1.2 m hkuc htut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Lathyrus palustris is a PERENNIAL CLIMBER growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist or wet soil.

kcaakta Edible Parts: Leaves SeedEdible Uses: Seed - cooked[105, 161, 179]. The fully grown seeds are shelled and cooked as a vegetable[257]. Some caution is advised, see the notes above on toxicity. Young leaves and stems - cooked[177].

tcanta None known dwatta None known

propta Pre-soak the seed for 24 hours in warm water and then sow in early spring in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. If you have sufficient seed, then it can also be sown in situ in mid spring[200]. Division in spring. It may not transplant well so care should be taken[200].

nwatta A good plant for the bog or marsh garden, succeeding in wet soils[1, 200]. It is easily grown in any moderately good garden soil, preferring a position in full sun[200]. Plants climb by means of tendrils[188]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

### 5.1.44 Vicia cracca

Tufted Vetch, Bird vetch, Cow vetch tfo2n 4 tlin 8 cyuc 1 kcaak 3 tcan 1 dwat 1.8 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli fyifxre7t hjonli

drutta Vicia cracca is a PERENNIAL CLIMBER growing to 1.8 m (6ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from May to August, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Leaves SeedEdible Uses: TeaSeed - cooked[2, 22, 105]. They are boiled or roasted[183]. Leaves and young stems - cooked[105]. Used as a potherb[183]. The leaves are a tea substitute[183].

tcanta Green manureCan be used as a green manure[46]. A dynamic accumulator gathering minerals or nutrients from the soil and storing them in a more bioavailable form - used as fertilizer or to improve mulch.

dwatta GalactogogueThe cooked plant is used as a galactogogue[218].

propta Pre-soak the seed for 24 hours in warm water and then sow in situ in spring or autumn.

nwatta Succeeds in any well-drained soil in a sunny position if the soil is reliably moist throughout the growing season, otherwise it is best grown in semi-shade[200]. This

htut cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Baptisia lactea is a PERENNIAL growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in May. The species is hermaphrodite (has both male and female organs). It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers moist soil.

kcaakta None known

tcanta None known

dwatta Cathartic Emetic LaxativeCathartic, emetic, laxative[61].

propta Seed - best sown as soon as it is ripe in a cold frame[200]. Stored seed should be pre-soaked for 24 hours in warm water and then sown in a cold frame in late winter or early spring. Prick out the seedlings into individual pots as soon as they are large enough to handle and plant them out into their permanent positions in the summer or following spring. Division in spring[188]. Larger divisions can be planted straight into their permanent positions whilst smaller clumps are best potted up and kept in a cold frame until they are growing away well.

nwatta Prefers a deep, well-drained neutral to slightly acid soil in full sun[188, 200]. Grows freely in a loamy soil[1]. Plants are hardy to about -20°C[187]. Some modern works treat this species as a variety of *B. alba*, naming it *Baptisia alba macrophylla*. Somewhat shy flowering in British gardens[1]. Plants have a very deep root system and dislike root disturbance, they should be left alone once they are established[188, 233]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

### 5.1.56 Caragana gerardiana

tfo2n 4 tlin 8 cyuc 0 kcaak 0 tcan 0 dwat 1 m hkuc htut cyutli tcup hwicli hyishrasjlutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Caragana gerardiana is a deciduous Shrub growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcaakta None known

tcanta Hedge HedgePlants can be grown as a low impenetrable hedge. They are viciously spiny[200].

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame[200]. It usually germinates in 2 weeks[K]. Stored seed should be pre-soaked for 24 hours in warm water then sown in a cold frame[78, 113, 200]. If the seed has not swollen then scarify it and re-soak for another 12 hours before sowing[138]. Germination usually takes place within 2 - 3 weeks at 20°C[138]. Good percentage[11]. As soon as they are large enough to handle, prick the seedlings out into individual pots and grow them on in a greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in a frame[113]. Layering in spring.

nwatta Prefers full sun and a light sandy dry or well-drained soil in a hot position[11, 182, 200]. Does not require a rich soil, succeeding on marginal land[11, 200]. Plants often do not flower well in British gardens, due in large degree to our lack of summer sun[182]. This species prefers a continental climate with hot summers and cold winters, it does not grow well in areas with mild damp winters[11, 200]. Plants in this genus are notably resistant to honey fungus[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

### 5.1.57 Desmodium paniculatum

Panicled tick trefoil tfo2n 4 tlin 10 cyuc 0 kcaak 3 tcan 0 dwat 1 m hkuc hmimhtut cyutli kyuctcup hwicli hyishrasjlutnyik hpa7tli frusflatprik hpa7tmwatli hjonli

drutta Desmodium paniculatum is an evergreen Perennial growing to 1 m (3ft 3in) by 0.2 m (0ft 8in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. It can fix Nitrogen. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcaakta None Known

tcanta FodderCarbon Farming Solutions - Agroforestry Services: nitrogen, understorey legume. Fodder: bank, pasture (Agroforestry is a land use management system in which trees or shrubs are grown around or among crops or pasture-land). Attracts bees and attracts birds.

dwatta None Known

propta Seed germinates quickly (3-4 days) without scarification.

nwatta Agroforestry Services: Nitrogen Agroforestry Services: Understorey legume Fodder: Bank Fodder: Pasture Management: Fodder Wild CropClimate: cold to warm temperate. Humidity: semi-arid to humid. Prefers partial sun, mesic to dry-mesic conditions, and sandy or rocky soil. Light preferences: part-sun, part-shade. Low to medium water usage with a dry to moist soil. Soil type: acid and neutral and an average to poor loam, clay, or sand. Carbon Farming Solutions - Cultivation: wild. Management: fodder (Describes the non-destructive management systems that are used in cultivation) [1-1].

### 5.1.58 Lathyrus pratensis

Meadow Vetchling tfo2n 4 tlin 8 cyuc 0 kcaak 0 tcan 1 dwat 1.2 m hkuc htut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli fyifxre7t hjonli

drutta Lathyrus pratensis is a PERENNIAL growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from May to August, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist or wet soil.

kcaakta None known

tcanta RepellentThe plant is said to repel mice.

dwatta ResolventThe seeds are used as a resolvent in Spain[240].

propta Pre-soak the seed for 24 hours in warm water and then sow in early spring in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. If you have sufficient seed, then it can also be sown in situ in mid spring[200]. Division in spring. It may not transplant well so care should be taken[200].

nwatta An easily grown plant, succeeding in any moderately good garden soil but preferring a position in full sun[200]. Succeeds on wet soils. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

### 5.1.59 Stylosanthes biflora

Sidebeak pencilflower tfo2n 4 tlin 8 cyuc 0 kcaak 2 tcan 0 dwat 0.5 m hkuc hmimhtut cyutli hgatkyuctcup hwicli hyishrasjlutnyik hpa7tli flatprik hpa7tmwatli hjonli

drutta Stylosanthes biflora is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.5 m (1ft 8in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. The flowers are pollinated by Bees. It can fix Nitrogen. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and

tcanta HedgeNitrogen fixer. Excellent flowers and foliage. Specimen or screen. Good plant for stabilizing embankments and slopes and for planting in poor, dry soils. Interesting informal hedge. Food and shelter for beneficials including shelter for lacewings and parasitoid wasps. Hummingbird nectar plant and bird shelter [1-2].

dwatta Native American Tribe: The Cherokee had several uses for the plant including: Root bark chewed as an emetic. Beaten root held on tooth for toothache. Infusion given to cows as a 'tonic' (brit.org).

propta Species are raised from seed. While cuttings will strike, the cultivars are usually grafted onto seedling stocks to ensure superior root systems.

nwatta A shrub or small tree which grows in dry woods and slopes. It has been reported to have occasionally escaped from cultivation. Grow in average, dry to medium moisture, well-drained soil in full sun. Prefers organically rich soils, but tolerates poor, dry soils. Flower: Showy. Bloom: Rosy pink to purplish-red. Bloom Time: May. Fruit: Showy. Tolerate: Deer, Drought, Erosion, Dry Soil, Shallow-Rocky Soil. As robinias have brittle branches that can be easily damaged by strong winds, it may be necessary to plant them in a protected spot. Otherwise, these are hardy, easily cultivated trees that will thrive in any bright position with moist well-drained soil. They can be pruned when young to establish a strongly branched structure. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. A clumping plant, forming a colony from shoots away from the crown but with a limited spread [1-2]. The root pattern is stoloniferous rooting from creeping stems above the ground [1-2].

### 5.1.53 Colutea arborescens

Bladder Senna

tfo2n 4 tin 8 cyuc 0 kcak 4 tcan 2 dwat 3.6 m hkuc  
hmimhtut cyutli hgatyuctcup hwicli vyhshrasjltunyk hpa7tli flatprikhwis hpa7tmwatli xre7t hjonli

drutta Colutea arborescens is a deciduous Shrub growing to 3.6 m (11ft) by 3 m (9ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from June to September, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It can fix Nitrogen. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta None known

tcanta Hedge Hedge Soil stabilizationThe plants have an extensive root system and are used to stabilize banks and prevent soil erosion[200]. Can be grown as a hedge[200]. Nitrogen Fixer.

dwatta Diuretic Emetic PurgativeThe leaves are diuretic and purgative[4, 9]. The leaves are sometimes used as a substitute for senna as a laxative, though they are much milder in their action[4]. The plant is rather unreliable when used medicinally so is rarely employed in herbalism[9]. The seeds are emetic[4]. They are also toxic[9].

propta Seed - pre-soak for 24 hours in hot water and sow late winter in a greenhouse[113]. Scarification can help speed up the germination process[164]. Germination can be slow and erratic[200], though treated seed usually germinates in 1 - 3 months at 20°C[164]. As soon as they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in a frame[78]. Cuttings are not very long-lived[78].

nwatta An easily grown plant, it tolerates most soil conditions other than a water-logged soil[11]. Prefers a position in full sun but tolerates light shade[11]. Grows well on dry sunny banks[1, 182]. Dislikes strong winds, though another report in the same book says that it tolerates salt-laden

winds[200]. In our experience the plants are very subject to wind-rock when grown in a windy site[K]. Tolerates atmospheric pollution[182, 200]. A fast growing plant, thriving on poor soils[182, 200]. Plants are hardy to about -20°C[184, 200]. Slugs love the young seedlings[K]. Flowers are produced on the current season's growth[182, 200]. These flowers are very attractive to bees[108]. Plants in this genus are notably resistant to honey fungus[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. The plant is heat tolerant in zones 8 through 6. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (20 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is multistemmed with multiple stems from the crown [1-2].

### 5.1.54 Robinia fertilis

Bristly Locust

tfo2n 4 tin 8 cyuc 0 kcak 0 tcan 0 dwat 2 m hkuc  
htut cyutli hgatyuctcup hwicli vyhshrasjltunyk hpa7tli flatprikhwis hpa7tmwatli xre7t hjonli

drutta Robinia fertilis is a deciduous Shrub growing to 2 m (6ft 7in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. It can tolerate atmospheric pollution.

kcakta None known

tcanta Soil stabilizationPlants produce an extensive suckering root system and can be used for soil stabilization on banks etc.

dwatta None known

propta Seed - pre-soak for 48 hours in warm water and sow the seed in late winter in a cold frame[80]. A short stratification improves germination rates and time[80]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in the following summer. The seed remains viable for over 10 years in normal storage[113]. Suckers taken during the dormant season.

nwatta Succeeds in any soil, preferring one that is not too rich[1, 200]. Requires a well-drained soil, succeeding on dry barren sites[200]. Plants are tolerant of drought and atmospheric pollution[200]. The branches are brittle and very liable to wind damage[200]. When plants are grown in rich soils they produce coarse and rank growth which is even more liable to wind damage[11, 200]. Plants sucker freely, the suckers have vicious thorns. Any pruning should be done in late summer in order to reduce the risk of bleeding[200]. Hardy to at least -20°C. This species is very closely allied to *R. hispida* and scarcely merits specific rank. A very greedy tree, tending to impoverish the soil. Plants in this genus are notably resistant to honey fungus[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

### 5.1.55 Baptisia lactea

Wild Indigo

tfo2n 4 tin 8 cyuc 0 kcak 0 tcan 1 dwat 2 m hkuc

species has occasionally been cultivated as a food plant, but yields are too low to make it very worthwhile[2]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. Growth habit is a single or multiple shooting vine from a crown [1-2]. Herbaceous. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

### 5.1.45 Lespedeza juncea

Chinese Lespedeza, Juncea lespedeza

tfo2n 4 tin 8 cyuc 1 kcak 0 tcan 1 dwat 1.2 m hkuc  
htut cyutli tcup hwicli hrasjltut hpa7tli flatprikhwis hpa7tmwatli xre7t hjonli

drutta Lespedeza juncea is a deciduous Shrub growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in September, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young leaves and shoots - cooked[179].

tcanta BroomThe twigs are used in making brooms[151].

dwatta Astringent DysenteryThe juice of the roots is used to treat diarrhoea and dysentery[272].

propta Pre-soak the seed for 24 hours in warm water and then sow it in spring in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in individual pots in a frame. It can be difficult to get the cuttings through their first winter, it is best to plunge the pots in a bed of ashes in a sheltered border outdoors[78].

nwatta Easily grown in a light loam in full sun[1]. The top growth is not very cold tolerant, although the rootstock is considerably hardier. Plants are usually cut back to the ground in all but very mild winters, though they generally resprout well from the base in the following spring and flower in late summer[182]. Related to *L. sericea*[182]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

### 5.1.46 Lespedeza capitata

Roundhead Lespedeza

tfo2n 4 tin 8 cyuc 1 kcak 3 tcan 2 dwat 1 m hkuc  
htut cyutli tcup hwicli hrasjltut hpa7tli flatprikhwis hpa7tmwatli xre7t hjonli

drutta Lespedeza capitata is a deciduous Shrub growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Edible Uses: TeaThe leaves have been boiled to make a tea[257].

tcanta Nitrogen Fixer.

dwatta Antidote Antirheumatic Cancer KidneyThe plant contains several biologically active compounds. Pharmaceutical preparations are manufactured from them[222]. An

extract of the plant is of disputed utility in chronic kidney diseases[222]. Experimentally, it has demonstrated antitumor activity against Walker-256 carcinosarcoma and is also reportedly effective in lowering blood cholesterol levels[222]. It is also believed to reduce blood levels of nitrogen compounds in persons with high nitrogen levels in their urine[222]. The root has been used as an antidote to poisoning[257]. The stems have been used in moxibustion in the treatment of neuralgia and rheumatism[222, 257].

propta Pre-soak the seed for 24 hours in warm water and then sow it in spring in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in individual pots in a frame. It can be difficult to get the cuttings through their first winter, it is best to plunge the pots in a bed of ashes in a sheltered border outdoors[78].

nwatta Easily grown in a light loam in full sun[1]. The top growth is not very cold tolerant, although the rootstock is considerably hardier. Plants are usually cut back to the ground in all but very mild winters, though they generally resprout well from the base in the following spring and flower in late summer[182]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2].

### 5.1.47 Baptisia tinctoria

Wild Indigo, Horseflyweed

tfo2n 4 tin 8 cyuc 1 kcak 2 tcan 3 dwat 0.9 m hkuc  
htut cyutli kyuctcup hwicli hrasjltut hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Baptisia tinctoria is a PERENNIAL growing to 0.9 m (3ft) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf from April to October, in flower from July to August, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs). It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid or neutral soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young shoots - cooked. An asparagus substitute[2, 105, 161, 177]. Some caution is advised, see the notes above on toxicity.

tcanta Dye RepellentThis species is related to the tropical plant Indigo (*Indigofera tinctoria*) and, like that species, contains a blue dyestuff in the leaves[1]. The dyestuff is only contained in very low concentrations, however, and a very large quantity of leaves would be required to obtain reasonable quantities of indigo[169]. A yellow dye can also be obtained from the plant[61]. If the growing plant is harvested and hung up, it is said to repel flies[13].

dwatta Adaptogen Alterative Antibacterial Antiseptic Astringent Cholagogue Emetic Febrifuge Homeopathy Purgative StimulantWild indigo was a favourite medicine of the N. American Indians, a decoction of the roots being used as an antiseptic wash for wounds and skin complaints[213, 238]. Modern research has shown that this acrid bitter herb stimulates the immune system[222, 238] and is particularly effective against bacterial infections[238]. Caution is advised in the internal use of this plant, large or frequent doses are potentially harmful[222]. A tea made from the roots is cholagogue, emetic, febrifuge and purgative[4, 21, 46, 165, 222]. The fresh root is also considered to be antiseptic, astringent and laxative[4, 21, 46, 165, 222]. The infusion is used in the treatment of upper respiratory infections such as tonsillitis and pharyngitis, and is also valuable in treating infections of the chest, gastro-intestinal tract and skin[254]. The plants antimicrobial and immunostimulant properties combat lymphatic problems, when used with detoxifying herbs such as *Arctium lappa* it helps to reduce enlarged lymph nodes[254]. Wild indigo is frequently prescribed, along with *Echinacea*, in the treatment of chronic

viral infections or chronic fatigue syndrome[254]. A decoction of the root soothes sore or infected nipples and infected skin conditions[254]. When used as a mouth wash or gargle the decoction treats mouth ulcers, gum infections and sore throats[254]. The fresh root, including the bark, is used to make a homeopathic medicine[232]. This has a limited range of action, but is used especially in the treatment of certain types of flu[232].

propta Seed - best sown as soon as it is ripe in a cold frame[200]. Stored seed should be pre-soaked for 24 hours in warm water and then sown in a cold frame in late winter or early spring. Prick out the seedlings into individual pots as soon as they are large enough to handle and plant them out into their permanent positions in the summer or following spring. Division in spring[188]. Larger divisions can be planted straight into their permanent positions whilst smaller clumps are best potted up and kept in a cold frame until they are growing away well.

nwatta Prefers a deep, rich, well-drained neutral to slightly acid soil in full sun[200, 233]. Grows freely in a loamy soil. Plants are shy flowering in British gardens[200, 233]. Plants have a very deep root system and dislike root disturbance, they should be left alone once they are established[188, 233]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is fibrous dividing into a large number of fine roots [1-2]. The root pattern is a tap root similar to a carrot going directly down [1-2].

### 5.1.48 Genista tinctoria

Dyer's Greenweed, Common Woadwaxen, Broom  
tfo2n 4 tlin 7 cyuc 1 kcaak 3 tcan 2 dwat 0.6 m hkuc  
htut cyutli kyucupc hwcil hyishrasjlut hpa7tli flatprikliwis hpa7tmwattli fyifxre7t hjonli

drutta Genista tinctoria is a deciduous Shrub growing to 0.6 m (2ft) by 1 m (3ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 2 and is not frost tender. It is in flower from June to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. It can fix Nitrogen. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: LeavesEdible Uses: Coffee CondimentThe seed has been suggested as a possible coffee substitute[177, 183]. The flower buds are pickled and used as a substitute for capers[2, 183]. Used as a vegetable[105].

tcanta Dye FibreA very good quality yellow dye is obtained from the whole plant, but especially from the flowers and young shoots[4, 9, 11, 57, 66, 141, 169, 244]. It produces a very good quality green when mixed with wood (Isatis tinctoria)[11, 238]. Alum, cream of tartar and sulphate of lime are used to fix the colour[4]. The stems can be dried and stored until the dye is required[169]. A fibre obtained from the stems is used for coarse cloth and cordage[4, 169]. Plants can be used as a ground cover when spaced about 45cm apart each way[208]. The cultivar 'Flore Pleno' is always dwarf and is more reliable than the species[208].

dwatta Cathartic Diaphoretic Diuretic Emetic Homeopathy Stimulant VasoconstrictorThe twigs, leaves and flowering stems are cathartic, diaphoretic, diuretic, emetic, stimulant and vasoconstrictor[4, 9, 21, 46]. The seeds are also sometimes used[4]. The plant is harvested in early summer as it comes into flower and can be dried for later use[9]. It should not be stored for more than 12 months since its active ingredients break down[238]. The powdered seeds act as a mild purgative and were at one time used to make a plaster for broken limbs[244]. A decoction of the whole plant has been

used as a remedy for dropsy, rheumatism and gout[4, 9, 244]. A homeopathic remedy is made from the fresh shoots[9]. It is used in the treatment of rheumatism[9].

propta The seed requires a period of cold stratification and is best sown autumn in a cold frame. Pre-soak stored seed for 24 hours in warm water and sow February in a cold frame. Good germination[78]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Cuttings of half-ripe wood, 5 - 10 cm with a heel, July/August in a frame. Roots are formed in the spring[11]. Cuttings of ripe wood, 5 - 10 cm with a heel, September/October in a frame. Good percentage. Plant out the following autumn[78].

nwatta Landscape Uses:Border, Container, Erosion control, Foundation, Massing, Specimen. Easily grown in a light well-drained soil in a sunny position[1, 11]. Prefers a rather dry soil, tolerating poor and sandy soils[238]. Prefers a lime-free soil[244]. Succeeds in acid or basic soils. A very cold-tolerant plant, tolerating temperatures down to about -35°C[200]. Resents root disturbance and should only be transplanted whilst young[11, 169]. Sometimes cultivated as a dye plant, but it is usually treated as a biennial for this purpose, the whole plant being harvested in the second year[141]. Plants do not require pruning, but they can be cut back as required once they have finished flowering in order to maintain shape[238]. Polymorphic, a number of named forms have been developed for their ornamental value[182]. A good bee plant[20]. Rabbits love eating this plant[169, K]. Cows also eat the plant, but it taints their milk[4]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. Special Features:Not North American native, Attractive flowers or blooms. The plant is heat tolerant in zones 8 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is multi-stemmed with multiple stems from the crown [1-2].

### 5.1.49 Alnus japonica

Japanese Alder  
tfo2n 4 tlin 8 cyuc 0 kcaak 0 tcan 1 dwat 22 m hkuc  
hmimhtut cyutli kyucupc hpa7n hwcil hylisjlutnykifrip hpa7tli flatprikliwis hpa7tmwattli hjonli

drutta Alnus japonica is a deciduous Tree growing to 22 m (72ft 2in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from February to March. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. It can fix Nitrogen. Suitable for: medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry moist or wet soil. The plant can tolerate strong winds but not maritime exposure.

kcakta None known  
tcanta Charcoal Dye WoodA dye is obtained from the bark[46, 61]. No more details are given. Wood - close grained. Used for turnery, charcoal[46, 61].

dwatta CancerVarious species of alder, including this species, seem to contain antitumour compounds[218].

propta Seed - best sown in a cold frame as soon as it is ripe and only just covered[200]. Spring sown seed should also germinate successfully so long as it is not covered[200, K]. The seed should germinate in the spring as the weather warms up. When large enough to handle, prick the seedlings out into individual pots. If growth is sufficient, it is possible to plant them out into their permanent positions in the summer,

otherwise keep them in pots outdoors and plant them out in the spring. If you have sufficient quantity of seed, it can be sown thinly in an outdoor seed bed in the spring[78]. The seedlings can either be planted out into their permanent positions in the autumn/winter, or they can be allowed to grow on in the seed bed for a further season before planting them. Cuttings of mature wood, taken as soon as the leaves fall in autumn, outdoors in sandy soil.

nwatta Prefers a heavy soil and a damp situation, but it succeeds in ordinary garden soil[11]. Grows well in heavy clay soils[11]. Thrives in drier soils than many members of this genus[200]. Tolerates very infertile sites[200]. This species has a symbiotic relationship with certain soil micro-organisms, these form nodules on the roots of the plants and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

### 5.1.50 Laburnum anagyroides

Laburnum, Golden chain tree  
tfo2n 4 tlin 8 cyuc 0 kcaak 4 tcan 1 dwat 6 m hkuc  
hmimhtut cyutli kyucupc hwcil hyishrasjlutnykifrip hpa7tli flatprikliwis hpa7tmwattli xre7t hjonli

drutta Laburnum anagyroides is a deciduous Tree growing to 6 m (19ft) by 6 m (19ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from May to June, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta None known  
tcanta Insecticide Rootstock WoodThis plant is often used as a rootstock for other members of the pea and bean family[11]. The seeds contain the poisonous alkaloid 'cytisine'. This has insecticidal properties similar to nicotine (Nicotiana spp.) but cannot be recommended for use since it needs to be used in such a concentration that it can then be absorbed over a wide area of the body with possibly fatal results[4]. Wood - coarse grained, durable, dark coloured and very hard, it can be used as an ebony substitute[4, 11, 46]. It is much in demand among turners, and is used in making instruments and furniture especially where strength and smoothness are important[4, 11, 46, 61].

dwatta PectoralThe seed contains the poisonous alkaloid 'cystisine'. This has been used in the treatment of whooping cough and asthma[4].

propta Seed - best sown as soon as it is ripe in a greenhouse or cold frame[200]. Germination is usually very quick and good[78]. Prick out indoor-sown seedlings into individual pots when they are large enough to handle and plant them out in the summer. Another option is to pre-soak the stored seed for 12 hours in warm water and sow in an outdoor seed bed in early spring. These plants can be allowed to grow on in the seedbed for two years before planting them out in the winter. Cuttings of mature wood in late winter planted in the open ground[200].

nwatta A very tolerant and easily grown plant, it succeeds in almost any soil or situation[1] so long as it is not water-logged[11]. It grows well in heavy clay soils. Succeeds in cold exposed situations and tolerates industrial pollution[200]. Plants can be successfully transplanted even when quite large[200]. The flowers are delicately scented[245]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. This species is notably susceptible to honey fungus[200]. In garden design, as well as the above-ground architecture of a plant, root structure considerations

help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

### 5.1.51 Laburnum alpinum

Scotch Laburnum, Alpine Bea Tree, Alpine Golden Chain Tree  
tfo2n 4 tlin 7 cyuc 0 kcaak 0 tcan 1 dwat 5 m hkuc  
hmimhtut cyutli kyucupc hwcil hyishrasjlutnykifrip hpa7tli flatprikliwis hpa7tmwattli xre7t hjonli

drutta Laburnum alpinum is a deciduous Tree growing to 5 m (16ft) by 6 m (19ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from May to June, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta None known  
tcanta Miscellany WoodWood - hard. It is highly esteemed by turners[7] and is used for making musical instruments[245].

dwatta Chologogue Miscellany PurgativeThe leaves are chologogue and purgative[7]. The leaves have a similar effect to tobacco and have thus been used in treating nicotineism[7]. The plant is very poisonous and should not be used internally without expert supervision[7].

propta Seed - best sown as soon as it is ripe in a greenhouse or cold frame[200]. Germination is usually very quick and good[78]. Prick out indoor-sown seedlings into individual pots when they are large enough to handle and plant them out in the summer. Another option is to pre-soak the stored seed for 12 hours in warm water and sow in an outdoor seed bed in early spring. These plants can be allowed to grow on in the seedbed for two years before planting them out in the winter. Cuttings of mature wood in late winter planted in the open ground[200].

nwatta Landscape Uses:Espalier, Specimen. A very tolerant and easily grown plant, it succeeds in almost any soil or situation[1] so long as it is not water-logged[11]. It grows well in heavy clay soils and in poor shallow limestone soils[245]. Succeeds in cold exposed situations and tolerates industrial pollution[200]. This species is closely related to *L. anagyroides*[11]. There are some named varieties, selected for their ornamental value[11]. The flowers have a delicious vanilla scent[245]. Plants can be successfully transplanted even when quite large[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. This species is notably susceptible to honey fungus[200]. Special Features:Not North American native, All or parts of this plant are poisonous, Blooms are very showy.

### 5.1.52 Robinia hispida

Bristly locust, Rose-acacia, or Moss locust  
tfo2n 4 tlin 8 cyuc 0 kcaak 3 tcan 1 dwat 3.5 m hkuc  
htut cyutli kyucupc hwcil hyishrasjlutnyk hpa7tli prikliwsslip hpa7tmwattli hjonli

drutta Robinia hispida is a deciduous Shrub growing to 3.5 m (11ft) by 2 m (6ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. The flowers are pollinated by Birds, Insects. It can fix Nitrogen. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta None Known

is mixed with flour for making bread etc[K]. Seed - raw or cooked[63, 64, 105, 226, 257]. Rich in oil, the seed has a slightly resinous flavour. Quite small, it is only about 8mm long[200]. The seed can be crushed into a meal and used in making bread etc[213]. The resin has been chewed as a gum[226, 257]. Young male cones have been chewed for the juice[257]. A vanillin flavouring is obtained as a by-product of other resins that are released from the pulpwood[200].

tcanta Basketry Cosmetic Dye Fuel Gum Herbicide Insulation Resin Shelterbelt Strewing Tinder WoodA tan or green dye is obtained from the needles[168]. A yellow dye can be made from the pollen[226]. A blue dye can be made from the roots[257]. The needles contain a substance called terpene, this is released when rain washes over the needles and it has a negative effect on the germination of some plants, including wheat[201]. The branches are used as a strewing herb[99]. A decoction of the plant tops has been used as a conditioning wash to give a person a fair and smooth skin[257]. A fairly wind-tolerant tree, it can be used in shelterbelt plantings[200]. This tree is a source of resin, though it is not exploited commercially[64, 171]. Oleo-resins are present in the tissues of all species of pines, but these are often not present in sufficient quantity to make their extraction economically worthwhile[64]. The resins are obtained by tapping the trunk, or by destructive distillation of the wood[4, 64]. In general, trees from warmer areas of distribution give the higher yields[64]. Turpentine consists of an average of 20% of the oleo-resin[64] and is separated by distillation[4, 64]. Turpentine has a wide range of uses including as a solvent for waxes etc, for making varnish, medicinal etc[4]. Rosin is the substance left after turpentine is removed. This is used by violinists on their bows and also in making sealing wax, varnish etc[4]. Pitch can also be obtained from the resin and is used for waterproofing, as a wood preservative, adhesive etc[257]. It burns well and so has been used to make torches[257]. The root fibres have been used in making baskets[257]. Material for insulation and a tinder are also obtained from the tree[99]. The cones make a quick fire, whilst the scales from the trunk bark burn easily, give off no smoke and cool quickly[213]. Wood - light, strong, fine-grained and pleasantly aromatic, the wood can vary from soft to hard[1, 46, 82, 171, 226, 229]. An important lumber tree, it is used for making furniture, boxes, toys etc[1, 46, 82, 171, 226, 229], and it is also used for fuel[99]. For reasons that are unclear, some tree stumps contain high concentrations of pitch - this makes them very rot-resistant and inflammable and therefore useful for fence posts and kindling[226].

dwatta Antiseptic Diuretic Febrifuge Ophthalmic Pectoral Poultice Rubefacient Salve Skin Vermifuge Vulnery-Ponderosa pine was employed medicinally by several native North American Indian tribes, who valued it especially for its antiseptic and vulnerary properties, using it to treat a range of skin problems, cuts, wounds, burns etc[257]. It was also valued for its beneficial effect upon the respiratory system and was used to treat various chest and lung complaints[257]. The turpentine obtained from the resin of all pine trees is antiseptic, diuretic, rubefacient and vermifuge[4]. It is a valuable remedy used internally in the treatment of kidney and bladder complaints and is used both internally and as a rub and steam bath in the treatment of rheumatic affections[4]. It is also very beneficial to the respiratory system and so is useful in treating diseases of the mucous membranes and respiratory complaints such as coughs, colds, influenza and TB[4]. Externally it is a very beneficial treatment for a variety of skin complaints, wounds, sores, burns, boils etc and is used in the form of liniment plasters, poultices, herbal steam baths and inhalers[4]. The branches are used in herbal steam baths as a treatment for muscular pains[257]. A decoction of the plant tops has been used in the treatment of internal bleeding and high fevers[257]. An infusion of the dried buds has been used as an eye wash[257].

propta It is best to sow the seed in individual pots in a cold frame as soon as it is ripe if this is possible otherwise in late winter. A short stratification of 6 weeks at 4°C can improve the germination of stored seed[80]. Plant seedlings out into their permanent positions as soon as possible and protect them for their first winter or two[11]. Plants have a very sparse root system and the sooner they are planted into their permanent positions the better they will grow[K]. Trees should be planted into their permanent positions when they are quite small, between 30 and 90cm[200]. We actually plant them out when they are about 5 - 10cm tall. So long

as they are given a very good weed-excluding mulch they establish very well[K]. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200]. Cuttings. This method only works when taken from very young trees less than 10 years old. Use single leaf fascicles with the base of the short shoot. Disbudding the shoots some weeks before taking the cuttings can help. Cuttings are normally slow to grow away[81].

nwatta Industrial Crop: Hydrocarbon Management: Standard Regional TimberThrives in a light well-drained sandy or gravelly loam[1, 11]. Dislikes poorly drained moorland soils[1]. Established plants tolerate drought[200]. Seedlings strongly dislike growing in the shade[60] and are unable to succeed under the canopy of the parent trees[226]. Plants are fairly wind tolerant[200]. Extensively used in cool temperate forestry[200], this species is occasionally planted for timber in central and southern Europe[50]. Growth can be quite fast when young but it soon drops of and averages around 30cm per year[185]. The best trees in Britain are found in a belt running from Kent through the Midlands to N. Wales and also in S. Scotland[185]. Trees live 300 - 600 years in the wild[229], they seem to be long-lived and healthy in Britain[185]. Seed production commences when the tree is about 20 years old[229]. There are usually several years of low to medium yields between each year of high yields[229]. The cones are 8 - 15cm long, they open and shed their seed whilst still attached to the tree and then soon fall from the tree[82, 226]. Plants are strongly outbreeding, self-fertilized seed usually grows poorly[200]. They hybridize freely with other members of this genus[200]. Leaf secretions inhibit the germination of seeds, thereby reducing the amount of plants that can grow under the trees[18]. Plants in this genus are notably susceptible to honey fungus[200].

## 5.2.150 *Tilia tomentosa*

Silver Lime

4 tlin 7 cyuc 3 kcak 2 tcan 1 dwat 25 m hkuc  
hmimhtut cyutli kyuctcup hwicli hrasjltunyk hpa7tli flat-prikkwis hpa7tmwatli xre7t hjonli

drutta *Tilia tomentosa* is a deciduous Tree growing to 25 m (82ft) by 20 m (65ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by In-sects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: LeavesEdible Uses: Condiment TeaYoung leaves - raw or cooked[179]. The dried leaves are sometimes used as an adulterant for marjoram (*Origanum majorana*)[183]. A tea can be made from the flowers. A very good chocolate substitute is made from a paste of the ground fruits and flowers[2]. Trials on marketing the product failed because the paste decomposes readily[2].

tcanta FibreA fibre is obtained from the tough inner bark It can be made into diverse items such as mats, shoes and coarse cloth[229].

dwatta Antispasmodic Diaphoretic SedativeA tea made from the flowers is antispasmodic, diaphoretic and sedative[226].

propta Seed - much of the seed produced in Britain is not viable, cut a few seedcases open to see if there is a seed inside[80]. If possible, obtain fresh seed that is ripe but has not as yet developed a hard seed coat and sow it immediately in a cold frame. It may germinate in the following spring though it could take 18 months[80]. Stored seed can be very slow to germinate. It has a hard seed coat, embryo dormancy and a hard coat on the pericarp. All these factors mean that the seed may take up to 8 years to germinate[80]. One way of shortening this time is to stratify the seed for 5 months at high temperatures (10°C at night, up to 30°C by day) and then 5 months cold stratification[80]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Layering in spring just before the leaves unfurl. Takes 1 - 3 years[78].

(sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: Inner bark SeedEdible Uses: CondimentSeed - raw or cooked[226]. They can also be ground into a powder and then used as a flavouring in soups etc or can be added to cereal flours when making bread, biscuits, cakes etc[226]. Large and sweetly-flavoured, the oil-rich seed is up to 9 x 7mm[200] and has a thick shell[82]. It has a pleasant slightly resinous flavour[K]. Eating the raw seeds in quantity can cause constipation[257]. Inner bark[161, 177, 257]. There are no more details but inner bark is often dried, ground into a powder and then used as a thickener in soups etc or added to cereals when making bread. A vanillin flavouring is obtained as a by-product of other resins that are released from the pulpwood[200].

tcanta Dye Herbicide WoodA tan or green dye is obtained from the needles[168]. The needles contain a substance called terpene, this is released when rain washes over the needles and it has a negative effect on the germination of some plants, including wheat[201]. Oleo-resins are present in the tissues of all species of pines, but these are often not present in sufficient quantity to make their extraction economically worthwhile[64]. The resins are obtained by tapping the trunk, or by destructive distillation of the wood[4, 64]. In general, trees from warmer areas of distribution give the higher yields[64]. Turpentine consists of an average of 20% of the oleo-resin[64] and is separated by distillation[4, 64]. Turpentine has a wide range of uses including as a solvent for waxes etc, for making varnish, medicinal etc[4]. Rosin is the substance left after turpentine is removed. This is used by violinists on their bows and also in making sealing wax, varnish etc[4]. Pitch can also be obtained from the resin and is used for waterproofing, as a wood preservative etc. Wood - soft, light, coarse grained, brittle[82]. Used occasionally for fuel[229].

dwatta The turpentine obtained from the resin of all pine trees is antiseptic, diuretic, rubefacient and vermifuge[4]. It is a valuable remedy used internally in the treatment of kidney and bladder complaints and is used both internally and as a rub and steam bath in the treatment of rheumatic affections[4]. It is also very beneficial to the respiratory system and so is useful in treating diseases of the mucous membranes and respiratory complaints such as coughs, colds, influenza and TB[4]. Externally it is a very beneficial treatment for a variety of skin complaints, wounds, sores, burns, boils etc and is used in the form of liniment plasters, poultices, herbal steam baths and inhalers[4].

propta It is best to sow the seed in individual pots in a cold frame as soon as it is ripe if this is possible otherwise in late winter. A short stratification of 6 weeks at 4°C can improve the germination of stored seed[80]. Plant seedlings out into their permanent positions as soon as possible and protect them for their first winter or two[11]. Plants have a very sparse root system and the sooner they are planted into their permanent positions the better they will grow[K]. Trees should be planted into their permanent positions when they are quite small, between 30 and 90cm[200]. We actually plant them out when they are about 5 - 10cm tall. So long as they are given a very good weed-excluding mulch they establish very well[K]. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200]. Cuttings. This method only works when taken from very young trees less than 10 years old. Use single leaf fascicles with the base of the short shoot. Disbudding the shoots some weeks before taking the cuttings can help. Cuttings are normally slow to grow away[81].

nwatta Landscape Uses:Specimen. Thrives in a light well-drained sandy or gravelly loam in a sunny position[1, 11]. Dislikes poorly drained moorland soils[1]. Established plants tolerate drought[200]. Plants often colonise exposed mountain slopes in the wild, their root system anchoring them firmly[226]. A long-lived but slow-growing tree in the wild[229]. It grows well in Britain[81], coning regularly at Kew[11], but not doing so well in the milder parts of the country[120]. It is best suited for growing in northern areas at higher elevations[120]. Trees do not produce large numbers of cones but small numbers are formed annually[229]. The cones are up to 8cm long, they ripen in late summer

and do not open on the tree but fall intact to the ground[81, 82, 200, 226]. This species is the only N. American pine within this habit and it is thus considered to be a primitive species[226]. The seed is extracted by breaking up the soft scales of the cone[200]. Birds and mammals often open the cones and eat the seeds before they mature[1]. Leaf secretions inhibit the germination of seeds, thereby inhibiting the growth of other plants below the tree[18]. Plants are strongly outbreeding, self-fertilized seed usually grows poorly[200]. They hybridize freely with other members of this genus[200]. This species is closely related to *P. flexilis*[11], differing mainly in the cones[226]. Plants in this genus are notably susceptible to honey fungus[200]. Special Features:Attracts birds, North American native, Inconspicuous flowers or blooms. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2]. An evergreen. The root pattern is a tap root similar to a carrot going directly down [1-2].

## 5.2.43 *Hemerocallis multiflora*

4 tlin 8 cyuc 4 kcak 0 tcan 1 dwat m hkuc  
hmimhtut cyutli kyuctcup hwicli hrasjltunykrip hpa7tli flat-prikkwis hpa7tmwatli xre7t hjonli

drutta *Hemerocallis multiflora* is a PERENNIAL growing to 1 m (3ft 3in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from July to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Leaves and young shoots - cooked[205]. They must be consumed when very young or else they become fibrous[K]. Flowers and flower buds - raw or cooked. Relatively small for a day lily, but the flowers are crisp with a pleasant sweetness and no aftertaste - they make a delicious addition to salads[K]. The flowers can also be dried and used as a thickener in soups etc. The flower buds contain about 43mg vitamin C per 100g, 983 IU vitamin A and 3.1% protein[205]. Root - raw or cooked[K]. We have found them to be tender but fairly bland with a slight sweetness[K]. The roots are slightly fleshy, with a swollen, tuberous part near the tip[266]. The swollen roots are quite small and are only really worthwhile using if the plant is being dug up for divisions or some other reason[K].

tcanta WeavingThe tough dried foliage is plaited into cord and used for making footwear[205].

dwatta Antidote Diuretic Vitamin CThe juice of the roots is an effective antidote in cases of arsenic poisoning[205]. A tea made from the boiled roots is used as a diuretic[205].

propta Seed - sow in the middle of spring in a greenhouse. Germination is usually fairly rapid and good. Prick out the seedlings into individual pots when they are large enough to handle. Grow the plants on for their first winter in a greenhouse and plant out in late spring[K]. Division in spring or after flowering in late summer or autumn[200]. Division is very quick and easy, succeeding at almost any time of the year[K]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Succeeds in most soils[1], including dry ones, preferring a rich moist soil and a sunny position[11] but tolerating partial shade[88]. Plants flower less freely in a shady position though the flowers can last longer in such a position[205]. Grows well in heavy clay soils. Succeeds in short grass if the soil is moist[1]. Prefers a pH between 6 and 7[200]. Hybridizes freely with other members of this genus[200]. This species is closely related to *H. micrantha* and *H. plicata*[205]. Individual flowers are short-lived but the plant produces a succession of blooms. Each scape carries between 75 and 100 blooms[205]. Plants take a year or two to become established after being moved[200]. Plants seem to be immune to the predations of rabbits[233]. The

plants are very susceptible to slug and snail damage, the young growth in spring is especially at risk[200].

### 5.2.44 Allium canadense

Canadian Garlic, Meadow garlic, Fraser meadow garlic, Hyacinth meadow garlic  
4 tlin 8 cyuc 4 kcaak 2 tcan 2 dwat 0.5 m hkuc  
hmimhtut cyutli tucphja7n hwicli hrasljut hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta Allium canadense is a BULB growing to 0.5 m (1ft 8in) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Bulb - raw or cooked[46, 61, 62, 177]. It can be used as a vegetable, or as a flavouring in soups and stews, and can also be pickled[2]. The bulb is up to 30mm in diameter, it is crisp, mild and with a pleasant flavour[183]. Used as a leek substitute according to one report[22], it is a garlic substitute according to others[55, 159, K]. Leaves - raw or cooked[55, 62, 177]. A delicious mild flavour, they are available from early spring until the autumn[K]. They make a very acceptable salad and can also be used as a greens or as a flavouring in cooked foods[K]. Flowers - raw. A little bit stronger flavour than the leaves, especially as the seeds begin to form, they can be used as a flavouring and garnish on salads[K]. Some forms of this species produce bulbils. These top-setting bulbils make a fine onion flavoured pickle[62, 105, 183]. They are said to have a superior flavour to other pickled onions[2].

tcanta RepellentThe juice of the plant is used as a moth repellent. The whole plant is said to repel insects and moles[20]. The plant can be rubbed on exposed parts of the body to protect them from insect bites and the bites of scorpions, lizards etc[257].

dwatta Antiasthmatic Carminative Cathartic Diuretic Expectorant StimulantThe plant is antiasthmatic, carminative, cathartic, diuretic, expectorant and stimulant[257]. A tincture is used to prevent worms and colic in children, and also as a remedy for croup[257]. Although no other specific mention of medicinal uses has been seen for this species, members of this genus are in general very healthy additions to the diet. They contain sulphur compounds (which give them their onion flavour) and when added to the diet on a regular basis they help reduce blood cholesterol levels, act as a tonic to the digestive system and also tonify the circulatory system[K].

propta Seed - sow spring in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle - if you want to produce clumps more quickly then put three plants in each pot. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in spring once they are growing vigorously and are large enough. Division in spring. Very easy, the plants divide successfully at any time in the growing season and the divisions can be planted straight out into their permanent positions if required. Bulbils planted in situ when ripe.

nwatta Prefers a sunny position in a light well-drained soil[1]. A moisture loving plant according to another report[42]. The bulbs should be planted fairly deeply[1]. Bulbs grow to a good size under cultivation[183]. Some forms of this species produce many bulbils and are considered to be a pernicious weed in some areas of America[159], there is some risk that they could spread aggressively in Britain[203]. A. canadense mobilense. (Reg.)F.M.Ownb. is a form that does not produce bulbils and is much better behaved[200]. Grows well with most plants, especially roses, carrots, beet and chamomile, but it inhibits the growth of legumes[18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. Members of this genus are rarely if ever troubled by browsing deer[233]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if

available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is a bulb.

### 5.2.45 Berberis buxifolia

Magellan Barberry  
4 tlin 8 cyuc 4 kcaak 3 tcan 2 dwat 2.5 m hkuc  
hmimhtut cyutli kyuctcup hwicli hyishrasljutnykifrip hpa7tli flatprikwis hpa7tmwatli yfifxre7t hjonli

drutta Berberis buxifolia is an evergreen Shrub growing to 2.5 m (8ft) by 3 m (9ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in leaf all year, in flower in April. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or used in conserves[3, 11, 69, 139, 177]. Freely borne in Britain. Large and black with a pleasant flavour, they are eaten out of hand[183]. Said to be the best flavoured of the South American barberries, the fruit is hardly acid and but slightly astringent[2]. The green unripe fruits can be used like gooseberries in pies etc[2, 183]. The fruits are about 8mm long[200].

tcanta Dye Hedge HedgeA yellow dye is obtained from the root[139]. The dwarf form, var. 'Nana' makes a good dwarf hedge to 1 metre tall[182].

dwatta Antibacterial Cancer DysenteryBerberine, universally present in rhizomes of Berberis species, has marked antibacterial effects. Since it is not appreciably absorbed by the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not be used with Glycyrrhiza species (Liquorice) because this nullifies the effects of the berberine[218]. Berberine has also shown antitumour activity[218].

propta Seed - best sown as soon as it is ripe in a cold frame, when it should germinate in late winter or early spring[78]. Seed from over-ripe fruit will take longer to germinate[78], whilst stored seed may require cold stratification and should be sown in a cold frame as early in the year as possible[80]. The seedlings are subject to damping off, so should be kept well ventilated[113]. When the seedlings are large enough to handle, prick them out into individual pots and grow them on in a cold frame. If growth is sufficient, it can be possible to plant them out into their permanent positions in the autumn, but generally it is best to leave them in the cold frame for the winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, July/August in a frame. Roots in 4 - 8 weeks[113]. Pot up in spring[113]. Cuttings of mature wood of the current season's growth, preferably with a heel, October/November in a frame[78].

nwatta Prefers a warm moist loamy soil and light shade but it is by no means fastidious, succeeding in thin, dry and shallow soils and in full sun[11, 200]. Grows well in heavy clay soils. Plants are hardy to about -15°C[184], but they can be deciduous in cold winters[188]. The dwarf B. buxifolia nana is the form of this species that is most commonly found growing in Britain. It is very free flowering but to date (1994) we have not seen this form bearing fruit[K]. The species is supposed to be self-fertile so it is possible that this form is sterile. Hybridizes freely with other members of this genus[1]. Plants can be pruned back quite severely and re-sprout well from the base[200].

### 5.2.46 Hemerocallis fulva longituba

4 tlin 8 cyuc 4 kcaak 2 tcan 1 dwat 1 m hkuc  
hmimhtut cyutli kyuctcup hwicli hrasljutnykifrip hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta Hemerocallis fulva longituba is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from June to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline)

or mixed with cereals when making bread[161]. Self-sown seedlings, gathered in early spring, are eaten fresh or dried for later use[213]. Seeds - cooked. The wings are removed and the seeds boiled then eaten hot[213]. The seed is very small, about 5mm long, and is produced in small clusters[K].

tcanta Basketry Companion Dye Pioneer Preservative WoodThe leaves are packed around apples, rootcrops etc to help preserve them[18, 20]. The dried inner bark yields a purple colour[4, 57, 82]. Mixed with lead sulphate this produces a black dye which can also be used as an ink[4]. The dye is dark blue according to another report[95]. The wood is used to make basket splints[257]. This species can successfully establish itself in recently cleared areas and partially open woodlands[229]. It can therefore be used as a pioneer species to speed the regeneration of woodland[K]. Wood - not strong, close grained, hard, very heavy[46, 82, 227]. It weighs 38lb per cubic foot[227]. The grain of some old specimens is undulated, this gives beautiful effects of light and shade on polished surfaces[4]. The wood is commonly used for making furniture, turnery, pulp, etc[46, 82, 227].

dwatta Antispasmodic Astringent Dysentery OphthalmicThe bark has astringent properties and has been used as an application for sore eyes[4]. The inner bark was used according to one report[257]. An infusion of the bark has been used to treat cramps and dysentery[257].

propta Seed - best sown as soon as it is ripe in the spring in a cold frame. It usually germinates immediately and by the end of summer has formed a small tree with several pairs of leaves[82]. Stored seed quickly loses its viability. Pre-soak stored seed for 24 hours and then stratify for 2 - 4 months at 1 - 8°C. It can be slow to germinate. When large enough to handle, prick the seedlings out into individual pots and grow them on until they are 20cm or more tall before planting them out in their permanent positions. Layering, which takes about 12 months, is successful with most species in this genus. Cuttings of young shoots in June or July. The cuttings should have 2 - 3 pairs of leaves, plus one pair of buds at the base. Remove a very thin slice of bark at the base of the cutting, rooting is improved if a rooting hormone is used. The rooted cuttings must show new growth during the summer before being potted up otherwise they are unlikely to survive the winter.

nwatta Landscape Uses:Firewood, Aggressive surface roots possible, Specimen, Street tree, Woodland garden. Of easy cultivation, it prefers a good moist well-drained soil[11, 98], though this species succeeds in wetter soils than most other members of the genus. Grows well in heavy clay soils. Dislikes chalk according to one report[98], whilst others say that it does less well on chalk[200], often becoming chlorotic as a result of iron deficiency. Prefers a sunny position but tolerates some shade. Tolerates atmospheric pollution[200]. A fast-growing tree for the first 20 - 30 years of its life, it may live for 75 - 100 years[229]. Red maple is a bad companion plant, inhibiting the growth of nearby plants[18, 20]. A variable species with several sub-species[227], there are also many named varieties that have been selected for their ornamental value[200]. This species is often confused with A. saccharinum[11]. Special Features:Attracts birds, North American native, Naturalizing, Wetlands plant, Attractive flowers or blooms.

### 5.2.148 Tilia heterophylla

White Basswood, American basswood  
4 tlin 8 cyuc 3 kcaak 0 tcan 2 dwat 30 m hkuc  
hmimhtut cyutli tcup hwicli hrasljutnykifrip hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta Tilia heterophylla is a deciduous Tree growing to 30 m (98ft 5in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in July, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: TeaYoung leaves - raw. A nice mild flavour with a slightly mucilaginous texture[K]. They go well in a mixed salad, though I have found that on their own they tend to leave a slightly rough feeling

in the throat[K]. The dried flowers make a refreshing tea substitute[159]. A very good chocolate substitute is made from a paste of the ground fruits and flowers[2]. Trials on marketing the product failed because the paste decomposes readily[2].

tcanta Fibre WoodA fibre is obtained from the tough inner bark It can be made into diverse items such as rope, mats, shoes and coarse cloth[229, 257]. Wood - soft, light, weak, straight grained[229, 235]. It weighs 26lb per cubic foot[235]. Widely used in interior finishing, cabinet making, woodenware, paper making and for piano keyboards[229].

dwatta Antispasmodic Diaphoretic Dysentery Poultice SedativeA tea made from the flowers is antispasmodic, diaphoretic and sedative[226]. A decoction of the inner bark has been used in the treatment of dysentery[257]. A decoction of the bark, mixed with corneal, has been used as a poultice in the treatment of boils[257]. A decoction of the inner bark and twigs has been used during pregnancy to treat heartburn, weak stomach and weak bowels[257].

propta Seed - much of the seed produced in Britain is not viable, cut a few seedcases open to see if there is a seed inside[80]. If possible, obtain fresh seed that is ripe but has not as yet developed a hard seed coat and sow it immediately in a cold frame. It may germinate in the following spring though it could take 18 months[80]. Stored seed can be very slow to germinate. It has a hard seed coat, embryo dormancy and a hard coat on the pericarp. All these factors mean that the seed may take up to 8 years to germinate[80]. One way of shortening this time is to stratify the seed for 5 months at high temperatures (10°C at night, up to 30°C by day) and then 5 months cold stratification[80]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Layering in spring just before the leaves unfurl. Takes 1 - 3 years[78]. Suckers, when formed, can be removed with as much root as possible during the dormant season and replanted immediately[200].

nwatta Prefers a good moist loamy alkaline to neutral soil but succeeds on slightly acid soils[11, 200]. Grows poorly on any very dry or very wet soil[200]. Dislikes exposed positions[200]. Succeeds in sun or semi-shade[188]. A moderately fast growing and long-lived species in the wild[229]. It prefers a continental climate, growing more slowly and not producing fertile seed in areas with cool summers[200]. It is fairly susceptible to forest fires because it has a thin bark[229]. Lime trees tend to hybridise freely if other members of the genus are growing nearby[238]. If growing plants from seed it is important to ensure the seed came from a wild source or from an isolated clump of the single species[K]. Grows best in a woodland situation, young plants tolerate a reasonable level of shade[200]. Trees are usually attacked by aphids which cover the ground and the leaves with a sticky honeydew[188]. Closely related to T. americana[11]. Quite tolerant of root disturbance, semi-mature trees up to 5 metres tall have been transplanted successfully. Plants in this genus are notably resistant to honey fungus[200].

### 5.2.149 Pinus ponderosa

Ponderosa Pine, Washoe pine  
4 tlin 8 cyuc 3 kcaak 0 tcan 2 dwat 25 m hkuc  
htut cyutli hgatkyuctcup hwicli hyishrasljut hpa7tli flatprik hpa7tmwatli dyat hjonli

drutta Pinus ponderosa is an evergreen Tree growing to 25 m (82ft) by 7 m (23ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in leaf all year, in flower in June, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: Inner bark SeedEdible Uses: Condiment GumInner bark - raw or cooked[257]. Mucilaginous[105, 161, 213]. Best harvested in the spring[257]. The inner bark can be eaten fresh, but is more often dried, ground into a powder and either used as a thickener in soups or

and tonic[7, 21]. They have been used in the treatment of rheumatism, neuralgia and haemorrhoids[4]. They are said to be narcotic and that 10 grains of the nut are equal to 3 grains of opium[213]. An oil extracted from the seeds has been used externally as a treatment for rheumatism[254]. A compound of the powdered roots is analgesic and has been used to treat chest pains[257]. The buds are used in Bach flower remedies - the keywords for prescribing it are 'Failure to learn by experience', 'Lack of observation in the lessons of life' and hence 'The need of repetition'[209]. The flowers are used in Bach flower remedies - the keywords for prescribing it are 'Persistent unwanted thoughts' and 'Mental arguments and conversations'[209]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve *Aesculus hippocastanum* for chronic venous insufficiency in the legs (see [302] for critics of commission E).

propta Seed - best sown outdoors or in a cold frame as soon as it is ripe[11, 80]. The seed germinates almost immediately and must be given protection from severe weather[130]. The seed has a very limited viability and must not be allowed to dry out. Stored seed should be soaked for 24 hours prior to sowing and even after this may still not be viable[80, 113]. It is best to sow the seed with its 'scar' downwards[130]. If sowing the seed in a cold frame, pot up the seedlings in early spring and plant them out into their permanent positions in the summer.

nwatta Landscape Uses:Firewood, Pollard, Specimen, Street tree. Prefers a deep loamy well-drained soil but is not too fussy tolerating poorer drier soils[11, 200]. Tolerates exposed positions and atmospheric pollution[200]. A very ornamental and fast-growing tree[1, 4], it succeeds in most areas of Britain but grows best in eastern and south-eastern England[200]. Trees are very hardy when dormant, but the young growth in spring can be damaged by late frosts. The flowers have a delicate honey-like perfume[245]. Trees are tolerant of drastic cutting back and can be severely lopped[200]. They are prone to suddenly losing old heavy branches[98]. The tree comes into bearing within 20 years from seed[98]. Most members of this genus transplant easily, even when fairly large[11]. Special Features: Attractive foliage, Not North American native, Naturalizing, Blooms are very showy.

## 5.2.146 *Carya tomentosa*

Mockernut, White Heart Hickory, Mockernut Hickory  
4 tin 9 cyuc 3 kcaak 0 tcan 1 dwat 30 m hkuc  
htut cyutli kyuctcup hwicli hyishrasjlutnyik hpa7tli flatprik-  
lwis hpa7tmwatli fyif hjonli

drutta *Carya tomentosa* is a deciduous Tree growing to 30 m (98ft 5in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in leaf from June to November, in flower in June, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Sap SeedEdible Uses: Seed - raw or cooked[1, 43, 101, 159]. A delicious sweet taste but the thick, hard shell makes extraction very difficult[2, 183, 226]. The kernel is quite small considering the size of the nut[226]. Even squirrels leave the seed to accumulate under trees[117, 183]. The seed can be up to 6cm long[229]. The seed ripens in late autumn and, when stored in its shell in a cool place, will keep for at least 6 months[K]. Sap - used as a drink. Tapped in spring, it has a sweet flavour[101].

tcanta Dye Fuel Repellent WoodA black dye is obtained by boiling the bark in a vinegar solution[229]. A beige dye is extracted from the leaves and twigs, cream of tartar is required as a mordant[226]. A yellow dye is obtained from the bark when alum is used as a mordant[226]. The inner bark has been used to finish baskets and to make chair bottoms[257]. The leaves have been scattered about to repel insects[257]. Wood - close-grained, tough, elastic, very heavy, hard[61, 82, 227, 229]. It weighs 51lb per cubic foot[227]. The wood has excellent bending qualities and can withstand compression better than most other woods[229]. One of the best hickory woods, it is an important commercial timber and

is used for vehicle parts, tool handles, fuel etc[61, 63, 82, 227, 229].

dwatta Astringent DetergentThe inner bark is astringent and detergent[257]. It has been used as a dressing for cuts and has also been chewed to treat sore mouths[257].

propta Seed - requires a period of cold stratification. It is best sown in a cold frame as soon as it is ripe[78]. Stored seed should be kept moist (but not wet) prior to sowing and should be sown in a cold frame as soon as possible[78]. Where possible, sow 1 or 2 seeds only in each deep pot and thin to the best seedling. If you need to transplant the seedlings, then do this as soon as they are large enough to handle, once more using deep pots to accommodate the tap root. Put the plants into their permanent positions as soon as possible, preferably in their first summer, and give them some protection from the cold for at least the first winter[78, K]. Seed can also be sown in situ so long as protection is given from mice etc and the seed is given some protection from cold[200] (a plastic bottle with the top and bottom removed and a wire mesh top fitted to keep the mice out is ideal)

nwatta Landscape Uses:Aggressive surface roots possible. Prefers a deep moisture-retentive loam in a sunny sheltered position, requiring a good summer for best development[1, 63, 137, 200]. Succeeds in poor soils[63] and in drier soils than many other members of the genus[200]. Generally a slow growing tree[200] though it is fast when young[149]. Trees respond well to coppicing[149]. A very ornamental and long-lived tree[1, 227], it is quite successful in Britain[137] and has been planted on an experimental scale for its timber in Germany[50]. Most species in this genus have quite a wide range of distribution and, in order to find trees more suited to this country, seed from the most appropriate provenances should be sought[137]. Most trees growing in Britain at present tend to only produce good seed after hot summers[137]. Trees in the wild commence fruiting when about 20 years old, with an optimum seed bearing age from 40 - 150 years, though they often live for 300 - 500 years[229]. Trees are self-fertile but larger crops of better quality seeds are produced if cross-pollination takes place[229]. Plants are strongly tap-rooted and should be planted in their permanent positions as soon as possible[1, 137]. Sowing in situ would be the best method so long as the seed could be protected from mice[1, 200]. Trees are late coming into leaf (usually late May to June)[137], but lose their leaves later in the autumn than other *Carya* species[229]. During this time they cast a heavy shade. These factors combine to make the trees eminently suitable for a mixed woodland planting with shrubs and other trees beneath them[137]. Plants in this genus are notably resistant to honey fungus[200]. Special Features:North American native, Attractive flowers or blooms.

## 5.2.147 *Acer rubrum*

Red Maple, Drummond's maple, Swamp Maple  
4 tin 10 cyuc 3 kcaak 3 tcan 1 dwat 30 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprik  
hpa7tmwatli xre7t hjonli

drutta *Acer rubrum* is a deciduous Tree growing to 30 m (98ft 5in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 3. It is in flower from March to April, and the seeds ripen from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. It can tolerate atmospheric pollution.

kcakta Edible Parts: Inner bark Leaves Sap SeedEdibl Uses: SweetenerThe sap contains sugar and this can be used as a drink or be concentrated into a syrup by boiling off the water[2, 11, 74, 159]. The syrup is used as a sweetener on many foods. This species only yields about half the quantity obtained from the sugar maple (*A. saccharum*)[4]. It makes a good maple syrup although the yield is comparatively small[183]. It can be harvested in late winter, the flow is best on warm sunny days following a frost. The best sap production comes from cold-winter areas with continental climates. Inner bark - cooked[105, 177]. It is dried, ground into a powder and then used as a thickening in soups etc

soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Leaves and young shoots - cooked[105, 116]. They must be consumed when very young or else they become fibrous[K]. Flowers and flower buds - raw or cooked[105, 177]. They can be dried and used as a thickener in soups etc. The flower buds contain about 43mg vitamin C per 100g, 983 IU vitamin A and 3.1% protein[205]. Root - raw or cooked[205]. A pleasant nutty flavour.

tcanta WeavingThe tough dried foliage is plaited into cord and used for making footwear[205].

dwatta Antidote Diuretic Vitamin CThe juice of the roots is an effective antidote in cases of arsenic poisoning[205]. A tea made from the boiled roots is used as a diuretic[205].

propta Seed - sow in the middle of spring in a greenhouse. Germination is usually fairly rapid and good. Prick out the seedlings into individual pots when they are large enough to handle. Grow the plants on for their first winter in a greenhouse and plant out in late spring[K]. Division in spring or after flowering in late summer or autumn[200]. Division is very quick and easy, succeeding at almost any time of the year[K]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Succeeds in most soils[1], including dry ones, preferring a rich moist soil and a sunny position[200] but tolerating partial shade. Plants flower less freely in a shady position though the flowers can last longer in such a position[205]. Grows well in heavy clay soils. Succeeds in short grass if the soil is moist[1]. Prefers a pH between 6 and 7[200]. Hybridizes freely with other members of this genus[200]. Unlike the type species, this form does produce viable seed[187]. Plants take a year or two to become established after being moved[200]. Individual flowers are short-lived, opening in the morning and withering in the evening. The plant, however, produces a succession of flowers over a period of about 6 weeks[205]. Plants seem to be immune to the predations of rabbits[233]. The plants are very susceptible to slug and snail damage, the young growth in spring is especially at risk[200].

## 5.2.47 *Ribes divaricatum*

Coastal Black Gooseberry, Spreading gooseberry, Parish's gooseberry, Straggly gooseberry

4 tin 8 cyuc 4 kcaak 2 tcan 1 dwat 2.7 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik  
lwis hpa7tmwatli xre7t hjonli

drutta *Ribes divaricatum* is a deciduous Shrub growing to 2.7 m (8ft 10in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower in April, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Fruit LeavesEdible Uses: Fruit - raw or cooked[2, 3, 61, 118, 257]. Sweet and juicy[183]. A very acceptable flavour, though a bit on the acid side[K]. It is considered to be one of the finest wild N. American gooseberries[183]. The fruit is sometimes harvested before it is fully ripe and then cooked[256]. The fruit is about 10mm in diameter[200]. On the wild species the fruit can hang on the plant until the autumn (if the birds leave it alone)[K]. Young leaves and unripe fruits are used to make a sauce[183].

tcanta Miscellany Needles StringThe roots have been boiled with cedar (*Juniperus* spp. Thuja sp.) and wild rose (*Rosa* spp) roots, then pounded and woven into rope[257]. The sharp thorns have been used as probes for boils, for removing splinters and for tattooing[257].

dwatta Miscellany TB VDTThe inner bark has been chewed, and the juice swallowed, as a treatment for colds and sore throats[257]. A decoction of the bark or the root has been used as an eye wash for sore eyes[257]. An infusion of the roots has been used in the treatment of sore throats, venereal disease and tuberculosis[257]. The burnt stems have been rubbed on neck sores[257].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. Stored seed requires 4 - 5 months cold stratification at between 0 to 9°C and should be sown as early in the year as possible[113, 164]. Under normal storage conditions the seed can remain viable for 17 years or more. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter, planting them out in late spring of the following year. Cuttings of half-ripe wood, 10 - 15cm with a heel, July/August in a frame[78, 113]. Cuttings of mature wood of the current year's growth, preferably with a heel of the previous year's growth, November to February in a cold frame or sheltered bed outdoors[78, 200].

nwatta Easily grown in a moisture retentive but well-drained loamy soil of at least moderate quality[11, 200]. Requires a very sunny position if it is to do well[11]. Plants are hardy to about -20°C[200]. This species is closely allied to *R. rotundifolium*[11]. Immune to mildew[101], this species is a parent of many mildew resistant hybrids and is being used in breeding programmes in Europe[200]. Plants can harbour a stage of white pine blister rust, so should not be grown in the vicinity of pine trees[155]. Plants in this genus are notably susceptible to honey fungus[200]. Sometimes cultivated for its edible fruit, there is at least one named variety[183]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out. The root pattern is suckering with new plants from underground runners away from the plant [2-1].

## 5.2.48 *Hemerocallis dumortieri*

Dumortier's daylily  
4 tin 8 cyuc 4 kcaak 3 tcan 1 dwat 0.5 m hkuc  
hmimhtut cyutli kyuctcup hwicli hrasjlutnyikfrip hpa7tli flat-  
priklwis hpa7tmwatli xre7t hjonli

drutta *Hemerocallis dumortieri* is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from May to June. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Flowers Leaves ShootsEdible Uses: Leaves and young shoots - cooked[105, 177, 183]. They must be consumed when very young or else they become fibrous[K]. Flowers and flower buds - raw or cooked[105, 177, 205]. The flowers are crisp and juicy with a pleasant sweetness and no unpleasant after-taste[K]. They can be dried and used as a thickener in soups etc[183]. The flower buds contain about 43mg vitamin C per 100g, 983 IU vitamin A and 3.1% protein[205]. Root - raw or cooked.

tcanta WeavingThe tough dried foliage is plaited into cord and used for making footwear[205]. Plants form a slowly spreading clump and are suitable for ground cover when spaced about 45cm apart each way[208]. The dead leaves should be left on the ground in the winter to ensure effective cover[208].

dwatta Antidote Diuretic Vitamin CThe juice of the roots is an effective antidote in cases of arsenic poisoning[205]. A tea made from the boiled roots is used as a diuretic[205].

propta Seed - sow in the middle of spring in a greenhouse. Germination is usually fairly rapid and good. Prick out the seedlings into individual pots when they are large enough to handle. Grow the plants on for their first winter in a greenhouse and plant out in late spring[K]. Division in spring or after flowering in late summer or autumn[200]. Division is very quick and easy, succeeding at almost any time of the year[K]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Succeeds in most soils[1], including dry ones, preferring a rich moist soil[200]. Grows well in heavy clay soils. Succeeding in sun or shade, it produces more flowers in a sunny position though these flowers can be shorter-lived in very sunny positions[205]. Succeeds in short grass if the

soil is moist[1]. Prefers a pH between 6 and 7[200]. This species is hardy to about -20°c[187]. Hybridizes freely with other members of this genus[200]. Individual flowers only live for one day[205]. The flowers are sweetly scented[245]. Plants form a tight clump that spreads slowly[K]. The roots are cylindrical[205]. Plants take a year or two to become established after being moved[200]. Plants seem to be immune to the predations of rabbits[233]. The plants are very susceptible to slug and snail damage, the young growth in spring is especially at risk[200].

## 5.2.49 Cryptotaenia japonica

Mitsuba, Japanese honewort

4 tin 8 cyuc 4 kcaak 0 tcan 1 dwat 1 m hkuc pcmhmitut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli fyfxre7t hjonli

drutta *Cryptotaenia japonica* is an evergreen Perennial growing to 1 m (3ft 3in) by 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf all year, in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kckakta Edible Parts: Leaves Root StemEdible Uses: CondimentLeaves and stems - raw or cooked[2, 52, 116]. Used as a flavouring with a parsley-like flavour if you let your imagination run away with you[K]. Seedlings and young leaves can be used in salads[206]. When cooking, the leaves should not be cooked for more than a couple of minutes or the flavour is destroyed[206]. The leaves contain about 2.3% protein, 0.23% fat, 4.4% carbohydrate, 2.1% ash[179]. Root - raw or cooked[2, 52, 116, 183]. Blanched stem - a celery substitute[2, 116]. The seed is used as a seasoning.

tcanta None known

dwatta Febrifuge Tonic Women's complaintsWomen's complaints. Used in the treatment of haemorrhages, colds, fevers etc[178]. Used as a tonic for strengthening the body[266].

propta Seed - sow April in a greenhouse. Germination is usually rapid, prick out the seedlings into individual pots when they are large enough to handle and plant them out in early summer. The ideal temperature for sowing is about 25°c, though seed does germinate at higher and lower temperatures[206]. Seed can also be sown in early autumn[206]. Division in spring or autumn.

nwatta Succeeds in most soils, preferring a moist shady position under trees where it often self-sows[52]. The leaves tend to turn yellow when plants are grown in full sun[206]. This species is not winter-hardy in all areas of Britain, though plants can tolerate short periods at temperatures down to -10°c[206]. Mitsuba is commonly cultivated as a vegetable in Japan, there are some named varieties[183]. It is usually grown as an annual[206]. It is closely allied to *C. canadensis*, and is considered to be no more than a synonym of that species by some botanists[200]. This plant is adored by slugs and snails and must be protected when small or when new growth is emerging in the spring[K]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is flat with shallow roots forming a plate near the soil surface [1-2]. The root pattern is a tap root similar to a carrot going directly down [1-2].

## 5.2.50 Castanea species

Chestnut Hybrids

4 tin 9 cyuc 4 kcaak 4 tcan 2 dwat 30 m hkuc hmimhtut cyutli hgtaktyucup hwicli hyishrasjltutnyik hpa7tli flatprik hpa7tmwatli hjonli

drutta *Castanea species* is a deciduous Tree growing to 30 m (98ft) by 25 m (82ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower in July, and the seeds ripen in October. The species is monoecious

(individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kckakta Edible Parts: SeedEdible Uses: Seed - raw or cooked[183]. Eaten raw, there is a distinct astringency, especially if the fleshy inner skin beneath the outer shell of the seed is not removed[K]. When cooked, however, and especially when baked, the seed becomes much sweeter and has a floury texture[K]. It then makes an excellent food and can be used as a staple food in much the same way as potatoes or cereals[K]. The seed is low in fats and oils but high in carbohydrates[183]. Carbon Farming Solutions - Staple Crop: balanced carb (The term staple crop typically refers to a food that is eaten routinely and accounts for a dominant part of people's diets in a particular region of the world) [1-1].

tcanta The bark, leaves, wood and seed husks all contain tannin. Wood - hard, strong, light. Carbon Farming Solutions - Industrial Crop: biomass, tannin (Crops growing for non-food uses. Industrial crops provide resources in three main categories: materials, chemicals, and energy. Traditional materials include lumber and thatch, paper and cardboard, and textiles) [1-1]. Other Systems: woody agriculture.

dwatta Some see for example the individual entries for *Castanea dentata*, *Castanea mollissima*, *Castanea pumila* propta Seed - where possible sow the seed as soon as it is ripe in a cold frame or in a seed bed outdoors[78]. The seed must be protected from mice and squirrels. The seed has a short viability and must not be allowed to become dry. It can be stored in a cool place, such as the salad compartment of a fridge, for a few months if it is kept moist, but check regularly for signs of germination. The seed should germinate in late winter or early spring. If sown in an outdoor seedbed, the plants can be left in situ for 1 - 2 years before planting them out in their permanent positions. If grown in pots, the plants can be put out into their permanent positions in the summer or autumn, making sure to give them some protection from the cold in their first winter[K]. These plants are of hybrid origin, so seed is unlikely to breed true[K].

nwatta Industrial Crop: Biomass Agricultural Crop: Tannin Management: Coppice Management: Standard New Crop Other Systems: Woody agriculture Staple Crop: Balanced carbClimate: cold to warm temperate. Humidity: humid. This record includes a number of garden hybrids involving various species - the origin of each hybrid will be mentioned in the individual cultivar notes. To date, these different hybrids have not been assigned their own specific name. The following notes are based on the general needs of the genus. Prefers a good well-drained slightly acid loam but succeeds in dry soils[1, 11, 200]. Once established, it is very drought tolerant[1, 11, 200]. Very tolerant of highly acid, infertile dry sands[200]. Averse to calcareous soils but succeeds on harder limestones[11, 200]. An excellent soil-enriching understorey in pine forests[200]. Flowers are produced on wood of the current year's growth[229]. Plants are fairly self-sterile[200]. They hybridize freely with other members of this genus[200]. Plants in this genus are notably resistant to honey fungus[200]. Carbon Farming Solutions - Cultivation: new crop. Management: standard, coppice (Describes the non-destructive management systems that are used in cultivation) [1-1].

## 5.2.51 Aesculus flava

Sweet Buckeye, Yellow buckeye

4 tin 8 cyuc 4 kcaak 0 tcan 0 dwat 20 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Aesculus flava* is a deciduous Tree growing to 20 m (65ft) by 8 m (26ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from May to June, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

nwatta Prefers a good moist loamy alkaline to neutral soil but succeeds on slightly acid soils[11, 200]. Grows poorly on any very dry or very wet soil[200]. Dislikes exposed positions[200]. Succeeds in sun or semi-shade[188]. Prefers a continental climate, growing more slowly and not producing fertile seed in areas with cool summers[200]. Grows best in a woodland situation, young plants tolerate a reasonable level of side shade[200]. This species is closely related to *T. cordata*[200]. It is also closely related to *Tilia japonica*, differing in having smaller leaves and bracts, and shorter cyme[266]. Lime trees tend to hybridise freely if other members of the genus are growing nearby[238]. If growing plants from seed it is important to ensure the seed came from a wild source or from an isolated clump of the single species[K]. Trees are usually attacked by aphids which cover the ground and the leaves with a sticky honeydew[188]. Quite tolerant of root disturbance, semi-mature trees up to 5 metres tall have been transplanted successfully. Plants in this genus are notably resistant to honey fungus[200].

## 5.2.144 Juglans intermedia

Hind's Black Walnut, Northern California walnut, Paradox hybrid walnuH

4 tin 8 cyuc 3 kcaak 0 tcan 0 dwat 30 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliw hpa7tmwatli fyf hjonli

drutta *Juglans intermedia* is a deciduous Tree growing to 30 m (98ft 5in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from May to June. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kckakta Edible Parts: Oil SeedEdible Uses: OilSeed - raw[183]. An edible oil is obtained from the seed, it tends to go rancid quickly.

tcanta Herbicide OilPlants produce chemicals which can inhibit the growth of other plants. These chemicals are dissolved out of the leaves when it rains and are washed down to the ground below, reducing the growth of plants under the tree[18, 20, 159]. The roots of many members of this genus produce substances that are toxic to many plant species, especially apples (*Malus species*), members of the Ericaceae, *Potentilla* spp and the white pines (certain *Pinus* spp.)[200].

dwatta None known

propta The seed is best sown as soon as it is ripe in individual deep pots in a cold frame[80]. You need to protect it from mice, birds, squirrels etc. The seed usually germinates in late winter or the spring. Plant out the seedlings into their permanent positions in early summer and give some protection from the cold for their first winter or two. The seed can also be stored in cool moist conditions (such as the salad compartment of a fridge) over the winter and sown in early spring but it may then require a period of cold stratification before it will germinate[78, 80]. This species is a natural hybrid and may not breed true from seed.

nwatta Requires a deep well-drained loam and a sunny position sheltered from strong winds[1, 11]. Prefers a slightly alkaline soil[200]. Plants produce a deep taproot and they are intolerant of root disturbance[1, 11]. Seedlings should be planted out into their permanent positions as soon as possible and given some protection for their first winter or two since they are somewhat tender when young[1, 11]. Flower initiation depends upon suitable conditions in the previous summer[200]. The flowers and young growths can be destroyed by even short periods down to -2°c, but fortunately plants are usually late coming into leaf[200]. Any pruning should only be carried out in late summer to early autumn or when the plant is fully dormant otherwise wounds will bleed profusely and this will severely weaken the tree[200]. Trees have a dense canopy which tends to reduce plant growth below them. We have no specific information for this species, but the roots of several members of this genus produce substances that are toxic to many plant species, especially apples (*Malus species*), members of the Ericaceae, *Potentilla* spp and the white pines (certain *Pinus* spp.)[200]. The leaves

of many species also secrete substances that have an inhibitory effect on plants growing underneath them. All in all this is not a very good companion plant[K]. A hybrid, *J. nigra* x *J. regia*, sometimes cultivated for its edible seed, there are some named varieties[183].

## 5.2.145 Aesculus hippocastanum

Horse Chestnut, European Horsechestnut, Common Horsechestnut

4 tin 7 cyuc 3 kcaak 3 tcan 4 dwat 30 m hkuc hmimhtut cyutli kyucutcup hwicli hyishrasjltutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta *Aesculus hippocastanum* is a deciduous Tree growing to 30 m (98ft) by 15 m (49ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 3 and is not frost tender. It is in flower in May, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kckakta Edible Parts: SeedEdible Uses: CoffeeThe roasted seed is used as a coffee substitute[2, 7]. Seed - cooked. It can be dried, ground into a powder and used as a gruel[7, 46, 55, 61]. The seed is quite large, about 3cm in diameter, and is easily harvested. It is usually produced in abundance in Britain. Unfortunately the seed is also rich in saponins, these must be removed before it can be used as a food and this process also removes many of the minerals and vitamins, leaving behind mainly starch. See also the notes above on toxicity. The seed contains up to 40% water, 8 - 11% protein and 8 - 26% toxic saponins[218]. The following notes apply to *A. californica*, but are probably also relevant here: The seed needs to be leached of toxins before it becomes safe to eat - the Indians would do this by slow-roasting the nuts (which would have rendered the saponins harmless) and then cutting them into thin slices, putting them into a cloth bag and rinsing them in this for 2 - 5 days[213].

tcanta Dye Soap Starch Tannin WoodSaponins in the seed are used as a soap substitute[169]. The saponins can be easily obtained by chopping the seed into small pieces and infusing them in hot water. This water can then be used for washing the body, clothes etc. Its main drawback is a lingering odour of horse chestnuts[K]. The seed contains variable amounts of saponins, up to a maximum of 10%[240]. A starch obtained from the seed is used in laundering[100]. The bark and other parts of the plant contain tannin, but the quantities are not given[223]. A yellow dye is obtained from the bark[4]. The flowers contain the dyestuff quercetin[223]. Wood - soft, light, not durable. Of little commercial value, it is used for furniture, boxes, charcoal[2, 11, 46, 61].

dwatta Alterative Analgesic Antiinflammatory Antirheumatic Astringent Bach Diuretic Dysentery Expectoant Febrifuge Haemostatic Malaria Narcotic Tonic Vasoconstrictor VulneraryHorse chestnut is an astringent, anti-inflammatory herb that helps to tone the vein walls which, when slack or distended, may become varicose, haemorrhoidal or otherwise problematic[254]. The plant also reduces fluid retention by increasing the permeability of the capillaries and allowing the re-absorption of excess fluid back into the circulatory system[254]. This plant is potentially toxic if ingested and should not be used internally without professional supervision[254]. Alterative, analgesic, haemostatic and vulnerary[165, 218]. The bark is anti-inflammatory, astringent, diuretic, febrifuge, narcotic, tonic and vasoconstrictive[4, 7, 222]. It is harvested in the spring and dried for later use[4]. The plant is taken in small doses internally for the treatment of a wide range of venous diseases, including hardening of the arteries, varicose veins, phlebitis, leg ulcers, haemorrhoids and frostbite[238, 254]. It is also made into a lotion or gel for external application[254]. A tea made from the bark is used in the treatment of malaria and dysentery, externally in the treatment of lupus and skin ulcers[4, 222]. A tea made from the leaves is tonic and is used in the treatment of fevers and whooping cough[222, 240, 254]. The pericarp is peripherally vasoconstrictive[7]. The seeds are decongestant, expectoant

## 5.2.142 *Carya ovata*

Shagbark Hickory

4 tin 8 cyuc 3 kcaak 4 tcan 1 dwat 30 m hkuc  
htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatprikliwis  
hpa7tmwatli fyif hjonli

drutta *Carya ovata* is a deciduous Tree growing to 30 m (98ft) by 15 m (49ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in leaf from June to October, in flower in June, and the seeds ripen from October to November. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Sap SeedEdible Uses: MilkSeed - raw or cooked and used in pies, cakes, bread etc[2, 4, 61, 62, 183]. Sweet and delicious[1, 117, 183]. The seed can be ground into a meal and used to thicken soups etc[183]. A nut milk can be prepared from the seed and this is used as a butter on bread, vegetables etc[183]. The shell is normally thick and hard[101] but in selected cultivars it can be thin[159]. The seed ripens in late autumn and can be stored for up to 2 years in a cool cellar[117]. The seed is up to 4cm long[229]. Sap - sweet[257]. It is tapped in spring[101] and can be made into a syrup[226].

tcanta Dye Fuel WoodA yellow dye is obtained from the inner bark[226]. Wood - close-grained, tough, elastic, heavy and very hard. It weighs 52lb per cubic foot[227]. An excellent quality wood, it is used for tool handles, wheel spokes, sporting goods, baskets etc[46, 61, 63, 82, 227, 229]. The wood is an excellent fuel, burning well and giving off a lot of heat[229]. It produces an excellent charcoal[229]. A dynamic accumulator gathering minerals or nutrients from the soil and storing them in a more bioavailable form - used as fertilizer or to improve mulch.

dwatta Analgesic AntirheumaticThe fresh small shoots have been steamed to make an inhalant for treating headaches[257]. A decoction of the bark has been taken internally to treat rheumatism and also used as a poultice on rheumatic joints[257].

propta Seed - requires a period of cold stratification. It is best sown in a cold frame as soon as it is ripe[78]. Stored seed should be kept moist (but not wet) prior to sowing and should be sown in a cold frame as soon as possible[78]. Where possible, sow 1 or 2 seeds only in each deep pot and thin to the best seedling. If you need to transplant the seedlings, then do this as soon as they are large enough to handle, once more using deep pots to accommodate the tap root. Put the plants into their permanent positions as soon as possible, preferably in their first summer, and give them some protection from the cold for at least the first winter[78, K]. Seed can also be sown in situ so long as protection is given from mice etc and the seed is given some protection from cold[200] (a plastic bottle with the top and bottom removed and a wire mesh top fitted to keep the mice out is ideal)

nwatta Management: Standard Regional Crop Staple Crop: OilLandscape Uses:Firewood, Pest tolerant, Aggressive surface roots possible, Specimen. Prefers a deep moisture-retentive loam in a sunny sheltered position, requiring a good summer for best development[1, 63, 137, 200]. Succeeds in drier soils than most members of this genus[200]. Slow growing[200]. A very ornamental but slow-growing tree[1, 11, 227], it grows well in Britain, especially when young[11, 137], and does well in Cornwall[59]. The tree has a loose grey bark that comes away in broad flakes and gives the tree its common name[11]. The shagbark hickory is occasionally cultivated for its edible seed, there are some named varieties[183]. It tends to be low-yielding[117] and is said to be of no value in Britain as a commercial nut crop[11]. Trees take 15 years to come into flower from seed[117]. This species is the fastest growing hickory in N. America, it can fruit in ten years from seed[137]. Recommended cultivars (these are often hybrids with *C. cathayensis* or *C. laciniosa*) include: Shagbarks - 'J Yoder No. 1', heavy cropping and early[200]. 'Porter'. 'Weschcke', a very thin shell and regular cropper[200]. 'Wilcox', an excellent producer[200]. Shellbarks (these are more likely to be hybrids with *C. laciniosa*) - 'Fayette', thin shelled[200].

'Henry', a very large nut[200]. Cultivated as a timber tree in C. Europe[50]. Plants are strongly tap-rooted and should be planted in their permanent positions as soon as possible[1, 137]. Sowing in situ would be the best method so long as the seed could be protected from mice[1, 200]. Trees are late coming into leaf (usually late May to June) and lose their leaves early in the autumn (usually in October)[137]. During this time they cast a heavy shade. These factors combine to make the trees eminently suitable for a mixed woodland planting with shrubs and other trees beneath them[137]. Plants in this genus are notably resistant to honey fungus[200]. Most species in this genus have quite a wide range of distribution and, in order to find trees more suited to this country, seed from the most appropriate provenances should be sought[137]. Most trees growing in Britain at present tend to only produce good seed after hot summers[137]. Trees are self-fertile but larger crops of better quality seeds are produced if cross-pollination takes place[229]. The leaves are aromatic[245]. Special Features:North American native, Attractive flowers or blooms. The plant is heat tolerant in zones 8 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2]. The root pattern is a tap root similar to a carrot going directly down [1-2].

## 5.2.143 *Tilia amurensis*

4 tin 8 cyuc 3 kcaak 0 tcan 1 dwat 30 m hkuc  
hmmihtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis  
hpa7tmwatli xre7t hjonli

drutta *Tilia amurensis* is a deciduous Tree growing to 30 m (98ft 5in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: TeaYoung leaves - raw[K]. A famine food, it is only used when all else fails[177]. A very good chocolate substitute is made from a paste of the ground fruits and flowers[2]. Trials on marketing the product failed because the paste decomposes readily[2].

tcanta FibreThe fibrous inner bark is used for making sandals etc[151].

dwatta Antispasmodic Diaphoretic SedativeA tea made from the flowers is antispasmodic, diaphoretic and sedative[226].

propta Seed - much of the seed produced in Britain is not viable, cut a few seedcases open to see if there is a seed inside[80]. If possible, obtain fresh seed that is ripe but has not as yet developed a hard seed coat and sow it immediately in a cold frame. It may germinate in the following spring though it could take 18 months[80]. Stored seed can be very slow to germinate. It has a hard seed coat, embryo dormancy and a hard coat on the pericarp. All these factors mean that the seed may take up to 8 years to germinate[80]. One way of shortening this time is to stratify the seed for 5 months at high temperatures (10°C at night, up to 30°C by day) and then 5 months cold stratification[80]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Layering in spring just before the leaves unfurl. Takes 1 - 3 years[78]. Suckers, when formed, can be removed with as much root as possible during the dormant season and replanted immediately[200].

kcakta Edible Parts: Nectar SeedEdible Uses: Seed - cooked. Said to be as sweet as a chestnut[105, 177]. We have only eaten the immature seed, harvested in late August, but these were very tasty with no noticeable bitterness[K]. The seed can be up to 45mm in diameter and is easily harvested[82]. It can be dried, ground into a flour and used as a gruel. The seed contains saponins and needs to be leached of these toxins before it becomes safe to eat - the North American Indians would do this by slow-roasting the nuts (which would have rendered the saponins harmless) and then cutting them into thin slices, putting them into a cloth bag and rinsing them in a stream for 2 - 5 days[213, 229]. The resulting product is said to be tasty and nutritious[229], though most of the minerals etc would have been leached out[K]. The flowers contain a sweet nectar which is delicious when sucked out[245].

tcanta Soap WoodSaponins in the seed are used as a soap substitute[169]. The saponins can be easily obtained by chopping the seed into small pieces and infusing them in hot water. This water can then be used for washing the body, clothes etc. Its main drawback is a lingering odour of horse chestnuts[K]. Wood - very soft, light, close grained, difficult to split. It weighs 27lb per cubic foot[235]. It is used for making artificial limbs, wooden ware, pulp etc, and is occasionally sawn into lumber[46, 62, 82, 171].

dwatta None known

propta Seed - best sown outdoors or in a cold frame as soon as it is ripe[11, 80]. The seed germinates almost immediately and must be given protection from severe weather[130]. The seed has a very limited viability and must not be allowed to dry out. Stored seed should be soaked for 24 hours prior to sowing and even after this may still not be viable[80, 113]. It is best to sow the seed with its 'scar' downwards[130]. If sowing the seed in a cold frame, pot up the seedlings in early spring and plant them out into their permanent positions in the summer.

nwatta Landscape Uses:Pest tolerant, Pollard, Specimen. Prefers a deep loamy well-drained soil but is not too fussy[1, 11]. Grows best in eastern and south-eastern areas of England probably needing a continental climate in order to thrive[126, 200]. Although the trees are very hardy when dormant, the new growth can be damaged by late spring frosts[11]. Plants grow well in a woodland situation, tolerating shading by larger trees[229]. Seedlings grow away quickly, the plants reaching maturity when about 60 - 80 years old[229]. The form *Asculus flava vestita* (Sarg.) Fern. is growing well at Kew Gardens. It has been seen with large crops of fruit on a number of occasions, even in cooler summers. These fruits have only been tried when immature (harvested at the end of August) but were then very tasty with no bitterness[K]. Fruits are produced more abundantly in warm summers[130]. Most members of this genus transplant easily, even when fairly large[11]. Special Features:Attractive foliage, North American native, Blooms are very showy.

## 5.2.52 *Hordeum vulgare*

Barley, Common barley

4 tin 8 cyuc 4 kcaak 0 tcan 3 dwat 1 m hkuc  
htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis  
hpa7tmwatli xre7t hjonli

drutta *Hordeum vulgare* is a ANNUAL growing to 1 m (3ft 3in) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: SeedEdible Uses: Coffee Drink Salt SweetenerSeed - cooked as a whole grain or ground up and used as a flour for making bread, porridges etc[2, 7, 46, 183]. It has a low gluten content and so is unsuitable for making wheat-type breads[238, K]. The seed can be fermented into sourdough and many other fermented foods such as 'tempeh' and 'miso'[183]. The seed can also be sprouted and added to salads or the sprouted seed juiced and the juice drunk as a health-food drink[183]. The decorticated seed is called pearl barley. This is no longer viable

since the decortication process damages the embryo. It is used in soups, stews etc[238]. Malt is obtained by sprouting the whole seed and then roasting it. The seed is then ground into a flour and boiled in water. The resulting liquid is very sweet and can be used in making beer or other drinks, and as a nutritious sweetener in various foods.[7, 46]. The roasted (unsprouted) seed is used as a coffee[46, 183] and a salt substitute.

tcanta Biomass Mulch PaperThe stems, after the seed has been harvested, have many uses. They are a source of fibres for making paper, a biomass for fuel etc, they can be shredded and used as a mulch[141, 171].

dwatta Abortifacient Cancer Carminative Demulcent Digestive Diuretic Emollient Expectorant Febrifuge Galactofuge Hypoglycaemic Lenitive Nutritive Poulitice StomachicThe shoots are diuretic[218]. The seed sprouts are demulcent, expectorant, galactofuge, lenitive and stomachic[176, 218]. They are sometimes abortifacient[218]. They are used in the treatment of dyspepsia caused by cereals, infantile lacto-dyspepsia, regurgitation of milk and breast distension[176]. They are best not given to a nursing mother since this can reduce milk flow[176]. The seed is digestive, emollient, nutritive, febrifuge and stomachic[218]. It is taken internally as a nutritious food or as barley water (an infusion of the germinated seed in water) and is of special use for babies and invalids[238]. Its use is said to reduce excessive lactation[238]. Barley is also used as a poultice for burns and wounds[4, 46, 176, 218]. The plant has a folk history of antitumor activity[218]. The germinating seed has a hypoglycaemic effect preceded by a hyperglycaemic action[218]. Modern research has shown that barley may be of aid in the treatment of hepatitis, whilst other trials have shown that it may help to control diabetes[254]. Barley bran may have the effect of lowering blood cholesterol levels and preventing bowel cancer[254]. Other uses for bronchitis and diarrhoea, and as a source of folic acid and vitamin B12 and B6. Weight loss[301].

propta Seed - sow in situ in March or October and only just cover the seed. Make sure the soil surface does not dry out if the weather is dry. Germination takes place within 2 weeks.

nwatta Staple Crop: Balanced carb Under DevelopmentSucceeds in most soils and in climates ranging from sub-arctic to sub-tropical[1, 171]. Easily grown in light soils[162]. Prefers a calcareous soil[7]. Best grown in a sunny position[238]. Barley first came under cultivation about 12,000 years ago[238]. It is widely cultivated in Temperate areas of the world for its edible seed, there are many named varieties[57, 183]. It succeeds further north than most other cereal crops (it succeeds in Norway at latitude 70° N[142]), and at higher altitudes (it is a staple crop in Tibet)[57, 238]. The *Coeleste* group contains the hull-less barleys. Although lower yielding than the type, these hull-less seeds are much easier to harvest making them a much easier crop to grow on a small scale[183].

## 5.2.53 *Vaccinium praestans*

Kamchatka Bilberry

4 tin 8 cyuc 4 kcaak 4 tcan 0 dwat 0.2 m hkuc  
hmmiyutli tcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli  
xre7t hjonli

drutta *Vaccinium praestans* is a deciduous Shrub growing to 0.2 m (0ft 8in) by 0.3 m (1ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower in June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[1, 105]. The taste is sweet and fragrant, somewhat like a strawberry[111]. A delicious flavour[183]. The fruit is about 12mm in diameter[200].

tcanta A good ground cover for cool moist shady areas[182].

dwatta None known

propta Seed - sow late winter in a greenhouse in a lime-free potting mix and only just cover the seed[78]. Stored

seed might require a period of up to 3 months cold stratification[113]. Another report says that it is best to sow the seed in a greenhouse as soon as it is ripe[200]. Once they are about 3cm tall, prick the seedlings out into individual pots and grow them on in a lightly shaded position in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 8cm with a heel, August in a frame[78]. Slow and difficult. Layering in late summer or early autumn[78]. Another report says that spring is the best time to layer[200]. Takes 18 months[78]. Division of suckers in spring or early autumn[113]. Larger divisions can be planted out direct into their permanent positions, but we have found that in general it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the summer or the following spring.

nwatta Requires a moist but freely-draining lime free soil, preferring one that is rich in peat or a light loamy soil with added leaf-mould[11, 200]. Prefers a very acid soil with a pH in the range of 4.5 to 6, plants soon become chlorotic when lime is present. Succeeds in full sun or light shade though it fruits better in a sunny position[200]. Requires shelter from strong winds[200]. Dislikes root disturbance, plants are best grown in pots until being planted out in their permanent positions[200]. In this country, plants grow better in northern England and Scotland, in southern England they need a position with plenty of light but little direct sun[11]. Plants in this genus are notably resistant to honey fungus[200].

### 5.2.54 Rhus trilobata

Skunk Bush, Basketbush, Squawbush, Three Leaf Sumac
4 tin 6 cyuc 4 kcaak 3 tcan 2 dwat 1.8 m hkuc
htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatprikliws hpa7tmwatli nyanhjen hjonli

drutta Rhus trilobata is a deciduous Shrub growing to 1.8 m (6ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 3 and is not frost tender. It is in flower in April. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Fruit OilEdible Uses: Drink OilFruit - raw or cooked[62, 85, 92, 94, 95, 149]. The fruit can be eaten fresh, dried, mixed with cornmeal or made into a jam[183]. The fruit is small with very little flesh, but it is produced in fairly large panicles and so is easily harvested. When soaked for 10 - 30 minutes in hot or cold water it makes a very refreshing lemonade-like drink (without any fizz of course)[85, 92, 149, 183]. The mixture should not be boiled since this will release tannic acids and make the drink astringent. The fruit is about 6mm in diameter[200].

tcanta Basketry Deodorant Deodorant Dye Mordant Oil Repellent TanninThe leaves are rich in tannin. They can be collected as they fall in the autumn and used as a black to brown dye or as a mordant[169, 257]. The fruits can also be used as a mordant[257]. A yellow dye is obtained from the twigs[149]. black dye can be obtained when the twigs are mixed with pine gum[257]. A red-brown dye can be made from the bark and leaves[257]. A pink-tan dye can be made from the fruit[257]. The ashes of the plant can be used as a mordant to fix dyes[257]. An oil is extracted from the seeds[4]. It attains a tallow-like consistency on standing and is used to make candles. These burn brilliantly, though they emit a pungent smoke[4]. The roots have been used as a perfume and deodorant[257]. The buds have been used on the body as a medicinal deodorant and perfume[257]. The leaves have been rubbed on the body as an insect and snake repellent[257]. Some caution should be employed here, see the notes above on toxicity[K]. The branches are tough and slender, they are stripped of their bark and split into several strands then used in basket making[46, 92, 94, 95, 149, 257].

dwatta Analgesic Antipruritic Astringent Contraceptive Deodorant Deodorant Diuretic Emetic Haemostatic Odontalgic Oxytoxic StomachicSkunk bush was employed medici-

nally by several native North American Indian tribes, who valued it especially for its astringent qualities and used it to treat a range of complaints[257]. It is little, if at all, used in modern herbalism. Due to its potentially toxic nature, it should be used with some caution and preferably only under the supervision of a qualified practitioner. The fruit is analgesic, astringent and stomachic[257]. It has been eaten as a treatment for stomach problems and grippel[257]. The dried berries have been ground into a powder and dusted onto smallpox pustules[257]. The fruit has been chewed as a treatment for toothache and also used as a mouthwash[257]. A decoction of the fruit has been used as a wash to prevent the hair falling out[257]. The leaves are astringent, diuretic, emetic and haemostatic[257]. An infusion of the leaves has been used in the treatment of head colds[257]. A decoction of the leaves has been drunk to induce impotency as a method of contraception[257]. A poultice of leaves has been used to treat itches[257]. An infusion of the bark has been used as a douche after childbirth[257]. The bark has been chewed, and the juice swallowed, as a treatment for colds and sore gums[257]. A decoction of the root bark has been taken to facilitate easy delivery of the placenta[257]. The roots have been used as a deodorant[257]. The buds have been used on the body as a medicinal deodorant and perfume[257].

propta Seed - best sown in a cold frame as soon as it is ripe. Pre-soak the seed for 24 hours in hot water (starting at a temperature of 80 - 90c and allowing it to cool) prior to sowing in order to leach out any germination inhibitors[200]. This soak water can be drunk and has a delicious lemon-flavour. The stored seed also needs hot water treatment and can be sown in early spring in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 10cm with a heel, July/August in a frame[200]. Root cuttings 4cm long taken in December and potted up vertically in a greenhouse. Good percentage[78, 200]. Suckers in late autumn to winter[200].

nwatta Landscape Uses:Border, Hedge, Massing. Succeeds in a well-drained fertile soil in full sun[11, 200], but produces its best fruit when grown close to moist ground[85]. Judging by the plants native habitat it should succeed in dry soils[K]. The young growth in spring can be damaged by late frosts. This species is closely allied to *R. aromatica*[11]. Plants have brittle branches and these can be broken off in strong winds[200]. Plants are also susceptible to coral spot fungus[11]. Plants in this genus are notably resistant to honey fungus[200]. Many of the species in this genus are highly toxic and can also cause severe irritation to the skin of some people, whilst other species such as this one are not poisonous. It is relatively simple to distinguish which is which, the poisonous species have axillary panicles and smooth fruits whilst non-poisonous species have compound terminal panicles and fruits covered with acid crimson hairs[1, 4]. The toxic species are sometimes separated into their own genus, Toxicodendron, by some botanists[200]. Dioecious. Male and female plants must be grown if seed is required. Special Features: North American native.

### 5.2.55 Schisandra chinensis

Magnolia Vine, Wu Wei Zi
4 tin 8 cyuc 4 kcaak 2 tcan 5 dwat 9 m hkuc
pcmhmmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliws hpa7tmwatli nyanhjen hjonli

drutta Schisandra chinensis is a deciduous Climber growing to 9 m (29ft 6in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from April to May, and the seeds ripen from August to October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). . The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: Fruit LeavesEdible Uses: Gum-Fruit - raw or cooked[183]. Usually dried and used on jour-

Suckers often reach 4 - 6 metres tall before succumbing to blight, but they rarely manage to produce fruit[229]. An excellent soil-enriching understorey in pine forests[200]. Flowers are produced on wood of the current year's growth[229]. Plants are fairly self-sterile[200]. They hybridize freely with other members of this genus[200]. Plants in this genus are notably resistant to honey fungus[200]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2]. The root pattern is a tap root similar to a carrot going directly down [1-2].

### 5.2.140 Juglans regia fallax

Walnut
4 tin 8 cyuc 3 kcaak 0 tcan 0 dwat 30 m hkuc
htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliws hpa7tmwatli fyif hjonli

drutta Juglans regia fallax is a deciduous Tree growing to 30 m (98ft 5in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from May to June. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Oil SeedEdible Uses: OilSeed - raw or cooked[46, 61, 105]. Thin shelled[200]. An edible oil is obtained from the seed, it tends to go rancid quickly.

tcanta Herbicide OilPlants produce chemicals which can inhibit the growth of other plants. These chemicals are dissolved out of the leaves when it rains and are washed down to the ground below, reducing the growth of plants under the tree[18, 20, 159]. The roots also produce substances that are toxic to many plant species, especially apples (Malus species), members of the Ericaceae, Potentilla spp and the white pines (certain Pinus spp.)[200].

dwatta None known

propta The seed is best sown as soon as it is ripe in individual deep pots in a cold frame[80]. You need to protect it from mice, birds, squirrels etc. The seed usually germinates in late winter or the spring. Plant out the seedlings into their permanent positions in early summer and give some protection from the cold for their first winter or two. The seed can also be stored in cool moist conditions (such s the salad compartment of a fridge) over the winter and sown in early spring but it may then require a period of cold stratification before it will germinate[78, 80, 113].

nwatta Requires a deep well-drained loam and a sunny position sheltered from strong winds[1, 11]. Prefers a slightly alkaline soil[200]. The dormant plant is very cold-tolerant, but the young growth in spring, however, can be damaged by late frosts. Plants produce a deep taproot and they are intolerant of root disturbance[1, 11]. Seedlings should be planted out into their permanent positions as soon as possible and given some protection for their first winter or two since they are somewhat tender when young[1, 11]. Flower initiation depends upon suitable conditions in the previous summer[200]. The flowers and young growths can be destroyed by even short periods down to -2°C, but fortunately plants are usually late coming into leaf[200]. Any pruning should only be carried out in late summer to early autumn or when the plant is fully dormant otherwise wounds will bleed profusely and this will severely weaken the tree[200]. Trees have a dense canopy which tends to reduce plant growth below them. We have no specific information for this species, but the roots of several members of this genus produce substances that are toxic to many plant species, especially apples (Malus species), members of the Ericaceae, Potentilla spp and the white pines (certain Pinus spp.)[200]. The leaves of many species also secrete substances that have an inhibitory affect on plants growing underneath them. All in all this is not a very good companion plant[K]. This plant is cultivated for its edible seed in China[46, 61]. This species is notably susceptible to honey fungus[200].

### 5.2.141 Carya glabra

Sweet Pignut, Pignut hickory, Broom Hickory, Pignut Hickory

4 tin 9 cyuc 3 kcaak 0 tcan 0 dwat 30 m hkuc
htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatprikliws hpa7tmwatli fyif hjonli

drutta Carya glabra is a deciduous Tree growing to 30 m (98ft) by 20 m (65ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in leaf from June to October, in flower from April to May, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Sap SeedEdible Uses: Seed - raw or cooked[61, 101, 161]. Very variable in quality, some are sweet and pleasant whilst others are bitter and astringent[1, 2, 11, 46, 63, 183]. In general it is inferior to other hickories[117, 159]. The nut is rather small[K], has a very thick shell and contains very little edible matter[82, 226]. The seed ripens in late autumn and, when stored in its shell in a cool place, will keep for at least 6 months[K]. Sap - tapped in spring and used as a refreshing drink. Sweet[101].

tcanta Fuel WoodWood - hard, strong, tough, very flexible. It weighs 51lb per cubic foot[235]. An excellent timber, it is used for tool handles, agricultural implements etc[46, 61, 82]. A very good fuel, burning well and giving off a lot of heat[46, 61, 82].

dwatta None known

propta Seed - requires a period of cold stratification - seed given 3 months cold stratification had a 91% germination rate[113]. Best sown in a cold frame as soon as it is ripe[78]. Stored seed should be kept moist (but not wet) prior to sowing and should be sown in a cold frame as soon as possible[78]. Where possible, sow 1 or 2 seeds only in each deep pot and thin to the best seedling. If you need to transplant the seedlings, then do this as soon as they are large enough to handle, once more using deep pots to accommodate the tap root. Put the plants into their permanent positions as soon as possible, preferably in their first summer, and give some protection from the cold for at least the first winter. Seed can also be sown in situ so long as protection is given from mice etc and the seed is given some protection from cold[200] (a plastic bottle with the top and bottom removed and a wire mesh top fitted to keep the mice out is ideal)

nwatta Landscape Uses:Firewood, Pest tolerant, Aggressive surface roots possible. Prefers a deep moisture-retentive loam in a sunny sheltered position, requiring a good summer for best development[1, 63, 137, 200]. Succeeds in drier soils than most members of this genus[200]. Slow growing[200]. Sometimes cultivated for its edible seed, there are some named varieties[63]. Trees take 25 - 30 years before they commence bearing seeds and peak production does not begin until they are about 80 years old[229]. Trees thrive in Britain, often bearing fruit[11]. Trees are planted for timber in Germany[50]. Plants are strongly tap-rooted and should be planted in their permanent positions as soon as possible[1, 137]. Sowing in situ would be the best method so long as the seed could be protected from mice[1, 200]. Trees are late coming into leaf (usually late May to June) and lose their leaves early in the autumn (usually in October)[137]. During this time they cast a heavy shade. These factors combine to make the trees eminently suitable for a mixed woodland planting with shrubs and other trees beneath them[137]. Plants in this genus are notably resistant to honey fungus[200]. Most species in this genus have quite a wide range of distribution and, in order to find trees more suited to this country, seed from the most appropriate provenances should be sought[137]. Most trees growing in Britain at present tend to only produce good seed after hot summers[137]. Trees are self-fertile but larger crops of better quality seeds are produced if cross-pollination takes place[229]. Special Features:North American native, Attracts butterflies, Inconspicuous flowers or blooms.

from mice, birds, squirrels etc. The seed usually germinates in late winter or the spring. Plant out the seedlings into their permanent positions in early summer and give some protection from the cold for their first winter or two. The seed can also be stored in cool moist conditions (such s the salad compartment of a fridge) over the winter and sown in early spring but it may then require a period of cold stratification before it will germinate[78, 80, 113].

nwatta Industrial Crop: Dye Management: Standard Other Systems: Strip intercrop Regional Crop Staple Crop: Protein-oilLandscape Uses:Firewood, Aggressive surface roots possible, Specimen. Requires a deep well-drained loam and a sunny position sheltered from strong winds[1, 11]. Prefers a slightly alkaline soil[200]. Plants are best suited to deep, rich, slightly acid or neutral soil, with good drainage, but will not succeed on infertile upland soil or on soils with poor drainage[269]. The black walnut grows best areas with an annual precipitation from 30 to 130cm, an annual temperature in the range of 7 to 19°C and a pH from 4.9 - 8.2[269]. The dormant plant is very cold hardy, but the young growth in spring, however, can be damaged by late frosts. The Black walnut is one of most valuable natural forest trees in the United States[269]. A very ornamental and fast growing plant[1, 200], it is sometimes cultivated in N. America for its edible seed. Whilst potential yields of 7.5 tonnes per hectare have been postulated, it is more feasible to expect annual yields of around 2.5 tonnes per hectare[269]. Good seed crops are usually produced every other year, though some plants fruit well annually whilst others produce good crops every third year[269]. The average weight of a seed from wild trees is about 17g, though there are many named varieties and the weight of their seeds varies from 20 - 30g[183, 269]. There are breeding programmes that are seeking to develop cultivars with thinner shells[226]. Trees in the wild commence bearing seeds when about 12 years old[227]. Black walnut trees mature their fruit rather generally throughout the plants natural range where there is a growing season of about 150 days and an average summer temperature of 16.5°C[269]. Trees do not fruit very freely in Britain unfortunately[1, 11]. They grow well in the eastern half of the country but often do not thrive in the west[98]. Trees have been extensively planted for timber in parts of C. and E. Europe[50]. This species hybridizes with *J. regia*[149], some named cultivars have been developed from this cross for their seed. Plants produce a deep taproot which makes them very drought resistant when established, though they are intolerant of root disturbance[1, 11, 269]. Seedlings should be planted out into their permanent positions as soon as possible and given some protection for their first winter or two since they are somewhat tender when young[1, 11]. Flower initiation depends upon suitable conditions in the previous summer[200]. The flowers and young growths can be destroyed by even short periods down to -2°C, but fortunately plants are usually late coming into leaf[200]. The black walnut is self-fertile, but the sequence of male and female blooming, called dichogamy, can often does minimize chances of a tree shedding pollen on its own pistils. In different trees pollen may be shed before the receptivity period of female flowers, or at same time, or after pistil receptivity. For greatest possible nut production, plant trees of 2 or more cvs, as different cvs have overlapping pollen-receptivity periods and can pollinate each other[269]. Any pruning should only be carried out in late summer to early autumn or when the plant is fully dormant otherwise wounds will bleed profusely and this will severely weaken the tree[200]. Plants produce chemicals which can inhibit the growth of other plants. These chemicals are dissolved out of the leaves when it rains and are washed down to the ground below, reducing the growth of plants under the tree[18, 20, 159]. The roots also produce substances that are toxic to many plant species, especially apples (*Malus* species), members of the Ericaceae, *Potentilla* spp and the white pines (certain *Pinus* spp.)[200]. Beans, peas and tomatoes are also particularly sensitive to these secretions and will not grow in the rooting zone[200]. Trees cast quite a dense shade so, along with their other anti-social tendencies, are not very friendly trees for a woodland garden[K]. The bruised leaves have a pleasant sweet though resinous smell[245]. Special Features: Attracts birds, North American native, Inconspicuous flowers or blooms. The plant is heat tolerant in zones 9 through 5. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering

from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2]. The root pattern is a tap root similar to a carrot going directly down [1-2].

## 5.2.139 Castanea dentata

American Sweet Chestnut

4 tin 8 cyuc 4 kcak 3 tcan 1 dwat 30 m hkuc  
hmimhut cyutli hgaktyuctup hwicli hyhisrasjlutnyk hpa7tli frusflatprik hpa7tmwatli hjonli

drutta *Castanea dentata* is a deciduous Tree growing to 30 m (98ft) by 15 m (49ft). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower in July, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought. kckahta Edible Parts: Oil SeedEdible Uses: Chocolate Coffee OilSeed - raw or cooked[2, 62, 63, 102, 117]. Rather on the small side, but these are the sweetest seeds of any species in this genus[183]. The seed contains about 7% fat, 11% protein[159]. It can be dried, ground into powder and then be added to cereals when making bread, cakes etc[213]. A delicious oil can be extracted from the seed by crushing the nuts, boiling them in water and then skimming off the oil as it comes to the surface[213]. It can be used as a topping for various puddings[213]. The roasted nut can be used as a coffee substitute and a chocolate substitute can also be made from it[183] (no further details).

tcanta Dye Oil Tannin WoodThe bark is a good source of tannin[46, 61, 171, 223]. The dried leaves contain 9% tannin[213]. The wood and the seed husks also contain tannin[223]. The husks contain 10 - 13% tannin[223]. A brown dye is obtained from the bark[257]. Wood - soft, not strong, light, very durable, liable to warp. It weighs 28lb per cubic foot. Easy to split, it is used for making chair furniture, fence posts, in construction etc[61, 82, 117, 171, 229, 235].

dwatta Astringent ExpectoantA warm water infusion of the leaves has been used to calm the respiratory nerves and promote expectoration[213, 257]. The infusion has also been used in the treatment of whooping cough but modern opinion is that the leaves are no more than a mild astringent[213].

propta Seed - where possible sow the seed as soon as it is ripe in a cold frame or in a seed bed outdoors[78]. The seed must be protected from mice and squirrels. The seed has a short viability and must not be allowed to become dry. It can be stored in a cool place, such as the salad compartment of a fridge, for a few months if it is kept moist, but check regularly for signs of germination. The seed should germinate in late winter or early spring. If sown in an outdoor seedbed, the plants can be left in situ for 1 - 2 years before planting them out in their permanent positions. If grown in pots, the plants can be put out into their permanent positions in the summer or autumn, making sure to give them some protection from the cold in their first winter[K].

nwatta Prefers a good well-drained slightly acid loam but succeeds in dry soils and in hot sunny sites[1, 11, 188, 200]. Once established, it is very drought tolerant[11, 200]. Very tolerant of highly acid, infertile dry sands[200]. Averse to calcareous soils but succeeds on harder limestones[11, 200]. Although it is very winter-hardy, this species only really thrives in areas with hot summers[200]. A tree at Kew in 1985 was 15 metres tall and thriving[11]. At one time widely cultivated in N. America for its edible seed, it is now virtually extinct in the wild due to chestnut blight[11]. There are some named varieties[183]. Trees are possibly becoming resistant, some suckering stands in America are producing fruit[11].

neys, it is very sustaining[74]. Rich in sugars[74], it has a sweet/sour flavour[178]. In Russia a paste made from the fruit is mixed with *Actinidia arguta* in order to counteract the insufficient acidity of that species[183]. The fruit is about 6mm in diameter and is borne in a grape-like bunch about 10cm long[200]. Young leaves - cooked and used as a vegetable[105, 177, 183].

tcanta Gum Hair Size WoodA viscid mucoid material is obtained from the fruit and the branches, it is used as a size for paper and as a hair dressing[178]. The dried wood is charmingly fragrant[11].

dwatta Antirheumatic Antitussive Aphrodisiac Astringent Cancer Cardiotoxic Cholagogue Dysentery Expectoant Hepatic Lenitive Nerve Pectoral Sedative Stimulant Tonic UrinaryWu Wei Zi is commonly used in Chinese herbalism, where it is considered to be one of the 50 fundamental herbs[218]. It is an excellent tonic and restorative, helping in stressful times and increasing zest for life[254]. It is considered to be a substitute for ginseng and is said to be a tonic for both the male and the female sex organs[238]. The fruit is antitussive, aphrodisiac, hepatic, astringent, cardiotoxic, cholagogue, expectoant, hypotensive, lenitive, nerve, pectoral, sedative, stimulant and tonic[174, 176, 178, 218]. Low doses of the fruit are said to stimulate the central nervous system whilst large doses depress it[218]. The fruit also regulates the cardiovascular system[218]. It is taken internally in the treatment of dry coughs, asthma, night sweats, urinary disorders, involuntary ejaculation, chronic diarrhoea, palpitations, insomnia, poor memory, hyperacidity, hepatitis and diabetes[238]. Externally, it is used to treat irritating and allergic skin conditions[238]. The fruit is harvested after the first frosts and sun-dried for later use[238]. The fruit contains lignans[254]. These have a pronounced protective action on the liver. In one clinical trial there was a 76% success rate in treating patients with hepatitis, no side effects were noticed[254]. The seed is used in the treatment of cancer[218]. The plant is antirheumatic[218]. A mucilaginous decoction obtained from the branches is useful in the treatment of coughs, dysentery and gonorrhoea[218].

propta Seed - best sown in the autumn in a cold frame[200, 238]. Pre-soak stored seed for 12 hours in warm water and sow in a greenhouse in the spring[238]. Germination can be slow and erratic. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in the greenhouse for their first 2 years. Plant them out into their permanent positions in early summer. Cuttings of half-ripe wood, 5 - 8cm with a heel, August in a frame. Overwinter in the greenhouse and plant out in late spring[11, 78]. Good percentage[78]. Layering of long shoots in the autumn[200].

nwatta Prefers a rich well-drained moisture retentive soil[11, 200]. Prefers a slightly acid soil but tolerates some alkalinity if plenty of organic matter is added to the soil[200]. Requires some protection from the most intense sunlight[200]. Plants succeed in quite deep shade and are suitable for north-facing walls[219]. Plants are intolerant of drought[K]. The fully dormant plant is hardy to about -17°C, though the young growth in spring can be damaged by late frosts. Plants climb by twining around supports. Any pruning is best carried out in the spring[219]. The flowers are sweetly scented[245]. The leaves are also aromatic[245]. Dioecious. Male and female plants must be grown if seed is required. The plant is heat tolerant in zones 9 through 7. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. Growth habit is a single or multiple shooting vine from a crown [1-2].

## 5.2.56 Crambe maritima

Sea Kale

4 tin 8 cyuc 4 kcak 3 tcan 0 dwat m hkuc  
hmimhut cyutli hgaktyuctup hwicli hyhisrasjlutnyk hpa7tli prikliwshom hpa7tmwatli fyfxfre7t hjonli

drutta *Crambe maritima* is a PERENNIAL growing to 0.6 m (2ft) by 0.6 m (2ft in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in nutritionally poor soil. Suitable pH: neutral and basic (mildly alkaline) soils and can grow in saline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

kckahta Edible Parts: Flowers Leaves Root ShootsEdible Uses: Young leaves - raw or cooked like spinach[9, 12, 37, 52, 183]. They have a pleasant almost nutty flavour and go well in a mixed salad[K]. They also make a very pleasant cooked vegetable[K]. Older leaves develop a bitterness and are not so pleasant[K]. Young shoots - raw or cooked[2, 5, 37, 46, 183]. Available in the spring, they have a delicate nutty flavour with a crisp texture[200, 264]. The shoots are usually blanched and can be cooked like asparagus[9, 183]. When properly cooked they retain their crispness and have a very agreeable flavour, somewhat like hazelnuts but with a slight bitterness[183]. Root - cooked. Rich in starch and sugars[74]. Young flower buds - raw or cooked[264]. The flowering shoots are harvested when about 10 - 15cm long and before the flowers have opened. Used like sprouting broccoli, they are quite nice raw and delicious when lightly steamed[K].

tcanta Plants can be used for ground cover when spaced about 60cm apart each way[208].

dwatta None known

propta Seed - sow March/April in a seedbed outdoors and either thin the plants out or move them to their permanent positions when about 10cm tall[111]. Plants can be cropped once they are more than 12 months old[264]. The young plants are very attractive to slugs so some protection will often be needed. Germination can be slow so it is best to sow the seed in pots in a cold frame[164]. Germination usually takes place in 3 - 26 weeks at 15°C[164]. Prick out the seedlings into individual pots as soon as they are large enough to handle and plant out into their permanent positions when they are at least 10cm tall. Division in spring or autumn[1, 111]. Dig up the root clump and cut off as many sections as you require, making sure they all have at least one growing point. The larger of these divisions can be planted out straight into their permanent positions, though small ones are best potted up and grown on in a cold frame until they are established. Root cuttings, 3 - 10 cm long, in spring[104]. These can be planted straight into the open ground or you can pot them up in the greenhouse and plant them out once they are growing strongly.

nwatta An easily grown plant, succeeding in a good loam and an open sunny position[1, 111, 200] but also tolerating some shade[188]. Prefers a slightly alkaline soil in a position sheltered from strong winds[200] (this report totally conflicts with the plants native habitat which is on sea shores - we have found this species to be very tolerant of strong maritime winds though it does not like cold northerlies much[K]). Tolerates poor soil and some shade[200]. Dislikes acid[11] and very stiff soils[37]. Prefers a rich, well-drained very deep sandy loam and a pH of 7[104, 264]. Established plants are very drought tolerant[190]. This species is hardy to about -20°C[187], it grows best in a cool maritime climate[200]. Seakale is sometimes cultivated for its edible young shoots in the spring which are blanched by excluding light in order to make them less bitter[61, 264]. Two or three crops can usually be harvested each year[264]. There are some named varieties[183]. The roots are sometimes brought into a greenhouse in the winter and grown on there in order to produce an early crop of shoots[183]. A deep-rooted and very long-lived plant[233, 264], it dislikes root disturbance[164]. The seed is dispersed by seawater, on which it can float for several days without loss of viability[17]. A good bee plant[115]. The plant is heat tolerant in zones 9 through 6. (Plant Hardiness Zones show how well plants withstand cold winter tem-

peratures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is a tap root similar to a carrot going directly down [1-2].

### 5.2.57 Cornus mas

Cornelian Cherry, Cornelian Cherry Dogwood  
4 tlin 8 cyuc 4 kcaak 3 tcan 2 dwat m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyikfrp hpa7tli flatprikliw  
wissip hpa7tmwatli xre7t hjonli  
drutta Cornus mas is a deciduous Shrub growing to 5 m (16ft) by 5 m (16ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from February to March, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: Fruit Oil OilEdible Uses: Coffee Oil OilFruit - raw, dried or used in preserves[2, 3, 7, 9, 13, 183]. Juicy, with a nice acid flavour[11]. The fully ripe fruit has a somewhat plum-like flavour and texture and is very nice eating, but the unripe fruit is rather astringent[K]. It is rather low in pectin and so needs to be used with other fruit when making jam[9]. At one time the fruit was kept in brine and used like olives[183]. The fruit is a reasonable size, up to 15mm long, with a single large seed[K]. A small amount of edible oil can be extracted from the seeds[7]. Seeds are roasted, ground into a powder and used as a coffee substitute[183].

tcanta Dye Hedge Hedge Oil Oil Tannin WoodAn oil is obtained from the seed[7]. A dye is obtained from the bark[3, 7]. No more details are given. Another report says that a red dye is obtained from the plant, but does not say which part of the plant[4]. The leaves are a good source of tannin[7]. Wood - very hard, it is highly valued by turners[7]. The wood is heavier than water and does not float[7]. It is used for tools, machine parts, etc[7, 11, 13, 61].

dwatta Astringent Cholera Febrifuge NutritiveThe bark and the fruit are astringent, febrifuge and nutritive[7]. The astringent fruit is a good treatment for bowel complaints and fevers, whilst it is also used in the treatment of cholera[4, 254]. The flowers are used in the treatment of diarrhoea[4].

propta Seed - best sown as soon as it is ripe in a cold frame or in an outdoors seedbed if there is sufficient seed[80, 113]. The seed must be separated from the fruit flesh since this contains germination inhibitors[80, 164]. Stored seed should be cold stratified for 3 - 4 months and sown as early as possible in the year[164]. Scarification may also help as may a period of warm stratification before the cold stratification[80, 164]. Germination, especially of stored seed, can be very slow, taking 18 months or more[164]. Prick out the seedlings of cold-frame sown seeds into individual pots as soon as they are large enough to handle and grow the plants on for their first winter in a greenhouse, planting out in the spring after the last expected frosts. Cuttings of half-ripe side shoots, July/August in a frame[188]. Cuttings of mature wood of the current year's growth, taken with a heel if possible, autumn in a cold frame. High percentage[78]. Layering of new growth in June/July. Takes 9 months[78].

nwatta Landscape Uses:Border, Firewood, Pest tolerant, Hedge, Screen, Specimen, Woodland garden. An easily grown plant, it succeeds in any soil of good or moderate fertility[1], ranging from acid to shallow chalk[200]. Grows well in heavy clay soils. Prefers a moist soil[108] and a sunny position[15] but also succeeds in light shade[188]. Plants

are fairly wind resistant[K]. Plants grow and crop well in pots. A very hardy plant, tolerating temperatures down to about -25°C[184]. At one time the cornelian cherry was frequently cultivated for its edible fruit, though it has fallen into virtual disuse as a fruit crop in most areas[3]. It is still being cultivated in parts of C. Europe and there are some named varieties[183]. 'Macrocarpa' has larger fruits than the type[182]. 'Nana' is a dwarf form, derived from a yellow-fruited clone[182]. 'Variegata' has been seen on a number of occasions with very large crops of fruit, even in years when the type species has not fruited well[K]. 'Jolico' has well-flavoured fruits 3 times larger than the species. There are also a number of cultivars with yellow, white and purplish fruit. Seedlings can take up to 20 years to come into fruit. Plants produced from cuttings come into fruit when much younger, though they do not live as long as the seedlings. A very ornamental plant[1] it flowers quite early in the year and is a valuable early food for bees[13, 108]. Plants in this genus are notably resistant to honey fungus[200].Special Features:Attracts birds, Not North American native, Attractive flowers or blooms. The plant is heat tolerant in zones 8 through 5. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

### 5.2.58 Lilium lancifolium

Tiger Lily, Devil Lily  
4 tlin 8 cyuc 4 kcaak 0 tcan 2 dwat 1.2 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliw  
hpa7tmwatli dyaxre7t hjonli

drutta Lilium lancifolium is a BULB growing to 1.2 m (4ft) by 0.3 m (1ft in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from August to September, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers RootEdible Uses: Bulb-cooked[2, 4, 42, 47]. Somewhat bitterish[105]. Fairly pleasant, when properly cooked they are highly esteemed as a vegetable and somewhat resemble parsnips in flavour[183]. The bulbs are up to 8cm in diameter[266]. They are a good source of starch[105, 183]. The bulb can be dried and ground into powder. Flowers - raw or cooked. Used fresh or dried in salads, soups, rice dishes etc[183].

tcanta None known  
dwatta Antiinflammatory Cardiac Carminative Diuretic Emmenagogue Emollient Expectorant Ophthalmic Women's complaintsThe bulb is antiinflammatory, diuretic, emmenagogue, emollient and expectorant[240, 279]. They are used to relieve heart diseases, pain in the cardiac region and angina pectoris[240]. They are used in Korea to treat coughs, sore throats, palpitations and boils[279]. The flowers are carminative[240]. They are used to strengthen the eye-lid muscles and are commended in the treatment of myopic astigmatism[240]. A tincture made from the flowering plant, harvested when in full flower, is used in the treatment of uterine neuralgia, congestion, irritation and the nausea of pregnancy[4]. It relieves the bearing-down pain accompanying

acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Oil SeedEdible Uses: OilSeed - raw or cooked[51, 177, 272]. An edible oil is obtained from the seed, it tends to go rancid quickly[51].

tcanta Herbicide Oil Tannin WoodThe bark and the unripe rind of the fruit are good sources of tannin[51, 272]. Plants produce chemicals which can inhibit the growth of other plants. These chemicals are dissolved out of the leaves when it rains and are washed down to the ground below, reducing the growth of plants under the tree[18, 20, 159]. The roots also produce substances that are toxic to many plant species, especially apples (Malus species), members of the Ericaceae, Potentilla spp and the white pines (certain Pinus spp.)[200]. Wood - hard, strongly grained, polishes well. Used for making furniture, carved work, veneers etc[51, 272].

dwatta Alterative Anthelmintic Antirheumatic Astringent Detergent TonicThe bark, leaves and fruit are used medicinally[51]. No more details are given in this report but another report on Indian medicinal plants gives the following uses for J. nigra (and almost certainly refers to this subspecies):- The bark is anthelmintic and detergent[240]. The leaves are anthelmintic, astringent and tonic[240]. A decoction is considered to be specific in the treatment of strumous sores[240]. The fruit is alterative[240]. It is used in the treatment of rheumatism[240].

propta The seed is best sown as soon as it is ripe in individual deep pots in a cold frame[80]. You need to protect it from mice, birds, squirrels etc. The seed usually germinates in late winter or the spring. Plant out the seedlings into their permanent positions in early summer and give some protection from the cold for their first winter or two. The seed can also be stored in cool moist conditions (such s the salad compartment of a fridge) over the winter and sown in early spring but it may then require a period of cold stratification before it will germinate[78, 80, 113].

nwatta Requires a deep well-drained loam and a sunny position sheltered from strong winds[1, 11]. Prefers a slightly alkaline soil[200]. The dormant plant is quite cold-tolerant, but the young growth in spring, however, can be damaged by late frosts. Plants produce a deep taproot and they are intolerant of root disturbance[1, 11]. Seedlings should be planted out into their permanent positions as soon as possible and given some protection since they are somewhat tender when young[1, 11]. Flower initiation depends upon suitable conditions in the previous summer[200]. The flowers and young growths can be destroyed by even short periods down to -2°C, but fortunately plants are usually late coming into leaf[200]. Any pruning should only be carried out in late summer to early autumn or when the plant is fully dormant otherwise wounds will bleed profusely and this will severely weaken the tree[200]. Trees have a dense canopy which tends to reduce plant growth below them. We have no specific information for this species, but the roots of several members of this genus produce substances that are toxic to many plant species, especially apples (Malus species), members of the Ericaceae, Potentilla spp and the white pines (certain Pinus spp.)[200]. The leaves of many species also secrete substances that have an inhibitory affect on plants growing underneath them. All in all this is not a very good companion plant[K]. This plant is cultivated for its edible seed in W. Himalayas[51]. This species is notably susceptible to honey fungus[200].

### 5.2.138 Juglans nigra

Black Walnut  
4 tlin 9 cyuc 3 kcaak 4 tcan 3 dwat 30 m hkuc  
htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliw  
hpa7tmwatli fyif hjonli

drutta Juglans nigra is a deciduous Tree growing to 30 m (98ft) by 20 m (65ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from May to June, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral

and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Oil Sap SeedEdible Uses: Oil SweetenerSeed - raw or cooked. A sweet, rich distinctive delicious flavour it makes an excellent dessert nut and is also widely used in confections, cakes etc[2, 34, 82, 183]. The kernel is hard to extract and the oil it contains quickly turns rancid[101, 159]. The unripe fruits can be pickled[183]. The seed is borne in solitary fruits or in pairs and is 3 - 4cm in diameter[82, 229]. The nuts can leave a permanent stain on clothing[226]. An edible oil is obtained from the seed[101, 183]. A sweet taste but it tends to go rancid quickly[159]. Used as a seasoning in bread, squash and other foods[183]. The tree yields a sweet sap that can be drunk or concentrated into syrup or sugar[101, 102, 183]. It is tapped in spring.

tcanta Beads Compost Dye Filter Herbicide Insecticide Oil Repellent Tannin WoodA brown dye is obtained from the nuts, husks and bark[14, 57, 101, 159]. It does not require a mordant[169]. The husks can be dried for later use[169]. A brown dye is obtained from the leaves and stems[168]. It does not require a mordant[168]. The dye turns black if it is prepared in an iron pot[168]. The leaves can be dried for later use[169]. The husks are rich in tannin[226]. The green fruit husks can be boiled to provide a yellow dye[269]. The husks can be made into a high quality coal (does the report mean charcoal?[K]) and is then used as a filter[226]. It was used in gas masks[226]. The woody shells on the fruits have been used to make jewellery[269]. Insects are said to avoid the walnut tree, hence it is often used as a poor man's insect repellent. When rubbed on faces, walnut leaves are said to repel flies[269]. The leaves repel fleas and have been used as a strewing herb[20, 201, 257]. They are also used as an insecticide against bed bugs[222]. The ground up husks are also insecticidal[226]. The leaves produce substances that depress the growth of other plants. These substances are washed onto the ground by rain and inhibit the growth of plants beneath the tree[18, 20, 159]. The roots also produce substances that are toxic to many plant species, especially apples (Malus species), members of the Ericaceae, Potentilla spp and the white pines (certain Pinus spp.)[200]. An alternative ingredient of 'QR' herbal compost activator[32]. This is a dried and powdered mixture of several herbs that can be added to a compost heap in order to speed up bacterial activity and thus shorten the time needed to make the compost[K]. Wood - very ornamental, heavy, hard, strong, close-grained, very durable. Easily worked, it glues well, does not warp, shrink or swell much and takes a good polish. It weighs 38lb per cubic foot. A very valuable timber tree and possibly the most sought after wood in N. America, it is used in cabinet making, the interior finishes of houses, furniture, airplanes, ship building, veneer etc[1, 46, 61, 82, 101, 149, 227, 229, 235, 269]. A dynamic accumulator gathering minerals or nutrients from the soil and storing them in a more bioavailable form - used as fertilizer or to improve mulch.

dwatta Alterative Anodyne Antiinflammatory Astringent Blood purifier Detergent Eczema Laxative Leprosy Pectoral VermifugeThe bark and leaves are alterative, anodyne, astringent, blood tonic, detergent, emetic, laxative, pectoral and vermifuge[4, 222, 257]. Especially useful in the treatment of skin diseases, black walnut is of the highest value in curing scrofulous diseases, herpes, eczema etc[4]. An infusion of the bark is used to treat diarrhoea and also to stop the production of milk, though a strong infusion can be emetic[21, 257]. The bark is chewed to allay the pain of toothache and it is also used as a poultice to reduce the pain of headaches[222, 257]. The juice from the fruit husk is applied externally as a treatment for ringworm[222, 257]. The husk is chewed in the treatment of colic and applied as a poultice to inflammations[222]. The burnt kernels, taken in red wine, are said to prevent falling hair, making it fair[269]. Green husks are supposed to ease the pain of toothache[269]. A tea made from the leaves is astringent[222]. An infusion has been used to lower high blood pressure[257]. It can be used as a cleansing wash[21]. The pulverized leaves have been rubbed on the affected parts of the body to destroy ringworm[257]. The oil from the ripe seeds has been used externally in the treatment of gangrene, leprosy, and wounds[269]. The sap has been used to treat inflammations[257].

propta The seed is best sown as soon as it is ripe in individual deep pots in a cold frame[80]. You need to protect it

Plants can come into bearing in 3 - 4 years from seed[63]. Even when grown on a very windy site in Cornwall, the plants flowered in their eighth year from seed (by which time they were more sheltered from the wind)[K] Plants produce a deep taproot and they are intolerant of root disturbance[1, 11]. Seedlings should be planted out into their permanent positions as soon as possible and then given some protection since they are somewhat tender when young[1, 11]. Flower initiation depends upon suitable conditions in the previous summer[200]. The flowers and young growths can be destroyed by even short periods down to -2°C, but fortunately plants are usually late coming into leaf[200]. Any pruning should only be carried out in late summer to early autumn or when the plant is fully dormant otherwise wounds will bleed profusely and this will severely weaken the tree[200]. Trees have a dense canopy which tends to reduce plant growth below them[K]. We have no specific information for this species, but the roots of several members of this genus produce substances that are toxic to many plant species, especially apples (*Malus* species), members of the Ericaceae, *Potentilla* spp and the white pines (certain *Pinus* spp.)[200]. The leaves of many species also secrete substances that have an inhibitory effect on plants growing underneath them. All in all this is not a very good companion plant[K]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

## 5.2.136 *Origanum vulgare hirtum*

Greek Oregano  
4 tin 8 cyuc 4 kca3 3 tcan 3 dwat 0.6 m hkuc  
hmimhtut cyutli kyuctup hwicli hysrasjnutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Origanum vulgare hirtum* is a PERENNIAL growing to 0.6 m (2ft) by 0.6 m (2ft in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from July to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: LeavesEdible Uses: Condi-mentLeaves - raw or cooked as a potherb[5, 52, 183]. Oregano is an important flavouring herb in Mediterranean cookery, and is often used dried rather than fresh[238]. This sub-species has a much stronger flavour than the type[238]. The leaves are used as a flavouring for salad dressings, vegetables and legumes, and are frequently included in strongly flavoured dishes with chillies, garlic, onions etc[2, 13, 21, 27, 183, 238]. A nutritional analysis is available[218]. Much of the commercially available dried oregano does not come from this plant but from a number of different, often unrelated plants[238]. These include *Lippia graveolens*, *L. palmeri* and *Origanum syriacum*[238]. A herb tea is made from the dried leaves and flowering stems[183, 207, 238].

tcanta Dye Essential RepellentAn essential oil from the plant is used as a food flavouring, in soaps and perfumery[115, 171]. A red or purple dye is obtained from the flowering tops[4, 7, 13, 100], it is neither brilliant nor durable[115]. The plant repels ants[46]. A useful ground cover for sunny positions, forming a slowly spreading clump[197, K].

dwatta Antiseptic Antispasmodic Carminative Cholagogue Diaphoretic Emmenagogue Expectorant Stimulant Stomachic TonicOregano has been used as a culinary and medicinal herb for thousands of years. It has a beneficial effect upon the digestive and respiratory systems and is also used to promote menstruation[254]. It should not be used medicinally by pregnant women though it is perfectly safe in small amounts for culinary purposes[254]. The leaves and flowering stems are strongly antiseptic, antispasmodic, carminative, cholagogue, diaphoretic, emmenagogue, expect-

torant, stimulant, stomachic and mildly tonic[4, 7, 9, 21, 254]. The plant is taken internally in the treatment of colds, influenza, mild febrish illnesses, indigestion, stomach upsets and painful menstruation[238]. It is strongly sedative and should not be taken in large doses, though mild teas have a soothing effect and aid restful sleep[244]. It should not be prescribed for pregnant women[238]. Externally, oregano is used to treat bronchitis, asthma, arthritis and muscular pain[238]. The plant can be used fresh or dried - harvest the whole plant (but not the roots) in late summer to dry and store for winter use[244]. Oregano is often used in the form of an essential oil that is distilled from the flowering plant[4]. A few drops of the essential oil, put on cotton wool and placed in the hollow of an aching tooth, frequently relieves the pain of toothache[4, 207]. This plant is one of the best natural antiseptics because of its high thymol content[7]. The essential oil is used in aromatherapy to treat the same kinds of complaints that the herb is used for[238].

propta Seed - sow early spring at 10 - 13°C and only just cover the seed. Germination usually takes place within 2 weeks. Prick out the seedlings into individual pots when they are large enough to handle and plant them out into their permanent positions in early summer. The seed can also be sown in situ in late spring. Division in March or October. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer. Basal cuttings of young barren shoots in June. Very easy. Harvest the shoots with plenty of underground stem when they are about 8 - 10cm above the ground. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Requires a rather dry, warm, well-drained soil in full sun, but is not fussy as to soil type, thriving on chalk[1, 27]. Prefers slightly alkaline conditions[200]. Tolerates poor soils[24]. Dislikes wet soils[37]. Often cultivated as a culinary herb, this is a sub-species from Greece, its flowers are white and it has a stronger fragrance. It is more commonly grown commercially because of its stronger fragrance. There are some named forms[183]. Plants growing near the sea have the most fragrance[7]. A good companion plant, improving the flavour of nearby plants. The flowers are very attractive to bees and butterflies[5, 30]. A good companion for the cucumber family[14], it is beneficial to all nearby plants[20]. The whole plant is strongly aromatic. Members of this genus are rarely if ever troubled by browsing deer[233]. The plant is heat tolerant in zones 10 through 2. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

## 5.2.137 *Juglans regia kamaonia*

Walnut

4 tin 8 cyuc 3 kca3 0 tcan 3 dwat 30 m hkuc  
htut cyutli tcup hwicli hrasjnutnyik hpa7tli flatprikliwis hpa7tmwatli fyif hjonli

drutta *Juglans regia kamaonia* is a deciduous Tree growing to 30 m (98ft 5in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from May to June. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly

uterine prolapse and is an important remedy in ovarian neuralgia[4].

propta Seed - this species is completely sterile and does not produce seed. Division with care in the autumn once the leaves have died down. Replant immediately[200]. Bulb scales can be removed from the bulbs in early autumn. If they are kept in a warm dark place in a bag of moist peat, they will produce bulblets. These bulblets can be potted up and grown on in the greenhouse until they are large enough to plant out[200]. Bulbils - gather in late summer when they start to fall off the stems and pot up immediately. Grow on in a greenhouse until large enough to go outside[200]. Plants can flower in three years from bulbils[4].

nwatta Landscape Uses:Border, Container, Foundation, Massing, Seashore. Prefers an open free-draining humus-rich loamy soil with its roots in the shade and its head in the sun[200]. Prefers a lime-free soil according to some reports[28, 47, 143], whilst one says that it succeeds in a calcareous soil[1] and another that it succeeds in ordinary garden soil[1, 42]. Prefers a deep acid loam[47]. Likes a sunny position according to one report[143] whilst others say that it is best grown in open woodland or amongst dwarf evergreen shrubs[1]. Stem rooting, the bulbs should be planted 15 - 20cm deep[143]. Early to mid autumn is the best time to plant out the bulbs in cool temperate areas, in warmer areas they can be planted out as late as late autumn[200]. Plants grow well in northern gardens in Britain[90]. A sterile triploid species, probably of hybrid origin[90]. A very ornamental plant[1], it is cultivated for its edible bulb in Japan[2, 42, 163]. This species tolerates virus infections, but it can transmit them to other species in this genus and so is best grown away from any of the other species[47]. The plant should be protected against rabbits and slugs in early spring. If the shoot tip is eaten out the bulb will not grow in that year and will lose vigour[200]. The plant is heat tolerant in zones 8 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is a bulb.

## 5.2.59 *Morus alba multicaulis*

White Mulberry

4 tin 8 cyuc 4 kca3 0 tcan 3 dwat m hkuc  
hmimhtut cyutli tcup hwicli hrasjnutnyik hpa7tli flatprikliwis hpa7tmwatli fyif hjonli

drutta *Morus alba multicaulis* is a deciduous Tree growing to 18 m (59ft 1in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower in May, and the seeds ripen from July to August. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Fruit Inner bark LeavesEdible Uses: Fruit - raw[2, 7, 158]. Sweet but usually insipid[3, 11]. It contains about 1.5% protein, 0.4% fat, 7.8% carbohydrate, 0.7% malic acid[179]. A richer flavour develops if the fruit is dried, it can then be used as a raisin substitute. The fruit is up to 25mm long[200]. Some caution is advised, see the notes above on toxicity. Young leaves and shoots - cooked[105, 183]. A famine food, it is only used when all else fails[177]. A good vegetable, it is rich in carotene and calcium[179]. The leaf also contains 10% tannin[179]. Inner bark - roasted and ground into a meal then used as a thickener in soups etc or mixed with cereals when making bread. A famine food when all else fails[179]. The tree is said to be a source of an edible manna[183]. Young shoots can be used as a tea substitute[183].

tcanta Dye Fibre WoodA fibre is obtained from the bark of one-year old stems, it is used in weaving[7, 74]. A brown dye is obtained from the trunk[178]. The leaves contain 10% tannin[179]. Wood - hard, durable, fine and close-grained. Used for boat building, furniture etc[145, 149, 158].

dwatta Analgesic Antisthmatic Antirheumatic Antitussive Astringent Diaphoretic Diuretic Emollient Expectorant Hypoglycaemic Hypotensive Odontalgic Sedative Urinary-The white mulberry has a long history of medicinal use in Chinese medicine, almost all parts of the plant are used in one way or another[238]. Recent research has shown improvements in elephantiasis when treated with leaf extract injections and in tetanus following oral doses of the sap mixed with sugar[238]. Analgesic, emollient, sedative[7, 176]. The leaves are antibacterial, astringent, diaphoretic, hypoglycaemic, odontalgic and ophthalmic[218, 238]. They are taken internally in the treatment of colds, influenza, eye infections and nosebleeds[238]. The leaves are collected after the first frosts of autumn and can be used fresh but are generally dried[238]. The stems are antirheumatic, diuretic, hypotensive and pectoral[218, 238]. A tincture of the bark is used to relieve toothache[7]. The branches are harvested in late spring or early summer and are dried for later use[238]. The fruit has a tonic effect on kidney energy[218, 238]. It is used in the treatment of urinary incontinence, tinnitus, premature greying of the hair and constipation in the elderly[238]. The root bark is antitussive, diuretic, expectorant and hypotensive[238]. It is used internally in the treatment of asthma, coughs, bronchitis, oedema, hypertension and diabetes[238]. The roots are harvested in the winter and dried for later use[238]. Extracts of the plant have antibacterial and fungicidal activity[218].

propta The seed germinates best if given 2 - 3 months cold stratification[80, 98]. Sow the seed as soon as it is ripe if possible, otherwise in February in a cold frame. The seed usually germinates in the first spring, though it sometimes takes another 12 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the cold frame for their first winter. Plant them out in late spring or early summer after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in a frame. Plant out in spring. A good percentage take, though they sometimes fail to thrive[78, 113]. Cuttings of mature wood of the current season's growth, 25 - 30cm with a heel of 2 year old wood, autumn or early spring in a cold frame or a shady bed outside[78, 113, 200]. Bury the cuttings to three-quarters of their depth. Layering in autumn[200].

nwatta Prefers a warm well-drained loamy soil in a sunny position[1, 11]. This variety of *M. alba* is said to have superior fruits[105]. According to many botanists it is no more than a clone of the species[200]. This is the form most commonly cultivated in India, where it is fast growing and adapted to field culture. It gives a high yield of large, tender, thick leaves[269]. Mulberries have brittle roots and so need to be handled with care when planting them out[238]. Any pruning should only be carried out in the winter when the plant is fully dormant because mulberries bleed badly when cut[238]. Ideally prune only badly placed branches and dead wood[238]. A good tree for growing grapes into[20]. The grapes are difficult to pick but always seem to be healthier and free from fungal diseases[201]. Plants in this genus are notably resistant to honey fungus[200].

## 5.2.60 *Amaranthus blitum*

Slender Amaranth, Purple amaranth

4 tin 8 cyuc 4 kca3 2 tcan 2 dwat 1 m hkuc  
htut cyutli tcup hwicli hrasjnutnyik hpa7tli frusflatprikliwis hpa7tmwatli fyif hjonli

drutta *Amaranthus blitum* is a ANNUAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in leaf from April to October, in flower in August, and the seeds ripen in September. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Leaves SeedEdible Uses: ColouringLeaves - raw or cooked as a spinach[2, 4, 55, 183]. The leaves contain about 3.88% protein, 1.1% fat, 9.38% carbohydrate, 3.2% ash, 323mg Ca, 8.3mg Fe, they are very rich in Vitamins A and C, rich in vitamin B1[179]. The leaves are used as a potherb in order to remove poison from the system[218]. Seed - cooked. Used as a cereal substitute in cakes, porridge etc[55, 183]. Very small, about 1.2mm in diameter[266], but it is easy to harvest and very nutritious. The seed can be cooked whole, and becomes very gelatinous like this, but it is rather difficult to crush all of the small seeds in the mouth and thus some of the seed will pass right through the digestive system without being assimilated[K]. An edible dye is obtained from the seed capsules[4].

tcanta DyeYellow and green dyes can be obtained from the whole plant[168].

dwatta AstringentA fluid extract of the plant is used as an astringent internally in the treatment of ulcerated mouths and throats, externally as a wash for ulcers and sores[4]. The juice of the roots is used externally to relieve headaches[272]. The plant has a folk reputation for being effective in the treatment of tumours and warts[218].

propta Seed - sow late spring in situ. An earlier sowing can be made in a greenhouse and the plants put out after the last expected frosts. Germination is usually rapid and good if the soil is warm[133]. A drop in temperature overnight aids germination[133]. Cuttings of growing plants root easily[206].

nwatta Often cultivated, especially the form oleraceus, the plant succeeds from the temperate zone through to the tropics. It grows best in areas where annual daytime temperatures are within the range 21 - 27°c, but can tolerate 18 - 32°c[418 ]. It can be killed by temperatures of 4°c or lower[418 ]. It prefers a mean annual rainfall in the range 1,200 - 1,500mm, but tolerates 200 - 2,700mm[418 ]. Prefers a well-drained fertile soil in a sunny position[200 ]. Requires a hot sheltered position if it is to do well[K ]. Prefers a pH in the range 5.5 - 7, tolerating 4.3 to 7.5[418 ]. The plant has become a weed in many areas of the world outside its original range. It is classified as 'invasive' in many Pacific Islands[305 ]. Plants are particularly susceptible to attacks by leaf-chewing insects[298 ]. Plants should not be given inorganic fertilizers, see notes above on toxicity. This plant was cultivated by the ancient Romans and Greeks for its edible leaves, there are some named varieties[183 ]. Most if not all members of this genus photosynthesize by a more efficient method than most plants. Called the 'C4 carbon-fixation pathway', this process is particularly efficient at high temperatures, in bright sunlight and under dry conditions[196 ]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is clumping, giving the plant a clumping habit. The predictable growth behaviour makes it easier to maintain without having to apply containment methods[2-1].

## 5.2.61 Hemerocallis littorea

Coastal Day Lily

4 tin 8 cyuc 4 kcak 2 tcan 1 dwat 0.9 m hkuc hmimhtut cyulti kyuctcup hwicli hrasjlutnyikfrip hpa7tli flat-prikliwis hpa7tmwatli xre7t hjonli

drutta Hemerocallis littorea is a PERENNIAL growing to 0.9 m (3ft) by 0.6 m (2ft in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from August to September, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Leaves and young shoots - cooked. They must be consumed when very young or else they become fibrous[K]. Flowers and flower buds - raw or cooked[105, 177]. They can be dried and used as a thickener in soups etc. The flower buds contain about 43mg vitamin C per 100g, 983 IU vitamin A and 3.1% protein[205]. Root - raw or cooked. A pleasant nutty flavour. This sub-species has a fibrous root system[205].

tcanta WeavingThe tough dried foliage is plaited into cord and used for making footwear[205]. Attractive flowers.

dwatta Antidote Diuretic Vitamin CThe juice of the roots is an effective antidote in cases of arsenic poisoning[205]. A tea made from the boiled roots is used as a diuretic[205].

propta Seed - sow in the middle of spring in a greenhouse. Germination is usually fairly rapid and good. Prick out the seedlings into individual pots when they are large enough to handle. Grow the plants on for their first winter in a greenhouse and plant out in late spring[K]. Division in spring or after flowering in late summer or autumn[200]. Division is very quick and easy, succeeding at almost any time of the year[K]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Succeeds in most soils[1], including dry ones, preferring a rich moist soil and a sunny position[200] but tolerating partial shade[88]. Plants flower less freely in a shady position though the flowers can last longer in such a position[205]. Grows well in heavy clay soils. Succeeds in short grass if the soil is moist[1]. Prefers a pH between 6 and 7[200]. Plants are hardy to about -15°c[187]. The plant has a fibrous root system[205]. Individual flowers are short-lived, opening in the morning and withering in the evening. The plant, however, produces a succession of flowers over a period of about 6 weeks[205]. Hybridizes freely with other members of this genus[200]. Unlike the type species, this form does produce viable seed[187]. Plants take a year or two to become established after being moved[200]. They can then spread quite freely[K]. Plants seem to be immune to the predations of rabbits[233]. The plants are very susceptible to slug and snail damage, the young growth in spring is especially at risk[200].

## 5.2.62 Acer saccharum

Sugar Maple, Florida Maple, Hard Maple, Rock Maple

4 tin 8 cyuc 4 kcak 4 tcan 2 dwat 30 m hkuc hmimhtut cyulti tcup hwicli hrasjlutnyikfrip hpa7tli frusflat-prikliwis hpa7tmwatli xre7t hjonli

drutta Acer saccharum is a deciduous Tree growing to 30 m (98ft) by 12 m (39ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 3. It is in flower from April to May, and the seeds ripen from October to December. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. It can tolerate atmospheric pollution.

kcakta Edible Parts: Inner bark Leaves Sap SeedEdible Uses: SweetenerThe sap contains quite a large proportion of sugar. This can be used as a refreshing drink, or be concentrated into a syrup by boiling off the water[1, 2, 11, 34, 57]. The syrup is used as a sweetener on many foods. The sap can be harvested in late winter or early spring[142]. The flow is best on a warm sunny day after a frost[213]. Trees on southern slopes in sandy soils give the best yields. It is best to make a hole about 7cm deep and about 1.3 metres above the ground[171]. Yields of 40 - 100 litres per tree can be obtained[142]. The best sap production comes from cold-winter areas with continental climates. The sap contains 2 - 6% sugar, thus about 32 litres are required to make a litre of maple syrup[229]. Self-sown seedlings, gathered in early spring, are eaten fresh or dried for later use[213]. Seeds - cooked. The wings are removed and the seeds boiled then eaten hot[62, 105, 159, 213]. The seed is about 6mm long and is produced in small clusters[82]. Inner bark - cooked. It is dried, ground into a powder and then used as a thickening in soups etc or mixed with cereals when making bread[105, 161]. The related Oregon Maple (*Acer macrophyllum*) has yellow flower clusters, sweet with nectar, eaten raw[183]. No information was found for this species.

tcanta Companion Fodder Fuel Potash Preservative WoodThe leaves are packed around apples, rootcrops etc to help preserve them[18, 20]. Wood - close grained, tough, hard, heavy, strong, not very durable, it takes a high polish, remains smooth under abrasion and has a high shock-

honey fungus[200]. Fruits are usually freely produced in Britain, but they do not always ripen[11, 182]. The plant grows and fruits well on a south wall at Kew[K]. A good bee plant, flowering early in the year and providing pollen and nectar[108]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching; a heart root, dividing from the crown into several primary roots going down and out [2-1].

## 5.2.134 Balsamorhiza sagittata

Oregon Sunflower, Arrowleaf balsamroot

4 tin 8 cyuc 4 kcak 2 tcan 2 dwat 0.3 m hkuc htut cyulti kyuctcup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Balsamorhiza sagittata is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Leaves Root Seed Shoots StemEdible Uses: CoffeeRoot - raw or cooked[46, 61, 106, 161, 257]. The root has a thick crown that is edible raw[213]. Roots have a sweet taste when cooked[2, 183]. A long slow baking is best, the Flathead Indians would bake them in a fire pit for at least 3 days[183]. The roots are resinous and woody with a taste like balsam[212]. Young shoots - raw or cooked[161, 257]. Added to salads or used as a potherb[183]. The large leaves and petioles are boiled and eaten[207]. When eaten in large quantities they act like sleeping pills to cause sleepiness[257]. The young flowering stem can be peeled and eaten raw like celery[183, 257]. Seed - raw or cooked[2, 94, 101, 161]. A highly prized source of food[257]. It can be roasted, ground into a powder and used with cereals when making bread[183, 257]. The raw seed can also be ground into a powder then formed into cakes and eaten without cooking[257]. The seed is rich in oil[213]. Oil. The seed was a prized source of oil for many native North Americans[257]. The roasted root is a coffee substitute[177, 183].

tcanta Hair InsulationThe large hairy leaves are used as an insulation in shoes to keep the feet warm[99]. An infusion of the root has been rubbed into the scalp to promote hair growth[257].

dwatta Antirheumatic Diaphoretic Diuretic Dysentery Febrifuge Odontalgic Poultice Skin Stomachic VulneraryOregon sunflower was quite widely employed as a medicinal herb by various native North American Indian tribes who used it to treat a variety of complaints, but especially stomach problems[257]. It is little used in modern herbalism. The root is antirheumatic, diuretic, cathartic, diaphoretic, febrifuge and vulnerary[94, 257]. An infusion of the leaves, roots and stems has been used as a treatment for stomach pains, colds, whooping cough, TB, fevers and headaches[257]. A decoction of the root has been taken at the beginning of labour to insure easy delivery[257]. The juice from the chewed root is allowed to trickle down the throat to treat sore mouths and throats whilst the root has also been chewed to treat toothaches[257]. The smoke from the root has been inhaled as a remedy for body aches such as rheumatism[257]. The root is chewed or pounded and used as a paste on wounds, blisters, bites, swellings and sores[207, 257]. A poultice made from the coarse, large leaves has been used to treat severe burns[257]. An infusion of the leaves has been used as a wash for poison ivy rash and running sores[257]. The seeds have been eaten as a treatment for dysentery[257].

propta Seed - sow early spring in a greenhouse and only just cover the seed. Germination usually takes place within 2 - 6 days at 18°c. Either sow the seed in individual pots or pot up the seedlings as soon as they are large enough to handle and plant them out into their permanent positions in the summer[134]. Division in spring. Very difficult since the plant strongly resents root disturbance[134]. It is probably best to take quite small divisions, or basal cuttings, without disturbing the main clump. Pot these up into individual pots and keep them in light shade in the greenhouse until they are growing away well. Plant them out in the summer if they

have grown sufficiently, otherwise over-winter them in the greenhouse and plant out in late spring.

nwatta Requires a deep fertile well-drained loam in full sun[134, 200]. Plants strongly resent winter wet[134, 200]. Hardy to at least -25°c[200]. Plants are intolerant of root disturbance and should be planted into their permanent positions whilst still small[134]. They withstand heavy grazing in the wild[212]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is a tap root similar to a carrot going directly down [1-2].

## 5.2.135 Juglans ailanthifolia cordiformis

Heartseed Walnut

4 tin 8 cyuc 4 kcak 4 tcan 1 dwat 20 m hkuc htut cyulti tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyif hjonli

drutta Juglans ailanthifolia cordiformis is a deciduous Tree growing to 20 m (65ft) by 15 m (49ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower in June. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Leaves Oil SeedEdible Uses: OilSeed - raw or cooked[183]. They are also used in sweets, pies etc[183]. A mild and pleasant flavour, they can be eaten in quantity for dessert[183]. The shell is thin and easily cracked[117]. It is considered to be superior in taste to *C. ailanthifolia*. An edible oil is obtained from the seed[183], though it tends to go rancid quickly. Young buds (leaf?) and peduncles - cooked[105, 177].

tcanta Dye Herbicide Oil Tannin WoodA brown dye is obtained from the seed husks and the bark[61]. Rich in tannin, it does not require a mordant. The bark is rich in tannin. It is used as a dye and also medicinally[178]. Plants produce chemicals which can inhibit the growth of other plants. These chemicals are dissolved out of the leaves when it rains and are washed down to the ground below, reducing the growth of plants under the tree[18, 20, 159]. The roots of many members of this genus produce substances that are toxic to many plant species, especially apples (*Malus* species), members of the Ericaceae, *Potentilla* spp and the white pines (certain *Pinus* spp.)[200]. Wood - soft, light, not easily cracked, of good quality. Used for cabinet making etc[46, 61].

dwatta Anthelmintic Astringent Diuretic Kidney Lithontripic Pectoral Skin TonicThe bark is anthelmintic, astringent, diuretic, lithontripic, pectoral, skin, tonic (kidneys)[178].

propta The seed is best sown as soon as it is ripe in individual deep pots in a cold frame[80]. You need to protect it from mice, birds, squirrels etc. The seed usually germinates in late winter or the spring. Plant out the seedlings into their permanent positions in early summer and give some protection from the cold for their first winter or two. The seed can also be stored in cool moist conditions (such s the salad compartment of a fridge) over the winter and sown in early spring but it may then require a period of cold stratification before it will germinate[78, 80].

nwatta Management: Standard Other Systems: Strip intercrop Regional Crop Staple Crop: Protein-oilRequires a deep well-drained loam and a sunny position sheltered from strong winds[1, 11]. Prefers a slightly alkaline soil[200]. This is the hardiest member of the genus[63], it should succeed outdoors in most parts of the country. It is also resistant to most insects[160]. The young growth in spring, however, can be damaged by late frosts. This is a form of *C. ailanthifolia* with a thinner shell and a better tasting nut. It is cultivated for its edible seed in Japan and has the potential for producing very superior nuts, especially if hybridized with *J. cinerea*[117, 160]. There are some named varieties[183].

## 5.2.131 *Campanula takesimana*

Korean Bellflower

4 tin 8 cyuc 4 kcaak 0 tcan 0 dwat 0.5 m hkuc  
hmmihtut cyutli tcup hwicli hrasjlut hpa7tli prikklwis  
hpa7tmwatli fyfjre7t hjonli

drutta *Campanula takesimana* is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to July, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves Root Edible Uses: Leaves - raw or cooked[K]. A mild flour with a subtle sweetness, especially in the spring and early summer they taste just like lettuce and are a pleasant addition to mixed salads[K]. In the height of summer, the leaves often develop a slightly bitter flavour, especially if the plant is growing in a sunny position[K]. Flowers - raw. Beautiful to look at, the flowers have a delicate sweetness and are a pleasant addition to salads[K]. Roots - raw, cooked or dried for later use. Known as 'do-ra-jee' in Korea, where they are eaten as a delicacy. The roots are a bit small and fiddly to utilize, though they are said to have a simply delicious flavour.

tcanta None known  
dwatta None known

propta Seed - surface sow May/June in situ. The seed usually germinates in 2 - 4 weeks at 18°C[138]. If the seed is in short supply it would be best to sow it in pots in a cold frame in the spring. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the summer or following spring.

nwatta Prefers a moist but well-drained rich sandy loam and a neutral or alkaline soil in sun or partial shade[1, 200]. Succeeds in most well-drained soils[233]. The species in this genus do not often hybridize and so seed can generally be relied upon to come true[221]. The plants are self-fertile[221]. This species is closely related to *C. punctata*[233, 271]. The plant spreads freely at the roots and can become rampant in lighter soils, though it is easily controlled by hoeing (or eating!)[233, 271, K]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 5.2.132 *Hordeum distichon*

Two-Rowed Barley

4 tin 8 cyuc 4 kcaak 0 tcan 3 dwat 1.2 m hkuc  
htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikklwis  
hpa7tmwatli xre7t hjonli

drutta *Hordeum distichon* is an ANNUAL growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Seed Edible Uses: Coffee Salt Sweetener Seed - cooked. The seed can be ground into a flour and used as a cereal in making bread, porridge etc[1, 4, 34, 46]. Malt is obtained by sprouting and roasting the seed, then boiling the seed. The resulting liquid is a sweet substance that is used in making beer and as a food[4, 46]. The longer the seed is roasted, the darker this liquid will be. The roasted (unsprouted) seed is used as a coffee and a salt substitute[46].

tcanta Biomass Mulch Paper The stems, after the seed has been harvested, have many uses. They are a source of

fibres for making paper, a biomass for fuel etc, they can be shredded and used as a mulch[141, 171].

dwatta Antidiarrhoeal Demulcent Nutritive Urinary Barley grain is an excellent food for convalescence, either in the form of porridge or as a decoction of the seed. It is soothing to the throat and provides easily assimilated nutrients[4, 254]. It can also be taken to clear catarrh. Its demulcent properties soothes inflammation of the gut and urinary tract[254]. It is commonly given to children suffering minor infections or diarrhoea and is particularly recommended as a treatment for feverish states and in catarrhal affections of the respiratory and urinary organs[4, 254]. Made into a poultice, the seed is an effective remedy for soothing and reducing inflammation in sores and swellings[254]. Modern research has shown that barley may be of aid in the treatment of hepatitis, whilst other trials have shown that it may help to control diabetes[254]. Barley bran may have the effect of lowering blood cholesterol levels and preventing bowel cancer[254].

propta Seed - sow in situ in March or October and only just cover the seed. Make sure the soil surface does not dry out if the weather is dry. Germination takes place within 2 weeks.

nwatta Succeeds in most soils and in climates ranging from sub-arctic to sub-tropical[1, 171]. Easily grown in light soils[162]. Widely cultivated in temperate zones, especially in cooler or moister areas, for its edible seed[1, 50, 171]. There are many named varieties. This species is sometimes considered to be no more than a sub-species of *H. vulgare*[61].

## 5.2.133 *Chaenomeles cathayensis*

Chinese Quince

4 tin 8 cyuc 4 kcaak 0 tcan 2 dwat 3 m hkuc  
hmmihtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprikklwis  
hpa7tmwatli xre7t hjonli

drutta *Chaenomeles cathayensis* is a deciduous Shrub growing to 3 m (9ft) by 3 m (9ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in April, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. It can tolerate atmospheric pollution.

kcakta Edible Parts: Fruit Edible Uses: Fruit - very harsh raw but fragrant when cooked[1, 3, 4, 11, 177]. It makes an excellent jelly[183] and a very good jam, it is especially good cooked with apples in apple pies[K]. The fruit is very large and can be 15cm long and 9cm wide[200].

tcanta None known

dwatta Antiemetic Antirheumatic Antispasmodic Digestive The fruit is antiemetic, antirheumatic, antispasmodic and digestive[176]. It is used in the treatment of rheumatic pain, convulsions of the calf muscles, vomiting, dyspepsia and diarrhoea[176].

propta Seed - best sown as soon as it is ripe in a sheltered position outdoors or in a cold frame[200]. Sow stored seed in February in a greenhouse[78]. Germination usually takes place within 6 weeks[78]. Prick out the seedlings into individual pots as soon as they are large enough to handle. If well grown, these seedling can be large enough to plant out in the summer, but give them some protection in their first winter. Otherwise plant them out in late spring of the following year[K]. Cuttings of half-ripe wood, July/August in a frame[11]. Cuttings of mature wood of the current year's growth, November in a cold frame. Layering in late spring or in autumn. This is a sure and easy method, though it takes 12 months[78, 200].

nwatta Easily cultivated in any reasonably good soil[1, 200]. Prefers a deep moist well-drained loam[4, 11]. Grows well in heavy clay soils. Tolerates full shade but requires a sunny position for best fruit production[3, 11, 200]. Becomes chlorotic on very alkaline soils[188, 200]. Tolerates atmospheric pollution[200]. A very ornamental plant[1], it is hardy to about -25°C[200]. Plants are subject to canker, especially when growing in the milder moister areas of Britain[49]. Plants in this genus are notably resistant to

resistance[46, 61, 82, 171, 227]. It holds nails well, is fair in gluing, dries easily and shrinks moderately[227]. The wood weighs 43lb per cubic foot[235]. Considered by many to be the most valuable hardwood tree in N. America, the sugar maple is used for a wide range of applications including furniture, flooring, turnery, musical instruments and ship building[46, 61, 82, 171, 227]. Accidental forms with the grain curled and contorted, known as curly maple and bird's eye maple, are common and are highly prized in cabinet making[82]. The wood is also a very good fuel, giving off a lot of heat and forming very hot embers[82, 226]. The ashes of the wood are rich in alkali and yield large quantities of potash[82]. A dynamic accumulator gathering minerals or nutrients from the soil and storing them in a more bioavailable form - used as fertilizer or to improve mulch.

dwatta Blood tonic Diuretic Expectorant Hepatic Ophthalmic A tea made from the inner bark is a blood tonic, diuretic and expectorant[222]. It has been used in the treatment of coughs, diarrhoea etc[222]. A compound infusion of the bark has been used as drops in treating blindness[257]. The sap has been used for treating sore eyes[257]. The inner bark has been used as an expectorant and cough remedy[257]. Maple syrup is used in cough syrups and is also said to be a liver tonic and kidney cleanser[222].

propta Seed - best sown as soon as it is ripe in a cold frame, it usually germinates in the following spring. A lot of the seed is non-viable, it is best to cut a few open to see if there is an embryo[113]. An average of 95% germination can be achieved from viable seed[98]. Pre-soak stored seed for 24 hours and then stratify for 2 - 4 months at 1 - 8°C. It can be slow to germinate, sometimes taking two years[125]. The seed can be harvested 'green' (when it has fully developed but before it has dried and produced any germination inhibitors) and sown immediately. It should germinate in late winter. If the seed is harvested too soon it will produce very weak plants or no plants at all[80, 113]. When large enough to handle, prick the seedlings out into individual pots and grow them on until they are 20cm or more tall before planting them out in their permanent positions. Layering, which takes about 12 months, is successful with most species in this genus. Cuttings of young shoots in June or July. The cuttings should have 2 - 3 pairs of leaves, plus one pair of buds at the base. Remove a very thin slice of bark at the base of the cutting, rooting is improved if a rooting hormone is used. The rooted cuttings must show new growth during the summer before being potted up otherwise they are unlikely to survive the winter.

nwatta Agroforestry Services: Crop shade Fodder: Bank Management: Standard Regional Crop Staple Crop: Sugar Landscape Uses: Firewood, Screen, Specimen, Street tree, Woodland garden. Of easy cultivation, it prefers a good moist well-drained soil but succeeds on most soils[11, 98], though it is more likely to become chlorotic as a result of iron deficiency on alkaline soils. Grows well in heavy clay soils. Trees need full light and a lot of space[98]. This species is one of the most shade tolerant of the N. American maples[226]. It tolerates atmospheric pollution[200] and so is often used as a street tree, though it can suffer from soil compaction and the use of salt on the roads in frosty weather. Tolerates a pH in the range 4.5 to 7.3. Hardy to about -45°C when fully dormant[160]. A fast-growing tree for its first 40 years in the wild[229], this species is not a great success in Britain[1], though it does better than once thought[11]. It grows well in Cornwall[59]. In cultivation it has proved to be slow growing when young[11]. Trees can live for 250 years in the wild[229]. A very ornamental tree[1] but a bad companion plant, inhibiting the growth of nearby plants[18, 20]. This species is commercially exploited in America for its sap[1, 11]. Along with its sub-species it is the major source of maple syrup[11]. There are some named varieties[183]. The sap can be tapped within 10 - 15 years from seed but it does not flow so well in areas with mild winters[160]. Special Features: Attracts birds, North American native, Inconspicuous flowers or blooms. The plant is heat tolerant in zones 8 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat

Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2]. The root pattern is flat with shallow roots forming a plate near the soil surface [1-2]. The root pattern is a heart root, dividing from the crown into several primary roots going down and out [1-2].

## 5.2.63 *Aralia cordata*

Udo

4 tin 9 cyuc 4 kcaak 0 tcan 2 dwat 1.8 m hkuc  
pimmhim cyutli tcup hwicli hyishrasjlutnyik hpa7tli flatprikklwis  
hpa7tmwatli xre7t hjonli

drutta *Aralia cordata* is a PERENNIAL growing to 1.8 m (6ft). See above for USDA hardiness. It is hardy to UK zone 5 and is frost tender. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: Leaves Root Shoots Stem Edible Uses: Young branched shoots - cooked or raw[2, 46, 61, 105, 177, 279]. They can be up to 1.5 metres long and have a mild and agreeable flavour[116]. They are usually blanched and are crisp and tender with a unique lemon-like flavour[183]. They can be sliced and added to salads, soups etc[206]. The shoots contain about 1.1% protein, 0.42% fat, 0.8% soluble carbohydrate, 0.55% ash[179]. Root - cooked[22, 105, 177]. Used like scorzonera[2].

tcanta None known

dwatta Analgesic Antiinflammatory Carminative Diuretic Febrifuge Stimulant Stomachic Tonic The root is sometimes used in China as a substitute for ginseng (*Panax species*)[218]. It is said to be analgesic, antiinflammatory, carminative, diuretic, febrifuge, stimulant, stomachic and tonic[218, 279]. The root contains an essential oil, saponins, sesquiterpenes and diterpene acids[279]. It is used in Korea to treat the common cold and migraines[279].

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed requires 3 - 5 months of cold stratification. Germination usually takes place within 1 - 4 months at 20°C[134]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in a greenhouse for at least their first winter. Once the plants are 25cm or more tall, they can be planted out into their permanent positions, late spring or early summer being the best time to do this. Store cuttings 8cm long, December in a cold frame[11, 78]. Root the roots upside down in sand and pot up in March/April. High percentage[78]. Division of suckers in late winter[11]. Very easy, the suckers can be planted out direct into their permanent positions if required.

nwatta Prefers a good deep loam and a semi-shady position[1, 134]. Requires a sheltered position[1]. Plants are harder when grown in poorer soils[200]. Tolerates a pH in the range 5.0 to 7.4. Dormant plants are hardy to about -25°C[187]. The young growing in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. This is a commonly cultivated food crop in Japan, where it is grown for its edible shoots. There are several named varieties[2, 46, 58, 116]. The plant is heat tolerant in zones 9 through 6. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2].

## 5.2.64 *Malva neglecta*

Dwarf Mallow, Common mallow

4 tlin 8 cyuc 4 kcaak 0 tcan 2 dwat 0.6 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flat-prikliwis hpa7tmwatli fyifxre7t hjonli

drutta *Malva neglecta* is a ANNUAL growing to 0.6 m (2ft). See above for USDA hardness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to September, and the seeds ripen from July to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Leaves SeedEdible Uses: Egg TeaLeaves and young shoots - raw or cooked[2, 9, 13, 74, 85]. A mild pleasant flavour[K], they are said to be highly nutritious[222]. They can be added in quantity to salads, and make an excellent lettuce substitute, they can also be cooked as greens[183, K]. The leaves are mucilaginous, when cooked in soups etc they tend to thicken it in much the same way as okra (*Abelmoschatus esculenta*)[222]. Some people find this mucilaginous texture unpleasant, especially if the leaves are cooked[K]. Immature seeds - raw or cooked[74, 85, 183]. A pleasant nutty flavour, they are nice as a nibble but too small for most people to want to collect in quantity[K]. A decoction of the roots is used as an egg-white substitute for making meringue[183]. The roots are brought to the boil in water and then simmered until the water becomes quite thick. This liquid can then be whisked in much the same way as egg whites[K]. A tea can be made from the dried leaves[85, 183].

tcanta Dye TeethCream, yellow and green dyes can be obtained from the plant and the seed heads[168]. The root is used as a toothbrush[74].

dwatta Antinflammatory Antiphlogistic Astringent Demulcent Diuretic Emollient Expectorant Laxative Poulitice Purgative Salve UrinaryAll parts of the plant are antiphlogistic, astringent, demulcent, diuretic, emollient, expectorant, laxative, salve[9, 222, 238]. The leaves and flowers can be eaten as part of the diet, or a tea can be made from the leaves, flowers or roots[222]. The leaves and flowers are the main part used, their demulcent properties making them valuable as a poultice for bruise, inflammations, insect bites etc, or taken internally in the treatment of respiratory system diseases or inflammation of the digestive or urinary systems[222, 238]. They have similar properties, but are considered to be inferior to the marsh mallow (*Althaea officinalis*), though they are stronger acting than the common mallow (*M. sylvestris*). They are seldom used internally[4]. The plant is an excellent laxative for young children[7].

propta Seed - sow early spring or autumn in situ. Germination should take place within 2 weeks. The seed germinates in the autumn in the wild.

nwatta A very easily grown plant, succeeding in ordinary garden soil, though it prefers a reasonably well-drained and moderately fertile soil in a sunny position. It also succeeds in dry soils. At one time this plant was often cultivated for its edible leaves[2]. Plants seem to be immune to the predations of rabbits[233]. Prone to infestation by rust fungus.

## 5.2.65 *Crataegus acclivis*

4 tlin 8 cyuc 4 kcaak 0 tcan 2 dwat 8 m hkuc hmimhtut cyutli hgattcuphja7n hwicli hrasjlutnyikfrip hpa7tli flatprikliwsslip hpa7tmwatli xre7t hjonli

drutta *Crataegus acclivis* is a deciduous Tree growing to 8 m (26ft) by 7 m (23ft). See above for USDA hardness. It is hardy to UK zone 5 and is not frost tender. It is in flower from April to May, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Midges. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[K]. The fruit ripens in early September, it is about 18mm long with a pleasantly sweet juicy flesh and makes an excellent dessert fruit[K]. The fruit contains up to 5 seeds in the centre, these usually stick together and so the effect is like eating a cherry with its single large seed[K].

tcanta None known

dwatta Cardiac HypotensiveAlthough no specific mention has been seen for this species, the fruits and flowers of many hawthorns are well-known in herbal folk medicine as a heart tonic and modern research has borne out this use. The fruits and flowers have a hypotensive effect as well as acting as a direct and mild heart tonic[222]. They are especially indicated in the treatment of weak heart combined with high blood pressure[222]. Prolonged use is necessary for it to be efficacious[222]. It is normally used either as a tea or a tincture[222].

propta Seed - this is best sown as soon as it is ripe in the autumn in a cold frame, some of the seed will germinate in the spring, though most will probably take another year. Stored seed can be very slow and erratic to germinate, it should be warm stratified for 3 months at 15°C and then cold stratified for another 3 months at 4°C[164]. It may still take another 18 months to germinate[78]. Scarifying the seed before stratifying it might reduce this time[80]. Fermenting the seed for a few days in its own pulp may also speed up the germination process[K]. Another possibility is to harvest the seed 'green' (as soon as the embryo has fully developed but before the seedcoat hardens) and sow it immediately in a cold frame. If timed well, it can germinate in the spring[80]. If you are only growing small quantities of plants, it is best to pot up the seedlings as soon as they are large enough to handle and grow them on in individual pots for their first year, planting them out in late spring into nursery beds or their final positions. When growing larger quantities, it might be best to sow them directly outdoors in a seedbed, but with protection from mice and other seed-eating creatures. Grow them on in the seedbed until large enough to plant out, but undercut the roots if they are to be left undisturbed for more than two years.

nwatta A very easily grown plant, it prefers a well-drained moisture retentive loamy soil but is not at all fussy[11, 200]. Once established, it succeeds in excessively moist soils and also tolerates drought[200]. It grows well on a chalk soil and also in heavy clay soils[200]. A position in full sun is best when plants are being grown for their fruit, they also succeed in semi-shade though fruit yields and quality will be lower in such a position[11, 200]. Most members of this genus succeed in exposed positions, they also tolerate atmospheric pollution[200]. Plants are hardy to at least -18°C[202]. We have very little specific information on this plant, and it is regarded as no more than a form of *C. pedicellata* by most botanists[235]. However, a tree seen at Kew in early September 1997 had a good crop of almost ripe fruit. This fruit was more elongated than *C. pedicellata* and was also ripe about 4 weeks before that species[K]. Hybridizes freely with other members of this genus[200]. Seedling trees take from 5 - 8 years before they start bearing fruit, though grafted trees will often flower heavily in their third year[K]. The flowers have a foetid smell somewhat like decaying fish. This attracts midges which are the main means of fertilization. When freshly open, the flowers have more pleasant scent with balsamic undertones[245]. Seedlings should not be left in a seedbed for more than 2 years without being transplanted[11].

## 5.2.66 *Amelanchier canadensis*

Juneberry, Canadian serviceberry, Serviceberry Downy, Shadblow, Shadbush, Serviceberry  
4 tlin 7 cyuc 4 kcaak 4 tcan 1 dwat 6 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprik hpa7tmwatli fyifxre7t hjonli

drutta *Amelanchier canadensis* is a deciduous Shrub growing to 6 m (19ft) by 3 m (9ft) at a medium rate. See above for USDA hardness. It is hardy to UK zone 4 and is not frost tender. It is in flower in April, and the seeds ripen in July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid

## 5.2.130 *Morus alba*

White Mulberry, Common Mulberry,

4 tlin 9 cyuc 4 kcaak 4 tcan 3 dwat 18 m hkuc hmimhtut cyutli hgattcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyif hjonli

drutta *Morus alba* is a deciduous Tree growing to 18 m (59ft) by 10 m (32ft) at a medium rate. See above for USDA hardness. It is hardy to UK zone 4. It is in flower in May, and the seeds ripen from July to August. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: Fruit Inner bark Leaves Manna ShrubEdible Uses: TeaFruit - raw[2, 7, 158]. A sweet taste, but the fruit is usually insipid[3, 11]. It contains about 1.5% protein, 0.5% fat, 8% carbohydrate, 0.7% malic acid[179]. Fruits of the cultivar 'Pendulum' tried at Kew in July 1994 had a pleasant flavour[K]. A richer flavour develops if the fruit is dried, it can then be used as a raisin substitute. The fruit is up to 25mm long[200]. Some caution is advised, see the notes above on toxicity. Per 100 g, the fruit is reported to contain 87.5 g water, 1.5 g protein, 0.49 g fat, 8.3 g carbohydrates, 1.4 g fiber, 0.9 g ash, 80 mg Ca, 40 mg P, 1.9 mg Fe, 174 IU vit. A, 9.7g thiamine, 184 µg riboflavin, 0.8 mg nicotinic acid, and 13 mg ascorbic acid. Young leaves and shoots - cooked[105, 183]. A famine food, used when all else fails[177]. The leaf makes a good vegetable, it is rich in carotene and calcium[179]. Protein preparations from young mulberry leaves form an excellent supplement to protein-deficient diets[269]. The dry leaves contain 18 - 28.8% protein, 0.2 - 0.7% Magnesium, 0.8 - 13.6% soluble sugars, 0.6 - 1.4% phosphorus, 2 - 3.9% potassium, 1.4 - 2.4% calcium, 0.8 - 1.8% aluminium, 0.05 - 0.26% iron, 1.8 - 2.6% silica, and 0.3 - 0.56% sulphur[269]. The leaf also contains 10% tannin[179]. Inner bark - roasted and ground into a meal then used as a thickener in soups etc or mixed with cereals when making bread. A famine food, used when all else fails[179]. The tree is said to be a source of an edible manna[183]. Young shoots can be used as a tea substitute[183].

tcanta Biomass Dye Fibre Fodder Shelterbelt Tannin WoodA fibre is obtained from the bark of one-year old stems, it is used in weaving clothes etc[7, 74, 266]. The stem bark is fibrous and is used in China and Europe for paper making[266, 269]. The twigs are used as binding material and for making baskets[269]. A brown dye is obtained from the trunk[178]. The leaves contain 10% tannin[179]. This tree can be grown as a part of a shelterbelt. The cultivar 'Tartarica' has been especially mentioned[200], it is very suitable for northern latitudes and is much used as a shelterbelt in Russia[269]. The wood of the mulberry is a potentially excellent source of ethanol, with yields of up to 6% from sawdust treated with acid and then given four days incubation[269]. Wood - light to moderately heavy, hard, durable, fine and close-grained, though it shows a tendency to warp. Due to its elasticity and flexibility when steamed, it is valued for making sports equipment such as tennis rackets and cricket bats, being considered as good as ash (*Fraxinus excelsior*)[238, 269]. It is also used for boat building, furniture, agricultural implements etc[145, 149, 158, 269]. It furnishes a medium grade fuel wood[269].

dwatta Analgesic Anthelmintic Antiasthmatic Antibacterial Antirheumatic Antitussive Astringent Diaphoretic Diuretic Emollient Expectorant Hypoglycaemic Hypotensive Odontalgic Ophthalmic Pectoral Purgative Sedative Tonic UrinaryThe white mulberry has a long history of medicinal use in Chinese medicine, almost all parts of the plant are used in one way or another[238]. Recent research has shown improvements in elephantiasis when treated with leaf extract injections and in tetanus following oral doses of the sap mixed with sugar[238]. The leaves are antibacterial, astringent, diaphoretic, hypoglycaemic, odontalgic and ophthalmic[176, 218, 238]. They are taken internally in the treatment of colds, influenza, eye infections and nose-bleeds[176, 238]. An injected extract of the leaves can be used in the treatment of elephantiasis and purulent fistulae[176]. The leaves are collected after the first frosts of au-

tumn and can be used fresh but are generally dried[238]. The stems are antirheumatic, antispasmodic, diuretic, hypotensive and pectoral[176, 218, 238]. They are used in the treatment of rheumatic pains and spasms, especially of the upper half of the body, high blood pressure[176]. A tincture of the bark is used to relieve toothache[7]. The branches are harvested in late spring or early summer and are dried for later use[238]. The fruit has a tonic effect on kidney energy[218, 238]. It is used in the treatment of urinary incontinence, dizziness, tinnitus, insomnia due to anaemia, neurasthenia, hypertension, diabetes, premature greying of the hair and constipation in the elderly[176, 238]. The root bark is antiasthmatic, antitussive, diuretic, expectorant, hypotensive and sedative[176, 238]. It is used internally in the treatment of asthma, coughs, bronchitis, oedema, hypertension and diabetes[176, 238]. The roots are harvested in the winter and dried for later use[238]. The bark is anthelmintic and purgative, it is used to expel tape worms[240]. Extracts of the plant have antibacterial and fungicidal activity[218].

propta The seed germinates best if given 2 - 3 months cold stratification[80, 98]. Sow the seed as soon as it is ripe if possible, otherwise in February in a cold frame. The seed usually germinates in the first spring, though it sometimes takes another 12 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the cold frame for their first winter. Plant them out in late spring or early summer after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in a frame. Plant out in spring. A good percentage take, though they sometimes fail to thrive[78, 113]. Cuttings of mature wood of the current season's growth, 25 - 30cm with a heel of 2 year old wood, autumn or early spring in a cold frame or a shady bed outside[78, 113, 200]. Bury the cuttings to threequarters of their depth. Layering in autumn[200].

nwatta Agroforestry Services: Contour hedgerow Agroforestry Services: Living fence Fodder: Bank Fodder: Insect Industrial Crop: Biomass Management: Coppice Management: Standard Minor Global Crop Other Systems: Dyke-pond/Landscape Uses:Pest tolerant, Aggressive surface roots possible, Pollard. Succeeds in a variety of soils[269], though it prefers a warm well-drained loamy soil in a sunny position[1, 11]. Plants are fairly wind-resistant[200], though the branches are often killed back when growing in strong maritime exposure[K]. At least some cultivars are drought resistant, the form 'Tatarica' has been especially mentioned[183]. The white mulberry is occasionally cultivated for its edible fruit, there are a number of varieties[183] and sub-species varying greatly in the quality of their fruit. The form *M. alba multicaulis* (Perretot/Loud, (synonym *M. multicaulis*, Perretot.) has been specially mentioned for its fruit[105]. The cultivars 'Nana' and 'Feggyvernekiana' are dwarf forms only making shrub size[182]. The cultivar 'Pendulum' was seen growing at Kew in July 1994 with a heavy crop of tasty fruits, the first of which were just ripening[K]. Mulberries have brittle roots and so need to be handled with care when planting them out[238]. Any pruning should only be carried out in the winter when the plant is fully dormant because mulberries bleed badly when cut[238]. Ideally prune only badly placed branches and dead wood[238]. This is a good tree for growing grapes into[20]. The grapes are difficult to pick but always seem to be healthier and free from fungal diseases[201]. Plants in this genus are notably resistant to honey fungus[200]. Special Features:Not North American native, Naturalizing, There are no flowers or blooms. The plant is heat tolerant in zones 8 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2].

Tolerates exposed positions and atmospheric pollution[200]. A very ornamental and fast-growing tree[1, 4], it succeeds in most areas of Britain but grows best in eastern and south-eastern England[200]. Trees are very hardy when dormant, but the young growth in spring can be damaged by late frosts. The flowers have a delicate honey-like perfume[245]. Trees are tolerant of drastic cutting back and can be severely lopped[200]. They are prone to suddenly losing old heavy branches[98]. The tree comes into bearing within 20 years from seed[98]. Most members of this genus transplant easily, even when fairly large[11]. Special Features: Attractive foliage, Not North American native, Naturalizing, Blooms are very showy. Carbon Farming Solutions - Cultivation: hypothetical. Management: standard (Describes the non-destructive management systems that are used in cultivation) [1-1].

## 5.2.128 Crataegus submollis

Quebec Hawthorn

4 tlin 8 cyuc 4 kcaak 0 tcan 0 dwat 7 m hkuc hmimhtut cyutli hgtaccuphja7n hwicli hrasjlutnykfrip hpa7tli flatprikwlis hpa7tmwatli xre7t hjonli

drutta Crataegus submollis is a deciduous Tree growing to 7 m (23ft) by 7 m (23ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in June, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Midges. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105, 161]. Sub-acid, dry and mealy[82]. Our experience has been that the fruit is sweet and somewhat juicy, it has a thick flesh with a nice flavour and makes an acceptable dessert fruit[K]. The fruit can also be used in making pies, preserves etc, and can be dried for later use[257]. It is about 20mm in diameter, is borne in large clusters and is easily harvested[K]. There are up to five fairly large seeds in the centre of the fruit, these often stick together and so the effect is of eating a cherry-like fruit with a single seed[K].

tcanta Hedge HedgePlants are very tolerant of trimming and will soon resprout even if cut back into very old wood. They can be used as a hedge[50]. Wood - heavy, hard, tough, close-grained. Useful for making tool handles, mallets and other small items[82].

dwatta Cardiotonic HypotensiveAlthough no specific mention has been seen for this species, the fruits and flowers of many hawthorns are well-known in herbal folk medicine as a heart tonic and modern research has borne out this use. The fruits and flowers have a hypotensive effect as well as acting as a direct and mild heart tonic[222]. They are especially indicated in the treatment of weak heart combined with high blood pressure[222]. Prolonged use is necessary for it to be efficacious[222]. It is normally used either as a tea or a tincture[222].

propta Seed - this is best sown as soon as it is ripe in the autumn in a cold frame, some of the seed will germinate in the spring, though most will probably take another year. Stored seed can be very slow and erratic to germinate, it should be warm stratified for 3 months at 15°C and then cold stratified for another 3 months at 4°C[164]. It may still take another 18 months to germinate[78]. Scarifying the seed before stratifying it might reduce this time[80]. Fermenting the seed for a few days in its own pulp may also speed up the germination process[K]. Another possibility is to harvest the seed 'green' (as soon as the embryo has fully developed but before the seedcoat hardens) and sow it immediately in a cold frame. If timed well, it can germinate in the spring[80]. If you are only growing small quantities of plants, it is best to pot up the seedlings as soon as they are large enough to handle and grow them on in individual pots for their first year, planting them out in late spring into nursery beds or their final positions. When growing larger quantities, it might be best to sow them directly outdoors in a seedbed, but with protection from mice and other seed-eating creatures. Grow

them on in the seedbed until large enough to plant out, but undercut the roots if they are to be left undisturbed for more than two years.

nwatta A very easily grown plant, it prefers a well-drained moisture retentive loamy soil but is not at all fussy[11, 200]. Once established, it succeeds in excessively moist soils and also tolerates drought[200]. It grows well on a chalk soil and also in heavy clay soils[200]. A position in full sun is best when plants are being grown for their fruit, they also succeed in semi-shade though fruit yields and quality will be lower in such a position[11, 200]. Most members of this genus succeed in exposed positions, they also tolerate atmospheric pollution[200]. Plants are hardy to about -18°C[202]. Hybridizes freely with other members of this genus[200]. Seedling trees take from 5 - 8 years before they start bearing fruit, though grafted trees will often flower heavily in their third year[K]. The flowers have a foetid smell somewhat like decaying fish. This attracts midges which are the main means of fertilization. When freshly open, the flowers have more pleasant scent with balsamic undertones[245]. Seedlings should not be left in a seedbed for more than 2 years without being transplanted[11]. This species is sometimes confused with *C. coccinea*[50]. It is also very close to *C. mollis*, differing in having 10 stamens to a flower (as compared to 20 in *C. mollis*)[202]. It is considered to be part of *C. mollis* by some botanists[229].

## 5.2.129 Dichelostemma pulchellum

Wild Hyacinth

4 tlin 8 cyuc 4 kcaak 0 tcan 0 dwat 0.6 m hkuc htut cyutli kyuctup hwicli hraslut hpa7tli flatprikwlis hpa7tmwatli xre7t hjonli

drutta Dichelostemma pulchellum is a CORM growing to 0.6 m (2ft) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from May to June, and the seeds ripen in August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Flowers RootEdible Uses: Corm - raw or cooked[22, 61, 161, 183]. A sweet flavour[46], it may seem rather flat at first, but the taste quickly grows on one[95]. A slow baking develops the sweetness of the corm[95]. The corm can be dried and ground into a powder then used as a thickener in soups or mixed with cereal flours to make bread etc[257]. The corm is usually harvested in the spring[257]. Flowers - raw[257]. A nice decoration in the salad bowl[183].

tcanta AdhesiveThe corms have been rubbed on metate into an adhesive and then spread on baskets to close the interstices and prevent small seeds falling through the gaps[257].

dwatta None known

propta Seed - best sown as soon as it is ripe in a free-draining compost in a cold frame[200]. Sow stored seed in spring in a cold frame[175]. Seedlings are prone to damping off and so should be kept well ventilated[175]. Germinates in 1 - 3 months at 15°C[175]. If the seed is sown thinly enough, it can be grown on for its first year without transplanting and then the dormant bulbs can be planted 2/3 to a pot. Otherwise prick out the seedlings when large enough to handle, planting them 2/3 to a pot. Grow on the plants in a greenhouse for at least two years before planting out in late spring after the last expected frosts. Division in autumn of offsets that have reached flowering size[1]. Dig up the clumps of bulbs and replant the larger ones into their permanent positions. It is best to pot up the smaller ones and grow them on for a year in a cold frame before planting them out.

nwatta Easily grown in a well-drained rich sandy loam[1], it likes plenty of moisture whilst in growth followed by a warm dry period in late summer to autumn in order to fully ripen its bulb[200]. Plants are susceptible to rot in wet soils[200]. This species is hardy to between -5 to -10°C, it may require protection in severe winters[90]. This can be done by applying a good organic mulch such as dry bracken in late autumn and removing it in early spring. Alternatively, you can cover the ground with a cloche or other device. A very ornamental plant, it can flower in 2 years from seed.

and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: FruitEdible Uses: Edible fruit - raw or cooked[3, 55, 101, 159]. The fruit contains a few small seeds at the centre, it has a sweet flavour with a hint of apple[1, 2]. It can be eaten out of hand, used in pies, preserves etc or dried and used like raisins[183]. We have found the fruit to be of variable quality, with some forms having a distinct bitterness in the flavour whilst others are sweet, juicy and delicious[K]. When the fruit is thoroughly cooked in puddings or pies the seed imparts an almond flavour to the food[183]. The fruit is rich in iron and copper[226]. It is about 10mm in diameter[200]. Trees can yield 7 to 15 tonnes per hectare[160].

tcanta Disinfectant Hedge Hedge Rootstock Shelterbelt WoodThis species can be used as a dwarfing rootstock for Malus spp. (the apples) and Pyrus spp. (the pears)[160]. Plants can be grown as an informal hedge[200]. Any trimming is best done after flowering[200]. A fairly wind-tolerant species, it can be used to give protection from the wind as part of a mixed shelterbelt[200]. Wood - hard, strong, close grained. Used for tool handles, small implements etc[46, 61].

dwatta Anthelmintic Disinfectant Women's complaintsA tea made from the root bark (mixed with other unspecified herbs) was used as a tonic in the treatment of excessive menstrual bleeding and also to treat diarrhoea[222, 257]. A bath of the bark tea was used on children with worms[222, 257]. An infusion of the root was used to prevent miscarriage after an injury[257]. A compound concoction of the inner bark was used as a disinfectant wash[257].

propta Seed - it is best harvested 'green', when the seed is fully formed but before the seed coat has hardened, and then sown immediately in pots outdoors or in a cold frame. If stored seed is obtained early enough in the autumn, it can be given 4 weeks warm stratification before being left out in the winter and it should then germinate in the spring. Otherwise seed can be very slow to germinate, perhaps taking 18 months or more. When large enough to handle, prick the seedlings out into individual pots and grow them on in a sheltered outdoor position, planting them out once they are 20cm or more tall. If there is sufficient seed it is best to sow it thinly in an outdoor seedbed[78, 80]. Grow the seedlings on for two years in the seedbed before planting them out into their permanent positions during the winter. Layering in spring - takes 18 months[78]. Division of suckers in late winter. The suckers need to have been growing for 2 years before you dig them up, otherwise they will not have formed roots. They can be planted out straight into their permanent positions if required.

nwatta Landscape Uses:Specimen, Woodland garden. Prefers a rich loamy soil in a sunny position or semi-shade[1, 200] but thrives in any soil that is not water-logged, too dry or poor[11], though it is more wet-tolerant than other members of this genus[11]. Grows well in heavy clay soils. Prefers an acid soil[17, 43]. Trees produce more and better quality fruits better when growing in a sunny position[1]. All members of this genus have edible fruits and, whilst this is dry and uninteresting in some species, in many others it is sweet and juicy. Many of the species have potential for use in the garden as edible ornamentals. The main draw-back to this genus is that birds adore the fruit and will often completely strip a tree before it is fully ripe[K]. There is at least one named variety of this species with superior fruits. 'Prince William' is a large multi-stemmed shrub to 3 metres tall and 2 metres across[183, 200]. It crops heavily and its good quality fruit is about 12mm in diameter[183]. Considerable confusion has existed between this species and *A. arborea*, *A. laevis* and *A. lamarckii*, see [11] for the most recent (1991) classification. Hybridizes freely with other members of this genus[200]. Grafting onto seedlings of *A. lamarckii* or *Sorbus aucuparia* is sometimes practised in order to avoid the potential problem of hybridizing[1]. Special Features:Attracts birds, North American native, Attracts butterflies, Blooms are very showy. The plant is heat tolerant in zones 7 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or

more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is multistemmed with multiple stems from the crown [1-2].

## 5.2.67 Ribes burejense

Bureja gooseberry,

4 tlin 8 cyuc 4 kcaak 0 tcan 0 dwat 1 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyk hpa7tli flatprikwlis hpa7tmwatli xre7t hjonli

drutta Ribes burejense is a deciduous Shrub growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in April, and the seeds ripen from July to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105]. Acid but palatable, it is a gooseberry and can hang on the bush until November if the birds leave it alone[K]. At this time of year it develops a rather nice black-currant flavour[K]. The fruit is about 10mm in diameter[200].

tcanta None known

dwatta None known

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. Stored seed requires 3 months cold stratification at 2 to 5°C and should be sown as early in the year as possible[113, 164]. Under normal storage conditions the seed can remain viable for 17 years or more. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter; planting them out in late spring of the following year. Cuttings of half-ripe wood, 10 - 15cm with a heel, July/August in a frame[78, 113]. Cuttings of mature wood of the current year's growth, preferably with a heel of the previous year's growth, November to February in a cold frame or sheltered bed outdoors[78, 200].

nwatta Easily grown in a moisture retentive but well-drained loamy soil of at least moderate quality[11, 200]. Quite tolerant of shade though not fruiting so well in such a position[11]. Hardy to about -20°C[200]. Plants can harbour a stage of 'white pine blister rust', so they should not be grown in the vicinity of pine trees[155]. Plants in this genus are notably susceptible to honey fungus[200].

## 5.2.68 Valerianella locusta

Corn Salad, Lewiston cornsalad

4 tlin 8 cyuc 4 kcaak 0 tcan 0 dwat 0.3 m hkuc htut cyutli kyuctup hwicli hrasjlutnyk hpa7tli flatprikwlis hpa7tmwatli fyfjxre7t hjonli

drutta Valerianella locusta is a ANNUAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from April to June, and the seeds ripen from May to July. The species is hermaphrodite (has both male and female organs). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Flowers LeavesEdible Uses: Young leaves - raw[1, 2, 4, 5, 12, 27, 33, 37]. A very mild flavour, with a delicate quality that makes them seem to melt in the mouth, they can be added in quantity to salads[183]. The leaves can be available all year round from successional sowings and will only require protection in the colder winters[K]. Flowers and flowering stems - raw[183].

tcanta None known

dwatta None known

propta Seed - in order to obtain a continuous supply of salad leaves, it is best to sow the seed successively from early spring to late summer in situ. A late summer sowing might also succeed, and this would supply edible leaves in the winter.

nwatta A very easily grown plant, it prefers a fairly rich light soil[1, 37] though it tolerates moist soils and wet or dry conditions[52]. Prefers a sunny position but tolerates some shade in summer[K]. This shade, plus an adequate supply of water, will slow down the plant's tendency to run to seed[200]. Late sowings will benefit from a sheltered sunny position and perhaps some protection in the winter. Often cultivated on a garden scale for its edible young leaves which, by successional sowing, can be available for most of the year although they will require protection in severe winters. There are several named varieties[183]. The plants do tend to run quickly to seed in the summer though. If allowed to flower, plants will often maintain themselves by self-sowing[K].

## 5.2.69 Crataegus succulenta

Fleshy hawthorn  
4 tlin 8 cyuc 4 kcaak 2 tcan 2 dwat 6 m hkuc  
hmimhtut cyutli hgatkuyctcuphja7n hwicli hrasjlutnykfrp hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli  
drutta Crataegus succulenta is a deciduous Shrub growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Midges. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry moist or wet soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[62, 101, 105]. Excellent for making jellies[183], it can also be dried for later use. A small fruit with a sweet, juicy and pulpy flesh[82, 183], it is up to 17mm in diameter[235]. Another report says that the fruit is large for a Crataegus species, it is about 35mm in diameter and is borne in small clusters[200]. There are up to five fairly large seeds in the centre of the fruit, these often stick together and so the effect is of eating a cherry-like fruit with a single seed[K].

tcanta Wood - heavy, hard, tough, close-grained. Useful for making tool handles, mallets and other small items[82].  
dwatta Cardiotonic HypotensiveAlthough no specific mention has been seen for this species, the fruits and flowers of many hawthorns are well-known in herbal folk medicine as a heart tonic and modern research has borne out this use. The fruits and flowers have a hypotensive effect as well as acting as a direct and mild heart tonic[222]. They are especially indicated in the treatment of weak heart combined with high blood pressure[222]. Prolonged use is necessary for it to be efficacious[222]. It is normally used either as a tea or a tincture[222].

propta Seed - this is best sown as soon as it is ripe in the autumn in a cold frame, some of the seed will germinate in the spring, though most will probably take another year. Stored seed can be very slow and erratic to germinate, it should be warm stratified for 3 months at 15°c and then cold stratified for another 3 months at 4°c[164]. It may still take another 18 months to germinate[78]. Scarifying the seed before stratifying it might reduce this time[80]. Fermenting the seed for a few days in its own pulp may also speed up the germination process[K]. Another possibility is to harvest the seed 'green' (as soon as the embryo has fully developed but before the seedcoat hardens) and sow it immediately in a cold frame. If timed well, it can germinate in the spring[80]. If you are only growing small quantities of plants, it is best to pot up the seedlings as soon as they are large enough to handle and grow them on in individual pots for their first year, planting them out in late spring into nursery beds or their final positions. When growing larger quantities, it might be best to sow them directly outdoors in a seedbed, but with protection from mice and other seed-eating creatures. Grow them on in the seedbed until large enough to plant out, but undercut the roots if they are to be left undisturbed for more than two years.

nwatta A very easily grown plant, it prefers a well-drained moisture retentive loamy soil but is not at all fussy[11, 200]. Once established, it succeeds in excessively

moist soils and also tolerates drought[200]. It grows well on a chalk soil and also in heavy clay soils[200]. A position in full sun is best when plants are being grown for their fruit, they also succeed in semi-shade though fruit yields and quality will be lower in such a position[11, 200]. Most members of this genus succeed in exposed positions, they also tolerate atmospheric pollution[200]. Hybridizes freely with other members of this genus[200]. Seedling trees take from 5 - 8 years before they start bearing fruit, though grafted trees will often flower heavily in their third year[K]. The flowers have a foetid smell somewhat like decaying fish. This attracts midges which are the main means of fertilization. When freshly open, the flowers have more pleasant scent with balsamic undertones[245]. Seedlings should not be left in a seedbed for more than 2 years without being transplanted[11]. This species is closely related to *C. tomentosa*[11].

## 5.2.70 Helianthus hybrids

Perennial Sunflower  
4 tlin 11 cyuc 4 kcaak 2 tcan 2 dwat 3.6 m hkuc  
htut cyutli kyuctcup hwicli hyishrasjlutnyk hpa7tli flatprikliwis hpa7tmwatli hjonli  
drutta Helianthus hybrids is a PERENNIAL growing to 3.6 m (11ft) by 0.6 m (2ft in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 10. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Flowers Oil Seed StemEdible Uses: Drink OilCarbon Farming Solutions - Staple Crop: protein-oil (The term staple crop typically refers to a food that is eaten routinely and accounts for a dominant part of people's diets in a particular region of the world) [1-1]. Perennial crops are being developed for their oil-seed. The Land Institute see them as part of a perennial polyculture system [1-1].  
tcanta Biomass OilSee individual species. Some sunflowers are a good source of biomass. The tubers are used in industry to make alcohol etc[141]. The alcohol fermented from the tubers is said to be of better quality than that from sugar beets[269]. Can be grown as a temporary summer screen[200]. Ornamental. A food plants for the larvae of many lepidopterans.

dwatta Various medicinal qualities depending on the species.

propta See individual species.  
nwatta Management: Standard Staple Crop: Protein-oil Under DevelopmentClimate: boreal to warm temperate. Humidity: semi-arid to humid. Carbon Farming Solutions - Cultivation: under development. Management: standard (Describes the non-destructive management systems that are used in cultivation) [1-1]. Perennial crops are being developed for their oil-seed. The Land Institute see them as part of a perennial polyculture system [1-1]. Several perennial sunflowers are being worked with including prairie natives handling boreal to warm temperate semi-arid conditions: Helianthus maximliani (Maximilian sunflower), Helianthus tuberosus (Jerusalem artichoke), Helianthus pauciflorus (Stiff sunflower). Less tolerant of boreal conditions but good on poor soils is Helianthus cusickii (Cusick's sunflower) [1-1].

## 5.2.71 Akebia x pentaphylla

4 tlin 8 cyuc 4 kcaak 0 tcan 0 dwat 9 m hkuc  
pcimhmimhtut cyutli tcup hwicli hrasjlutnyk hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta Akebia x pentaphylla is a deciduous Climber growing to 9 m (29ft 6in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in April, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

necessary (eat the thinnings) and transplant the young plants into their final positions in the following spring. Prick out the pot-grown seedlings into individual pots when they are large enough to handle and plant them out in spring. Division in spring or autumn. Remove the tapering tap root and cut the remaining root into sections with at least one eye per section and replant in their permanent position.

nwatta Prefers a moist rich soil in a shady position[14, 52, 200]. Thrives in all soils[1] in sun or shade[111, 200]. This species is hardy to about -15°c according to one report[200] whilst another says that it is hardy to at least -20°c[187]. Plants often self-sow freely[200]. Sweet cicely used to be quite widely cultivated as a food plant but is now only occasionally grown in the herb garden. This is a shame since it is an extremely useful and tasty plant to grow and can provide food all year round[K]. A good bee plant[4]. The plant is heat tolerant in zones 7 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is flat with shallow roots forming a plate near the soil surface [1-2]. The root pattern is a tap root similar to a carrot going directly down [1-2].

## 5.2.126 Hemerocallis thunbergii

4 tlin 8 cyuc 4 kcaak 2 tcan 1 dwat 0.5 m hkuc  
hmimhtut cyutli kyuctcup hwicli hrasjlutnykfrp hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Hemerocallis thunbergii is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from July to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Flowers LeavesEdible Uses: Leaves and young shoots - cooked[205]. They must be consumed when very young or else they become fibrous[K]. Flowers and flower buds- raw or cooked[105, 177]. The flowers can be dried and used as a thickener in soups etc. The flower buds contain about 43mg vitamin C per 100g, 983 IU vitamin A and 3.1% protein[205].

tcanta WeavingThe tough dried foliage is plaited into cord and used for making footwear[205]. Attractive Flowers.  
dwatta Antidote Diuretic Vitamin CThe juice of the roots is an effective antidote in cases of arsenic poisoning[205]. A tea made from the boiled roots is used as a diuretic[205].

propta Seed - sow in the middle of spring in a greenhouse. Germination is usually fairly rapid and good. Prick out the seedlings into individual pots when they are large enough to handle. Grow the plants on for their first winter in a greenhouse and plant out in late spring[K]. Division in spring or after flowering in late summer or autumn[200]. Division is very quick and easy, succeeding at almost any time of the year[K]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Succeeds in most soils[1], including dry ones, preferring a rich moist soil and a sunny position[111] but tolerating partial shade[88]. Plants flower less freely in a shady position though the flowers can last longer in such a position[205]. Grows well in heavy clay soils. Succeeds in short grass if the soil is moist[1]. Prefers a pH between 6 and 7[200]. Hybridizes freely with other members of this genus[200]. Plants take a year or two to become established after being moved[200]. They increase by means of runners[205] and form loose spreading clumps[K]. The roots are

not swollen[233]. Plants seem to be immune to the predations of rabbits[233]. The plants are very susceptible to slug and snail damage, the young growth in spring is especially at risk[200]. The fragrant flowers are very short-lived, they open in the late afternoon and die in the morning[200, 205]. However, plants produce a succession of flowers for several weeks of the summer, each scape carrying between 4 and 20 blooms[205].

## 5.2.127 Aesculus spp

Horse chestnut  
4 tlin 9 cyuc 4 kcaak 4 tcan 4 dwat 30 m hkuc  
hmimhtut cyutli kyuctcup hwicli hyishrasjlutnykfrp hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta Aesculus spp is a deciduous Tree growing to 30 m (98ft) by 25 m (82ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: SeedEdible Uses: The roasted seed is used as a coffee substitute[2, 7]. Seed - cooked. It can be dried, ground into a powder and used as a gruel[7, 46, 55, 61]. The seed is quite large, about 3cm in diameter, and is easily harvested. It is usually produced in abundance in Britain. Unfortunately the seed is also rich in saponins, these must be removed before it can be used as a food and this process also removes many of the minerals and vitamins, leaving behind mainly starch. See also the notes above on toxicity. The seed contains up to 40% water; 8 - 11% protein and 8 - 26% toxic saponins[218]. The following notes apply to A. californica, but are probably also relevant here:- The seed needs to be leached of toxins before it becomes safe to eat - the Indians would do this by slow-roasting the nuts (which would have rendered the saponins harmless) and then cutting them into thin slices, putting them into a cloth bag and rinsing them in a stream for 2 - 5 days[213].

tcanta Saponins in the seed are used as a soap substitute[169]. The saponins can be easily obtained by chopping the seed into small pieces and infusing them in hot water. This water can then be used for washing the body, clothes etc. Its main drawback is a lingering odour of horse chestnuts[K]. The seed contains variable amounts of saponins, up to a maximum of 10%[240]. A starch obtained from the seed is used in laundering[100]. The bark and other parts of the plant contain tannin, but the quantities are not given[223]. A yellow dye is obtained from the bark[4]. The flowers contain the dyestuff quercetin[223]. Wood - soft, light, not durable. Of little commercial value, it is used for furniture, boxes, charcoal[2, 11, 46, 61]. Carbon Farming Solutions - Industrial Crop: starch, medicinal (Crops grown for non-food uses. Industrial crops provide resources in three main categories: materials, chemicals, and energy. Traditional materials include lumber and thatch, paper and cardboard, and textiles) [1-1].

dwatta Various medicinal qualities depending on the species. They include: Alternative; Analgesic; Antiinflammatory; Antirheumatic; Astringent; Bach; Diuretic; Expecto-rant; Fibrifuge; Haemostatic; Narcotic; Tonic; Vasoconstrictor; Vulnerary.

propta Seed - best sown outdoors or in a cold frame as soon as it is ripe[11, 80]. The seed germinates almost immediately and must be given protection from severe weather[130]. The seed has a very limited viability and must not be allowed to dry out. Stored seed should be soaked for 24 hours prior to sowing and even after this may still not be viable[80, 113]. It is best to sow the seed with its 'scar' downwards[130]. If sowing the seed in a cold frame, pot up the seedlings in early spring and plant them out into their permanent positions in the summer.

nwatta Hypothetical Crop Industrial Crop: Medicinal Industrial Crop: Starch Management: StandardClimate: cold to warm temperate, Mediterranean.Humidity: semi-arid to humid. Landscape Uses: Firewood, Pollard, Specimen, Street tree. Prefers a deep loamy well-drained soil but is not too fussy tolerating poorer drier soils[11, 200].

drutta *Ribes rubrum* is a deciduous Shrub growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from April to May, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[1, 2, 5, 11]. A pleasant acid flavour, it can be eaten out of hand but is more often cooked in pies, jams etc[K]. There are rather a lot of seeds in each fruit[K].

tcanta Cosmetic DyeA yellow dye is obtained from the leaves[100]. A black dye is obtained from the fruit[100]. The fruit is used cosmetically in face-masks for firming up tired and lifeless skin[7].

dwatta Antirheumatic Antiscorbuc Apertient Poulitce Refrigerant SialagogueThe fruit is antiscorbuc, apertient, depurative, digestive, diuretic, laxative, refrigerant and sialagogue[4, 7, 21]. The leaves contain the toxin hydrogen cyanide[240]. A concoction of them is used externally to relieve rheumatic symptoms[7]. They are also used in poultices to relieve sprains or reduce the pain of dislocations[7].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. Stored seed requires 3 months cold stratification at between 0 and 5°C and should be sown as early in the year as possible[113, 164]. Under normal storage conditions the seed can remain viable for 17 years or more. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter, planting them out in late spring of the following year. Cuttings of half-ripe wood, 10 - 15cm with a heel, July/August in a frame[78, 113]. Cuttings of mature wood of the current year's growth, preferably with a heel of the previous year's growth, November to February in a cold frame or sheltered bed outdoors[78, 200].

nwatta Easily grown in a moisture retentive but well-drained loamy soil of at least moderate quality[11, 200]. Plants are quite tolerant of shade, even succeeding on a north-facing wall[200], though they do not fruit so well in such a position[11]. Prefers a pH in the range 5.5 to 6[200]. Hardy to about -20°C[200]. Red currants are often cultivated in temperate zones for their edible fruit, there are some named varieties, including forms with white fruits[4, 61]. Most cultivars are self-fertile and set a good crop on their own[200]. The fruit is produced at the base of one-year old and older wood, plants start to fruit at 3 - 4 years from seed[200]. This is an aggregate species comprising *R. spicatum* and *R. rubrum*. There is some confusion in nomenclature with some botanists only recognising 2 species, *R. silvestre*. (syn *R. sativum*) and *R. spicatum* (syn *R. rubrum*)[17, 200]. Plants can harbour a stage of white pine blister rust, so should not be grown in the vicinity of pine trees[155]. Plants in this genus are notably susceptible to honey fungus[200]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is multistemmed with multiple stems from the crown [1-2].

### 5.2.124 Pyrus bretschneideri

4 tlin 8 cyuc 4 kcak 0 tcan 0 dwat 6 m hkuc hmimhtut cyutli hgattcup hwicli hrasljutnykfrip hpa7tli flat-prikliwis hpa7tmwatli xre7t hjonli

drutta *Pyrus bretschneideri* is a deciduous Tree growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in May, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil and can tolerate drought. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[177, 200]. The fruit is up to 3cm in diameter[200].

tcanta None known

dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe in the autumn, it will then usually germinate in mid to late winter. Stored seed requires 8 - 10 weeks cold stratification at 1°C and should be sown as early in the year as possible[200]. Temperatures over 15 - 20°C induce a secondary dormancy in the seed[200]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in a cold frame or greenhouse for their first year. Plant them out in late spring or early summer of the following year.

nwatta Prefers a good well-drained loam in full sun[200]. Grows well in heavy clay soils. Tolerates light shade but does not fruit so well in such a position. Tolerates atmospheric pollution, excessive moisture and a range of soil types if they are moderately fertile[200]. Established plants are drought tolerant[200]. Plants are hardy to at least -15°C[200]. This species is closely related to *P. ussuriensis ovoidea*[200]. This species is commonly cultivated in northern China, preferring sunny, dry, loamy soils. It includes many important forms with excellent fruit[266]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2].

### 5.2.125 Myrrhis odorata

Sweet Cicely, Anise

4 tlin 8 cyuc 4 kcak 3 tcan 3 dwat 1 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli fyfuxre7t hjonli

drutta *Myrrhis odorata* is a PERENNIAL growing to 1 m (3ft 3in) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from May to June, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves Root SeedEdible Uses: TeaLeaves - raw or cooked[2, 5, 37, 52]. Excellent raw, the leaves have a delicious sweet aniseed flavour[9] and are liked by the majority of people who try them[K]. They are also used as a flavouring for vegetables[183], and are an important ingredient of the herb mix 'bouquet garni'[244]. They can be cooked with tart fruits in order to reduce their acidity[14, 183]. The plant produces fresh leaves from late winter to early the following winter[200]. The leaves can also be dried for later use[21]. It is best to prevent the plant from flowering if the leaves are required for culinary use, because they lose their flavour when the plant is in flower[244]. Root - raw or cooked[1, 2, 5, 14, 37]. A similar flavour to the leaves[K]. So long as it is not too old, the root can be boiled and mixed with other vegetables or added to salads[9]. Seed - raw or cooked[1, 2, 183]. An aniseed flavour, it is usually used as a flavouring[14, 115] but can also be eaten raw whilst it is still green and before the fibrous coat has formed[1, 9]. It makes an excellent mouth freshener[K]. A tea is made from the leaves[183].

tcanta PolishThe leaves and the seed make good polishes for wood[4, 6, 115]. You just rub them over the wood and then rub the wood with a clean cloth to remove any greenness. It is particularly good on oak panels[5], giving a lovely glossy finish and an aromatic smell[244]. Invertebrate shelter, Nectary. Aromatic.

dwatta Antiseptic Aromatic Carminative Expectorant StomachicThe whole plant, including the seed, is aromatic, carminative, expectorant and stomachic[4]. It is useful in the treatment of coughs and flatulence, and also as a gentle stimulant for the stomach[4, 238]. The root is antiseptic and a decoction has been used to treat snake and dog bites[4, 244]. An ointment made from the roots has been used to ease gout and soothe wounds[244].

propta Seed - best sown as soon as it is ripe since stored seed is difficult to germinate[1]. The seed can be sown in an outdoor seedbed or, if supplies are limited, it can be sown in pots in a cold frame. Thin the seedlings in the outdoor bed as

kcakta Edible Parts: FruitEdible Uses: TeaFruit - raw[200]. Sweet but insipid. The fruit has a delicate flavour and a soft juicy texture[K]. The flavour can be enhanced by the addition of a little lemon juice. Valued as a novelty, it looks somewhat like a deep-purpl coloured sausage. The dried young leaves are a tea substitute.

tcanta BasketryThe peeled stems are very pliable. They can be bleached and used in basket making[46, 61].

dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe. Surface sow in a light position[133]. The seed usually germinates in 1 - 3 months at 15°C[133]. Stored seed should be given 1 month cold stratification[113, 133] and can be very difficult to germinate. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least their first winter. Plant out in late spring or early summer, after the last expected frosts. This is a hybrid species and so it will not breed true from seed. Cuttings of half-ripe wood, July/August in a frame[11, 113]. The cuttings can be slow to root[200]. Cuttings can also be taken of soft wood in spring[113]. Root cuttings, December in a warm greenhouse[113]. Layering in early spring[1]. Very easy, the plants usually self-layer and so all you need to do is dig up the new plants and plant them out directly into their permanent positions.

nwatta Requires a well-drained moisture retentive soil[200]. Succeeds in acid or alkaline soils[200]. Prefers partial shade but succeeds in full sun[200]. Succeeds on a north facing wall[219]. Dormant plants are hardy to about -15°C but they can be somewhat tender when young and are best given some protection at this time[200]. The young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. Resentful of root disturbance, either grow plants in containers prior to planting them out or plant them out whilst very young[219]. A naturally occurring hybrid, *A. quinata* x *A. trifoliata*[200]. Plants are evergreen in mild winters[11, 200]. They are fast growing and can be invasive[200]. Plants are not normally pruned, if they are growing too large they can be cut back by trimming them with shears in early spring[202]. Shy to fruit, it possibly requires some protection in the flowering season - hand pollination is advisable. Plants are also possibly self-sterile. Plants in this genus are notably resistant to honey fungus[200].

### 5.2.72 Quercus prinus

Rock Chestnut Oak

4 tlin 8 cyuc 4 kcak 3 tcan 2 dwat 20 m hkuc hmimhtut cyutli tcup hwicli jlutnyik hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta *Quercus prinus* is a deciduous Tree growing to 20 m (65ft 7in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in May, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: SeedEdible Uses: CoffeeSeed - raw or cooked[2, 46, 83, 159]. Somewhat sweet according to some reports[62, 82, 95, 229, 235] whilst another says that it contains bitter tannin[183]. The seed is quite large, up to 4cm long and 25mm wide[82, 200]. It can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread[183]. If the seed contains bitter tannins, these can be leached out by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute.

tcanta Buttons Dye Repellent Tannin WoodA mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth[20]. The seed cups are used as buttons[95]. The bark is a commercial source of tannin[46, 223]. On a 10% moisture basis, the bark contains 9.7% tannin[223]. Tannin is also found in the leaves and wood[223]. Oak galls are excrecences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4]. A red dye is obtained from the bark[4]. Tan-coloured according to another report[257]. Wood - close-grained, heavy, hard, rather tough, strong, durable in contact with the soil[46, 61, 82, 229]. It weighs 47lb per cubic foot[235]. Used commercially like *Q. alba*, it is used for furniture, cabinet making, interior finishes, fence posts and fuel[46, 61, 229].

dwatta Astringent DysenteryAny galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4].

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Young plants tolerate reasonable levels of side shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. Prefers warmer summers than are usually experienced in Britain[200], but trees still grow well in this country[1]. A slow-growing tree in the wild, though it can live 400 years[229]. The tree produces large crops of acorns every 4 - 7 years, with small crops in the intervening years[229]. The tree flowers on new growth produced in spring, the seed ripening in its first year[200, 229]. This species is often confused with *Q. michauxii*, *Q. muehlenbergii* and *Q. prinoides*[200]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. Hybridizes freely with other members of the genus[200]. This species is notably resistant to honey fungus[88, 200]. The plant is heat tolerant in zones 8 through 3. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2]. The root pattern is a heart root, dividing from the crown into several primary roots going down and out [1-2]. The root pattern is a tap root similar to a carrot going directly down [1-2]. The root pattern is suckering with new plants from underground runners away from the plant [1-2].

### 5.2.73 Rhus copallina

Dwarf Sumach, Winged sumac, Flameleaf Sumac, Winged Sumac, Shining Sumac

4 tlin 10 cyuc 4 kcak 3 tcan 2 dwat 2 m hkuc htut cyutli hgatkyuctup hwicli hyishrasljutnyik hpa7tli flat-prikliwis hpa7tmwatli nyanhjen hjonli

drutta *Rhus copallina* is a deciduous Shrub growing to 2 m (6ft) by 2 m (6ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from July to September, and the seeds ripen from October to December. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must

be grown if seed is required). and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure.

**kcakta Edible Parts:** Fruit Oil**Edible Uses:** Drink OilFruit - raw or cooked[22, 46, 161]. An agreeable acid flavour[2]. The fruit is only 3 - 5mm long with very little flesh, but it is borne on dense panicles and is thus easily harvested[229]. When soaked for 10 - 30 minutes in hot or cold water it makes a very refreshing lemonade-like drink (without any fizz of course)[95, 105, 149, 159, 183]. The mixture should not be boiled since this will release tannic acids and make the drink astringent.

**tcanta Dye Hedge Hedge Mordant Oil Resin Soil stabilization Tannin Vernish Wood**The leaves are rich in tannin[46, 82, 169], so is the bark[149] and the fruit[169]. The leaves can be collected as they fall in the autumn and used as a brown dye or as a mordant[169, 171]. The leaves contain 10 - 25% tannin[171]. Up to 35.8% has been obtained from some plants[223]. An oil is extracted from the seeds[4]. It attains a tallow-like consistency on standing and is used to make candles. These burn brilliantly, though they emit a pungent smoke[4]. The plants extensive root system makes it useful for stabilizing soils. A black dye is obtained from the fruit[149, 257]. A resin, 'copal resin', is obtained from the sap of this plant. When dissolved in any volatile liquid, such as oil of turpentine, it makes a beautiful varnish[4]. (Is this a mistaken entry? Perhaps it belongs with one of the toxic species[K]). Wood - light, soft, coarse grained[82]. It weighs 32lb per cubic foot[227]. Sometimes used for small posts[149].

**dwatta Astringent Dysentery Enuresis Galactogogue Poultrice SalveA** decoction of the root has been used in the treatment of dysentery[222]. An infusion of the roots has been used in the treatment of VD[257]. A poultice of the root has been applied to sores and skin eruptions[257]. A tea made from the bark has been drunk to stimulate milk flow in nursing mothers. A decoction of the bark has been used as a wash for blisters and sunburn blisters[222, 257]. An infusion of the leaves has been used to cleanse and purify skin eruptions[257]. The berries were chewed in the treatment of bed-wetting and mouth sores[222, 257]. Some caution is advised in the use of the leaves and stems of this plant, see the notes above on toxicity.

**propta Seed** - best sown in a cold frame as soon as it is ripe. Pre-soak the seed for 24 hours in hot water (starting at a temperature of 80 - 90c and allowing it to cool) prior to sowing in order to leach out any germination inhibitors[200]. This soak water can be drunk and has a delicious lemon-flavour. The stored seed also needs hot water treatment and can be sown in early spring in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 10cm with a heel, July/August in a frame[200]. Root cuttings 4cm long taken in December and potted up vertically in a greenhouse. Good percentage[78, 200]. Suckers in late autumn to winter[200].

**nwatta Experimental Crop Industrial Crop: Dye Industrial Crop: Hydrocarbon Industrial Crop: Tannin Management: CoppiceLandscape Uses:Border, Erosion control, Pest tolerant, Massing, Specimen.** Succeeds in a well-drained fertile soil in full sun[11, 200]. Tolerates poor soils[169, 200]. Established plants are drought resistant[169]. A very hardy species, when fully dormant it can tolerate temperatures down to about -25°C[200]. However, the young growth in spring can be damaged by late frosts. A very ornamental plant[1]. It is quite fast-growing but short-lived in the wild[229]. In the north of its range plants are dwarf, around 1.2 metres tall, but in the south they can be up to 7 metres tall[182]. Some botanists divide this species into separate species, whilst others see it as a single species with geographical forms. R. copallina is usually a shrub and is found in moist soils in sun or shade[227]. R. copallina lanceolata. Gray. is more tree-like and is found in drier soils[227]. Transplants easily[169]. Plants have brittle branches and these can be broken off in strong winds[200]. Plants are also

susceptible to coral spot fungus[11]. Many of the species in this genus are highly toxic and can also cause severe irritation to the skin of some people, whilst other species such as this one are not poisonous. It is relatively simple to distinguish which is which, the poisonous species have axillary panicles and smooth fruits whilst non-poisonous species have compound terminal panicles and fruits covered with acid crimson hairs[1, 4]. The toxic species are sometimes separated into their own genus, Toxicodendron, by some botanists[200]. Plants in this genus are notably resistant to honey fungus[200]. Dioecious. Male and female plants must be grown if seed is required. Special Features:Attracts birds, North American native, Attracts butterflies, Attractive flowers or blooms. Carbon Farming - Cultivation: experimental. Management: coppice. The plant is heat tolerant in zones 9 through 5. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a running thicket former forming a colony from shoots away from the crown spreading indefinitely [1-2]. The root pattern is flat with shallow roots forming a plate near the soil surface [1-2]. The root pattern is suckering with new plants from underground runners away from the plant [1-2].

## 5.2.74 Crataegus holmesiana

Holmes' hawthorn

4 tin 8 cyuc 4 kcaok 0 tcan 2 dwat 10 hkuc  
hmmhtut cyuti hgattcuphja7n hwicli hrsajlutnykfrp hpa7tli  
flatprikhwisslip hpa7tmwatli xre7t hjonli

**drutta** Crataegus holmesiana is a deciduous Tree growing to 10 m (32ft) by 8 m (26ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in May, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Midges. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

**kcakta Edible Parts:** Fruit**Edible Uses:** Fruit - raw or cooked. An excellent dessert fruit, it has an acid yet sweet flavour, is juicy but with a mealy texture, it makes very pleasant eating[K]. Some forms have fruits with a disagreeable flavour[82]. The fruit can also be used in making pies, preserves etc, and can be dried for later use. The fruit is about 10mm in diameter[200]. A specimen at Cambridge Botanical garden has fruits up to 20mm in diameter[K]. There are up to five fairly large seeds in the centre of the fruit, these often stick together and so the effect is of eating a cherry-like fruit with a single seed[K].

**tcanta Wood** - heavy, hard, tough, close-grained. Useful for making tool handles, mallets and other small items[82].

**dwatta Cardiac Hypotensive**Although no specific mention has been seen for this species, the fruits and flowers of many hawthorns are well-known in herbal folk medicine as a heart tonic and modern research has borne out this use. The fruits and flowers have a hypotensive effect as well as acting as a direct and mild heart tonic[222]. They are especially indicated in the treatment of weak heart combined with high blood pressure[222]. Prolonged use is necessary for it to be efficacious[222]. It is normally used either as a tea or a tincture[222].

**propta Seed** - this is best sown as soon as it is ripe in the autumn in a cold frame, some of the seed will germinate in the spring, though most will probably take another year. Stored seed can be very slow and erratic to germinate, it should be warm stratified for 3 months at 15°C and then cold

is used to make candles. These burn brilliantly, though they emit a pungent smoke[4]. Pipes are made from the young shoots and are used for drawing the sap of sugar maples (Acer spp)[82]. They are also used as flutes[159]. The plant has an extensive root system and is planted as a windbreak screen and to prevent soil erosion[200]. Wood - soft, light, brittle, coarse grained[82, 101]. It weighs 27lb per cubic foot[235]. Of no commercial value, though it is sometimes used as a rough construction wood or is employed in turning[226].

**dwatta Antihemorrhoidal Antiseptic Astringent Blood purifier Diuretic Emetic Galactogogue Poultrice Stomachic Tonic VD** WartsStag's horn sumach was often employed medicinally by several native North American Indian tribes who valued it especially for its astringent qualities[257]. It is little used in modern herbalism. Some caution is advised in the use of the leaves and stems of this plant, see the notes above on toxicity. The bark is antiseptic, astringent, galactogogue and tonic[222, 257]. An infusion is used in the treatment of diarrhoea, fevers, piles, general debility, uterine prolapse etc[213, 222]. An infusion is also said to greatly increase the milk flow of a nursing mother - small pieces of the wood were also eaten for this purpose[257]. The inner bark is said to be a valuable remedy for piles[257]. The roots are astringent, blood purifier, diuretic and emetic[222]. An infusion of the roots, combined with purple coneflower (Echinacea purpurea) has been used in the treatment of venereal disease[257]. A poultice of the roots has been used to treat boils[257]. The leaves are astringent. They have been used in the treatment of asthma, diarrhoea and stomatitis[222]. An infusion of the fruits has been used as a tonic to improve the appetite and as a treatment for diarrhoea[257]. The berries are astringent and blood purifier[257]. They were chewed as a remedy for bed-wetting[222, 257]. A tea made from the berries has been used to treat sore throats[213]. The flowers are astringent and stomachic. An infusion has been used to treat stomach pains[257]. The sap has been applied externally as a treatment of warts[226]. Some caution is advised here since the sap can cause a rash on many people[K].

**propta Seed** - best sown in a cold frame as soon as it is ripe. Pre-soak the seed for 24 hours in hot water (starting at a temperature of 80 - 90c and allowing it to cool) prior to sowing in order to leach out any germination inhibitors[200]. This soak water can be drunk and has a delicious lemon-flavour. The stored seed also needs hot water treatment and can be sown in early spring in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 10cm with a heel, July/August in a frame[200]. Root cuttings 4cm long taken in December and potted up vertically in a greenhouse. Good percentage[78, 200]. Suckers in late autumn to winter[200].

**nwatta Landscape Uses:**Border, Massing, Specimen. Succeeds in a well-drained fertile soil in full sun[11, 200]. Tolerates poor soils[169, 200]. Succeeds in dry soils and is drought resistant once it is established[169]. A fairly wind hardy plant, though the branches are brittle and can be broken off in very high winds[200, K]. A very hardy plant, when fully dormant it can tolerate temperatures down to at least -25°C[200]. However, the young growth in spring can be damaged by late frosts. A fast growing but short-lived tree[159], it can sucker freely, forming thickets and becoming quite anti-social when grown in small areas[11]. Single-stem plants are short-lived in cultivation, but if the plants are coppiced regularly and allowed to form thickets, then they will live longer and also be more ornamental with larger leaves[238]. Any coppicing is best carried out in early spring[238]. A very ornamental plant, there are some named varieties[182]. It is susceptible to coral spot fungus[11] but is notably resistant to honey fungus[88, 200]. It transplants easily[169]. This is a very good bee plant, the flowers producing an abundance of pollen and nectar[226]. There is some doubt over the validity of this name and the earlier R. hirta. [L.] has been proposed as the correct name. However, it seems likely that R. typhina will be retained because it is so well known[214]. This species is closely related to and hybridizes with R. glabra[101]. Many of the species in this genus are highly toxic and can also cause severe irritation to the skin of some people, whilst other species such as this

one are not poisonous. It is relatively simple to distinguish which is which, the poisonous species have axillary panicles and smooth fruits whilst non-poisonous species have compound terminal panicles and fruits covered with acid crimson hairs[1, 4]. The toxic species are sometimes separated into their own genus, Toxicodendron, by some botanists[200]. Dioecious. Male and female plants must be grown if seed is required. Special Features: Attracts birds, North American native, Attractive flowers or blooms. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a running thicket former forming a colony from shoots away from the crown spreading indefinitely [1-2]. The root pattern is flat with shallow roots forming a plate near the soil surface [1-2]. The root pattern is suckering with new plants from underground runners away from the plant [1-2].

## 5.2.122 Hemerocallis yezoensis

4 tin 8 cyuc 4 kcaok 0 tcan 1 dwat 0.8 m hkuc  
hmmhtut cyuti kyuctcup hwicli hrsajlutnykfrp hpa7tli flat-  
prikhlwis hpa7tmwatli xre7t hjonli

**drutta** Hemerocallis yezoensis is a PERENNIAL growing to 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from May to June. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

**kcakta Edible Parts:** Flowers Leaves**Edible Uses:** Leaves and young shoots - cooked[105, 177]. They must be consumed when very young or else they become fibrous[K]. Flowers and flower buds - raw or cooked[205]. The flowers can be dried and used as a thickener in soups etc. The flower buds contain about 43mg vitamin C per 100g, 983 IU vitamin A and 3.1% protein[205].

**tcanta Weaving**The tough dried foliage is plaited into cord and used for making footwear[205].

**dwatta Antidote Diuretic Vitamin C**The juice of the roots is an effective antidote in cases of arsenic poisoning[205]. A tea made from the boiled roots is used as a diuretic[205].

**propta Seed** - sow in the middle of spring in a greenhouse. Germination is usually fairly rapid and good. Prick out the seedlings into individual pots when they are large enough to handle. Grow the plants on for their first winter in a greenhouse and plant out in late spring[K]. Division in spring or after flowering in late summer or autumn[200]. Division is very quick and easy, succeeding at almost any time of the year[K]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

**nwatta** Succeeds in most soils[1], including dry ones, preferring a rich moist soil and a sunny position[111] but tolerating partial shade[88]. Plants flower less freely in a shady position though the flowers can last longer in such a position[205]. Grows well in heavy clay soils. Succeeds in short grass if the soil is moist[1]. Prefers a pH between 6 and 7[200]. A very cold-hardy plant, tolerating temperatures down to about -25°C[187]. The roots are slender and not swollen[187]. The scapes carry between 4 and 12 blooms[205]. Hybridizes freely with other members of this genus[200]. It is closely related to H. vespertina Hara.[58]. Plants take a year or two to become established after being moved[200]. Plants seem to be immune to the predations of rabbits[233]. The plants are very susceptible to slug and snail damage, the young growth in spring is especially at risk[200].

## 5.2.123 Ribes rubrum

Red Currant, Cultivated currant  
4 tin 8 cyuc 4 kcaok 2 tcan 1 dwat 1.2 m hkuc  
hmmhtut cyuti tcup hwicli hrsajlutnyk hpa7tli flatprikhlwis  
hpa7tmwatli fyfkrx7t hjonli

habit is a clumper with limited spread [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2]. The root pattern is tuberous with swollen potato-like roots [1-2].

## 5.2.120 Quercus bicolor

Swamp White Oak

4 tin 8 cyuc 4 kcaak 3 tcan 2 dwat 25 m hkuc hmimhtut cyutli tcuphja7n hwicli jlutnyikfrip hpa7tli flat-prikliwis hpa7tmwatli hjonli

drutta Quercus bicolor is a deciduous Tree growing to 25 m (82ft 0in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower in May, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: SeedEdible Uses: CoffeeSeed - raw or cooked[105, 161, 226]. A rather sweet flavour[159, 235]. The seed is quite large, about 2 - 3cm long and 15 - 20mm wide[82, 200], and unlike most other oaks, is attached to the tree by a long stem[183]. It matures in its first year[235]. The seed can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread[183]. The seed from some trees can contain bitter tannins, these can be leached out by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. Roasted seed is a coffee substitute.

tcanta Repellent Rust Tannin WoodThe leaves of most species in this genus are more or less rich in tannins. A mulch of the leaves can be placed around vulnerable plants in order to repel slugs, snails, grubs etc. Fresh leaves should be used with caution, since these can utilize some of the nitrogen in the soil and this inhibit plant growth[20, K ]. Oak galls are excrescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4 ]. The bark has been boiled with hemlock (Tsuga sp.?) and soft maple bark (Acer spp), and the liquid used to remove rust. The mixture was also believed to prevent rust[257 ]. The wood is close-grained, strong, hard, tough, heavy[46, 82, 171, 229 ]. It weighs 48lb per cubic foot[235 ]. Trees do not self-prune and dead branches remain on the trees for many years. This does mean that the wood is usually quite knotty[236 ]. The wood machines well, though it can check and warp if not dried properly. It is of some importance commercially. And is used for construction, cabinet making, furniture, interior finishes, veneers, fence posts etc[6, 82, 171, 229, 338, 1050 ]. The wood makes a good fuel.

dwatta Astringent DysenteryAny galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4].

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Landscape Uses:Pest tolerant, Specimen, Street tree. Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Young plants tolerate reasonable levels of side shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. Prefers warmer summers than are usually experienced in Britain, trees often grow poorly in this country and fail to properly ripen their wood resulting in frost damage overwinter[200]. A relatively fast-growing tree in the wild, living 300 - 350 years[229], though it is relatively shallow-rooted and is considerably more susceptible to forest fires than most other oaks[226]. This species is one of the best of the white oaks for growing in this country[1]. However, it is said that the seed is rarely formed in Britain[105]. The tree flowers on new growth produced in spring, the seed ripening in its first year[200, 229]. Trees do not commence bearing until about 25 - 30 years old, large crops being produced every 3 - 5 years[229]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. The seed of this species is attached to the tree by unusually long (by oak tree standards) stems[183]. Hybridizes freely with other members of the genus[200]. Plants in this genus are notably resistant to honey fungus[200]. Special Features: Attracts birds, North American native, Attracts butterflies, Inconspicuous flowers or blooms. The plant is heat tolerant in zones 8 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2].

## 5.2.121 Rhus typhina

Stag's Horn Sumach, Velvet Sumac, Staghorn Sumac

4 tin 8 cyuc 4 kcaak 3 tcan 2 dwat 6 m hkuc htut cyutli hgatyuctcup hwicli hyhisrasjlyutnyik hpa7tli flat-prikliwis hpa7tmwatli nyanhjen hjonli

drutta Rhus typhina is a deciduous Shrub growing to 6 m (19ft) by 6 m (19ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 3 and is not frost tender. It is in flower from June to August, and the seeds ripen from October to December. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: Fruit OilEdible Uses: Drink OilFruit - cooked[22, 62]. A very sour flavour, they are used in pies[183]. The fruit is rather small and with very little flesh, but it is produced in quite large clusters and so is easily harvested. When soaked for 10 - 30 minutes in hot or cold water it makes a very refreshing lemonade-like drink (without any fizz of course)[55, 85, 95, 101, 102, 183]. The mixture should not be boiled since this will release tannic acids and make the drink astringent.

tcanta Dye Hedge Hedge Ink Mordant Musical Oil Pipes Shelterbelt Soil stabilization Tannin WoodThe leaves are rich in tannin, up to 48% has been obtained in a controlled plantation[223]. They can be collected as they fall in the autumn and used as a brown dye or as a mordant[169, 171]. The bark, especially the root bark, and the fruits are also very rich in tannin[82, 159, 169]. A yellow dye can be obtained from the roots[257]. An orange dye can be obtained from the inner bark and central pith of the stem, mixed with bloodroot (Sanguinaria canadensis)[257]. A black ink can be made by boiling the leaves and the fruit[226]. An oil is extracted from the seeds[4]. It attains a tallow-like consistency on standing and

stratified for another 3 months at 4°C[164]. It may still take another 18 months to germinate[78]. Scarifying the seed before stratifying it might reduce this time[80]. Fermenting the seed for a few days in its own pulp may also speed up the germination process[K]. Another possibility is to harvest the seed 'green' (as soon as the embryo has fully developed but before the seedcoat hardens) and sow it immediately in a cold frame. If timed well, it can germinate in the spring[80]. If you are only growing small quantities of plants, it is best to pot up the seedlings as soon as they are large enough to handle and grow them on in individual pots for their first year, planting them out in late spring into nursery beds or their final positions. When growing larger quantities, it might be best to sow them directly outdoors in a seedbed, but with protection from mice and other seed-eating creatures. Grow them on in the seedbed until large enough to plant out, but undercut the roots if they are to be left undisturbed for more than two years.

nwatta A very easily grown plant, it prefers a well-drained moisture retentive loamy soil but is not at all fussy[11, 200]. Once established, it succeeds in excessively moist soils and also tolerates drought[200]. It grows well on a chalk soil and also in heavy clay soils[200]. A position in full sun is best when plants are being grown for their fruit, they also succeed in semi-shade though fruit yields and quality will be lower in such a position[11, 200]. Most members of this genus succeed in exposed positions, they also tolerate atmospheric pollution[200]. Hawthorns in general hybridize freely with other members of the genus[200]. Seedling trees take from 5 - 8 years before they start bearing fruit, though grafted trees will often flower heavily in their third year[K]. The flowers have a foetid smell somewhat like decaying fish. This attracts midges which are the main means of fertilization. When freshly open, the flowers have more pleasant scent with balsamic undertones[245]. Seedlings should not be left in a seedbed for more than 2 years without being transplanted[11]. A very ornamental plant[11].

## 5.2.75 Sambucus caerulea

Blue Elder

4 tin 8 cyuc 4 kcaak 3 tcan 2 dwat 3 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlyutnyikfrip hpa7tli flat-prikliwis hpa7tmwatli xre7t hjonli

drutta Sambucus caerulea is a deciduous Shrub growing to 3 m (9ft 10in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from June to July, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: Flowers FruitEdible Uses: TeaFruit - raw, cooked or used in preserves[2, 3, 15, 85, 94, 183, 257]. Rather sweet and juicy but full of small seeds[82, 256], this is the best flavoured of the North American elders[212]. The fruit is rather nice raw, seven people ate and enjoyed a small quantity of the raw fruit with no ill effects[K]. The fruit can be dried for later use[257]. A somewhat rank taste fresh[101], the fruit is usually dried before being used[183]. The fruit is about 6mm in diameter and is borne in large clusters[200]. Some caution is advised, see the notes above on toxicity. Flowers - raw or cooked in fritters etc[15, 85, 94, 183]. Very pleasant and refreshing raw[K]. A pleasant tea is made from the dried flowers[62, 183].

tcanta Musical Repellent Tinder WoodA decoction of the leaves, when watered on plants, repels caterpillars[94]. The dried flower stems repel insects and rodents[101]. The hollow stems can be used as flutes and pipes[257]. The pith of the stems has been used as a tinder for lighting fires[257]. Wood - light, soft, weak, coarse grained. Of no commercial value, though it is used locally for flutes, skewers, pegs, straws etc[82, 94, 99, 229].

dwatta Analgesic Antiseptic Astringent Diaphoretic Emetic Febrifuge Haemostatic Laxative Pectoral Salve Stomachic TonicHaemostatic[94]. An infusion or extract made

from the flowers, bark and root has been used to cure fevers and gripe, it is also laxative[226]. A decoction of the plant has been used as an antiseptic wash to treat itches[257]. The bark is analgesic and astringent[257]. An infusion has been used in the treatment of diarrhoea and rheumatism[257]. A decoction has been used as a wash in the treatment of swellings and pain[257]. An ointment made by mixing the bark with fat has been used externally in the treatment of burns, ulcers, skin irritations etc[226]. The fresh bark has been placed in a tooth cavity to ease the pain of toothache[257]. The inner bark is strongly emetic[257]. The leaves are analgesic, antiseptic, diaphoretic, febrifuge and purgative[257]. A decoction has been used in the treatment of new colds[257]. An infusion of the leaves and flowers has been used as a steam bath in the treatment of colds and headaches[257]. A decoction of the leaves has been used as an antiseptic wash on limbs affected by blood poisoning[257]. The crushed leaves have been used as a poultice to treat burns and swollen hands[257]. A decoction of the root has been used in the treatment of bladder problems and dyspepsia[257]. A decoction of the flowers has been used in the treatment of stomach troubles and lung complaints[257]. Applied externally, it has been used to treat sprains and bruises and as an antiseptic wash for open sores and itches[257]. A wine made from the fruit has been used as a tonic[257].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame, when it should germinate in early spring. Stored seed can be sown in the spring in a cold frame but will probably germinate better if it is given 2 months warm followed by 2 months cold stratification first[78, 98, 113]. Prick out the seedlings into individual pots when they are large enough to handle. If good growth is made, the young plants can be placed in their permanent positions during the early summer. Otherwise, either put them in a sheltered nursery bed, or keep them in their pots in a sheltered position and plant them out in spring of the following year. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in a frame[78]. Cuttings of mature wood of the current season's growth 15 - 20cm with a heel, late autumn in a frame or a sheltered outdoor bed[78].

nwatta Tolerates most soils, including chalk[200], but prefers a moist loamy soil[11, 200]. Grows well in heavy clay soils. Tolerates some shade but is best in a sunny position[1]. Tolerates atmospheric pollution and coastal situations[200]. A fast-growing but short-lived tree in the wild[229]. A shrub at Kew in September 1993 was carrying a good crop of tasty fruits[K]. Plants in this genus are notably resistant to honey fungus[200].

## 5.2.76 Allium senescens

German Garlic

4 tin 10 cyuc 4 kcaak 0 tcan 2 dwat 0.5 m hkuc htut cyutli hgatyuctcup hwicli hrasjlyut hpa7tli flatprikliwis hpa7tmwatli fyfxre7t hjonli

drutta Allium senescens is a BULB growing to 0.5 m (1ft 8in) by 0.2 m (0ft 8in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Bulb - raw or cooked[2, 46, 61, 105]. An onion substitute[22, 177]. The small bulbs are formed in clusters on a rhizome and are up to 10mm in diameter[200]. Leaves - raw or cooked[105, 177]. A fairly strong onion flavour with a slight bitterness, but acceptable raw[K]. We use them in salads or as a flavouring in cooked foods[K]. Flowers - raw or cooked. An attractive garnish in salads[K].

tcanta RepellentThe juice of the plant is used as a moth repellent. The whole plant is said to repel insects and moles[20].

dwatta Although no specific mention of medicinal uses has been seen for this species, members of this genus are in general very healthy additions to the diet. They contain sulphur compounds (which give them their onion flavour) and

when added to the diet on a regular basis they help reduce blood cholesterol levels, act as a tonic to the digestive system and also tonify the circulatory system[K].

propta Seed - sow spring in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle - if you want to produce clumps more quickly then put three plants in each pot. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in spring once they are growing vigorously and are large enough. Division in spring. Very easy, the plants divide successfully at any time in the growing season and the divisions can be planted straight out into their permanent positions if required.

nwatta Landscape Uses:Alpine garden, Border, Container, Massing, Rock garden, Specimen. Prefers a sunny position in a light well-drained soil[1]. Established plants are fairly drought tolerant[190]. A very ornamental plant[42], it is frequently confused with *A. montanum*[1]. The bulbs should be planted fairly deeply[1]. Most members of this genus are intolerant of competition from other growing plants[203]. Grows well with most plants, especially roses, carrots, beet and chamomile, but it inhibits the growth of legumes[18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. Members of this genus are rarely if ever troubled by browsing deer[233]. Special Features: Attractive foliage, Fragrant foliage, Attracts butterflies, Suitable for cut flowers, Suitable for dried flowers.

## 5.2.77 Origanum vulgare

Origanum, Pot Marjoram

4 tlin 10 cyuc 4 kcaok 5 tcan 3 dwat 0.6 m hkuc hmimhtut cyuti kyuctcup hwicli hyishrasjltunyk hpa7tli flatprkikwis hpa7tmwatli xre7t hjonli

drutta Origanum vulgare is a PERENNIAL growing to 0.6 m (2ft) by 0.8 m (2ft 7in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from July to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: Flowers Leaves StemEdible Uses: Condiment TeaLeaves - raw or cooked as a potherb[5, 52, 183]. Origanum is an important flavouring herb in Mediterranean cookery, and is often used dried rather than fresh[238]. The leaves are used as a flavouring for salad dressings, vegetables and legumes, and are frequently included in strongly flavoured dishes with chillies, garlic, onions etc[2, 13, 21, 27, 183, 238]. A nutritional analysis is available[218]. Flowers, usually appear in late spring, are edible. Much of the commercially available dried oregano does not come from this plant but from a number of different, often unrelated plants[238]. These include *Lippia graveolens*, *L. palmeri* and *Origanum syriacum*[238]. A herb tea is made from the dried leaves and flowering stems[183, 207, 238].

tcanta Dye Essential Parasiticide Repellent StrewingAn essential oil from the plant is used as a food flavouring, in soaps and perfumery[115, 171]. The herb contains 0.15 - 0.4% essential oil[218] and makes good herbal pillows and baths[244]. The plant was formerly used as a strewing herb[201]. The essential oil has also been used to kill lice, though some caution is advised since it can cause skin irritations[238]. A red or purple dye is obtained from the flowering tops[4, 7, 13, 100], it is neither brilliant nor durable[115]. The plant repels ants[46]. The growing plant repels many insect pests so it is a good plant to grow in the vegetable area[201]. A useful ground cover for sunny positions, forming a slowly spreading clump[197, K]. Plants should be spaced about 30cm apart each way[208].

dwatta Antirheumatic Antiseptic Antispasmodic Aromatherapy Carminative Cholagogue Diaphoretic Emmenagogue Expectorant Odontalgic Parasiticide Stimulant Stomachic TonicOriganum has been used as a culinary and medic-

inal herb for thousands of years. It has a beneficial effect upon the digestive and respiratory systems and is also used to promote menstruation[254]. It should not be used medicinally by pregnant women though it is perfectly safe in small amounts for culinary purposes[254]. The leaves and flowering stems are strongly antiseptic, antispasmodic, carminative, cholagogue, diaphoretic, emmenagogue, expectorant, stimulant, stomachic and mildly tonic[4, 7, 9, 21, 254]. The plant is taken internally in the treatment of colds, influenza, mild feverish illnesses, indigestion, stomach upsets and painful menstruation[238]. It is strongly sedative and should not be taken in large doses, though mild teas have a soothing effect and aid restful sleep[244]. It should not be prescribed for pregnant women[238]. Externally, oregano is used to treat bronchitis, asthma, arthritis and muscular pain[238]. The plant can be used fresh or dried - harvest the whole plant (but not the roots) in late summer to dry and store for winter use[244]. Oregano is often used in the form of an essential oil that is distilled from the flowering plant[4]. A few drops of the essential oil, put on cotton wool and placed in the hollow of an aching tooth, frequently relieves the pain of toothache[4, 207]. This plant is one of the best natural antiseptics because of its high thymol content[7]. The essential oil is used in aromatherapy to treat the same kinds of complaints that the herb is used for[238].

propta Seed - sow early spring at 10 - 13°C and only just cover the seed. Germination usually takes place within 2 weeks. Prick out the seedlings into individual pots when they are large enough to handle and plant them out into their permanent positions in early summer. The seed can also be sown in situ in late spring. Division in March or October. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer. Basal cuttings of young barren shoots in June. Very easy. Harvest the shoots with plenty of underground stem when they are about 8 - 10cm above the ground. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Landscape Uses:Border, Container, Ground cover, Rock garden, Seashore. Requires a rather dry, warm, well-drained soil in full sun, but is not fussy as to soil type, thriving on chalk[1, 27]. Prefers slightly alkaline conditions[200]. Tolerates poor soils[24]. Dislikes wet soils[37]. Hardy to about -20°C[187]. Oregano has a long history of culinary and medicinal use and is often cultivated in modern gardens as a culinary herb, there are some named varieties[183, 187, 238, 244]. Plants growing near the sea have the most fragrance[7]. A good companion plant, improving the flavour of nearby plants[201]. The flowers are very attractive to bees and butterflies[5, 30]. A good companion for the cucumber family[14], it is beneficial to all nearby plants[20]. The whole plant has a sweet yet slightly peppery aroma[245]. Members of this genus are rarely if ever troubled by browsing deer[233]. Special Features: Attractive foliage, Fragrant foliage, Not North American native, Attracts butterflies, Suitable for cut flowers, Suitable for dried flowers, Fragrant flowers. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [2-1].

## 5.2.78 Streptopus amplexifolius

Wild Cucumber, Claspleaf twistedstalk, Tubercle twisted-stalk

4 tlin 8 cyuc 4 kcaok 1 tcan 2 dwat 1 m hkuc pcmhmm cyuti tcup hwicli hrsajut hpa7tli flatprkikwis hpa7tmwatli xre7t hjonli

drutta Streptopus amplexifolius is a PERENNIAL growing to 1 m (3ft 3in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from May to July, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It

drutta *Fritillaria camschatcensis* is a BULB growing to 0.5 m (1ft 8in) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in saline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Root SeedpodEdible Uses: Bulb - raw, cooked or dried for later use[2, 46, 105, 183]. A staple food in areas where it grows wild[177], when cooked it tastes like baked chestnuts[74]. One report says that the bulbs have a slightly bitter taste, even after cooking[256]. The best-tasting bulbs are said to come from coastal areas where the plants are occasionally covered with salt water[254]. A pudding is made by mixing the bulbs with the fruit of *Empetrum nigrum*[183]. The bulb is also dried and ground into a powder, then used as a flour or starch for making breads and soups[183]. The bulb is best if harvested in the autumn[172], it resembles a cluster of cooked rice grains[207]. The green seedpods can be eaten raw or cooked. They are somewhat bitter[172].

tcanta None known

dwatta None known

propta Seed - best sown as soon as ripe in a cold frame, it should germinate in the spring[11]. Protect from frost[134]. Stored seed should be sown as soon as possible and can take a year or more to germinate[134]. Sow the seed quite thinly to avoid the need to prick out the seedlings. Once they have germinated, give them an occasional liquid feed to ensure that they do not suffer mineral deficiency. Once they die down at the end of their second growing season, divide up the small bulbs, planting 2 - 3 to an 8cm deep pot. Grow them on for at least another year in light shade in the greenhouse before planting them out whilst dormant. Division of offsets in August[1]. The larger bulbs can be planted out direct into their permanent positions, but it is best to pot up the smaller bulbs and grow them on in a cold frame for a year before planting them out in the autumn. Bulb scales[163].

nwatta A woodland plant, preferring a moraine or rock garden[1]. Easily grown in a light moist but well-drained sandy woodland soil[42, 163, 200]. Prefers a moist peaty soil and partial shade and must not be allowed to become dry[90]. Another report says that it prefers a sunny position[42] whilst yet another says that it succeeds in full sun or light shade in a rich soil[200]. The plants often grow close to the sea and survive periodic inundation with salt water[256]. The dormant bulb is very hardy and has withstood soil temperatures down to -20°C, though the embryonic flower shoot will be damaged at temperatures around -15°C[214]. A very ornamental plant[1], it is very variable in size and flower colour[90]. The flowers are sweetly scented[245]. Plants flower within 3 - 5 years from seed[164]. The plant is heat tolerant in zones 8 through 2. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

## 5.2.119 Hemerocallis lilioasphodelus

Yellow Day Lily

4 tlin 8 cyuc 4 kcaok 2 tcan 2 dwat 0.6 m hkuc hmimhtut cyuti kyuctcup hwicli hrsajut hpa7tli flatprkikwis hpa7tmwatli fyixre7t hjonli

drutta *Hemerocallis lilioasphodelus* is a PERENNIAL growing to 0.6 m (2ft) by 1 m (3ft 3in). See above for USDA

hardness. It is hardy to UK zone 4 and is not frost tender. It is in flower from May to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Flowers Leaves Root ShootsEdible Uses: Leaves and young shoots - raw or cooked like asparagus or celery[85, 105, 183]. They must be consumed when very young or else they become fibrous[K]. Flower buds - raw or cooked. They taste somewhat like green beans[85, 105]. They contain about 43mg vitamin C per 100g, 983 IU vitamin A and 3.1% protein[205]. Flowers - raw or cooked[85, K]. They can be dried and used as a thickener in soups etc[183]. If the flowers are picked just as they start to wither they can be used as a condiment[85]. The flowers are a traditional food in China where they are steamed and then dried[266]. Root - cooked[85, 105]. They taste like a blend of sweet corn and salsify[183]. We have found them to be tender but fairly bland with a slight sweetness[K]. The swollen roots are quite small and are only really worthwhile using if the plant is being dug up for divisions or for other reasons[K].

tcanta WeavingThe tough dried foliage is plaited into cord and used for making footwear[205]. Plants form a spreading clump and are suitable for ground cover when spaced about 45cm apart each way[208]. The dead leaves should be left on the ground in the winter to ensure effective cover[208].

dwatta Antidote Cancer Diuretic Vitamin CThe juice of the roots is an effective antidote in cases of arsenic poisoning[205]. The root also has a folk history of use in the treatment of cancer - extracts from the roots have shown antitumour activity[218]. A tea made from the boiled roots is used as a diuretic[205].

propta Seed - sow in the middle of spring in a greenhouse. Germination is usually fairly rapid and good. Prick out the seedlings into individual pots when they are large enough to handle. Grow the plants on for their first winter in a greenhouse and plant out in late spring[K]. Division in spring or after flowering in late summer or autumn[200]. Division is very quick and easy, succeeding at almost any time of the year[K]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Succeeds in most soils[1], including dry ones, preferring a rich moist soil and a sunny position[111] but tolerating partial shade[88, 111]. Plants flower less freely in a shady position though the flowers can last longer in such a position[205]. Grows well in heavy clay soils. Succeeds in short grass if the soil is moist[1]. Prefers a pH between 6 and 7[200]. Plants are very cold-hardy, tolerating temperatures down to about -25°C[187]. A very vigorous plant, spreading by underground rhizomes[1]. The plant has a fibrous root system with occasional spindle-like swellings[205]. Cultivated as a food and medicinal plant in Japan[127]. Individual flowers are short-lived, they open at night and last for 20 - 76 hours. The plant produces a succession of blooms over a period of about 2 months[205]. The flowers are fragrant[205]. The flowers have a honeysuckle-like scent and this can pervade the air for a considerable distance when warmed by the summer sunshine[245]. Hybridizes freely with other members of this genus[200]. Plants take a year or two to become established after being moved[200]. Plants seem to be immune to the predations of rabbits[233]. The plants are very susceptible to slug and snail damage, the young growth in spring is especially at risk[200]. The plant is heat tolerant in zones 12 through 2. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth

be dried for later use. There are up to five fairly large seeds in the centre of the fruit, these often stick together and so the effect is of eating a cherry-like fruit with a single seed[K].

tcanta Wood - heavy, hard, tough, close-grained. Useful for making tool handles, mallets and other small items[82].

dwatta Cardiotonic HypotensiveAlthough no specific mention has been seen for this species, the fruits and flowers of many hawthorns are well-known in herbal folk medicine as a heart tonic and modern research has borne out this use. The fruits and flowers have a hypotensive effect as well as acting as a direct and mild heart tonic[222]. They are especially indicated in the treatment of weak heart combined with high blood pressure[222]. Prolonged use is necessary for it to be efficacious[222]. It is normally used either as a tea or a tincture[222].

propta Seed - this is best sown as soon as it is ripe in the autumn in a cold frame, some of the seed will germinate in the spring, though most will probably take another year. Stored seed can be very slow and erratic to germinate, it should be warm stratified for 3 months at 15°C and then cold stratified for another 3 months at 4°C[164]. It may still take another 18 months to germinate[78]. Scarifying the seed before stratifying it might reduce this time[80]. Fermenting the seed for a few days in its own pulp may also speed up the germination process[K]. Another possibility is to harvest the seed 'green' (as soon as the embryo has fully developed but before the seedcoat hardens) and sow it immediately in a cold frame. If timed well, it can germinate in the spring[80]. If you are only growing small quantities of plants, it is best to pot up the seedlings as soon as they are large enough to handle and grow them on in individual pots for their first year, planting them out in late spring into nursery beds or their final positions. When growing larger quantities, it might be best to sow them directly outdoors in a seedbed, but with protection from mice and other seed-eating creatures. Grow them on in the seedbed until large enough to plant out, but undercut the roots if they are to be left undisturbed for more than two years.

nwatta A very easily grown plant, it prefers a well-drained moisture retentive loamy soil but is not at all fussy[11, 200]. Once established, it succeeds in excessively moist soils and also tolerates drought[200]. It grows well on a chalk soil and also in heavy clay soils[200]. A position in full sun is best when plants are being grown for their fruit, they also succeed in semi-shade though fruit yields and quality will be lower in such a position[11, 200]. Most members of this genus succeed in exposed positions, they also tolerate atmospheric pollution[200]. A very hardy plant, tolerating temperatures down to about -18°C[202]. Hybridizes freely with other members of this genus[200]. Seedling trees take from 5 - 8 years before they start bearing fruit, though grafted trees will often flower heavily in their third year[K]. The flowers have a foetid smell somewhat like decaying fish. This attracts midges which are the main means of fertilization. When freshly open, the flowers have more pleasant scent with balsamic undertones[245]. Seedlings should not be left in a seedbed for more than 2 years without being transplanted[11]. Probably a natural hybrid, *C. pruinosa* x *C. suborbiculata*[43].

## 5.2.116 *Astrebla squarrosa*

Bull Mitchell grass

4 tin 12 cyuc 4 kacak 1 tcan 0 dwat 1.5 m hkuc htut cyutli hgatkycutcup hwicli hyishrasjltunykfrrip hpa7tli flatprikrlwis hpa7tmwatli hjonli

drutta *Astrebla squarrosa* is a PERENNIAL growing to 1.5 m (5ft) by 0.1 m (0ft 4in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 10. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: SeedEdible Uses: Carbon Farming Solutions - Staple Crop: balanced carb (The term staple crop typically refers to a food that is eaten routinely and accounts for a dominant part of people's diets in a particular region of the world) [1-1]. Cultivated in the past but largely or completely abandoned.

tcanta Providing habitat for organisms such as mammals.

dwatta None Known  
propta Wild. Seed.

nwatta Historic Crop Management: Standard Staple Crop: Balanced carbClimate: subtropical to tropical. Humidity: semi-arid. Grow on clay soils, mainly between an upper limit of 600 mm average annual rainfall, and a lower limit of 200 mm, and even below in depressions where the water concentrates following rains e.g. in Sturt's Stony Desert. Mitchell grasses are deep rooted and become dormant during drought, allowing them to survive extended periods without rainfall. Carbon Farming Solutions - Cultivation: historic crop. Cultivated in the past but largely or completely abandoned. Management: standard (Describes the non-destructive management systems that are used in cultivation) [1-1].

## 5.2.117 *Prunus cerasifera divaricata*

4 tin 8 cyuc 4 kacak 0 tcan 1 dwat 10 m hkuc hmimhtut cyutli tcup hwicli hrasjltunykfrrip hpa7tli flatprikrlwis hpa7tmwatli xre7t hjonli

drutta *Prunus cerasifera divaricata* is a deciduous Tree growing to 10 m (32ft 10in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Fruit SeedEdible Uses: Fruit - raw or cooked[74]. Tastes like a Mirabelle plum[2, 11]. A very pleasant plum-like flavour when fully ripe with a mealy though juicy flesh[K]. It is high in citric acid, containing about 4.7%[74]. The fruit is about 30mm in diameter and contains one large seed[200]. Seed - raw or cooked. Do not eat the seed if it is too bitter - see the notes above on toxicity.

tcanta Dye RootstockUsed as a rootstock for plums, peaches and apricots[74]. A green dye can be obtained from the leaves[168]. A dark grey to green dye can be obtained from the fruit[168].

dwatta Although no specific mention has been seen for this species, all members of the genus contain amygdalin and prunasin, substances which break down in water to form hydrocyanic acid (cyanide or prussic acid). In small amounts, this exceedingly poisonous compound stimulates respiration, improves digestion and gives a sense of well-being[238].

propta Seed - requires 2 - 3 months cold stratification and is best sown in a cold frame as soon as it is ripe[200]. Sow stored seed in a cold frame as early in the year as possible[200]. Protect the seed from mice etc. The seed can be rather slow, sometimes taking 18 months to germinate[113]. Prick out the seedlings into individual pots when they are large enough to handle. Grow them on in a greenhouse or cold frame for their first winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood with a heel, July/August in a frame[11, 200]. Softwood cuttings from strongly growing plants in spring to early summer in a frame[200]. Layering in spring.

nwatta Requires a well-drained moisture retentive soil[11, 200]. Succeeds in light shade but fruits better in a sunny position[11, 200]. Thrives in a loamy soil, doing well on limestone[11]. Grows well in heavy clay soils. Prefers some chalk in the soil but apt to become chlorotic if too much is present[1]. Plants are hardy to about -25°C[184]. According to some botanists this plant should be named *P. divaricata* and *P. cerasifera* should be named *P. divaricata cerasifera*[11]. Most members of this genus are shallow-rooted and will produce suckers if the roots are damaged[238]. Plants in this genus are notably susceptible to honey fungus[200].

## 5.2.118 *Fritillaria camschatcensis*

Kamchatka Lily, Kamchatka fritillary

4 tin 8 cyuc 4 kacak 0 tcan 0 dwat 0.5 m hkuc hmimhtut cyutli tcup hwicli hrasjltunykfrrip hpa7tli flatprikrlwishsom hpa7tmwatli xre7t hjonli

can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: Fruit Leaves RootEdible Uses: Fruit - raw or cooked in soups and stews[105, 161, 172]. Juicy with a cucumber flavour[183], they are reported to be slightly cathartic when growing in certain areas only[183]. The fruit is laxative if eaten in large quantities according to another report[172]. The oval berry is up to 15mm long[235]. Tender young shoots - raw in salads or cooked like asparagus[177, 183, 257]. A cucumber-like flavour[172, 183]. Root - raw. It is sometimes used in salads for its cucumber flavour[105, 177, 183].

tcanta IncenseThe plant has been tied to the clothes, body or hair and used as a scent[257].

dwatta Analgesic Appetizer Cathartic Haemostatic Kidney Oxytoxic Stomachic VDTThe fruit is cathartic[172, 207]. An infusion of the stems and fruit has been used to treat 'sickness in general'[257]. The plant is tonic[257]. An infusion of the whole plant has been used to treat stomach complaints and loss of appetite[257]. A compound infusion of the plant has been used in the treatment of spitting up of blood, kidney problems and gonorrhoea[257]. The root has been chewed in order to induce labour in cases of protracted delay[257]. A compound infusion of the root has been used as an analgesic in the treatment of internal pain[257].

propta Seed - best sown in a cold frame as soon as it is ripe in the summer[200]. Sow stored seed in a cold frame as soon as it is received. The seed, especially if it has been stored, can be very slow to germinate, sometimes taking 18 months or more. Prick out the seedlings into individual pots once they are large enough to handle and grow them on in a shady part of the greenhouse or cold frame. It will normally take 2 or more growing seasons before the roots are large enough to plant out - this is best done when the plant is dormant in the autumn. Division as the plant comes into growth in early spring. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame for their first year, planting them out in the following spring.

nwatta Requires a cool leafy soil in shade or partial shade[187]. Thrives in a moist light soil containing organic matter[1]. Hardy to at least -20°C. A polymorphic species, there are many sub-species[43]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is fibrous dividing into a large number of fine roots [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

## 5.2.79 *Carya hybrids*

Hybrid and neo-hybrid hickories

4 tin 11 cyuc 4 kacak 3 tcan 3 dwat 40 m hkuc htut cyutli kyucutcup hwicli hrasjltunykfrrip hpa7tli flatprikrlwis hpa7tmwatli hjonli

drutta *Carya hybrids* is a deciduous Tree growing to 40 m (131ft) by 35 m (114ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Leaves Oil SeedEdible Uses: Oil-Carbon Farming Solutions - Staple Crop: oil (The term staple crop typically refers to a food that is eaten routinely and accounts for a dominant part of people's diets in a particular region of the world) [1-1].

tcanta OilSee individual plant entries. A dynamic accumulator gathering minerals or nutrients from the soil and storing them in a more bioavailable form - used as fertilizer or to improve mulch.

dwatta See individual species.

propta Seed - requires a period of cold stratification. It is best sown in a cold frame as soon as it is ripe[78]. Stored seed should be kept moist (but not wet) prior to sowing and should be sown in a cold frame as soon as possible[78]. Where possible, sow 1 or 2 seeds only in each deep pot and thin to the best seedling. If you need to transplant

the seedlings, then do this as soon as they are large enough to handle, once more using deep pots to accommodate the tap root. Put the plants into their permanent positions as soon as possible, preferably in their first summer, and give them some protection from the cold for at least the first winter[78, K]. Seed can also be sown in situ so long as protection is given from mice etc and the seed is given some protection from cold[200] (a plastic bottle with the top and bottom removed and a wire mesh top fitted to keep the mice out is ideal)

nwatta Management: Standard Minor Global Crop Staple Crop: OilClimate: cold temperate to subtropical, tropical highlands. Humidity: humid. Carbon Farming Solutions - Cultivation: minor global crops. Management: standard (Describes the non-destructive management systems that are used in cultivation) [1-1]. . For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2]. The root pattern is a tap root similar to a carrot going directly down [1-2].

## 5.2.80 *Mentha x villosa alopecuroides*

Apple Mint, Bowles' Mint

4 tin 8 cyuc 4 kacak 3 tcan 2 dwat 0.6 m hkuc hmimhtut cyutli tcup hwicli hrasjltunykfrrip hpa7tli flatprikrlwis hpa7tmwatli xre7t hjonli

drutta *Mentha x villosa alopecuroides* is a PERENNIAL growing to 0.6 m (2ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Condiment TeaLeaves - raw or cooked[14]. A strong spearmint flavour, they are used as a flavouring in salads or cooked foods[183], this is also the main species that is used to make mint sauce. A herb tea is made from the fresh or dried leaves[21, 183].

tcanta Essential Repellent StrewingAn essential oil is obtained from the whole plant. The plant repels insects and was formerly used as a strewing herb[14, 18, 20]. Rats and mice intensely dislike the smell of mint. The plant was therefore used in homes as a strewing herb and has also been spread in granaries to keep the rodents off the grain[244].

dwatta Antiseptic Carminative FebrifugeApple mint, like many other members of this genus, is often used as a domestic herbal remedy, being valued especially for its antiseptic properties and its beneficial effect on the digestion. Like other members of the genus, it is best not used by pregnant women because large doses can cause an abortion. A tea made from the leaves of most mint species has traditionally been used in the treatment of fevers, headaches, digestive disorders and various minor ailments[222]. The leaves are harvested as the plant comes into flower and can be dried for later use[238]. The essential oil in the leaves is antiseptic, though it is toxic in large doses[222].

propta Seed - sow spring in a cold frame. Germination is usually fairly quick. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in the summer. *Mentha* species are very prone to hybridisation and so the seed cannot be relied on to breed true. Even without hybridisation, seedlings will not be uniform and so the content of medicinal oils etc will vary. When growing plants with a particular aroma it is best to propagate them by division[K]. Division can be easily carried out at almost any time of the year, though it is probably best done in the spring or autumn to allow the plant to establish more quickly. Virtually any part of the root is capable of growing into a new plant. Larger divisions can be planted out direct into their permanent positions. However, for maximum increase it is possible to divide the roots up into sections no more than 3cm long and pot these up in light shade in a cold frame. They will quickly become established and can be planted out in the summer.

nwatta A very easily grown plant, it succeeds in most soils and situations so long as the soil is not too dry[1, 200]. Grows well in heavy clay soils. Prefers a slightly acid soil[16]. A sunny position is best for the production of essential oils, but the plant also succeeds in partial shade. Apple mint is commonly grown in the herb garden. There is at least one named variety, 'Bowles mint' is said to be a superior form and it is the form usually cultivated commercially for mint sauce. Unlike most members of the genus, this species is resistant to the disease 'rust'[238]. Most mints have fairly aggressive spreading roots and, unless you have the space to let them roam, they need to be restrained by some means such as planting them in containers that are buried in the soil[K]. Hybridizes freely with other members of this genus. The whole plant has a strong aroma of spearmint. The flowers are very attractive to bees and butterflies[24]. A good companion for growing near cabbages and tomatoes, helping to keep them free of insect pests[14, 20]. Members of this genus are rarely if ever troubled by browsing deer[233]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2]. The root pattern is stoloniferous rooting from creeping stems above the ground [1-2].

### 5.2.81 Amelanchier basalticola

Dwarf Service-berry
4 tlin 8 cyuc 4 kcaak 0 tcan 0 dwat 3 m hkuc
hmimhtut cyutli tcup hwicli hrasjltutnyikfriip hpa7tli flatprik hpa7tmwatli fyifxre7t hjonli

drutta Amelanchier basalticola is a deciduous Shrub growing to 3 m (9ft) by 3 m (9ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in April, and the seeds ripen from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

ckakta Edible Parts: FruitEdible Uses: We have no records for this species, but the fruit is almost certainly edible both raw or cooked[K]. It is 9 - 12mm in diameter[200]. The fruit is rich in iron and copper[226].

tcanta None known
dwatta None known

propta Seed - it is best harvested 'green', when the seed is fully formed but before the seed coat has hardened, and then sown immediately in pots outdoors or in a cold frame. If stored seed is obtained early enough in the autumn, it can be given 4 weeks warm stratification before being left out in the winter and it should then germinate in the spring. Otherwise seed can be very slow to germinate, perhaps taking 18 months or more. When large enough to handle, prick the seedlings out into individual pots and grow them on in a sheltered outdoor position, planting them out once they are 20cm or more tall. If there is sufficient seed it is best to sow it thinly in an outdoor seedbed[78, 80]. Grow the seedlings on for two years in the seedbed before planting them out into their permanent positions during the winter. Layering in spring - takes 18 months[78]. Division of suckers in late winter. The suckers need to have been growing for 2 years before you dig them up, otherwise they will not have formed roots. They can be planted out straight into their permanent positions if required.

nwatta Prefers a rich loamy soil in a sunny position or semi-shade[1, 200] but thrives in any soil that is not too dry or water-logged[11]. Grows well in heavy clay soils. Prefers an acid or neutral soil. All members of this genus have edible fruits and, whilst this is dry and uninteresting in some species, in many others it is sweet and juicy. Many of the species have potential for use in the garden as edible oramentals. The main draw-back to this genus is that birds adore the fruit and will often completely strip a tree before it is fully ripe[K]. There is much difference of opinion in the naming of members of this genus, with many botanists viewing this species as no more than a form of *A. alnifolia*[60].

It hybridizes freely with other members of the genus[200]. Grafting onto seedlings of *A. lamarckii* or *Sorbus aucuparia* is sometimes practised in order to avoid the potential problem of hybridizing[1].

### 5.2.82 Allium cepa aggregatum

Potato Onion
4 tlin 8 cyuc 4 kcaak 3 tcan 3 dwat 1.2 m hkuc
htut cyutli tcup hwicli hrasjltut hpa7tli flatprikwiisslip hpa7tmwatli xre7t hjonli

drutta Allium cepa aggregatum is a BULB growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers moist soil.

ckakta Edible Parts: Flowers Leaves RootEdible Uses: Bulb - raw or cooked[4, 33]. A nice onion flavour, when chopped up finely they make a nice addition to salads and can also be used as a cooked vegetable or as a flavouring in cooked foods[K]. Some of the cultivars are considered to be gourmet onions[183]. Leaves - raw or cooked. A strong onion flavour[K]. Flowers - raw. Used as a garnish on salads. The flowers are somewhat dry and are less pleasant than many other species[K].

tcanta Cosmetic Dye Hair Polish Repellent RustThe juice of the plant is used as a moth repellent and can also be rubbed onto the skin to repel insects[7]. The plant juice can be used as a rust preventative on metals and as a polish for copper and glass[7]. A yellow-brown dye is obtained from the skins of the bulbs[141, 168]. Onion juice rubbed into the skin is said to promote the growth of hair and to be a remedy for baldness[7]. It is also used as a cosmetic to get rid of freckles[7]. The growing plant is said to repel insects and moles[201]. A spray made by pouring enough boiling water to cover 1kg of chopped unpeeled onions is said to increase the resistance of other plants to diseases and parasites[201].

dwatta Anthelmintic Antiinflammatory Antiseptic Antispasmodic Carminative Diuretic Expectorant Febrifuge Hypoglycaemic Hypotensive Lithotropic Skin Stomachic TonicAlthough rarely used specifically as a medicinal herb, the onion has a wide range of beneficial actions on the body and when eaten (especially raw) on a regular basis will promote the general health of the body. The bulb is anthelmintic, anti-inflammatory, antiseptic, antispasmodic, carminative, diuretic, expectorant, febrifuge, hypoglycaemic, hypotensive, lithotropic, stomachic and tonic[4, 7, 21]. When used regularly in the diet it offsets tendencies towards angina, arteriosclerosis and heart attack[254]. It is also useful in preventing oral infection and tooth decay[254]. Baked onions can be used as a poultice to remove pus from sores[254]. Fresh onion juice is a very useful first aid treatment for bee and wasp stings, bites, grazes or fungal skin complaints[7, 201]. When warmed the juice can be dropped into the ear to treat earache[254]. It also aids the formation of scar tissue on wounds, thus speeding up the healing process, and has been used as a cosmetic to remove freckles[7].

propta Seed - sow spring in a cold frame. Seed is seldom produced by this plant[4]. Division in late summer. Harvest the bulbs as the foliage dies down and store them in a cool place. In areas with mild winters the bulbs are traditionally replanted on the shortest day of the year, but in colder areas it is best to wait until late winter or even early spring[4]. Plant the bulbs only just below the soil surface[4].

nwatta Prefers a sunny sheltered position in a light well-drained fertile soil[1] but tolerates most soils. Tolerates a pH in the range 4.5 to 8.3. The potato onion was at one time fairly widely grown as a vegetable, but it has now fallen into virtual disuse[16]. There are still some named forms available[183]. This is a genuinely perennial form of *A. cepa*, the bulb grows deeper in the soil and divides to produce a number of underground bulbs each year in much the same way as shallots. Large bulbs divide to form 5 - 15 bulbs whilst smaller bulbs grow into one large bulb[160]. According to one report, the bulbs should be planted fairly deeply[1], whilst another report says that they should be planted just

germination rate. Prick out the seedlings into individual pots as soon as they are large enough to handle and plant out into their permanent positions in the summer. Division in spring[200]. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the summer or following spring.

nwatta Historic Grain Crop Management: Standard Staple Crop: Balanced carbPrefers a fertile humus rich soil in a sunny position[9, 16, 200]. The plant produces a better quality harvest in the summer if it is grown in light shade[264, K]. A very easily grown plant, it tolerates considerable neglect and succeeds in most soils and situations[16, 33, K]. Good King Henry was at one time frequently cultivated in the garden as a perennial vegetable, but it has fallen out of favour and is seldom grown at present[4, 46]. About thirty plants can produce a good supply of food for four people[264]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is a tap root similar to a carrot going directly down [1-2].

### 5.2.113 Balsamorhiza hookeri

Balsam Root, Hooker's balsamroot, Hairy balsamroot, Idaho balsamroot, Rabbithead balsamroot, Negle
4 tlin 8 cyuc 4 kcaak 0 tcan 1 dwat 0.3 m hkuc
htut cyutli kyuctup hwicli hrasjltut hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta Balsamorhiza hookeri is a PERENNIAL growing to 0.3 m (1ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

ckakta Edible Parts: Root SeedEdible Uses: Root - raw or cooked[2, 46, 106, 183, 257]. A sweet and agreeable taste when cooked[61, 105]. Seed - raw or cooked[105, 161]. It can be ground into a powder and formed into cakes for eating raw or made into a bread[257].

tcanta None known

dwatta Stomachic Women's complaintsA decoction of the root has been used for stomach problems, bladder complaints and female complaints[257. The sub-species *B. hookeri hirsuta* has been specified for these uses[257].

propta Seed - sow early spring in a greenhouse and only just cover the seed. Germination usually takes place within 2 - 6 days at 18°C. Either sow the seed in individual pots or pot up the seedlings as soon as they are large enough to handle and plant them out into their permanent positions in the summer[134]. Division in spring. Very difficult since the plant strongly resents root disturbance[134]. It is probably best to take quite small divisions, or basal cuttings, without disturbing the main clump. Pot these up into individual pots and keep them in light shade in the greenhouse until they are growing away well. Plant them out in the summer if they have grown sufficiently, otherwise over-winter them in the greenhouse and plant out in late spring.

nwatta Requires a deep fertile well-drained loam in full sun[134, 200]. Plants strongly resent winter wet[134, 200]. Hardy to at least -25°C[200]. Plants are intolerant of root disturbance and should be planted into their permanent positions whilst still small[134].

### 5.2.114 Hemerocallis minor

Grassleaf Day Lily, Small daylily
4 tlin 8 cyuc 4 kcaak 2 tcan 1 dwat m hkuc
hmimhtut cyutli kyuctup hwicli hrasjltutnyikfriip hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta Hemerocallis minor is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from May to June. The species is hermaphrodite (has

both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

ckakta Edible Parts: Flowers Leaves RootEdible Uses: Leaves and young shoots - cooked[2, 20, 46, 61, 183]. They must be consumed when very young or else they become fibrous[K]. One report says that eating these leaves appears to stimulate or intoxicate to some extent[2]. Flowers and flower buds - raw or cooked[2, 20, 46, 61]. Considered to be a great delicacy[177]. The flowers are a traditional food in China where they are steamed and then dried[266]. The flowers can be dried and used as a relish or a thickener in soups etc[178, 183]. The flower buds contain about 43mg vitamin C per 100g, 983 IU vitamin A and 3.1% protein[205]. Root - raw or cooked[183, 205]. A radish-like flavour but not so sharp[205].

tcanta WeavingThe tough dried foliage is plaited into cord and used for making footwear[205].

dwatta Anodyne Antidote Cancer Diuretic Febrifuge Vitamin AAnodyne, antidote, diuretic, febrifuge[178]. The juice of the roots is an effective antidote in cases of arsenic poisoning[205]. The root also has a folk history of use in the treatment of cancer - extracts from the roots have shown antitumour activity[218]. A tea made from the boiled roots is used as a diuretic[205].

propta Seed - sow in the middle of spring in a greenhouse. Germination is usually fairly rapid and good. Prick out the seedlings into individual pots when they are large enough to handle. Grow the plants on for their first winter in a greenhouse and plant out in late spring[K]. Division in spring or after flowering in late summer or autumn[200]. Division is very quick and easy, succeeding at almost any time of the year[K]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Succeeds in most soils[1], including dry ones, preferring a rich moist soil and a sunny position[111] but tolerating partial shade[88]. Plants flower less freely in a shady position though the flowers can last longer in such a position[205]. Grows well in heavy clay soils. Succeeds in short grass if the soil is moist[1]. Prefers a pH between 6 and 7[200]. A very cold-hardy plant, tolerating temperatures down to about -25°C[187]. Hybridizes freely with other members of this genus[200]. A very ornamental plant, its roots are slender and not tuberous, whilst the rhizomes are not spreading[187]. The roots sometimes have bulbous swellings at their tips[205]. The flowers open in the evening and live for about 2 days[205]. The flowers have a powerful scent of honeysuckle[245]. Plants take a year or two to become established after being moved[200]. Plants seem to be immune to the predations of rabbits[233]. The plants are very susceptible to slug and snail damage, the young growth in spring is especially at risk[200].

### 5.2.115 Crataegus durobrivensis

Caughuawaga Hawthorn
4 tlin 8 cyuc 4 kcaak 2 tcan 2 dwat 5 m hkuc
hmimhtut cyutli hgattcuphja7n hwicli hrasjltutnyikfriip hpa7tli flatprikwiisslip hpa7tmwatli xre7t hjonli

drutta Crataegus durobrivensis is a deciduous Shrub growing to 5 m (16ft) by 5 m (16ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. The species is hermaphrodite (has both male and female organs) and is pollinated by Midgees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

ckakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. A reasonable size, it is up to 15mm in diameter[200], and is very acceptable for raw eating[K]. It is sweet and fairly juicy when fully ripe with a hint of apple in its flavour[K]. The fruit can be used in making pies, preserves, etc, and can also

obtained from the seed[57]. Although the report does not mention edibility it can be assumed that it is edible. A gum is obtained from the stem. It can be used for chewing[64].

tcanta Adhesive Cleanser Dye Gum Oil OilA green dye can be obtained from the leaves[168]. A dark grey to green dye can be obtained from the fruit[168]. A semi-drying oil is obtained from the seed[57]. It is used as a substitute for almond oil in skin creams[238]. The bruised leaves, when rubbed within any container, will remove strong odours such as garlic or cloves so long as any grease has first been fully cleaned off[4]. A gum obtained from the stem is used as an adhesive[64]. Espalier.

dwatta Alternative Antiasthmatic Antitussive Astringent Demulcent Diuretic Emollient Expectorant Febrifuge Haemolytic Laxative SedativeAntihistosis[194]. The leaves are astringent, demulcent, diuretic, expectorant, febrifuge, laxative, parasiticide and mildly sedative[21, 218]. They are used internally in the treatment of gastritis, whooping cough, coughs and bronchitis[238]. They also help to relieve vomiting and morning sickness during pregnancy, though the dose must be carefully monitored because of their diuretic action[21]. The dried and powdered leaves have sometimes been used to help heal sores and wounds[21]. The leaves are harvested in June and July then dried for later use[4]. The flowers are diuretic, sedative and vermifuge[4, 21, 176, 194, 218]. They are used internally in the treatment of constipation and oedema[238]. A gum from the stems is alternative, astringent, demulcent and sedative[4, 21, 176, 194, 218]. The seed is antiasthmatic, antitussive, emollient, haemolytic, laxative and sedative[4, 21, 176, 194, 218]. It is used internally in the treatment of constipation in the elderly, coughs, asthma and menstrual disorders[238]. The bark is demulcent, diuretic, expectorant and sedative[4]. It is used internally in the treatment of gastritis, whooping cough, coughs and bronchitis[238]. The root bark is used in the treatment of dropsy and jaundice[218]. The bark is harvested from young trees in the spring and is dried for later use[4]. The seed contains 'laetrile', a substance that has also been called vitamin B17[218]. This has been claimed to have a positive effect in the treatment of cancer, but there does not at present seem to be much evidence to support this[K]. The pure substance is almost harmless, but on hydrolysis it yields hydrocyanic acid, a very rapidly acting poison - it should thus be treated with caution[218]. In small amounts this exceedingly poisonous compound stimulates respiration, improves digestion and gives a sense of well-being[238].

propta Seed - requires 2 - 3 months cold stratification and is best sown in a cold frame as soon as it is ripe[200]. Sow stored seed in a cold frame as early in the year as possible[200]. The stored seed is best given 2 months warm followed by 3 months cold stratification[113]. Protect the seed from mice etc. The seed can be rather slow, sometimes taking 18 months to germinate[113]. Prick out the seedlings into individual pots when they are large enough to handle. Grow them on in a greenhouse or cold frame for their first winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood with a heel, July/August in a frame[11, 200]. A very low percentage[113]. Softwood cuttings from strongly growing plants in spring to early summer in a frame[200]. Layering in spring.

nwatta Requires a well-drained moisture retentive soil[1, 11]. Thrives in a loamy soil, doing well on limestone[11]. Best not grown in acid soils. Prefers some chalk in the soil but it is apt to become chlorotic if too much is present[1]. Prefers a pH in the range 6 to 7[200]. Succeeds in light shade but fruits better in a sunny position[11]. Requires shelter from north and north-east winds[11] and also from spring frosts[200]. Widely cultivated for its edible fruit in warm temperate areas and continental climates, this is a form of the peach with a smooth skin. There are some named varieties[183]. There are numerous divisions of the varieties according to skin colour etc. Perhaps the most useful from the eaters point of view is whether it is free-stone (the flesh parts easily from the seed) or cling-stone (the flesh adheres to the seed)[200, K]. Trees are normally hardy in southern Britain[11], tolerating temperatures down to about -20°C[184], but they require some protection if cropping is to be at all reliable[11]. This is not due so much to lack of cold hardness, more to the cooler summers in Britain which do not fully ripen the wood and the fruit, plus the unpredictable winters and springs which, in a mild spell, can excite the tree into premature flowering and growth which is

then very liable to damage in any following cold spell. Hand pollination at this time can improve fruit-set[200]. In general it is best to site nectarines in a very warm sheltered sunny position, preferably against a south or west facing wall[200, 219], though some success is occasionally seen with plants grown fully in the open[K]. Most cultivars are self-fertile[200]. Trees are often grafted onto plum or other rootstocks but are said to be better when grown on their own roots in southern Britain[11]. Trees are not generally long-lived[200], this is partly because of the need for the tree to produce a constant supply of new wood since most fruit is formed on one-year old wood (though some fruit spurs are formed)[200]. Garlic is a good companion for this plant, helping to prevent disease, especially peach leaf curl[20, 201]. Tansy grown below peach trees helps to keep them healthier[201]. Peach leaf curl can also be prevented by protecting the plants from winter and early spring rains, perhaps by covering them in plastic[200]. Most members of this genus are shallow-rooted and will produce suckers if the roots are damaged[238]. Plants in this genus are notably susceptible to honey fungus[200]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2]. Espalier: tree or other plant that is trained to grow flat against a support (such as a trellis or wall).

### 5.2.112 Chenopodium bonus

Good King Henry

4 tin 8 cyuc 4 kcaak 0 tcan 2 dwat 0.3 m hkuc  
htut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliws  
hpa7tmwatli xre7t hjonli

drutta Chenopodium bonus-henricus is a PERENNIAL growing to 0.3 m (1ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from May to July, and the seeds ripen from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcaakta Edible Parts: Flowers Leaves SeedEdible Uses: Young leaves - raw or cooked[2, 5, 7, 9, 12, 33]. The leaves wilt quickly after picking and so they need to be used as soon after harvesting as possible[264]. They can be used as a potherb[4]. The leaves are best in spring and early summer, the older leaves become tough and bitter[200]. The raw leaves should only be eaten in small quantities, see the notes above on toxicity. Young leaves can be chopped and used as a small part of mixed salads, though we are not enamoured by their flavour[K]. The cooked leaves make an acceptable spinach substitute, but are best mixed with nicer leaves[K]. The leaves are a good source of iron[244]. Young flowering shoots - cooked[2, 27, 132, 264]. When grown on good soil, the shoots can be as thick as a pencil[4]. When about 12cm long, they are cut just under the ground, peeled and used like asparagus[183]. A very pleasant spring vegetable[K]. The plant is sometimes blanchered by excluding the light in order to produce a longer and more succulent shoot, though this practice also reduces the quantity of vitamins in the shoots[264, K]. Young flower buds - cooked[33, 183]. Considered to be a gourmet food[183], though they are rather small and harvesting any quantity takes quite a while[K]. Seed - ground and mixed with flour then used in making bread etc. The seed is small and fiddly but is easily harvested[K]. It should be soaked in water overnight and thoroughly rinsed before it is used in order to remove any saponins[K].

tcanta DyeGold/green dyes can be obtained from the whole plant[168].

dwatta Emollient Laxative VermifugeThe herb is emollient, laxative and vermifuge[7, 154]. This remedy should not be used by people suffering from kidney complaints or rheumatism[7]. A poultice of the leaves has been used to cleanse and heal chronic sores, boils and abscesses[4, 7]. The seed is a gentle laxative that is suitable for children[7].

propta Seed - sow spring in a cold frame. Germination can be slow, but usually a high percentage will germinate[K]. These seeds germinate best at 20C. Cold stratification of up to 9 weeks at 4C prior to exposure at 20C will increase the

below soil level[4]. Onions grow well with most plants, especially roses, carrots, beet and chamomile, but they inhibit the growth of legumes[18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. Members of this genus are rarely if ever troubled by browsing deer[233]. The plant is heat tolerant in zones 12 through 2. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is a bulb.

### 5.2.83 Bunium bulbocastanum

Pig Nut, Earth-nut

4 tin 8 cyuc 4 kcaak 0 tcan 1 dwat 0.6 m hkuc  
htut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliws  
hpa7tmwatli fyifxre7t hjonli

drutta Bunium bulbocastanum is a PERENNIAL growing to 0.6 m (2ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to July, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers moist soil.

kcaakta Edible Parts: Leaves RootEdible Uses: CondimentRoot - raw or cooked[46, 61, 115]. A delicious taste very much like sweet chestnuts when cooked[2, K], but the tubers are very small and fiddly to harvest[183]. Seed and flowers. Used as a flavouring[61, 183], they are a cumin substitute[46]. Leaves - raw or cooked. They are used as a garnish and a flavouring in much the same way as parsley[46, 61, 183].

tcanta None known

dwatta AstringentAstringent[61].

propta Seed - sow spring in a cold frame. The seedlings only have one cotyledon[17]. Germination is usually free and quick, prick out the seedlings into individual pots as soon as they are large enough to handle and grow on for their first season in pots. Plant them out into their final positions when dormant in the autumn. The seed can also be sown in situ, but this is best done only if you have lots of seed since far fewer plants will result. Division in spring or autumn.

nwatta See the plants native habitat for ideas on its cultivation needs. The pig nut has at times been cultivated for its edible root[61]. Although quite small in the wild, there is a potential to improve the size of this root through selective breeding and cultivation. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is tuberous with swollen potato-like roots [1-2].

### 5.2.84 Triteleia grandiflora

Wild Hyacinth, Largeflowered triteleia, Howell's triteleia

4 tin 8 cyuc 4 kcaak 0 tcan 0 dwat 0.7 m hkuc  
htut cyutli kyuctcup hwicli hrasljut hpa7tli flatprikliws  
hpa7tmwatli xre7t hjonli

drutta Triteleia grandiflora is a BULB growing to 0.7 m (2ft 4in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from May to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy)

and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcaakta Edible Parts: RootEdible Uses: Bulb - raw or cooked[207, 257]. A sweet nut-like flavour[212], they can be used like potatoes. Said by some people to be the tastiest of the North American edible bulbs[207]. At their best when slow roasted for an hour when they become rather sweet[183]. Young seedpods - cooked as a potherb[183, 207]. An excellent green[212].

tcanta None known

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame. Alternatively, the seed can be sown in spring in a cold frame. Germination usually takes place within 1 - 3 months at 15°C. Sow the seed thinly so that there is no need to prick them out and grow the seedlings in the pot for their first year. Give an occasional liquid feed to ensure that they do not become mineral deficient. Seedlings are prone to damping off so be careful not to overwater them and keep them well ventilated. When they become dormant, pot up the small bulbs placing about 3 in each pot. Grow them on in the greenhouse for another year or two until the bulbs are about 20mm in diameter and then plant them out into their permanent positions when they are dormant in the autumn. Division of flowering size bulbs in autumn. Dig up the clumps of bulbs, replanting the larger ones direct into their permanent positions. It is best to pot up the smaller ones and grow them on in a greenhouse for a year before planting them out when they are dormant in early autumn.

nwatta Requires a rich well-drained sandy loam[1]. Likes plenty of moisture whilst in growth followed by a warm dry period in late summer and autumn[200]. Succeeds outdoors in a very sheltered warm position. Plants grow in patches in the wild and these can cover considerable areas[212]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. Ephemeral emerging in spring and dying back by summer every year [1-2]. The root pattern is a corm swelling at the stem base [1-2].

### 5.2.85 Beta vulgaris craca

Beetroot

4 tin 8 cyuc 4 kcaak 0 tcan 2 dwat 0.9 m hkuc  
htut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliws  
hpa7tmwatli xre7t hjonli

drutta Beta vulgaris craca is a BIENNIAL growing to 0.9 m (3ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline and saline soils. It cannot grow in the shade. It prefers moist soil.

kcaakta Edible Parts: Leaves RootEdible Uses: Root - raw or cooked[2, 16, 27, 132]. Well-grown roots are sweet and tender, especially when young, and can be grated and used in salads. Beetroots are traditionally boiled until tender then pickled in vinegar and used in salads. The roots can also be cooked and used as a vegetable, they are sweet and delicious when baked[K]. The root contains up to 8% sugar[143]. The root is tasteless when grown on very wet soils and dry when grown on clay soils[132]. Immature roots can be harvested in the summer and early autumn for immediate use, these are usually much more tender than the older roots[K]. Mature roots can be left in the ground all winter and harvested as required, though they might suffer damage in severe winters[K]. Alternatively, they are harvested in late autumn or early winter and will store for up to 6 months in a cool but not dry frost-free place[K]. Leaves - raw or cooked like spinach[183]. A reasonable spinach substitute, though harvesting leaves from growing plants can reduce yields of the roots[K]. Some people dislike the raw leaves since they can leave an unpleasant taste in the mouth[K]. A nutritional analysis is available[218].

tcanta None known

dwatta Antitumor Carminative Emmenagogue Haemostatic Stomachic Tonic Although little used in modern herbalism, beet has a long history of folk use, especially in the treatment of tumours[269]. The root of white-rooted forms contain betaine which promotes the regeneration of liver cells and the metabolism of fat cells[254]. The root of red-rooted forms contains betanin - an anthocyanin similar to those found in red wine - which is partly responsible for red beet's immune-enhancing effect[254]. The root is carminative, haemostatic, stomachic and a tonic for women[218]. The root can be used as part of the diet, or the juice can be extracted and used as a health-promoting drink[254]. At least one litre of the juice from red-rooted forms must be taken each day in order to stimulate the immune system[254]. The juice is prescribed by herbalists as part of a cancer-treatment regime[254]. A decoction prepared from the seed has been used as a remedy for tumours of the intestines. The seed, boiled in water, is said to cure genital tumours[269]. The juice or other parts of the plant is said to help in the treatment of tumours, leukaemia and other forms of cancer such as cancer of the breast, oesophagus, glands, head, intestines, leg, lip, lung, prostate, rectum, spleen, stomach, and uterus[269]. Some figure that betacyanin and anthocyanin are important in the exchange of substances of cancer cells; others note two main components of the amines, choline and its oxidation product betaine, whose absence produces tumours in mice[269]. The juice has been applied to ulcers[269]. A decoction is used as a purgative by those who suffer from haemorrhoids in South Africa[269]. Leaves and roots used as an emmenagogue[269]. Plant effective in the treatment of feline ascariasis[269]. In the old days, beet juice was recommended as a remedy for anaemia and yellow jaundice, and, put into the nostrils to purge the head, clear ringing ears, and alleviate toothache[269]. Beet juice in vinegar was said to rid the scalp of dandruff as scurf, and was recommended to prevent falling hair[269].

propta Seed - pre-soaking for 12 hours in warm water prior to sowing encourages mare rapid and even germination[264]. For the earliest crop, ready to harvest in late spring, sow the seed in situ in late February or early March, giving it some protection such as a cloche. The first outdoor sowings can be made in March in situ to provide a crop from early summer onwards. For both of these sowings it is important to choose varieties that are resistant to bolting in case there is a cold spell in the spring. Sowings for the main crop can be made in April to early June to provide roots for autumn, winter and early spring use. Late sowings of fast-maturing varieties can be made in June and early July in order to provide fresh young roots in the autumn.

nwatta A very easily grown plant, it succeeds in sun or light shade in moist soils but prefers a rich well-drained light neutral to alkaline soil[33, 37]. Beets grow well in a variety of soils, growing best in a deep, friable well-drained soil abundant with organic matter, but doing poorly on clay. They prefer an open position and a light well-drained soil[52]. The optimum pH is 6.0 - 6.8, but neutral and alkaline soils are tolerated in some areas. Some salinity may be tolerated after the seedling stage. Beets are notable for their tolerance to manganese toxicity[269]. Beet is reported to tolerate an annual precipitation of 23 to 315cm, an average annual temperature range of 5.0 to 26.6°C and a pH of 4.2 to 8.2[269]. Plants are tolerant of saline soils and respond positively if salt is added to non-saline soils at a rate of about 30g per square metre[264]. Beetroot plants are generally hardy in Britain and can be left outdoors in the soil in most winters, though prolonged cold weather or severe winters can damage the roots. If the plants are exposed to prolonged temperatures below -10°C they will quickly run to seed[200]. This also applies to the young plants of most beetroot varieties if they are sown in early spring - a short period where temperatures fall below zero can fool the plant into believing that there has been a winter and it will then try to flower and produce seed. There are, however, come varieties, such as 'Bolthardy', that are more resistant to bolting and so more suited to these early sowings[200, 264]. The beetroot is widely cultivated, especially in temperate zones, for its edible root. There are two basic forms, those with rounded roots and those with elongated roots with many named varieties of each form. The roots can be available all year round from successional sowings. A fast-growing plant, some cultivars can produce a root ready for harvesting within 7 weeks from sowing the seed[264]. Most beetroot seed is actually a cluster of several

seeds, though monogerm varieties have been produced that only have one seed - these monogerm varieties are less likely to require thinning once they have germinated[264]. A good companion for dwarf beans, onions and kohlrabi[18, 201]. Its growth is inhibited by runner beans, charlock and field mustard[18, 201].

## 5.2.86 Quercus robur

Pedunculate Oak, English oak  
4 tin 8 cyuc 4 kcaak 5 tcan 3 dwat 30 m hkuc  
hmmhtut cyutli hgattcuphja7n hwicli jlutnyikfrip hpa7tli flat-prikliwis hpa7tmwatli hjonli

drutta Quercus robur is a deciduous Tree growing to 30 m (98ft) by 30 m (98ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from April to May, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. It is noted for attracting wildlife. Suitable for: medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: SeedEdible Uses: Coffee GumSeed - cooked[2, 5, 8, 13]. Nourishing but indigestible[4]. Chopped and roasted, the seed is used as an almond substitute[8]. It can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread[183]. The seed contains bitter tannins, these can be leached out by thoroughly washing the seed in running water though many minerals will also be lost[63]. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute[21, 61]. An edible gum is obtained from the bark[177]. Another report says that an edible manna is obtained from the plant and that it is used instead of butter in cooking[183]. This report probably refers to the gum[K].

tcanta Basketry Charcoal Compost Fuel Gum Ink Repellent Tannin WoodA mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth[20, 201]. The bark is an ingredient of 'Quick Return' herbal compost activator[32]. This is a dried and powdered mixture of several herbs that can be added to a compost heap in order to speed up bacterial activity and thus shorten the time needed to make the compost[K]. The bark is very rich in calcium[18]. Oak galls are excrecences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4]. A black dye and an excellent long-lasting ink is made from the oak galls, mixed with salts of iron[4, 7, 66]. The colour is not very durable[4]. When mixed with alum, the dye is brown and with salts of tin it is yellow[4]. Trees can be coppiced to provide material for basket making, fuel, construction etc[23]. The wood is a source of tar, quaiacol, acetic acid, creosote and tannin[123]. Tannin is extracted commercially from the bark and is also found in the leaves[223]. On a 10% moisture basis, the bark contains 11.6% tannin and the wood 9.2%[223]. The bark strips easily from the wood in April and May[4]. A purplish dye is obtained from an infusion of the bark with a small quantity of copperas[4]. It is not bright, but is said to be durable[4]. Wood - hard, tough, durable even under water - highly valued for furniture, construction etc[4, 13, 61, 66]. It is also a good fuel[6] and charcoal[61].

dwatta Antiseptic Astringent Bach Decongestant Dysentery Haemostatic TonicThe oak tree has a long history of medicinal use. It is anti-inflammatory, antiseptic, astringent, decongestant, haemostatic and tonic[4, 7, 9, 13, 21, 165].

## 5.2.109 Amaranthus caudatus

Love Lies Bleeding  
4 tin 8 cyuc 4 kcaak 2 tcan 1 dwat 2 m hkuc  
htut cyutli hgatkuyctup hwicli hyishraslutnyik hpa7tli flat-prikliwisliphsom hpa7tmwatli fyif hjonli

drutta Amaranthus caudatus is an ANNUAL growing to 2 m (6ft) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from July to September, and the seeds ripen from August to September. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid, very alkaline and saline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Leaves SeedEdible Uses: ColouringLeaves - raw or cooked as a spinach or added to soups etc[22, 46, 61, 105, 183]. The mild flavoured leaves are rich in vitamins and minerals[183, K]. Seed - cooked[22, 46, 57, 105]. Very small but easy to harvest and very nutritious, individual plants can bear up to 100,000 seeds[196]. It is eaten cooked or ground into a powder and used in baking[61, 183, 196]. The seed can also be popped in much the same way as popcorn[97, 183]. The seed can be cooked whole, and becomes very gelatinous like this, but it is rather difficult to crush all of the small seeds in the mouth and thus some of the seed will pass right through the digestive system without being assimilated[K]. The seed is very nutritious and contains 13 - 18% of a very high quality protein that is rich in the amino acid lysine[196]. It also contains good quantities of calcium, phosphorus, iron, potassium, zinc, vitamin E and the vitamin B complex[196]. A red food colouring called 'betalaina' is obtained from red cultivars[196].

tcanta DyeYellow and green dyes can be obtained from the whole plant[168].

dwatta Anthelmintic AstringentThe plant is astringent, anthelmintic and diuretic[4, 240]. It is used in the treatment of strangury and is applied externally to scrofulous sores[240].

propta Seed - sow late spring in situ. An earlier sowing can be made in a greenhouse and the plants put out after the last expected frosts. Germination is usually rapid and good if the soil is warm[133]. A drop in temperature overnight aids germination[133]. Cuttings of growing plants root easily[206].

nwatta Prefers a well-drained fertile soil in a sunny position[196, 200]. Grows moderately well in poor soils[200]. Requires a hot sheltered position if it is to do well[K]. Plants are drought resistant though reasonable moisture levels are required for germination and also at pollination[196]. Some forms can tolerate a pH up to 8.5, there are also some that can tolerate mild salinity[196]. It is likely that they will also tolerate acid soils and aluminium toxicity[196]. Plants are not frost-hardy, the most cold tolerant cultivars can tolerate temperatures down to about 4°C[196]. Plants should not be given inorganic fertilizers, see notes above on toxicity. This species is cultivated for its edible seed and leaves in the Andes and various other parts of S. America[46, 61, 97]. It probably arose through cultivation from *A. quitensis*. There are some named varieties[196]. Plants take 4 - 6 months from sowing to harvesting the seed, but up to 10 months in some Andean highland regions[196]. Yields from 1 - 3 tonnes per hectare are common, 5 tonnes has been achieved and research sites have produced the equivalent of 6 tonnes per hectare[196]. The seed is usually harvested just before maturity otherwise some of the seed will be lost during harvesting[196]. Plants usually have downward facing seedheads but varieties have been developed with upward facing heads that can be harvested mechanically[196]. This species is sensitive to day-length most cultivars are short-day and have not done well in northern latitudes, but there are some varieties that flower at day-lengths up to 16 hours[196]. Most if not all members of this genus photosynthesize by a more efficient method than most plants. Called the 'C4 carbon-fixation pathway', this process is particularly efficient at high temperatures, in bright sunlight and under dry conditions[196]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants

that work together for their optimal soil requirements including nutrients and water. The root pattern is clumping, giving the plant a clumping habit. The predictable growth behaviour makes it easier to maintain without having to apply containment methods[2-1].

## 5.2.110 Loniceria angustifolia

Narrow-leaved honeysuckle  
4 tin 8 cyuc 4 kcaak 2 tcan 0 dwat 2.7 m hkuc  
htut cyutli tcup hwicli hraslutnyik hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Loniceria angustifolia is a deciduous Shrub growing to 2.7 m (8ft 10in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from April to May, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw[11, 51, 158, 200, 272]. Sweet and pleasant tasting, the fruit is a bit smaller than a blackcurrant[K]. Plants often produce a second crop in late summer[K].

tcanta WoodWood - hard, very close grained. Used for walking sticks[158, 272].

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed requires 2 months cold stratification[113] and should be sown as soon as possible in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm with or without a heel, July/August in a frame. Good percentage[78]. Cuttings of mature wood of the current season's growth, 15 - 20cm with or without a heel, November in a cold frame. Good percentage[78]. Layering in autumn[200].

nwatta An easily grown plant, it grows best in a good moist soil in a sunny position, it does not fruit so well in the shade[200]. Plants are fairly wind tolerant[K]. Plants flower and fruit better in hotter climates than Britain[182]. Plants have been seen bearing good crops of fruit in eastern Britain, though we have only managed to produce light crops on our Cornish trial grounds[K]. The flowers have a soft 'honeysuckle' perfume[245]. This species is closely related to *L. myrtillus*[11].

## 5.2.111 Prunus persica nucipersica

Neectarine  
4 tin 8 cyuc 4 kcaak 2 tcan 3 dwat 6 m hkuc  
htut cyutli tcup hwicli hraslutnyik hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Prunus persica nucipersica is a deciduous Tree growing to 6 m (19ft) by 6 m (19ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in April, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Flowers Fruit Oil SeedEdible Uses: Gum Oil Oil TeaFruit - raw, cooked or dried for later use[1, 2, 34, 46]. The fruit is often used in ice creams, pies, jams etc[183]. When fully ripe, the fruits of the best forms are soft and juicy with a rich delicious flavour[K]. The size of fruit varies between cultivars but can be up to 7cm in diameter and contains one large seed[200]. Flowers - raw or cooked. Added to salads or used as a garnish[183]. They can also be brewed into a tea[183]. The distilled flowers yield a white liquid which can be used to impart a flavour resembling the seed[183]. Seed - raw or cooked. Do not eat if it is too bitter, seed can contain high concentrations of hydrocyanic acid. See the notes above on toxicity. A semi-drying oil is

diameter[200], with a thick flesh[229]. There are up to five fairly large seeds in the centre of the fruit, these often stick together and so the effect is of eating a cherry-like fruit with a single seed[K]. A tea-like beverage can be made from the twigs[257].

tcanta Hedge HedgeThe plant is tolerant of being trimmed and will even resprout if cut back into very old wood. It can be used as a hedge[50]. Wood - heavy, hard, tough, close-grained. Useful for making tool handles, mallets and other small items[82].

dwatta Cardiotoxic HypotensiveAlthough no specific mention has been seen for this species, the fruits and flowers of many hawthorns are well-known in herbal folk medicine as a heart tonic and modern research has borne out this use. The fruits and flowers have a hypotensive effect as well as acting as a direct and mild heart tonic[222]. They are especially indicated in the treatment of weak heart combined with high blood pressure[222]. Prolonged use is necessary for it to be efficacious[222]. It is normally used either as a tea or a tincture[222].

propta Seed - this is best sown as soon as it is ripe in the autumn in a cold frame, some of the seed will germinate in the spring, though most will probably take another year. Stored seed can be very slow and erratic to germinate, it should be warm stratified for 3 months at 15°C and then cold stratified for another 3 months at 4°C[164]. It may still take another 18 months to germinate[78]. Scarifying the seed before stratifying it might reduce this time[80]. Fermenting the seed for a few days in its own pulp may also speed up the germination process[K]. Another possibility is to harvest the seed 'green' (as soon as the embryo has fully developed but before the seedcoat hardens) and sow it immediately in a cold frame. If timed well, it can germinate in the spring[80]. If you are only growing small quantities of plants, it is best to pot up the seedlings as soon as they are large enough to handle and grow them on in individual pots for their first year, planting them out in late spring into nursery beds or their final positions. When growing larger quantities, it might be best to sow them directly outdoors in a seedbed, but with protection from mice and other seed-eating creatures. Grow them on in the seedbed until large enough to plant out, but undercut the roots if they are to be left undisturbed for more than two years.

nwatta Landscape Uses:Espalier, Pollard, Specimen, Street tree. A very easily grown plant, it prefers a well-drained moisture retentive loamy soil but is not at all fussy[11, 200]. Once established, it succeeds in excessively moist soils and also tolerates drought[200]. It grows well on a chalk soil and also in heavy clay soils[200]. A position in full sun is best when plants are being grown for their fruit, they also succeed in semi-shade though fruit yields and quality will be lower in such a position[11, 200]. Most members of this genus succeed in exposed positions, they also tolerate atmospheric pollution[200]. A very hardy plant, tolerating temperatures down to at least -18°C[202]. Hybridizes freely with other members of this genus[200]. Seedling trees take from 5 - 8 years before they start bearing fruit, though grafted trees will often flower heavily in their third year[K]. The flowers have a foetid smell somewhat like decaying fish. This attracts midges which are the main means of fertilization. When freshly open, the flowers have more pleasant scent with balsamic undertones[245]. Seedlings should not be left in a seedbed for more than 2 years without being transplanted[11]. A very ornamental plant[11], the branches are almost thornless[229]. A rather variable species, it has been separated into several different species by some botanists[82]. This species is much confused with *C. chrysocarpa*[11] and with *C. coccinea*[50]. It is very closely related to *C. submollis*, differing in having 20 stamens to a flower (as compared to 10 in *C. submollis*)[202]. Special Features: North American native, Attractive flowers or blooms. The plant is heat tolerant in zones 6 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture

(form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2]. The root pattern is a tap root similar to a carrot going directly down [1-2].

## 5.2.108 Actinidia polygama

Silver Vine

4 tlin 8 cyuc 4 kcaak 0 tcan 2 dwat 6 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

drutta Actinidia polygama is a deciduous Climber growing to 6 m (19ft 8in). See above for USDA hardness. It is hardy to UK zone 4 and is not frost tender. It is in flower from June to July, and the seeds ripen from October to November. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Bees, insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Fruit LeavesEdible Uses: TeaFruit - raw or cooked[183]. Not very palatable, it is eaten salted[151, 177]. Some cultivars have nice flavoured fruits[183]. The fruit contains up to 5 times the vitamin C of blackcurrants[74]. Fairly large fruits, up to 3cm across[200]. The ovoid fruits are orange and hairless when fully ripe[266]. It contains a number of small seeds, but these are easily eaten with the fruit[K]. Leaves - raw or cooked[4, 61, 105, 177, 183]. The leaves can also be roasted and mixed with tea[183].

tcanta None known

dwatta Hallucinogenic Sedative Vitamin CThe leaves are hallucinogenic and sedative[192]. The leaves contain substances that make them very attractive to cats and for this reason they are especially useful as a sedative for lions etc in zoos[192]. When consumed in large quantities the leaves can have a mild hallucinatory effect[192]. Polygamol, which is made from the fruits, is used as a heart tonic[218]. A dry decoction is used to treat colic and rheumatism[218].

propta Seed - sow spring in a greenhouse[133]. It is probably best if the seed is given 3 months stratification[113], either sow it in a cold frame as soon as it is ripe in November or as soon as it is received. Fresh seed germinates in 2 - 3 months at 10°C, stored seed can take longer[133]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least their first winter. When the plants are 30cm or more tall, plant them out into their permanent positions in late spring or early summer, after the last expected frosts[K]. Most seedlings are male[126]. The seedlings are subject to damping off, they must be kept well ventilated[113]. Cuttings of softwood as soon as ready in spring in a frame[K]. Cuttings of half-ripe wood, July/August in a frame. Very high percentage[113]. Cuttings of ripe wood, October/November in a frame.

nwatta Prefers a sound loamy neutral soil[1, 200]. Succeeds in semi-shade but full sun is best for fruit production[200]. Prefers a sheltered position[200]. Plants are hardy to about -30°C. when dormant but young growth in spring can be cut back by late frosts[160]. Fruits are formed on second year wood and also on fruit spurs on older wood[126], any pruning is best carried out in the winter[219]. The flowers are fragrant[245]. This is a climbing plant, supporting itself by twining around branches etc[200]. The plant is very attractive to cats and can be damaged by them[74, 151, 200]. This species has been confused in literature with *A. kolomikta*[198]. It is closely related but can be distinguished by the leaves which are tapered at the base whilst those of *A. kolomikta* are heart-shaped[219]. Plants in this genus are notably resistant to honey fungus[200]. One report suggests that plants are self-fertile whilst another says that they are dioecious. It is likely that most plants are dioecious but that there are some self-fertile hermaphrodite forms. A cultivar named 418-77 is self-fertile[183].

The bark is the part of the plant that is most commonly used[4], though other parts such as the galls, seeds and seed cups are also sometimes used[7]. A decoction of the bark is useful in the treatment of chronic diarrhoea, dysentery, intermittent fevers, haemorrhages etc[4]. Externally, it is used to bathe wounds, skin eruptions, sweaty feet, piles etc[9]. It is also used as a vaginal douche for genital inflammations and discharge, and also as a wash for throat and mouth infections[9]. The bark is harvested from branches 5 - 12 years old, and is dried for later use[9]. Any galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4]. The plant is used in Bach flower remedies - the keywords for prescribing it are 'homeopathic', 'Despair, but never ceasing effort'[209]. A 'Despondency' remedy is made from the bark. It is used in the treatment of disorders of the spleen and gall bladder[9]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve *Quercus robur* Pedunculate Oak for coughs/bronchitis, diarrhoea, inflammation of mouth and pharynx, inflammation of the skin (see [302] for critics of commission E).

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Prefers a good deep fertile loam which can be on the stiff side[11]. Young plants tolerate reasonable levels of shade[200]. Succeeds in heavy clay soils[13] and in wet soils so long as the ground is not water-logged for long periods[186]. Dislikes dry or shallow soils but is otherwise drought tolerant once it is established[186]. Tolerant of exposed sites though it dislikes salt-laden winds[186]. The oak is a very important timber tree in Britain, it is also a very important food plant for the caterpillars of many species of butterfly[30], there are 284 insect species associated with this tree[24]. It has often been coppiced or pollarded for its wood in the past[23], though this should not be done too frequently[186], about once every 50 years is the average. The tree flowers on new growth produced in spring, the seed ripening in its first year[200, 229]. Older trees have a thick corky bark and this can protect them from forest fires, young trees will often regenerate from the base if cut down or killed back by a fire[186]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. Hybridizes freely with other members of the genus[200]. Immune to attacks by the tortrix moth[1]. This species is notably resistant to honey fungus[88, 200].

## 5.2.87 Sanguisorba minor

Salad Burnet, Small burnet

4 tlin 8 cyuc 4 kcaak 3 tcan 2 dwat m hkuc  
htut cyutli tcup hwicli hyishrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Sanguisorba minor is an evergreen Perennial growing to 0.6 m (2ft) by 0.3 m (1ft in). See above for USDA hardness. It is hardy to UK zone 5 and is not frost tender. It is in leaf all year; in flower from May to August, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerate maritime exposure.

kcaakta Edible Parts: LeavesEdible Uses: TeaYoung leaves and shoots - raw or cooked[2, 5, 9, 14, 21]. They are best used before the plant comes into flower[9]. Eaten in salads, used as a garnish or added to soups, cooling drinks and claret cups[183]. Young seedlings are boiled and eaten[183]. A bit fiddly to harvest and the leaves sometimes become bitter in hot dry summers, but they are usually fairly mild tasting in the winter and some people detect a cucumber flavour to them[K]. In the acid soil of our Cornish trial grounds, the

leaves have a distinctly bitter flavour, though when the same plants were grown on a chalky soil they had a much milder flavour[K]. The leaves contain about 5.65% protein, 1.2% fat, 11% carbohydrate, 1.7% ash, 74.5% water[179]. A herb tea is made from the dried leaves[21, 183].

tcanta Soil reclamation Soil stabilizationPlants have extensive root systems and are used for erosion control, they are also used to reclaim landfills and mined-out terrain[160]. A dynamic accumulator gathering minerals or nutrients from the soil and storing them in a more bioavailable form - used as fertilizer or to improve mulch.

dwatta Astringent Diaphoretic Eczema Skin StypticBoth the root and the leaves are astringent, diaphoretic and styptic, though the root is most active[4]. The plant is an effective wound herb, quickly staunching any bleeding[244]. An infusion is used in the treatment of gout and rheumatism[244]. The leaves can be used fresh, or are harvested in July and dried (the plant should be prevented from flowering[4]). The root is harvested in the autumn and dried[4]. An infusion of the leaves is used as a soothing treatment for sunburn or skin troubles such as eczema[201].

propta Seed - sow March/April or September/October in a cold frame. Germinates in 3 weeks. Prick out the seedlings when they are large enough to handle into individual pots. Plant them out in the spring or early summer. The seed can also be sown in situ in spring or autumn if you have sufficient seed. Division in spring.

nwatta Prefers a light dry calcareous soil[1, 37, 200] but succeeds in most good soils[1, 37]. Plants also succeed in poor soils[4]. One report says that it grows well in marshy soil[24] but this is possibly a mistake[K]. Dislikes shade[14]. Occasionally cultivated in the herb garden, this is an evergreen herbaceous plant and it supplies fresh edible leaves all the year round, even in quite severe winters[K]. When grown as a salad, the plant should be prevented from flowering[4]. Grows well in the spring meadow[24]. Makes a good edging plant in the border[200]. Plants often self-sow, sometimes to the point of nuisance[K]. The plant is heat tolerant in zones 8 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

## 5.2.88 Campanula rapunculus

Rampion

4 tlin 8 cyuc 4 kcaak 0 tcan 0 dwat 0.9 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlut hpa7tli priklwis hpa7tmwatli fyifxre7t hjonli

drutta Campanula rapunculus is a BIENNIAL growing to 0.9 m (3ft) by 0.3 m (1ft in). See above for USDA hardness. It is hardy to UK zone 4. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Leaves RootEdible Uses: Root - raw or cooked[2, 5, 33, 37, 100, 183]. A very nice sweet flavour[27], reminiscent of walnuts[2]. They are best mixed with other root vegetables and used in winter salads[2, 9]. Leaves - raw or cooked as a potherb[2, 5, 9, 27, 33, 37, 100, 183]. A fairly bland flavour, with a hint of sweetness, they are quite acceptable raw in salads[K]. The leaves are rich in vitamin C, they make an acceptable winter salad[4]. Young

shoots in spring can be blanched and cooked like asparagus[183].

tcanta None known  
dwatta Vitamin CNone known  
propta Seed - surface sow May/June in situ. The seed usually germinates in 2 - 4 weeks at 18°C[138].

nwatta An easily cultivated plant, it prefers a moist but well-drained rich sandy loam and a neutral or alkaline soil in sun or partial shade[1, 4, 200], though it succeeds in most good soils[4]. Tolerates a pH in the range 4.8 to 7.5. Plants are hardy to at least -15°C[200]. Plants often self-sow in the garden[271]. The species in this genus do not often hybridize and so seed can generally be relied upon to come true[221]. The plants are self-fertile[221]. Rampion was formerly often cultivated for its edible root, though it has fallen into virtual disuse[4]. When grown for its edible root, the plant should not be allowed to flower[4]. Plants can be grown in a meadow[200]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 5.2.89 Acer saccharum nigrum

Black Maple

4 tlin 6 cyuc 4 kcaak 2 tcan 1 dwat 25 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyikfripr hpa7tli flatprikwis hpa7tmwatli hjonli

drutta *Acer saccharum nigrum* is a deciduous Tree growing to 25 m (82ft 0in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 3. It is in flower in April, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Inner Bark Sap SeedEdible Uses: SweetenerThe sap contains reasonable quantities of sugar and can be used as a drink or concentrated into a syrup by boiling off the water[1, 2, 11, 43, 34, 57, 142, 159]. The syrup is used as a sweetener on many foods. The sap can be harvested in late winter or early spring[142], the flow is best on a warm sunny day after a frost. Trees on southern slopes in sandy soils give the best yields. It is best to make a hole about 7cm deep and about 1.3 metres above the ground[171]. Yields of 40 - 100 litres per tree can be obtained[142]. The best sap production comes from cold-winter areas with continental climates. Seed - boiled then roasted[62, 105, 159]. The seed is about 6mm long and is produced in small clusters[82]. Inner bark - cooked. It is dried, ground into a powder and then used as a thickening in soups etc or mixed with cereals when making bread[105, 161].

tcanta Fuel Preservative WoodThe leaves are packed around apples, rootcrops etc to help preserve them[18, 20]. Wood - close grained, tough, hard, heavy. Used for furniture, ship building, etc[43, 46, 61, 82, 171]. It is a good fuel[82]. A dynamic accumulator gathering minerals or nutrients from the soil and storing them in a more bioavailable form - used as fertilizer or to improve mulch.

dwatta AstrigentA decoction of the inner bark has been used in the treatment of diarrhoea[257].

propta Seed - best sown as soon as it is ripe in a cold frame, it usually germinates in the following spring. A lot of the seed is non-viable, it is best to cut a few open to see if there is an embryo[113]. An average of 95% germination can be achieved from viable seed[98]. Pre-soak stored seed for 24 hours and then stratify for 2 - 4 months at 1 - 8°C. It can be slow to germinate, sometimes taking two years[125]. The seed can be harvested 'green' (when it has fully developed but before it has dried and produced any germination inhibitors) and sown immediately. It should germinate in late winter. If the seed is harvested too soon it will produce very weak plants or no plants at all[80, 113]. When large enough to handle, prick the seedlings out into individual pots and grow them on until they are 20cm or more tall before planting them out in their permanent positions. Layering, which takes about 12 months, is successful with most species in this genus. Cuttings of young shoots in June or July. The cuttings should have 2 - 3 pairs of leaves, plus one pair of buds at the base. Remove a very thin slice of bark at the base of the cutting, rooting is improved if a rooting hormone is used. The

rooted cuttings must show new growth during the summer before being potted up otherwise they are unlikely to survive the winter.

nwatta Landscape Uses:Specimen, Street tree. Of easy cultivation, it prefers a good moist well-drained soil but succeeds on most soils[11, 98]. Chlorosis can often develop as a result of iron deficiency when the plants are grown in alkaline soils, but in general maples are not fussy as to soil pH. Grows well in heavy clay soils. Trees need full light and a lot of space[98]. Plants are hardy to about -45°C when fully dormant[160]. This species is not a great success in Britain[1], though it does better than once thought[11]. It grows well in Cornwall[59]. Slow growing when young[11]. Plants produce prodigious root growth but very little top growth in first year from seed[133]. Trees grow rapidly for their first 25 years in the wild, but then slow down and only occasionally surviving for more than 200 years[229]. A very ornamental tree[1] but a bad companion plant, inhibiting the growth of nearby plants[18, 20]. This species is commercially exploited in America for its sap[1, 11]. Along with *A. saccharum* and the sub-species *A. s. grandidentatum* it is the major source of maple syrup[11]. There are some named varieties[183]. The sap can be tapped within 10 - 15 years from seed but it does not flow so well in areas with mild winters[160]. Special Features:North American native, Inconspicuous flowers or blooms. The plant is heat tolerant in zones 8 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2]. The root pattern is flat with shallow roots forming a plate near the soil surface [1-2].

## 5.2.90 Helianthus tuberosus

Jerusalem Artichoke

4 tlin 8 cyuc 4 kcaak 3 tcan 1 dwat 2.4 m hkuc  
htut cyutli kyuctup hwicli yihshrasjlutnyik hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta *Helianthus tuberosus* is a PERENNIAL growing to 2.4 m (7ft) by 0.6 m (2ft in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower in October, and the seeds ripen in November. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: RootEdible Uses: Coffee SweetenerTubers - raw or cooked[2, 46, 61, 95]. The tuber develops a pleasant sweetness during the winter, especially if subjected to frosts, and is then reasonably acceptable raw[K]. Otherwise it is generally best cooked, and can be used in all the ways that potatoes are used[K]. The tubers are rich in inulin[46], a starch which the body cannot digest, so Jerusalem artichokes provide a bulk of food without many calories[K]. Some people are not very tolerant of inulin, it tends to ferment in their guts and can cause quite severe wind[K]. The tubers are fairly large, up to 10cm long and 6cm in diameter[200]. The tubers burse easily and lose moisture rapidly so are best left in the ground and harvested as required[200]. The inulin from the roots can be converted into fructose, a sweet substance that is safe for diabetics to use[46, 171]. The roasted tubers are a coffee substitute[183].

tcanta BiomassThe plants are a good source of biomass. The tubers are used in industry to make alcohol etc[141]. The alcohol fermented from the tubers is said to be of better quality than that from sugar beets[269]. A fast-growing plant,

ing[238]. The seed residue is poisonous[9, 57]. The roasted seed is used as a coffee substitute[2, 63].

tcanta Charcoal Fuel Hedge Hedge Oil Stuffing Teeth WoodA semi-drying oil is obtained from the seed, it is used as a fuel for lighting, as a lubricant, for polishing wood etc[12, 13, 46, 57, 63]. The seed residue is poisonous[9, 57]. The leaf buds harvested in the winter and dried on the twigs are used as toothpicks[66]. The leaves are gathered in autumn and used as a stuffing material for mattresses etc[115]. Wood - hard, heavy, strong, very durable[13, 46]. It is not suitable for outdoor use[1] and is often attacked by a small beetle[4]. It has a wide range of applications, including furniture, flooring, turnery etc[100]. It makes a very good fuel[6, 66], burning with a lot of heat[4], and yields a charcoal known as 'Carbo Ligni Pulveratus'[46]. The wood has often been used as a source of creosote, tar, methyl alcohol, acetic acid[123]. A dynamic accumulator gathering minerals or nutrients from the soil and storing them in a more bioavailable form - used as fertilizer or to improve mulch.

dwatta Antacid Antipyretic Antiseptic Antitussive Bach Expectorant Odontalgic SkinThe bark is antacid, antipyretic, antiseptic, antitussive, expectorant, odontalgic[7, 9]. A tar (or creosote), obtained by dry distillation of the branches, is stimulating and antiseptic[4]. It is used internally as a stimulating expectorant and externally as an application to various skin diseases[4, 238]. The pure creosote has been used to give relief from toothache, but it should not be used without expert guidance[7]. The plant is used in Bach flower remedies - the keywords for prescribing it are 'Intolerance', 'Criticism' and 'Passing judgements'[209].

propta Seed - the seed has a short viability and is best sown as soon as it is ripe in the autumn in a cold frame. Protect the seed from mice. Germination takes place in the spring. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. The seedlings are slow growing for the first few years and are very susceptible to damage by late frosts. The seed can also be sown in an outdoor seedbed in the autumn[186]. The seedlings can be left in the open ground for three years before transplanting, but do best if put into their final positions as soon as possible and given some protection from spring frosts.

nwatta Landscape Uses:Firewood, Pest tolerant, Hedge, Aggressive surface roots possible, Screen, Specimen. Thrives on a light or medium soil, doing well on chalk, but ill-adapted for a heavy wet soil[1, 11]. Prefers a calcareous soil but succeeds in acid soils though it does not make such a fine tree in such a situation[186]. Succeeds in almost any soil and any pH, it is also very tolerant of a wide range of climatic conditions so long as there is sufficient rainfall[200]. Established trees are drought tolerant[186]. Very wind tolerant but dislikes salt[200]. Trees are shallow rooted and this might make them less wind resistant[186]. Trees have two growth periods a year, each of about 3 weeks in duration. The first is in spring around the end of April, the second is in summer, around the end of July. Trees are often slow growing and also can be very slow to establish after transplanting. However, in good conditions they are capable of growing up to a metre in a year. Young trees are very shade tolerant, but are subject to frost damage to their flowers and young leaves and so are best grown in a woodland position which will protect them[200]. An important food plant for many caterpillars, it has 64 species of associated insects[24].

Trees have a heavy canopy and cast a dense shade, very few other species can grow in a dense beech wood and on suitable soils it becomes the dominant species[186]. Very intolerant of coppicing, trees producing none or only very weak growth afterwards and this is soon smothered by other plants[186]. Plants are very tolerant of light pruning however and if this is carried out in late summer the plants will retain their dead leaves over winter[29]. There are many named forms selected for their ornamental value. Those forms with purple leaves prefer a position in full sun whilst forms with yellow leaves prefer some shade[188]. This species is notably resistant to honey fungus[200]. Special Features: Not North American native, All or parts of this plant are poisonous, Inconspicuous flowers or blooms. The plant is heat tolerant in zones 9 through 4. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The

Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. A sprouting standard sending up shoots from the base [1-2]. The root pattern is suckering with new plants from underground runners away from the plant [1-2].

## 5.2.106 Balsamorhiza deltoidea

Deltoid Balsamroot

4 tlin 8 cyuc 4 kcaak 0 tcan 1 dwat 0.6 m hkuc  
htut cyutli kyuctup hwicli hrasjlut hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta *Balsamorhiza deltoidea* is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Leaves Root Seed ShootsEdible Uses: CoffeeRoot - raw or cooked[22, 46, 61, 105, 106]. A sweet taste when cooked[161]. Young shoots - raw[46, 105, 161]. Seed - raw or cooked. It can be ground into a powder and made into a bread[46, 105, 161]. The ground seeds can be formed into cakes and eaten raw[257]. The roasted root is a coffee substitute[177].

tcanta MiscellanyNone known

dwatta MiscellanyA decoction of the split roots has been used in the treatment of coughs and colds[257].

propta Seed - sow early spring in a greenhouse and only just cover the seed. Germination usually takes place within 2 - 6 days at 18°C. Either sow the seed in individual pots or put up the seedlings as soon as they are large enough to handle and plant them out into their permanent positions in the summer[134]. Division in spring. Very difficult since the plant strongly resents root disturbance[134]. It is probably best to take quite small divisions, or basal cuttings, without disturbing the main clump. Pot these up into individual pots and keep them in light shade in the greenhouse until they are growing away well. Plant them out in the summer if they have grown sufficiently, otherwise over-winter them in the greenhouse and plant out in late spring.

nwatta Requires a deep fertile well-drained loam in full sun[134, 200]. Plants strongly resent winter wet[134, 200]. Hardy to at least -25°C[200]. Plants are intolerant of root disturbance and should be planted into their permanent positions whilst still small[134].

## 5.2.107 Crataegus mollis

Red Haw, Downy hawthorn

4 tlin 8 cyuc 4 kcaak 2 tcan 2 dwat m hkuc  
hmimhtut cyutli hgattcuphja7n hwicli hrasjlutnyikfripr hpa7tli flatprikwisliip hpa7tmwatli xre7t hjonli

drutta *Crataegus mollis* is a deciduous Tree growing to 9 m (29ft) by 12 m (39ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from May to June, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Midges. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: TeaFruit - raw or cooked[22, 46, 62, 101, 183]. Sub-acid, dry and mealy[82, 227]. The fruit is also used for making jellies and preserves[61, 95, 183]. Fairly large, it is about 20 - 25mm in

grow away[81].

**nwatta** Management: Standard Minor Global Crop Other Systems: Irreg. Intercrop Staple Crop: Protein-oilThrives in a light well-drained sandy or gravelly loam[1, 11]. Dislikes poorly drained moorland soils[1]. Established plants tolerate drought[200]. This species prefers a cool moist climate[81]. Leaf secretions inhibit the germination of seeds, thereby inhibiting the growth of other plants below the tree[18]. This species is sometimes cultivated for its edible seed, there are some named varieties[183]. It is one of the main species utilized for its edible seeds[200], being gathered from cultivated and wild trees. Large quantities of the seeds are exported as a food crop from N. China[183]. Plants bear cones when they are 3.5 metres tall in Cornwall[59]. Trees are slow growing when young[11, 81]. Growth in the south-east of Britain is generally poor but trees in the west and north are healthy and growing well with average annual height increases of around 25cm and girth increases of 3cm or more[185]. Plants are strongly outbreeding, self-fertilized seed usually grows poorly[200]. They hybridize freely with other members of this genus[200]. The cones do not open, seed is extracted by breaking up the soft scales of the cone[200]. Plants in this genus are notably susceptible to honey fungus[200]. The plant is heat tolerant in zones 7 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2]. An evergreen. The root pattern is flat with shallow roots forming a plate near the soil surface [1-2]. The root pattern is a tap root similar to a carrot going directly down [1-2].

## 5.2.104 Beta vulgaris cicla

Spinach Beet

4 tlin 8 cyuc 4 kcaak 0 tcan 2 dwat 0.9 m hkuc htuc cyutli tcup hwicli hrasjutnyik hpa7tli flatprikllwissliph-som hpa7tmwatli xre7t hjonli

drutta Beta vulgaris cicla is a BIENNIAL growing to 0.9 m (3ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline and saline soils. It cannot grow in the shade. It prefers moist soil.

**kcaakta** Edible Parts: Leaves StemEdible Uses: Leaves and leaf stems - raw or cooked like spinach[2, 16, 27, 33]. A very good spinach substitute, the leaves are large and easily harvested, yields are high[K]. Some people dislike the raw leaves since they can leave an unpleasant taste in the mouth[K]. Flowering stem - cooked. A broccoli substitute[K].

**tcanta** None known

**dwatta** Although little used in modern herbalism, beet has a long history of folk use, especially in the treatment of tumours[269]. A decoction prepared from the seed has been used as a remedy for tumours of the intestines. The seed, boiled in water, is said to cure genital tumours[269]. The juice or other parts of the plant is said to help in the treatment of tumours, leukaemia and other forms of cancer such as cancer of the breast, oesophagus, glands, head, intestines, leg, lip, lung, prostate, rectum, spleen, stomach, and uterus[269]. Some figure that betacyanin and anthocyanin are important in the exchange of substances of cancer cells; others note two main components of the amines, choline and its oxidation product betaine, whose absence produces tumours in mice[269]. The juice has been applied to ulcers[269]. A decoction is used as a purgative by those who suffer from haemorrhoids in South Africa[269]. Leaves

and roots used as an emmenagogue[269]. Plant effective in the treatment of feline ascariasis[269]. In the old days, beet juice was recommended as a remedy for anaemia and yellow jaundice, and, put into the nostrils to purge the head, clear ringing ears, and alleviate toothache[269]. Beet juice in vinegar was said to rid the scalp of dandruff as scurf, and was recommended to prevent falling hair[269]. Juice of the white beet was said to clear obstructions of the liver and spleen[269]. Culpepper (1653) recommended it for treating headache and vertigo as well as all affections of the brain[269].

**propta** Seed - sow in situ in early April for the summer crop and again in early July to August for the winter and spring crop. It is also possible to obtain an earlier crop by sowing the seed in a tray in a greenhouse in March and planting out in April/May[264].

**nwatta** A very easily grown plant, it succeeds in sun or light shade in moist soils but prefers a rich well-drained light neutral to alkaline soil[33, 37]. Beets grow well in a variety of soils, growing best in a deep, friable well-drained soil abundant with organic matter, but doing poorly on clay. They prefer an open position and a light well-drained soil[52]. The optimum pH is 6.0 - 6.8, but neutral and alkaline soils are tolerated in some areas. Some salinity may be tolerated after the seedling stage. Beets are notable for their tolerance to manganese toxicity[269]. Beet is reported to tolerate an annual precipitation of 23 to 315cm, an average annual temperature range of 5.0 to 26.6°C and a pH of 4.2 to 8.2[269]. Plants are tolerant of saline soils and respond positively if salt is added to non-saline soils at a rate of about 30g per square metre[264]. Spinach beet is often cultivated by gardeners for its edible leaves[16], it does not make a very good commercial crop since the leaves quickly droop after being harvested and so do not stand the journey to market. This plant is a good hot weather substitute for spinach[183]. The leaves are available all year round from successional sowings if the winters are not too severe[K]. In severe winters it is possible to dig up some plants and move them to a protected area such as a greenhouse in order to produce fresh leaves[1]. Plants usually self-sow freely if they are well-sited and the ground is disturbed by hoeing etc[K]. A good companion for dwarf beans, onions and kohlrabi[18], though the growth of spinach beet is inhibited by runner beans, charlock and field mustard[18].

## 5.2.105 Fagus sylvatica

Beech, European beech, Common Beech

4 tlin 7 cyuc 4 kcaak 2 tcan 2 dwat 30 m hkuc pcmhmmhtuc cyutli kyuctcup hwicli hrasjutnyik hpa7tli frusflatprikllwissliph hpa7tmwatli hjonli

drutta Fagus sylvatica is a deciduous Tree growing to 30 m (98ft) by 15 m (49ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from April to May, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and very alkaline soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

**kcaakta** Edible Parts: Leaves Oil SeedEdible Uses: Coffee OilYoung leaves - raw[183]. A very nice mild flavour, they go well in a mixed salad. However, the leaves quickly become tough so only the youngest should be used[2, 5, 12, K]. New growth is usually produced for 2 periods of 3 weeks each year, one in spring and one in mid-summer. Seed - raw or cooked[2, 5, 7, 63, 183]. A pleasant sweet flavour, though rather small and fiddly[K]. The seed can also be dried and ground into a powder and then used with cereal flours when making bread, cakes etc[12]. The seed is rich in oil. The seed should not be eaten in large quantities because it contains a deleterious principle[65, 238]. The seed contains 17 - 20% of an edible semi-drying oil[4, 7, 8, 57]. This stores well without going rancid and is said to be equal in delicacy to olive oil[183]. It is used as a dressing for salads and also for cook-

Jerusalem artichokes can be grown as a temporary summer screen[200]. Very temporary, it is July before they reach a reasonable height and by October they are dying down[K].

**dwatta** Aperient Cholagogue Diuretic Stomachic TonicReported to be aperient, aphrodisiac, cholagogue, diuretic, spermatogenetic, stomachic, and tonic, Jerusalem artichoke is a folk remedy for diabetes and rheumatism[269].

**propta** Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring or autumn[200]. Harvest the tubers in late autumn or the winter and either replant the tubers immediately or store them in a cool but frost-free place and plant them out in early spring. Jerusalem artichoke is propagated by tubers, which should be planted as early as possible in the spring when the soil can be satisfactorily worked[269]. Late planting usually reduces tuber yields and size seriously. Whole tubers or pieces about 50 g (2 oz.) should be planted like potatoes and covered to a depth of 10 cm. Pieces larger than 50 g do not increase the yield, though those smaller will decrease it. Deeper planting may delay emergence, weaken the sprouts, and cause the tubers to develop deeper, making harvest more difficult[269]. Basal cuttings in spring. Harvest the shoots when they are about 10 - 15cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

**nwatta** Management: Standard Staple Crop: Protein-oilA very easily grown plant, it grows best in a loose circumneutral loam but succeeds in most soils and conditions in a sunny position[1, 16, 37, 38, 269]. Plants are more productive when grown in a rich soil[1, 37, 38]. Heavy soils produce the highest yields, but the tubers are easily damaged at harvest-time so lighter well-drained sandy loams are more suitable[200]. Dislikes shade[1]. Likes some lime in the soil[16]. Jerusalem artichoke is reported to tolerate an annual precipitation of 31 to 282cm, an average annual temperature of 6.3 to 26.6°C and a pH in the range of 4.5 to 8.2[269]. Jerusalem artichokes were cultivated as a food plant by the N. American Indians and they are today often grown in temperate areas for their edible tubers. There are some named varieties[4, 46, 183, 200]. The plant is a suitable crop in any soil and climate where corn (Zea mays) will grow. It survives in poor soil and in areas as cold as Alaska. It also tolerates hot to sub-zero temperatures[269]. The first frost kills the stems and leaves, but the tubers can withstand freezing for months[269]. The plants are particularly suited to dry regions and poor soils where they will out-yield potatoes[200]. Tuber production occurs in response to decreasing day-length in late summer[200]. Yields range from 1 - 2kg per square metre[200]. The tubers are very cold-tolerant and can be safely left in the ground in the winter to be harvested as required. They can be attacked by slugs, however, and in sites prone to slug damage it is probably best to harvest the tubers in late autumn and store them over the winter. It is almost impossible to find all the tubers at harvest time, any left in the soil will grow away vigorously in the spring. Plants do not flower in northern Europe. They are sensitive to day-length hours, requiring longer periods of light from seedling to maturation of plant, and shorter periods for tuber formation. They do not grow where day-lengths vary little[269]. The plant is good weed eradicator, it makes so dense a shade that few other plants can compete[269]. The young growth is extremely attractive to slugs, plants can be totally destroyed by them[K]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. Plants only produce flowers in Britain after a long hot summer[17] and seed is rarely formed[200]. Grows well with corn[20]. Plants can be invasive[1]. The plant is heat tolerant in zones 9 through 7. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown

above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2]. The root pattern is tuberous with swollen potato-like roots [1-2].

## 5.2.91 Aralia nudicaulis

Wild Sarsaparilla

4 tlin 8 cyuc 4 kcaak 3 tcan 3 dwat 0.4 m hkuc pcmhmm cyutli tcup hwicli hyishrasjutnyik hpa7tli flat-prikllwis hpa7tmwatli xre7t hjonli

drutta Aralia nudicaulis is a PERENNIAL growing to 0.4 m (1ft 4in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower in June, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

**kcaakta** Edible Parts: Fruit Leaves Root ShootsEdible Uses: Condiment TeaThe rootstock is used as a flavouring[102], it is a substitute for sarsaparilla[43] and is also used for making 'root beer'[183]. It is also used as an emergency food[177] (usually mixed with oil[257]), having a sweet spicy taste and a pleasant aromatic smell[4]. A nutritious food[207], it was used by the Indians during wars or when they were hunting since it is very sustaining[213]. Young shoots - cooked as a potherb[207]. A refreshing herbal tea is made from the root[183]. Pleasantly flavoured[222, 238]. The roots are boiled in water until the water is reddish-brown[256]. A jelly is made from the fruit[207]. The fruit is also used to make wine[257]. The fruit is about 6mm in diameter[200]. The fruit is a round, purplish-black berry.

**tcanta** Groundcover. Wildlife - food source. A specialist nectary plant [1-2].

**dwatta** Alterative Diaphoretic Diuretic Eczema Homeopathy Pectoral StimulantWild sarsaparilla is a sweet pungent tonic herb that acts as an alterative. It had a wide range of traditional uses amongst the North American Indians and was at one time widely used as a substitute for the tropical medicinal herb sarsaparilla[222, 257]. The root is alterative, diaphoretic, diuretic, pectoral and stimulant[4, 21, 213, 222]. The herb encourages sweating, is stimulating and detoxifying and so is used internally in the treatment of pulmonary diseases, asthma, rheumatism, stomach aches etc[4, 213, 238, 254, 257]. Externally it is used as a poultice in treating rheumatism, sores, burns, itchy skin, ulcers and skin problems such as eczema[4, 222, 254]. The root is collected in late summer and the autumn and dried for later use[4, 213]. A drink made from the pulverised roots is used as a cough treatment[213]. A poultice made from the roots and/or the fruit is applied to sores, burns, itchy skin, ulcers, swellings etc[213, 222]. A homeopathic remedy made from the roots is important in the treatment of cystitis[238].

**propta** Seed - best sown as soon as ripe in a cold frame. Stored seed requires 3 - 5 months of cold stratification. Germination usually takes place within 1 - 4 months at 20°C[134]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in a greenhouse for at least their first winter. Once the plants are 25cm or more tall, they can be planted out into their permanent positions, late spring or early summer being the best time to do this. Root cuttings 8cm long, December in a cold frame[11, 78]. Store the roots upside down in sand and pot up in March/April. High percentage[78]. Division of suckers in late winter[11]. Very easy, the suckers can be planted out direct into their permanent positions if required.

**nwatta** Prefers a good deep loam and a semi-shady position[1, 134]. Requires a sheltered position[1]. Plants are hardier when grown in poorer soils[200]. The young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2]. The

root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

### 5.2.92 Sorbus latifolia

French Hales

4 tlin 8 cyuc 4 kcak 0 tcan 0 dwat 14 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Sorbus latifolia is a deciduous Tree growing to 14 m (46ft) by 10 m (32ft) at a medium rate. See above for USDA hardness. It is hardy to UK zone 5 and is not frost tender. It is in flower in May, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects, Apomictic (re-produce by seeds formed without sexual fusion). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[183]. The fruit is usually blotted if it is going to be eaten raw[K]. This involves storing the fruit in a cool dry place until it is almost but not quite going rotten. At this stage the fruit has a delicious taste, somewhat like a luscious tropical fruit. The fruit is up to 1.5cm across[200] and is borne in bunches which makes harvesting easier[K].

tcanta None known

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame[78, 80]. If you have sufficient seed it can be sown in an outdoor seedbed[78, 80]. Stored seed germinates better if given 2 weeks warm then 14 - 16 weeks cold stratification[98], so sow it as early in the year as possible. Prick out the seedlings into individual pots when they are large enough to handle. Seedlings are very slow to put on top-growth for their first year or two[11], but they are busy building up a good root system. It is best to keep them in pots in a cold frame for their first winter and then plant them out into their permanent positions in late spring.

nwatta Succeeds in most reasonably good soils in an open sunny position[11]. Tolerates light shade[188], though it fruits better in a sunny position[K]. Plants are susceptible to fireblight[188]. Probably of hybrid origin with *S. torminalis* as one parent and *S. aria* or a species from that complex as the other parent[11]. The trees usually have apomictic flowers. They thus produce seed asexually, each seedling being a clone of the parent[11].

### 5.2.93 Akebia quinata

Akebia, Chocolate vine, Fiveleaf Akebia, Chocolate Vine

4 tlin 8 cyuc 4 kcak 3 tcan 2 dwat 12 m hkuc pcmhmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flat-priklwis hpa7tmwatli dyat hjonli

drutta Akebia quinata is a deciduous Climber growing to 12 m (39ft 4in) at a fast rate. See above for USDA hardness. It is hardy to UK zone 5 and is not frost tender. It is in flower from April to May, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Fruit LeavesEdible Uses: TeaFruit - raw[2, 105, 177]. Sweet but insipid[3]. The fruit has a delicate flavour and a soft, juicy texture[K]. Lemon juice is sometimes added to the fruit to enhance the flavour[183]. The bitter skin of the fruit is fried and eaten[183]. The fruit is 5 - 10cm long and up to 4m wide[200, 266]. Soft young shoots are used in salads or pickled[183]. The leaves are used as a tea substitute[105, 177, 183].

tcanta BasketryThe peeled stems are very pliable and can be used in basket making[174]. Plants have sometimes been used as a ground cover, but their method of growth

does not really lend themselves to this use[208]. Scented. Landscape Uses: Arbor.

dwatta Anodyne Antiphlogistic Bitter Cancer Contra-receptive Depurative Diaphoretic Diuretic Emmenagogue Febrifuge Galactogogue Laxative Resolvent Stimulant Stomachic Urinary VulneraryThe stems are anodyne, antifungal, antiphlogistic, bitter, diaphoretic, diuretic, emmenagogue, febrifuge, laxative, galactogogue, resolvent, stimulant, stomachic and vulnerary[174, 178, 218, 238]. Taken internally, it controls bacterial and fungal infections and is used in the treatment of urinary tract infections, lack of menstruation, to improve lactation etc[238]. The stems are harvested in the autumn and dried for later use[238]. The fruit is anti-rheumatic, depurative, diuretic, febrifuge, stomachic and tonic[218]. It is a popular remedy for cancer[218]. The root is febrifuge[218]. The plant was ranked 13th in a survey of 250 potential antifertility plants in China[218].

propta Seed - best sown in a cold frame as soon as it is ripe. Surface sow in a light position[133]. The seed usually germinates in 1 - 3 months at 15°C[133]. Stored seed should be given 1 month cold stratification[113, 133] and can be very difficult to germinate. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least their first winter. Plant out in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame[11, 113]. The cuttings can be slow to root[200]. Cuttings can also be taken of soft wood in spring[113]. Root cuttings, December in a warm greenhouse[113]. Layering in early spring[1]. Very easy, the plants usually self-layer and so all you need to do is dig up the new plants and plant them out directly into their permanent positions.

nwatta Requires a well-drained moisture retentive soil[200]. Prefers a good loamy soil[11]. Succeeds in acid or alkaline soils[200]. Prefers partial shade but succeeds in full sun[3, 200]. Succeeds on north facing walls[219]. Plants are fast growing and can be invasive[200]. Dormant plants are hardy to about -20°C but they can be somewhat tender when young[200]. The young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. This species grows very well in S.W England[11]. Plants are evergreen in mild winters[11]. Resentful of root disturbance, either grow the plants in containers prior to planting them out or plant them out whilst very young[219]. Plants are not normally pruned, if they are growing too large they can be cut back by trimming them with shears in early spring[202]. The flowers have a spicy fragrance, reminiscent of vanilla[219]. Plants are shy to fruit, they possibly require some protection in the flowering season, hand pollination is advisable[3, 11]. Plants are probably self-sterile[11, 182], if possible at least 2 plants should be grown, each from a different source. Plants in this genus are notably resistant to honey fungus[200]. Special Features: Not North American native, Fragrant flowers, Attractive flowers or blooms. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out. The root pattern is suckering with new plants from underground runners away from the plant [2-1].

### 5.2.94 Linum usitatissimum

Flax, Common flax

4 tlin 8 cyuc 4 kcak 4 tcan 3 dwat 0.7 m hkuc htut cyutli tcup hwicli hrasljut hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Linum usitatissimum is a ANNUAL growing to 0.7 m (2ft 4in) by 0.2 m (0ft 8in). See above for USDA hardness. It is hardy to UK zone 4 and is not frost tender. It is in flower from June to July, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure.

edible leaves, though it has now fallen out of favour to be replaced by less strong-tasting plants[2, 200, K]. This is a pity because it is a very productive and useful vegetable and can produce its leaves all through the winter if the weather is not too severe[K]. A very important plant for the caterpillars of many species of butterflies[30].

## 5.2.102 Smilax herbacea

Carrion Flower, Smooth carrionflower

4 tlin 8 cyuc 4 kcak 2 tcan 1 dwat 2.5 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Smilax herbacea is a PERENNIAL CLIMBER growing to 2.5 m (8ft 2in). See above for USDA hardness. It is hardy to UK zone 4. It is in flower from May to June. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). . The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Fruit Leaves RootEdible Uses: GelatineLeaves and young shoots - raw or cooked and used like asparagus[85, 102, 159]. A delicate and palatable vegetable[183]. Fruit - raw or cooked and used in jellies etc[85, 183]. It should only be used when fully ripe[183]. A pleasant flavour[207, 257]. The fruit is about 10mm in diameter[200]. Root - cooked[257]. It can be dried, ground into a powder and then used with cereals for making bread etc[62, 102]. It can also be used as a gelatine substitute[62, 102].

tcanta None known

dwatta Analgesic Antiaphonic Kidney Pectoral Poultice SalveEating the fruit is said to be effective in treating hoarseness[207, 257]. The parched and powdered leaves have been used as a dressing on burns[257]. The wilted leaves have been used as a dressing on boils[257]. The root is analgesic[257]. A decoction has been used in the treatment of back pains, stomach complaints, lung disorders and kidney problems[257].

propta Seed - sow March in a warm greenhouse[1]. This note probably refers to the tropical members of the genus, seeds of plants from cooler areas seem to require a period of cold stratification, some species taking 2 or more years to germinate[K]. We sow the seed of temperate species in a cold frame as soon as we receive it, and would sow the seed as soon as it is ripe if we could obtain it then[K]. When the seedlings eventually germinate, prick them out into individual pots when they are large enough to handle and grow them on in the greenhouse for at least their first year, though we normally grow them on in pots for 2 years. Plant them out into their permanent positions in early summer. Division in early spring as new growth begins[238]. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them out in a lightly shaded position in a cold frame, planting them out once they are well established in the summer. Cuttings of half-ripe shoots, July in a frame[238].

nwatta Succeeds in moist soils in sun or semi-shade[200]. Hardy to about -20°C[200]. A polymorphic species, varying in both leaf shape and growth habit[43, 270]. The flowers are malodorous[200], they smell like dead rats[207]. A vigorous plant, it can be grown through trees or shrubs or over tree stumps[200]. The sub-species *S. herbacea nipponicum* is used in Japan[61]. This report probably refers to the species *S. nipponica*[K]. Dioecious. Male and female plants must be grown if seed is required. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. Growth habit is a single or multiple shooting vine from a crown [1-2]. Herba-ceous.

### 5.2.103 Pinus koraiensis

Korean Nut Pine, Chinese pinenut

4 tlin 7 cyuc 4 kcak 3 tcan 2 dwat 20 m hkuc

htut cyutli hgatkyuctcup hwicli hyhisrasljut hpa7tli flatprik hpa7tmwatli dyat hjonli

drutta Pinus koraiensis is an evergreen Tree growing to 20 m (65ft 7in) at a medium rate. See above for USDA hardness. It is hardy to UK zone 3. It is in leaf all year, in flower in May, and the seeds ripen in September. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Oil SeedEdible Uses: Condi-ment OilSeed - raw or cooked. Rich in oil[2, 11, 46, 63, 74, 81]. A soft texture with a hint of resin in the flavour, it makes a delicious snack and can also be used as a staple food[K]. The seed can also be dried and ground into a powder then used as a flavouring and thickener in soups etc[183]. Fairly large, the seeds are up to16mm x 12mm[200]. A vanillaflavouring is obtained as a by-product of other resins that are released from the pulpwood[200].

tcanta Dye Herbicide Oil Resin Tannin WoodA tan or green dye is obtained from the needles[168]. The seeds are a source of soap and lubricating oil[266]. Tannin is obtained from the bark[266]. The needles contain a substance called terpene, this is released when rain washes over the needles and it has a negative effect on the germination of some plants, including wheat[201]. Yields turpentine and tar[74]. Oleo-resins are present in the tissues of all species of pines, but these are often not present in sufficient quantity to make their extraction economically worthwhile[64]. The resins are obtained by tapping the trunk, or by destructive distillation of the wood[4, 64]. In general, trees from warmer areas of distribution give the higher yields[64]. Turpentine consists of an average of 20% of the oleo-resin[64] and is separated by distillation[4, 64]. Turpentine has a wide range of uses including as a solvent for waxes etc. for making varnish, medicinal etc[4]. Rosin is the substance left after turpentine is removed. This is used by violinists on their bows and also in making sealing wax, varnish etc[4]. Pitch can also be obtained from the resin and is used for waterproofing, as a wood preservative etc. Wood. Used for construction and carpentry[74, 81]. The timber is used for construction, bridge building, vehicles, furniture, and wood pulp[266].

dwatta Analgesic Antibacterial Antiinflammatory Galac-togogue PoulticeThe seed contains several medically active compounds and is analgesic, antibacterial and antiinflamma-tory[279]. It is used in Korea in the treatment of earache, epistaxis and to promote milk flow in nursing mothers[279]. The turpentine obtained from the resin of all pine trees is antiseptic, diuretic, rubefacient and vermifuge[4]. It is a valu-able remedy used internally in the treatment of kidney and bladder complaints and is used both internally and as a rub and steam bath in the treatment of rheumatic affections[4]. It is also very beneficial to the respiratory system and so is useful in treating diseases of the mucous membranes and respi-ratory complaints such as coughs, colds, influenza and TB[4]. Externally it is a very beneficial treatment for a variety of skin complaints, wounds, sores, burns, boils etc and is used in the form of liniment plasters, poultices, herbal steam baths and inhalers[4]. The stem bark is used in the treatment of burns and skin ailments[218].

propta It is best to sow the seed in individual pots in a cold frame as soon as it is ripe if this is possible otherwise in late winter. A short stratification of 6 weeks at 4°C can improve the germination of stored seed[80]. Plant seedlings out into their permanent positions as soon as possible and protect them for their first winter or two[11]. Plants have a very sparse root system and the sooner they are planted into their permanent positions the better they will grow[K]. Trees should be planted into their permanent positions when they are quite small, between 30 and 90cm[200]. We actually plant them out when they are about 5 - 10cm tall. So long as they are given a very good weed-excluding mulch they estab-lish very well[K]. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200]. Cuttings. This method only works when taken from very young trees less than 10 years old. Use single leaf fascicles with the base of the short shoot. Disbudding the shoots some weeks before taking the cuttings can help. Cuttings are normally slow to

this is often extracted and used as a sweetener[142]. This plant is a major source of sugar in many temperate areas. The root can also be used as a vegetable. When cooked it is quite tender, but with some fibrous strands. It has a very sweet flavour that some people find too sweet[K]. The raw root is rather tough, but makes a pleasant addition to salads when grated finely[K]. Leaves - raw or cooked. A very acceptable spinach substitute[K]. Some people dislike the raw leaves since they can leave an unpleasant taste in the mouth[K].

tcanta BiomassSugar beet has excellent potential as a biomass crop, both as a source of sugar and also using the plant residue for fuel[269].

dwatta Antitumor EmmenagogueAlthough little used in modern herbalism, beet has a long history of folk use, especially in the treatment of tumours[269]. A decoction prepared from the seed has been used as a remedy for tumours of the intestines. The seed, boiled in water, is said to cure genital tumours[269]. The juice or other parts of the plant is said to help in the treatment of tumours, leukaemia and other forms of cancer such as cancer of the breast, oesophagus, glands, head, intestines, leg, lip, lung, prostate, rectum, spleen, stomach, and uterus[269]. Some figure that betacyanin and anthocyanin are important in the exchange of substances of cancer cells; others note two main components of the amines, choline and its oxidation product betaine, whose absence produces tumours in mice[269]. The juice has been applied to ulcers[269]. A decoction is used as a purgative by those who suffer from haemorrhoids in South Africa[269]. Leaves and roots used as an emmenagogue[269]. Plant effective in the treatment of feline ascariasis[269]. In the old days, beet juice was recommended as a remedy for anaemia and yellow jaundice, and, put into the nostrils to purge the head, clear ringing ears, and alleviate toothache[269]. Beet juice in vinegar was said to rid the scalp of dandruff as scurf, and was recommended to prevent falling hair[269]. Juice of the white beet was said to clear obstructions of the liver and spleen[269]. Culpepper (1653) recommended it for treating headache and vertigo as well as all affections of the brain[269].

propta Seed - sow April in situ.

nwatta Beets grow well in a variety of soils, growing best in a deep, friable well-drained soil abundant with organic matter, but doing poorly on clay. They prefer an open position and a light well-drained soil[52]. The optimum pH is 6.0 - 6.8, but neutral and alkaline soils are tolerated in some areas. Some salinity may be tolerated after the seedling stage. Beets are notable for their tolerance to manganese toxicity. Beet is reported to tolerate an annual precipitation of 23 to 315cm, an average annual temperature range of 5.0 to 26.6°C and a pH of 4.2 to 8.2[269]. Sugar beet is widely cultivated as a commercial sugar crop in temperate climates. About one third of all sugar production in the world is derived from this plant[269]. It is not usually grown on a garden scale. There are several named varieties[46].

## 5.2.100 Hemerocallis exaltata

4 tlin 8 cyuc 4 kcaak 0 tcan 1 dwat 1 m hkuc hmimhtut cyutli kyuctup hwicli hrasljutnyikfrrip hpa7tli flatprklwis hpa7tmwatli xre7t hjonli

drutta Hemerocallis exaltata is a PERENNIAL growing to 1 m (3ft 3in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from June to July. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcaakta Edible Parts: Flowers LeavesEdible Uses: Leaves and young shoots - cooked[116, 205]. They must be consumed when very young or else they become fibrous[K]. Flowers and flower buds - raw or cooked[105, 177]. They can be dried and used as a thickener in soups etc. The flower buds contain about 43mg vitamin C per 100g, 983 IU vitamin A and 3.1% protein[205].

tcanta WeavingThe tough dried foliage is plaited into cord and used for making footwear[205].

dwatta Antidote Diuretic Vitamin CThe juice of the roots is an effective antidote in cases of arsenic poisoning[205]. A

tea made from the boiled roots is used as a diuretic[205].

propta Seed - sow in the middle of spring in a greenhouse. Germination is usually fairly rapid and good. Prick out the seedlings into individual pots when they are large enough to handle. Grow the plants on for their first winter in a greenhouse and plant out in late spring[K]. Division in spring or after flowering in late summer or autumn[200]. Division is very quick and easy, succeeding at almost any time of the year[K]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Succeeds in most soils[1], including dry ones, preferring a rich moist soil[200, 205]. Grows well in heavy clay soils. Succeeding in sun or shade, it produces more flowers in a sunny position though these flowers can be shorter-lived in very sunny positions[205]. Succeeds in short grass if the soil is moist[1]. Prefers a pH between 6 and 7[200]. This species is hardy to about -15°C[187]. Hybridizes freely with other members of this genus[200]. Some roots are short and enlarged, others long with spindle-shaped tuberous ends. The plant forms a compact clump[233], but it also produces rhizomes that tend to spread[205]. Individual flowers are very short-lived, they open in the morning and wither in the evening[205]. Plants take a year or two to become established after being moved[200]. Plants seem to be immune to the predations of rabbits[233]. The plants are very susceptible to slug and snail damage, the young growth in spring is especially at risk[200].

## 5.2.101 Rumex alpinus

Alpine Dock, Munk's rhubarb  
4 tlin 8 cyuc 4 kcaak 1 tcan 2 dwat 1.2 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprklwis hpa7tmwatli xre7t hjonli

drutta Rumex alpinus is a PERENNIAL growing to 1.2 m (4ft) by 0.3 m (1ft in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in July, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked[1, 2, 5, 21, 22, 46, 183]. They can also be dried for later use[12]. A strong flavour, the leaves can be used in salads in late autumn to the spring, but are better cooked like spinach[K]. The fresh leaves can be available for most months of the year, only dying down for a short period in severe winters[K]. The leaves often become bitter in the summer[K]. In taste trials, this has proved to be a very popular autumn and spring cooked leaf, making an excellent spinach[K].

tcanta DyeDark green to brown and dark grey dyes can be obtained from the roots, they do not need a mordant[168].

dwatta Astringent LaxativeThe root is astringent and laxative[4, 9]. It has a regulatory effect on the digestive system, similar to but weaker than rhubarb (Rheum raphaniticum)[4]. It can act either as a laxative or a cure for diarrhoea according to dosage[4]. The root is harvested in early spring and dried for later use[4].

propta Seed - sow spring in a cold frame. The seed can also be sown as soon as it is ripe when it will germinate rapidly and will provide edible leaves from early spring the following year. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring. Division is easy at almost any time of the year, though the plants establish more rapidly in the spring[K]. Use a sharp spade or knife to divide the rootstock, ensuring that there is at least one growth bud on each section of root. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta A very easily grown and tolerant plant[K], it succeeds in most soils, preferring a moist moderately fertile well-drained soil in a sunny position[200]. Hardy to about -20°C[187]. Alpine dock was at one time cultivated for its

kcaakta Edible Parts: Oil Oil SeedEdible Uses: Coffee Gum Oil OilSeed - raw or cooked[61]. The seed contains 30 - 40% oil, which comprises mainly linoleic and linolenic acids[238]. The seed also contains cyanogenic glycosides (prussic acid). In small quantities these glycosides stimulate respiration and improve digestion, but in excess can cause respiratory failure and death[238]. Cultivars low in these glycosides have been developed and large quantities of the seed would need to be eaten to achieve a harmful dose. The seed is used in breads and cereals, it can also be sprouted and used in salads[183]. The seed is hard to digest and provokes flatulence[4]. A nutritional analysis is available[218]. The roasted seed is said to be a coffee substitute[183]. A herbal tea can be brewed from the seed[183]. An edible oil is obtained from the seed[183, 269], though it needs to be properly refined before it can be eaten. Some caution is advised in the use of the seeds for food since some varieties of this plant contain toxins.

tcanta Biomass Fibre Gum Insulation Oil Oil SizeA fibre is obtained from the stem[6, 7, 13, 57, 89]. It is of very high quality and is used in making cloth, sails, nets, paper, insulating material etc.The best quality flax fibre is used for making cloth. It is soft, lustrous and flexible, although not so flexible or elastic as cotton or wool[269]. It is stronger than cotton, rayon or wool, but weaker than ramie[269]. Lower quality fibre is used in manufacturing of towelling, matting, rugs, twines, canvas, bags, and for quality papers such as printing currency notes[269]. The plant is harvested just after it flowers[115]. The yield is 0.5 to 0.9 tonnes of fibre per hectare. When used for paper making, the stems are harvested in late summer or autumn when they are two thirds yellow and are then retted[189]. The fibre is then stripped from the stem, cooked for two hours or more with lye and then beaten in a Hollander beater[189]. The lower quality flax straw from seed flax varieties is used in the manufacture of upholstery tow, insulating material, rugs, twine, and paper. Some of the better quality straw is used in the manufacture of cigarette and other high-grade papers[269]. The seed contains 38 - 40% of a drying oil[141]. It has a very wide range of applications. The paint and varnish industries consume about 80% of all the linseed oil produced. The remainder is used in items such as furniture polish, enamels, linoleum, oilcloth, printer's inks, soap making and patent leather[46, 57, 169, 244, 269]. It is also used as a wood preservative and as a waterproofing for raincoats, slickers, and tarpaulins[269]. The oil is also used in a spray on concrete roads to prevent ice and snow from sticking - it has the additional benefit of helping to preserve the concrete and prevent surface cracking and wear[269]. Yields of over 4 tonnes of seed per hectare have been recorded in N. America, but yields of 2 tonnes or less are more common[269]. A mulcigen from the soaked or boiled seeds is used as a size for linen warps[169].

dwatta Analgesic Cancer Cardiotoxic Demulcent Emollient Expectorant Laxative Nerve Pectoral Resolvent Urinary VDLinseed has a long history of medicinal use, its main effects being as a laxative and expectorant that soothes irritated tissues, controls coughing and relieves pain[238]. The seed, or the oil from the seed are normally used[238]. The seed is analgesic, demulcent, emollient, laxative, pectoral and resolvent[4, 9, 21, 46, 165, 218, 240]. The crushed seed makes a very useful poultice in the treatment of ulceration, abscesses and deep-seated inflammations[4, 244]. An infusion of the seed contains a good deal of mucilage and is a valuable domestic remedy for coughs, colds and inflammation of the urinary organs[4]. If the seed is bruised and then eaten straight away, it will swell considerably in the digestive tract and stimulate peristalsis[9] and so is used in the treatment of chronic constipation[238]. The oil in the seed contains 4% L-glutamic acid, which is used to treat mental deficiencies in adults[218]. It also has soothing and lubricating properties, and is used in medicines to soothe tonsillitis, sore throats, coughs, colds, constipation, gravel and stones[4, 244]. When mixed with an equal quantity of lime water it is used to treat burns and scalds[244]. The bark and the leaves are used in the treatment of gonorrhoea[240]. The flowers are cardiotoxic and nerve[240]. The plant has a long history of folk use in the treatment of cancer[218]. It has been found to contain various anticancer agents[218]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve Linum usitatissimum for constipation, inflammation of the skin (see [302] for critics of commission E).

propta Seed - sow early to late spring in situ. Do not transplant the seedlings[238].

nwatta Prefers a light well-drained moderately fertile humus-rich soil in a sunny sheltered position[200]. Plants grow best in a well-drained, loamy soil, those overlying a clay subsoil produce the best results[269]. They prefer a pH in the range of 5 - 7[269]. Very light highly fertile soils are not desirable as they produce tall rank growth tending to lodge[269]. Plants are more sensitive to salt than most field crops[269]. Prefers a cool moist climate during the growing season, dry weather making the plants short and woody[61, 269]. A very greedy plant, depleting the soil[4, 123] and requiring a rich, well prepared soil if it is to do well[123]. Plants help to break up organic matter and prepare the soil for following crops[201]. Cultivars selected for seed production succeed under a fairly wide range of conditions, but those selected for fibre production require abundant moisture and cool weather during the growing season, and warm dry weather during harvesting, especially where water-retting is practiced[269]. The crop requires 15 - 20cm of rainfall if spread evenly over growing season, with 2.5 cm falling just before or after planting[269]. The plant needs a relatively long ripening period between flowering and harvesting. Warm, dry weather is desirable at the heading stage to cause plants to branch and produce seed; after vegetative growth, dry weather is required for curing the seed[269]. Linseed has a very long history of cultivation in temperate climates with evidence to show that it was being grown in Egypt over 5,000 years ago[269]. It fell into almost complete disuse in Britain in the 20th century as artificial fibres were increasingly used, but it is once again coming into prominence both as a fibre and as an oilseed crop(1995)[K]. Linseed is grown for its edible seed, the oil from the seed and for the fibres obtained from the stems[46]. There are many named varieties, though these usually fall within two classes. One class, generally known as flax, does not branch much and is grown mainly for the fibre in its stem, whilst the other class, known as linseed, branches much more freely and is grown mainly for its seed. Although classified as a species, linseed is possibly an ancient cultigen derived in cultivation from *L. bienne*[17, 238]. Flax crops take 3 - 4 months to reach maturity, though autumn or early spring sown crops can take 6 - 7 months[269]. *Lolium specis* (Rye grasses) and *Pheum specis* (Timothy grass) have allelopathic effects on *Linum*, reducing its carbohydrate synthesis[269]. Linseed is a good companion plant for potatoes and carrots but is inhibited by *Camelina sativa*[18, 20].

## 5.2.95 Castanea pumila

Chinquapin, Ozark chinkapin  
4 tlin 8 cyuc 4 kcaak 2 tcan 1 dwat 4 m hkuc htut cyutli htkayuctup hwicli hyishrasljutnyik hpa7tli frusflatprki hpa7tmwatli hjonli

drutta Castanea pumila is a deciduous Shrub growing to 4 m (13ft 1in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in July, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcaakta Edible Parts: SeedEdible Uses: Seed - raw or cooked[2, 61, 105]. Sweet with a nice nutty flavour[46, 82, 183], it is very acceptable raw and has a superior flavour to sweet chestnuts (*C. sativa*)[142, 161, K]. When baked it becomes even sweeter and develops a floury texture, it makes an excellent potato or cereal substitute[K]. The seed is quite small, about 2cm thick[270], which is about half the size of *C. dentata*[183]. It is sold in local markets in America[82]. The seed husks only contain one (rarely two) seed[235]. The seed contains 45% starch and 2.5% protein[213].

tcanta Tannin WoodThe bark, leaves, wood and seed husks all contain tannin. Wood - coarse-grained, hard, strong, light, durable, easy to split. It weighs 37lb per cubic foot. Too small for commercial use, but it is occasionally used for fence posts, fuel etc[46, 61, 227, 229].

dwatta Antiperiodic Astringent TonicThe leaves contain tannin and are antiperiodic, astringent and tonic[46, 61, 213]. An infusion of the leaves has been used as an external wash for the feverish condition common to colds[213, 257].

propta Seed - where possible sow the seed as soon as it is ripe in a cold frame or in a seed bed outdoors[78]. The seed must be protected from mice and squirrels. The seed has a short viability and must not be allowed to become dry. It can be stored in a cool place, such as the salad compartment of a fridge, for a few months if it is kept moist, but check regularly for signs of germination. The seed should germinate in late winter or early spring. If sown in an outdoor seedbed, the plants can be left in situ for 1 - 2 years before planting them out in their permanent positions. If grown in pots, the plants can be put out into their permanent positions in the summer or autumn, making sure to give them some protection from the cold in their first winter[K]. Division of suckers in winter[200]. They can be planted straight out into their permanent positions.

nwatta Prefers a good well-drained slightly acid loam but succeeds in dry soils[1, 11, 200]. Once established, it is very drought tolerant[1, 11, 200]. Very tolerant of highly acid, infertile dry sands[200]. Averse to calcareous soils but succeeds on harder limestones[11, 200]. This species is an excellent soil-enriching understorey in pine forests[200], growing and fruiting well so long as the canopy of pines is fairly light. Although it is very winter-hardy, this species only really thrives in areas with hot summers[200]. The young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. Plants can spread widely by means of underground suckers[11]. Flowers are produced on wood of the current year's growth[229]. Plants are fairly self-sterile[200]. They hybridize freely with other members of this genus[200]. Fruits are produced in 2 - 3 years from seed[117]. One report says that plants never fruit in Britain[11], but a 2 metre tall plant at Wisley fruits most years[K]. Trees on our Cornish trial grounds produced a few female flowers when 1 metre tall and 4 years old[K]. This species is occasionally cultivated for its edible seed in N. America, there are some named varieties[183]. The plants produce seeds abundantly in the wild[183]. The sub-species *C. pumila* ashei. Sudw. (Zone 7) is a coastal form, found from Virginia to Texas[200]. Plants in this genus are notably resistant to honey fungus[200]. The plant is heat tolerant in zones 9 through 5. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is multistemmed with multiple stems from the crown [1-2]. The root pattern is flat with shallow roots forming a plate near the soil surface [1-2]. The root pattern is a heart root, dividing from the crown into several primary roots going down and out [1-2]. The root pattern is suckering with new plants from underground runners away from the plant [1-2].

### 5.2.96 Rumex acetosella

Sheeps Sorrel, Common sheep sorrel

4 tlin 8 cyuc 4 kcaak 1 tcan 3 dwat 0.3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli frusflatprikhwis hpa7tmwatli nyanhjen hjonli

drutta Rumex acetosella is a PERENNIAL growing to 0.3 m (1ft) by 1 m (3ft 3in) at a fast rate. See above for USDA hardness. It is hardy to UK zone 5 and is not frost tender. It is in flower from May to August, and the seeds ripen from July to September. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. It is noted for attracting wildlife. Suitable for:

light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure.

kckahta Edible Parts: Leaves Root SeedEdible Uses: DrinkLeaves - raw or cooked[4, 12, 55, 62, 183]. A delicious lemon-like flavour, most people consider them too strong to use in quantity, but they are excellent as a flavouring in mixed salads[K]. The leaves should only be used in small quantities due to the oxalic acid content. The leaves can be used as thickeners in soups etc[102], they can also be dried for later use[12]. Root - cooked. It can be dried, ground into a powder and made into noodles[105]. Seed - raw or cooked[172]. Easy to harvest, but the seed is rather small and fiddly to use[K]. A drink similar to lemonade (but without the fizz) is made by boiling up the leaves[102].

tcanta DyeDark green to brown and dark grey dyes can be obtained from the roots, they do not need a mordant[168]. A dynamic accumulator gathering minerals or nutrients from the soil and storing them in a more bioavailable form - used as fertilizer or to improve mulch.

dwatta Astringent Diuretic Poultrice UrinarySheep's sorrel is a detoxifying herb, the fresh juice of the leaves having a pronounced diuretic effect[254]. Like other members of the genus, it is mildly laxative and holds out potential as a long term treatment for chronic disease, in particular that of the gastro-intestinal tract[254]. The plant is also part of a North American formula called *essiac* which is a popular treatment for cancer. Its effectiveness has never been reliably proven or disproven since controlled studies have not been carried out. The other herbs included in the formula are *Arctium lappa*, *Ulmus rubra* and *Rheum palmatum*[254]. The whole plant, used in the fresh state, is diaphoretic, diuretic and refrigerant[222]. A tea made from the leaves is used in the treatment of fevers, inflammation and scurvy[222]. The leaf juice is useful in the treatment of urinary and kidney diseases[4]. A leaf poultice is applied to tumours, cysts etc, and is a folk treatment for cancer[222]. A tea made from the roots is astringent and is used in the treatment of diarrhoea and excessive menstrual bleeding[222].

propta Seed - sow autumn or spring in situ. Division in spring.

nwatta Succeeds in most soils[37], preferring a moist moderately fertile well-drained soil in a sunny position[200]. Although a plant of acid soils, it can tolerate some alkalinity[17]. A good food plant for the caterpillars of many species of butterflies[24, 30], it grows well in the summer meadow[24]. Dioecious. Male and female plants must be grown if seed is required. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. A clumping mat former. Forming a dense prostrate carpet spreading indefinitely [1-2]. The root pattern is stoloniferous rooting from creeping stems above the ground [1-2].

### 5.2.97 Crataegus douglasii

Black Hawthorn

4 tlin 8 cyuc 4 kcaak 0 tcan 2 dwat 9 m hkuc hmimhtut cyutli hgattcuphja7n hwicli hrasjlutnyikfrip hpa7tli flatprikwisslip hpa7tmwatli xre7t hjonli

drutta Crataegus douglasii is a deciduous Tree growing to 9 m (29ft 6in). See above for USDA hardness. It is hardy to UK zone 5 and is not frost tender. It is in flower in May, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Midges. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kckahta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[2, 3, 95, 99, 101]. A very pleasant flavour with a sweet and juicy succulent flesh[46, 82, K], it makes an excellent dessert fruit and can be eaten in quantity[K]. The fruit can also be used for making pies, preserves etc, and can be

dried for later use[183]. The fruit is about 8mm in diameter and is borne in small clusters[200]. The fruits I have eaten have been considerably larger than this[K]. There are up to five fairly large seeds in the centre of the fruit, these often stick together and so the effect is of eating a cherry-like fruit with a single seed[K].

tcanta Needles WoodThe spines on the branches are used as needles for lancing boils, removing splinters etc[99]. Wood - close-grained, heavy, hard and tough. Used for tool handles etc[82, 99, 101].

dwatta Antirheumatic Astringent Cardiotonic Dysentery Hypotensive Poultrice StomachicAn infusion of the shoots has been used to treat diarrhoea in children and sores in babies mouths[257]. A poultice of the chewed leaves has been applied to swellings[257]. An infusion of the bark has been used in the treatment of diarrhoea and dysentery[257]. An infusion of the sapwood, bark and roots has been used as a stomach medicine[257]. The thorns have been used as a treatment for arthritis[257].The point of the thorn was used to pierce an area affected by arthritic pain. The other end of the thorn was ignited and burned down to the point buried into the skin. This treatment was very painful but it was said that after a scab had formed and disappeared, the arthritic pain had also disappeared[257]. The thorns have been used as probes for boils and ulcers[257]. Although no other specific mention has been seen for this species, the fruits and flowers of many hawthorns are well-known in herbal folk medicine as a heart tonic and modern research has borne out this use. The fruits and flowers have a hypotensive effect as well as acting as a direct and mild heart tonic[222]. They are especially indicated in the treatment of weak heart combined with high blood pressure[222]. Prolonged use is necessary for it to be efficacious[222]. It is normally used either as a tea or a tincture[222].

propta Seed - this is best sown as soon as it is ripe in the autumn in a cold frame, some of the seed will germinate in the spring, though most will probably take another year. Stored seed can be very slow and erratic to germinate, it should be warm stratified for 3 months at 15°c and then cold stratified for another 3 months at 4°c[164]. It may still take another 18 months to germinate[78]. Scarifying the seed before stratifying it might reduce this time[80]. Fermenting the seed for a few days in its own pulp may also speed up the germination process[K]. Another possibility is to harvest the seed 'green' (as soon as the embryo has fully developed but before the seedcoat hardens) and sow it immediately in a cold frame. If timed well, it can germinate in the spring[80]. If you are only growing small quantities of plants, it is best to pot up the seedlings as soon as they are large enough to handle and grow them on in individual pots for their first year, planting them out in late spring into nursery beds or their final positions. When growing larger quantities, it might be best to sow them directly outdoors in a seedbed, but with protection from mice and other seed-eating creatures. Grow them on in the seedbed until large enough to plant out, but undercut the roots if they are to be left undisturbed for more than two years.

nwatta A very easily grown plant, it prefers a well-drained moisture retentive loamy soil but is not at all fussy[11, 200]. Once established, it succeeds in excessively moist soils and also tolerates drought[200]. It grows well on a chalk soil and also in heavy clay soils[200]. A position in full sun is best when plants are being grown for their fruit, they also succeed in semi-shade though fruit yields and quality will be lower in such a position[11, 200]. Most members of this genus succeed in exposed positions, they also tolerate atmospheric pollution[200]. Hybridizes freely with other members of this genus[200]. Seedling trees take from 5 - 8 years before they start bearing fruit, though grafted trees will often flower heavily in their third year[K]. The flowers have a foetid smell somewhat like decaying fish. This attracts midges which are the main means of fertilization. When freshly open, the flowers have more pleasant scent with balsamic undertones[245]. Seedlings should not be left in a seedbed for more than 2 years without being transplanted[11].

#### 5.2.98 Campanula glomerata

Clustered Bellflower, Dane's blood, Clustered Bellflower
4 tlin 9 cyuc 4 kcaak 0 tcan 0 dwat 1 m hkuc

hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprikwisslip hpa7tmwatli fyfekre7t hjonli

drutta Campanula glomerata is a PERENNIAL growing to 1 m (3ft 3in) by 0.6 m (2ft) at a medium rate. See above for USDA hardness. It is hardy to UK zone 2 and is not frost tender. It is in flower from June to July. The species is hermaphrodite (has both male and female organs). The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kckahta Edible Parts: Flowers LeavesEdible Uses: Leaves - raw or cooked. A mild flavour with a pleasant sweetness, it can be used as a major ingredient in salads[K]. Flowers - raw[K]. Beautiful to look at, they have a pleasant sweetness and make a very attractive decoration to a salad[K].

tcanta None known

dwatta None known

propta Seed - surface sow spring in a cold frame. The seed usually germinates in 2 - 4 weeks at 18°c. Very easy[221]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Basal cuttings in spring. Very easy[221]. Harvest the shoots when they are about 10 - 15cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer. Division in spring or autumn. Very easy[221], larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the summer or following spring.

nwatta Landscape Uses:Border, Container, Foundation, Massing, Rock garden, Specimen. Prefers a moist but well-drained rich sandy loam and a neutral or alkaline soil in sun or partial shade[1, 200]. Succeeds in any well-drained soil in sun or partial shade[233]. A very ornamental plant, there are several named forms[200]. This is a very vigorous species and can be invasive, spreading by means of its creeping rootstock, when well suited to its site[200]. Members of this genus are rarely if ever troubled by browsing deer[233]. The species in this genus do not often hybridize and so seed can generally be relied upon to come true[221]. The plants are self-fertile[221]. Special Features:Not North American native, Invasive, Attracts butterflies, Suitable for cut flowers. The plant is heat tolerant in zones 8 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2].

### 5.2.99 Beta vulgaris altissima

Sugar Beet

4 tlin 8 cyuc 4 kcaak 0 tcan 2 dwat 1.5 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwisslipsh-som hpa7tmwatli xre7t hjonli

drutta Beta vulgaris altissima is a BIENNIAL growing to 1.5 m (5ft) by 0.2 m (0ft 8in). See above for USDA hardness. It is hardy to UK zone 5 and is not frost tender. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline and saline soils. It cannot grow in the shade. It prefers moist soil.

kckahta Edible Parts: Leaves RootEdible Uses: SweetenerRoot - raw or cooked. The root contains 16 - 20% sugar and

hmimhtut cyutli tcup hwicli hrasjut hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Liliu canadense is a BULB growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in July, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Bulb - cooked[2, 105, 177]. Rich in starch, it can be used as a vegetable in similar ways to potatoes (Solanum tuberosum). The taste is rather like raw green corn on the ear[207]. The bulb can be dried, ground into a powder and used in making bread etc[257]. A famine food, only used when better foods are not available[257]. The bulb is up to 5cm in diameter[235].

tcanta None known

dwatta Dysentery Poultice StomachicA poultice made from the bulbs is applied to snakebites[222]. A tea made from the bulbs is stomachic and is also used in the treatment of irregular menses and dysentery[222, 257].

propta Seed - delayed hypogeal germination[130]. Best sown as soon as ripe in a cold frame, it should germinate in spring[143]. Stored seed will require a warm/cold/warm cycle of stratification, each period being about 2 months long[163]. Grow on in cool shady conditions. Great care should be taken in pricking out the young seedlings, many people leave them in the seed pot until they die down at the end of their second years growth. This necessitates sowing the seed thinly and using a reasonably fertile sowing medium. The plants will also require regular feeding when in growth. Divide the young bulbs when they are dormant, putting 2 - 3 in each pot, and grow them on for at least another year before planting them out into their permanent positions when the plants are dormant[K]. Division with care in the autumn once the leaves have died down. Replant immediately[200]. Bulb scales can be removed from the bulbs in early autumn. If they are kept in a warm dark place in a bag of moist peat, they will produce bulblets. These bulblets can be potted up and grown on in the greenhouse until they are large enough to plant out[200].

nwatta Prefers an open free-draining humus-rich loamy soil with its roots in the shade and its head in the sun[200]. Dislikes lime[42]. The sub-species L. canadense editorium is said to be lime tolerant[163, 200]. Does well in open woodland[1, 143]. Succeeds in partial shade but rapidly degenerates when grown in deep shade[143]. The dormant bulbs are very hardy and will withstand soil temperatures down to at least -10°C[214]. Stolonerous[200], the bulbs should be planted 15 - 25cm deep[143]. Only replant in autumn, never in spring[143]. A very ornamental[1] and easily grown plant[143]. The species is not easy to grow in Europe[90]. Polymorphic, there are a number of sub-species[143]. It hybridizes in nature with L. superbum but it does not hybridize readily in the garden[143]. Closely allied to L. michiganense[143]. The plant should be protected against rabbits and slugs in early spring. If the shoot tip is eaten out the bulb will not grow in that year and will lose vigour[200]. The plant is heat tolerant in zones 8 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone, 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is a bulb. The root pattern is stoloniferous rooting from creeping stems above the ground [1-2].

## 5.2.272 Liliu canadense editorium

Meadow Lily

4 tin 8 cyuc 3 kcaak 0 tcan 0 dwat 1.5 m hkuc hmimhtut cyutli tcup hwicli hrasjut hpa7tli flatprikliws hpa7tmwatli xre7t hjonli

drutta Liliu canadense editorium is a BULB growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in July, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

Only replant in autumn, never in spring[143]. A very ornamental plant[1], unlike the main species, this form is easily grown in Britain[143]. Polymorphic[143]. It hybridizes in nature with L. superbum but it does not hybridize readily in the garden[143]. Closely allied to L. michiganense[143]. The plant should be protected against rabbits and slugs in early spring. If the shoot tip is eaten out the bulb will not grow in that year and will lose vigour[200].

## 5.2.273 Tragopogon dubius

Yellow Salsify

4 tin 8 cyuc 3 kcaak 0 tcan 0 dwat 1 m hkuc htut cyutli tcup hwicli hrasjutnyikfrip hpa7tli flatprikliws hpa7tmwatli xre7t hjonli

drutta Tragopogon dubius is a ANNUAL/PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can not grow in the shade. It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Root - raw or cooked[105, 183]. Fleshy[177]. Young stems, when 5 - 10cm high, and the bases of the lower leaves - raw or cooked. Used as a potherb[183].

tcanta None known

Suckers, when formed, can be removed with as much root as possible during the dormant season and replanted immediately[200].

nwatta Landscape Uses:Firewood, Pollard, Screen, Specimen, Street tree. Prefers a good moist loamy alkaline to neutral soil but succeeds on slightly acid soils[11, 200]. Grows poorly on any very dry or very wet soil[200]. According to another report this species succeeds in a hot dry position. Dislikes exposed positions[200]. Succeeds in sun or semi-shade[188]. This species thrives in southern England[11], though it prefers a continental climate, growing more slowly and not producing fertile seed in areas with cool summers[200]. Lime trees tend to hybridise freely if other members of the genus are growing nearby[238]. If growing plants from seed it is important to ensure the seed came from a wild source or from an isolated clump of the single species[K]. Grows best in a woodland situation, young plants tolerate a reasonable level of side shade[200]. The fragrant flowers of this tree are toxic to bees[188]. Trees are usually attacked by aphids which cover the ground and the leaves with a sticky honeydew[188]. Rarely produces suckers. Quite tolerant of root disturbance, semi-mature trees up to 5 metres tall have been transplanted successfully. Plants in this genus are notably resistant to honey fungus[200]. Special Features:Attracts birds, Attractive foliage, Not North American native, Fragrant flowers, Attractive flowers or blooms.

## 5.2.151 Tilia chinensis

4 tin 8 cyuc 3 kcaak 0 tcan 1 dwat 25 m hkuc hmimhtut cyutli tcup hwicli hrasjutnyik hpa7tli flatprikliws hpa7tmwatli xre7t hjonli

drutta Tilia chinensis is a deciduous Tree growing to 25 m (82ft 0in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to July, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: TeaYoung leaves - raw[K]. A tea is made from the flowers. A very good chocolate substitute is made from a paste of the ground fruits and flowers[2]. Trials on marketing the product failed because the paste decomposes readily[2].

tcanta FibreA fibre is obtained from the inner bark and used for making sandals, nets etc[178].

dwatta Antispasmodic Diaphoretic SedativeA tea made from the flowers is antispasmodic, diaphoretic and sedative[226].

propta Seed - much of the seed produced in Britain is not viable, cut a few seedcases open to see if there is a seed inside[80]. If possible, obtain fresh seed that is ripe but has not as yet developed a hard seed coat and sow it immediately in a cold frame. It may germinate in the following spring though it could take 18 months[80]. Stored seed can be very slow to germinate. It has a hard seed coat, embryo dormancy and a hard coat on the pericarp. All these factors mean that the seed may take up to 8 years to germinate[80]. One way of shortening this time is to stratify the seed for 5 months at high temperatures (10°C at night, up to 30°C by day) and then 5 months cold stratification[80]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Layering in spring just before the leaves unfurl. Takes 1 - 3 years[78]. Suckers, when formed, can be removed with as much root as possible during the dormant season and replanted immediately[200].

nwatta Prefers a good moist loamy alkaline to neutral soil but succeeds on slightly acid soils[11, 200]. Grows poorly on any very dry or very wet soil[200]. Dislikes exposed positions[200]. Succeeds in sun or semi-shade[188]. Grows best in a woodland situation, young plants tolerate a reasonable level of side shade[200]. Prefers a continental climate, growing more slowly and not producing fertile seed in areas with cool summers[200]. Lime trees tend to hybridise freely

if other members of the genus are growing nearby[238]. If growing plants from seed it is important to ensure the seed came from a wild source or from an isolated clump of the single species[K]. Trees are usually attacked by aphids which cover the ground and the leaves with a sticky honeydew[188]. Closely related to T. intonsa[11]. Quite tolerant of root disturbance, semi-mature trees up to 5 metres tall have been transplanted successfully. Plants in this genus are notably resistant to honey fungus[200].

## 5.2.152 Quercus palustris

Pin Oak, Swamp Oak

4 tin 8 cyuc 3 kcaak 0 tcan 2 dwat 25 m hkuc hmimhtut cyutli tcup hwicli jutnyik hpa7tli flatprikliws hpa7tmwatli hjonli

drutta Quercus palustris is a deciduous Tree growing to 25 m (82ft) by 8 m (26ft) at a fast rate. It is in flower from April to May, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: SeedEdible Uses: CoffeeSeed - cooked[159]. The seed is about 15mm long[200], it can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread. The seed contains bitter tannins, these can be leached out by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute.

tcanta Ink Repellent Tannin WoodA mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth[20]. Oak galls are excrecences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4]. A black ink is made from the galls[226]. Wood - strong, hard, coarse grained, heavy, often knotty owing to the persistence of many small limbs[46, 61, 82, 171, 227]. It weighs 43lb per cubic foot[227]. It is occasionally used for shingles, clap-boards, furniture, wooden nails etc and as a fuel[46, 61, 82, 171, 227, 229].

dwatta Astringent Dysentery StomachicAn infusion of the inner bark has been used to treat intestinal pains[257]. Any galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4].

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Average germination rate is about 68%[227]. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Landscape Uses:Aggressive surface roots possible, Specimen, Street tree. Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Lime tolerant[188]. Young plants tolerate reasonable levels of side shade[200]. Withstands atmospheric pollution[227]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. A fairly fast growing tree[200]. It is occasionally cultivated for timber in eastern central Europe[50]. It coppices fairly well[227]. The tree seldom lives longer than 150 - 200 years

in the wild, commencing to bear seeds when 15 - 25 years old[229]. Seed production is cyclic, a year of high yields being followed by 2 - 3 years of low yields[229]. The tree flowers on new growth produced in spring, the seed taking two summers to ripen[229]. There are some named varieties selected for their ornamental value[200]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. This species has a relatively shallow tap-root, making it easier to transplant[226]. Hybridizes freely with other members of the genus[200]. Plants in this genus are notably resistant to honey fungus[200]. Special Features: Attracts birds, North American native, Inconspicuous flowers or blooms.

### 5.2.153 *Carya cordiformis*

Bitternut, Bitternut Hickory, Swamp Hickory  
4 tin 9 cyuc 3 kcaak 0 tcan 1 dwat 25 m hkuc  
htut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliws hpa7tmwatli fyif hjonli

drutta *Carya cordiformis* is a deciduous Tree growing to 25 m (82ft) by 15 m (49ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in leaf from June to October, in flower from April to May, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Oil Seed Edible Uses: Oil Seed - raw or cooked[161, 177]. Thin shelled but bitter and astringent[82, 183]. Even squirrels tend to pass it over[226]. The seed is about 3cm long[229]. The seed ripens in late autumn and, when stored in its shell in a cool place, will keep for at least 6 months[K].

tcanta Fuel Oil Rootstock Wood An oil expressed from the seeds has been used as an illuminant in oil lamps[229]. Often used as a potted stock for grafting varieties of pecans (*C. illinoensis*)[227]. Wood - heavy, very hard, strong, elastic, tough, close grained[82, 227, 229]. It weighs 47lb per cubic foot[227]. Although the wood tends to be brittle, it has an amazing quality of shock-resistance and is used for hoops, tool handles etc, though it is considered to be inferior to other hickories[82, 227, 229]. A very good fuel, burning well and giving off a lot of heat[229].

dwatta Antirheumatic Diuretic Laxative The oil from the seeds has been used in the treatment of rheumatism[226]. The bark is diuretic and laxative[257].

propta Seed - requires a period of cold stratification. It is best sown in a cold frame as soon as it is ripe[78]. Stored seed should be kept moist (but not wet) prior to sowing and should be sown in a cold frame as soon as possible[78]. Where possible, sow 1 or 2 seeds only in each deep pot and thin to the best seedling. If you need to transplant the seedlings, then do this as soon as they are large enough to handle, once more using deep pots to accommodate the tap root. Put the plants into their permanent positions as soon as possible, preferably in their first summer, and give them some protection from the cold for at least the first winter[78, K]. Seed can also be sown in situ so long as protection is given from mice etc and the seed is given some protection from cold[200] (a plastic bottle with the top and bottom removed and a wire mesh pot fitted to keep the mice out is ideal)

nwatta Landscape Uses: Pest tolerant, Aggressive surface roots possible. Prefers a deep moisture-retentive loam in a sunny sheltered position, requiring a good summer for best development[1, 63, 137, 200]. Slow growing[200]. This is the hardiest and best growing member of this genus in Britain[11], unfortunately the seed is bitter[82]. Hybridizes in the wild with *C. illinoensis*[43]. Hybridizes with other members of this genus[200]. Plants are strongly tap-rooted and should be planted in their permanent positions as soon as possible[1, 137]. Sowing in situ would be the best method so long as the seed could be protected from mice[1, 200]. Trees are late coming into leaf (usually late May to June) and lose their leaves early in the autumn (usually in October)[137]. During this time they cast a heavy shade. These factors combine to make the trees eminently suitable for a

mixed woodland planting with shrubs and other trees beneath them[137]. Plants in this genus are notably resistant to honey fungus[200]. Most species in this genus have quite a wide range of distribution and, in order to find trees more suited to this country, seed from the most appropriate provenances should be sought[137]. Most trees growing in Britain at present tend to only produce good seed after hot summers[137]. Trees are self-fertile but larger crops of better quality seeds are produced if cross-pollination takes place[229]. Special Features: North American native, Wetlands plant, Inconspicuous flowers or blooms.

### 5.2.154 *Juglans ailanthifolia*

Japanese Walnut

4 tin 8 cyuc 3 kcaak 5 tcan 1 dwat 20 m hkuc  
htut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliws hpa7tmwatli fyif hjonli

drutta *Juglans ailanthifolia* is a deciduous Tree growing to 20 m (65ft) by 15 m (49ft). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower in June. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Leaves Oil Seed Edible Uses: Oil Seed - raw, cooked or used in confectionery[22, 105, 177, 183]. A very good flavour[2]. The shell is easily cracked[117]. An edible oil is obtained from the seed, but it tends to go rancid quickly[183]. Young buds (flower?) and fruit stalks - cooked[105, 177, 183].

tcanta Companion Dye Herbicide Oil Tannin Wood A brown dye is obtained from the seed husks and the bark[61]. Rich in tannin, it does not require a mordant. The bark is rich in tannin. It is used as a dye and also medicinally[178]. Plants produce chemicals which can inhibit the growth of other plants. These chemicals are dissolved out of the leaves when it rains and are washed down to the ground below, reducing the growth of plants under the tree[18, 20, 159]. The roots of many members of this genus produce substances that are toxic to many plant species, especially apples (*Malus* species), members of the Ericaceae, *Potentilla* spp and the white pines (certain *Pinus* spp.)[200]. Wood - soft, light, not easily cracked, of good quality. Used for cabinet making etc[46, 61]. A dynamic accumulator gathering minerals or nutrients from the soil and storing them in a more bioavailable form - used as fertilizer or to improve mulch.

dwatta Anthelmintic Astringent Diuretic Kidney Lithontripic Pectoral Skin Tonic The bark is anthelmintic, astringent, diuretic, lithontripic, pectoral, skin, tonic (kidneys)[178].

propta The seed is best sown as soon as it is ripe in individual deep pots in a cold frame[80]. You need to protect it from mice, birds, squirrels etc. The seed usually germinates in late winter or the spring. Plant out the seedlings into their permanent positions in early summer and give some protection from the cold for their first winter or two. The seed can also be stored in cool moist conditions (such s the salad compartment of a fridge) over the winter and sown in early spring but it may then require a period of cold stratification before it will germinate[78, 80].

nwatta Requires a deep well-drained loam and a sunny position sheltered from strong winds[1, 11]. Prefers a slightly alkaline soil[200]. This is the hardiest member of the genus, capable of growing in all areas of Britain[63]. It is also resistant to the attacks of most insects[160]. The young growth in spring, however, can be damaged by late frosts. This species is cultivated for its edible seed in Japan, it has the potential for producing very superior nuts, especially if hybridized with *J. cinerea*[117, 160]. Trees can come into bearing within 3 - 4 years from seed[63]. Plants produce a deep taproot and they are intolerant of root disturbance[1, 11]. Seedlings should be planted out into their permanent positions as soon as possible and given some protection since they are somewhat tender when young[1, 11]. Flower initiation depends upon suitable conditions in the previous summer[200]. The flowers and young growths can be destroyed by even short periods down to -2°C, but fortunately plants

drutta *Symphytum uplandicum* is a PERENNIAL growing to 1.2 m (4ft) by 0.6 m (2ft) in at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves Edible Uses: Gum Tea Young leaves - cooked or raw[2, 4, 5, 9, 46, 61]. The leaf is hairy and the texture is mucilaginous. It may be full of minerals but it is not pleasant eating for most tastes. It can be chopped up finely and added to salads, in this way the hairiness is not so obvious[183]. Young shoots can be used as an asparagus substitute[46]. The blanched stalks are used[183]. Older leaves can be dried and used as a tea[26]. The peeled roots are cut up and added to soups[183]. A tea is made from the dried leaves and roots[183]. The roasted roots are used with dandelion and chicory roots for making coffee[183].

tcanta Biomass Compost Gum The plant grows very quickly, producing a lot of bulk. It is tolerant of being cut several times a year and can be used to provide 'instant compost' for crops such as potatoes. Simply layer the wilted leaves at the bottom of the potato trench or apply them as a mulch in no-dig gardens. A liquid feed can be obtained by soaking the leaves in a small amount of water for a week, excellent for potassium demanding crops such as tomatoes. The leaves are also a very valuable addition to the compost heap[26, 200]. A gum obtained from the roots was at one time used in the treatment of wool before it was spun[100]. Plants can be grown as a ground cover when planted about 1.2 metres apart each way[208]. A dynamic accumulator gathering minerals or nutrients from the soil and storing them in a more bioavailable form - used as fertilizer or to improve mulch.

dwatta Anodyne Astringent Demulcent Eczema Emollient Expectorant Haemostatic Refrigerant Vulnerary Comfrey is a commonly used herbal medicine with a long and proven history in the treatment of various complaints. The root and the leaves are used, the root being more active, and they can be taken internally or used externally as a poultice[4, 222]. Comfrey is especially useful in the external treatment of cuts, bruises, sprains, sores, eczema, varicose veins, broken bones etc, internally it is used in the treatment of a wide range of pulmonary complaints, internal bleeding etc[4, 238, K]. The plant contains a substance called 'allantoin', a cell proliferant that speeds up the healing process[4, 21, 26, 165, 222, 238]. This substance is now synthesized in the pharmaceutical industry and used in healing creams[238]. The root and leaves are anodyne, astringent (mild), demulcent, emollient, expectorant, haemostatic, refrigerant, vulnerary[4, 21, 26, 165, 222]. Some caution is advised, however, especially in the internal use of the herb. External applications and internally taken teas or tinctures of the leaves are considered to be completely safe, but internal applications of tablets or capsules are felt to have too many drawbacks for safe usage[238]. See also the notes above on toxicity. The leaves are harvested in early summer before the plant flowers, the roots are harvested in the autumn. Both are dried for later use[238]. A homeopathic remedy is made from the fresh root, harvested before the plant flowers[232]. This has a very limited range of application, but is of great benefit in the treatment of broken bones and eye injuries[232].

propta Seed - sow spring or autumn in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. This is a hybrid species that does not usually produce seed. If you have sufficient seed you can try an outdoor sowing in situ in the spring. Division succeeds at almost any time of the year. Simply use a spade to chop off the top 7cm of root just below the soil level. The original root will regrow and you will have a number of root tops, each of which will make a new plant. These can either be potted up or planted out straight into their permanent positions.

nwatta Tolerates most soils and situations but prefers a moist soil and some shade[1, 4]. Grows well in heavy clay soils. Best grown in an open sunny site in a deep rich soil

if it is being grown for compost material[200]. Hardy to about -20°C[187]. A naturally occurring hybrid species (*S. asperum* x *S. officinale*), it does not set viable seed and so is not aggressive. The root system is very deep, fragments of root left in the soil can produce new plants. A number of named forms have been selected for their higher production of leaves[183]. Subject to attacks by the rust fungus, this can be alleviated by giving the plants a high potash feed, wood ashes are often used[26]. The plant is heat tolerant in zones 9 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is fibrous dividing into a large number of fine roots [1-2].

### 5.2.270 *Ribes hirtellum*

Currant-Gooseberry, Hairystem gooseberry

4 tin 8 cyuc 3 kcaak 0 tcan 0 dwat 1 m hkuc  
htut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliws hpa7tmwatli xre7t hjonli

drutta *Ribes hirtellum* is a deciduous Shrub growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower in April. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Fruit Edible Uses: Fruit - raw or cooked in jams, jellies, pies, preserves etc[3, 11, 85, 101, 183]. A smooth-skinned gooseberry[235] with a pleasant taste[183, K]. The fruit can also be dried for later use[183, 257]. The fruit is about 8 - 10mm in diameter[200].

tcanta None known

dwatta None known

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. Stored seed requires 4 - 5 months cold stratification at between 0 to 9°C and should be sown as early in the year as possible[113, 164]. Under normal storage conditions the seed can remain viable for 17 years or more. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter, planting them out in late spring of the following year. Cuttings of half-ripe wood, 10 - 15cm with a heel, July/August in a frame[78, 113]. Cuttings of mature wood of the current year's growth, preferably with a heel of the previous year's growth, November to February in a cold frame or sheltered bed outdoors[78, 200].

nwatta Easily grown in a moisture retentive but well-drained loamy soil of at least moderate quality[11, 200]. Prefers a very sunny position[11]. Hardy to about -20°C[200]. Closely allied to *R. uva-crispa* and *R. oxycanthoides*[11], it is often cultivated for its edible fruit[132] and is the parent of many disease-resistant American gooseberry cultivars[200]. It is sometimes crossed with European hybrids[200]. Plants can harbour a stage of white pine blister rust, so should not be grown in the vicinity of pine trees[155]. Plants in this genus are notably susceptible to honey fungus[200]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is multistemmed with multiple stems from the crown [1-2].

### 5.2.271 *Lilium canadense*

Meadow Lily, Canada lily  
4 tin 8 cyuc 3 kcaak 0 tcan 1 dwat 1.5 m hkuc

pollinated by Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in nutritionally poor soil. Suitable pH: neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**ckakta Edible Parts:** Leaves **RootEdible Uses:** Leaves and young stems- raw or cooked[2, 46, 74]. Usually blanched in much the same way as seekale (C. maritima)[61, 183]. **Root - raw or cooked**[105]. The root, which can be as thick as a person's arm, is fleshy and sweet[2, 183]. It can be used raw in salads, or be cooked as a vegetable[2]. It can be dried and ground into a powder, then mixed with cereal flours when making bread[2]. The root is rich in starch and sugars[74].

**tcanta Attracts wildlife.**

**dwatta None known**

**propta Seed - sow** March/April in a seedbed outdoors and either thin the plants out or move them to their permanent positions when about 10cm tall[111]. The young plants are very attractive to slugs so some protection will often be needed. Germination can be slow so it is best to sow the seed in pots in a cold frame[164]. Germination usually takes place in 3 - 26 weeks at 15°C[164]. Prick out the seedlings into individual pots as soon as they are large enough to handle and plant out into their permanent positions when they are at least 10cm tall. Division in spring or autumn[1, 111]. Dig up the root clump and cut off as many sections as you require, making sure they all have at least one growing point. The larger of these divisions can be planted out straight into their permanent positions, though small ones are best potted up and grown on in a cold frame until they are established. Root cuttings, 3 - 10 cm long, in spring[104]. These can be planted straight into the open ground or you can pot them up in the greenhouse and plant them out once they are growing strongly.

**nwatta** An easily grown plant, succeeding in a good loam and an open sunny position[1]. Prefers a slightly alkaline soil in a position sheltered from strong winds[200]. Tolerates poor soil and some shade[200]. Dislikes acid soils[1]. A deep-rooted plant[233], it dislikes root disturbance[164]. This is an aggregate species[54]. There is some confusion over the correct spelling of this species name, it is written as C. tataria in some books[50]. Plants can be grown in the summer meadow if the grass is not cut too low (since this would damage the growing point)[200]. A good bee plant[74].

## 5.2.267 Campanula lactiflora

Milky Bellflower

4 tlin 8 cyuc 3 ckak 0 tcan 0 dwat 1 m hkuc  
hmimhtut cyutli tcup hwicli hrasljut hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

**drutta** Campanula lactiflora is a PERENNIAL growing to 1 m (3ft 3in) by 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to August. The species is hermaphrodite (has both male and female organs). The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**ckakta Edible Parts:** Flowers **LeavesEdible Uses:** Leaves - raw or cooked. A mild flavour with a pleasant sweetness[K]. Flowers - raw. A decorative and tasty addition to salads[K].

**tcanta None known**

**dwatta None known**

**propta Seed - best sown** as soon as it is ripe, otherwise surface sow spring in a cold frame. The seed usually germinates in 2 - 4 weeks at 18°C. Easy[221]. Plants, especially as they grow, resent root disturbance so, as soon as they are large enough to handle the seedlings should be pricked out into individual pots and grow them on in a cold frame for at least their first winter. It is generally better to grow the plants on in larger pots than average in order to ensure good root development[271]. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Basal cuttings in spring. Easy[K]. Harvest the shoots when they are about 10 - 15cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they

are rooting well. Plant them out in the summer. Division in spring or autumn. Very easy[221], larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the summer or following spring. Another report says that it is difficult to divide the thick tenacious roots of mature plants, and that they resent the disturbance[271].

**nwatta** Succeeds in most fertile well-drained soils[233], though it prefers a moist but well-drained rich sandy loam and a neutral or alkaline soil in sun or partial shade[1, 200]. A very tolerant plant, thriving even when growing in unkempt grassy areas[233]. There are some named forms, selected for their ornamental value[200]. Plants tend to be top-heavy and will need supports in windy gardens[233]. The species in this genus do not often hybridize and so seed can generally be relied upon to come true[221]. The plants are self-fertile[221]. Although usually freely set, it is quite difficult to harvest the seed since it is readily dispersed by the plant as soon as it ripens[271]. The plant often self-sows in the garden and, if potted up whilst small, the seedlings usually transplant fairly well[271]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233].

## 5.2.268 Berberis cooperi

4 tlin 8 cyuc 3 ckak 1 tcan 2 dwat 1.5 m hkuc  
hmimhtut cyutli tcup hwicli hyishrasljutnyikfrip hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

**drutta** Berberis cooperi is a deciduous Shrub growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 3. It is in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**ckakta Edible Parts:** Fruit**Edible Uses:** Fruit - raw or cooked. An acid taste, but it is pleasant raw in small quantities[K].

**tcanta DyeA** yellow dye is obtained from the root.

**dwatta** Antibacterial Cancer DysenteryBerberine, universally present in rhizomes of Berberis species, has marked antibacterial effects. Since it is not appreciably absorbed by the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not be used with Glycyrrhiza species (Liquorice) because this nullifies the effects of the berberine[218]. Berberine has also shown antitumour activity[218].

**propta Seed - best sown** as soon as it is ripe in a cold frame, when it should germinate in late winter or early spring[78]. Seed from over-ripe fruit will take longer to germinate[78], whilst stored seed may require cold stratification and should be sown in a cold frame as early in the year as possible[80]. The seedlings are subject to damping off, so should be kept well ventilated[113]. When the seedlings are large enough to handle, prick them out into individual pots and grow them on in a cold frame. If growth is sufficient, it can be possible to plant them out into their permanent positions in the autumn, but generally it is best to leave them in the cold frame for the winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, July/August in a frame. Cuttings of mature wood of the current season's growth, preferably with a heel, October/November in a frame[78].

**nwatta** Prefers a warm moist loamy soil and light shade but it is by no means fastidious, succeeding in thin, dry and shallow soils[11, 200]. Grows well in heavy clay soils. Hybridizes freely with other members of this genus[1]. Plants can be pruned back quite severely and resprout well from the base[200].

## 5.2.269 Symphytum uplandicum

Comfrey

4 tlin 8 cyuc 3 ckak 4 tcan 5 dwat 1.2 m hkuc  
hmimhtut cyutli tcup hwicli hrasljutnyikfrip hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

are usually late coming into leaf[200]. Any pruning should only be carried out in late summer to early autumn or when the plant is fully dormant otherwise wounds will bleed profusely and this will severely weaken the tree[200]. Trees have a dense canopy which tends to reduce plant growth below them. We have no specific information for this species, but the roots of several members of this genus produce substances that are toxic to many plant species, especially apples (Malus species), members of the Ericaceae, Potentilla spp and the white pines (certain Pinus spp.)[200]. The leaves of many species also secrete substances that have an inhibitory affect on plants growing underneath them. All in all this is not a very good companion plant[K]. The plant is heat tolerant in zones 8 through 5. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

## 5.2.155 Corylus colurna

Turkish Hazel, Chinese hazelnut, Turkish Filbert, Turkish Hazel

4 tlin 7 cyuc 3 ckak 3 tcan 1 dwat 20 m hkuc  
hmimhtut cyutli hgattcup hwicli hrasljutnyik hpa7tli flatpriklwissip hpa7tmwatli fyif hjonli

**drutta** Corylus colurna is a deciduous Tree growing to 20 m (65ft) by 7 m (23ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from April to May, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure.

**ckakta Edible Parts:** Oil **SeedEdible Uses:** OilSeed - raw or cooked[2, 22, 46, 105]. Rich in oil. As nice a flavour as C. avellana, the common hazel nut[146, 158]. The seed ripens in mid to late autumn and will probably need to be protected from squirrels[K]. When kept in a cool place, and not shelled, the seed should store for at least 12 months[K]. An edible oil is obtained from the seed.

**tcanta Oil** WoodWood - firm, durable, moderately hard. Used for furniture, turnery etc[74, 158].

**dwatta Tonic**The seeds are tonic[240].

**propta Seed - best sown** as soon as it is harvested in autumn in a cold frame[164]. Germinates in late winter or spring. Stored seed should be pre-soaked in warm water for 48 hours and then given 2 weeks warm followed by 3 - 4 months cold stratification[164]. Germinates in 1 - 6 months at 20°C[164]. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame or sheltered place outdoors for their first winter. Plant them out into their permanent positions in late spring or early summer[K]. Layering in autumn. Easy, it takes about 6 months[78, 200].

**nwatta** Management: Standard Regional Crop Staple Crop: Protein-oilLandscape Uses:Firewood, Specimen, Street tree. An easily grown plant, it succeeds in most soils, but is in general more productive of seeds when grown on soils of moderate fertility[11, 200]. It does less well in rich heavy soils or poor ones[11, 63]. Does well in a loamy

soil[11]. Very suitable for an alkaline soil[11], but it dislikes very acid soils[17]. Tolerates a pH in the range 5.3 to 7.3. Once established, this is a very drought resistant tree[183]. It does not produce suckers[183]. Plants are fairly wind tolerant[1, 11]. A very ornamental tree[1]. Members of this genus bear transplanting well and can be easily moved even when relatively large[11]. The Turkish hazel is occasionally cultivated for its edible seed[46, 61, 158]. This species is also useful in hybridizing with C. avellana in order to develop superior fruiting cultivars[183]. **Special Features:**Not North American native, Inconspicuous flowers or blooms. The plant is heat tolerant in zones 7 through 5. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2]. The root pattern is flat with shallow roots forming a plate near the soil surface [1-2].

## 5.2.156 Carya x laneyi

4 tlin 8 cyuc 3 ckak 0 tcan 0 dwat 20 m hkuc  
hpa7tmwatli tcup hwicli hrasljutnyik hpa7tli flatpriklwis hpa7tmwatli fyif hjonli

**drutta** Carya x laneyi is a deciduous Tree growing to 20 m (65ft 7in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf from June to October, in flower from April to May. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

**ckakta Edible Parts:** Seed**Edible Uses:** Seed - raw or cooked[183]. Thin shelled[200]. The seed ripens in late autumn and, when stored in its shell in a cool place, will keep for at least 6 months[K].

**tcanta Fuel** WoodWood - close grained, tough, strong, brittle. Used mainly for fuel, it burns well giving off a lot of heat.

**dwatta None known**

**propta Seed - requires** a period of cold stratification. It is best sown in a cold frame as soon as it is ripe[78]. Stored seed should be kept moist (but not wet) prior to sowing and should be sown in a cold frame as soon as possible[78]. Where possible, sow 1 or 2 seeds only in each deep pot and thin to the best seedling. If you need to transplant the seedlings, then do this as soon as they are large enough to handle, once more using deep pots to accommodate the tap root. Put the plants into their permanent positions as soon as possible, preferably in their first summer, and give them some protection from the cold for at least the first winter[78, K]. Seed can also be sown in situ so long as protection is given from mice etc and the seed is given some protection from cold[200] (a plastic bottle with the top and bottom removed and a wire mesh top fitted to keep the mice out is ideal)

**nwatta** Prefers a deep moisture-retentive loam in a sunny sheltered position, requiring a good summer for best development[1, 63, 137, 200]. A natural hybrid, C. cordiformis x C. ovata, it is generally faster growing, bears at an earlier age and ripens its seed earlier than C. ovata, but lacks the high quality kernel[183]. There are some named varieties[183]. Plants are strongly tap-rooted and should be planted in their permanent positions as soon as possible[1, 137]. Sowing in situ would be the best method so long as the seed could be protected from mice[1, 200]. Trees are late coming into leaf (usually late May to June) and lose their leaves early in the autumn (usually in October)[137]. During this time they cast a heavy shade. These factors combine to make the trees eminently suitable for a

mixed woodland planting with shrubs and other trees beneath them[137]. Plants in this genus are notably resistant to honey fungus[200]. Most species in this genus have quite a wide range of distribution and, in order to find trees more suited to this country, seed from the most appropriate provenances should be sought[137]. Most trees growing in Britain at present tend to only produce good seed after hot summers[137]. Trees are self-fertile but larger crops of better quality seeds are produced if cross-pollination takes place[229].

## 5.2.157 Quercus stellata

Post Oak  
4 tlin 8 cyuc 3 kcaak 0 tcan 2 dwat 20 m hkuc  
hmimhtut cyutli hgattcut hwicli jlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Quercus stellata is a deciduous Tree growing to 20 m (65ft 7in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from April to May, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure.

kckahta Edible Parts: SeedEdible Uses: CoffeeSeed - raw or cooked[61, 63, 105]. A sweet taste[159]. The seed is up to 25mm long and 18mm wide[82, 200], it can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread. The seed from some trees might contain bitter tannins, these can be leached out by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute[177, 257].

tcanta Disinfectant Repellent Tannin WoodA mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth[20]. Oak galls are excrescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4]. Wood - very heavy, hard, close grained, very durable in contact with the soil but difficult to cure. It weighs about 52lb per cubic foot. It is largely used for fencing, lumber, furniture and fuel[46, 61, 82, 149, 159, 171, 227].

dwatta Antihypnotic Astringent Disinfectant Dysentery Emetic Febrifuge TonicThe bark is astringent, disinfectant, emetic, febrifuge and tonic[257]. An infusion is used in the treatment of chronic dysentery, indigestion, asthma, lost voice and intermittent fevers[257]. The bark can be chewed to treat mouth sores[257]. An infusion of the bark can be used as a wash on sore and chapped skin[257]. Any galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4].

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Young plants tolerate reasonable lev-

els of side shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. Prefers warmer summers than are usually experienced in Britain, trees often grow poorly in this country and fail to properly ripen their wood resulting in frost damage overwinter[200]. A slow-growing drought resistant tree, it takes 20 - 30 years before it produces seed[229]. It then usually produces a good crop of seeds every 2 - 4 years[229]. The tree flowers on new growth produced in spring, the seed ripening in its first year[200, 229]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. Hybridizes freely with other members of the genus[200]. Plants in this genus are notably resistant to honey fungus[200].

## 5.2.158 Gleditsia triacanthos

Honey Locust

4 tlin 8 cyuc 3 kcaak 2 tcan 2 dwat 20 m hkuc  
htut cyutli hgatyuctuc hwicli hyhisrasjnutnyik hpa7tli flatpriklwishsom hpa7tmwatli xre7t hjonli

drutta Gleditsia triacanthos is a deciduous Tree growing to 20 m (65ft) by 15 m (49ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 3. It is in flower in July, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in saline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. It can tolerate atmospheric pollution.

kckahta Edible Parts: Seed SeedpodEdible Uses: Coffee Drink Gum SweetenerSeed - raw or cooked. It can contain up to 30% sugar[160]. Young seeds taste like raw peas[183]. Seeds are not always borne in maritime regions because the tree prefers long hot summers[11]. The oval seeds are about 8mm long[227]. They contain 10.6 - 24.1% protein, 0.8 - 4.3% fat, 84.7% carbohydrate, 21.1% fibre, 4% ash, 280mg calcium and 320mg phosphorus per 100g[218]. The seeds have been roasted and used as a coffee substitute[269]. Seedpods - the pulp is sweet and can be eaten raw or made into sugar[149, 159, 183]. The tender young seedpods can be cooked and eaten[183]. The pulp in older pods turns bitter[227]. The seedpods are up to 40cm long and 4cm wide[227]. A sweet, pleasant tasting drink can be made from the seed pods[257]. The seed pulp has been used to make a drink[257].

tcanta Fodder Gum Soil reclamation Tannin WoodPlanted for land reclamation on mining waste[200]. The gum from the seeds has been suggested as an emulsifying substitute for acacia and tragacanth[269]. The heartwood contains 4 - 4.8% tannin[240]. Wood - strong, coarse-grained, elastic, very hard, very durable in contact with the soil, highly shock resistant[46, 61, 82, 149]. It does not shrink much but splits rather easily and does not glue well[227]. It weighs 42lb per cubic foot[227]. Largely used for making fence posts and rails, wheel hubs, farm implements etc and in construction[46, 61, 82, 149].

dwatta Anaesthetic Antiseptic Cancer StomachicThe pods have been made into a tea for the treatment of indigestion, measles, catarrh etc[222, 257]. The juice of the pods is antiseptic[222]. The pods have been seen as a good antidote for children's complaints[257]. The alcoholic extract of the fruits of the honey locust, after elimination of tannin, considerably retarded the growth, up to 63% of Ehrlich mouse carcinoma[269]. However, the cytotoxicity of the extract was quite high and the animals, besides losing weight, showed dystrophic changes in their liver and spleen[260]. The alcoholic extract of the fruit exerted moderate oncostatic activity against sarcoma 180 and Ehrlich carcinoma at the total dose 350 mg/kg/body weight/mouse. Weight loss was considerable[269]. An infusion of the bark has been drunk and used as a wash in the treatment of dyspepsia[257]. It has also been used in the treatment of whooping cough, measles, smallpox etc[257]. The twigs and the leaves contain the alkaloids gleditschine and stenocarpine[4]. Stenocarpine has been used as a local anaesthetic whilst gleditschine causes stupor and loss of reflex activity[4]. Current research is examining the leaves as a potential source of anticancer compounds[222].

Uses: The plant is used in breeding programmes with the raspberry (*Rubus idaeus*) in North America[317 ]. A purple to dull blue dye is obtained from the fruit[168 ]. The hollowed stems are used as pipes[99 ]. (The report does not specify what type of pipes).

dwatta Analgesic Astringent Disinfectant Odontalgic Poultrice StomachicThe leaves and the root are astringent[172]. A poultice of the chewed leaves has been used as a dressing on burns[257]. The root bark is analgesic, astringent, disinfectant and stomachic[257]. A decoction is used in the treatment of stomach complaints[257]. A decoction has been used to lessen the pains of labour[257]. The powdered bark has been used as a dusting powder on burns and sores[257]. A poultice of the bark has been applied to wounds and aching teeth to ease the pain[257]. A poultice of the chewed bark has been used as a dressing to relieve pain and clean burns and wounds[257].

propta Seed - requires stratification and is best sown in early autumn in a cold frame. Stored seed requires one month stratification at about 3°C and is best sown as early as possible in the year. Prick out the seedlings when they are large enough to handle and grow on in a cold frame. Plant them out into their permanent positions in late spring of the following year. Cuttings of half-ripe wood, July/August in a frame[200]. Tip layering in July. Plant out in autumn. Division in early spring or just before leaf-fall in the autumn[200].

nwatta Easily grown in a good well-drained loamy soil in sun or semi-shade[1, 11, 200]. Grows well in the shade of trees[200] though it is less likely to fruit well in such a position[K]. Hardy to about -25°C[184]. A very ornamental plant, but it is invasive[1]. It does not fruit well in Britain[11], but has become naturalized in Surrey and Cumbria in cool acid woodland soils[182]. This species is a raspberry with biennial stems, it produces a number of new stems each year from the perennial rootstock, these stems fruit in their second year and then die[200]. Plants in this genus are notably susceptible to honey fungus[200]. The plant is heat tolerant in zones 8 through 5. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. A clumping plant, forming a colony from shoots away from the crown but with a limited spread [1-2]. The root pattern is suckering with new plants from underground runners away from the plant [1-2].

## 5.2.264 Cryptotaenia canadensis

Honewort, Canadian honewort  
4 tlin 8 cyuc 3 kcaak 0 tcan 0 dwat 1 m hkuc  
hmim cyutli tcup hwicli hrasjnutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta *Cryptotaenia canadensis* is a PERENNIAL growing to 1 m (3ft 3in) by 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 5. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kckahta Edible Parts: Flowers Leaves Root StemEdible Uses: Young leaves, stems and flowers - raw or cooked[105, 177]. Used as a potherb or added to salads[183]. A flavour that is somewhat like celery[238], if you use your imagination[K]. Root - cooked[177, 183]. The seeds are used as a flavouring for cakes, breads and biscuits[183].

tcanta None known

dwatta None known

propta Seed - sown April in a greenhouse. Germination is usually rapid, prick out the seedlings into individual pots when they are large enough to handle and plant them out in early summer. The ideal temperature for sowing is about

25°C, though seed does germinate at higher and lower temperatures[206]. Seed can also be sown in early autumn[206]. Division in spring or autumn.

nwatta Succeeds in a rich moist soil, preferring to grow in dappled shade[200, 238]. Closely related to *C. japonica*, a species that is cultivated as a vegetable in Japan[43, K]. This species is being cultivated in America to supply the Japanese market with a chervil-like herb[218]. Slugs are extremely fond of this plant, especially when the new growth emerges in spring[K]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is fibrous dividing into a large number of fine roots [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

## 5.2.265 Angelica sylvestris

Wild Angelica, Woodland angelica  
4 tlin 8 cyuc 3 kcaak 0 tcan 2 dwat 1.5 m hkuc  
pcimhmhtut cyutli tcup hwicli hrasjnutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta *Angelica sylvestris* is a BIENNIAL growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from July to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kckahta Edible Parts: Leaves Root SeedEdible Uses: CondimentLeaves, young shoots and stems - used as an aromatic addition to salads[7], or cooked and used as a vegetable[2, 5, 8, 13, 183]. The taste is somewhat bitter[5]. The chopped leaves are a good addition to cooked acid fruits, especially rhubarb[183]. The stem and leafstalks are used in candies and sweetmeats[2, 46, 105, 183]. Seed - used as an aromatic flavouring in confections and pastries[2, 7]. Root - cooked[2].

tcanta Dye ParasiticideThe pulverized fruits are used to kill head parasites[46, 61]. A good yellow dye is obtained from the plant (the report does not specify which part of the plant)[4].

dwatta Antispasmodic Carminative Diuretic Expectorant Parasiticide Stimulant Stomachic TonicThe root and the seeds are antispasmodic, aromatic, carminative, diaphoretic, diuretic, emmenagogue, expectorant, stimulant, stomachic, and tonic[7, 13, 21, 147, 218]. This plant is less rich in active principles than *A. archangelica* and so is much less used medicinally than that species[9, 244], but a decoction is sometimes used in the treatment of bronchial catarrh, coughs and dyspepsia[9]. Large doses have the effect of depressing the central nervous system[7].

propta Seed - best sown in a cold frame as soon as it is ripe since the seed only has a short viability[200]. Seed can also be sown in the spring, though germination rates will be lower. It requires light for germination[200]. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for their first winter, planting them out into their permanent positions in the spring. The seed can also be sown in situ as soon as it is ripe.

nwatta Requires a deep moist fertile soil in dappled shade or full sun[200]. Succeeds in deep shade. Plants are reliably perennial if they are prevented from setting seed[200].

## 5.2.266 Crambe tatarica

Tartar Bread Plant  
4 tlin 8 cyuc 3 kcaak 2 tcan 0 dwat 1 m hkuc  
hmimhtut cyutli tcup hwicli hyhisrasjnutnyik hpa7tli prikwlisp hpa7tmwatli xre7t hjonli

drutta *Crambe tatarica* is a PERENNIAL growing to 1 m (3ft 3in) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. The species is hermaphrodite (has both male and female organs) and is

Ground cover, Massing, Rock garden, Seashore, Specimen. A very easily grown plant, it thrives in most soils but prefers a sandy loam and full exposure to the south[11]. Dislikes peaty or chalky soils[111]. Can succeed in light shade[K]. Plants are hardier when grown on poor sandy soils[200]. Established plants are very drought resistant[190]. Plants are hardy to at least -15°C when grown in a well-drained soil. This species is one of the toughest members of the genus and once established is capable of surviving, and even thriving, despite considerable neglect. Plants growing in dense weed competition on our Cornwall trial grounds have managed to spread and even flower[K]. A very ornamental and free flowering species[1], there are some named varieties[182]. In the plants native environment, its flowers can only be pollinated by a certain species of moth. This moth cannot live in Britain and, if fruit and seed is required, hand pollination is necessary. This can be quite easily and successfully done using something like a small paint brush. Individual crowns are monocarpic, dying after flowering[233]. However, the crown will usually produce a number of sideshoots before it dies and these will grow on to flower in about four years[233]. Plants in this genus are notably resistant to honey fungus[200]. Members of this genus seem to be immune to the predations of rabbits[233]. Special Features:Attracts birds, Attractive foliage, North American native, Attracts butterflies, Attractive flowers or blooms.

### 5.2.262 *Monarda fistulosa*

Wild Bergamot, Mintleaf bergamot, Wild Bee-Balm, Lupine  
4 tin 10 cyuc 3 kcaak 2 tcan 2 dwat 1.5 m hkuc  
htut cyutli kyuctup hwicli hrasjlutnyikfrp hpa7tli flatprikliwis hpa7tmwatli fyifre7t hjonli

drutta *Monarda fistulosa* is a PERENNIAL growing to 1.5 m (5ft) by 0.5 m (1ft 8in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower in July, and the seeds ripen in August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcaakta Edible Parts: Flowers LeavesEdible Uses: Condiment TeaLeaves - raw or cooked. The entire plant above ground level can be used as a potherb[183], though it is rather aromatic. It is also used as a flavouring in salads and cooked foods[46, 105, 183, 213]. The flowers make an attractive edible garnish in salads[183]. The fresh or dried leaves are brewed into a refreshing aromatic tea[183, 257].

tcanta RepellentThe leaves have been used as an insect repellent[257].

dwatta Carminative Diaphoretic Diuretic Pectoral StimulantWild bergamot was often employed medicinally by several native North American Indian tribes who used it to treat a variety of complaints, but especially those connected with the digestive system[257]. It is still sometimes used in modern herbalism. The leaves and flowering stems are carminative, diaphoretic, diuretic and stimulant[4, 222]. An infusion is used internally in the treatment of colds, catarrh, headaches, gastric disorders, aching kidneys, to reduce low fevers and soothe sore throats[213, 238, 257]. Externally, it is applied as a poultice to skin eruptions, cuts etc and as a wash for sore eyes[238, 257]. The leaves can be harvested before the plant flowers, or they can be harvested with the flowering stems. They can be used fresh or dried[238]. The plant contains the essential oil 'bergamot oil' which can be inhaled to treat bronchial complaints[213]. The leaves also contain 'thymol', an essential oil that can be used to expel gas from the digestive tract[213].

propta Seed - sow mid to late spring in a cold frame. Germination usually takes place within 10 - 40 days at 20°C. When large enough to handle, prick the seedlings out into individual pots and plant them out into their permanent positions in early summer. The seed can also be sown in situ in late summer in areas where the winters are not too severe and will produce larger plants. Cuttings of soft basal shoots in spring. Harvest the shoots with plenty of underground stem when they are about 8 - 10cm above the ground. Pot them up into individual pots and keep them in light shade

in a cold frame or greenhouse until they are rooting well. Plant them out in the summer. Division in spring or autumn. Very easy, large divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Landscape Uses:Massing. Easily grown in ordinary garden soil so long as it is not too dry[1, 200]. Grows well in heavy clay soils. Requires a moist soil and a sunny position[1, 200], though it also succeeds in light shade[187]. This species thrives when grown in a dry soil[233, 238, K]. It prefers alkaline soil conditions[238]. Plants are hardy to at least -25°C[187]. A very ornamental plant, there are several named varieties[1, 233]. A good bee plant[200]. Subject to mildew in dry summers[200]. Special Features:Attracts birds, North American native, Attracts butterflies, Suitable for cut flowers, Attractive flowers or blooms. The plant is heat tolerant in zones 9 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

### 5.2.263 *Rubus spectabilis*

Salmonberry

4 tin 8 cyuc 3 kcaak 3 tcan 2 dwat 1.8 m hkuc  
hmmihtut cyutli tucp hwicli hrasjlutnyik hpa7tli frusflatprikliwis hpa7tmwatli ire7t hjonli

drutta *Rubus spectabilis* is a deciduous Shrub growing to 1.8 m (6ft) by 1 m (3ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in April, and the seeds ripen from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Flowers Fruit StemEdible Uses: TeaFruit - raw, cooked or dried for later use[1, 2, 17, 85, 101, 183]. Juicy with a very good flavour[182, 183]. The fruit can be made into jams and jellies[257]. This species is not of much value in Britain, it does not fruit freely in the cooler summers of this country and the fruits do not always develop their full flavour[11]. The fruit can range in colour from yellow, through orange to red, it is about the size of a cultivated raspberry but is rather inferior in flavour and often has a distinctive bitterness, especially in cooler summers[K]. Another report says that it fruits freely in Britain[182]. Young shoots - peeled and eaten raw or cooked like asparagus[11, 101, 118, 183, 257]. They are harvested in the spring as they grow above the soil and whilst they are still tender[161]. Flowers - raw[172]. The leaves are used as a tea substitute[183].

tcanta Disinfectant Dye PipesAgroforestry Uses: The deep root system of salmonberry can help prevent soil erosion on steep slopes[1050] | Salmonberry is a pioneer or early seral species noted for its ability to spread aggressively on disturbed sites. A certain amount of soil disturbance is essential for good seedling establishment. Seedlings generally appear in abundance after fire, timber harvest, or other types of disturbance. Rhizomes enable the plant to spread vigorously and form dense patches. In many areas dense stands may form within 2 to 3 years after disturbance[1050]. The stands will often diminish as tree species become established and form a canopy, though it can persist almost indefinitely, especially under hardwood canopies such as Alder. Other

propta Seed - pre-soak for 24 hours in warm water and then sow in spring in a greenhouse[78]. The seed should have swollen up, in which case it can be sown, if it has not swollen then soak it for another 24 hours in warm water. If this does not work then file away some of the seed coat but be careful not to damage the embryo[78]. Further soaking should then cause the seed to swell. One it has swollen, the seed should germinate within 2 - 4 weeks at 20°C. As soon as they are large enough to handle, prick the seedlings out into individual deep pots and plant them out into their permanent positions in the summer. Give the plants some protection from the cold for their first few winters outdoors.

nwatta Agroforestry Services: Living fence Fodder: Bank Fodder: Pod Industrial Crop: Biomass Management: Coppice Management: Standard Minor Global Crop Staple Crop: Balanced carbLandscape Uses:Aggressive surface roots possible, Specimen. Succeeds in most soils, acid or alkaline[160, 200], so long as they are well-drained[202]. Requires a sunny position[111]. Tolerates drought once established[1] and atmospheric pollution[200]. Salt tolerant[200]. The honey locust is speculated to tolerate an annual precipitation of 60 to 150cm, an annual temperature range of 10 to 21°C, and a pH in the range of 6 to 8[269]. Trees are rather tender when young, but they are hardy to about -30°C once they are established[200]. They grow best in southern Britain[11]. The honey locust is often cultivated in warm temperate zones for its edible seeds and seedpods[202], trees start to bear when about 10 years old and produce commercial crops for about 100 years[227]. Wild trees seldom live longer than 120 years[229]. Trees are shy to flower and therefore do not often produce a worthwhile crop in Britain due to our cooler summers[202]. There are some named varieties[183]. The sub-species nana produced lots of viable seed in the hot summer of 1989 at Kew[K], it also had a very good crop in 1994, 1996 and in 1999[K]. The sub-species inermis had a very good crop of pods in the autumn of 1996[K]. 'Ashworth' has pods with a very sweet pulp that has a melonlike flavour[183]. The flowers have a pleasing scent[245]. A very ornamental tree[1], the flowers are very attractive to bees[149, 269]. Trees have a light canopy, they come into leaf late and lose their leaves early[11] making them an excellent canopy tree for a woodland garden. Plants in this genus are notably resistant to honey fungus[200]. Unlike most plants in this family, honey locusts do not fix atmospheric nitrogen[160, 226]. Special Features:North American native, Naturalizing, Fragrant flowers, Inconspicuous flowers or blooms. The plant is heat tolerant in zones 7 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2]. The root pattern is flat with shallow roots forming a plate near the soil surface [1-2]. The root pattern is a heart root, dividing from the crown into several primary roots going down and out [1-2]. The root pattern is a tap root similar to a carrot going directly down [1-2].

### 5.2.159 *Juglans x bisbyi*

Buartnut

4 tin 8 cyuc 3 kcaak 2 tcan 0 dwat 20 m hkuc  
htut cyutli tucp hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyif hjonli

drutta *Juglans x bisbyi* is a deciduous Tree growing to 20 m (65ft 7in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from May to June. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic

(mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcaakta Edible Parts: Oil SeedEdible Uses: OilSeed - raw[183]. The shell is thin and the seed well-flavoured[183, 200]. An edible oil is obtained from the seed, it tends to go rancid quickly.

tcanta Herbicide OilPlants produce chemicals which can inhibit the growth of other plants. These chemicals are dissolved out of the leaves when it rains and are washed down to the ground below, reducing the growth of plants under the tree[18, 20, 159]. The roots of many members of this genus produce substances that are toxic to many plant species, especially apples (*Malus* species), members of the Ericaceae, *Potentilla* spp and the white pines (certain *Pinus* spp.)[200]. A dynamic accumulator gathering minerals or nutrients from the soil and storing them in a more bioavailable form - used as fertilizer or to improve mulch.

dwatta None known

propta The seed is best sown as soon as it is ripe in individual deep pots in a cold frame[80]. You need to protect it from mice, birds, squirrels etc. The seed usually germinates in late winter or the spring. Plant out the seedlings into their permanent positions in early summer and give some protection from the cold for their first winter or two. The seed can also be stored in cool moist conditions (such s the salad compartment of a fridge) over the winter and sown in early spring but it may then require a period of cold stratification before it will germinate[78, 80, 113]. This is a hybrid species and so it might not breed true from seed.

nwatta Requires a deep well-drained loam and a sunny position sheltered from strong winds[1, 11]. Prefers a slightly alkaline soil[200]. Plants produce a deep taproot and they are intolerant of root disturbance[1, 11]. Seedlings should be planted out into their permanent positions as soon as possible and given some protection for their first winter or two since they are somewhat tender when young[1, 11]. Flower initiation depends upon suitable conditions in the previous summer[200]. The flowers and young growths can be destroyed by even short periods down to -2°C, but fortunately plants are usually late coming into leaf[200]. Any pruning should only be carried out in late summer to early autumn or when the plant is fully dormant otherwise wounds will bleed profusely and this will severely weaken the tree[200]. Trees have a dense canopy which tends to reduce plant growth below them. We have no specific information for this species, but the roots of several members of this genus produce substances that are toxic to many plant species, especially apples (*Malus* species), members of the Ericaceae, *Potentilla* spp and the white pines (certain *Pinus* spp.)[200]. The leaves of many species also secrete substances that have an inhibitory effect on plants growing underneath them. All in all this is not a very good companion plant[K]. A hybrid, *J. cinerea* x *J. ailanthifolia cordiformis*, is sometimes cultivated for its edible seed, there are some named varieties[183]. This hybrid combines the best qualities of each parent[200] - the aromatic kernel flavour and superior climatic adaptability of *J. cinerea* with the higher yields, better appearance and crackability of *J. ailanthifolia cordiformis*[183]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2].

### 5.2.160 *Juglans cathayensis*

Chinese Walnut

4 tin 8 cyuc 3 kcaak 0 tcan 0 dwat 20 m hkuc  
htut cyutli tucp hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyif hjonli

drutta *Juglans cathayensis* is a deciduous Tree growing to 20 m (65ft) by 20 m (65ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from May to June. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Oil SeedEdible Uses: OilSeed - raw or cooked[183]. Made into confections and sweet-meats[183]. A good flavour but the shell is very thick and the seed is small[11]. An edible oil is obtained from the seed[183], it tends to go rancid quickly.

tcanta Herbicide OilPlants produce chemicals which can inhibit the growth of other plants. These chemicals are dissolved out of the leaves when it rains and are washed down to the ground below, reducing the growth of plants under the tree[18, 20, 159]. The roots of many members of this genus produce substances that are toxic to many plant species, especially apples (*Malus* species), members of the Ericaceae, *Potentilla* spp and the white pines (certain *Pinus* spp.)(200).

dwatta None known

propta The seed is best sown as soon as it is ripe in individual deep pots in a cold frame[80]. You need to protect it from mice, birds, squirrels etc. The seed usually germinates in late winter or the spring. Plant out the seedlings into their permanent positions in early summer and give some protection from the cold for their first winter or two. The seed can also be stored in cool moist conditions (such s the salad compartment of a fridge) over the winter and sown in early spring but it may then require a period of cold stratification before it will germinate[78, 80].

nwatta Requires a deep well-drained loam and a sunny position sheltered from strong winds[1, 11]. Prefers a slightly alkaline soil[200]. Plants produce a deep taproot and they are intolerant of root disturbance[1, 11]. Seedlings should be planted out into their permanent positions as soon as possible and given some protection for their first winter or two since they are somewhat tender when young[1, 11]. Flower initiation depends upon suitable conditions in the previous summer[200]. The flowers and young growths can be destroyed by even short periods down to -2°C, but fortunately plants are usually late coming into leaf[200]. A plant growing in an open sunny position at Wisley Garden in Surrey has been seen on a number of occasions bearing good crops of seed[K]. This species is closely related to *J. mandshurica* and is included as a synonym of that species in some modern floras[266]. Any pruning should only be carried out in late summer to early autumn or when the plant is fully dormant otherwise wounds will bleed profusely and this will severely weaken the tree[200]. Trees have a dense canopy which tends to reduce plant growth below them. We have no specific information for this species, but the roots of several members of this genus produce substances that are toxic to many plant species, especially apples (*Malus* species), members of the Ericaceae, *Potentilla* spp and the white pines (certain *Pinus* spp.)(200). The leaves of many species also secrete substances that have an inhibitory affect on plants growing underneath them. All in all this is not a very good companion plant[K].

## 5.2.161 *Quercus x schuettei*

Schuettei's oak

4 tin 8 cyuc 3 kcak 3 tcan 0 dwat 18 m hkuc htut cyutli tcuphja7n hwicli jlutnyik hpa7tli prik hpa7tmwatli hjonli

drutta *Quercus x schuettei* is a deciduous Tree growing to 18 m (59ft) by 18 m (59ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. The flowers are pollinated by Wind. It is noted for attracting wildlife. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: neutral soils. It cannot grow in the shade. It prefers moist or wet soil.

kcakta Produces large, edible acorns that are low in tannins. Seed - cooked[101, 105, 161, 257]. The seed can be ground into a powder and used in making bread, dumplings etc and as a thickener in soups[183]. Many trees have sweet seeds with little tannin and the seed can be eaten raw or cooked. If the seed is bitter then this is due to the presence of tannins, these can be leached out by thoroughly washing the dried and ground up seed in water, though many minerals will also be lost. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute.

tcanta Agroforestry Uses: rehabilitation of the soil. It may be either seeded or transplanted onto disturbed ar-

eas[1050 ]. Other Uses: The leaves of most species in this genus are more or less rich in tannins. A mulch of the leaves can be placed around vulnerable plants in order to repel slugs, snails, grubs etc. Fresh leaves should be used with caution, since these can utilize some of the nitrogen in the soil and this inhibit plant growth[20 , K ]. Oak galls are excrescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4 ]. The bark has been used as a mordant for fixing dyes[257 ]. The wood is hard, heavy, strong, tough, very durable, close grained. The wood is a good fuel[82 ]. Acorns are abundant and an excellent source of food for wildlife. Schuettei's oak is considered to be a low-maintenance tree with good pest resistance. A medium shade tree for moist landscape areas. Specimen or group. Lawns or parks. Street tree. Well suited to soggy soils. Riverbanks.

dwatta None known

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Schuettei Oak is a hybrid between *Quercus bicolor* (swamp white oak) and *Quercus macrocarpa* (bur oak). It grows best in rich, humusy, medium to wet soils, but can tolerate soggy soils to drier upland soils. Great for low and high areas on properties. Tolerates a wide range of moisture, pH, and soil types. Bloom Time: April to May. Bloom Description: Yellowish-green. Leaf: Good Fall color. Fall color is a yellowish-brown, sometimes tinged with red. Fruit: Showy. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2].

## 5.2.162 *Juniperus occidentalis*

Western Juniper

4 tin 8 cyuc 3 kcak 3 tcan 2 dwat 18 m hkuc htut cyutli hgatkuyctup hwicli hrasjlutnyik hpa7tli flatprikli-wisslip hpa7tmwatli dyat hjonli

drutta *Juniperus occidentalis* is an evergreen Tree growing to 18 m (59ft 1in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf all year, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[46, 61, 105]. A thin dry flesh[82] with a resinous flavour[2, 82]. The fruit is sweet and nutritious[2], it can also be dried or ground into a powder and mixed with cereal flours to be made into a bread[161]. The cones are about 10mm in diameter; they take 2 years to mature[200].

tcanta Basketry Beads Fibre Fuel Intense Lighting Miscellany Tinder WoodThe bark is employed as a tinder and is also made into a slow match[216, 257]. The crushed bark was twisted into a rope, tied at intervals with yucca (*Yucca* species), and wrapped into a coil. The free end was set on fire and kept smouldering by blowing on it at intervals. Fire could be carried in this fashion for several hours[257]. The bark can be wound around a stick and used as a torch to provide light and carry fire to a new campsite[257]. The bark can be rubbed between the hands until it is soft and the fibres can then be woven into clothing[257]. The bark can also be rolled into rope, coiled and then sown to form sandal shoes[257]. The root fibre is used to make twined bas-

that work together for their optimal soil requirements including nutrients and water. The root pattern is fleshy. Thick or swollen - fibrous or tap root [2-1].

## 5.2.260 *Inula helenium*

Elecampane, Elecampane inula

4 tin 8 cyuc 3 kcak 2 tcan 3 dwat 1.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta *Inula helenium* is a PERENNIAL growing to 1.5 m (5ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: Leaves RootEdible Uses: Leaves - cooked. Rather bitter and aromatic[115], they were used as a potherb by the ancient Romans[183] but are rarely used at present. Root - candied and eaten as a sweetmeat[4, 7, 27, 105, 183]. It contains up to 44% inulin[46, 240]. Inulin is a starch that cannot be digested by humans. It usually passes straight through the digestive system, though it can ferment and cause wind problems for some people[K]. Inulin can be converted into a sugar that is suitable for diabetics to eat[238]. The Council of Europe list *Inula helenium* as a natural food flavouring.

tcanta Dye EssentialA blue dye is obtained from the bruised and macerated root mixed with ashes and whortleberries (*Vaccinium myrtillus*)[4, 46, 61]. The root yields up to 2% of a camphor-scented essential oil, this is used as a flavouring and medicinally[46, 61, 238].

dwatta Alterative Anthelmintic Antiseptic Antitussive Astringent Bitter Chologogue Demulcent Diaphoretic Diuretic Expectorant Stimulant Stomachic TonicElecampane has a long history of use as a medicinal herb. A gently warming and tonic herb, it is especially effective in treating coughs, consumption, bronchitis and many other complaints of the chest as well as disorders of the digestive system[4, 9, 254]. A very safe herb to use, it is suitable for the old and the young and especially useful when the patient is debilitated[254]. It cleanses toxins from the body, stimulating the immune and digestive systems and treating bacterial and fungal infections[238]. The root is alterative, anthelmintic, antiseptic, astringent, bitter, chologogue, demulcent, diaphoretic, diuretic, mildly expectorant, gently stimulant, stomachic, tonic[4, 7, 9, 21, 46, 165, 200, 218, 222]. It is best harvested in the autumn from plants that are two years old, and it can be dried for later use[4]. The roots should be at least 3 years old according to another report[7]. This remedy should not be prescribed for pregnant women[238]. An extract of the plant is a powerful antiseptic and bactericide, particularly effective against the organism that causes TB[213, 238]. The root contains alantolactone, which is strongly anthelmintic. In a 1:1000 dilution it kills the parasitic worm Ascaris in 16 hours[218]. Alantolactone has an anti-inflammatory action, it also reduces mucous secretions and stimulates the immune system[254]. The plant is sometimes recommended as an external wash for skin inflammations and varicose ulcers, but has been known to cause allergic reactions[238].

propta Seed - sow in spring or autumn in a cold frame[4]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. If you have sufficient seed, it could be worthwhile trying an outdoor sowing in situ in the spring. Division in spring or autumn[111]. Fairly small pieces of root can be used, so long as each piece has a growth bud on it[4]. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring. Root cuttings in winter. Cut sections of root about 5cm long, place them in a warm greenhouse over the winter and they should grow away vigorously[4].

nwatta An easily grown plant, it grows well in moist shady positions in ordinary garden soil, though it grows best in a good loamy soil[4]. Succeeds in an ordinary garden soil in a sunny position[1]. Plants are also tolerant of considerable neglect, succeeding on our Cornwall trial ground even when left unweeded for four years[K]. Elecampane has a long history of cultivation as a medicinal herb, though it is not commonly grown nowadays[4]. When first dug up, the roots smell like ripe bananas, but as they dry they take on the scent of violets[245]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is clumping, giving the plant a clumping habit. The predictable growth behaviour makes it easier to maintain without having to apply containment methods[2-1].

## 5.2.261 *Yucca filamentosa*

Spoonleaf Yucca, Adam's needle, Desert Candle, Needle Palm, St. Peter's Palm, Spanish Bayonet, Comm

4 tin 10 cyuc 3 kcak 4 tcan 1 dwat 1.2 m hkuc hmimhtut cyutli hgatkuyctup hwicli hyishrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Yucca filamentosa* is an evergreen Shrub growing to 1.2 m (4ft) by 0.6 m (2ft in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in leaf all year; in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Hand. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: Flowers Fruit StemEdible Uses: Fruit - raw or cooked[2, 46, 61]. Large and fleshy[161, 183]. The fruit is often dried for winter use[1]. Flowers - raw or dried, crushed and used as a flavouring[159, 164, 177]. A tasty addition to the salad bowl[183]. We have found the flowers to be fairly bitter[K]. Flowering stem - cooked and used like asparagus[164].

tcanta Brush Fibre Paper SoapA fibre obtained from the leaves is used for making ropes, cloth, baskets and mats[21, 46, 61, 82, 169]. The fibre can also be used for making paper[189] The leaves are harvested in summer, they are scraped to remove the outer skin and are then soaked in water for 24 hours prior to cooking. The fibres are cooked for 2 hours with lye and then beaten in a ball mill for 4 hours. They make a cream paper[189]. The leaves are used as paint brushes[92]. The roots are rich in saponins and can be used as a soap substitute for washing the hair, body and clothing[46, 61, 82, 257].

dwatta Poultice SalveMedicinal Parts: Leaves and roots of non-flowering plants[301]. A poultice made from the roots is used in the treatment of sores, skin diseases and sprains[222, 257]. Liver and gallbladder disorders[301].

propta Seed - sow spring in a greenhouse. Pre-soaking the seed for 24 hours in warm water may reduce the germination time. It usually germinates within 1 - 12 months if kept at a temperature of 20°C. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse or cold frame for at least their first two winters. Plant them out into their permanent positions in early summer and consider giving them some winter protection for at least their first winter outdoors - a simple pane of glass is usually sufficient[K]. Seed is not produced in Britain unless the flowers are hand pollinated. Root cuttings in late winter or early spring. Lift in April/May and remove small buds from base of stem and rhizomes. Dip in dry wood ashes to stop any bleeding and plant in a sandy soil in pots in a greenhouse until established[78]. Division of suckers in late spring. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the following spring.

nwatta Agroforestry Services: Living fence Industrial Crop; Fiber Management: Standard Regional CropLandscape Uses:Border, Container, Erosion control, Foundation,

the autumn once the leaves have died down. Replant immediately[200]. Bulb scales can be removed from the bulbs in early autumn. If they are kept in a warm dark place in a bag of moist peat, they will produce bulblets. These bulblets can be potted up and grown on in the greenhouse until they are large enough to plant out[200].

nwatta Prefers an open free-draining humus-rich loamy soil with its roots in the shade and its head in the sun[200]. Dislikes lime[42]. Does well in open woodland but rapidly degenerates in deep shade[143]. The dormant bulbs are very hardy and will withstand soil temperatures down to at least -10°C[14]. A very ornamental plant[1], unlike the main species this form is easily grown in Britain[143]. Polymorphic, there are a number of sub-species. Closely related to *L. michiganense*. Hybridizes in nature with *L. superbum* but does not hybridize readily in the garden[143]. Stoliferous[200], the bulbs should be planted 15 - 25cm deep[143]. Early to mid autumn is the best time to plant out the bulbs in cool temperate areas, in warmer areas they can be planted out as late as late autumn[200]. Never plant out in the spring[143]. The plant should be protected against rabbits and slugs in early spring. If the shoot tip is eaten out the bulb will not grow in that year and will lose vigour[200].

### 5.2.258 Heracleum sphondylium

Cow Parsnip, Eltrot

4 tin 8 cyuc 3 kcaak 2 tcan 2 dwat 1.8 m hkuc pcmhimmtt cyuti tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli fyfxre7t hjonli

drutta Heracleum sphondylium is a BIENNIAL/PERENNIAL growing to 1.8 m (6ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to September, and the seeds ripen from July to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves Root StemEdible Uses: SweetenerStem and young shoots - raw or cooked[5, 7, 9, 17]. Used as a green vegetable, when harvested just as they are sprouting from the ground they are somewhat like asparagus in flavour[183]. The rind is somewhat acid[115]. The leaf stems are tied in bundles and dried in the sun until they turn yellow[238]. A sweet substance resembling sugar forms on the dried stems and is considered to be a great delicacy[2, 115, 183, 238]. The peduncles, before flowering, can be eaten as a vegetable or added to soups[183]. Root - cooked. It is usually boiled[7].

tcanta None known

dwatta Antidiarrhoeal Antipsoriatic Aphrodisiac Digestive Expectorant SedativeThe roots and the leaves are aphrodisiac, digestive, mildly expectorant and sedative[7, 9, 238]. The plant is little used in modern herbalism but has been employed in the treatment of laryngitis and bronchitis[9, 238]. A tincture made from the aerial parts of the plant has also been used to relieve general debility, though it is uncertain how it works[7, 238]. The plant is harvested as it comes into flower and can be dried for later use[9].

propta Seed - sow mid to late spring or early autumn in situ. Division in autumn.

nwatta A very easily grown plant, succeeding in any ordinary garden soil[1, 238], doing best in moist soils or deep woodland[1]. Grows well in full sun or partial shade[238]. This species contains a large number of sub-species. Some, but by no means all of them, can cause various problems as detailed at the top of this record. Subspecies transylvanicum, pyrenaicum, montanum, orsinii and alpinum are distinctly phototoxic, subspecies sphondylium and sibiricum are not phototoxic whilst subspecies granatense and ternatum vary in their toxicity[65]. A good bee plant[108]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is a tap root similar to a carrot going directly down [1-2].

### 5.2.259 Oenothera biennis

Evening Primrose, Sun Drop, Common evening primrose
4 tin 8 cyuc 3 kcaak 3 tcan 5 dwat 1.2 m hkuc htut cyuti hgatkycutcup hwicli vyhshrasljut hpa7tli flatprikliwis hpa7tmwatli fyfxre7t hjonli

drutta Oenothera biennis is a BIENNIAL growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from June to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Lepidoptera (Moths and Butterflies), bees. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Flowers Leaves Oil Root. Seedpor Uses: OilRoot - cooked. Boiled and eaten like salsify[4, 12, 27, 33, 66]. Fleshy, sweet and succulent[74]. Wholesome and nutritious[2]. A peppery taste[159]. The taste somewhat resembles salsify or parsnips[183]. Young shoots - raw or cooked[2, 12, 52, 85, 183]. Mucilaginous, with a peppery flavour, they are best used sparingly[159]. Another source suggests that the shoots should not be eaten[9]. Flowers - sweet. Used in salads or as a garnish[183]. Young seedpods - cooked. Steamed[183]. The seed contains 28% of a drying oil[114]. It is edible and a very good source of gamma-linolenic acid[141], an essential fatty acid that is not found in many plant sources and has numerous vital functions in the body. The seed, however, is very small and difficult to harvest, it has to be done by hand[160]. Overall yields are low, making the oil very expensive to produce.

tcanta Cosmetic Dye Miscellany OilThe oil from the seed is added to skin preparations and cosmetics. It is often combined with vitamin E to prevent oxidation[238]. A yellow dye is obtained from the flowers[7]. A finely ground powder made from the flowering stems is used cosmetically in face-masks to counteract reddened skins[7].

dwatta Anticholesterolemic Antipruritic Astringent Eczema Hypotensive Miscellany SedativeThe bark and the leaves are astringent and sedative[4, 21].They have proved of use in the treatment of gastro-intestinal disorders of a functional origin, whooping cough and asthma[4]. A syrup made from the flowers is also an effective treatment for whooping cough[7]. The bark is stripped from the flowering stem and dried for later use, the leaves are also harvested and dried at this time[4]. Evening primrose oil has become a well-known food supplement since the 1980's. Research suggests that the oil is potentially very valuable in the treatment of multiple sclerosis, pre-menstrual tension, hyperactivity etc[66]. It is also taken internally in the treatment of eczema, acne, brittle nails, rheumatoid arthritis and alcohol-related liver damage[238]. Regular consumption of the oil helps to reduce blood cholesterol levels and lower the blood pressure[21, 66]. The seed is a good source of gamma-linolenic acid, an unsaturated fatty acid which assists the production of hormone-like substances[222, 238]. This process is commonly blocked in the body, causing disorders that affect the uterine muscles, nervous system and metabolism[238]. The poulticed root is applied to piles and bruises[222]. A tea made from the roots is used in the treatment of obesity and bowel pains[222].

propta Seed - sow in situ from late spring to early summer[200].

nwatta Prefers a dryish well-drained sandy loam and a warm sunny position[1, 4, 200], though it is tolerant of most soils[4]. Heavy clay soils may induce winter rots[200]. Grows well on very poor soils[160, 238]. Established plants are drought resistant[160]. Formerly cultivated for its edible roots, the evening primrose is being increasingly cultivated for the oil contained in its seed which contains certain essential fatty acids and is a very valuable addition to the diet[66]. See the notes on medicinal uses for more details. The flowers open in the evening and are strongly scented with a delicious sweet perfume[245], attracting pollinating moths[4]. The seeds are a good food source for birds[200]. Plants usually self-sow freely if they are growing in a suitable position, they can naturalize in the wild garden[4, K]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants

kets[257]. The branches have been burnt as an incense and fumigant in the home[257]. The dried seeds have been used as beads or as the 'rattle' in rattles[216]. Wood - very close-grained, light, soft, exceedingly durable. It is easily worked and can be exquisitely finished. Because of its small size, however, it is mainly used for fencing, fuel[46, 61, 82, 229].

dwatta Analgesic Antiseptic Birthing aid Blood tonic Diuretic Febrifuge Laxative Miscellany Odontalgic PouliticeWestern juniper was quite widely employed as a medicinal herb by a number of native North American tribes who used it to treat a variety of complaints, especially those related to the kidneys and the skin[257]. It is rarely, if at all, used in modern herbalism. The leaves are blood tonic and laxative[216]. A decoction is used in the treatment of constipation, coughs and colds[216]. An infusion of the leaves has been taken by pregnant women prior to giving birth in order to relax the muscles[257]. A poultice of the pounded moistened leaves has been applied to the jaw to treat swollen and sore gums and toothaches[257]. The berries are analgesic, blood tonic and diuretic[257]. A decoction is used to relieve the pain of menstrual cramps and to induce urination[257]. Externally, the decoction is used as a poultice on rheumatic joints[257]. The young twigs are antiseptic, blood tonic and febrifuge[257]. A decoction is used in the treatment of kidney problems, fevers, stomach aches, smallpox, influenza and haemorrhages[257]. The branches have been used in a sweat bath to ease rheumatism[257]. A poultice of the twigs has been used as a dressing on burns and as a drawing agent on boils or splinters[257]. A decoction has been used as an antiseptic wash on sores[257]. The leaves or young twigs have been burnt and the smoke inhaled to ease the pain of headaches[257].

propta The seed requires a period of cold stratification. The seed has a hard seedcoat and can be very slow to germinate, requiring a cold period followed by a warm period and then another cold spell, each of 2 - 3 months duration[78, 81]. Soaking the seed for 3 - 6 seconds in boiling water may speed up the germination process[11]. The seed is best sown as soon as it is ripe in a cold frame. Some might germinate in the following spring, though most will take another year. Another possibility is to harvest the seed 'green' (when the embryo has fully formed but before the seedcoat has hardened). The seedlings can be potted up into individual pots when they are large enough to handle. Grow on in pots until large enough, then plant out in early summer. When stored dry, the seed can remain viable for several years[1]. Cuttings of mature wood, 5 - 10cm with a heel, September/October in a cold frame. Plant out in the following autumn[1, 78]. Layering in September/October. Takes 12 months[78].

nwatta Succeeds in most soils, including chalk, so long as they are well drained[1, 11], preferring a neutral or slightly alkaline soil[11]. Established plants are drought tolerant, succeeding in hot dry positions[200]. Plants are slow-growing, though they can live for 3000 years in the wild[200, 229]. They are much shorter-lived in cultivation[200], growing better in dry areas with hot summers[200]. Western Britain is generally too cool and wet for this species to thrive[200]. Plants are usually monoecious but are sometimes dioecious. Male and female plants must usually be grown if seed and fruit is required. The fruit takes two summers to ripen[229]. Plants are resistant to honey fungus[88]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is flat with shallow roots spreading near the soil surface [2-1].

### 5.2.163 Vitis labruscana

4 tin 8 cyuc 3 kcaak 0 tcan 0 dwat 15 m hkuc hmimhtt cyuti kyucutcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Vitis labruscana is a deciduous Climber growing to 15 m (49ft 3in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to July, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light

woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Fruit LeavesEdible Uses: Fruit - raw or dried for winter use[11, 177]. A 'foxy' flavour that is not normally relished in Europe[11]. However, the fruit is larger and less 'foxy' than *V. labrusca*[11]. The fruit is about 25mm in diameter[200] and is carried in fairly large bunches. The fruit is commonly used for making wine in N. America[11]. Young leaves are wrapped around other foods and then baked, they impart a pleasant flavour. Young tendrils - raw or cooked.

tcanta DyeA yellow dye is obtained from the fresh or dried leaves[168]. Greenish-blue and dark blue dyes can be obtained from the fruit skins of the cultivar 'Concord'[168].

dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe[K]. Six weeks cold stratification improves the germination rate, and so stored seed is best sown in a cold frame as soon as it is obtained. Germination should take place in the first spring, but sometimes takes another 12 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant out in early summer. This is a hybrid species and so seed is unlikely to breed true. Cuttings of mature wood of the current seasons growth, December/January in a frame. These cuttings can be of wood 15 - 30cm long or they can be of short sections of the stem about 5cm long with just one bud at the top of the section. In this case a thin, narrow strip of the bark about 3cm long is removed from the bottom half of the side of the stem. This will encourage callusing and the formation of roots. Due to the size of these cuttings they need to be kept in a more protected environment than the longer cuttings. Layering.

nwatta Prefers a deep rich moist well-drained moderately fertile loam[1, 200]. Grows best in a calcareous soil[200]. Succeeds in sun or partial shade though a warm sunny position is required for the fruit to ripen[200]. The young growth in spring can be damaged by late frosts. Cultivated for its edible fruits, used mainly for making wine, in Eastern N. America[11]. There are many named varieties. Plants climb by means of tendrils[182]. Any pruning should be carried out in winter when the plants are dormant otherwise they bleed profusely[182, 200]. Plants in this genus are notably susceptible to honey fungus[200].

### 5.2.164 Vitis labrusca

Northern Fox Grape, Fox grape

4 tin 9 cyuc 3 kcaak 2 tcan 1 dwat 15 m hkuc hmimhtt cyuti kyucutcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Vitis labrusca is a deciduous Climber growing to 15 m (49ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from May to July, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Fruit Leaves Oil Sap ShootsEdibl Uses: OilFruit - raw or dried for winter use[1, 2, 46, 61, 161]. The fruit can also be made into pies, preserves etc[183]. A distinctive musky aroma and taste that is not acceptable to many people[11, 183, 200]. The fruit is best after a frost[101]. Sweetish[43], it contains 6.6 - 16.6% sugars[179]. The fruit is up to 2cm in diameter[200] and is produced in fairly large bunches[235]. Young leaves - cooked[55, 159]. A pleasant acid flavour, they are cooked as greens or can be wrapped around other foods and then baked, when they impart a pleasant flavour[183]. Young tendrils - raw or cooked[55, 85, 159]. Sap. Best harvested in the spring or early summer, it has a sweet flavour and makes a pleasant drink[101]. The sap should not be harvested in quantity or it will weaken the plant[K]. An oil is obtained from the seed[46, 61]. This would only really be a viable crop if large quantities of grapes were being grown for wine.

tcanta Dye Miscellany Oil RootstockA yellow dye is obtained from the fresh or dried leaves[168]. The plant is used as a rootstock for the common grape, *V. vinifera*, especially in areas where phylloxera disease is prevalent[61].

dwatta Miscellany Poultice UrinaryThe leaves are hepatic[257]. An infusion has been used in the treatment of diarrhoea, hepatitis, stomach aches, fevers, headaches and thrush[222, 257]. Externally, the leaves are poulticed and applied to sore breasts, rheumatic joints and headaches[222, 257]. The wilted leaves have been applied as a poultice to the breasts to draw away soreness after the birth of a child[257]. An infusion of the bark has been used to treat urinary complaints[257].

propta Seed - best sown in a cold frame as soon as it is ripe[K]. Six weeks cold stratification improves the germination rate, and so stored seed is best sown in a cold frame as soon as it is obtained. Germination should take place in the first spring, but sometimes takes another 12 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant out in early summer. Cuttings of mature wood of the current seasons growth, December/January in a frame. These cuttings can be of wood 15 - 30cm long or they can be of short sections of the stem about 5cm long with just one bud at the top of the section. In this case a thin, narrow strip of the bark about 3cm long is removed from the bottom half of the side of the stem. This will encourage callusing and the formation of roots. Due to the size of these cuttings they need to be kept in a more protected environment than the longer cuttings. Layering.

nwatta Prefers a deep rich moist well-drained moderately fertile loam[1, 200]. Grows best in a calcareous soil[200]. Succeeds in sun or partial shade though a warm sunny position is required for the fruit to ripen[200]. The young growth in spring can be damaged by late frosts. Plants climb by means of tendrils[182], they grow particularly well into elm trees[18]. The flowers have the sweet scent of mignonette[245]. Any pruning should be carried out in winter when the plants are dormant otherwise they bleed profusely[182, 200]. Cultivated for its edible fruit in N. America, where it can produce yields of up to 17 tonnes per hectare[183]. It is the parent of several named varieties[1, 43, 183]. However, it is of no value as a fruit bearer in Britain, requiring hotter summers than are usually experienced in this country in order to ripen its fruit[11]. Another report says that this species is of interest for its hardiness and its ability to produce crops in cooler climates[200]. Resistant to Phylloxera disease, a disease that almost destroyed the European grape crops. This species can be used as a rootstock in areas where the disease is prevalent[61] and can also be used in breeding programmes with *V. vinifera* in order to impart resistance to that species[183]. Plants in this genus are notably susceptible to honey fungus[200]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. Woody. Growth habit is a single or multiple shooting vine from a crown [1-2].

## 5.2.165 Morus rubra

Red Mulberry, Common Mulberry, White Mulberry  
4 tin 9 cyuc 3 kcaak 2 tcan 2 dwat 15 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwis hpa7tmwatli nyanhjen hjonli

drutta Morus rubra is a deciduous Tree growing to 15 m (49ft 3in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in May, and the seeds ripen from July to August. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). . The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kakta Edible Parts: Fruit Leaves ShootsEdible Uses: Fruit - raw, cooked or made into preserves[2, 3, 21, 62, 149, 183]. Large and sweet with a good flavour, the fruit can be up to 3cm long[200]. The fruit can also be dried and ground into a powder[183]. This is used to make a delicious confection with almonds and other nuts[183]. The fruit is soft and juicy, when fully ripe it falls from the tree and is easily squashed[227]. Unripe fruits can cause stomach disorders[226]. Young shoots and unfolding leaves - raw or

cooked. The related White Mulberry (*Morus alba*) has edible young leaves and shoots eaten cooked[105, 183] but we have found no information for this plant.

tcanta Fibre WoodA cloth can be made from the fibrous bark[149]. Wood - coarse-grained, light, very durable, not strong, soft, rather tough. It weighs about 45lb per cubic foot and is used for boats, fencing and cooperage[46, 61, 82, 227, 229].

dwatta Anthelmintic Cathartic Dysentery FebrifugeThe root bark is anthelmintic and cathartic[21]. A tea made from the roots has been used in the treatment of weakness, difficult urination, dysentery, tapeworms and as a panacea[222, 257]. The sap is used in the treatment of ringworm[222, 257]. Another report says that the milky juice obtained from the axis of the leaf is used[21]. The fruits are used to reduce fevers[222].

propta The seed germinates best if given 2 - 3 months cold stratification[80, 98]. Sow the seed as soon as it is ripe if possible, otherwise in February in a cold frame. The seed usually germinates in the first spring, though it sometimes takes another 12 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the cold frame for their first winter. Plant them out in late spring or early summer after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in a frame. Plant out in spring. A good percentage take, though they sometimes fail to thrive[78, 113]. Cuttings of mature wood of the current season's growth, 25 - 30cm with a heel of 2 year old wood, autumn or early spring in a cold frame or a shady bed outside[78, 113, 200]. Bury the cuttings to threequarters of their depth. Layering in autumn[200].

nwatta Landscape Uses:Pest tolerant, Aggressive surface roots possible, Pollard. Prefers a warm well-drained loamy soil in a sunny position[1, 11]. The red mulberry is sometimes cultivated for its edible fruit, there are some named varieties[183]. It is said to be of no value as a fruiting tree in Britain[1, 11]. Trees come into bearing when about 10 years old, fruiting best between the ages of 30 - 85 years and declining from the age of 125 years[227]. A good plant to grow grapes into. The grapes are difficult to pick but they always seem to be healthier and free from fungal diseases[201]. Mulberries have brittle roots and so need to be handled with care when planting them out[238]. Any pruning should only be carried out in the winter when the plant is fully dormant because mulberries bleed badly when cut[238]. Ideally prune only badly placed branches and dead wood[238]. Plants in this genus are notably resistant to honey fungus[200]. Dioecious[229] Male and female plants must be grown if fruit is required. Special Features: Not North American native, Naturalizing, There are no flowers or blooms. The plant is heat tolerant in zones 9 through 5. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2]. The root pattern is a heart root, dividing from the crown into several primary roots going down and out [1-2]. The root pattern is a tap root similar to a carrot going directly down [1-2].

## 5.2.166 Hydrangea anomala

Hydrangea

4 tin 8 cyuc 3 kcaak 0 tcan 1 dwat 12 m hkuc  
pcimhmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli frusflatprikwis hpa7tmwatli xre7t hjonli

drutta Hydrangea anomala is a deciduous Climber growing to 12 m (39ft 4in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to July, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable

sow - sometimes to the point of nuisance[245].

## 5.2.255 Symphytum asperum

Prickly Comfrey

4 tin 8 cyuc 3 kcaak 0 tcan 2 dwat 1.5 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta Symphytum asperum is a PERENNIAL growing to 1.5 m (5ft) by 0.6 m (2ft in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from May to June, and the seeds ripen from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kakta Edible Parts: LeavesEdible Uses: Gum TeaThe following reports are for *S. officinale*, they are said to also apply to this species[200]. Young leaves - cooked or raw[2, 4, 5, 9, 46, 61]. The leaf is hairy and the texture is mucilaginous. It may be full of minerals but it is not pleasant eating for most tastes. It can be chopped up finely and added to salads, in this way the hairiness is not so obvious[183]. Young shoots can be used as an asparagus substitute[46]. The blanched stalks are used[183]. Older leaves can be dried and used as a tea[26]. The peeled roots are cut up and added to soups[183]. A tea is made from the dried leaves and roots[183]. The roasted roots are used with dandelion and chicory roots for making coffee[183].

tcanta Biomass Compost GumThe following reports are for *S. officinale*, they are said to also apply to this species[200]. The plant grows very quickly, producing a lot of bulk. It is tolerant of being cut several times a year and can be used to provide 'instant compost' for crops such as potatoes. Simply layer the wilted leaves at the bottom of the potato trench or apply them as a mulch in no-dig gardens. A liquid feed can be obtained by soaking the leaves in a small amount of water for a week, excellent for potassium demanding crops such as tomatoes. The leaves are also a very valuable addition to the compost heap[26, 200]. A gum obtained from the roots was at one time used in the treatment of wool before it was spun[100].

dwatta Anodyne Astringent Demulcent Emollient Expectorant Haemostatic Refrigerant VulneraryThe leaves are anodyne, mildly astringent, demulcent, emollient, expectorant, haemostatic, refrigerant and vulnerary. They are used as an external poultice in the treatment of cuts, bruises and sprains. Internally, they are used as a tea in the treatment of chest complaints. The plant contains a substance called 'allantoin', a cell proliferant that speeds up the healing process[4, 21, 26, 165]. The leaves are harvested in the summer and can be used fresh or dried.

propta Seed - sow spring or autumn in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. If you have sufficient seed you can try an outdoor sowing in situ in the spring. Division succeeds at almost any time of the year. Simply use a spade to chop off the top 7cm of root just below the soil level. The original root will regrow and you will have a number of root tops, each of which will make a new plant. These can either be potted up or planted out straight into their permanent positions.

nwatta Tolerates moist soils and situations but prefers a moist soil and some shade[1, 4]. Grows well in heavy clay soils. Best grown in an open sunny site in a deep rich soil if it is being grown for compost material[200]. Plants can be invasive, often spreading freely by means of self-sown seed. They are also very difficult to remove, the root system is very deep and even small fragments of root left in the soil can produce new plants.

## 5.2.256 Silphium integrifolium

Prairie Rosinweed

4 tin 8 cyuc 3 kcaak 2 tcan 1 dwat 1.8 m hkuc

htut cyutli hgatkyuctcup hwicli hyishrasjlutnyikfrip hpa7tli flatprikwis hpa7tmwatli hjonli

drutta Silphium integrifolium is a PERENNIAL growing to 1.8 m (6ft) by 0.9 m (3ft in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kakta Edible Parts: OilEdible Uses: OilCarbon Farming Solutions - Staple Crop: protein-oil (The term staple crop typically refers to a food that is eaten routinely and accounts for a dominant part of people's diets in a particular region of the world) [1-1]. Under development at the Land Institute to domesticate this species for use as an oilseed crop. Trials yielded 1.1t/ha of seed [1-1].

tcanta OilGarden Ornamental. Compared to other Silphium species, it is shorter, less likely to topple over, and faster from seed to flower. More manageable than most perennial sunflowers as it spreads slowly, and it is not known to be allelopathic. Adapts well to prairies, wildflower/native plant gardens, naturalized areas, meadows or moist, open woodland areas. Attracts birds and butterflies

dwatta Native American peoples used the roots to treat pain from injuries [4].

propta Seed. Plants may be slow to establish in the garden, particularly when grown from seed. Plants often self-seed in optimum growing conditions. Plants develop taproots. Once established, division is not recommended.

nwatta Management: Standard Staple Crop: Protein-oil Under DevelopmentClimate: boreal to warm temperate. Humidity: semi-arid to humid. It needs full sun, poor to loamy soils, and mesic to dry conditions. Average, medium moisture, well-drained soils. Tolerates some light shade. Also tolerates some drought once established. Will grow in a variety of soils including sandy, loamy or clay ones. Cultivation: under development. Management: standard (Describes the non-destructive management systems that are used in cultivation) [1-1].

## 5.2.257 Lilium canadense flavum

Meadow Lily

4 tin 8 cyuc 3 kcaak 0 tcan 0 dwat 1.5 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta Lilium canadense flavum is a BULB growing to 1.5 m (5ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in July, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kakta Edible Parts: RootEdible Uses: Bulb - cooked[2, 105, 177]. Rich in starch, it can be used as a vegetable in similar ways to potatoes (*Solanum tuberosum*). The taste is rather like raw green corn on the ear[207]. The bulb can be dried, ground into a powder and used in making bread etc[257]. A famine food, only used when better foods are not available[257]. The bulb is up to 5cm in diameter[235].

tcanta None known

dwatta None known

propta Seed - delayed hypogeal germination[130]. Best sown as soon as ripe in a cold frame, it should germinate in spring[143]. Stored seed will require a warm/cold/warm cycle of stratification, each period being about 2 months long[163]. Grow on in cool shady conditions. Great care should be taken in pricking out the young seedlings, many people leave them in the seed pot until they die down at the end of their second years growth. This necessitates sowing the seed thinly and using a reasonably fertile sowing medium. The plants will also require regular feeding when in growth. Divide the young bulbs when they are dormant, putting 2 - 3 in each pot, and grow them on for at least another year before planting them out into their permanent positions when the plants are dormant[K]. Division with care in

25cm or more tall, they can be planted out into their permanent positions, late spring or early summer being the best time to do this. Root cuttings 8cm long, December in a cold frame[11, 78]. Store the roots upside down in sand and pot up in March/April. High percentage[78]. Division of suckers in late winter[11]. Very easy, the suckers can be planted out direct into their permanent positions if required.

nwatta An easily grown plant, succeeding in sun or part shade in any fertile soil[233]. Prefers a good deep loam and a semi-shady position[1, 111, 134]. Requires a sheltered position[1]. Plants are harder when grown in poorer soils[200]. The young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. Grows well by water[111]. The plant is heat tolerant in zones 9 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is multi-stemmed with multiple stems from the crown [1-2]. The root pattern is suckering with new plants from underground runners away from the plant [1-2].

### 5.2.253 Sporobolus cryptandrus

Sand Dropseed

4 tin 8 cyuc 3 kcaak 0 tcan 0 dwat 1 m hkuc htut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Sporobolus cryptandrus is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: SeedEdible Uses: Seed - raw or cooked[257]. It can be parched, ground into a flour and eaten dry or made into a mush[61, 101, 105, 183]. The ground seed can also be added to biscuits, breads and other cereal concoctions[183, 257]. The tiny seed is easily freed from its husks[183].

tcanta Brush Soil reclamationA bunch of the grass, about 30cm long, can be tied together with string and used as a brush for cleaning[257].

dwatta None known

propta Seed - sow spring in a greenhouse and only just cover the seed. Germination should take place within 2 weeks. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in the summer if they have grown sufficiently. Otherwise, grow them on in a greenhouse for their first winter and plant them out in late spring of the following year. Division in spring. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Succeeds in any well drained soil in a sunny position[200].

### 5.2.254 Angelica archangelica

Angelica, Norwegian angelica

4 tin 8 cyuc 3 kcaak 0 tcan 3 dwat 1.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli frusflatpriklwis hpa7tmwatli fyixre7t hjonli

drutta Angelica archangelica is a BIENNIAL growing to 1.5 m (5ft) by 0.8 m (2ft 7in). See above for USDA hardi-

ness. It is hardy to UK zone 4 and is not frost tender. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves Root Seed StemEdible Uses: CondimentLeaves - raw or cooked[2, 4, 14, 27, 37, 52]. A liquorice-like flavour[183], they can be used as a flavouring in mixed salads[K]. They are also used to sweeten tart fruits[K]. Stalks and young shoots - cooked or raw[2, 37]. The stalks should be peeled[115], they can be used like celery[183]. They can also be used to sweeten tart fruits[52] and to make jam[244]. They are often crystallised in sugar and used as sweets and cake decorations[244]. The stems are best harvested in the spring[244]. An essential oil is obtained from the root and seeds, it is used as a food flavouring[46, 57, 100, 183]. Root - cooked[2]. Seed - used as a flavouring in liqueurs such as Chartreuse[244]. A tea can be made from the leaves, seed or roots[183].

tcanta EssentialAn essential oil from the root and seeds is used in perfumery, medicinally and as a food flavouring[4, 46, 57, 100]. The oil from the seeds has a musk-like aroma and is often used to flavour liqueurs[245]. The dried root contains 0.35% essential oil, the seed about 1.3%[240]. Yields of the essential oil vary according to location, plants growing at higher altitudes have higher yields with a better aroma[240].

dwatta Antispasmodic Appetizer Carminative Diaphoretic Diuretic Expectorant Stimulant Stomachic Tonic UrinaryAngelica has a long folk-history of use as a medicinal herb, in particular for the treatment of digestive disorders and problems with blood circulation[4, 254]. The root is the most active medicinally, it should be harvested in the autumn of its first year of growth, sliced longitudinally if necessary and dried quickly[4]. If well stored, the root retains its medicinal virtues for many years[4]. The leaves and seeds can also be used[4]. The leaves are harvested and dried in late spring before the plant comes into flower[244]. The plant is antispasmodic, carminative, diaphoretic, diuretic, expectorant, stimulant, stomachic, tonic[4, 9, 14, 21, 46, 165]. An infusion is used to ease flatulence, indigestion, chronic bronchitis and typhus[244]. It stimulates blood flow to the peripheral parts of the body and so is of value in treating poor circulation - it is considered a specific treatment for Buerger's disease, a condition that narrows the arteries of the hands and feet[254]. Angelica is contra-indicated for people with a tendency towards diabetes since its use can increase sugar levels in the urine[4]. This plant should not be prescribed for pregnant women[238], nor should the juice be allowed to come into contact with the eyes[244]. An essential oil from the seeds is sometimes used as a rub to relieve rheumatic conditions[244]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve Angelica archangelica fruit for fevers and colds, infection of the urinary tract, dyspeptic complaints and loss of appetite. The root has been approved for dyspeptic complaints and loss of appetite. (see [302] for critics of commission E). No health hazards or side-effects if the proper administration of therapeutic dosages. Avoid sunbathing and intensive UV radiation for the duration of a treatment [301].

propta Seed - best sown in a cold frame as soon as it is ripe since the seed only has a short viability[200]. Seed can also be sown in the spring, though germination rates will be lower. It requires light for germination[200]. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for their first winter, planting them out into their permanent positions in the spring. The seed can also be sown in situ as soon as it is ripe.

nwatta Requires a deep moist fertile soil in dappled shade or full sun[52, 200]. Tolerates a pH in the range 4.5 to 7.3. A very hardy plant, tolerating severe frosts without damage[4]. Although by nature biennial, the plants are reliably perennial if they are prevented from setting seed[200]. Angelica is occasionally cultivated in the herb garden, mainly for its culinary uses[46]. The plants have a pervading aromatic odour[4]. The growing plant is almost untroubled by pests and diseases[4]. It attracts bees and hoverflies in the garden, helping to create a natural balance of insect pests and predators[24]. When well-sited, the plant will often self-

for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: Leaves SapEdible Uses: Condiment SweetenerLeaves - cooked. A cucumber taste[183]. The Japanese crush the leaves and use them fresh with miso[177, 183]. A boiled concoction of the leaves is used to make a syrup[177, 183]. The sweet sap is used as a drink[183].

tcanta PaperThe bark is a paper substitute[146, 158]. The sub-species *H. anomala petiolaris* can be used as a ground cover plant in a shady position[188]. It is best spaced about 1.8 metres apart each way[208].

dwatta The leaves are used medicinally[266]. No further information is given.

propta Seed - surface sow in a greenhouse in spring[113]. Cover the pot with paper until the seed germinates[78]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 8cm long, July/August in a frame. Overwinter in a greenhouse and plant out in late spring[78]. Cuttings of mature wood in late autumn in a frame[200]. Mound layering in spring. Takes 12 months[78]. Basal softwood cuttings of non-flowering shoots[200]. Leaf-bud cuttings of the current seasons growth in a frame[200].

nwatta Landscape Uses:Arbor, Espalier. Tolerates most soils[200], thriving in a well-drained loamy soil[1], but resenting dryness at the roots[11, 200]. Succeeds in full sun or semi-shade[200], but if it is grown in a low rainfall area then it requires shade at the hottest part of the day[11]. Does well on very acid soils with a pH around 4.5[200]. The colour of the flowers reflects the pH of the soil the plant is growing in, the flowers are pink in a neutral to alkaline soil and blue in an acid soil. Although the dormant plant is quite hardy in Britain, the young growth in spring can be damaged by late frosts. A fast-growing self-clinging climbing plant[208], attaching itself by means of aerial roots[200], and growing up walls or tree trunks on any aspect. The plants may need initial support, however[200]. Plants are growing well on a wall at Kew[11]. Grows well on north walls but prefers a sunnier position[208]. Closely related to *H. petiolaris*[11]. *H. petiolaris* is normally treated as no more than a sub-species of this species[200]. This species is notably susceptible to honey fungus[200]. Special Features: Not North American native, Blooms are very showy.

### 5.2.167 Sorbopyrus auricularis

Bollwyller Pear

4 tin 8 cyuc 3 kcaak 0 tcan 0 dwat 12 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Sorbopyrus auricularis is a deciduous Tree growing to 12 m (39ft 4in). See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf from May to November, in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[183]. The fruit has a dry and sweet yellowish flesh[11, 200]. Rather like a small pear, it has a very nice flavour when fully ripe[K]. The fruit is up to 5cm long[200].

tcanta None known

dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe if this is possible, otherwise in late winter. The plant produces very little fertile seed, and this does not breed true[200], though some interesting plants might be produced[K]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer,

after the last expected frosts. Grafting is the best method of propagating this plant. This is best carried out in early spring, though budding can be carried out in the summer.

nwatta Succeeds in a well-drained moisture-retentive soil in an open sunny position[200]. Succeeds in light shade but fruits less well in such a position. This species is a bigeneric hybrid of garden origin between *Sorbus aria* and *Pyrus communis*[183].

### 5.2.168 Viburnum rufidulum

Southern Black Haw, Rusty blackhaw

4 tin 8 cyuc 3 kcaak 0 tcan 1 dwat 12 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli dyatxre7t hjonli

drutta Viburnum rufidulum is a deciduous Shrub growing to 12 m (39ft 4in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in June, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[183]. The fleshy fruit has a sweet taste, somewhat like raisins[274], but it is nearly all seed[43, 159]. The taste is best after a frost. The ellipsoid fruit is up to 15mm long and contains a single large seed[229].

tcanta WoodWood - fine-grained, heavy, hard, strong, with a disagreeable odour[227]. Of no particular value[227].

dwatta AntispasmodicThe bark is antispasmodic and has been used in the treatment of cramps and colic[254].

propta Seed - best sown in a cold frame as soon as it is ripe. Germination can be slow, sometimes taking more than 18 months. If the seed is harvested 'green' (when it has fully developed but before it has fully ripened) and sown immediately in a cold frame, it should germinate in the spring[80]. Stored seed will require 2 months warm then 3 months cold stratification and can still take 18 months to germinate[113]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame or greenhouse. Plant out into their permanent positions in late spring or early summer of the following year. Cuttings of soft-wood, early summer in a frame[200]. Pot up into individual pots once they start to root and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, 5 - 8 cm long with a heel if possible, July/August in a frame[78, 113]. Plant them into individual pots as soon as they start to root. These cuttings can be difficult to overwinter, it is best to keep them in a greenhouse or cold frame until the following spring before planting them out[113]. Cuttings of mature wood, winter in a frame. They should root in early spring - pot them up when large enough to handle and plant them out in the summer if sufficient new growth is made, otherwise keep them in a cold frame for the next winter and then plant them out in the spring. Layering of current seasons growth in July/August. Takes 15 months[78].

nwatta An easily grown plant, it succeeds in most soils but is ill-adapted for poor soils and for dry situations[1]. It prefers a deep rich loamy soil in sun or semi-shade[11, 200]. Best if given shade from the early morning sun in spring[200]. A fast-growing but short-lived species in the wild[229]. Plants grow well but do not flower very freely in Britain[11]. Plants are self-incompatible and need to grow close to a genetically distinct plant in the same species in order to produce fruit and fertile seed[11, 200].

### 5.2.169 Cercis canadensis

Redbud, Eastern redbud, Mexican redbud,Texas redbud

4 tin 9 cyuc 3 kcaak 2 tcan 2 dwat 12 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli frusflatpriklwis hpa7tmwatli xre7t hjonli

drutta Cercis canadensis is a deciduous Tree growing to 12 m (39ft) by 10 m (32ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from May to June, and the seeds ripen in

October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**kcakta Edible Parts:** Flowers Leaves Seedpod**Edible Uses:** CondimentFlowers - raw[46, 61, 94, 183] or pickled[2, 105, 149]. A nice refreshing acid taste, the flowers are rich in vitamin C and make a pleasant addition to salads[183, K]. They can also be used as a condiment[200]. The unopened buds are pickled or used as a caper substitute[183]. On a zero moisture basis, the seed contains 22.9 - 27.5% protein, 7.7 - 8.8% fat and 3% ash[218]. (This report does not say if the seed is edible[K]). There is some evidence that both the young seed pods (eaten like snow peas) and the young leaves can be eaten.

**tcanta Basketry Wood**The bark of young shoots is used in basket making[94, 106]. Wood - heavy, hard, not strong, close grained, takes a very fine polish[82, 94]. It weighs 40lb per cubic foot[235].

**dwatta Astringent Cancer Dysentery Febrifuge Pectoral Vitamin C** Tea made from the inner bark is highly astringent[46, 61, 94, 149, 222]. Used in the treatment of fevers, diarrhoea and dysentery, it is also a folk remedy for leukaemia[222]. A cold infusion of the roots and inner bark have been used to treat various chest complaints including whooping cough and congestion[257].

**propta Seed** - best sown as soon as it is ripe in a cold frame[200]. Pre-soak stored seed for 24 hours in warm water then cold stratify for 3 months[113]. Sow spring in the greenhouse[78]. As soon as they are large enough to handle, prick the seedlings out into individual pots and grow them on in a greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Plants resent root disturbance and are best planted out in their permanent positions as soon as possible[11]. Cuttings of half-ripe wood, July/August in a frame[200].

**nwatta Landscape Uses:**Border, Standard, Specimen, Street tree, Woodland garden. Succeeds in most soils and pH types, but dislikes growing in wet soils, especially when these are of clay[200]. Prefers a deep sandy loam and a very sunny position[11, 98, 182]. Succeeds in light shade[200]. Dislikes drought[200]. Although the dormant plant is cold-hardy, the young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. A fast-growing but short-lived tree in the wild[229]. It does not flower freely in Britain[188]. There is at least one named form, selected for its ornamental value[188]. This species is the state tree of Oklahoma[274]. The flowers are produced on the branches of the previous or earlier years, and also on the trunk of the plant[82]. Plants are susceptible to coral spot fungus, especially when growing in areas with cooler summers where the wood is not fully ripened[11]. Plants in this genus are notably resistant to honey fungus[200]. A good bee plant[149]. Resents root disturbance, plants should be planted into their permanent positions as soon as possible, preferably in May, and should be kept well watered until established[11, 188]. This species is one of the few members of the family Leguminosae that do not fix atmospheric nitrogen[226]. **Special Features:**North American native, Attracts butterflies, Blooms are very showy. The plant is heat tolerant in zones 9 through 2. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2]. The root pattern is a tap root similar to a carrot going directly down [1-2].

## 5.2.170 Sorbus aria

**Whitebeam, Chess-apple**  
4 tin 8 cyuc 3 kcaak 4 tcan 1 dwat 12 m hkuc  
hmmihhut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli frusflat-prikhwisslip hpa7tmwatli xre7t hjonli

**drutta Sorbus aria** is a deciduous Tree growing to 12 m (39ft) by 8 m (26ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from May to June, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure. It can tolerate atmospheric pollution.

**kcakta Edible Parts:** Fruit**Edible Uses:** Fruit - raw or cooked and used in preserves etc. The fruit is usually bletted if it is going to be eaten raw[2, 3, 5, 105, 115, 183]. This involves storing the fruit in a cool dry place until it is almost but not quite going rotten. At this stage the fruit has a delicious taste, somewhat like a luscious tropical fruit[K]. Fruit from some trees has a pleasant mild flavour and a mealy texture, we like eating small quantities of it. The fruit can also be dried and ground into a powder and mixed with cereals such as wheat[2, 46, 66]. The fruit is about 10 - 12mm across[200].

**tcanta Pioneer Shelterbelt Wood**Very tolerant of exposed maritime conditions, it makes a good windbreak tree near the coast[75, 200]. A useful pioneer species, especially on chalky soils and in windy situations[186, K]. Wood - hard, heavy, close grained. Used for beams etc[11, 115].

**dwatta Diuretic Emmenagogue Laxative**Both the flowers and the fruit are mildly diuretic, laxative and emmenagogue[9]. An infusion is used in the treatment of painful menstruation, constipation and kidney disorders[9].

**propta Seed** - best sown as soon as it is ripe in a cold frame[78, 80]. If you have sufficient seed it can be sown in an outdoor seedbed[78, 80]. Stored seed germinates better if given 2 weeks warm then 14 - 16 weeks cold stratification[98], so sow it as early in the year as possible. Prick out the seedlings into individual pots when they are large enough to handle. Seedlings are very slow to put on top-growth for their first year or two[11], but they are busy building up a good root system. It is best to keep them in pots in a cold frame for their first winter and then plant them out into their permanent positions in late spring.

**nwatta Succeeds** in most reasonably good soils in an open sunny position[11]. Tolerates acid sands and thin chalky soils[98, 200]. Does well on heavy clays[200]. Tolerates light shade[188], though it fruits better in a sunny position[K]. Very tolerant of atmospheric pollution and of exposed maritime positions[186]. The whitebeam is one of the first colonizers of chalk scrub[186]. As well as being a good pioneer species for this situation, it will often survive through the development to woodland[186]. There are several named varieties selected for their ornamental value[188]. Trees cast a fairly dense shade when mature[186]. Regenerating well after cutting, it is suitable for coppicing[186]. The fruit is very attractive to birds[11]. Plants are susceptible to fire-blight[188]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

## 5.2.171 Smilax rotundifolia

**Horse Brier, Roundleaf greenbrier, Brambles**  
4 tin 9 cyuc 3 kcaak 0 tcan 2 dwat 12 m hkuc  
hmmihhut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikhwis hpa7tmwatli nyanhjen hjonli

**drutta Smilax rotundifolia** is a deciduous Climber growing to 12 m (39ft 4in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower in June. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant

pie[183]. Cherry-like, a harsh sour taste[178]. A reasonable size, about 14mm in diameter with one large seed[200]. Seed - raw or cooked. Do not eat the seed if it is too bitter - see the notes above on toxicity.

**tcanta DyeA green dye** can be obtained from the leaves[168]. A dark grey to green dye can be obtained from the fruit[168].

**dwatta Aperient Carminative Demulcent Deobstruent Diuretic Lenitive Ophthalmic**The kernels are aperient, carminative, demulcent, deobstruent, diuretic, hypotensive, laxative, lenitive and ophthalmic[147, 176, 178, 218, 238]. They are taken internally in the treatment of dry constipation, oedema and insomnia following a trauma[238]. The root is used in the treatment of constipation, children's fever, pinworms and teeth ailments[218]. Although no specific mention has been seen for this species, all members of the genus contain amygdalin and prunasin, substances which break down in water to form hydrocyanic acid (cyanide or prussic acid). In small amounts this exceedingly poisonous compound stimulates respiration, improves digestion and gives a sense of well-being[238].

**propta Seed** - requires 2 - 3 months cold stratification and is best sown in a cold frame as soon as it is ripe[200]. Sow stored seed in a cold frame as early in the year as possible[200]. Protect the seed from mice etc. The seed can be rather slow, sometimes taking 18 months to germinate[113]. Prick out the seedlings into individual pots when they are large enough to handle. Grow them on in a greenhouse or cold frame for their first winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood with a heel, July/August in a frame[11, 200]. Softwood cuttings from strongly growing plants in spring to early summer in a frame[200]. Layering in spring.

**nwatta Thrives** in a well-drained moisture-retentive loamy soil[11, 200]. Prefers some lime in the soil but is likely to become chlorotic if too much lime is present[1]. Succeeds in sun or partial shade though it fruits better in a sunny position[11, 200]. Plants are hardy to at least -15°C[238]. A very ornamental plant[1], but it is subject to die-back[11]. Plants in this genus are notably susceptible to honey fungus[200]. The Korean cherry is sometimes cultivated for its edible fruit, there is at least one named variety[183]. The sub-species *P. japonica nakai*. (Lév.)Rehd., which comes from Manchuria, has larger plum-like fruits up to 50mm in diameter[200]. This species is closely related to *P. glandulosa*[11, 58]. Most members of this genus are shallow-rooted and will produce suckers if the roots are damaged[238].

## 5.2.251 Berberis canadensis

**Allegheny Barberry, American barberry**  
4 tin 8 cyuc 3 kcaak 1 tcan 2 dwat 1 y 8 m hkuc  
hmmihhut cyutli kyuctup hwicli hy8hrasjlutnyikfrip hpa7tli flatprikhwis hpa7tmwatli fyfuxre7t hjonli

**drutta Berberis canadensis** is a deciduous Shrub growing to 1.8 m (6ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in May, and the seeds ripen in August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

**kcakta Edible Parts:** Flowers Fruit Leaves**Edible Uses:** Fruit - raw or cooked. Agreeably acid[2, 22, 46, 95, 161], they are an acceptable raw fruit in small quantities but are more commonly used in preserves[177, K]. The fruits are about 9mm long[200]. Leaves - raw. A trailside nibble[102]. Flowers[102]. No more details.

**tcanta DyeA yellow dye** is obtained from the root.  
**dwatta Antibacterial Cancer Dysentery**Berberine, universally present in rhizomes of Berberis species, has marked antibacterial effects. Since it is not appreciably absorbed by the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not be used with Glycyrrhiza species (Licorice) because this nullifies the effects of the berberine[218]. Berberine has also shown antitumour activity[218]. A tea made from the roots is used in the treatment of fevers and diarrhoea[222].

**propta Seed** - best sown as soon as it is ripe in a cold frame, when it should germinate in late winter or early spring[78]. Seed from over-ripe fruit will take longer to germinate[78], whilst stored seed may require cold stratification and should be sown in a cold frame as early in the year as possible[80]. The seedlings are subject to damping off, so should be kept well ventilated[113]. When the seedlings are large enough to handle, prick them out into individual pots and grow them on in a cold frame. If growth is sufficient, it can be possible to plant them out into their permanent positions in the autumn, but generally it is best to leave them in the cold frame for the winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, July/August in a frame. Cuttings of mature wood of the current season's growth, preferably with a heel, October/November in a frame[78].

**nwatta Prefers** a warm moist loamy soil but is by no means fastidious, succeeding in thin, dry and shallow soils[11, 200]. Grows well in heavy clay soils. Succeeds in full sun or light shade[11, 200]. The plant is an alternate host of 'black stem rust' of cereals and so it is often grubbed out when growing wild in cereal-producing areas. Hybridizes freely with other members of this genus[1]. Plants can be pruned back quite severely and resprout well from the base[200]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is multistemmed with multiple stems from the crown [1-2].

## 5.2.252 Aralia racemosa

**American Spikenard**  
4 tin 8 cyuc 3 kcaak 2 tcan 3 dwat 1.8 m hkuc  
pcimhmm cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikhwis hpa7tmwatli xre7t hjonli

**drutta Aralia racemosa** is a PERENNIAL growing to 1.8 m (6ft) by 1.2 m (4ft in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower in June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

**kcakta Edible Parts:** Fruit Leaves Root**Edible Uses:** CondimentYoung shoot tips - cooked[161]. Used as a pot herb[207] or as a flavouring in soups[257]. Root - cooked. Large and spicy, it is used in soups[43, 105, 161, 177]. Pleasantly aromatic, imparting a liquorice-like flavour[183]. A substitute for sarsaparilla (*Smilax* spp.)[200], it is also used in making 'root beer'[183]. Fruit - raw or cooked[207]. Pleasant and wholesome to eat[207]. They can be made into a jelly[183, 207]. The fruit is about 4mm in diameter[200]. The roots have an aroma. The fruit are purple-brown [1-4].

**tcanta A specialist nectary plant** [1-2].

**dwatta Alternative Antirheumatic Diaphoretic Eczema Expectorant Poulitice Skin Stimulant**American spikenard is a sweet pungent tonic herb that is often used in modern herbalism where it acts as an alterative[238]. It had a wide range of traditional uses amongst the North American Indians and was at one time widely used as a substitute for the tropical medicinal herb sarsaparilla[222, 257]. The root is alterative, diaphoretic, diuretic, pectoral and stimulant[4, 21, 46, 222]. The herb encourages sweating, is stimulating and detoxifying and so is used internally in the treatment of pulmonary diseases, asthma, rheumatism etc[4, 213, 238, 254]. Externally it is used as a poultice in treating rheumatism and skin problems such as eczema[4, 213, 238, 254]. The root is collected in late summer and the autumn and dried for later use[4, 213]. A drink made from the pulverised roots is used as a cough treatment[213]. A poultice made from the roots and/or the fruit is applied to sores, burns, itchy skin, ulcers, swellings etc[213, 222].

**propta Seed** - best sown as soon as ripe in a cold frame. Stored seed requires 3 - 5 months of cold stratification. Germination usually takes place within 1 - 4 months at 20°C[134]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in a greenhouse for at least their first winter. Once the plants are

can be grown as a low hedge and does not need trimming. Because of its suckering habit, it also makes a good dense ground cover plant though it can be slow to become established[197, 200].

dwatta Alternative Antibacterial Antipsoriatic Antiseborrheic Antitumor Blood Tonic Cholagogue Diuretic Dysentery Laxative Ophthalmic TonicOregon grape was often used by several native North American Indian tribes to treat loss of appetite and debility[254]. Its current herbal use is mainly in the treatment of gastritis and general digestive weakness, to stimulate the kidney and gallbladder function and to reduce catarrhal problems[254, 257]. The root and root bark is alternative, blood tonic, cholagogue, diuretic, laxative and tonic[4, 21, 165, 257]. It improves the digestion and absorption and is taken internally in the treatment of psoriasis, syphilis, haemorrhages, stomach complaints and impure blood conditions[4, 238]. Externally, it has been used as a gargle for sore throats and as a wash for blurry or blood-shot eyes[257]. The roots are harvested in late autumn or early spring and dried for later use[238]. The fruit is an excellent gentle and safe laxative[257]. Berberine, universally present in rhizomes of Mahonia species, has marked antibacterial effects[218] and is used as a bitter tonic[213]. Since it is not appreciably absorbed by the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not be used with Glycyrrhiza species (Licorice) because this nullifies the effects of the berberine[218]. Berberine has also shown antitumour activity[218]. The root and root bark are best harvested in the autumn[213].

propta Seed - best sown as soon as it is ripe in a cold frame[78]. It usually germinates in the spring[K]. 'Green' seed (harvested when the embryo has fully developed but before the seed case has dried) should be sown as soon as it is harvested and germinates within 6 weeks[K]. Stored seed should be sown as soon as possible in late winter or spring. 3 weeks cold stratification will improve its germination, which should take place in 3 - 6 months at 10°C. Prick out the seedlings when they are large enough to handle and grow them on in a cold frame for at least their first winter. Plant them out in late spring or early summer. Division of suckers in spring[78]. Whilst they can be placed direct into their permanent positions, better results are achieved if they are potted up and placed in a frame until established[11]. Leaf cuttings in the autumn.

nwatta Landscape Uses:Border, Foundation, Pest tolerant, Massing, Specimen, Woodland garden. A very easy plant to grow, thriving in any good garden soil[11, 200] and tolerating dense shade under trees[1, 28]. It grows well in heavy clay soils and also succeeds in dry soils if it is given a good mulch annually[197]. It dislikes exposure to strong winds[K]. Plants are hardy to about -20°C[184]. Very tolerant of pruning, plants can be cut back into old wood if they grow too large and straggly[238]. Spring is the best time to do this[238]. Suckers are fairly freely produced, with established plants forming dense thickets[200]. Most plants grown under this name are casual hybrids with *M. repens*[67]. This species is easily confused with *M. pinata*[67], with which it also hybridizes[200]. The flowers are delicately scented[245]. A number of named forms have been developed for their ornamental value[182]. This species is notably resistant to honey fungus[88, 200]. This plant is the state flower of Oregon[95]. Special Features: North American native, Fragrant flowers, Attractive flowers or blooms. The plant is heat tolerant in zones 9 through 6. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. An evergreen. The root pattern is flat with shallow roots forming a plate near the soil surface [1-2]. The root pattern is stoloniferous rooting from creeping stems above the ground [1-2].

## 5.2.249 Ribes lacustre

Prickly Blackcurrant, Prickly currant  
4 tlin 8 cyuc 3 kcaak 2 tcan 1 dwat 1.5 m hkuc  
hmmihhut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis  
hpa7tmwatli xre7t hjonli

drutta Ribes lacustre is a deciduous Shrub growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[2, 3, 85, 101, 257]. Tart and very juicy[183]. The fully ripe fruit has an agreeable flavour[256]. When crushed the fruit has a foul odour[43] but when eaten by the handful the odour is inoffensive (this sounds a bit strange!) and when cooked they make a good sauce[183]. The fruit can also be dried for later use or used to make jams and preserves[257]. The fruit is about 5mm in diameter[200] and is covered with weak gland-tipped bristles[235].

tcanta Needles StringThe roots have been boiled with cedar (*Juniperus* spp, Thuja sp.) and wild rose (*Rosa* spp) roots, then pounded and woven into rope[257]. The sharp thorns have been used as probes for boils, for removing splinters and for tattooing[257].

dwatta Analgesic Birthing aid Laxative Ophthalmic StomachicThe leaves or the bark can be chewed and then placed on sores caused by the prickles of this plant[257]. A decoction of the bark has been used as a wash for sore eyes[257]. The decoction has also been taken by women during labour to ease the birth[257]. A decoction of the root can be taken several times a day as a treatment for constipation[257]. A decoction of the twigs has been taken in the treatment of general body aches[257]. A decoction of dried branches has been used in the treatment of stomach complaints, diarrhoea and colds[257].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. Stored seed requires 4 - 6 months cold stratification at about 0°C and should be sown as early in the year as possible[113, 164]. Under normal storage conditions the seed can remain viable for 17 years or more. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter, planting them out in late spring of the following year. Cuttings of half-ripe wood, 10 - 15cm with a heel, July/August in a frame[78, 113]. Cuttings of mature wood of the current year's growth, preferably with a heel of the previous year's growth, November to February in a cold frame or sheltered bed outdoors[78, 200].

nwatta Easily grown in a moisture retentive but well-drained loamy soil of at least moderate quality[11, 200]. Plants are quite tolerant of shade though do not fruit so well in such a position[11]. Hardy to about -20°C[200]. Although this plant has spines, it belongs to the blackcurrant section of the genus[101]. Plants can harbour a stage of 'white pine blister rust', so they should not be grown in the vicinity of pine trees[155]. Plants in this genus are notably susceptible to honey fungus[200].

## 5.2.250 Prunus japonica

Korean Cherry, Japanese bush cherry  
4 tlin 8 cyuc 3 kcaak 1 tcan 3 dwat 1.5 m hkuc  
hmmihhut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis  
hpa7tmwatli xre7t hjonli

drutta Prunus japonica is an evergreen Shrub growing to 1.5 m (5ft) by 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower in May, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Fruit SeedEdible Uses: Fruit - raw or cooked. A sweet agreeable flavour, they make a good

so both male and female plants must be grown if seed is required). . The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Drink-Root - cooked[2, 102, 161, 257]. Rich in starch[105]. The root can be dried and ground into a powder that is used in making cakes, puddings, sweet drinks etc[46, 183], it can also be made into a jelly or eaten in soups[159]. A beer resembling root beer or sarsaparilla is made from the roots[183]. Young shoots - raw or cooked[62, 102, 105, 159]. They can be added to salads or cooked like asparagus[183].

tcanta None known  
dwatta Birthing aid Poultice RubefacientThe stem prickles have been rubbed on the skin as a counter-irritant to relieve localised pains, muscle cramps and twitching[222]. A tea made from the leaves and stems has been used in the treatment of rheumatism and stomach problems[222]. The parched and powdered leaves have been used as a dressing on burns and scalds[257]. The wilted leaves have been used as a poultice on boils[222, 257]. A tea made from the roots is used to help the expelling of afterbirth[222]. Reports that the roots contain the hormone testosterone have not been confirmed, they might contain steroid precursors, however[222].

propta Seed - sow March in a warm greenhouse[1]. This note probably refers to the tropical members of the genus, seeds of plants from cooler areas seem to require a period of cold stratification, some species taking 2 or more years to germinate[K]. We sow the seed of temperate species in a cold frame as soon as we receive it, and would sow the seed as soon as it is ripe if we could obtain it then[K]. When the seedlings eventually germinate, prick them out into individual pots when they are large enough to handle and grow them on in the greenhouse for at least their first year, though we normally grow them on in pots for 2 years. Plant them out into their permanent positions in early summer. Division in early spring as new growth begins[238]. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer. Cuttings of half-ripe shoots, July in a frame[238].

nwatta Succeeds in most soils in sun or semi-shade[1, 200]. A very free growing plant, it can be used to clamber over large trees, shrubs or tree stumps[1, 200]. Hardy to about -20°C[200]. Dioecious. Male and female plants must be grown if seed is required. Special Features:North American native, Invasive, Naturalizing, Attractive flowers or blooms.

## 5.2.172 Taxus cuspidata

Japanese Yew  
4 tlin 7 cyuc 3 kcaak 2 tcan 4 dwat 10 m hkuc  
pcimhmmihhut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli  
frusflatprikliwislip hpa7tmwatli nyanhjen hjonli

drutta Taxus cuspidata is an evergreen Tree growing to 10 m (32ft) by 10 m (32ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in leaf all year, and the seeds ripen from September to November. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and very alkaline soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or made into jam[105, 183]. Very sweet and gelatinous, most people find it delicious though some find it sickly. The fruit is a fleshy berry about 8mm in diameter and containing a single seed[200]. All other parts of this plant, including the seed, are highly poisonous. When eating the fruit you should spit out the large seed found in the fruit's centre. Should you swallow the whole seed it will just pass straight through you

without harm, if the seed has been bitten into, however, it could cause some problems.

tcanta Dye WoodA brown dye is obtained from the heart-wood[46, 61]. Red according to another report[266]. An oil is extracted from the seeds[266]. Wood - hard, strong, elastic, fine grained, takes a beautiful polish. Used for furniture, bows etc[1, 46, 61]. The wood is used in building construction, furniture manufacture and as a carving material[266].

dwatta CancerModern research has shown that yew trees contain the substance 'taxol' in their shoots and bark. Taxol has shown exciting potential as an anti-cancer drug, particularly in the treatment of ovarian cancers[218, 238]. This remedy is very toxic and, even when used externally, should only be used under the supervision of a qualified practitioner[238]. See also the notes above on toxicity. A compound used to treat diabetes is extracted from the wood, bark, leaves, and roots[266].

propta Seed - can be very slow to germinate, often taking 2 or more years[78, 80]. It is best sown as soon as it is ripe in the autumn when it should germinate 18 months later. Stored seed may take 2 years or more to germinate. 4 months warm followed by 4 months cold stratification may help reduce the germination time[113]. Harvesting the seed 'green' (when fully developed but before it has dried on the plant) and then sowing it immediately has not been found to reduce the germination time because the inhibiting factors develop too early[80]. Prick out the seedlings into individual pots once they are large enough to handle and grow them on in pots in a cold frame. The seedlings are very slow-growing and will probably require at least 2 years of pot cultivation before being large enough to plant out. Any planting out is best done in late spring or early summer, after the last expected frosts[K]. Cuttings of half-ripe terminal shoots, 5 - 8cm long, July/August in a shaded frame. Should root by late September but leave them in the frame over winter and plant out in late spring[78]. High percentage[11]. Cuttings of ripe terminal shoots, taken in winter after a hard frost, in a shaded frame[113].

nwatta Landscape Uses:Hedge, Screen, Superior hedge, Specimen. Thrives in almost any soil, acid or alkaline, as long as it is well-drained[1, 200]. Succeeds in dry soils[188]. Very shade tolerant[81]. The dormant plant is hardy to about -35°C[200] but it requires more summer heat and humidity than *T. baccata* and is rarely more than a shrub in Britain[81]. Young shoots can be damaged by late spring frosts. The foliage may turn reddish-brown in cold winters[81]. There are several named varieties selected for their ornamental value[188]. Plants produce very little fibrous root and should be planted in their final positions when still small[200]. Plants in this genus are notably resistant to honey fungus[200]. Dioecious. Male and female plants must be grown if fruit and seed is required. Female plants fruit freely in Britain if they are pollinated[11, 185]. Special Features:Not North American native, All or parts of this plant are poisonous, Inconspicuous flowers or blooms.

## 5.2.173 Sorbopyrus species

4 tlin 8 cyuc 3 kcaak 0 tcan 0 dwat 10 m hkuc  
hmmihhut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis  
hpa7tmwatli xre7t hjonli

drutta Sorbopyrus species is a deciduous Tree growing to 10 m (32ft 10in). See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf from May to November, in flower in April, and the seeds ripen in August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Fruit - raw or cooked[183].  
tcanta None known  
dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe if this is possible, otherwise in late winter. The plant produces very little fertile seed, and this does not breed true[200], though some interesting plants might be produced[K]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into

their permanent positions in late spring or early summer, after the last expected frosts. Grafting is the best method of propagating this plant. This is best carried out in early spring, though budding can be carried out in the summer.

nwatta Succeds in a well-drained moisture-retentive soil in an open sunny position[200]. Succeds in light shade but fruits less well in such a position. This species is a bi-generic hybrid of garden origin between a Sorbus species and Pyrus communis[183].

## 5.2.174 Crataegus punctata

Dotted Hawthorn,

4 tlin 8 cyuc 3 kcaak 2 tcan 2 dwat 10 m hkuc hmimhtut cyutli hgattcuphja7n hwicli brasljutnyikfrrip hpa7tli flatprikwisslip hpa7tmwatli xre7t hjonli

drutta Crataegus punctata is a deciduous Tree growing to 10 m (32ft 10in). See above for USDA hardness. It is hardy to UK zone 4 and is not frost tender. It is in flower in June, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Midges. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcaakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[159]. Eaten out of hand or made into jellies, preserves etc[177, 183]. A good size, about 25mm in diameter, and borne in small clusters[200]. Ripening in October, it is quite apple-like in texture and appearance, making a good dessert fruit[K]. There are up to five fairly large seeds in the centre of the fruit, these often stick together and so the effect is of eating a cherry-like fruit with a single seed[K].

tcanta MiscellanyWood - heavy, hard, tough, close-grained. Useful for making tool handles, mallets and other small items[82].

dwatta Cardiotonic Hypotensive MiscellanyA compound decoction of the shoots and bark has been used to stop menstrual flow[257]. Although no other specific mention has been seen for this species, the fruits and flowers of many hawthorns are well-known in herbal folk medicine as a heart tonic and modern research has borne out this use. The fruits and flowers have a hypotensive effect as well as acting as a direct and mild heart tonic[222]. They are especially indicated in the treatment of weak heart combined with high blood pressure[222]. Prolonged use is necessary for it to be efficacious[222]. It is normally used either as a tea or a tincture[222].

propta Seed - this is best sown as soon as it is ripe in the autumn in a cold frame, some of the seed will germinate in the spring, though most will probably take another year. Stored seed can be very slow and erratic to germinate, it should be warm stratified for 3 months at 15°C and then cold stratified for another 3 months at 4°C[164]. It may still take another 18 months to germinate[78]. Scarifying the seed before stratifying it might reduce this time[80]. Fermenting the seed for a few days in its own pulp may also speed up the germination process[K]. Another possibility is to harvest the seed 'green' (as soon as the embryo has fully developed but before the seedcoat hardens) and sow it immediately in a cold frame. If timed well, it can germinate in the spring[80]. If you are only growing small quantities of plants, it is best to pot up the seedlings as soon as they are large enough to handle and grow them on in individual pots for their first year, planting them out in late spring into nursery beds or their final positions. When growing larger quantities, it might be best to sow them directly outdoors in a seedbed, but with protection from mice and other seed-eating creatures. Grow them on in the seedbed until large enough to plant out, but undercut the roots if they are to be left undisturbed for more than two years.

nwatta A very easily grown plant, it prefers a well-drained moisture retentive loamy soil but is not at all fussy[11, 200]. Once established, it succeeds in excessively moist soils and also tolerates drought[200]. It grows well on a chalk soil and also in heavy clay soils[200]. A position in full sun is best when plants are being grown for their fruit,

they also succeed in semi-shade though fruit yields and quality will be lower in such a position[11, 200]. Most members of this genus succeed in exposed positions, they also tolerate atmospheric pollution[200]. Hybridizes freely with other members of this genus[200]. Seedling trees take from 5 - 8 years before they start bearing fruit, though grafted trees will often flower heavily in their third year[K]. The flowers have a foetid smell somewhat like decaying fish. This attracts midges which are the main means of fertilization. When freshly open, the flowers have more pleasant scent with balsamic undertones[245]. Seedlings should not be left in a seedbed for more than 2 years without being transplanted[11]. A very ornamental plant[1], it grows very well in Britain, flowering and fruiting abundantly[11]. There are some named varieties selected for their ornamental value[200]. 'Ohio Pioneer' is a thornless form growing about 8 metres tall[200]. The plant is heat tolerant in zones 7 through 5. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2]. The root pattern is a tap root similar to a carrot going directly down [1-2].

## 5.2.175 Malus sylvestris

Crab Apple, European crab apple  
4 tlin 8 cyuc 3 kcaak 0 tcan 2 dwat 10 m hkuc hmimhtut cyutli tcup hwicli hasrajlutnyikfrrip hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta Malus sylvestris is a deciduous Tree growing to 10 m (32ft 10in). See above for USDA hardness. It is hardy to UK zone 4 and is not frost tender. It is in flower in May, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Fruit OilEdible Uses: Oil Pectin Pectin TeaFruit - raw or cooked[9, 15]. Used for jellies, preserves and juices[183]. The flavour improves considerably if the fruit is not harvested until it has been frosted[12]. The fruit is quite variable in size (it is about 2 - 4cm in diameter[200]) and quality. Whilst usually harsh and acid, some forms are quite sweet and can be eaten out of hand[K]. The fruit is rich in pectin and can be used in helping other fruits to set when making jam etc[61, 142]. Pectin is also said to protect the body against radiation[201]. An edible oil can be obtained from the seed[4]. It would only really be viable to use these seeds as an oil source if the fruit was being used for some purpose such as making cider and then the seeds could be extracted from the remaining pulp[K]. A very pleasant tea can be made from the leaves[7].

tcanta Dye Fuel Oil Pectin PectinThe fruit is a source of pectin[61, 142]. Pectin is used as a thickener in jams etc and as a culture medium in laboratories. A red to yellow dye is obtained from the bark[257]. The wood is an excellent fuel[67].

dwatta Anthelmintic Antibacterial Astringent Hypnotic Laxative RefrigerantThe fruit is astringent and laxative[4, 9]. The crushed fruit pulp can be used as a poultice to heal inflammations or small flesh wounds[7]. The fruit is eaten to obviate constipation[240]. The bark, and especially the root bark, is anthelmintic, refrigerant and soporific[218, 240]. An infusion is used in the treatment of intermittent, remittent and bilious fevers[4, 240]. The leaves contain up to 2.4% of an antibacterial substance called 'florin'[240]. This inhibits the growth of a number of gram-positive and gram-negative bacteria in as low a concentration as 30 ppm[240].

Petals - raw. The petals are pleasantly aromatic, but you need to remove the bitter white base[172]. Young shoots - raw or cooked. Peeled and eaten in spring when they are still tender[101, 172, 177, 183, 257]. The seed is a good source of vitamin E, it can be ground and mixed with flour or added to other foods as a supplement[102, 183]. Be sure to remove the seed hairs[102]. The peeled stems are used to make a beverage[257]. The leaves are used to make a tea[257].

tcanta Hedge HedgeThe plant makes a good informal hedge[1].

dwatta Analgesic Astringent Birthing aid Cancer Foot care Ophthalmic Stings Vitamin C Women's complaintsAn infusion of the roots and sprouts has been used as an eyewash for sore eyes[257]. A decoction of the roots has been used by women after giving birth and also in the treatment of sore throats[257]. A decoction of the bark has been taken to ease the labour pains of childbirth[257]. A poultice of the chewed leaves has been used to alleviate the pain of bee stings[257]. A decoction of the branches, combined with chokecherry (Prunus virginiana) and red willow (Salix bonplandiana), has been used in the treatment of various women's complaints, diarrhoea and vomiting[257]. The leaves have been placed in shoes as a protection from athletes foot[257]. The fruit of many members of this genus is a very rich source of vitamins and minerals, especially in vitamins A, C and E, flavanoids and other bio-active compounds. It is also a fairly good source of essential fatty acids, which is fairly unusual for a fruit. It is being investigated as a food that is capable of reducing the incidence of cancer and also as a means of halting or reversing the growth of cancers[214].

propta Seed. Rose seed often takes two years to germinate. This is because it may need a warm spell of weather after a cold spell in order to mature the embryo and reduce the seedcoat[80]. One possible way to reduce this time is to scarify the seed and then place it for 2 - 3 weeks in damp peat at a temperature of 27 - 32°C (by which time the seed should have imbibed). It is then kept at 3°C for the next 4 months by which time it should be starting to germinate[80]. Alternatively, it is possible that seed harvested 'green' (when it is fully developed but before it has dried on the plant) and sown immediately will germinate in the late winter. This method has not as yet(1988) been fully tested[80]. Seed sown as soon as it is ripe in a cold frame sometimes germinates in spring though it may take 18 months. Stored seed can be sown as early in the year as possible and stratified for 6 weeks at 5°C[200]. It may take 2 years to germinate[200]. Prick out the seedlings into individual pots when they are large enough to handle. Plant out in the summer if the plants are more than 25cm tall, otherwise grow on in a cold frame for the winter and plant out in late spring. Cuttings of half-ripe wood with a heel, July in a shaded frame. Overwinter the plants in the frame and plant out in late spring[78]. High percentage[78]. Cuttings of mature wood of the current seasons growth. Select pencil thick shoots in early autumn that are about 20 - 25cm long and plant them in a sheltered position outdoors or in a cold frame[78, 200]. The cuttings can take 12 months to establish but a high percentage of them normally succeed[78]. Division of suckers in the dormant season. Plant them out direct into their permanent positions. Layering. Takes 12 months[11].

nwatta Succeds in most soils[11], preferring a circumneutral soil and a sunny position[200]. Grows well in heavy clay soils. Prefers a slightly acid soil[14]. Dislikes water-logged soils[200]. Grows well with alliums, parsley, mignonette and lupins[18, 20]. Garlic planted nearby can help protect the plant from disease and insect predation[18, 20]. Grows badly with boxwood[18]. A very ornamental plant[1], it fruits well in Britain[11]. This plant is often wrongly grown under the name R. californica[200]. Hybridizes freely with other members of this genus[80]. Plants in this genus are notably susceptible to honey fungus[200].

## 5.2.247 Amelanchier spicata

4 tlin 8 cyuc 3 kcaak 0 tcan 0 dwat 2 m hkuc hmimhtut cyutli tcup hwicli hasrajlutnyikfrrip hpa7tli flatprik hpa7tmwatli fyixre7t hjonli

drutta Amelanchier spicata is a deciduous Shrub growing to 2 m (6ft 7in). See above for USDA hardness. It is hardy to UK zone 4 and is not frost tender. It is in flower in May. The species is hermaphrodite (has both male and

female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: FruitEdible Uses: Edible fruit - raw or cooked. Sweet and juicy[177, 183]. The fruit is rich in iron and copper[226]. It is rather small, about 8mm in diameter[200].

tcanta None known

dwatta None known

propta Seed - it is best harvested 'green', when the seed is fully formed but before the seed coat has hardened, and then sown immediately in pots outdoors or in a cold frame. If stored seed is obtained early enough in the autumn, it can be given 4 weeks warm stratification before being left out in the winter and it should then germinate in the spring. Otherwise seed can be very slow to germinate, perhaps taking 18 months or more. When large enough to handle, prick the seedlings out into individual pots and grow them on in a sheltered outdoor position, planting them out once they are 20cm or more tall. If there is sufficient seed it is best to sow it thinly in an outdoor seedbed[78, 80]. Grow the seedlings on for two years in the seedbed before planting them out into their permanent positions during the winter. Layering in spring - takes 18 months[78]. Division of suckers in late winter. The suckers need to have been growing for 2 years before you dig them up, otherwise they will not have formed roots. They can be planted out straight into their permanent positions if required.

nwatta Prefers a rich loamy soil in a sunny position or semi-shade[1, 200], but thrives in any soil that is not too dry or water-logged[11]. Grows well in heavy clay soils. Plants are hardy to about -25°C[184]. All members of this genus have edible fruits and, whilst this is dry and uninteresting in some species, in many others it is sweet and juicy. Many of the species have potential for use in the garden as edible ornamentals. The main draw-back to this genus is that birds adore the fruit and will often completely strip a tree before it is fully ripe[K]. Produces suckers freely, forming thickets. This species is closely related to A stolonifera[11], it is possibly a hybrid of A. canadensis x A stolonifera[177]. Hybridizes freely with other members of this genus[200]. Grafting onto seedlings of A. lamarckii or Sorbus aucuparia is sometimes practised in order to avoid the potential problem of hybridizing[1].

## 5.2.248 Mahonia aquifolium

Oregon Grape, Hollyleaved barberry, Oregon Holly Grape, Oregon Holly

4 tlin 8 cyuc 3 kcaak 3 tcan 3 dwat 2 m hkuc pimhmimhtut cyutli kyuctup hwicli hasrajlutnyikfrrip hpa7tli flatprikwis hpa7tmwatli fyifxre7t hjonli

drutta Mahonia aquifolium is an evergreen Shrub growing to 2 m (6ft) by 1.5 m (5ft) at a fast rate. See above for USDA hardness. It is hardy to UK zone 5. It is in leaf all year, in flower from January to May, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcaakta Edible Parts: Flowers FruitEdible Uses: Drink-Fruit - raw or cooked[2, 3, 5, 95]. The fruit is almost as large as a blackcurrant and is produced in large bunches so it is easy to harvest[K]. It has an acid flavour, but it is rather nice raw and is especially good when added to a porridge or muesli[K]. Unfortunately, there is relatively little flesh and a lot of seeds, though some plants have larger and juicier fruits[K]. The cooked fruit tastes somewhat like blackcurrants[K]. The fruit can also be dried and stored for later use[257]. Flowers - raw. They can also be used to make a lemonade-like drink[183].

tcanta Dye Hedge HedgeA yellow dye is obtained from the inner bark of the stem and roots[99, 101, 257]. It is green according to another report[168]. Dark green, violet and dark blue-purple dyes are obtained from the fruit[168]. A green dye is obtained from the leaves[168]. This species

## 5.2.244 Chenopodium giganteum

Tree Spinach

4 tlin 8 cyuc 3 kcaak 0 tcan 0 dwat 2.4 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikklwis hpa7tmwatli xre7t hjonli

drutta Chenopodium giganteum is a ANNUAL growing to 2.4 m (7ft 10in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Leaves SeedEdible Uses: Leaves - cooked[46, 61, 105, 177]. Of excellent quality, they are a spinach substitute[74]. The raw leaves should only be eaten in small quantities, see the notes above on toxicity. Seed - cooked. Ground into a powder and used with wheat or other cereals in making bread etc. The seed is small and fiddly, about 1.5mm in diameter[266]. It should be soaked in water overnight and thoroughly rinsed before it is used in order to remove any saponins.

tcanta Dye WoodGold/green dyes can be obtained from the whole plant[168]. The stout stems have been used for making walking sticks[266].

dwatta None known

propta Seed - sow spring in situ. Most of the seed usually germinates within a few days of sowing.

nwatta An easily grown plant, succeeding in most soils but disliking shade[1, 200]. It prefers a moderately fertile soil[200]. This species is closely related to *C. album*[50], and was probably derived from it through cultivation[266]. The tree spinach is sometimes cultivated for its edible leaves[74], there are some named varieties[183]. ‘Magentaspreen’ is a vigorous plant growing 1.5 metres tall. It has large leaves, the new growth is a brilliant magenta colour. Tastiest when young, the leaves are eaten raw or cooked like spinach[183]. A warm climate is required in order to ripen the seed[74].

## 5.2.245 Artemisia tridentata

Sage Brush, Big sagebrush, Bonneville big sagebrush

4 tlin 10 cyuc 3 kcaak 5 tcan 2 dwat 2.5 m hkuc htut cyutli hgatkyuctup hwicli hyishrasjlut hpa7tli flatprikklwisslip hpa7tmwatli xre7t hjonli

drutta Artemisia tridentata is an EVERGREEN Shrub growing to 2.5 m (8ft 2in). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in leaf all year, in flower in October, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Leaves SeedEdible Uses: Condiment TeaLeaves - cooked[61]. The subspecies *A. tridentata vaseyana* has a pleasant mint-like aroma whilst some other subspecies are very bitter and pungent[164]. The leaves are used as a condiment and to make a tea[257]. Seed - raw or cooked. Oily[46, 61]. It can be roasted then ground into a powder and mixed with water or eaten raw[84, 106, 161, 257]. The seed is very small and fiddly to use[K].

tcanta Basketry Disinfectant Dye Fibre Friction sticks Fuel Hair Miscellany Paper Repellent Stuffing TinderAn infusion of the leaves is used as a hair rinse, it treats dandruff and falling hair[84, 106, 168]. An infusion of the plant repels insects[99], it is also disinfectant and so is used for washing walls, floors etc[99]. A yellow to gold dye is obtained from the leaves, buds and stems combined[168]. The fibrous bark is used for weaving mats, baskets, cloth etc., or as a stuffing material in pillows etc and as an insulation in shoes to keep the feet warm[99, 257]. A fibre obtained from the inner bark is used for making paper[189]. The fibres are about 1.3mm long[189]. The stems are harvested in late summer, the leaves removed and the stems steamed until the fibre can be stripped off. The fibre is then cooked for two hours with lye before being ball milled for 4 hours. The resulting paper is a

light tan/gold colour[189]. A bunch of the leafy stems can be tied together and used as a broom[257]. The shredded bark is a fine tinder for starting fires[99, 257]. The stems make good friction sticks for making fires[257]. The seeds are used during celebrations because, when thrown into a fire, they explode like crackers[257]. Wood - hard, dense[229]. It burns rapidly and well, even when green, and has a pleasant aromatic smell[212]. Sagebrush provides food and habitat for a variety of species, such as sage grouse, pronghorn antelope, gray vireo, pygmy rabbit, and mule deer.

dwatta Antirheumatic Antiseptic Digestive Disinfectant Febrifuge Miscellany Ophthalmic Poultice Sedative SkinSage brush was widely employed by many native North American Indian tribes who used it to treat a wide range of disorders[257]. It is little used in modern herbalism, though it certainly merits further investigation[K]. The plant is antirheumatic, antiseptic, digestive, disinfectant, febrifuge, ophthalmic, poultice and sedative[46, 61, 99, 257]. A decoction of the leaves is used in the treatment of digestive disorders and sore throats[216, 257]. An infusion of the fresh or dried leaves is used to treat pneumonia, bad colds with coughing and bronchitis[257]. It is used both internally and externally in the treatment of rheumatism[257]. The crushed plant is used as a liniment on cuts, sores etc whilst a decoction of the leaves is used as an antiseptic wash for cuts, wounds and sores[257]. A poultice of the steeped leaves is applied to sore eyes[257]. The plant is burnt in the house in order to disinfect it[257].

propta Seed - surface sow from late winter to early summer in a greenhouse in a very free-draining soil, but making sure that the compost does not dry out. The sub-species *A. tridentata vaseyana* germinates better if given a cool stratification for 30 - 50 days. Other sub-species germinate in 1 - 2 weeks in a warm greenhouse[164]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter, planting them out in late spring or early summer. Cuttings of half-ripe wood, July/August in a frame. Very slow to root[11] Division in spring or autumn. Layering[164].

nwatta Requires a sunny position and a well-drained soil that is not too rich[1, 11]. Requires a lime-free soil[60]. There are a number of sub-species growing in different habitats from deep fertile soils to poor shallow ones[164]. Plants are longer lived, more hardy and more aromatic when they are grown in a poor dry soil[245]. Established plants are very drought tolerant[200]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°C[200]. The young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. The plant is very aromatic, especially after rain[11, 182]. The pollen of this species is one of the main causes of hayfever in N. America[212]. Plants in this genus are notably resistant to honey fungus[200]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 5.2.246 Rosa nutkana

Nootka Rose, Bristly Nootka rose

4 tlin 8 cyuc 3 kcaak 4 tcan 2 dwat 2.7 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprikklwis hpa7tmwatli fyifxre7t hjonli

drutta Rosa nutkana is a deciduous Shrub growing to 2.7 m (8ft 10in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from June to July, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers Fruit Seed StemEdible Uses: TeaFruit - raw or cooked[2, 101, 118, 161, 257]. The taste is best after a frost[172]. Juicy, pleasantly acid and a good source of vitamin C[183]. The fruit can be dried, powdered and added to tea as a flavouring or used in its own right as a fruity-flavoured tea[21, 101, 183]. The fruit is about 20mm in diameter[200], but there is only a thin layer of flesh surrounding the many seeds[K]. Some care has to be taken when eating this fruit, see the notes above on known hazards.

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. It usually germinates in late winter. Stored seed requires stratification for 3 months at 1°C and should be sown in a cold frame as soon as it is received[200]. It might not germinate for 12 months or more. Prick out the seedlings into individual pots as soon as they are large enough to handle. If given a rich compost they usually grow away quickly and can be large enough to plant out in late summer, though consider giving them some protection from the cold in their first winter. Otherwise, keep them in pots in a cold frame and plant them out in late spring of the following year. Cuttings of mature wood, November in a frame[11].

nwatta An easily grown plant, it succeeds in most fertile soils, including heavy ones, preferring a moisture retentive well-drained loamy soil[1, 98, 200]. Prefers a sunny position but succeeds in partial shade though it fruits less well in such a situation[186, 200]. Fairly tolerant of cutting, it succeeds in a mixed hedgerow[186]. A parent of the cultivated apple[11], it is often used as a rootstock[50]. The fruit is a good wildlife food source, especially for birds[200]. The plant has over 90 associated insect species[24]. Hybridizes freely with other members of this genus[200]. Plants in this genus are notably susceptible to honey fungus[200].

## 5.2.176 Arundinaria spp

Running Bamboo

4 tlin 10 cyuc 3 kcaak 4 tcan 1 dwat 10 m hkuc pcmhimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikklwis hpa7tmwatli hjonli

drutta Arundinaria spp is an evergreen Bamboo growing to 10 m (32ft) by 3 m (9ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: Seed ShootsEdible Uses: Young shoots - cooked[11, 22, 46, 105, 183]. Used as a pot-herb[236]. Seed - cooked[46, 61, 161]. It can be used as a wheat substitute[2, 105], for which it is not much inferior[213], but it is rather small and difficult to collect in quantity[159]. The plants only flower at irregular intervals of several years. See individual species for more information.

tcanta FodderAgroforestry Uses: With its extensive running root system, the plant is ideal for helping to control soil erosion, especially along the sides of rivers[352]. The extensive growth of the plant provides streambank stabilization, sediment retention, and bioaccumulation of nutrients and toxins[1050]. So long as it can be restrained, the plant makes an excellent, dense hedge or screen[352]. The canes are used as pipe-stems, are woven into baskets and mats plus a variety of other purposes[169, 236]. The hollow stems can be made into flutes[257]. Carbon Farming Solutions - Industrial Crop: biomass (Crops grown in non-food uses. Industrial crops provide resources in three main categories: materials, chemicals, and energy. Traditional materials include lumber and thatch, paper and cardboard, and textiles) [1-1]. Fodder: bank.

dwatta See individual species.

propta Seed - surface sow as soon as it is ripe in a greenhouse at about 20°C. Do not allow the compost to dry out. Germination usually takes place fairly quickly so long as the seed is of good quality, though it can take 3 - 6 months. When large enough to handle, prick the seedlings out into individual pots and grow them on in a lightly shaded place in the greenhouse until large enough to plant out. Bamboos only flower at intervals of several years and so seed is rarely available. Division in late spring as new growth commences. Take divisions with at least three canes in the clump, trying to cause as little root disturbance to the main plant as possible. Grow them on in light shade in a greenhouse in pots of a high fertility sandy medium. Mist the foliage regularly until plants are established. Plant them out into their permanent positions when a good root system has developed, which can take a year or more[200]. Rhizome cuttings. Basal cane cuttings.

nwatta Fodder: Bank Industrial Crop: Biomass Management Managed Multistem Minor Global CropThere are three rec-

ognized species of the genus *Arundinaria* accepted: *Arundinaria appalachiana* Triplett, Weakley and L.G.Clark - Hill cane, *Arundinaria gigantea* (Walt.) Muhl. - River cane, *Arundinaria tecta* Muhl. - Switch cane. Climate: cold to warm temperate. Humidity: humid. Carbon Farming Solutions - Managed bamboo forest sequester more carbon than wild bamboo and the same as fast-growing tropical trees like eucalyptus. Cultivation: minor global crop. Management: managed multistem (Describes the non-destructive management systems that are used in cultivation) [1-1].

## 5.2.177 Pinus bungeana

Lace-Bark Pine, Bunge's pine

4 tlin 7 cyuc 3 kcaak 0 tcan 2 dwat 10 m hkuc htut cyutli hgatkyuctup hwicli hyishrasjlut hpa7tli flatprikklwis hpa7tmwatli dyat hjonli

drutta Pinus bungeana is an evergreen Tree growing to 10 m (32ft) by 6 m (19ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf all year, in flower from April to May, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: SeedEdible Uses: CondimentSeed - raw or cooked[105, 177]. A reasonable size, being up to 10mm x 8mm[200]. The oil-rich seed has a resinous flavour. A vanilla flavouring is obtained as a by-product of other resins that are released from the pulpwood[200].

tcanta Dye HerbicideA tan or green dye is obtained from the needles[168]. The needles contain a substance called terpene, this is released when rain washes over the needles and it has a negative effect on the germination of some plants, including wheat[201]. Oleo-resins are present in the tissues of all species of pines, but these are often not present in sufficient quantity to make their extraction economically worthwhile[64]. The resins are obtained by tapping the trunk, or by destructive distillation of the wood[4, 64]. In general, trees from warmer areas of distribution give the higher yields[64]. Turpentine consists of an average of 20% of the oleo-resin[64] and is separated by distillation[4, 64]. Turpentine has a wide range of uses including as a solvent for waxes etc, for making varnish, medicinal etc[4]. Rosin is the substance left after turpentine is removed. This is used by violinists on their bows and also in making sealing wax, varnish etc[4]. Pitch can also be obtained from the resin and is used for waterproofing, as a wood preservative etc.

dwatta The turpentine obtained from the resin of all pine trees is antiseptic, diuretic, rubefacient and vermifuge[4]. It is a valuable remedy used internally in the treatment of kidney and bladder complaints and is used both internally and as a rub and steam bath in the treatment of rheumatic affections[4]. It is also very beneficial to the respiratory system and so is useful in treating diseases of the mucous membranes and respiratory complaints such as coughs, colds, influenza and TB[4]. Externally it is a very beneficial treatment for a variety of skin complaints, wounds, sores, burns, boils etc and is used in the form of liniment plasters, poultices, herbal steam baths and inhalers[4].

propta It is best to sow the seed in individual pots in a cold frame as soon as it is ripe if this is possible otherwise in late winter. A short stratification of 6 weeks at 4°C can improve the germination of stored seed[80]. Plant seedlings out into their permanent positions as soon as possible and protect them for their first winter or two[11]. Plants have a very sparse root system and the sooner they are planted into their permanent positions the better they will grow[K]. Trees should be planted into their permanent positions when they are quite small, between 30 and 90cm[200]. We actually plant them out when they are about 5 - 10cm tall. So long as they are given a very good weed-excluding mulch they establish very well[K]. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200]. Cuttings. The method only works when taken from very young trees less than 10 years old. Use single leaf fascicles with the base of

the short shoot. Disbudding the shoots some weeks before taking the cuttings can help. Cuttings are normally slow to grow away[81].

nwatta Landscape Uses:Border, Pest tolerant, Rock garden, Specimen, Street tree. Prefers a deep loamy soil[20]. Thrives in a light well-drained sandy or gravelly loam[1]. Dislikes poorly drained moorland soils[1]. Established plants tolerate drought, succeeding in hot dry sites[200]. A very ornamental tree with beautiful bark. Plants are strongly outbreeding, self-fertilized seed usually grows poorly[200]. They hybridize freely with other members of this genus[200]. This species is slow growing and hard to establish in Britain, doing best in the mild areas of the country[120, 185]. Leaf secretions inhibit the germination of seeds, thereby inhibiting the growth of other plants below the tree[18]. Plants in this genus are notably susceptible to honey fungus[200]. Special Features:Not North American native, Inconspicuous flowers or blooms.

### 5.2.178 Sorbus lanata

4 tin 8 cyuc 3 kcaak 0 tcan 0 dwat 10 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta Sorbus lanata is a deciduous Tree growing to 10 m (32ft 10in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure.

kcaakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[272]. The fruit is usually bletted if it is going to be eaten raw[2, 51, 146, 158]. This involves storing the fruit in a cool dry place until it is almost but not quite going rotten. At this stage the fruit has a delicious taste, somewhat like a luscious tropical fruit[K]. The fruit is about 1.2 - 3cm across[200] and is borne in bunches which makes harvesting easier[K].

tcanta WoodWood - moderately hard, close and even grained, seasons well[146].

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame[78, 80]. If you have sufficient seed it can be sown in an outdoor seedbed[78, 80]. Stored seed germinates better if given 2 weeks warm then 14 - 16 weeks cold stratification[98], so sow it as early in the year as possible. Prick out the seedlings into individual pots when they are large enough to handle. Seedlings are very slow to put on top-growth for their first year or two[11], but they are busy building up a good root system. It is best to keep them in pots in a cold frame for their first winter and then plant them out into their permanent positions in late spring.

nwatta Succeeds in most reasonably good soils in an open sunny position[11]. Tolerates light shade[188], though it fruits better in a sunny position[K]. This species grows best in S.W. England[121]. Plants are susceptible to fire-blight[188]. Closely related to *S. cuspidata*[121] and to *S. aria*[200].

### 5.2.179 Malus floribunda

Japanese Crab, Japanese flowering crab apple

4 tin 7 cyuc 3 kcaak 0 tcan 0 dwat 10 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfri hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta Malus floribunda is a deciduous Tree growing to 10 m (32ft) by 10 m (32ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105]. Up to 1cm in diameter[200]. It tastes like a soft fruit. Acid but nice, about the size of a large blackcurrant[K].

tcanta None known

dwatta None known

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. It usually germinates in late winter. Stored seed requires stratification for 3 months at 1°c and should be sown in a cold frame as soon as it is received[200]. It might not germinate for 12 months or more. Prick out the seedlings into individual pots as soon as they are large enough to handle. If given a rich compost they usually grow away quickly and can be large enough to plant out in late summer, though consider giving them some protection from the cold in their first winter. Otherwise, keep them in pots in a cold frame and plant them out in late spring of the following year. Cuttings of mature wood, November in a frame[11].

nwatta Landscape Uses:Border, Espalier, Pest tolerant, Standard, Specimen, Street tree. An easily grown plant, it succeeds in most fertile soils, preferring a moisture retentive well-drained loamy soil[1, 200]. Grows well in heavy clay soils. Prefers a sunny position but succeeds in partial shade, though it fruits less well in such a situation[200]. A very ornamental plant[1], the fruit is a good wildlife food source, especially for birds[200]. Hybridizes freely with other members of this genus[200]. The tree is a very good pollinator for the apple orchard[200]. Plants in this genus are notably susceptible to honey fungus[200]. Special Features:Not North American native, Fragrant flowers, Attractive flowers or blooms.

### 5.2.180 Castanea mollissima

Chinese Chestnut

4 tin 8 cyuc 3 kcaak 3 tcan 2 dwat m hkuc

hmimhtut cyutli hqatkyuctcup hwicli hyishrasjlutnyik hpa7tli flatprik hpa7tmwatli hjonli

drutta Castanea mollissima is a deciduous Tree growing to 25 m (82ft 0in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower in July, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcaakta Edible Parts: SeedEdible Uses: Seed - raw or cooked[46, 61, 63, 105]. Eaten raw, there is a distinct astringency, especially if the fleshy inner skin beneath the outer shell of the seed is not removed[K]. When cooked, however, and especially when baked, the seed becomes much sweeter and has a floury texture[K]. It then makes an excellent food and can be used as a staple food in much the same way as potatoes or cereals[K]. The skin (or pellicle) of the seed is easily peeled[183]. The seed is low in fats and oils but high in carbohydrates[183]. A nutritional analysis is available[218].

tcanta Fuel Tannin WoodThe bark, leaves, wood and seed husks all contain tannin. Wood - hard, strong, light. Used for fence posts etc[11]. Coppiced for fuel.

dwatta Antidote Astringent Dysentery StomachicThe burrs (seed cases?) are rich in tannin and are astringent and stomachic[147, 218]. A decoction is used in the treatment of diarrhoea, uncontrollable nose bleed, dysentery, regurgitation and profound thirst[147]. The flowers are used in the treatment of scrofula[218]. The stem bark is used to treat poisoned wounds whilst the stem sap is used to treat lacquer poisoning[218].

propta Seed - where possible sow the seed as soon as it is ripe in a cold frame or in a seed bed outdoors[78]. The seed must be protected from mice and squirrels. The seed has a short viability and must not be allowed to become dry. It can be stored in a cool place, such as the salad compartment of a fridge, for a few months if it is kept moist, but check regularly for signs of germination. The seed should germinate in late winter or early spring. If sown in an outdoor seedbed, the plants can be left in situ for 1 - 2 years before planting them out in their permanent positions. If grown in pots, the plants can be put out into their permanent positions in the summer

has a long history of medicinal use, being employed traditionally in the treatment of diseases related to a compromised immune system. The plant has an interesting chemistry and it is currently (1995) being investigated as a potential anti-AIDS drug[238]. It contains potent anti-inflammatory agents, antiviral proteins and substances that affect cell division[238]. These compounds are toxic to many disease-causing organisms, including the water snails that cause schistosomiasis[238]. All parts of the plant are toxic, an excess causing diarrhoea and vomiting[238]. This remedy should be used with caution and preferably under the supervision of a qualified practitioner. It should not be prescribed for pregnant women[238]. The root is alterative, anodyne, anti-inflammatory, cathartic, expectorant, hypnotic, narcotic and purgative[4, 21, 46, 61, 165, 192, 238]. The dried root is used as an anodyne and anti-inflammatory[213]. The root is taken internally in the treatment of auto-immune diseases (especially rheumatoid arthritis), tonsillitis, mumps, glandular fever and other complaints involving swollen glands, chronic catarrh, bronchitis etc[238]. The fresh root is used as a poultice on bruises, rheumatic pains etc, whilst a wash made from the roots is applied to swellings and sprains[222]. The root is best harvested in the autumn and can be dried for later use[238]. The fruit has a similar but milder action to the roots[238].The juice is used in the treatment of cancer, haemorrhoids and tremors[213]. A poultice made from the fruit is applied to sore breasts[222]. A tea made from the fruit is used in the treatment of rheumatism, dysentery etc[222]. The plant has an unusually high potassium content and the ashes, which contain over 45% caustic potash, have been used as a salve for ulcers and cancerous growths[232]. The leaves are cathartic, emetic and expectorant[222]. A homeopathic remedy is made from the fresh root[232]. Its main action is on the throat, breast, muscular tissues and the joints[232].

propta Seed - sow autumn or spring in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. If you have sufficient seed, it might be worthwhile trying an outdoor sowing in a seed bed in early spring. Grow the plants on in the seedbed for their first year and plant them out the following spring. Division in March or October. Use a sharp spade or knife to divide the rootstock, making sure that each section has at least one growth bud. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta An easily grown plant, succeeding in most soils[1], though preferring a moisture retentive soil in full sun or partial shade[111, 200]. Plants can be grown in quite coarse grass, which can be cut annually in the autumn[233]. Succeeds in an open woodland garden[200], growing well under trees[20]. Whilst the dormant plant is hardy in much of Britain, the young growth in spring can be damaged by late frosts. A very ornamental plant[1], it often self sows when in a suitable position[200]. Cultivated as a dye plant[50] and on a small scale for its edible young shoots, there is at least one named form. 'White Stem' has white stems and the berries yield a golden-peach dye instead of purple. It is not yet known (1992) if it will breed true from seed[183]. This plant is an alternative host to a number of viral diseases that affect members of the Amaryllidaceae, Liliaceae (broad view, including plants recently [1992] moved into separate families) and Solanaceae[200]. Plants seem to be immune to the predations of rabbits[233]. The plant is heat tolerant in zones 9 through 5. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zones. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a

clumper with limited spread [1-2].

### 5.2.243 Viburnum edule

Mooseberry, Squashberry

4 tin 8 cyuc 3 kcaak 3 tcan 1 dwat 2.5 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyikfri hpa7tli flatprikwis hpa7tmwatli dyatxre7t hjonli

drutta Viburnum edule is a deciduous Shrub growing to 2.5 m (8ft 2in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in June, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Flowers FruitEdible Uses: Fruit - raw or cooked[11, 62, 101, 257]. The fully ripe fruits are mildly acid with a pleasant taste[183]. The ovoid fruit is about 8mm long and contains a single large seed[200]. The fruit can also be dried for winter use[183]. It is highly valued for jam[43]. It is best before a frost and with the skin removed[85, 172]. Another report says that the native Americans would often not harvest the fruit until it had been frosted[257]. Some caution is advised, see the notes above on toxicity. Flowers - used in fritters[172].

tcanta BasketryThe stems have been used to reinforce birch bark basket rims[257].

dwatta Antispasmodic Astringent Dysentery Odontalgic SalveThe bark is antispasmodic and astringent[172, 257]. An infusion of the crushed inner bark has been used in the treatment of dysentery and has also been used as a purgative[257]. The bark has been chewed and the juice swallowed in the treatment of whooping cough and 'cold on the lungs'[257]. A decoction of the stems has been used in the treatment of coughs[257]. An infusion of the leaves and stems has been used as a gargle in the treatment of sore throats[257]. The twig tips have been chewed and the juice swallowed in the treatment of sore throats[257]. A poultice of the chewed, unopened flower buds has been applied to lip sores[257]. A decoction of the roots has been used to treat sickness associated with teething[257].

propta Seed - best sown in a cold frame as soon as it is ripe. Germination can be slow, sometimes taking more than 18 months. If the seed is harvested 'green' (when it has fully developed but before it has fully ripened) and sown immediately in a cold frame, it should germinate in the spring[80]. Stored seed will require 2 months warm then 3 months cold stratification and can still take 18 months to germinate[113]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame or greenhouse. Plant out into their permanent positions in late spring or early summer of the following year. Cuttings of soft-wood, early summer in a frame[200]. Pot up into individual pots once they start to root and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, 5 - 8 cm long with a heel if possible, July/August in a frame[78, 113]. Plant them into individual pots as soon as they start to root. These cuttings can be difficult to overwinter, it is best to keep them in a greenhouse or cold frame until the following spring before planting them out[113]. Cuttings of mature wood, winter in a frame. They should root in early spring - pot them up when large enough to handle and plant them out in the summer if sufficient new growth is made, otherwise keep them in a cold frame for the next winter and then plant them out in the spring. Layering of current seasons growth in July/August. Takes 15 months[78].

nwatta An easily grown plant, it succeeds in most soils but is ill-adapted for poor soils and for dry situations[1]. It prefers a deep rich loamy soil in sun or semi-shade[11, 200]. Grows well in heavy clay soils. Prefers a slightly acidic soil[172]. Best if given shade from the early morning sun in spring[200]. Plants are possibly self-incompatible[11] and may need to grow close to a genetically distinct plant in the same species in order to produce fruit and fertile seed[11, 200]. Closely allied to *V. opulus*, but this species has no sterile flowers in the inflorescence and is a superior fruiting form[11].

of rabbits[233]. Often cultivated as a dye and a medicinal plant[46, 61]. Very closely related to *P. conspicuum*[58]. Dioecious, male and female plants must be grown if seed is required[58]. Special Features:Attractive foliage, Invasive, Wetlands plant.

## 5.2.240 Reynoutria japonica

Japanese knotweed.  
4 tlin 8 cyuc 3 kcaak 3 tcan 3 dwat 2 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta *Reynoutria japonica* is a PERENNIAL growing to 2 m (6ft) by 2 m (6ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves Root Seed Shoots StemEdible

Uses: Edible Portion: Leaves, Shoots, Rhizomes, Roots. Young shoots in spring - cooked. They can be used as an asparagus substitute[55, 62, 116, 1599, 179, 183]. They have an acid flavour and can also be used as a rhubarb substitute in pies, fruit soups, jams etc[183]. Older stems and shoot tips - cooked[62, 159]. They taste like a mild version of rhubarb[K]. Seed - raw or cooked. It is rather small and fiddly to utilize. The seed can also be ground into a powder and used as a flavouring and thickener in soups etc, or can be mixed with cereals when making bread, cakes etc. The root is sometimes eaten[183].

tcanta Carbon Farming Solutions - Industrial Crop: fiber (Crops grown for non-food uses. Industrial crops provide resources in three main categories: materials, chemicals, and energy. Traditional materials include lumber and thatch, paper and cardboard, and textiles) [1-1].

dwatta Possibly may have similar properties to other knotweeds where the root can be antiphlogistic, bechic, depurative, diuretic, emmenagogue, emollient, febrifuge, stomachic and vulnerary[46, 61, 147, 178, 218]. It is also used in the treatment of women's complaints[147]. A decoction is used in the treatment of burn injuries, boils and abscesses, poisonous snakebites, acute hepatitis, appendicitis, traumatic injuries and menstrual irregularities[147]. The leaves can be crushed and applied externally as a poultice to abscesses, cuts etc, whilst the dried roots can be ground into a powder and applied externally[147]. Extracts of the plant have shown antitumour activity[218].

propta Plants can be grown from seeds.

nwatta Experimental Crop Industrial Crop: Fiber Management: HayClimate: cold to warm temperate. Humidity: humid. Carbon Farming Solutions - Cultivation: experimental. Management: hay (Describes the non-destructive management systems that are used in cultivation) [1-1]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [2-1].

## 5.2.241 Scirpus lacustris

Bulrush  
4 tlin 8 cyuc 3 kcaak 0 tcan 1 dwat 2.5 m hkuc  
hmimhtut cyutli tcuphja7nhs6s hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Scirpus lacustris* is a PERENNIAL growing to 2.5 m (8ft 2in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from June to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can grow in water.

kcakta Edible Parts: Leaves Pollen Root Seed StemEdible Uses: Root - raw or cooked[2, 85, 95, 183]. Rich in starch, it can be dried and ground into a powder or made into a

syrup[13, 85, 95, 183]. The buds at the end of the rhizomes are crisp and sweet, making excellent eating raw[183]. Young shoots - raw or cooked[85, 183]. Used in spring. Seed - ground up into a powder and mixed with flour for use in making cakes etc[85, 183]. The seed is small and rather fiddly to harvest and utilize. Base of mature stems - raw or cooked. Somewhat tough[85]. Pollen - raw or cooked. Rich in pollen, it is mixed with flour and used in making cakes etc[85, 183].

tcanta Paper Thatching WeavingThe stems are frequently used for making matting, chair bottoms etc and thatching[1, 4, 23, 85, 100, 115]. They were at one time imported in large quantities for this purpose[4]. The pith of the stems is used in paper making[100].

dwatta Astringent Cancer DiureticThe roots are astringent and diuretic[240]. They were formerly employed medicinally but have fallen into disuse[4]. This plant is a traditional medicine for cancer[218].

propta Seed - sow in a cold frame as soon as it is ripe in a pot standing in 3cm of water. Only just cover the seed with soil[200]. The seed usually germinates fairly quickly. Prick out the plants when large enough to handle and plant out in their permanent positions in early summer. Division in spring. Very easy, larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Succeeds in any wet to moisture retentive soil, pond margins and shallow water in full sun or shade[1, 200]. Plants can succeed in fairly deep water. Hardy to about -25°C[187]. Some named forms have been selected for their ornamental value[187].

## 5.2.242 Phytolacca americana

Pokeweed, American pokeweed, Garnet, Pigeon Berry, Poke  
4 tlin 8 cyuc 3 kcaak 2 tcan 3 dwat 2 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Phytolacca americana* is a PERENNIAL growing to 2 m (6ft) by 1.5 m (5ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from August to September, and the seeds ripen from September to November. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Fruit LeavesEdible Uses: Colouring/Leaves - they must be cooked and even then it is best to change the water once[1, 2, 4, 33, 95]. They are used like spinach[183]. Only the young leaves should be used since they become toxic with age[102]. Caution is advised, see the notes above on toxicity. Young shoots - cooked[20, 33, 62, 102]. An asparagus substitute[183], they are delicious[159]. The shoots are sometimes blanched before using, or forced in cellars to provide an early crop[183]. The tender clear inner portion of the stem can be rolled in cornmeal and fried[183]. Although cultivated on a small scale in N. America for its shoots, caution is advised, see notes above. A nutritional analysis is available[218]. Fruit - cooked and used in pies[159, 213]. Poisonous raw, causing vomiting and diarrhoea. Even the cooked fruits should be viewed with caution. The fruit is a berry about 12mm in diameter[200]. A red dye is obtained from the fruit and used as a food colouring[183].

tcanta Ink Insecticide SoapA red ink and a dye are obtained from the fruit[46, 50, 57, 100, 102, 159, 169]. A beautiful colour, though it is not very permanent[4]. It makes a good body paint, washing off easily when no longer required, though the slightly toxic nature of the berries should be remembered[K]. The rootstock is rich in saponins and can be used as a soap substitute[169]. Cut the root into small pieces and simmer it in boiling water to obtain the soap. The plant is currently (1980) being evaluated for its snail-killing properties[213].

dwatta Alterative Anodyne Antiinflammatory Antirheumatic Antiviral Cancer Cathartic Dysentery Expectorant Homeopathy Hypnotic Narcotic PurgativePokeweed

or autumn, making sure to give them some protection from the cold in their first winter[K].

nwatta Industrial Crop: Biomass Industrial Crop: Tannin Management: Standard Minor Global Crop Other Systems: Strip intercrop Staple Crop: Balanced carbPrefers a good well-drained slightly acid loam but succeeds in dry soils[1, 11, 200]. Once established, it is very drought tolerant[1, 11, 200]. Very tolerant of highly acid, infertile dry sands[200]. Averse to calcareous soils but succeeds on harder limestones[11, 200]. Although very winter-hardy, this species does not do well in Britain, it only really thrives in areas with hot summers[200]. Does not fruit well in Britain[11, 200]. A tree in semi-shade at Kew in 1990 was 9 metres tall[K]. Extensively cultivated for its edible seed in China, and also much grown in America, there are a number of named varieties[117, 183, 200, 266]. Plants can fruit in 5 - 7 years from seed[117] and yields from mature trees are around 25 - 60 kilos per tree[160]. Resistant, but not immune, to blight[183], it is hybridized with *C. dentata* to try and find blight resistant cultivars with superior seeds[200]. A shallow rooted tree[160]. Responds well to coppicing[11, 109]. An excellent soil-enriching understorey in pine forests[200]. Flowers are produced on wood of the current year's growth[229]. Plants are fairly self-sterile[200]. They hybridize freely with other members of this genus[200]. Plants in this genus are notably resistant to honey fungus[200]. Special Features: Not North American native, Fragrant flowers, Blooms are very showy. The plant is heat tolerant in zones 8 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2].

## 5.2.181 Pyrus pashia

Indian Wild Pear  
4 tlin 8 cyuc 3 kcaak 0 tcan 1 dwat 9 m hkuc  
hmimhtut cyutli hqattcup hwicli hrasjlutnyikfrip hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Pyrus pashia* is a deciduous Tree growing to 9 m (29ft 6in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in April. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil and can tolerate drought. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[2, 11, 51, 105, 158, 272]. Up to 2.5cm in diameter[194]. The fruit is usually bletted[183], but even then it is not sweet[146]. Tasty when fully ripe, even when dried[194]. Our experience is that the fully ripe fruit has a reasonable flavour and, when bletted, is sweet and very pleasant[K]. A mature tree yields about 45kg of fruit per year[194]. The fruit contains about 6.8% sugars, 3.7% protein, 1% ash, 0.4% pectin. Vitamin C is very low, about 1.2mg per 100g[194].

tcanta Rootstock WoodThis plant can be used as a rootstock for the cultivated pear[194]. Wood - compact fine grained, hard, durable, liable to split and warp during seasoning. Used for small implements, walking sticks and fuel[51, 158, 266].

dwatta AstringentThe juice of the ripe fruit is used in the treatment of diarrhoea[272].

propta Seed - best sown in a cold frame as soon as it is ripe in the autumn, it will then usually germinate in mid to late winter. Stored seed requires 8 - 10 weeks cold stratification at 1°C and should be sown as early in the year as possible[200]. Temperatures over 15 - 20°C induce a secondary

dormancy in the seed[200]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in a cold frame or greenhouse for their first year. Plant them out in late spring or early summer of the following year.

nwatta Prefers a good well-drained loam in full sun[200]. Grows well in heavy clay soils. Tolerates light shade but does not fruit so well in such a position. Tolerates atmospheric pollution, excessive moisture and a range of soil types if they are moderately fertile[200]. Established plants are drought tolerant[200]. Plants are hardy to at least -15°C[200].

## 5.2.182 Taxus x media

Anglojapanese Yew  
4 tlin 7 cyuc 3 kcaak 4 tcan 4 dwat m hkuc  
pcimhmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli frusflatprikliwissip hpa7tmwatli nyanhjen hjonli

drutta *Taxus x media* is an evergreen Shrub growing to 6 m (19ft) by 6 m (19ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in leaf all year, and the seeds ripen from September to November. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and very alkaline soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw[K]. Very sweet and gelatinous, most people find it delicious though some find it sickly[K]. The fruit is a fleshy berry about 10mm in diameter and containing a single seed[200]. All other parts of this plant, including the seed, are highly poisonous. When eating the fruit you should spit out the large seed found in the fruit's centre. Should you swallow the whole seed it will just pass straight through you without harm, if the seed has been bitten into, however, it could cause some problems.

tcanta WoodWood - strong, hard, heavy. Used for paddles, fence posts etc.

dwatta Modern research has shown that yew trees contain the substance 'taxol' in their shoots and bark. Taxol has shown exciting potential as an anti-cancer drug, particularly in the treatment of ovarian cancers[222, 238]. This remedy is very toxic and, even when used externally, should only be used under the supervision of a qualified practitioner[238]. See also the notes above on toxicity.

propta Seed - can be very slow to germinate, often taking 2 or more years[78, 80]. It is best sown as soon as it is ripe in the autumn when it should germinate 18 months later. Stored seed may take 2 years or more to germinate. 4 months warm followed by 4 months cold stratification may help reduce the germination time[113]. Harvesting the seed 'green' (when fully developed but before it has dried on the plant) and then sowing it immediately has not been found to reduce the germination time because the inhibiting factors develop too early[80]. Prick out the seedlings into individual pots once they are large enough to handle and grow them on in pots in a cold frame. The seedlings are very slow-growing and will probably require at least 2 years of pot cultivation before being large enough to plant out. Any planting out is best done in late spring or early summer, after the last expected frosts[K]. This is a hybrid species, it will not breed true from seed. Cuttings of half-ripe terminal shoots, 5 - 8cm long, July/August in a shaded frame. Should root by late September but leave them in the frame over winter and plant out in late spring[78]. High percentage[11]. Cuttings of ripe terminal shoots, taken in winter after a hard frost, in a shaded frame[113].

nwatta Landscape Uses:Border, Hedge, Massing, Screen, Superior hedge. Thrives in almost any soil, acid or alkaline, as long as it is well-drained[200]. Succeeds in dry soils. Plants are very shade tolerant[82]. Dormant plants are very cold-hardy in Britain, though the new growth in spring can be damaged by light frosts[K]. Leaves have a reddish

tinge when the plants are grown in a sunny position[200]. Plants produce very little fibrous root and should be planted in their final positions when still small[200]. Plants in this genus are notably resistant to honey fungus[200]. Dioecious. Male and female plants must be grown if seed is required. The cultivar 'Sargenti' was 3 metres tall and 1 metre wide at the Hillier Arboretum in September 1993. It was growing well and carrying a good crop of tasty fruit though the harvest time seemed to be somewhat later than that of *T. baccata*[K]. Special Features: Not North American native, Inconspicuous flowers or blooms.

## 5.2.183 *Carya glabra megacarpa*

Coastal Pignut Hickory

4 tin 8 cyuc 3 kcaak 0 tcan 0 dwat m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyif hjonli

drutta *Carya glabra megacarpa* is a deciduous Tree growing to 30 m (98ft 5in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in leaf from June to October, in flower from April to May. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: Seed - raw or cooked[105]. A sweet flavour. The seed ripens in late autumn and, when stored in its shell in a cool place, will keep for at least 6 months[K].

tcanta Fuel WoodNone known dwatta None known

propta Seed - requires a period of cold stratification. It is best sown in a cold frame as soon as it is ripe[78]. Stored seed should be kept moist (but not wet) prior to sowing and should be sown in a cold frame as soon as possible[78]. Where possible, sow 1 or 2 seeds only in each deep pot and thin to the best seedling. If you need to transplant the seedlings, then do this as soon as they are large enough to handle, once more using deep pots to accommodate the tap root. Put the plants into their permanent positions as soon as possible, preferably in their first summer, and give them some protection from the cold for at least the first winter[78, K]. Seed can also be sown in situ so long as protection is given from mice etc and the seed is given some protection from cold[200] (a plastic bottle with the top and bottom removed and a wire mesh top fitted to keep the mice out is ideal)

nwatta Prefers a deep moisture-retentive loam in a sunny sheltered position, requiring a good summer for best development[1, 63, 137, 200]. Slow growing[200]. Plants are strongly tap-rooted and should be planted in their permanent positions as soon as possible[1, 137]. Sowing in situ would be the best method so long as the seed could be protected from mice[1, 200]. Trees are late coming into leaf (usually late May to June) and lose their leaves early in the autumn (usually in October)[137]. During this time they cast a heavy shade. These factors combine to make the trees eminently suitable for a mixed woodland planting with shrubs and other trees beneath them[137]. Plants in this genus are notably resistant to honey fungus[200]. Most species in this genus have quite a wide range of distribution and, in order to find trees more suited to this country, seed from the most appropriate provenances should be sought[137]. Most trees growing in Britain at present tend to only produce good seed after hot summers[137]. Trees are self-fertile but larger crops of better quality seeds are produced if cross-pollination takes place[229].

## 5.2.184 *Claytonia megarhiza*

Alpine Spring Beauty

4 tin 8 cyuc 3 kcaak 0 tcan 0 dwat m hkuc htut cyutli tcup hwicli hrasjlut hpa7tli flat hpa7tmwatli xre7t hjonli

drutta *Claytonia megarhiza* is an evergreen Perennial growing to 0.2 m (0ft 8in) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 4. It is in leaf all year,

in flower from April to July, and the seeds ripen in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Root - raw or cooked[2, 62, 85, 161]. Peeled, then boiled or baked[183]. The root is long, fleshy and up to 2.5cm thick[183, 200]. Leaves and flowering tops - raw or cooked as a potherb[85, 172, 183]. Succulent, juicy and mild in flavour[183]. Flowers - raw.

tcanta None known dwatta None known

propta Seed - surface sow on a peat based compost in spring in a cold frame. Germination usually takes place within 2 - 4 weeks at 10°C[164]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the cold frame for at least their first winter. Plant them out in late spring or early summer after the last expected frosts. Division of offsets in spring or autumn.

nwatta Prefers a damp peaty soil and a position in full sun[1, 164]. Requires a very well-drained lime-free soil[164, 200]. A very cold hardy plant, succeeding outdoors in all parts of Britain, but it is liable to rot if the soil is wet[60, 200]. A good plant for the rock garden[60]. Plants are prone to aphid infestation[188]. The plant is heat tolerant in zones 7 through 5. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is a tap root similar to a carrot going directly down [1-2].

## 5.2.185 *Juglans mandschurica*

Manchurian Walnut

4 tin 8 cyuc 3 kcaak 0 tcan 1 dwat m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyif hjonli

drutta *Juglans mandschurica* is a deciduous Tree growing to 20 m (65ft 7in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from May to June, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Oil Oil SeedEdible Uses: Oil OilSeed - raw or roasted[183]. The kernels are well filled but difficult to extract because the shell is thick[74, 117, 183]. An edible oil is obtained from the seed[105, 183], it tends to go rancid quickly.

tcanta Herbicide Miscellany Oil Oil Rootstock String WoodThe seed contains up to 52% oil and, as well as being edible, it has industrial uses[74]. A rope is made from the bark of young trees[74]. Plants produce chemicals which can inhibit the growth of other plants. These chemicals are dissolved out of the leaves when it rains and are washed down to the ground below, reducing the growth of plants under the tree[18, 20, 159]. The roots of many members of this genus produce substances that are toxic to many plant species, especially apples (*Malus* species), members of the Ericaceae, *Potentilla* spp and the white pines (certain *Pinus* spp).[200]. The inner bark is used to make heel pieces for straw shoes[151]. Sometimes used as a rootstock to confer greater cold resistance[183]. Wood - hard, durable. Used for veneer, furniture etc[46, 61, 74].

## 5.2.238 *Chaenomeles speciosa*

Japanese Quince, Flowering quince

4 tin 8 cyuc 3 kcaak 3 tcan 2 dwat 3 m hkuc pcmhmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta *Chaenomeles speciosa* is a deciduous Shrub growing to 3 m (9ft) by 5 m (16ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from February to June, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - cooked[3, 4, 177]. Very harsh and acid raw but fragrant when cooked[1, 11]. Used for jams, jellies etc and as a flavouring with cooked apples[183, K]. The fruit can be apple or pear-shaped and up to 6.5cm long x 6.5cm wide[200].

tcanta Hedge HedgePlants can be grown as a medium sized hedge[11, 29, 200]. Some cultivars, such as 'Jet Trail' are suitable for ground cover[182].

dwatta Analgesic Antiemetic Antiinflammatory Antispasmodic Astringent Cholera DigestiveThe fruit is analgesic, anti-inflammatory, antispasmodic, astringent and digestive[147, 218, 238]. A decoction is used internally in the treatment of nausea, joint pains, cholera and associated cramps[147, 218, 238].

propta Seed - best sown as soon as it is ripe in a sheltered position outdoors or in a cold frame[200]. Sow stored seed in February in a greenhouse[78]. Germination usually takes place within 6 weeks[78]. Prick out the seedlings into individual pots as soon as they are large enough to handle. If well grown, these seedling can be large enough to plant out in the summer, but give them some protection in their first winter. Otherwise plant them out in late spring of the following year[K]. Cuttings of half-ripe wood, July/August in a frame[11]. Easy[113]. Cuttings of mature wood of the current year's growth, November in a cold frame. Layering in late spring or in autumn. This is a sure and easy method, though it takes 12 months[78, 200].

nwatta Landscape Uses:Border; Espalier; Hedge, Massing, Woodland garden . Easily cultivated in any reasonably good soil[1, 11]. Prefers a deep moist well-drained loam[11]. Grows well in heavy clay soils. Tolerates full shade but requires a sunny position for best fruit production[3, 11, 200]. Becomes chlorotic on very alkaline soils[200]. Tolerates atmospheric pollution[200]. This species is hardy to about -25°C[200]. Plants fruit freely in Britain, but the fruit does not always ripen. They do best when grown against a south-facing wall[11]. A very ornamental plant[1], there are many named varieties developed for their ornamental value[182, 183]. Closely allied to *C. japonica*[11]. A good bee plant, flowering early in the year and providing pollen and nectar[108]. Plants in this genus are notably resistant to honey fungus[200]. Special Features:Not North American native, Attractive flowers or blooms. The plant is heat tolerant in zones 9 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is multistemmed with multiple stems from the crown [1-2]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

## 5.2.239 *Polygonum japonicum*

Japanese Knotweed, Mexican Bamboo, Japanese Knotweed

4 tin 10 cyuc 3 kcaak 0 tcan 3 dwat 3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta *Polygonum japonicum* is a PERENNIAL growing to 3 m (9ft) by 5 m (16ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to October, and the seeds ripen from August to October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required) . . The plant is not self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves Root Seed StemEdible Uses: Young shoots in spring - cooked. They can be used as an asparagus substitute[55, 62, 116, 1599, 179, 183]. They have an acid flavour and can also be used as a rhubarb substitute in pies, fruit soups, jams etc[183]. Older stems and shoot tips - cooked[62, 159]. They taste like a mild version of rhubarb[K]. Seed - raw or cooked. It is rather small and fiddly to utilize. The seed can also be ground into a powder and used as a flavouring and thickener in soups etc, or can be mixed with cereals when making bread, cakes etc. The root is sometimes eaten[183].

tcanta Biomass DyeA yellow dye is obtained from the root[46, 61]. The plant is potentially a good source of biomass. Plants can be grown to form a ground cover that will exclude all other growth[208]. It is best to use the sub-species compactum since this is less invasive[208].

dwatta Antiphlogistic Antitumor Depurative Diuretic Emollient Febriifuge Stomachic Vulnerary Women's complaintsThe root is antiphlogistic, bechic, depurative, diuretic, emmenagogue, emollient, febriifuge, stomachic and vulnerary[46, 61, 147, 178, 218]. It is also used in the treatment of women's complaints[147]. A decoction is used in the treatment of burn injuries, boils and abscesses, poisonous snakebites, acute hepatitis, appendicitis, traumatic injuries and menstrual irregularities[147]. The leaves can be crushed and applied externally as a poultice to abscesses, cuts etc, whilst the dried roots can be ground into a powder and applied externally[147]. Extracts of the plant have shown anti-tumour activity[147].

propta Seed - sow spring in a cold frame. Seed - sow spring in a cold frame. Germination is usually free and easy. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer if they have reached sufficient size. If not, overwinter them in a cold frame and plant them out the following spring after the last expected frosts. Division in spring or autumn. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Landscape Uses:Container, Specimen, Woodland garden. A very easily grown plant, it succeeds in ordinary garden soil in sun or shade[1, 111], though it prefers a moist soil in partial shade[187]. Japanese knotweed is an extremely invasive plant capable of sending up new shoots at a considerable distance from the main clump and also of growing up through tarmac[200]. The sub-species cuspidatum is the form that is most likely to cause problems. It is considered to be a pest in many areas, where it is forming large clumps in the wild and out-competing native species. If grown in the garden it should be planted within a strong barrier to contain its roots. The sub-species compacta is only about 70cm tall and is far less invasive, but should still not be grown in small gardens[200]. A report on the Natural History Programme stated that Japanese knotweed is actually becoming a very valuable habitat for spiders, frogs, grass snakes and many other creatures. Its hollow stems allow a wide variety of insects and other small creatures to overwinter and find hiding places, thus a greater abundance of food is provided for insectivores such as frogs, who are themselves eaten by grass snakes. In areas of north Wales where Japanese knotweed has run rife, it is now the primary habitat for grass snakes[215]. Plants seem to be immune to the predations

kcakta Edible Parts: Flowers FruitEdible Uses: Fruit - raw or cooked[13]. The tastiest fruit in this genus[7]. Rich in vitamin C, the seed can be removed and the fruit used in jellies, preserves etc[183]. The fruit is about 5mm in diameter and is borne in large clusters, making it easy to harvest[200]. Some caution is advised, see notes above on toxicity. Flowers - raw or cooked.

tcanta Repellent Straw WoodThe leaves are used to repel insects[6]. Wood - commonly used in the manufacture of domestic items. It can be hollowed out to make flutes, pipes, straws etc[7, 99].

dwatta Anodyne Carminative Depurative Diaphoretic Diuretic Laxative Purgative Resolvent Vitamin C Vulnerary-The leaves, stems and the roots are anodyne, carminative and vulnerary[13, 147]. A decoction is used in the treatment traumatic injuries, fractures, rheumatoid arthralgia, gas pains, acute and chronic nephritis[147]. The fruit is depurative and laxative[7, 9]. The leaves are diuretic, resolvent and sudorific[7]. They are used externally to soothe abscesses and boils[7]. The root, and the oil from the seed, are purgative[7, 9].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame, when it should germinate in early spring. Stored seed can be sown in the spring in a cold frame but will probably germinate better if it is given 2 months warm followed by 2 months cold stratification first[78, 98, 113]. Prick out the seedlings into individual pots when they are large enough to handle. If good growth is made, the young plants can be placed in their permanent positions during the early summer. Otherwise, either put them in a sheltered nursery bed, or keep them in their pots in a sheltered position and plant them out in spring of the following year. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in a frame[78]. Cuttings of mature wood of the current season's growth, 15 - 20cm with a heel, late autumn in a frame or a sheltered outdoor bed[78]. Division of suckers in the dormant season.

nwatta Tolerates most soils, including chalk[200], but prefers a moist loamy soil[11, 200]. Grows well in heavy clay soils. Tolerates some shade but is best in a sunny position. Prefers cool moist conditions. Tolerates atmospheric pollution and coastal situations. Hardy to about -25°C[184]. Plants self-sow in N. Britain but they rarely fruit well in S. Britain[3, 182]. There are some named varieties developed for their ornamental value[182]. The flowers have a sweet smell, free from the fishy undertones found in some other members of the genus[245]. This subspecies has larger fruits and seeds than the type[200]. Plants in this genus are notably resistant to honey fungus[200].

## 5.2.236 Amelanchier sanguinea

Roundleaf Serviceberry, Gaspé serviceberry  
4 tin 8 cyuc 3 kcaak 0 tcan 0 dwat 3 m hkuc  
hmmihmtt cyutli kyucctcup hwicli hrasjlutnykfrp hpa7tli flatprikliws hpa7tmwatli fyfxre7t hjonli

drutta Amelanchier sanguinea is a deciduous Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower in April. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acidic, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: FruitEdible Uses: Edible fruit - raw or cooked[101, 105]. A sweet flavour[177]. The fruit is produced in small clusters and is up to 11mm in diameter[229]. The fruit is rich in iron and copper[226].

tcanta None known

dwatta None known

propta Seed - it is best harvested 'green', when the seed is fully formed but before the seed coat has hardened, and then sown immediately in pots outdoors or in a cold frame. If stored seed is obtained early enough in the autumn, it can be given 4 weeks warm stratification before being left out in the winter and it should then germinate in the spring. Otherwise seed can be very slow to germinate, perhaps taking 18 months or more. When large enough to handle, prick the

seedlings out into individual pots and grow them on in a sheltered outdoor position, planting them out once they are 20cm or more tall. If there is sufficient seed it is best to sow it thinly in an outdoor seedbed[78, 80]. Grow the seedlings on for two years in the seedbed before planting them out into their permanent positions during the winter. Layering in spring - takes 18 months[78]. Division of suckers in late winter. The suckers need to have been growing for 2 years before you dig them up, otherwise they will not have formed roots. They can be planted out straight into their permanent positions if required.

nwatta Prefers a rich loamy soil in a sunny position or semi-shade[1, 200], but thrives in any soil that is not water-logged[11]. Grows well in heavy clay soils. Tolerates dry soils[200]. All members of this genus have edible fruits and, whilst this is dry and uninteresting in some species, in many others it is sweet and juicy. Many of the species have potential for use in the garden as edible ornamentals. The main draw-back to this genus is that birds adore the fruit and will often completely strip a tree before it is fully ripe[K]. Plants produce suckers and form thickets[200]. Hybridizes with *A. stolonifera*, *A. laevis* and *A. bartramiana*. Grafting onto seedlings of *A. lamarckii* or *Sorbus aucuparia* is sometimes practised in order to avoid the potential problem of hybridizing[1].

## 5.2.237 Vaccinium stamineum

Deerberry

4 tin 8 cyuc 3 kcaak 0 tcan 0 dwat 3 m hkuc  
hmmihmtt cyutli kyucctcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta Vaccinium stamineum is a deciduous Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acidic soils and can grow in very acidic soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. Unpalatable[200]. The quality varies from shrub to shrub[183]. When cooked and served cold they are considered to be delicious with a flavour suggesting gooseberry and cranberry sauce with the slightly bitter aftertaste of grapefruit marmalade[183]. The fruit is about 10mm in diameter[200].

tcanta None known

dwatta None known

propta Seed - sow late winter in a greenhouse in a lime-free potting mix and only just cover the seed[78]. Stored seed might require a period of up to 3 months cold stratification[113]. Another report says that it is best to sow the seed in a greenhouse as soon as it is ripe[200]. Once they are about 5cm tall, prick the seedlings out into individual pots and grow them on in a lightly shaded position in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 8cm with a heel, August in a frame[78]. Slow and difficult. Layering in late summer or early autumn[78]. Another report says that spring is the best time to layer[200]. Takes 18 months[78]. Division of suckers in spring or early autumn[113].

nwatta Requires a moist but freely-draining lime free soil, preferring one that is rich in peat or a light loamy soil with added leaf-mould[11, 200]. Prefers a very acid soil with a pH in the range of 4.5 to 6, plants soon become chlorotic when lime is present. Succeeds in full sun or light shade though it fruits better in a sunny position[200]. Another report says that it prefers a position in partial shade[184]. Requires shelter from strong winds[200]. Plants are hardy to about -25°C[184]. Dislikes root disturbance, plants are best grown in pots until being planted out in their permanent positions[200]. A polymorphic species, the plants are very variable in leaf shape. It is closely related to *V. neglectum*[11]. Plants in this genus are notably resistant to honey fungus[200].

dwatta Cancer MiscellanyThe cotyledons are said to be a cure for cancer[218].

propta The seed is best sown as soon as it is ripe in individual deep pots in a cold frame[80]. You need to protect it from mice, birds, squirrels etc. The seed usually germinates in late winter or the spring. Plant out the seedlings into their permanent positions in early summer and give some protection from the cold for their first winter or two. The seed can also be stored in cool moist conditions (such as the salad compartment of a fridge) over the winter and sown in early spring but it may then require a period of cold stratification before it will germinate[78, 80, 113].

nwatta Requires a deep well-drained loam and a sunny position sheltered from strong winds[1, 11]. Prefers a slightly alkaline soil[200]. A very hardy and ornamental tree[1], it is recommended for cultivation in severe cold climates[183]. Plants produce a deep taproot and they are intolerant of root disturbance[1, 11]. Seedlings should be planted out into their permanent positions as soon as possible and given some protection for their first winter or two since they are somewhat tender when young[1, 11]. Flower initiation depends upon suitable conditions in the previous summer[200]. The flowers and young growths can be destroyed by even short periods down to -2°C, but fortunately plants are usually late coming into leaf[200]. Any pruning should only be carried out in late summer to early autumn or when the plant is fully dormant otherwise wounds will bleed profusely and this will severely weaken the tree[200]. Trees have a dense canopy which tends to reduce plant growth below them. We have no specific information for this species, but the roots of several members of this genus produce substances that are toxic to many plant species, especially apples (*Malus* species), members of the Ericaceae, *Potentilla* spp and the white pines (certain *Pinus* spp.)[200]. The leaves of many species also secrete substances that have an inhibitory effect on plants growing underneath them. All in all this is not a very good companion plant[K]. Closely allied to *J. cathayensis*[11].

## 5.2.186 Heracleum sphondylium montanum

Cow Parsnip

4 tin 8 cyuc 3 kcaak 0 tcan 2 dwat m hkuc  
pcimhmmihmtt cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliws hpa7tmwatli fyfxre7t hjonli

drutta Heracleum sphondylium montanum is a PERENNIAL growing to 2.4 m (7ft 10in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in July, and the seeds ripen in August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acidic, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves Root StemEdible Uses: Condiment SaltRoot - cooked[2, 46, 85, 94]. Tastes like a swede[155, 183]. Used like potatoes, though it is considered to be poisonous by some writers[213]. The peeled stem can be eaten raw but is best cooked[2, 61, 183]. The unpeeled stem can be used when young, or just the inner tissue of older stems can be used, before the plants flower[85, 94]. For people not used to the flavour, they are best cooked in two changes of water when they make a tasty celery-like vegetable[213]. Another report says that, despite the strong odour of the leaves and outer skin, the peeled young stems are mild and sweet, resembling celery in flavour[256]. The stems cannot be eaten raw in large quantities because they give a burning sensation in the mouth[257]. The stems are highly nutritious, containing up to 18% protein[213]. Leaves and young shoots - raw or cooked[55, 85, 94, 118]. Cooked as greens or added to salads[183]. Young flowers[46, 61, 105]. No further details. The dried seeds are used as a flavouring for soups, stews and potato salads[85, 183]. The dried base of the plant and ashes from the burnt leaves are used as a salt substitute[183].

tcanta Dye Musical Packing Repellent StrawWhistles, flutes, straws etc can be made from the hollow stems[99, 257]. The leaves are used as a covering for baskets of fruit

etc[99]. A yellow dye is obtained from the roots[257]. An infusion of the blossoms, rubbed on the body, repels flies and mosquitoes[257].

dwatta Antidandruff Antirheumatic Antispasmodic Carminative Epilepsy Febrifuge Odontalgic Stimulant TB TonicCow parsnip was widely employed medicinally by a large number of native North American Indian tribes who used it to treat a wide variety of complaints, but especially as a poultice on bruises, sores etc[257]. It is little used in modern herbalism, though perhaps it merits further investigation. All parts of the plant are antirheumatic, antispasmodic, carminative, febrifuge, odontalgic and stimulant[21, 94, 155, 172, 257]. The leaves are tonic[257]. They have been used in the treatment of colds[257]. A soothing drink made from the leaves is used to treat sore throats[257]. A poultice of the heated leaves has been applied to minor cuts, sore muscles etc[257]. An infusion of the fresh young stems has been used in the treatment of diarrhoea[257]. It has also been used as a wash to remove warts[257]. The plant has been used in the treatment of epilepsy[213]. A tea made from the roots is used in the treatment of indigestion, colds, stomach cramps, rheumatism, sore throats, TB etc[222, 257]. Externally, the root is used as a poultice on sores, bruises, swellings, boils, rheumatic joints, VD scabs etc, whilst a bit of root has been held on an aching tooth to reduce the pain[222, 257]. The root can be crushed, mixed with water and used as an antidandruff hair wash[257]. The root contains psoralen, which is being investigated for its use in the treatment of psoriasis, leukaemia and AIDS[222]. The seed has been used to treat severe headaches[257].

propta Seed - sow mid to late spring or early autumn in situ. Division in autumn.

nwatta Succeeds in any ordinary garden soil, doing best in moist soils or deep woodland[1, 55, 60].

## 5.2.187 Arctium minus

Lesser Burdock

4 tin 8 cyuc 3 kcaak 4 tcan 5 dwat m hkuc  
hmmihmtt cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliws hpa7tmwatli fyfxre7t hjonli

drutta Arctium minus is a BIENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from July to September, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acidic, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves Root Seed StemEdible Uses: CoffeeRoot - raw or cooked[62, 85]. The best roots are obtained from young plants[85]. Usually peeled and sliced[183]. The roasted root is a coffee substitute[183]. Young leaves and leaf stems - raw or cooked[85]. Used as a potherb[183]. Mucilaginous. It is best to remove the rind from the stem[85]. Young flowering stem - peeled and eaten raw or cooked like asparagus[177, 183]. Seed sprouts[55]. No further details.

tcanta PaperA fibre is obtained from the inner bark and is used to make paper. It is about 0.9mm long[189]. The stems are harvested in late summer, the leaves are removed and the stems steamed in order to strip off the fibre. The fibres are then cooked for two hours in soda ash before being put in a ball mill for 2 hours[189]. The resulting paper is a light tan/ brown colour[189].

dwatta Alterative Antibacterial Antifungal Aperient Blood purifier Carminative Chologogue Diaphoretic Diuretic Eczema Hypoglycaemic Burdock is one of the foremost detoxifying herbs in both Chinese and Western herbal medicine[254]. *Arctium lappa* is the main species used, though this species has similar properties[254]. The dried root of one year old plants is the official herb, but the leaves and fruits can also be used[4]. It is used to treat conditions caused by an 'overload' of toxins, such as throat and other infections, boils, rashes and other skin problems[254]. The root is thought to be particularly good at helping to eliminate heavy metals from the body[254]. The plant is antibac-

terial, antifungal and carminative[9, 21, 147, 165, 176]. It has soothing, mucilaginous properties and is said to be one of the most certain cures for many types of skin diseases, burns, bruises etc[4, 244]. It is used in the treatment of herpes, eczema, acne, impetigo, ringworm, boils, bites etc[244]. The plant can be taken internally as an infusion, or used externally as a wash[244]. Use with caution[165]. One-year old roots are alterative, aperient, blood purifier, cholagogue, depurative, diaphoretic, diuretic and stomachic[218, 222]. The seed is alterative, antibacterial, antifungal, antiplogistic, depurative, diaphoretic, diuretic and hypoglycaemic[176, 218]. It is used in the treatment of colds with sore throat and cough, measles, pharyngitis, acute tonsillitis and abscesses[176]. The crushed seed is poulticed onto bruises[222]. The seed is harvested in the summer and dried for later use[254]. The seed contains arctiin, this excites the central nervous system producing convulsions an increase in respiration and later paralysis. It also lowers the blood pressure by dilating the blood vessels[176]. The leaves are poulticed onto burns, ulcers and sores[222].

propta Seed - best sown in situ in autumn.

nwatta Succeeds on most soils, preferably moist[200]. Prefers a sunny position. Prefers partial shade according to another report[200]. A polymorphic species[17]. A good butterfly plant[24]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is fleshy. Thick or swollen - fibrous or tap root [2-1].

## 5.2.188 Achillea millefolium

Yarrow, Boreal yarrow, California yarrow, Giant yarrow, Coast yarrow, Western yarrow, Pacific yarrow  
4 tin 8 cyuc 3 kcaak 4 tcan 4 dwat m hkuc  
hmimhtut cyutli hqatkyuctup hwicli hyshrasj]lutnyik hpa7tli flatprikwslip hpa7tmwatli xre7t hjonli

drutta Achillea millefolium is a PERENNIAL growing to 0.6 m (2ft) by 0.6 m (2ft in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 2 and is not frost tender. It is in flower from June to August, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

ckakta Edible Parts: LeavesEdible Uses: Condiment TeaLeaves - raw or cooked[4, 5, 46, 52]. A rather bitter flavour, they make an acceptable addition to mixed salads and are best used when young[9, 183, K]. The leaves are also used as a hop-substitute for flavouring and as a preservative for beer etc[2, 9, 53, 183]. Although in general yarrow is a very nutritious and beneficial plant to add to the diet, some caution should be exercised[K]. See the notes above on possible toxicity. An aromatic tea is made from the flowers and leaves[183]. An essential oil from the flowering heads is used as a flavouring for soft drinks[183].

tcanta Companion Compost Cosmetic Dye Essential Hair Liquid feed RepellentThe growing plant repels beetles, ants and flies[14, 99, 172]. The plant has been burnt in order to ward off mosquitoes[257]. A liquid plant feed can be made from the leaves[54]. You fill a container with the leaves and then add some water. Leave it to soak for a week or two and then dilute the rather smelly dark liquid, perhaps 10 - 1 with water though this figure is not crucial[K]. This plant is an essential ingredient of 'Quick Return' herbal compost activator[32]. This is a dried and powdered mixture of several herbs that can be added to a compost heap in order to speed up bacterial activity and thus shorten the time needed to make the compost[K]. The fragrant seeds have been used to impart a pleasant smell indoors[257]. An essential oil obtained from the leaves is used medicinally[17, 46, 61]. The leaves contain from 0.6 to 0.85% essential oil[240]. The leaves have been used as a cosmetic cleanser for greasy skin[268]. Yellow and green dyes are obtained from the flowers[168]. A good ground cover plant, spreading quickly by

its roots[208]. A dynamic accumulator gathering minerals or nutrients from the soil and storing them in a more bioavailable form - used as fertilizer or to improve mulch. Nectary, invertebrate shelter.

dwatta Antidiarrhoeal Antiinflammatory Antiseptic Antispasmodic Appetizer Aromatic Astringent Carminative Cholagogue Diaphoretic Digestive Emmenagogue Odontalgic Stimulant Tonic Vasodilator VulneraryYarrow has a high reputation and is widely employed in herbal medicine, administered both internally and externally. It is used in the treatment of a very wide range of disorders but is particularly valuable for treating wounds, stopping the flow of blood, treating colds, fevers, kidney diseases, menstrual pain etc[218, 238, 254, 257]. The whole plant is used, both fresh and dried, and is best harvested when in flower[222]. Some caution should be exercised in the use of this herb since large or frequent doses taken over a long period may be potentially harmful[222], causing allergic rashes and making the skin more sensitive to sunlight[238]. The herb combines well with Sambucus nigra flowers (Elder) and Mentha x piperita vulgaris (Peppermint) for treating colds and influenza[268]. The herb is antiseptic, antispasmodic, mildly aromatic, astringent, carminative, cholagogue, diaphoretic, digestive, emmenagogue, odontalgic, stimulant, bitter tonic, vasodilator and vulnerary[4, 9, 14, 21, 54, 145, 165, 172, 238, 240, 254]. It also contains the anti-inflammatory agent azulene, though the content of this varies even between plants in the same habitat[238]. The herb is harvested in the summer when in flower and can be dried for later use[4]. The fresh leaf can be applied direct to an aching tooth in order to relieve the pain[268].

propta Seed - sow spring or early autumn in a cold frame[133]. The seed usually germinates in 1 - 3 months[133]. When large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring or autumn. Very easy, the divisions can be planted direct into their permanent positions. Divisions succeed at any time of the year. Basal cuttings of new shoots in spring. Very easy, collect the shoots when they are about 10cm tall, potting them up individually in pots and keeping them in a warm but lightly shaded position. They should root within 3 weeks and will be ready to plant out in the summer.

nwatta Landscape Uses:Container, Ground cover, Massing, Seashore, Woodland garden. Succeeds in most soils and situations but prefers a well-drained soil in a sunny position[1, 14]. Shade tolerant[13]. Plants live longer when grown in a poor soil[200] and also do well on lime[208]. Established plants are very drought tolerant[200], they can show distress in very severe droughts but usually recover[190]. It remains green after grass has turned brown in a drought[187]. Plants succeed in maritime gardens[233]. The plant has a very spreading root system and is usually quite invasive[233, K]. A very hardy plant, tolerating temperatures down to about -25°C[187]. Yarrow is an excellent plant for growing in lawns, meadows, orchards etc., it is tolerant of repeated close cutting and of being walked on[20, 54]. It works to improve the soil fertility[20, 54]. A very good companion plant, it improves the health of plants growing nearby and enhances their essential oil content thus making them more resistant to insect predations[14, 18, 20, 53]. There are some named forms, selected for their ornamental value[183, 238]. 'Pink' (syn. 'Rosea') has very aromatic foliage and deep pink flowers[183]. Hybridizes freely with other members of this genus[200]. A good bee plant, it is an important nectar source for many insects[24]. Special Features: Attractive foliage, Edible, Fragrant foliage, Invasive, Naturalizing, Attracts butterflies, Suitable for cut flowers, Suitable for dried flowers. The plant is heat tolerant in zones 9 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a

drutta Eleutherococcus sieboldianus is a deciduous Shrub growing to 3 m (9ft) by 2.5 m (8ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from June to July, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. It can tolerate atmospheric pollution.

ckakta Edible Parts: LeavesEdible Uses: TeaYoung leaves - cooked[46, 61, 177]. A delicious somewhat fragrant flavour[105, 183]. The dried leaves are a tea substitute[183]. tcanta Hedge HedgeThe plant is used as a hedge[200]. dwatta None known propta Seed - best sown as soon as it is ripe in the autumn in a cold frame[200]. It can be slow to germinate. Stored seed requires 6 months warm followed by 3 months cold stratification[113] and can be very slow to germinate[133]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in a cold frame or greenhouse for at least the first winter. Plant out in late spring or early summer. Cuttings of half-ripe wood, July/August in a frame[113, 200]. Cuttings of ripe wood of the current season's growth, 15 - 30cm long in a cold frame[238]. Root cuttings in late winter[200]. Division of suckers in the dormant season[200].

nwatta Landscape Uses:Border, Hedge, Massing, Screen, Specimen. Prefers a light warm open loamy humus-rich soil and a position sheltered from north and east winds[11, 200]. Prefers a well-drained soil and full sun[200]. Thrives in sun or shade according to another report. Tolerates urban pollution and poor soils[200]. Plants are hardy to at least -15°C if they are sheltered from cold winds[200]. Cultivated as a medicinal and culinary plant in Japan[58], there are some named varieties selected for their ornamental value[200]. Special Features:Attractive foliage, Not North American native.

## 5.2.233 Vaccinium fuscatum

Black Highbush Blueberry  
4 tin 8 cyuc 3 kcaak 0 tcan 0 dwat 3.5 m hkuc  
hmimhtut cyutli tcuphja7n hwicli hrasj]lut hpa7tli frusflat hpa7tmwatli dyatxre7t hjonli

drutta Vaccinium fuscatum is a deciduous Shrub growing to 3.5 m (11ft 6in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from March to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

ckakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[3, 105, 200]. Large, sweet, juicy and very flavourful[183]. The fruit is about 8mm in diameter[200].

tcanta None known dwatta None known propta Seed - sow late winter in a greenhouse in a lime-free potting mix and only just cover the seed[78]. Stored seed might require a period of up to 3 months cold stratification[113]. Another report says that it is best to sow the seed in a greenhouse as soon as it is ripe[200]. Once they are about 5cm tall, prick the seedlings out into individual pots and grow them on in a lightly shaded position in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 8cm with a heel, August in a frame[78]. Slow and difficult. Layering in late summer or early autumn[78]. Another report says that spring is the best time to layer[200]. Takes 18 months[78]. Division of suckers in spring or early autumn[113].

nwatta Requires a moist or wet lime free soil[11, 184, 200], preferring one that is rich in peat or a light loamy soil with added leaf-mould[11, 200]. Prefers a very acid soil with a pH in the range of 4.5 to 6. plants soon become chlorotic when lime is present. Succeeds in full sun or light shade though it fruits better in a sunny position[200]. Requires shelter from strong winds[200]. Plants are hardy to about

-25°C[184]. This species is often cultivated for its edible fruit[3]. Plants are self-sterile, at least two different varieties must be grown if seed is required[11]. Dislikes root disturbance, plants are best grown in pots until being planted out in their permanent positions[200]. Closely related to *V. corymbosum*[11, 182]. Plants in this genus are notably resistant to honey fungus[200].

## 5.2.234 Helianthus giganteus

Giant Sunflower  
4 tin 8 cyuc 3 kcaak 0 tcan 0 dwat 3.6 m hkuc  
hmimhtut cyutli tcup hwicli hrasj]lutnyik hpa7tli flatprikwliw hpa7tmwatli xre7t hjonli

drutta Helianthus giganteus is a PERENNIAL growing to 3.6 m (11ft 10in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from September to October, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

ckakta Edible Parts: Root SeedEdible Uses: Tubers - cooked[95]. A similar taste to Jerusalem artichokes but less productive. The var. 'subtuberosus' is used[1, 177]. Seed - raw or cooked. It can be dried and ground into a powder, then mixed with cornmeal and used for making bread[2, 14, 46, 61, 183]. The seed is very small and fiddly to use[K].

tcanta None known dwatta None known propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring or autumn. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring. Basal cuttings in spring. Harvest the shoots when they are about 10 - 15cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Succeeds in most soils in a sunny position[1]. Requires a rich soil[1]. Dislikes shade[1]. Likes moist soils, doing well by a stream[200]. The young growth is extremely attractive to slugs, plants can be totally destroyed by them[K]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. Plants have a running root system and can be invasive[1]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

## 5.2.235 Sambucus racemosa kamschica

Red Elder  
4 tin 8 cyuc 3 kcaak 2 tcan 2 dwat 3 m hkuc  
hmimhtut cyutli tcup hwicli hrasj]lutnyikfrip hpa7tli flatprikwliw hpa7tmwatli xre7t hjonli

drutta Sambucus racemosa kamschatica is a deciduous Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from April to May, and the seeds ripen from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

sloe is very resistant to maritime exposure and also suckers freely. It can be used as a hedge in exposed maritime positions. The hedge is stock-proof if it is well maintained[1, 29], though it is rather bare in the winter and, unless the hedge is rather wide, it is not a very good shelter at this time[K]. Because of its suckering habit, the plant is a natural pioneer species, invading cultivated fields and creating conditions conducive to the regeneration of woodland. Wood - very hard. Used for turnery, the teeth of rakes etc[1, 13, 46, 66]. Suitable branches are used for making walking sticks and are highly valued for this purpose because of their twisted and interesting shapes[7].

dwatta Antidiarrhoeal Antiflatulent Antispasmodic Aperient Astringent Depurative Diaphoretic Diuretic Febrifuge Laxative StomachicThe flowers, bark, leaves and fruits are aperient, astringent, depurative, diaphoretic, diuretic, febrifuge, laxative and stomachic[7, 9, 21]. An infusion of the flowers is used in the treatment of diarrhoea (especially for children), bladder and kidney disorders, stomach weakness et[9]. Although no specific mention has been seen for this species, all members of the genus contain amygdalin and prunasin, substances which break down in water to form hydrocyanic acid (cyanide or prussic acid). In small amounts this exceedingly poisonous compound stimulates respiration, improves digestion and gives a sense of well-being[238]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve *Prunus spinosa* Sloe - Blackthorn for inflammation of mouth and pharynx (see [302] for critics of commission E).

propta Seed - requires 2 - 3 months cold stratification and is best sown in a cold frame as soon as it is ripe[200]. Sow stored seed in a cold frame as early in the year as possible[200]. Protect the seed from mice etc. The seed can be rather slow, sometimes taking 18 months to germinate[113]. Prick out the seedlings into individual pots when they are large enough to handle. Grow them on in a greenhouse or cold frame for their first winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood with a heel, July/August in a frame[11, 200]. Softwood cuttings from strongly growing plants in spring to early summer in a frame. Layering in spring. Division of suckers during the dormant season. They can be planted out direct into their permanent positions.

nwatta Agroforestry Services: Living fence Agroforestry Services: Windbreak Industrial Crop: Oil Management: Standard Regional CropLandscape Uses:Specimen. Requires a well-drained moisture retentive soil[11]. Succeeds in all soils except very acid peats[186]. Succeeds in light shade but fruits better in a sunny position[11, 200]. Thrives in a loamy soil, doing well on limestone[11]. Prefers some chalk in the soil but apt to become chlorotic if too much is present[1]. Thrives on chalk according to another report[182]. Plants are very resistant to maritime exposure[186]. An important food plant for the caterpillars of several species of butterfly[30], especially the larvae of the brown and black hairstreak butterflies[186]. A good bee plant. Plants are shallow-rooted and of a suckering habit, they can form dense impenetrable thickets which are ideal for nesting birds, especially nightingales[186]. Flowers are often damaged by late frosts[186]. Plants regenerate quickly after cutting or after fast moving forest fires, producing suckers from below ground level[186]. This species is notably resistant to honey fungus[88, 200]. Special Features: All or parts of this plant are poisonous. Blooms are very showy. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is flat with shallow roots spreading near the soil surface. The root pattern is suckering with new plants from runners away from the plant [2-1].

### 5.2.231 *Corylus cornuta*

Beaked Hazel, California hazelnut, Turkish Filbert, Turkish Hazel

4 tin 7 cyuc 3 kcaak 3 tcan 1 dwat 3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik-wisslip hpa7tmwatli fyif hjonli

drutta *Corylus cornuta* is a deciduous Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to

UK zone 4. It is in flower from April to May, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kckaakta Edible Parts: Oil SeedEdible Uses: OilSeed - raw or cooked[2, 62, 101]. Very popular in America, the seed is sweet and well-flavoured with a thin shell[2, 85]. The seed can be dried and ground into a powder which is added to cereals and used in making bread, pies etc[85, 183]. The seed ripens in mid to late autumn and will probably need to be protected from squirrels[K]. When kept in a cool place, and not shelled, the seed should store for at least 12 months[K]. An edible oil is obtained from the seed.

tcanta Basketry Dye Oil StringYoung sucker shoots are used to make a rope[99]. The shoots are soaked in urine first, to make them more pliable[257]. A blue dye is obtained from the root or inner bark[99, 101]. The branches are used in basketry[160].

dwatta Cardiac Odontalgic StomachicAn infusion of the branches and leaves has been used in the treatment of heart complaints and intestinal disorders[257]. A decoction of the bark has been given to children to alleviate teething pain[257].

propta Seed - best sown as soon as it is harvested in autumn in a cold frame[164]. Germinates in late winter or spring. Stored seed should be pre-soaked in warm water for 48 hours and then given 2 weeks warm followed by 3 - 4 months cold stratification[164]. Germinates in 1 - 6 months at 20°C[164]. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame or sheltered place outdoors for their first winter. Plant them out into their permanent positions in late spring or early summer[K]. Layering in autumn. Easy, it takes about 6 months[78, 200]. Division of suckers in early spring. Very easy, they can be planted out straight into their permanent positions.

nwatta Landscape Uses:Firewood, Specimen, Street tree. An easily grown plant, it succeeds in most soils, but is in general more productive of seeds when grown on soils of moderate fertility[11, 200]. It does less well in rich heavy soils or poor ones[11, 63]. Does well in a loamy soil[11]. Very suitable for an alkaline soil[11], but it dislikes very acid soils[17]. Tolerates a pH in the range 5.8 to 7.5. Plants are fairly wind tolerant[1, 11]. Plants are hardy to about -30°C[160]. They thrive in a short growing season[160]. This species is occasionally cultivated for its edible seed in N. America[61] but is of no value in Britain as a seed bearer[11]. Plants can bear fruit in 5 - 6 years from seed[160]. Members of this genus bear transplanting well and can be easily moved even when relatively large[11]. Special Features:Not North American native, Inconspicuous flowers or blooms. The plant is heat tolerant in zones 7 through 5. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. A clumping plant, forming a colony from shoots away from the crown but with a limited spread [1-2]. The root pattern is suckering with new plants from underground runners away from the plant [1-2].

### 5.2.232 *Eleutherococcus sieboldianu*:

Ukogi, Five Leafed Aralia

4 tin 8 cyuc 3 kcaak 2 tcan 0 dwat 3 m hkuc hmimhtut cyutli tcup hwicli hyishrasjlutnyik hpa7tli flatprik-wis hpa7tmwatli xre7t hjonli

runner spreading indefinitely by rhizomes or stolons [1-2]. The root pattern is fibrous dividing into a large number of fine roots [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

### 5.2.189 *Viola mirabilis*

wonder violet

4 tin 8 cyuc 3 kcaak 0 tcan 1 dwat m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli fyifxre7t hjonli

drutta *Viola mirabilis* is a PERENNIAL growing to 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from June to July, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Cleistogomy (self-pollinating without flowers ever opening). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kckaakta Edible Parts: Flowers LeavesEdible Uses: TeaYoung leaves and flower buds - raw or cooked[105]. When added to soup they thicken it in much the same way as okra[85, 159]. A tea can be made from the leaves[85].

tcanta None known

dwatta CardiacCardiac[61].

propta Seed - best sown in the autumn in a cold frame. Sow stored seed in early spring in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in the summer. Division in the autumn or just after flowering. Larger divisions can be planted out direct into their permanent positions, though we have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the summer or the following spring.

nwatta Prefers a cool moist well-drained humus-rich soil in partial or dappled shade and protection from scorching winds. Tolerates sandstone and limestone soils but becomes chlorotic if the pH is too high. Prefers a pH between 6 and 6.5[200]. All members of this genus have more or less edible leaves and flower buds, though those species with yellow flowers can cause diarrhoea if eaten in large quantities[62, 85, 159].

### 5.2.190 *Juniperus monosperma*

One-Seed Juniper

4 tin 8 cyuc 3 kcaak 3 tcan 2 dwat m hkuc htut cyutli hgatkuyctcup hwicli hrasjlutnyik hpa7tli flatprik-wisslip hpa7tmwatli nyanhjen hjonli

drutta *Juniperus monosperma* is an evergreen Tree growing to 18 m (59ft 1in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in leaf all year, in flower in April, and the seeds ripen in October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kckaakta Edible Parts: FruitEdible Uses: GumFruit - raw or cooked. Soft, juicy and pulpy[81, 85, 105], but with a thin flesh[82]. It can be dried and ground into a powder and then be baked[82, 227], or can be used as a seasoning in stews etc[161, 257]. The fruits were only used when other foods were in short supply[257]. The cones are about 5 - 8mm in diameter and ripen in their first year[200]. Inner bark - raw or cooked[257]. It was chewed in times of food shortage for the little nourishment it supplied[257]. The gum is chewed as a delicacy[161, 257]. No further details are given.

tcanta Bedding Dye Fibre Fuel Gum Lighting Mordant Tinder WoodThin strips of the fibrous bark are used for making sleeping mats etc[82, 227]. It has also been used as a lining in shoes to absorb moisture and to keep the feet warmer[257].

When rubbed fine, the bark can be used to make children's clothing[257]. The bark is employed as a tinder and is also made into a slow match or can be shredded, bound into bundles and used as a torch to give light in the house[216, 257]. The crushed bark was twisted into a rope, tied at intervals with yucca (*Yucca* species), and wrapped into a coil. The free end was set on fire and kept smouldering by blowing on it at intervals. Fire could be carried in this fashion for several hours[257]. The dried seeds have been used as beads or as the 'rattle' in rattles[216, 257]. A green dye is obtained from the bark and berries[229, 257]. A yellow dye is obtained from the whole plant[257]. Ashes from the whole plant have been used as a mordant to fix the colour of dyes[257]. Wood - moderately hard, somewhat heavy, slightly fragrant. When seasoned properly it is very durable and is used mainly for fencing and fuel[82, 227, 229]. As a fuel it burns steadily and evenly[257].

dwatta Antiphlogistic Birthing aid Diuretic Dysentery Febrifuge Laxative Odontalgic Pectoral Poultice StomachicOne-seed juniper was commonly employed medicinally by a number of native North American Indian tribes, who used it to treat a variety of complaints[257]. It is little, if at all, used in modern herbalism. The leaves are febrifuge, laxative and pectoral[216]. An infusion is used in the treatment of stomach complaints, constipation, coughs and colds[216]. An infusion was also used by pregnant women prior to childbirth in order to relax the muscles[257]. A poultice of the heated twigs can be bound over a bruise or sprain in order to reduce the swelling[257]. An infusion of the staminate cones has been used as a stomach tonic and in the treatment of dysentery[257]. The chewed bark has been applied externally to help heal spider bites[257]. It is also highly prized as a dressing on burns[257]. The fruits are strongly diuretic[257]. A gum from the plant has been used as a temporary filling in a decayed tooth[257].

propta The seed requires a period of cold stratification. The seed has a hard seedcoat and can be very slow to germinate, requiring a cold period followed by a warm period and then another cold spell, each of 2 - 3 months duration[78, 81]. Soaking the seed for 3 - 6 seconds in boiling water may speed up the germination process[11]. The seed is best sown as soon as it is ripe in a cold frame. Some might germinate in the following spring, though most will take another year. Another possibility is to harvest the seed 'green' (when the embryo has fully formed but before the seedcoat has hardened). The seedlings can be potted up into individual pots when they are large enough to handle. Grow on in pots until large enough, then plant out in early summer. When stored dry, the seed can remain viable for several years[1]. Cuttings of mature wood, 5 - 10cm with a heel, September/October in a cold frame. Plant out in the following autumn[1, 78]. Layering in September/October. Takes 12 months[78].

nwatta Succeeds in dry soils. Succeeds in most soils, including chalk, if they are well drained[1, 11, 200], preferring a neutral or slightly alkaline soil[11]. Trees are fairly fast growing for a Juniper, and are also long-lived in their native habitats[227]. They grow better in dry areas with hot summers, western Britain is generally to cool and wet for this species to thrive[200]. Plants are resistant to honey fungus[88]. This species is closely related to *J. occidentalis*[11]. The seed matures in 1 year[200]. Some fruit is produced most years, but heavy crops only occur every 2 - 3 years[229]. Dioecious. Male and female plants must be grown if seed is required. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is flat with shallow roots spreading near the soil surface [2-1].

### 5.2.191 *Juniperus communis*

Juniper, Common juniper

4 tin 10 cyuc 3 kcaak 4 tcan 3 dwat 9 m hkuc hmimhtut cyutli hgatkuyctcup hwicli hyishrasjlutnyikfrip hpa7tli frusflatprikwisslip hpa7tmwatli nyanhjen hjonli

drutta *Juniperus communis* is an evergreen Shrub growing to 9 m (29ft) by 4 m (13ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 2 and is not frost tender. It is in leaf all year, in flower from May to June, and the seeds ripen in October. The species is dioecious (individual flowers are either male or female, but only one sex is to be

found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

**kcakta Edible Parts:** Fruit Leaves Seed**Edible Uses:** Coffee Condiment TeaFruit - raw or cooked[2, 5, 9, 15]. It is usually harvested in the autumn when fully ripe and then dried for later use[12]. A soft, mealy, sweet, resinous flesh[82]. The fruit is often used as a flavouring in sauerkraut, stuffings, vegetable pates etc, and is an essential ingredient of gin[183]. The aromatic fruit is used as a pepper substitute according to one report[183]. An essential oil is sometimes distilled from the fruit to be used as a flavouring[183]. Average yields are around 1%[7]. The cones are about 4 - 8mm in diameter and take 2 - 3 years to mature[82, 200]. Some caution is advised when using the fruit, see the notes above on toxicity. The roasted seed is a coffee substitute[177]. A tea is made by boiling the leaves and stems[161]. A tea made from the berries has a spicy gin-like flavour[183].

**tcanta Fibre Fuel Hair Incense Repellent Resin Strewing Tindaer** A decoction of the branches is used as an anti-dandruff shampoo[172]. The essential oil distilled from the fruits is used in perfumes with spicy fragrances[238]. In hot countries the tree yields the resin 'Sandarac' from incisions in the trunk[4, 74]. This is used in the production of a white varnish[74]. The stems were at one time used as a strewing herb to sweeten the smell of rooms[14, 244]. The whole plant can be burnt as an incense and fumigant[66, 102, 146]. It was used during epidemics in the belief that it would purify the air and cleanse it of infection[244]. Fresh or dried juniper branches also make a good insect repellent[102, 172]. Many forms of this species are good ground cover plants for sunny situations[208]. Forms to try include 'Depressa Aurea', 'Dumosa', 'Effusa', and 'Repanda'[197]. 'Prostrata' can also be used[188]. The bark is used as cordage[61] and as a tinder[172]. Wood - strong, hard, fragrant, very durable in contact with the soil and very close-grained, but usually too small to be of much use[82, 229, 244, 245]. It makes an excellent fuel[66].

**dwatta Antiseptic Aromatherapy Aromatic Carminative Diaphoretic Diuretic Rubefacient Stomachic Tonic Urinary** juniper fruits are commonly used in herbal medicine, as a household remedy, and also in some commercial preparations. They are especially useful in the treatment of digestive disorders plus kidney and bladder problems[4]. The fully ripe fruits are strongly antiseptic, aromatic, carminative, diaphoretic, strongly diuretic, rubefacient, stomachic and tonic[4, 7, 9, 21, 46, 165, 240, 254]. They are used in the treatment of cystitis, digestive problems, chronic arthritis, gout and rheumatic conditions[254]. They can be eaten raw or used in a tea[222], but some caution is advised since large doses can irritate the urinary passage[4]. Externally, it is applied as a diluted essential oil, having a slightly warming effect upon the skin and is thought to promote the removal of waste products from underlying tissues[254]. It is, therefore, helpful when applied to arthritic joints etc[254]. The fruits should not be used internally by pregnant women since this can cause an abortion[9]. The fruits also increase menstrual bleeding so should not be used by women with heavy periods[254]. When made into an ointment, they are applied to exposed wounds and prevent irritation by flies[4]. The essential oil is used in aromatherapy. Its keyword is 'Toxin elimination'[210].

propta The seed requires a period of cold stratification. The seed has a hard seedcoat and can be very slow to germinate, requiring a cold period followed by a warm period and then another cold spell, each of 2 - 3 months duration[78, 81]. Soaking the seed for 3 - 6 seconds in boiling water may speed up the germination process[11]. The seed is best sown as soon as it is ripe in a cold frame. Some might germinate in the following spring, though most will take another year. Another possibility is to harvest the seed 'green' (when the embryo has fully formed but before the seedcoat has hardened). The seedlings can be potted up into individual pots when they are large enough to handle. Grow on in pots until

large enough, then plant out in early summer. When stored dry, the seed can remain viable for several years[1]. Cuttings of mature wood, 5 - 10cm with a heel, September/October in a cold frame. Plant out in the following autumn[1, 78]. Layering in September/October. Takes 12 months[78].

**nwatta Landscape Uses:**Specimen. An easily grown plant, it succeeds in hot dry soils and in poor soils. Succeeds in most soils so long as they are well drained[186], preferring a neutral or slightly alkaline soil. Does well in chalky soils[1]. Grows well in heavy clay soils. Tolerates a pH range from 4 to 8[186]. Succeeds in light woodland but dislikes heavy shade[186]. Established plants are very tolerant of drought[186]. Although the fully dormant plant is cold-tolerant throughout Britain, the young growth in spring can be damaged by late frosts. All parts of the plant are very aromatic[245]. Juniper is a very polymorphic species that has a long history of culinary and medicinal use[244]. It is frequently grown in the ornamental and herb garden, there is a huge range of cultivars of widely diverse habits[11, 81]. At least some forms tolerate maritime exposure[186], there is a thriving colony in an exposed position at Land's End in Cornwall[81]. The fruits take 2 - 3 years to ripen on the plant[11]. Plants are usually very slow growing, often only a few centimetres a year[186]. Resists honey fungus[88]. Plants are sometimes attacked by a rust, this fungus has an aecidial stage on hawthorn (*Crataegus* spp.)[1]. Dioecious. Male and female plants must be grown if seed is required. **Special Features:** North American native, Fragrant foliage, Inconspicuous flowers or blooms.

## 5.2.192 *Crataegus monogyna*

**Hawthorn, Oneseed hawthorn**  
4 tlin 8 cyuc 3 kcaak 3 tcan 5 dwat m hkuc  
hmmihmtt cyutli hgattcuphja7n hwicli hyishrasjlutnyikrip  
hpa7tli frusflatprikkwisslip hpa7tmwatli xre7t hjonli

**drutta** *Crataegus monogyna* is a deciduous Shrub growing to 6 m (19ft) by 6 m (19ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from May to June, and the seeds ripen from September to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Midges. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can tolerate drought. The plant can tolerate maritime exposure. It can tolerate atmospheric pollution.

**kcakta Edible Parts:** Flowers Fruit Leaves**Edible Uses:** Coffee TeaFruit - raw or cooked[2, 12]. Not very appetizing raw[9, K], it is normally used for making jams and preserves[9, 183]. The fruit can be dried, ground, mixed with flour and used for making bread etc[46]. The fruit is about 1cm in diameter[200]. There are up to five fairly large seeds in the centre of the fruit, these often stick together and so the effect is of eating a cherry-like fruit with a single seed[K]. Young shoots - raw[5, 177]. A pleasant nutty flavour[144], they are a good addition to the salad bowl[183]. A tea is made from the dried leaves[21, 46, 177, 183], it is a china tea substitute. The roasted seeds are a coffee substitute[12, 21, 46, 177]. The flowers are used in syrups and sweet puddings[183].

**tcanta Fuel Hedge Hedge Wood**A good hedge plant, it is very tolerant of being cut and of neglect and is able to regenerate if cut back severely, it makes a good thorny stock-proof barrier[186] and resists very strong winds. It is often used in layered hedges[11, 29]. The cultivar 'Stricta' has made a very good hedge 3.5 metres tall in an exposed maritime position at Rosewarne in N. Cornwall[K]. Wood - very hard and tough, difficult to work. Used for tool handles etc. Valued in turning[7, 46, 61]. A good fuel, giving out a lot of heat[4].

**dwatta Antispasmodic Astringent Cardiotonic Diuretic Hypotensive Malaria Sedative Tonic Vasodilator**Hawthorn is an extremely valuable medicinal herb. It is used mainly for treating disorders of the heart and circulation system, especially angina[254]. Western herbalists consider it a 'food for the heart', it increases the blood flow to the heart muscles and restores normal heart beat[254]. This effect is brought about by the presence of bioflavonoids in the fruit, these

238]. It warrants scientific investigation[222]. The bark is aromatic, astringent, diaphoretic, febrifuge, stimulant and tonic[61, 149, 227, 257]. It is pleasant to chew[227]. It is used in the treatment of coughs and colds[257]. The bark can be harvested at any time of the year and is used fresh or dried[238]. The fruits are carminative[222]. The oil from the fruits has been used in the treatment of bruises and rheumatism[222]. A tea made from the twigs was a household remedy for colds, fevers, worms and colic[222]. A steam bath of the twigs is used to cause perspiration in order to ease aches and pains in the body[257]. The young shoots are harvested during the spring and can be used fresh or dried[238]. The bark is diaphoretic and vermifuge. It was once widely used as a treatment for typhoid fevers and other forms of fevers[213, 222].

**propta Seed** - best sown as soon as it is ripe in the autumn in a greenhouse. The seed has a short viability and should not be allowed to dry out[200]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in early summer. Cuttings of half-ripe wood, July in a frame[200]. Cuttings of mature side-shoots, 10 - 12cm with a heel, September/October in a cold frame. They may root by spring. Fair to good percentage[78]. Layering.

**nwatta Landscape Uses:**Border, Pest tolerant, Massing, Woodland garden. Requires a lime-free rather moist soil[200] with a pH in the range 4.5 - 6[238]. Prefers partial shade or dappled sunlight in a fertile moisture-retentive soil enriched with leafmould[200]. Succeeds in full sun or semi-shade[184]. Plants are hardy to about -25°C[184]. The leaves, bark and berries are very aromatic[182, 213]. Plants can be pruned right back to the base if required, though any drastic pruning is best spread over several seasons[200]. Plants in this genus are notably resistant to honey fungus[200]. The fruit has a high fat content and is much eaten by migratory birds to supply their high energy demands when migrating[274]. Dioecious, male and female plants must be grown if seed is required[188, 238]. **Special Features:**Attracts birds, North American native, Fragrant foliage, Wetlands plant, Attracts butterflies, Attractive flowers or blooms. The plant is heat tolerant in zones 8 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11 -11 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is multi-stemmed with multiple stems from the crown [1-2]. The root pattern is a heart root, dividing from the crown into several primary roots going down and out [1-2].

## 5.2.229 *Prunus sibirica*

**Siberian Apricot**  
4 tlin 8 cyuc 3 kcaak 4 tcan 2 dwat 3 m hkuc  
hmmihmtt cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikkwisslip hpa7tmwatli xre7t hjonli

**drutta** *Prunus sibirica* is a deciduous Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in March, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**kcakta Edible Parts:** Fruit Oil Seed**Edible Uses:** Condiment OilFruit - raw or cooked[2, 105]. A good size, it is about 25mm x 25mm and contains one large seed[200]. Sour and scarcely edible[11, 266]. The fruit is occasionally eaten. Seed - raw or cooked. A bitter taste[11], they are normally used as an almond flavouring[74, 105]. Do not eat the seed if it is too bitter - see the notes above on toxicity. An edible

oil is obtained from the seed[183] - it is used as an almond flavouring[74]. The oil resembles olive oil[183].

**tcanta Dye Oil Rootstock**A potential rootstock for apricots[113]. A green dye can be obtained from the leaves[168]. A dark grey to green dye can be obtained from the fruit[168].

**dwatta Analgesic Antiasthmatic Antiseptic Antitussive Digestive Emollient Laxative Tonic**The seed is analgesic, antiasthmatic, antiseptic, antitussive and emollient[176]. It is used in the treatment of coughs, asthma, acute or chronic bronchitis and constipation[176]. The seed contains amygdalin and prunasin, substances which break down in water to form hydrocyanic acid (cyanide or prussic acid). In small amounts this exceedingly poisonous compound stimulates respiration, improves digestion and gives a sense of well-being[238].

**propta Seed** - requires 2 - 3 months cold stratification and is best sown in a cold frame as soon as it is ripe[200]. Sow stored seed in a cold frame as early in the year as possible[200]. Protect the seed from mice etc. The seed can be rather slow, sometimes taking 18 months to germinate[113]. Prick out the seedlings into individual pots when they are large enough to handle. Grow them on in a greenhouse or cold frame for their first winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood with a heel, July/August in a frame[11, 200]. Softwood cuttings from strongly growing plants in spring to early summer in a frame[200]. Layering in spring.

**nwatta Industrial Crop:** Oil Management: Standard Regional Crop Staple Crop: OilThrives in a well-drained moisture-retentive loamy soil, growing well on limestone[11, 200]. Prefers some lime in the soil but is likely to become chlorotic if too much lime is present[11]. Succeeds in sun or partial shade though it fruits better in a sunny position[11, 200]. This species is reputed to be hardy to about -50°C and as such is of potential use for conferring greater cold tolerance in breeding programmes with the closely related apricot, *P. armeniaca*. Most members of this genus are shallow-rooted and will produce suckers if the roots are damaged[238]. Plants in this genus are notably susceptible to honey fungus[200].

## 5.2.230 *Prunus spinosa*

**Sloe - Blackthorn**  
4 tlin 8 cyuc 3 kcaak 4 tcan 2 dwat 3 m hkuc  
hmmihmtt cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikkwisslip hpa7tmwatli xre7t hjonli

**drutta** *Prunus spinosa* is a deciduous Shrub growing to 3 m (9ft 10in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from March to April, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure.

**kcakta Edible Parts:** Flowers Fruit Seed**Edible Uses:** TeaFruit - raw or cooked[2, 5, 7, 11, 12, 13, 34]. Exceedingly astringent, it is normally cooked but once the fruit has been frosted it loses some of its astringency and some people find they can enjoy it raw[183, K]. The fruit is more usually used in jellies, syrups, conserves etc and as a flavouring for sloe gin and other liqueurs[183]. Some fruits that we ate in December were fairly pleasant raw[K]. In France the unripe fruit is pickled like an olive[183]. The fruit is about 15mm in diameter and contains one large seed[200]. Seed - raw or cooked. Do not eat the seed if it is too bitter - see the notes above on toxicity. The leaves are used as a tea substitute[7, 183]. The dried fruits can be added to herbal teas[176]. The flowers are edible and can be crystallised or sugared[183].

**tcanta Cosmetic Dye Hedge Hedge Ink Pioneer Tannin Wood**The bark is a good source of tannin[7]. It is used to make an ink[66]. The juice of unripe fruits is used as a laundry mark[66], it is almost indelible[115]. The pulped ripe fruit is used cosmetically in making astringent face-masks[7]. A green dye can be obtained from the leaves[168]. A dark grey to green dye can be obtained from the fruit[168]. The bark, boiled in an alkali, produces a yellow dye[66]. The

acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**kcakta Edible Parts:** Fruit **SeedEdible Uses:** Fruit - raw or cooked[11, 82, 105, 183]. The thick juicy flesh is pleasantly acid[183, 229]. The fruit can also be made into jams, preserves etc[82, 183]. The fruit has a tough skin, it can be up to 2cm in diameter and contains one large seed[82, 229]. **Seed** - raw or cooked. Do not eat the seed if it is too bitter - see the notes above on toxicity.

**tcanta Dye WoodA** green dye can be obtained from the leaves[168]. A dark grey to green dye can be obtained from the fruit[168]. Wood - hard, heavy, close grained[82]. Trees are too small for the wood to be commercially valuable[229].

**dwatta** Although no specific mention has been seen for this species, all members of the genus contain amygdalin and prunasin, substances which break down in water to form hydrocyanic acid (cyanide or prussic acid). In small amounts this exceedingly poisonous compound stimulates respiration, improves digestion and gives a sense of well-being[238].

**propta Seed** - requires 2 - 3 months cold stratification and is best sown in a cold frame as soon as it is ripe[200]. Sow stored seed in a cold frame as early in the year as possible[200]. Protect the seed from mice etc. The seed can be rather slow, sometimes taking 18 months to germinate[113]. Prick out the seedlings into individual pots when they are large enough to handle. Grow them on in a greenhouse or cold frame for their first winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood with a heel, July/August in a frame[11, 200]. Softwood cuttings from strongly growing plants in spring to early summer in a frame[200]. Layering in spring.

**nwatta** Thrives in a well-drained moisture-retentive loamy soil, growing well on limestone[11, 200]. Prefers some lime in the soil but is likely to become chlorotic if too much lime is present[1]. Succeeds in sun or partial shade though it fruits better in a sunny position[11, 200]. A fast-growing but short-lived tree in the wild[229]. Most members of this genus are shallow-rooted and will produce suckers if the roots are damaged[238]. This species is closely related to *P. americana*[200]. Plants in this genus are notably susceptible to honey fungus[200]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. A sprouting standard sending up shoots from the base [1-2].

### 5.2.227 *Corylus americana*

American Hazel

4 tlin 8 cyuc 3 kcak 2 tcan 1 dwat 3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik-wisslip hpa7tmwatli fyif hjonli

**drutta** *Corylus americana* is a deciduous Tree growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from April to May, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

**kcakta Edible Parts:** Oil **SeedEdible Uses:** Oil**Seed** - raw or cooked in soups, bread, biscuits, sweets etc[63, 101, 183]. The nuts have a thick shell with a small sweet kernel[183], they make an excellent dessert[K]. Although smaller than the seeds of cultivated species, the seed is of the same general quality[270]. Nuts at the 'milk' stage (before they are fully ripe) are softer and sweeter[183]. The seed is rich in oil. The seed ripens in mid to late autumn and will probably need to be protected from squirrels[K]. When kept in a cool place, and not shelled, the seed should store for at least 12 months[K]. An edible oil is obtained from the seed,

**tcanta Hedge Hedge Oil**The plant makes a good screening hedge[159].

**dwatta** Astringent **Poultice**A tea made from the bark is astringent[222]. It was used in the treatment of hives and

fevers[222, 257]. A poultice made from the bark is used to close cuts and wounds, treat tumours, old sores etc[222, 257].

**propta Seed** - best sown as soon as it is harvested in autumn in a cold frame[164]. Germinates in late winter or spring. Stored seed should be pre-soaked in warm water for 48 hours and then given 2 weeks warm followed by 3 - 4 months cold stratification[164]. Germinates in 1 - 6 months at 20°C[164]. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame or sheltered place outdoors for their first winter. Plant them out into their permanent positions in late spring or early summer[K]. Layering in autumn. Easy, it takes about 6 months[78, 200]. Division of suckers in early spring. Very easy, they can be planted out straight into their permanent positions.

**nwatta** An easily grown plant, it succeeds in most soils including chalk, but is in general more productive of seeds when grown on soils of moderate fertility[11, 200]. It does well in a loamy soil[11, 200]. Plants are fairly wind tolerant[1, 11]. This species is cultivated in America for its edible seed, there are some named varieties[61, 183]. This species is of little value in Britain, however, rarely bearing seeds[11]. Members of this genus bear transplanting well and can be easily moved even when relatively large[11]. The plant is heat tolerant in zones 9 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. A clumping plant, forming a colony from shoots away from the crown but with a limited spread [1-2]. The root pattern is flat with shallow roots forming a plate near the soil surface [1-2]. The root pattern is suckering with new plants from underground runners away from the plant [1-2].

### 5.2.228 *Lindera benzoin*

Spice Bush, Northern spicebush, Bush Northern Spice

4 tlin 9 cyuc 3 kcak 3 tcan 3 dwat 3 m hkuc hmim cyutli tcup hwicli hrasjlutnyik hpa7tli frusflatprik hpa7tmwatli nyanhjen hjonli

**drutta** *Lindera benzoin* is a deciduous Shrub growing to 3 m (9ft) by 3 m (9ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in April, and the seeds ripen from August to September. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in semi-shade (light woodland). It prefers moist soil.

**kcakta Edible Parts:** Edible Uses: **Condiment** TeaThe young leaves, twigs and fruit contain an aromatic essential oil and make a very fragrant tea[55, 62, 95, 102, 149, 183]. The twigs are best gathered when in flower as the nectar adds considerably to the flavour[183]. The dried and powdered fruit is used as a substitute for the spice 'allspice'[2, 46, 55, 62, 95, 183]. The fruit is about the size of an olive[245]. The leaves can also be used as a spice substitute[55]. The new bark is pleasant to chew[183].

**tcanta** Disinfectant **Repellent**The leaves contain small quantities of camphor and can be used as an insect repellent and disinfectant[169]. An oil with a lavender-like fragrance is obtained from the leaves[245]. The fruit, upon distillation, yield a spice-scented oil resembling camphor[245]. An oil smelling of wintergreen is obtained from the twigs and bark[245].

**dwatta** Aromatic Astringent **Diaphoretic** **Disinfectant** **Dysentery** **Febrifuge** **Stimulant** **Tonic**Spice bush has a wide range of uses as a household remedy, especially in the treatment of colds, dysentery and intestinal parasites[222,

bioflavonoids are also strongly antioxidant, helping to prevent or reduce degeneration of the blood vessels[254]. The fruit is antispasmodic, cardiac, diuretic, sedative, tonic and vasodilator[4, 9, 21, 46, 165]. Both the fruits and flowers of hawthorns are well-known in herbal folk medicine as a heart tonic and modern research has borne out this use. The fruits and flowers have a hypotensive effect as well as acting as a direct and mild heart tonic[222]. They are especially indicated in the treatment of weak heart combined with high blood pressure[222], they are also used to treat a heart muscle weakened by age, for inflammation of the heart muscle, arteriosclerosis and for nervous heart problems[21]. Prolonged use is necessary for the treatment to be efficacious[222]. It is normally used either as a tea or a tincture[222]. Hawthorn is combined with ginkgo (*Ginkgo biloba*) to enhance poor memory, working by improving the blood supply to the brain[254]. The bark is astringent and has been used in the treatment of malaria and other fevers[7]. The roots are said to stimulate the arteries of the heart[218].

**propta Seed** - this is best sown as soon as it is ripe in the autumn in a cold frame, some of the seed will germinate in the spring, though most will probably take another year. Stored seed can be very slow and erratic to germinate, it should be warm stratified for 3 months at 15°C and then cold stratified for another 3 months at 4°C[164]. It may still take another 18 months to germinate[78]. Scarifying the seed before stratifying it might reduce this time[80]. Fermenting the seed for a few days in its own pulp may also speed up the germination process[K]. Another possibility is to harvest the seed 'green' (as soon as the embryo has fully developed but before the seedcoat hardens) and sow it immediately in a cold frame. If timed well, it can germinate in the spring[80]. If you are only growing small quantities of plants, it is best to pot up the seedlings as soon as they are large enough to handle and grow them out in individual pots for their first year, planting them out in late spring into nursery beds or their final positions. When growing larger quantities, it might be best to sow them directly outdoors in a seedbed, but with protection from mice and other seed-eating creatures. Grow them on in the seedbed until large enough to plant out, but undercut the roots if they are to be left undisturbed for more than two years.

**nwatta** A very easily grown plant, it prefers a well-drained moisture retentive loamy soil but is not at all fussy[11, 200]. Succeeds in all but the very poorest acid soils[186]. Once established, it succeeds in excessively moist soils and also tolerates drought[200]. It grows well on a chalk soil and also in heavy clay soils[200]. A position in full sun is best when plants are being grown for their fruit, they also succeed in semi-shade though fruit yields and quality will be lower in such a position[11, 200]. Most members of this genus succeed in exposed positions, they also tolerate atmospheric pollution[200]. A very hardy plant, tolerating temperatures down to at least -18°C[202]. Hybridizes freely with other members of this genus and with *C. laevigata* in the wild[186, 200]. There are many named forms selected for their ornamental value[200]. Seedling trees take from 5 - 8 years before they start bearing fruit, though grafted trees will often flower heavily in their third year[K]. The flowers have a foetid smell somewhat like decaying fish. This attracts midges which are the main means of fertilization. When freshly open, the flowers have more pleasant scent with balsamic undertones[245]. Seedlings should not be left in a seedbed for more than 2 years without being transplanted[11]. In heavier shade they quickly become drawn and leggy, eventually dying[186]. An important food plant for the caterpillars of many lepidoptera species[30], there are 149 insect species associated with this tree[24]. Plants are susceptible to fireblight[200]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

### 5.2.193 *Vitis cinerea floridana*

Currant Grape

4 tlin 8 cyuc 3 kcak 0 tcan 0 dwat m hkuc

hmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flat-priklwis hpa7tmwatli xre7t hjonli

**drutta** *Vitis cinerea floridana* is a deciduous Climber. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to July, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

**kcakta Edible Parts:** Fruit **Leaves** **SapEdible Uses:** Fruit - raw or dried for winter use[183]. It can also be used in pies, jellies etc. The fruit is about 4 - 6mm in diameter[200] and is borne in bunches. Young leaves are wrapped around other foods and then baked, they impart a pleasant flavour. Young tendrils - raw or cooked. The sap is made into a tasty beverage.

**tcanta** Dye **Rootstock**A yellow dye is obtained from the fresh or dried leaves[168]. Used as a rootstock.

**dwatta** None known

**propta Seed** - best sown in a cold frame as soon as it is ripe[K]. Six weeks cold stratification improves the germination rate, and so stored seed is best sown in a cold frame as soon as it is obtained. Germination should take place in the first spring, but sometimes takes another 12 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant out in early summer. Cuttings of mature wood of the current seasons growth, December/January in a frame. These cuttings can be of wood 15 - 30cm long or they can be of short sections of the stem about 5cm long with just one bud at the top of the section. In this case a thin, narrow strip of the bark about 3cm long is removed from the bottom half of the side of the stem. This will encourage callusing and the formation of roots. Due to the size of these cuttings they need to be kept in a more protected environment than the longer cuttings. Layering.

**nwatta** Prefers a deep rich moist well-drained moderately fertile loam[1, 200]. Grows best in a calcareous soil[200]. Succeeds in sun or partial shade though a warm sunny position is required for the fruit to ripen[200]. The young growth in spring can be damaged by late frosts. Plants climb by means of tendrils[182]. Any pruning should be carried out in winter when the plants are dormant otherwise they bleed profusely[182, 200]. Used in breeding programmes to develop resistant varieties for Florida and other hot areas[183]. There are some named varieties[183]. Plants in this genus are notably susceptible to honey fungus[200].

### 5.2.194 *Vitis mustangensis*

Mustang Grape

4 tlin 8 cyuc 3 kcak 0 tcan 0 dwat m hkuc

hmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flat-priklwis hpa7tmwatli xre7t hjonli

**drutta** *Vitis mustangensis* is a deciduous Climber growing to 10 m (32ft 10in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from June to July, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

**kcakta Edible Parts:** Fruit **Leaves****Edible Uses:** Fruit - raw, cooked or dried for winter use[105, 161, 177]. Tough skinned, they are used mainly for pies and jellies[183]. A disagreeable flavour[11, 200]. The fruit is about 16mm in diameter[200] and is borne in bunches. Young leaves are wrapped around other foods and then baked, they impart a pleasant flavour. Young tendrils - raw or cooked.

**tcanta** DyeA yellow dye is obtained from the fresh or dried leaves[168].

**dwatta** None known

**propta Seed** - best sown in a cold frame as soon as it is ripe[K]. Six weeks cold stratification improves the germination rate, and so stored seed is best sown in a cold frame as soon as it is obtained. Germination should take place in the

first spring, but sometimes takes another 12 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. ## 5.2.195 *Erythronium albidum mesochoreum*

Prairie Trout Lily

4 tin 8 cyuc 3 kcaak 0 tcan 0 dwat m hkuc hmim cyutli tcup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Erythronium albidum mesochoreum is a BULB growing to 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from March to April, and the seeds ripen from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcaкта Edible Parts: RootEdible Uses: Bulb - raw or cooked[105, 161]. Rather small, it is about 20mm long[235]. The bulbs are eaten avidly by children[257]. Young leaves - raw or cooked. Crisp, tasty, tender and mild when eaten raw[183]. Eating the leaves will greatly reduce the vigour of the bulb, so can only be recommended in times of emergency[K].

tcanta None known

dwatta None known

propta Seed - best sown as soon as it is ripe in a shady position in a cold frame. Water lightly in summer, it should germinate in autumn or winter[164, 200]. Stored seed requires a period of cold stratification[164]. Sow as early in spring as possible in a cold frame. Sow the seed thinly so that it will not be necessary to prick them out for their first year of growth. Give an occasional liquid feed to the seedlings to make sure that they do not become nutrient deficient. When the plants are dormant, pot up the small bulbs putting 2 - 3 bulbs in each pot. Grow them on in a shady position in the greenhouse for another 2 3 years and then plant them out into their permanent positions when they are dormant in late summer. Division in summer as the leaves die down. This species does not produce offsets[200].

nwatta Prefers slightly acid soil conditions but succeeds in chalky soils if these contain plenty of humus[164]. Requires semi-shade, preferably provided by trees or shrubs, and a well-drained soil[164]. Succeeds in almost any light soil, preferring one that is rich in humus[1]. This species is unsatisfactory in cultivation outdoors in Britain. It comes into growth early in the year and the flowers probably need more heat than our typical spring provides if they are to open properly[90]. Because stolons are absent in Erythronium mesochoreum, most plants in a population produce flowers; nonflowering plants may sometimes appear after flowering plants have flowered[270]. Flowers are produced in 3 - 4 years from seed[164]. This species does not produce offsets[200].

## 5.2.196 *Allium macropetalum*

Largeflower Wild Onion

4 tin 8 cyuc 3 kcaak 0 tcan 2 dwat m hkuc htut cyutli tcup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Allium macropetalum is a BULB growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcaкта Edible Parts: Flowers Leaves RootEdible Uses: Bulb - raw or cooked[161, 257]. They can be dried and stored for winter use[257]. The North American Indians would singe the bulb to reduce the strong flavour and then eat it immediately or dry it for later use[257]. Leaves - raw or cooked. Flowers - raw. Used as a garnish on salads.

tcanta RepellentThe juice of the plant is used as a moth repellent. The whole plant is said to repel insects and moles[20].

dwatta Although no specific mention of medicinal uses has been seen for this species, members of this genus are in general very healthy additions to the diet. They contain sulphur compounds (which give them their onion flavour) and when added to the diet on a regular basis they help reduce blood cholesterol levels, act as a tonic to the digestive system and also tonify the circulatory system[K].

propta Seed - sow spring in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle - if you want to produce clumps more quickly then put three plants in each pot. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in spring once they are growing vigorously and are large enough. Division in spring. The plants divide successfully at any time in the growing season, pot up the divisions in a cold frame or greenhouse until they are growing well and then plant them out into their permanent positions.

nwatta Prefers a sunny position in a light well-drained soil[1]. The bulbs should be planted fairly deeply[1]. Most members of this genus are intolerant of competition from other growing plants[203]. Grows well with most plants, especially roses, carrots, beet and chamomile, but it inhibits the growth of legumes[18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 5.2.197 *Quercus muehlenbergii*

Yellow Chestnut Oak, Chinkapin oak

4 tin 8 cyuc 3 kcaak 3 tcan 2 dwat m hkuc hmimhtut cyutli tcup hwicli jlutnyik hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta Quercus muehlenbergii is a deciduous Tree growing to 20 m (65ft) by 10 m (32ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from May to June, and the seeds ripen in November. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcaкта Edible Parts: SeedEdible Uses: CoffeeSeed - cooked. It is up to 18mm long[227]. The seed contains very little bitter tannin, it is quite sweet and rather pleasant eating[183, 227]. Tastes nice when baked in an oven[183]. Any bitter seeds can be leached by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method

kcaкта Edible Parts: Flowers FruitEdible Uses: TeaFruit - raw or cooked[105, 161, 257]. A bitter flavour[183]. The fruit is quite nutritious, having a relatively high fat and protein as well as carbohydrate content[212]. The fruit can be dried prior to use, it will then lose some of its rank taste[183]. The fruit is about 5mm in diameter and is borne in large clusters making it easy to harvest[200]. Some caution is advised, see the notes above on toxicity. Flowers - raw or cooked. The root is made into a tea-like beverage[105, 161, 183].

tcanta MusicalThe stem is easily hollowed and can be used to make a whistle[212].

dwatta Diuretic PurgativeThe bark and the leaves are used as a diuretic and purgative[212]. The blossoms have been used in the treatment of measles[257].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame, when it should germinate in early spring. Stored seed can be sown in the spring in a cold frame but will probably germinate better if it is given 2 months warm followed by 2 months cold stratification first[78, 98, 113]. Prick out the seedlings into individual pots when they are large enough to handle. If good growth is made, the young plants can be placed in their permanent positions during the early summer. Otherwise, either put them in a sheltered nursery bed, or keep them in their pots in a sheltered position and plant them out in spring of the following year. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in a frame[78]. Cuttings of mature wood of the current season's growth, 15 - 20cm with a heel, late autumn in a frame or a sheltered outdoor bed[78].

nwatta Tolerates most soils, including chalk[200], but prefers a moist loamy soil[1, 200]. Grows well in heavy clay soils. Tolerates some shade but is best in a sunny position[1]. Tolerates atmospheric pollution and coastal situations[200]. Closely related to *S. racemosa* and considered part of that species by some botanists[43]. Plants in this genus are notably resistant to honey fungus[200].

## 5.2.224 *Staphylea trifolia*

American Bladder Nut

4 tin 8 cyuc 3 kcaak 2 tcan 1 dwat 4 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Staphylea trifolia is a deciduous Shrub growing to 4 m (13ft 1in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from May to June, and the seeds ripen from September to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaкта Edible Parts: Oil SeedEdible Uses: OilSeed - raw or cooked[161, 177]. They are eaten like pistachios[2]. The seed can be used in place of walnuts (*Juglans* spp) in making chocolate-chip cookies[183]. A sweet edible oil is obtained from the seed[2]. It is used for cooking purposes[183].

tcanta Oil Soil stabilizationPlants have dense underground root systems and are of some value in erosion control[229].

dwatta SkinAn infusion of the powdered bark has been used as a wash for sore faces[257].

propta Seed - this can be very slow to germinate, sometimes taking 18 months or more. It is best sown as soon as it is ripe in a cold frame[200], and some of it at least should then germinate in the spring. Stored seed should be sown as early in the year as possible and given cold stratification - it might not germinate until spring of the following year. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in the greenhouse for their first winter. Plant them out early the following summer. Cuttings of half-ripe wood, 5 - 8cm with a heel, July/August in a frame. Fair to good percentage[78]. Layering in July/August. Takes 15 months. Good percentage[78].

nwatta Tolerant of a wide range of soils so long as they are not too dry[11, 182, 200], it prefers a rich loamy soil in full sun or semi-shade[200]. A fast-growing but short-lived tree in the wild[229]. The plants flower best in years that

follow hot summers[200]. Plants in this genus are notably resistant to honey fungus[200].

## 5.2.225 *Amelanchier bartramiana*

Oblongfruit serviceberry

4 tin 8 cyuc 3 kcaak 0 tcan 0 dwat 3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprik hpa7tmwatli fyfekre7t hjonli

drutta Amelanchier bartramiana is a deciduous Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaкта Edible Parts: FruitEdible Uses: Edible fruit - raw or cooked[101, 105, 161]. The fruit contains a few small seeds at the centre, it is sweet but rather dry according to one report[177] whilst others have found it to be sweet and juicy[183, K]. The fruit can be added to pancakes or dried for later use[183]. Fruits are oval or pear shaped unlike other members of this genus that have round fruits[183]. They are 15mm long[200]. The fruit is rich in iron and copper[226].

tcanta None known

dwatta None known

propta Seed - it is best harvested 'green', when the seed is fully formed but before the seed coat has hardened, and then sown immediately in pots outdoors or in a cold frame. If stored seed is obtained early enough in the autumn, it can be given 4 weeks warm stratification before being left out in the winter and it should then germinate in the spring. Otherwise seed can be very slow to germinate, perhaps taking 18 months or more. When large enough to handle, prick the seedlings out into individual pots and grow them on in a sheltered outdoor position, planting them out once they are 20cm or more tall. If there is sufficient seed it is best to sow it thinly in an outdoor seedbed[78, 80]. Grow the seedlings on for two years in the seedbed before planting them out into their permanent positions during the winter. Layering in spring - takes 18 months[78]. Division of suckers in late winter. The suckers need to have been growing for 2 years before you dig them up, otherwise they will not have formed roots. They can be planted out straight into their permanent positions if required.

nwatta Prefers a rich loamy soil in a sunny position or semi-shade[1, 200] but thrives in any soil, including chalk, so long as it is not too dry or water-logged[11, 200]. Grows well in heavy clay soils. Plants are hardy to about -30°c[184]. All members of this genus have edible fruits and, whilst this is dry and uninteresting in some species, in many others it is sweet and juicy. Many of the species have potential for use in the garden as edible ornamentals. The main draw-back to this genus is that birds adore the fruit and will often completely strip a tree before it is fully ripe[K]. This species hybridises with *A. sanguinea*, *A. humilis*, *A. stolonifera*, *A. fernaldii* and *A. canadensis*. Grafting onto seedlings of *A. lamarkii* or *Sorbus aucuparia* is sometimes practised in order to avoid the potential problem of hybridizing[1]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is multistemmed with multiple stems from the crown [1-2].

## 5.2.226 *Prunus alleghaniensis*

Allegheny Plum, Davis' plum

4 tin 8 cyuc 3 kcaak 2 tcan 1 dwat 3.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Prunus alleghaniensis is a deciduous Tree growing to 3.5 m (11ft 6in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in April, and the seeds ripen in August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly

species is notably resistant to honey fungus[88, 200]. Special Features: North American native, Inconspicuous flowers or blooms. The plant is heat tolerant in zones 8 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. A clumping plant, forming a colony from shoots away from the crown but with a limited spread [1-2]. The root pattern is suckering with new plants from underground runners away from the plant [1-2].

## 5.2.221 Decaisnea fargesii

Blue Sausage Fruit

4 tlin 8 cyuc 3 ckaak 0 tcan 0 dwat 4 m hkuc  
hmmihmt cyutli tcup hwicli hrasjltunykrip hpa7tli flatprikliwis hpa7tmwatli fyfcre7t hjonli

drutta Decaisnea fargesii is a deciduous Shrub growing to 4 m (13ft) by 4 m (13ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in leaf from April to October, in flower in June, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

ckakta Edible Parts: FruitEdible Uses: Fruit - raw[1, 105]. A sweet taste, but rather insipid[109]. A very nice delicate flavour according to our palates[K]. The fruit looks like a bright blue sausage or broad bean pod[K] and is up to 10cm long[200]. You peel off the skin in much the same way as you would peel a broad bean pod, this reveals a line of seed running the entire length of the fruit surrounded by a relatively thin layer of flesh[K].

tcanta None known

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame[200], it then usually germinates freely in early spring[K]. Sow stored seed in February in a greenhouse. This usually germinates well, within 1 - 3 months at 18°C[175]. Prick out the seedlings into individual pots as soon as they are large enough to handle and grow them on under protection for their first winter. Plant out in late spring after the last expected frosts. Cuttings.

nwatta An easily grown plant[182] succeeding in most soils[202], but it prefers a rich moist loamy soil and a sunny position sheltered from cold winds[175, 200]. Succeeds in partial shade[200]. Prefers partial shade, succeeding in full sun if the soil is reliably moist[202]. Dislikes drought[K]. A very cold-hardy plant when fully dormant, but the flowers and young growth in spring can be damaged by late frosts[11, 200]. Plants usually fruit well and regularly in Cornwall[11, 58] and a specimen has been seen on a number of occasions at Kew Botanical gardens laden down with fruit[K]. The flowers are produced at the tips of the new upright growths in the spring[11, 202]. Plants take some years from seed to produce fruit[202]. A very ornamental plant[1]. It is fairly fast growing but it looks gaunt and open in the winter[182]. Plants do not usually require pruning[202]. In some new florals, this species is seen as no more than a synonym for *D. insignis*[266]. The plant is heat tolerant in zones 9 through 7. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones

11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is multi-stemmed with multiple stems from the crown [1-2].

## 5.2.222 Sambucus racemosa

American Red Elder

4 tlin 8 cyuc 3 ckaak 1 tcan 1 dwat 4 m hkuc  
hmmihmt cyutli tcup hwicli hrasjltunykrip hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Sambucus racemosa is a deciduous Shrub growing to 4 m (13ft 1in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

ckakta Edible Parts: Flowers FruitEdible Uses: Fruit - raw or cooked[105, 161, 257]. A bitter flavour[183]. The fruit is quite nutritious, having a relatively high fat and protein as well as carbohydrate content[212]. The fruit can be dried prior to use, it will then lose some of its rank taste[183]. The fruit is about 5mm in diameter and is borne in large clusters making it easy to harvest[200]. Some caution is advised, see the notes above on toxicity. Flowers - raw or cooked. The root is made into a tea-like beverage[105, 161, 183].

tcanta Repellent Straw WoodThe stem is easily hollowed and can be used to make a whistle[212].

dwatta Anodyne Carminative Depurative Diaphoretic Diuretic Laxative Purgative Resolvent Vitamin C Vulnerary-The bark and the leaves are used as a diuretic and purgative[212]. The blossoms have been used in the treatment of measles[257].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame, when it should germinate in early spring. Stored seed can be sown in the spring in a cold frame but will probably germinate better if it is given 2 months warm followed by 2 months cold stratification first[78, 98, 113]. Prick out the seedlings into individual pots when they are large enough to handle. If good growth is made, the young plants can be placed in their permanent positions during the early summer. Otherwise, either put them in a sheltered nursery bed, or keep them in their pots in a sheltered position and plant them out in spring of the following year. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in a frame[78]. Cuttings of mature wood of the current season's growth, 15 - 20cm with a heel, late autumn in a frame or a sheltered outdoor bed[78].

nwatta Tolerates most soils, including chalk[200], but prefers a moist loamy soil[11, 200]. Grows well in heavy clay soils. Tolerates some shade but is best in a sunny position[1]. Tolerates atmospheric pollution and coastal situations[200]. Closely related to *S. racemosa* and considered part of that species by some botanists[43]. Plants in this genus are notably resistant to honey fungus[200].

## 5.2.223 Sambucus pubens

American Red Elder

4 tlin 8 cyuc 3 ckaak 1 tcan 1 dwat 4 m hkuc  
hmmihmt cyutli tcup hwicli hrasjltunykrip hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Sambucus pubens is a deciduous Shrub growing to 4 m (13ft 1in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency Roasted seed is a coffee substitute.

tcanta Fuel Repellent Tannin WoodA mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth[20]. Oak galls are excrecences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4]. Wood - heavy, very hard, strong, close grained, durable. It weighs 53lb per cubic foot[227]. Not abundant enough to be used commercially, it is used for fencing, cooperage etc and makes an excellent fuel[82, 149, 229].

dwatta Antiemetic Astringent DysenteryAn infusion of the bark has been used in the treatment of vomiting[257]. Any galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4].

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Landscape Uses: Pest tolerant, Aggressive surface roots possible, Specimen, Street tree. Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Young plants tolerate reasonable levels of side shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. Prefers warmer summers than are usually experienced in Britain, trees often grow poorly in this country and fail to properly ripen their wood resulting in frost damage overwinter[200]. Growth is fairly rapid for an oak[227], especially when the tree is young, though it slows down with age[229]. Seed production is cyclic, a year with high yields is followed by 2 - 3 years of light crops[229]. The tree flowers on new growth produced in spring, the seed ripening in its first year[200, 229]. Q. muhlenbergii brayi (Small.)Sarg. has somewhat larger seeds than the type, sometimes 3cm long[227]. Closely related to Q. prinus[11]. Trees are often confused with Q. prinus, Q. prinoides and Q. michauxii[200]. Trees respond well to coppicing[149]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. Hybridizes freely with other members of the genus[200]. Plants in this genus are notably resistant to honey fungus[200]. Special Features:North American native, Inconspicuous flowers or blooms. The plant is heat tolerant in zones 8 through 2. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2]. The root pattern is a heart root, dividing from the crown into several primary roots going down and out [1-2].

## 5.2.198 Malus spectabilis

Chinese Flowering Apple, Asiatic apple

4 tlin 8 cyuc 3 ckaak 0 tcan 0 dwat 9 m hkuc  
hmmihmt cyutli tcup hwicli hrasjltunykrip hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Malus spectabilis is a deciduous Tree growing to 9 m (29ft) by 9 m (29ft). See above for USDA hardiness. It

is hardy to UK zone 4 and is not frost tender. It is in flower from April to May, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

ckakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[2, 105]. About 2 - 3 cm in diameter[200]. Bitter and harsh when eaten fresh[11], when stored in a cool dry place and allowed to bleed it becomes quite acceptable[K].

tcanta None known

dwatta None known

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. It usually germinates in late winter. Stored seed requires stratification for 3 months at 1°C and should be sown in a cold frame as soon as it is received[200]. It might not germinate for 12 months or more. Prick out the seedlings into individual pots as soon as they are large enough to handle. If given a rich compost they usually grow away quickly and can be large enough to plant out in late summer, though consider giving them some protection from the cold in their first winter. Otherwise, keep them in pots in a cold frame and plant them out in late spring of the following year. Cuttings of mature wood, November in a frame[11].

nwatta An easily grown plant, it succeeds in most fertile soils, preferring a moisture retentive well-drained loamy soil[1, 200]. Grows well in heavy clay soils. Prefers a sunny position but succeeds in partial shade, though it fruits less well in such a situation[200]. A very ornamental tree[1], it is much cultivated in China for its edible fruit[11]. The fruit is a good wildlife food source, especially for birds[200]. Hybridizes freely with other members of this genus[200]. Plants in this genus are notably susceptible to honey fungus[200].

## 5.2.199 Eryngium maritimum

Sea Holly, Seaside eryngo

4 tlin 8 cyuc 3 ckaak 2 tcan 3 dwat m hkuc  
htut cyutli hgatkyuuctup hwicli hyishrasjrlut hpa7tli flatprikliwisliphsom hpa7tmwatli fyfcre7t hjonli

drutta Eryngium maritimum is an evergreen Perennial growing to 0.5 m (1ft 8in) by 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf all year, in flower from July to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline and saline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

ckakta Edible Parts: Leaves Root ShootsEdible Uses: Young shoots - cooked[46, 61, 66]. They are normally blanched by excluding light from the growing plant, and are then used as an asparagus substitute[2, 115, 183]. They are said to be palatable and nourishing[4]. Root - cooked[2]. Used as a vegetable or candied and used as a sweetmeat[5, 66, 115]. Palatable and nutritious[4], it is slightly sweet and smells of carrots[13]. The boiled or roasted roots are said to resemble parsnips or chestnuts in flavour[2, 183].

tcanta Soil stabilizationThe extensive root system helps to bind sand on the sea shore[13].

dwatta Aphrodisiac Aromatic Diaphoretic Diuretic Expectoant Stimulant TonicSea holly roots were collected on a large scale in the 17th and 18th centuries in England and were candied then used as restorative, quasi-aphrodisiac lozenges[238]. The plant is still used in modern herbalism where it is valued especially for its diuretic action[254]. The root is to be aphrodisiac, aromatic, diaphoretic, diuretic, expectoant, stimulant and tonic[4, 165, 200]. The root promotes free expectoration and is very useful in the treatment of debility attendant on coughs of chronic standing in the advanced stages of pulmonary consumption[4]. It is used in the treatment of cystitis, urethritis, as a means to alleviate kidney stones (it is unlikely that it dissolves the stones, but

it probably helps to retard their formation), and to treat enlargement or inflammation of the prostate gland[254]. Drunk freely, it is used to treat diseases of the liver and kidneys[4, 238]. Used externally as a poultice, the dried powdered root aids tissue regeneration[268]. The root should be harvested in the autumn from plants that are at least 2 years old[4].

propta Seed - best sown as soon as it is ripe in early autumn on the surface of a well-drained compost in a cold frame[200]. The seed can also be sown in spring. Germination can be very slow[4], although another report says that the seed usually germinates in 5 - 90 days at 20°C. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in early spring or autumn. Take care since the plant resents root disturbance[200]. Root cuttings in autumn or winter[200].

nwatta Requires a deep well-drained soil and a sunny position[1]. Prefers a light sandy saline soil but tolerates most soil types including lime and poor gravels[200, 268]. Plants are best grown in a hot dry position[187, 233]. Established plants are drought tolerant[190]. Plants are hardy to about -15°C[187]. Sea holly has very long roots that penetrate deeply in the soil and are often several feet long[4]. These roots are sweetly scented[245]. The plant should be placed in its final position whilst small since it resents root disturbance[200]. Although a sea-shore plant, it is amenable to garden cultivation[4]. A good bee plant[108]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is a tap root similar to a carrot going directly down [1-2].

### 5.2.200 Crataegus opaca

Western Mayhaw
4 tin 8 cyuc 3 kcaak 3 tcan 2 dwat 9 m hkuc
hmimhtut cyutli hgattcuphja7n hwicli hrasjlutnyikfrip hpa7tli frusflatprikkwis hpa7tmwatli xre7t hjonli

drutta Crataegus opaca is a deciduous Shrub growing to 9 m (29ft 6in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower in March, and the seeds ripen from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Midges. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[160]. Juicy and acid with a pleasant flavour[2]. It is up to 2cm in diameter[227]. The fruit is frequently used and much prized in parts of southern N. America where it is often gathered in quantity from the wild. Its acid flavour makes it a favourite for preserves and jellies[82, 183, 227]. The fruit can also be dried for later use. There are up to five fairly large seeds in the centre of the fruit, these often stick together and so the effect is of eating a cherry-like fruit with a single seed[K].

tcanta Wood - heavy, hard and strong, but not large enough for commercial use[227]. Useful for making tool handles, mallets and other small items[82].

dwatta Cardiotonic HypotensiveAlthough no specific mention has been seen for this species, the fruits and flowers of many hawthorns are well-known in herbal folk medicine as a heart tonic and modern research has borne out this use. The fruits and flowers have a hypotensive effect as well as acting as a direct and mild heart tonic[222]. They are especially indicated in the treatment of weak heart combined with high blood pressure[222]. Prolonged use is necessary for it to be efficacious[222]. It is normally used either as a tea or a tincture[222].

propta Seed - this is best sown as soon as it is ripe in the autumn in a cold frame, some of the seed will germinate in the spring, though most will probably take another year.

Stored seed can be very slow and erratic to germinate, it should be warm stratified for 3 months at 15°C and then cold stratified for another 3 months at 4°C[164]. It may still take another 18 months to germinate[78]. Scarifying the seed before stratifying it might reduce this time[80]. Fermenting the seed for a few days in its own pulp may also speed up the germination process[K]. Another possibility is to harvest the seed 'green' (as soon as the embryo has fully developed but before the seedcoat hardens) and sow it immediately in a cold frame. If timed well, it can germinate in the spring[80]. If you are only growing small quantities of plants, it is best to pot up the seedlings as soon as they are large enough to handle and grow them on in individual pots for their first year, planting them out in late spring into nursery beds or their final positions. When growing larger quantities, it might be best to sow them directly outdoors in a seedbed, but with protection from mice and other seed-eating creatures. Grow them on in the seedbed until large enough to plant out, but undercut the roots if they are to be left undisturbed for more than two years.

nwatta A very easily grown plant, it prefers a well-drained moisture retentive loamy soil but is not at all fussy[11, 200]. Once established, it succeeds in excessively moist soils and also tolerates drought[200]. It grows well on a chalk soil and also in heavy clay soils[200]. It thrives in acid soils[160]. A position in full sun is best when plants are being grown for their fruit, they also succeed in semi-shade though fruit yields and quality will be lower in such a position[11, 200]. Most members of this genus succeed in exposed positions, they also tolerate atmospheric pollution[200]. A very hardy species, tolerating temperatures down to about -30°C[160]. Hybridizes freely with other members of this genus[200]. Seedling trees take from 5 - 8 years before they start bearing fruit, though grafted trees will often flower heavily in their third year[K]. The flowers have a foetid smell somewhat like decaying fish. This attracts midges which are the main means of fertilization. When freshly open, the flowers have more pleasant scent with balsamic undertones[245]. Seedlings should not be left in a seedbed for more than 2 years without being transplanted[11]. Occasionally cultivated for its fruit in America, there are some named varieties[183].

### 5.2.201 Castanea crenata

Japanese Chestnut
4 tin 8 cyuc 3 kcaak 0 tcan 0 dwat 9 m hkuc
hmimhtut cyutli hgatkyuctup hwicli hyishrasjlutnyik hpa7tli frusflatprik hpa7tmwatli hjonli

drutta Castanea crenata is a deciduous Tree growing to 9 m (29ft 6in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower in July, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: SeedEdible Uses: Seed - raw or cooked[1, 46, 61]. A good potato substitute[63, 105, 142, 171]. A source of starch[177]. Very poor flavour[142]. Coarse and of little value. Very variable in size and quality, any astringency can be removed by boiling the seed in salty water[183].

tcanta Tannin WoodThe bark, leaves, wood and seed husks all contain tannin. Wood - hard, strong, light, very durable. Used for furniture, construction, fence posts etc[46, 61].

dwatta None known

propta Seed - where possible sow the seed as soon as it is ripe in a cold frame or in a seed bed outdoors[78]. The seed must be protected from mice and squirrels. The seed has a short viability and must not be allowed to become dry. It can be stored in a cool place, such as the salad compartment of a fridge, for a few months if it is kept moist, but check regularly for signs of germination. The seed should germinate in late winter or early spring. If sown in an outdoor seedbed, the plants can be left in situ for 1 - 2 years before planting them out in their permanent positions. If grown in pots, the plants

this genus succeed in exposed positions, they also tolerate atmospheric pollution[200]. Hybridizes freely with other members of this genus[200]. Seedling trees take from 5 - 8 years before they start bearing fruit, though grafted trees will often flower heavily in their third year[K]. The flowers have a foetid smell somewhat like decaying fish. This attracts midges which are the main means of fertilization. When freshly open, the flowers have more pleasant scent with balsamic undertones[245]. Seedlings should not be left in a seedbed for more than 2 years without being transplanted[11]. This species is closely related to *C. douglasii*[71].

### 5.2.219 Castanea x neglecta

Chinknut

4 tin 8 cyuc 3 kcaak 3 tcan 0 dwat 4 m hkuc
htut cyutli hgatkyuctup hwicli hyishrasjlutnyik hpa7tli frusflatprik hpa7tmwatli hjonli

drutta Castanea x neglecta is a deciduous Shrub growing to 4 m (13ft) by 4 m (13ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in July, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: SeedEdible Uses: Seed - raw or cooked[183]. Eaten raw, there is a distinct astringency, especially if the fleshy inner skin beneath the outer shell of the seed is not removed[K]. When cooked, however, and especially when baked, the seed becomes much sweeter and has a floury texture[K]. It then makes an excellent food and can be used as a staple food in much the same way as potatoes or cereals[K]. The seed is quite small, though it is larger than *C. pumila*[11]. Another report says that only one large seed is formed in each seed case[82].

tcanta Tannin WoodThe bark, leaves, wood and seed husks all contain tannin. Wood - coarse-grained, hard, strong, light, durable, easy to split.

dwatta None known

propta Seed - where possible sow the seed as soon as it is ripe in a cold frame or in a seed bed outdoors[78]. The seed must be protected from mice and squirrels. The seed has a short viability and must not be allowed to become dry. It can be stored in a cool place, such as the salad compartment of a fridge, for a few months if it is kept moist, but check regularly for signs of germination. The seed should germinate in late winter or early spring. If sown in an outdoor seedbed, the plants can be left in situ for 1 - 2 years before planting them out in their permanent positions. If grown in pots, the plants can be put out into their permanent positions in the summer or autumn, making sure to give them some protection from the cold in their first winter[K]. This species is a natural hybrid and might not breed true from seed[K]. Division of suckers in winter[200]. They can be planted straight out into their permanent positions.

nwatta Prefers a good well-drained slightly acid loam but succeeds in dry soils[1, 11, 200]. Once established, it is very drought tolerant[1, 11, 200]. Very tolerant of highly acid, infertile dry sands[200]. Averse to calcareous soils but succeeds on harder limestones[11, 200]. This species is an excellent soil-enriching understorey in pine forests[200], growing and fruiting well so long as the canopy of pines is fairly light. Although it is very winter-hardy, this species only really thrives in areas with hot summers[200]. This species is a natural hybrid, *C. dentata* x *C. pumila*[11, 200]. It is very similar to *C. pumila*[270], but has larger fruits than *C. pumila*[11] and often produces two fertile seeds in each fruit[270].. Flowers are produced on wood of the current year's growth[229]. Plants are fairly self-sterile[200]. They hybridize freely with other members of this genus[200]. Fruits are produced in 2 - 3 years from seed[117]. This species is occasionally cultivated for its edible seed in N. America, there are some named varieties[183]. The plants produce seeds abundantly in the wild[183]. Plants in this genus are notably resistant to honey fungus[200].

### 5.2.220 Quercus gambelii

Shin Oak, Gambel oak, Rocky Mountain White Oak
4 tin 8 cyuc 3 kcaak 3 tcan 2 dwat 4.5 m hkuc
hmimhtut cyutli kyuctup hwicli jlutnyik hpa7tli flatprikkwis hpa7tmwatli hjonli

drutta Quercus gambelii is a deciduous Shrub growing to 4.5 m (14ft 9in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower in May, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: SeedEdible Uses: CoffeeSeed - raw or cooked[257]. A staple food for several native North American Indian tribes[257]. A sweet taste[61, 62, 63, 85, 161]. The seed is about 2cm long and wide[82, 200], it can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread. If the seed contains bitter tannins, these can be leached out by thoroughly washing the seed in running water though many minerals will also be lost[85]. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute.

tcanta Buttons Fuel Repellent Tannin WoodA mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth[20]. Oak galls are excrescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4]. The seed cups are used as buttons[5]. Wood - hard, heavy, close-grained. The trees are generally too small to be of use commercially, though the wood is used locally for lumber and also makes a good fuel[229].

dwatta Analgesic Astringent Cathartic DysenteryAny galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4]. The acorns have been eaten to give greater sexual potency[257]. The root bark is analgesic and cathartic[257]. A decoction has been used to treat postpartum pain and facilitate delivery of the placenta[257].

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly. Division of suckers in the dormant season[11].

nwatta Landscape Uses:Specimen, Street tree. Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Young plants tolerate reasonable levels of side shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. Prefers warmer summers than are usually experienced in Britain, trees often grow poorly in this country and fail to properly ripen their wood resulting in frost damage overwinter[200]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. A slow growing shrub that often produces suckers and grows as a thicket[182, 229], it occasionally makes a small tree[229]. Seed production is cyclical, a year when good crops are produced is followed by several years of light production[229]. The tree flowers on new growth produced in spring, the seed ripening in its first year[200, 229]. Hybridizes freely with other members of the genus[200]. This

The flowers have a foetid smell somewhat like decaying fish. This attracts midges which are the main means of fertilization. When freshly open, the flowers have more pleasant scent with balsamic undertones[245]. Hybridizes freely with other members of this genus[200]. Seedlings should not be left in a seedbed for more than 2 years without being transplanted[11].

## 5.2.217 Crataegus anomala

Arnold hawthorn

4 tlin 8 cyuc 3 kcaak 3 tcan 2 dwat 5 m hkuc hmimhtut cyutli hgattcuphja7n hwicli hrasjlutnyikfrip hpa7tli flatprikwisslip hpa7tmwatli xre7t hjonli

drutta Crataegus anomala is a deciduous Shrub growing to 5 m (16ft 5in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. The species is hermaphrodite (has both male and female organs) and is pollinated by Midges. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105, 177, 235]. Juicy[43]. A very nice flavour, it makes a very good dessert fruit[K]. The fruit can also be used in making pies, preserves, etc, and can be dried for later use. The fruit is up to 20mm in diameter with a thick flesh[235]. There are up to five fairly large seeds in the centre of the fruit, these often stick together and so the effect is of eating a cherry-like fruit with a single seed[K].

tcanta Wood - heavy, hard, tough, close-grained. Useful for making tool handles, mallets and other small items[82].

dwatta Cardiotonic HypotensiveAlthough no specific mention has been seen for this species, the fruits and flowers of many hawthorns are well-known in herbal folk medicine as a heart tonic and modern research has borne out this use. The fruits and flowers have a hypotensive effect as well as acting as a direct and mild heart tonic[222]. They are especially indicated in the treatment of weak heart combined with high blood pressure[222]. Prolonged use is necessary for it to be efficacious[222]. It is normally used either as a tea or a tincture[222].

propta Seed - this is best sown as soon as it is ripe in the autumn in a cold frame, some of the seed will germinate in the spring, though most will probably take another year. Stored seed can be very slow and erratic to germinate, it should be warm stratified for 3 months at 15°C and then cold stratified for another 3 months at 4°C[164]. It may still take another 18 months to germinate[78]. Scarifying the seed before stratifying it might reduce this time[80]. Fermenting the seed for a few days in its own pulp may also speed up the germination process[K]. Another possibility is to harvest the seed 'green' (as soon as the embryo has fully developed but before the seedcoat hardens) and sow it immediately in a cold frame. If timed well, it can germinate in the spring[80]. If you are only growing small quantities of plants, it is best to pot up the seedlings as soon as they are large enough to handle and grow them on in individual pots for their first year, planting them out in late spring into nursery beds or their final positions. When growing larger quantities, it might be best to sow them directly outdoors in a seedbed, but with protection from mice and other seed-eating creatures. Grow them on in the seedbed until large enough to plant out, but undercut the roots if they are to be left undisturbed for more than two years.

nwatta A very easily grown plant, it prefers a well-drained moisture retentive loamy soil but is not at all fussy[11, 200]. Once established, it succeeds in excessively moist soils and also tolerates drought[200]. It grows well on a chalk soil and also in heavy clay soils[200]. A position in full sun is best when plants are being grown for their fruit, they also succeed in semi-shade though fruit yields and quality will be lower in such a position[11, 200]. Most members of this genus succeed in exposed positions, they also tolerate atmospheric pollution[200]. Hybridizes freely with other members of this genus[200]. This species is growing in a number of botanical gardens in Britain, where it is fruiting

very well[K]. Some botanists do not recognise it as a distinct species and place it as part of *C. pedicellata*[82]. The flowers have a foetid smell somewhat like decaying fish. This attracts midges which are the main means of fertilization. When freshly open, the flowers have more pleasant scent with balsamic undertones[245]. Seedling trees take from 5 - 8 years before they start bearing fruit, though grafted trees will often flower heavily in their third year[K]. Seedlings should not be left in a seedbed for more than 2 years without being transplanted[11].

## 5.2.218 Crataegus columbiana

Columbian Hawthorn

4 tlin 8 cyuc 3 kcaak 0 tcan 2 dwat 5 m hkuc hmimhtut cyutli hgattcuphja7n hwicli hrasjlutnyikfrip hpa7tli flatprikwisslip hpa7tmwatli xre7t hjonli

drutta Crataegus columbiana is a deciduous Tree growing to 5 m (16ft 5in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. The species is hermaphrodite (has both male and female organs) and is pollinated by Midges. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[161, 166]. A very pleasant flavour, it is slightly mealy but juicy and can be eaten in quantity as a dessert fruit[K]. It is also used in making pies, preserves etc and can be dried for later use[161, 177]. The fruit is up to 11mm in diameter and is borne in small clusters[K]. There are up to five fairly large seeds in the centre of the fruit, these often stick together and so the effect is of eating a cherry-like fruit with a single seed[K].

tcanta Wood - heavy, hard, tough, close-grained. Useful for making tool handles, mallets and other small items[82].

dwatta Cardiotonic HypotensiveAlthough no specific mention has been seen for this species, the fruits and flowers of many hawthorns are well-known in herbal folk medicine as a heart tonic and modern research has borne out this use. The fruits and flowers have a hypotensive effect as well as acting as a direct and mild heart tonic[222]. They are especially indicated in the treatment of weak heart combined with high blood pressure[222]. Prolonged use is necessary for it to be efficacious[222]. It is normally used either as a tea or a tincture[222].

propta Seed - this is best sown as soon as it is ripe in the autumn in a cold frame, some of the seed will germinate in the spring, though most will probably take another year. Stored seed can be very slow and erratic to germinate, it should be warm stratified for 3 months at 15°C and then cold stratified for another 3 months at 4°C[164]. It may still take another 18 months to germinate[78]. Scarifying the seed before stratifying it might reduce this time[80]. Fermenting the seed for a few days in its own pulp may also speed up the germination process[K]. Another possibility is to harvest the seed 'green' (as soon as the embryo has fully developed but before the seedcoat hardens) and sow it immediately in a cold frame. If timed well, it can germinate in the spring[80]. If you are only growing small quantities of plants, it is best to pot up the seedlings as soon as they are large enough to handle and grow them on in individual pots for their first year, planting them out in late spring into nursery beds or their final positions. When growing larger quantities, it might be best to sow them directly outdoors in a seedbed, but with protection from mice and other seed-eating creatures. Grow them on in the seedbed until large enough to plant out, but undercut the roots if they are to be left undisturbed for more than two years.

nwatta A very easily grown plant, it prefers a well-drained moisture retentive loamy soil but is not at all fussy[11, 200]. Once established, it succeeds in excessively moist soils and also tolerates drought[200]. It grows well on a chalk soil and also in heavy clay soils[200]. A position in full sun is best when plants are being grown for their fruit, they also succeed in semi-shade though fruit yields and quality will be lower in such a position[11, 200]. Most members of

can be put out into their permanent positions in the summer or autumn, making sure to give them some protection from the cold in their first winter[K].

nwatta Industrial Crop: Tannin Management: Standard Regional Crop Staple Crop: Balanced carbPrefers a good well-drained slightly acid loam but succeeds in dry soils[1, 11, 200]. Once established, it is very drought tolerant[1, 11, 200]. Very tolerant of highly acid, infertile dry sands[200]. Averse to calcareous soils but succeeds on harder limestones[11, 200]. The majority of species in this genus only really thrive in areas with hot summers, though this species is better adapted to British conditions than most[200]. Cultivated for its edible seed in Japan, there are many named varieties[58, 63, 183]. It is often also cultivated for its seed in America because it is fairly resistant to chestnut blight[171, 200]. Individual trees are very variable with regard to size of the seed, resistance to blight and astringency of the seed[183]. Some cultivars have the largest seeds of any member of this genus. Trees fruit freely when only 3 - 3.5 metres tall[11]. This species is occasionally planted as a timber tree in S. Europe[50]. An excellent soil-enriching understorey in pine forests[200]. Flowers are produced on wood of the current year's growth[229]. Plants are fairly self-sterile[200]. They hybridize freely with other members of this genus[200]. Plants in this genus are notably resistant to honey fungus[200].

## 5.2.202 Corylus cornuta californica

California Hazel

4 tlin 8 cyuc 3 kcaak 4 tcan 0 dwat 8 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwisslip hpa7tmwatli fyif hjonli

drutta Corylus cornuta californica is a deciduous Shrub growing to 8 m (26ft 3in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from April to May, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: Oil SeedEdible Uses: OilSeed - raw or cooked[177]. Eaten fresh or preserved for winter use[183]. The seed ripens in mid to late autumn and will probably need to be protected from squirrels[K]. When kept in a cool place, and not shelled, the seed should store for at least 12 months[K]. An edible oil is obtained from the seed.

tcanta Biomass Fencing Fibre Oil PaperA fibre is obtained from the inner bark and is used to make paper[189]. The branches are removed in the autumn, the leaves removed and the branches steamed then the fibre is removed[189]. The fibres are cooked for two hours with lye and then put through a blender[189]. It makes a brown paper[189]. The fibre is also used for cordage[189].

dwatta None known

propta Seed - best sown as soon as it is harvested in autumn in a cold frame[164]. Germinates in late winter or spring. Stored seed should be pre-soaked in warm water for 48 hours and then given 2 weeks warm followed by 3 - 4 months cold stratification[164]. Germinates in 1 - 6 months at 20°C[164]. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame or sheltered place outdoors for their first winter. Plant them out into their permanent positions in late spring or early summer[K]. Layering in autumn. Easy, it takes about 6 months[78, 200]. Division of suckers in early spring. Very easy, they can be planted out straight into their permanent positions.

nwatta An easily grown plant, it succeeds in most soils, but is in general more productive of seeds when grown on soils of moderate fertility[11, 200]. It does less well in rich heavy soils or poor ones[11, 63]. Does well in a loamy soil[11]. Very suitable for an alkaline soil[11], but it dislikes very acid soils[17]. Plants are fairly wind tolerant[1, 11]. Members of this genus bear transplanting well and can be easily moved even when relatively large[11].

## 5.2.203 Malus sieversii

Crabapple

4 tlin 10 cyuc 3 kcaak 0 tcan 0 dwat 8 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprikwisslip hpa7tmwatli xre7t hjonli

drutta Malus sieversii is a deciduous Tree growing to 8 m (26ft 3in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in May, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. Large and well-flavoured[74]. The fruit is usually between 3 - 5cm in diameter, though it can be up to 7cm[266].

tcanta None known

dwatta None known

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. It usually germinates in late winter. Stored seed requires stratification for 3 months at 1°C and should be sown in a cold frame as soon as it is received[200]. It might not germinate for 12 months or more. Prick out the seedlings into individual pots as soon as they are large enough to handle. If given a rich compost they usually grow away quickly and can be large enough to plant out in late summer, though consider giving them some protection from the cold in their first winter. Otherwise, keep them in pots in a cold frame and plant them out in late spring of the following year. Cuttings of mature wood, November in a frame[11].

nwatta An easily grown plant, it succeeds in most fertile soils, preferring a moisture retentive well-drained loamy soil[1, 200]. Grows well in heavy clay soils. Prefers a sunny position but succeeds in partial shade though it fruits less well in such a situation[1, 200]. This species is vulnerable to extinction because of its limited range and exploitation[266]. It is believed to be the principal ancestor of commercially grown apples[266]. A parent of the cultivated apple[11], the large well-flavoured fruit is possibly of economic interest[74]. The fruit is a good wildlife food source, especially for birds[200]. Hybridizes freely with other members of this genus[200]. Plants in this genus are notably susceptible to honey fungus[200]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

## 5.2.204 Amelanchier asiatica

Korean Juneberry

4 tlin 8 cyuc 3 kcaak 0 tcan 0 dwat 8 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprikwisslip hpa7tmwatli fyifxre7t hjonli

drutta Amelanchier asiatica is a deciduous Tree growing to 8 m (26ft) by 10 m (32ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in May, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Edible fruit, raw or cooked[3, 105, 177]. Of good quality[183], the fruit is sweet and juicy, contains a few small seeds at the centre and has a hint of apple in the flavour[K]. The fruit is rich in iron and copper[226]. The fruit is up to 15mm in diameter[266].

tcanta None known

dwatta None known

propta Seed - it is best harvested 'green', when the seed is fully formed but before the seed coat has hardened, and then sown immediately in pots outdoors or in a cold frame. If stored seed is obtained early enough in the autumn, it can be given 4 weeks warm stratification before being left out in

the winter and it should then germinate in the spring. Otherwise seed can be very slow to germinate, perhaps taking 18 months or more. When large enough to handle, prick the seedlings out into individual pots and grow them on in a sheltered outdoor position, planting them out once they are 20cm or more tall. If there is sufficient seed it is best to sow it thinly in an outdoor seedbed[78, 80]. Grow the seedlings on for two years in the seedbed before planting them out into their permanent positions during the winter. Layering in spring - takes 18 months[78]. Division of suckers in late winter. The suckers need to have been growing for 2 years before you dig them up, otherwise they will not have formed roots. They can be planted out straight into their permanent positions if required.

nwatta Prefers a rich loamy soil in a sunny position or semi-shade[1, 200] but thrives in any soil, including chalk, so long as it is not too dry or water-logged[11, 200]. Plants succeed in quite shady positions but do not flower or fruit well there[K]. Grows well in heavy clay soils. All members of this genus have edible fruits and, whilst this is dry and uninteresting in some species, in many others it is sweet and juicy. Many of the species have potential for use in the garden as edible ornamentals. The main draw-back to this genus is that birds adore the fruit and will often completely strip a tree before it is fully ripe[K]. A very ornamental plant[1], it is closely allied to *A. canadensis* and *A. laevis*, and is also very similar to *A. arborea*[11]. The sub-species *A. asiatica sinica* C. Schneid. is found in China. It has smaller fruits than the type species[200]. Hybridizes freely with other members of this genus[200]. Grafting onto seedlings of *A. lamarckii* or *Sorbus aucuparia* is sometimes practised in order to avoid the potential problem of hybridizing[1].

### 5.2.205 *Crataegus pedicellata gloriosa*

Scarlet Haw

4 tin 8 cyuc 3 kcaak 3 tcan 2 dwat 7 m hkuc hmimhtut cyutli hgattcuphja7n hwicli hrasjltunykfrrip hpa7tli flatprikwisslip hpa7tmwatli xre7t hjonli

drutta *Crataegus pedicellata gloriosa* is a deciduous Shrub growing to 7 m (23ft) by 7 m (23ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from April to May, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Midges. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[K]. Up to 2cm long and pear shaped[11]. The fruit can be used in making pies, preserves, etc, and can also be dried for later use. There are up to five fairly large seeds in the centre of the fruit, these often stick together and so the effect is of eating a cherry-like fruit with a single seed[K].

tcanta Wood - heavy, hard, tough, close-grained. Useful for making tool handles, mallets and other small items[82].

dwatta Cardiotonic HypotensiveAlthough no specific mention has been seen for this species, the fruits and flowers of many hawthorns are well-known in herbal folk medicine as a heart tonic and modern research has borne out this use. The fruits and flowers have a hypotensive effect as well as acting as a direct and mild heart tonic[222]. They are especially indicated in the treatment of weak heart combined with high blood pressure[222]. Prolonged use is necessary for it to be efficacious[222]. It is normally used either as a tea or a tincture[222].

propta Seed - this is best sown as soon as it is ripe in the autumn in a cold frame, some of the seed will germinate in the spring, though most will probably take another year. Stored seed can be very slow and erratic to germinate, it should be warm stratified for 3 months at 15°C and then cold stratified for another 3 months at 4°C[164]. It may still take another 18 months to germinate[78]. Scarifying the seed before stratifying it might reduce this time[80]. Fermenting the seed for a few days in its own pulp may also speed up

the germination process[K]. Another possibility is to harvest the seed 'green' (as soon as the embryo has fully developed but before the seedcoat hardens) and sow it immediately in a cold frame. If timed well, it can germinate in the spring[80]. If you are only growing small quantities of plants, it is best to pot up the seedlings as soon as they are large enough to handle and grow them on in individual pots for their first year, planting them out in late spring into nursery beds or their final positions. When growing larger quantities, it might be best to sow them directly outdoors in a seedbed, but with protection from mice and other seed-eating creatures. Grow them on in the seedbed until large enough to plant out, but undercut the roots if they are to be left undisturbed for more than two years.

nwatta A very easily grown plant, it prefers a well-drained moisture retentive loamy soil but is not at all fussy[11, 200]. Once established, it succeeds in excessively moist soils and also tolerates drought[200]. It grows well on a chalk soil and also in heavy clay soils[200]. A position in full sun is best when plants are being grown for their fruit, they also succeed in semi-shade though fruit yields and quality will be lower in such a position[11, 200]. Most members of this genus succeed in exposed positions, they also tolerate atmospheric pollution[200]. Plants are hardy to at least -18°C[202]. This sub-species has larger fruits than the type[11]. Hybridizes freely with other members of this genus[200]. Seedlings trees take from 5 - 8 years before they start bearing fruit, though grafted trees will often flower heavily in their third year[K]. The flowers have a foetid smell somewhat like decaying fish. This attracts midges which are the main means of fertilization. When freshly open, the flowers have more pleasant scent with balsamic undertones[245]. Seedlings should not be left in a seedbed for more than 2 years without being transplanted[11].

### 5.2.206 *Corylus heterophylla*

Siberian Filbert

4 tin 8 cyuc 3 kcaak 4 tcan 1 dwat 7 m hkuc hmimhtut cyutli tcup hwicli hrasjltunyk hpa7tli flatprikwisslip hpa7tmwatli fyif hjonli

drutta *Corylus heterophylla* is a deciduous Tree growing to 7 m (23ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from April to May, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: Oil SeedEdible Uses: OilSeed - raw or cooked[46, 61, 105, 177]. The seed, which has a hard shell, is of relatively good flavour[183]. Rich in oil. The seed ripens in mid to late autumn and will probably need to be protected from squirrels[K]. When kept in a cool place, and not shelled, the seed should store for at least 12 months[K]. An edible oil is obtained from the seed.

tcanta OilNone known

dwatta Appetizer DigestiveThe seed is digestive and appetizer[218].

propta Seed - best sown as soon as it is harvested in autumn in a cold frame[164]. Germinates in late winter or spring. Stored seed should be pre-soaked in warm water for 48 hours and then given 2 weeks warm followed by 3 - 4 months cold stratification[164]. Germinates in 1 - 6 months at 20°C[164]. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame or sheltered place outdoors for their first winter. Plant them out into their permanent positions in late spring or early summer[K]. Layering in autumn. Easy, it takes about 6 months[78, 200]. Division of suckers in early spring. Very easy, they can be planted out straight into their permanent positions.

nwatta Management: Coppice Management: Standard Other Systems: Strip intercrop Regional Crop Staple Crop: Protein-oilAn easily grown plant, it succeeds in most soils, but is in general more productive of seeds when grown on soils of moderate fertility[11, 200]. It does less well in

with balsamic undertones[245]. Hybridizes freely with other members of this genus[200]. Seedlings should not be left in a seedbed for more than 2 years without being transplanted[11].

### 5.2.215 *Aralia elata*

Japanese Angelica Tree, Angelica Tree

4 tin 9 cyuc 3 kcaak 2 tcan 2 dwat 6 m hkuc hmimhtut cyutli tcup hwicli hyishrasjltunyk hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta *Aralia elata* is a deciduous Tree growing to 6 m (19ft) by 6 m (19ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves ShootsEdible Uses: Young shoots - cooked[177, 200]. They can also be blanched and used in salads. The young shoots of *Aralia elata* are a popular wild food in Japan where the tree is known as Taranoki and the shoots as Taranome. In Korea the shoots are called dureup.

tcanta Landscape Uses: Specimen. Special Features: Not North American native, Blooms are very showy, attracts wildlife. Nectary - Shelter [1-2].

dwatta Anodyne Cancer CarminativeThe roots and stems are anodyne and carminative[147]. All parts of the plant are used for the treatment of rheumatoid arthralgia, coughs, diabetes, jaundice, stomach ulcers and stomach cancers[147, 218].

propta Seed - best sown as soon as ripe in a cold frame. Stored seed requires 3 - 5 months of cold stratification. Germination usually takes place within 1 - 4 months at 20°C[134]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in a greenhouse for at least their first winter. Once the plants are 25cm or more tall, they can be planted out into their permanent positions, late spring or early summer being the best time to do this. Root cuttings 8cm long, December in a cold frame[11, 78]. Store the roots upside down in sand and pot up in March/April. High percentage[78]. Division of suckers in late winter[11]. Very easy, the suckers can be planted out direct into their permanent positions if required.

nwatta Prefers a good deep loam and a position in semi-shade but it also succeeds in a sunny position[11, 200]. Requires a sheltered position. Plants are hardier when grown on poorer soils[11, 200]. Prefers an acid soil[184]. Dormant plants are hardy to at least -15°C[184, 200]. The young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. A very ornamental species, there are a number of named varieties. It is usually a single stemmed shrub, spreading by means of suckers[182]. This species is closely allied to *A. chinensis*. In Japan *Aralia elata* is a pioneering plant that often grows where forests have been cleared. In open sunny areas with adequate soil moisture it grows rapidly. The plant is heat tolerant in zones 9 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. A clumping plant, forming a colony from shoots away from the crown but with a limited spread [1-2]. The root pattern is suckering with new plants from underground runners away from the plant [1-2].

### 5.2.216 *Crataegus chrysoarpa*

Fireberry Hawthorn, Red haw, Piper's hawthorn, 4 tin 8 cyuc 3 kcaak 0 tcan 2 dwat 6 m hkuc hmimhtut cyutli hgattcuphja7n hwicli hrasjltunykfrrip hpa7tli flatprikwisslip hpa7tmwatli xre7t hjonli

drutta *Crataegus chrysoarpa* is a deciduous Tree growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in May, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Midges. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[161, 177]. Used mainly as a famine food[257]. A very pleasant flavour when ripe, with the added bonus of ripening in late summer before most other members of the genus[K]. The fruit can be used in making pies, preserves, etc, and can also be dried for later use. It is about 1cm in diameter and borne in small clusters[200]. There are up to five fairly large seeds in the centre of the fruit, these often stick together and so the effect is of eating a cherry-like fruit with a single seed[K]. A tea can be made from the twigs[257]. (This probably means the young shoots with leaves[K].)

tcanta Wood - heavy, hard, tough, close-grained. Useful for making tool handles, mallets and other small items[82].

dwatta Cardiotonic Hypotensive LaxativeA decoction of the dried berries has been used as a mild laxative[257]. A compound decoction of the root has been used in the treatment of diarrhoea[257]. Although no other specific mention has been seen for this species, the fruits and flowers of many hawthorns are well-known in herbal folk medicine as a heart tonic and modern research has borne out this use. The fruits and flowers have a hypotensive effect as well as acting as a direct and mild heart tonic[222]. They are especially indicated in the treatment of weak heart combined with high blood pressure[222]. Prolonged use is necessary for it to be efficacious[222]. It is normally used either as a tea or a tincture[222].

propta Seed - this is best sown as soon as it is ripe in the autumn in a cold frame, some of the seed will germinate in the spring, though most will probably take another year. Stored seed can be very slow and erratic to germinate, it should be warm stratified for 3 months at 15°C and then cold stratified for another 3 months at 4°C[164]. It may still take another 18 months to germinate[78]. Scarifying the seed before stratifying it might reduce this time[80]. Fermenting the seed for a few days in its own pulp may also speed up the germination process[K]. Another possibility is to harvest the seed 'green' (as soon as the embryo has fully developed but before the seedcoat hardens) and sow it immediately in a cold frame. If timed well, it can germinate in the spring[80]. If you are only growing small quantities of plants, it is best to pot up the seedlings as soon as they are large enough to handle and grow them on in individual pots for their first year, planting them out in late spring into nursery beds or their final positions. When growing larger quantities, it might be best to sow them directly outdoors in a seedbed, but with protection from mice and other seed-eating creatures. Grow them on in the seedbed until large enough to plant out, but undercut the roots if they are to be left undisturbed for more than two years.

nwatta A very easily grown plant, it prefers a well-drained moisture retentive loamy soil but is not at all fussy[11, 200]. Once established, it succeeds in excessively moist soils and also tolerates drought[200]. It grows well on a chalk soil and also in heavy clay soils[200]. A position in full sun is best when plants are being grown for their fruit, they also succeed in semi-shade though fruit yields and quality will be lower in such a position[11, 200]. Most members of this genus succeed in exposed positions, they also tolerate atmospheric pollution[200]. Seedling trees take from 5 - 8 years before they start bearing fruit, though grafted trees will often flower heavily in their third year[K]. A ten year old tree was seen at Kew Gardens in 2002. It was about 2.5 metres tall and was bearing a very good crop of fruit[K].

well in quite dense shade[17, 186]. A very hardy plant, tolerating temperatures down to at least -18°C[202]. Hybridizes freely with other members of this genus[200]. Closely allied to *C. monogyna*, it often hybridizes with that species in the wild when growing in its proximity[186]. There are many named forms selected for their ornamental value[200]. Seedling trees take from 5 - 8 years before they start bearing fruit, though grafted trees will often flower heavily in their third year[K]. The flowers have a foetid smell somewhat like decaying fish. This attracts midges which are the main means of fertilization. When freshly open, the flowers have more pleasant scent with balsamic undertones[245]. Seedlings should not be left in a seedbed for more than 2 years without being transplanted[11]. An important food plant for the larvae of many lepidoptera species[30]. Special Features: Not North American native, Blooms are very showy.

## 5.2.213 Amelanchier intermedia

June berry,  
4 tin 8 cyuc 3 kcaak 0 tcan 0 dwat 6 m hkuc  
hmmihmtt cyutli tcup hwicli hrasjutnykfrp hpa7tli flatprik hpa7tmwatli fyfxfre7t hjonli  
drutta *Amelanchier intermedia* is a deciduous Shrub growing to 6 m (19ft) by 4 m (13ft). See above for USDA hardness. It is hardy to UK zone 4 and is not frost tender. It is in flower in April, and the seeds ripen from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Fruit/Edible Uses: Edible fruit - raw or cooked[11]. We have yet to see the fruit on this species, but if it is like the closely related *A. lamarkii*, then it will be sweet and succulent with a flavour of apples[K]. The fruit can also be dried for later use and is up to 10mm in diameter. The fruit is rich in iron and copper[226].

tcanta None known  
dwatta None known  
propta Seed - it is best harvested 'green', when the seed is fully formed but before the seed coat has hardened, and then sown immediately in pots outdoors or in a cold frame. If stored seed is obtained early enough in the autumn, it can be given 4 weeks warm stratification before being left out in the winter and it should then germinate in the spring. Otherwise seed can be very slow to germinate, perhaps taking 18 months or more. When large enough to handle, prick the seedlings out into individual pots and grow them on in a sheltered outdoor position, planting them out once they are 20cm or more tall. If there is sufficient seed it is best to sow it thinly in an outdoor seedbed[78, 80]. Grow the seedlings on for two years in the seedbed before planting them out into their permanent positions during the winter. Layering in spring - takes 18 months[78]. Division of suckers in late winter. The suckers need to have been growing for 2 years before you dig them up, otherwise they will not have formed roots. They can be planted out straight into their permanent positions if required.

nwatta Prefers a rich loamy soil in a sunny position or semi-shade[1, 200] but thrives in any soil that is not too dry or water-logged[11]. Grows well in heavy clay soils. Prefers an acid or neutral soil. Plants are hardy to about -25°C[184]. All members of this genus have edible fruits and, whilst this is dry and uninteresting in some species, in many others it is sweet and juicy. Many of the species have potential for use in the garden as edible ornamentals. The main drawback to this genus is that birds adore the fruit and will often completely strip a tree before it is fully ripe[K]. Considerable confusion has existed between this species and *A. arborea*, *A. canadensis* and *A. laevis*, see [1] for the latest (1991) classification. Some botanists consider this species to be part of *A. canadensis* or *A. lamarkii*[11, 200]. A group of plants growing at Kew were about 5 years old in 1995. They were flowering well in early April, were about 2 metres tall and had lots of side branches[K]. Their native range was given as western N. America, which conflicts with other reports[K]. Older plants are being grown at Hilliers Arboretum in Hampshire, in early April 1999 they were 4 metres

tall, suckering quite freely in a tight clump and flowering very freely[K]. Hybridizes freely with other members of this genus[200]. Grafting onto seedlings of *Sorbus aucuparia* is sometimes practised in order to avoid the potential problem of hybridizing[1].

## 5.2.214 Crataegus coccinoides

Kansas Hawthorn  
4 tin 8 cyuc 3 kcaak 0 tcan 2 dwat 6 m hkuc  
hmmihmtt cyutli hgatkuyctcuphja7n hwicli hrasjutnykfrp hpa7tli flatprikwiissip hpa7tmwatli xre7t hjonli  
drutta *Crataegus coccinoides* is a deciduous Tree growing to 6 m (19ft 8in). See above for USDA hardness. It is hardy to UK zone 5 and is not frost tender. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Midges. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry moist or wet soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: Fruit/Edible Uses: Fruit - raw or cooked[2, 177]. Firm and sub-acid[82]. The fruit can be used in making pies, preserves, etc, and can also be dried for later use. The fruit is borne in small clusters and is up to 17mm in diameter[229]. There are up to five fairly large seeds in the centre of the fruit, these often stick together and so the effect is of eating a cherry-like fruit with a single seed[K].  
tcanta Wood - heavy, hard, tough, close-grained. Useful for making tool handles, mallets and other small items[82].

dwatta Cardiotonic Hypotensive/Although no specific mention has been seen for this species, the fruits and flowers of many hawthorns are well-known in herbal folk medicine as a heart tonic and modern research has borne out this use. The fruits and flowers have a hypotensive effect as well as acting as a direct and mild heart tonic[222]. They are especially indicated in the treatment of weak heart combined with high blood pressure[222]. Prolonged use is necessary for it to be efficacious[222]. It is normally used either as a tea or a tincture[222].

propta Seed - this is best sown as soon as it is ripe in the autumn in a cold frame, some of the seed will germinate in the spring, though most will probably take another year. Stored seed can be very slow and erratic to germinate, it should be warm stratified for 3 months at 15°C and then cold stratified for another 3 months at 4°C[164]. It may still take another 18 months to germinate[78]. Scarifying the seed before stratifying it might reduce this time[80]. Fermenting the seed for a few days in its own pulp may also speed up the germination process[K]. Another possibility is to harvest the seed 'green' (as soon as the embryo has fully developed but before the seedcoat hardens) and sow it immediately in a cold frame. If timed well, it can germinate in the spring[80]. If you are only growing small quantities of plants, it is best to pot up the seedlings as soon as they are large enough to handle and grow them on in individual pots for their first year, planting them out in late spring into nursery beds or their final positions. When growing larger quantities, it might be best to sow them directly outdoors in a seedbed, but with protection from mice and other seed-eating creatures. Grow them on in the seedbed until large enough to plant out, but undercut the roots if they are to be left undisturbed for more than two years.

nwatta A very easily grown plant, it prefers a well-drained moisture retentive loamy soil but is not at all fussy[11, 200]. Once established, it succeeds in excessively moist soils and also tolerates drought[200]. It grows well on a chalk soil and also in heavy clay soils[200]. A position in full sun is best when plants are being grown for their fruit, they also succeed in semi-shade though fruit yields and quality will be lower in such a position[11, 200]. Most members of this genus succeed in exposed positions, they also tolerate atmospheric pollution[200]. Seedling trees take from 5 - 8 years before they start bearing fruit, though grafted trees will often flower heavily in their third year[K]. The flowers have a foetid smell somewhat like decaying fish. This attracts midges which are the main means of fertilization. When freshly open, the flowers have more pleasant scent

rich heavy soils or poor ones[11, 63]. Does well in a loamy soil[11]. Very suitable for an alkaline soil[11], but it dislikes very acid soils[17]. Plants are fairly wild tolerant[1, 11]. This species is cultivated in Asia for its edible seed[61] but it is of little value as a nut bearer in Britain[1]. Closely related to *C. avellana*[1]. Members of this genus bear transplanting well and can be easily moved even when relatively large[11].

## 5.2.207 Malus coronaria

Garland Crab, Sweet crab apple  
4 tin 8 cyuc 3 kcaak 0 tcan 1 dwat 7 m hkuc  
hmmihmtt cyutli tcuphja7n hwicli hrasjutnykfrp hpa7tli flatprikwis hpa7tmwatli xre7t hjonli  
drutta *Malus coronaria* is a deciduous Tree growing to 7 m (23ft) by 7 m (23ft). See above for USDA hardness. It is hardy to UK zone 4 and is not frost tender. It is in flower from May to June, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta Edible Parts: Fruit/Edible Uses: Pectin/Fruit - raw or cooked[159, 161]. Fairly large, it is up to 5cm in diameter[200]. Harsh and acid[11], it is mainly used for jellies[183] but can be eaten raw when it is fully ripe[101]. The fruits can be buried in the ground overwinter and will have lost much of their acidity by the spring[183]. The fruit can also be dried and stored for later use[257]. Rich in pectin, so it can be added to pectin-low fruits when making jams or jellies[226]. Pectin is also said to protect the body against radiation[201].

tcanta Pectin Rootstock Wood/The plant can be used as a rootstock for cultivated apples, conferring a greater hardness[226]. Wood - heavy, close-grained, not strong[46, 82, 229]. It weighs 43lb per cubic foot[235]. Used for making levers, the handles of tools, small domestic items and fuel[46, 82, 229].

dwatta Abortifacient Astringent Birthing aid Emmenagogue Lithotropic Ophthalmic/An infusion of the bark has been used to ease a difficult birth and also in the treatment of gallstones, piles and as a wash for sore mouths[257]. A cold infusion of the bark has been used as a wash for black eyes, sore eyes and snow blindness[257]. A decoction of the root has been used to treat suppressed menses and so can cause an abortion, especially early in the pregnancy[257].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. It usually germinates in late winter. Stored seed requires stratification for 3 months at 1°C and should be sown in a cold frame as soon as it is received[200]. It might not germinate for 12 months or more. Prick out the seedlings into individual pots as soon as they are large enough to handle. If given a rich compost they usually grow away quickly and can be large enough to plant out in late summer, though consider giving them some protection from the cold in their first winter. Otherwise, keep them in pots in a cold frame and plant them out in late spring of the following year. Cuttings of mature wood, November in a frame[11].

nwatta An easily grown plant, it succeeds in most fertile soils, preferring a moisture retentive well-drained loamy soil[1, 200]. Grows well in heavy clay soils. Prefers a sunny position but succeeds in partial shade, though it fruits less well in such a situation[200]. A slow-growing and short-lived tree in the wild[229]. The fruit is a good wildlife food source, especially for birds[200]. The flowers are sweetly scented[245]. This species is closely related to *M. ionensis*[1]. Plants in this genus are notably susceptible to honey fungus[200].

## 5.2.208 Crataegus altaica

Altai Mountain Thorn  
4 tin 8 cyuc 3 kcaak 0 tcan 2 dwat 6 m hkuc  
hmmihmtt cyutli hgattcuphja7n hwicli hrasjutnykfrp hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta *Crataegus altaica* is a deciduous Tree growing to 6 m (19ft) by 4 m (13ft). See above for USDA hardness. It is hardy to UK zone 5 and is not frost tender. The species

is hermaphrodite (has both male and female organs) and is pollinated by Midges. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta Fruit - raw or cooked. About 8mm in diameter, the fruit is yellow with a fairly dry mealy texture and a pleasantly sweet flesh[K]. The fruit can also be used in making pies, preserves, etc, and can also be dried for later use. The fruit ripens in August, making it one of the earliest ripening hawthorns[K]. There are up to five fairly large seeds in the centre of the fruit, these often stick together and so the effect is of eating a cherry-like fruit with a single seed[K].

tcanta Wood - heavy, hard, tough, close-grained. Useful for making tool handles, mallets and other small items[82].

dwatta Although no specific mention has been seen for this species, the fruits and flowers of many hawthorns are well-known in herbal folk medicine as a heart tonic and modern research has borne out this use. The fruits and flowers have a hypotensive effect as well as acting as a direct and mild heart tonic[222]. They are especially indicated in the treatment of weak heart combined with high blood pressure[222]. Prolonged use is necessary for it to be efficacious[222]. It is normally used either as a tea or a tincture[222].

propta Seed - this is best sown as soon as it is ripe in the autumn in a cold frame, some of the seed will germinate in the spring, though most will probably take another year. Stored seed can be very slow and erratic to germinate, it should be warm stratified for 3 months at 15°C and then cold stratified for another 3 months at 4°C[164]. It may still take another 18 months to germinate[78]. Scarifying the seed before stratifying it might reduce this time[80]. Fermenting the seed for a few days in its own pulp may also speed up the germination process[K]. Another possibility is to harvest the seed 'green' (as soon as the embryo has fully developed but before the seedcoat hardens) and sow it immediately in a cold frame. If timed well, it can germinate in the spring[80]. If you are only growing small quantities of plants, it is best to pot up the seedlings as soon as they are large enough to handle and grow them on in individual pots for their first year, planting them out in late spring into nursery beds or their final positions. When growing larger quantities, it might be best to sow them directly outdoors in a seedbed, but with protection from mice and other seed-eating creatures. Grow them on in the seedbed until large enough to plant out, but undercut the roots if they are to be left undisturbed for more than two years.

nwatta A very easily grown plant, it prefers a well-drained moisture retentive loamy soil but is not at all fussy[11, 200]. Once established, it succeeds in excessively moist soils and also tolerates drought[200]. It grows well on a chalk soil and also in heavy clay soils[200]. A position in full sun is best when plants are being grown for their fruit, they also succeed in semi-shade though fruit yields and quality will be lower in such a position[11, 200]. Most members of this genus succeed in exposed positions, they also tolerate atmospheric pollution[200]. Seedling trees take from 5 - 8 years before they start bearing fruit, though grafted trees will often flower heavily in their third year[K]. The flowers have a foetid smell somewhat like decaying fish. This attracts midges which are the main means of fertilization. When freshly open, the flowers have more pleasant scent with balsamic undertones[245]. This species is closely related to *C. wattiana*[11]. Hawthorns in general hybridize freely with other members of the genus[200]. Seedlings should not be left in a seedbed for more than 2 years without being transplanted[11].

## 5.2.209 Xanthoceras sorbifolium

Yellowhorn  
4 tin 7 cyuc 3 kcaak 0 tcan 0 dwat 6 m hkuc  
htut cyutli kyuctcup hwicli hrasjutnyk hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta *Xanthoceras sorbifolium* is a deciduous Shrub growing to 6 m (19ft) by 2.5 m (8ft) at a slow rate. See above for USDA hardness. It is hardy to UK zone 6 and

is not frost tender. It is in flower from May to June, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

**kcakta Edible Parts:** Flowers Leaves Seed**Edible Uses:** Flowers - cooked[2, 105, 183]. They are usually boiled[179]. Leaves - cooked[2, 105, 183]. They are usually boiled[179]. Seed - cooked[2, 105, 177]. The seed is about the size of a pea, it is quite sweet[183], with a taste like a sweet chestnut[178]. The seed is husked and then ground into a powder and boiled[179].

**tcanta None known**  
**dwatta None known**  
**propta Seed - 3 months** cool stratification improves germination rates[113] so the seed is probably best sown in a cold frame in the autumn[K]. Another report says that the seed can be sown in a warm greenhouse in February or March[78], probably after stratification[K]. When large enough to handle, prick the seedlings out into individual pots. Grow the on in a lightly shaded position in a greenhouse for their first winter then plant them out into their permanent positions in late spring or early summer. Consider giving them some protection from winter cold for their first winter or two outdoors. Root cuttings, 3cm long planted horizontally in pots in a frame in December or January. Good percentage[78]. Division of suckers in the dormant season[200]. They can be planted out straight into their permanent positions.

**nwatta Management:** Standard Other Systems: Strip intercrop Regional Crop Staple Crop: Protein-oilPrefers a good loamy soil[1], but succeeds in most well-drained fertile soils in a sunny position[184, 200]. Prefers a warm dry situation[184]. Requires protection from cold winds[202]. Dormant plants are hardy to about -20°C[184]. They grow best in areas with warm summers and dry springs without late frosts[184], the young growth can be damaged by late spring frosts[1, 11]. They require summer heat in order to fully ripen their wood and to stimulate the production of flower buds[11, 200]. They are subject to attacks by 'coral spot' fungus, particularly if the wood is not fully ripened and is then damaged by winter cold[11]. Flowers are produced on the previous year's wood[202]. Plants are usually slow to become established[202]. **Special Features:**Not North American native, Fragrant flowers, Blooms are very showy. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2].

## 5.2.210 Crataegus flabellata

Fanleaf hawthorn  
4 tlin 8 cyuc 3 kcaak 3 tcan 2 dwat 6 m hkuc  
hmimhtut cyutli hgattcuphja7n hwicli hrasljutnyikfrip hpa7tli flatprikwisslip hpa7tmwatli xre7t hjonli  
drutta Crataegus flabellata is a deciduous Shrub growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. The species is hermaphrodite (has both male and female organs) and is pollinated by Midges. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

**kcakta Edible Parts:** Fruit**Edible Uses:** Fruit - raw or cooked. A sweet but very soft and mealy flesh, it makes an acceptable dessert fruit[K]. The fruit can be used in making pies, preserves, etc, and can also be dried for later use. The fruit is up to 15mm long and 8mm wide, it is borne in small clusters[82, 229]. There are up to five fairly large seeds in the centre of the fruit, these often stick together and so the effect is of eating a cherry-like fruit with a single seed[K].

**tcanta Wood - heavy, hard, tough, close-grained.** Useful for making tool handles, mallets and other small items[82].

**dwatta Cardiotoxic Hypotensive**Although no specific mention has been seen for this species, the fruits and flowers of many hawthorns are well-known in herbal folk medicine as a heart tonic and modern research has borne out this use. The fruits and flowers have a hypotensive effect as well as acting as a direct and mild heart tonic[222]. They are especially indicated in the treatment of weak heart combined with high blood pressure[222]. Prolonged use is necessary for it to be efficacious[222]. It is normally used either as a tea or a tincture[222].

**propta Seed - this is best sown as soon as it is ripe in the autumn in a cold frame, some of the seed will germinate in the spring, though most will probably take another year.** Stored seed can be very slow and erratic to germinate, it should be warm stratified for 3 months at 15°C and then cold stratified for another 3 months at 4°C[164]. It may still take another 18 months to germinate[78]. Scarifying the seed before stratifying it might reduce this time[80]. Fermenting the seed for a few days in its own pulp may also speed up the germination process[K]. Another possibility is to harvest the seed 'green' (as soon as the embryo has fully developed but before the seedcoat hardens) and sow it immediately in a cold frame. If timed well, it can germinate in the spring[80]. If you are only growing small quantities of plants, it is best to pot up the seedlings as soon as they are large enough to handle and grow them on in individual pots for their first year, planting them out in late spring into nursery beds or their final positions. When growing larger quantities, it might be best to sow them directly outdoors in a seedbed, but with protection from mice and other seed-eating creatures. Grow them on in the seedbed until large enough to plant out, but undercut the roots if they are to be left undisturbed for more than two years.

**nwatta A** very easily grown plant, it prefers a well-drained moisture retentive loamy soil but is not at all fussy[11, 200]. Once established, it succeeds in excessively moist soils and also tolerates drought[200]. It grows well on a chalk soil and also in heavy clay soils[200]. A position in full sun is best when plants are being grown for their fruit, they also succeed in semi-shade though fruit yields and quality will be lower in such a position[11, 200]. Most members of this genus succeed in exposed positions, they also tolerate atmospheric pollution[200]. Hybridizes freely with other members of this genus[200]. Seedling trees take from 5 - 8 years before they start bearing fruit, though grafted trees will often flower heavily in their third year[K]. The flowers have a foetid smell somewhat like decaying fish. This attracts midges which are the main means of fertilization. When freshly open, the flowers have more pleasant scent with balsamic undertones[245]. Seedlings should not be left in a seedbed for more than 2 years without being transplanted[11]. A tree at Kew in September 1993 was fruiting heavily[K].

## 5.2.211 Crataegus pruinosa

Frosted Hawthorn, Waxypfruit hawthorn  
4 tlin 8 cyuc 3 kcaak 0 tcan 2 dwat 6 m hkuc  
hmimhtut cyutli hgattcuphja7n hwicli hrasljutnyikfrip hpa7tli flatprikwisslip hpa7tmwatli xre7t hjonli  
drutta Crataegus pruinosa is a deciduous Tree growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in May, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Midges. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

**kcakta Edible Parts:** Fruit**Edible Uses:** Fruit - raw or cooked[105, 161, 177]. The flesh is thick[82]. A sweet yellow flesh[200]. The fruit can be used in making pies, preserves, etc, and can also be dried for later use[257]. The fruit is about 1cm in diameter[200]. The fruit is up to 16mm in diameter with a thin flesh[229]. There are up to five fairly large seeds in the centre of the fruit, these often stick together and so the effect is of eating a cherry-like fruit with a single seed[K].

**tcanta Wood - heavy, hard, tough, close-grained.** Useful for making tool handles, mallets and other small items[82].

**dwatta Cardiotoxic Hypotensive**Although no specific mention has been seen for this species, the fruits and flowers of many hawthorns are well-known in herbal folk medicine as a heart tonic and modern research has borne out this use. The fruits and flowers have a hypotensive effect as well as acting as a direct and mild heart tonic[222]. They are especially indicated in the treatment of weak heart combined with high blood pressure[222]. Prolonged use is necessary for it to be efficacious[222]. It is normally used either as a tea or a tincture[222].

**propta Seed - this is best sown as soon as it is ripe in the autumn in a cold frame, some of the seed will germinate in the spring, though most will probably take another year.** Stored seed can be very slow and erratic to germinate, it should be warm stratified for 3 months at 15°C and then cold stratified for another 3 months at 4°C[164]. It may still take another 18 months to germinate[78]. Scarifying the seed before stratifying it might reduce this time[80]. Fermenting the seed for a few days in its own pulp may also speed up the germination process[K]. Another possibility is to harvest the seed 'green' (as soon as the embryo has fully developed but before the seedcoat hardens) and sow it immediately in a cold frame. If timed well, it can germinate in the spring[80]. If you are only growing small quantities of plants, it is best to pot up the seedlings as soon as they are large enough to handle and grow them on in individual pots for their first year, planting them out in late spring into nursery beds or their final positions. When growing larger quantities, it might be best to sow them directly outdoors in a seedbed, but with protection from mice and other seed-eating creatures. Grow them on in the seedbed until large enough to plant out, but undercut the roots if they are to be left undisturbed for more than two years.

**nwatta A** very easily grown plant, it prefers a well-drained moisture retentive loamy soil but is not at all fussy[11, 200]. Once established, it succeeds in excessively moist soils and also tolerates drought[200]. It grows well on a chalk soil and also in heavy clay soils[200]. A position in full sun is best when plants are being grown for their fruit, they also succeed in semi-shade though fruit yields and quality will be lower in such a position[11, 200]. Most members of this genus succeed in exposed positions, they also tolerate atmospheric pollution[200]. Hybridizes freely with other members of this genus[200]. Seedling trees take from 5 - 8 years before they start bearing fruit, though grafted trees will often flower heavily in their third year[K]. The flowers have a foetid smell somewhat like decaying fish. This attracts midges which are the main means of fertilization. When freshly open, the flowers have more pleasant scent with balsamic undertones[245]. Seedlings should not be left in a seedbed for more than 2 years without being transplanted[11].

## 5.2.212 Crataegus laevigata

Midland Hawthorn, Smooth hawthorn, English Hawthorn  
4 tlin 8 cyuc 3 kcaak 5 tcan 5 dwat 6 m hkuc  
pcimhmimhtut cyutli hgattcuphja7n hwicli hrasljutnyikfrip hpa7tli flatprikwisslip hpa7tmwatli xre7t hjonli

**drutta Crataegus laevigata** is a deciduous Shrub growing to 6 m (19ft) by 6 m (19ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from April to May, and the seeds ripen from September to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Midges. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist or wet soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

**kcakta Edible Parts:** Fruit Leaves**Edible Uses:** Coffee TeaFruit - raw or cooked[2, 9, 12, 183]. A dry and mealy texture, they are not very appetizing[K]. The fruit can be used for jams and preserves[9]. The fruit pulp can be dried, ground into a meal and mixed with flour in making bread etc[46, 183]. The fruit is about 1cm in diameter[200]. There are up to five fairly large seeds in the centre of the fruit, these

often stick together and so the effect is of eating a cherry-like fruit with a single seed[K]. Young leaves and young shoots - raw[5, 177]. A tasty nibble, they are nice in a salad[K]. Young leaves are a tea substitute[21, 46, 177, 183]. The roasted seed is a coffee substitute[12, 21, 183].

**tcanta Charcoal Fuel** Hedge Rootstock WoodA good hedge plant, it is very tolerant of neglect and is able to regenerate if cut back severely, it makes a good thorny stockproof barrier[186] and resists very strong winds. It can be used in layered hedges[11, 29]. The plant is often used as a rootstock for several species of garden fruit such as the medlar (*Mespilus germanica*) and the pear (*Pyrus communis sativa*)[4]. Wood - very hard and tough but difficult to work[7, 46, 61]. It has a fine grain and takes a beautiful polish but is seldom large enough to be of great value[4]. It is used for tool handles and making small wooden articles etc[4, 7, 46, 61]. The wood is valued in turning and makes an excellent fuel, giving out a lot of heat, more so even than oak wood[4]. Charcoal made from the wood is said to be able to melt pig iron without the aid of a blast[4].

**dwatta Antiarrhythmic Antispasmodic Astringent Cardiotoxic Diuretic Hypotensive Malaria Sedative Tonic Vasodilator**Hawthorn is an extremely valuable medicinal herb. It is used mainly for treating disorders of the heart and circulation system, especially angina[254]. Western herbalists consider it a 'food for the heart', it increases the blood flow to the heart muscles and restores normal heart beat[254]. This effect is brought about by the presence of bioflavonoids in the fruit, these bioflavonoids are also strongly antioxidant, helping to prevent or reduce degeneration of the blood vessels[254]. The fruit is antispasmodic, cardiac, diuretic, sedative, tonic and vasodilator[4, 9, 21, 46, 165]. Both the fruits and flowers of hawthorns are well-known in herbal folk medicine as a heart tonic and modern research has borne out this use. The fruits and flowers have a hypotensive effect as well as acting as a direct and mild heart tonic[222]. They are especially indicated in the treatment of weak heart combined with high blood pressure[222], they are also used to treat a heart muscle weakened by age, for inflammation of the heart muscle, arteriosclerosis and for nervous heart problems[21]. Prolonged use is necessary for the treatment to be efficacious[222]. It is normally used either as a tea or a tincture[222]. Hawthorn is combined with ginkgo (*Ginkgo biloba*) to enhance poor memory, working by improving the blood supply to the brain[254]. The bark is astringent and has been used in the treatment of malaria and other fevers[7]. The roots are said to stimulate the arteries of the heart[218].

**propta Seed - this is best sown as soon as it is ripe in the autumn in a cold frame, some of the seed will germinate in the spring, though most will probably take another year.** Stored seed can be very slow and erratic to germinate, it should be warm stratified for 3 months at 15°C and then cold stratified for another 3 months at 4°C[164]. It may still take another 18 months to germinate[78]. Scarifying the seed before stratifying it might reduce this time[80]. Fermenting the seed for a few days in its own pulp may also speed up the germination process[K]. Another possibility is to harvest the seed 'green' (as soon as the embryo has fully developed but before the seedcoat hardens) and sow it immediately in a cold frame. If timed well, it can germinate in the spring[80]. If you are only growing small quantities of plants, it is best to pot up the seedlings as soon as they are large enough to handle and grow them on in individual pots for their first year, planting them out in late spring into nursery beds or their final positions. When growing larger quantities, it might be best to sow them directly outdoors in a seedbed, but with protection from mice and other seed-eating creatures. Grow them on in the seedbed until large enough to plant out, but undercut the roots if they are to be left undisturbed for more than two years.

**nwatta Landscape Uses:**Border, Espalier, Pollard, Specimen, Street tree. A very easily grown plant, it prefers a well-drained moisture retentive loamy soil but is not at all fussy[11, 200]. Once established, it succeeds in excessively moist soils and also tolerates drought[200]. It grows well on a chalk soil and also in heavy clay soils[200]. A position in full sun is best when plants are being grown for their fruit, they also succeed in semi-shade though fruit yields and quality will be lower in such a position[11, 200]. Most members of this genus succeed in exposed positions, they also tolerate atmospheric pollution[200]. A true woodland species, it grows

The tuber should be treated as being dormant, whilst the remaining plant should be encouraged to continue in growth in order to give it time to produce new tubers[230]. Division can also be carried out when the plant has a fully developed rosette of leaves but before it comes into flower[230]. The entire new growth is removed from the old tuber from which it has arisen and is potted up, the cut being made towards the bottom of the stem but leaving one or two roots still attached to the old tuber. This can often be done without digging up the plant. The old tuber should develop one or two new growths, whilst the new rosette should continue in growth and flower normally[230].

nwatta Succeeds in most soils, but it prefers a moist loam and lots of leaf mould[42]. Requires a deep rich soil[1]. Grows well in full sun or partial shade[42], doing well in a woodland garden[230]. It also succeeds in a sunny dry border or on a scree[230]. Orchids are, in general, shallow-rooting plants of well-drained low-fertility soils. Their symbiotic relationship with a fungus in the soil allows them to obtain sufficient nutrients and be able to compete successfully with other plants. They are very sensitive to the addition of fertilizers or fungicides since these can harm the symbiotic fungus and thus kill the orchid[230]. This symbiotic relationship makes them very difficult to cultivate, though they will sometimes appear uninvited in a garden and will then thrive. Transplanting can damage the relationship and plants might also thrive for a few years and then disappear, suggesting that they might be short-lived perennials[230]. Plants seem to be immune to the predations of rabbits[233]. The flowers have a fairly pleasant odour from a distance, but an unpleasant fur-like smell near to which is more pronounced at night-fall and as the flowers begin to fade[245]. Cultivated plants are very susceptible to the predation of slugs and snails[230]. Plants can succeed in a lawn in various parts of the country. The lawn should not be mown early in the year before or immediately after flowering[200]. Plant out bulbs whilst the plant is dormant, preferably in the autumn[200]. Bulbs can also be transplanted with a large ball of soil around the roots when they are in leaf, they are impatient of root disturbance[1].

### 5.2.412 Cotoneaster microphyllus

4 tlin 8 cyuc 2 kcaak 3 tcan 1 dwat m hkuc hmimhtut cyutli kyuctup hwicli hyishraslutnykfrp hpa7ti flatpriklwis hpa7tmwatli xre7t hjonli

drutta Cotoneaster microphyllus is an evergreen Shrub growing to 1 m (3ft 3in) by 2 m (6ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf year round, in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies, midges. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw[272]. It is sweet when fully ripe[158]. A watery flavour[272]. It is possibly edible[177]. The fruit is about 7mm in diameter[200].

tcanta Basketry Dye Incense Soil stabilization WoodA rose-tan dye is obtained from the fruit. The leaves are used for incense[272]. The plant has an extensive root system and a creeping habit above ground. It makes a good soil binder[272]. The sub-species C. microphyllus cochleatus can be used as a ground cover plant in a sunny position[188, 208]. It forms a dense carpet of growth[208]. The branches are used for making baskets[146, 158, 272]. Wood - hard, close and even grained[146, 158]. Used for fuel[272].

dwatta AstringentThe stolons are said to be astringent[240].

propta Seed. Members of this genus hybridize freely so, if you require seed that breeds true, it is important to obtain it from a known wild source or from a controlled fertilization of garden plants. The seed is best sown as soon as it is ripe in the autumn in a cold frame, when it will usually germinate in the spring[11, 200]. Stored seed germinates faster if given 3 months warm stratification at 15°c and then 3 months

cold stratification at 4°c[164]. The seed usually germinates within 1 - 18 months at 15°c but it can take 2 years[164]. Pot the seedlings up as soon as they are large enough to handle and plant them out into nursery beds or into their permanent positions when they are more than 10cm tall. Cuttings of half-ripe wood with a heel, July/August in a frame[11, 200].

nwatta An easily grown plant, it prefers a good soil but also does well in poor soils[1, 11, 200]. It thrives in lime and is also happy in peaty soils[1]. It succeeds in any soil that is not marshy or waterlogged[11, 200]. Succeeds in dry soils[188]. Grows well in heavy clay soils. Succeeds in full sun or semi-shade but does not fruit so freely in a shady position[11, 200]. Tolerates atmospheric pollution[200]. A very hardy plant, tolerating temperatures down to about -25°c[184, 200]. A very ornamental plant[1], there are some named forms[202]. Most forms are quite slow-growing[200, 202]. It hybridizes freely with other members of this genus[200] and often self-sows in British gardens[219]. A low-growing plant, the branches often root when they come into contact with the soil[219]. The flowers, when inhaled near to, have an unpleasant smell like decaying fish[245]. They are very attractive to bees whilst the fruit is a good winter food source for many species of birds[200]. Plants are notably susceptible to honey fungus[200]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

#### 5.2.413 Malus x micromalus

Kaido Crab Apple

4 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat m hkuc hmimhtut cyutli tcup hwicli hraslutnykfrp hpa7ti flatpriklwis hpa7tmwatli xre7t hjonli

drutta Malus x micromalus is a deciduous Shrub growing to 4 m (13ft) by 3 m (9ft). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[183]. About 15mm in diameter[200].

tcanta RootstockUsed as a rootstock for the cultivated apple, *M. sylvestris domestica*, it is said to be the best dwarfing rootstock from seed[183].

dwatta None known

propta Seed - this is a hybrid species and will not breed true. The seed is best sown as soon as it is ripe in the autumn in a cold frame. It usually germinates in late winter. Stored seed requires stratification for 3 months at 1°c and should be sown in a cold frame as soon as it is received[200]. It might not germinate for 12 months or more. Prick out the seedlings into individual pots as soon as they are large enough to handle. If given a rich compost they usually grow away quickly and can be large enough to plant out in late summer, though consider giving them some protection from the cold in their first winter. Otherwise, keep them in pots in a cold frame and plant them out in late spring of the following year. Cuttings of mature wood, November in a frame[11].

nwatta An easily grown plant, it succeeds in most fertile soils, preferring a moisture retentive well-drained loamy soil[1, 200]. Grows well in heavy clay soils. Prefers a sunny position but succeeds in partial shade though it fruits less well in such a situation[1, 200]. The fruit is a good wildlife food source, especially for birds[200]. Hybridizes freely with other members of this genus[200]. Plants in this genus are notably susceptible to honey fungus[200].

### 5.2.414 Pyrus elaeagnifolia kotschyar

4 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat m hkuc hmimhtut cyutli hgatyuctup hwicli hraslutnykfrp hpa7ti flatpriklwis hpa7tmwatli xre7t hjonli

dwatta None known

propta Seed - sow spring in situ. Make sure to water the seed in if the weather is dry.

nwatta Succeeds in ordinary garden soils, including heavy clays[200].

### 5.2.274 Taxus canadensis

Canadian Yew

4 tlin 8 cyuc 3 kcaak 1 tcan 4 dwat 1.5 m hkuc pcmhmimhtut cyutli kyuctup hwicli hraslutnyik hpa7tii frusflatpriklwisslip hpa7tmwatli dwat hjonli

drutta Taxus canadensis is an evergreen Tree growing to 1.5 m (5ft) by 1.5 m (5ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in leaf all year, and the seeds ripen from September to November. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and very alkaline soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw[43, 46, 61, 105]. Very sweet and gelatinous, most people find it delicious though some find it sickly[K]. The fruit is a fleshy berry about 8mm in diameter and containing a single seed[200]. All other parts of this plant, including the seed, are highly poisonous. When eating the fruit you should spit out the large seed found in the fruit's centre. Should you swallow the whole seed it will just pass straight through you without harm, if the seed has been bitten into, however, it could cause some problems.

tcanta DyeA green dye can be obtained from the leaves[257].

dwatta Abortifacient Analgesic Antirheumatic Cancer Diaphoretic Diuretic Emmenagogue FebrifugeThe Canadian yew is a very poisonous plant, though it was employed medicinally by several native North American Indian tribes who used minute amounts of the leaves both internally and externally in order to treat a variety of complaints including rheumatism, fevers, influenza, expelling afterbirth and dispelling clots[213, 222, 257]. Modern research has shown that it contains the substance 'taxol' in its shoots and bark. Taxol has shown exciting potential as an anti-cancer drug, particularly in the treatment of ovarian cancers[222, 238]. This remedy is very toxic and, even when used externally, should only be used under the supervision of a qualified practitioner[238]. See also the notes above on toxicity. The plant is abortifacient, analgesic, antirheumatic, antitumor, diaphoretic, diuretic, emmenagogue, febrifuge and pectoral[257].

propta Seed - can be very slow to germinate, often taking 2 or more years[78, 80]. It is best sown as soon as it is ripe in the autumn when it should germinate 18 months later. Stored seed may take 2 years or more to germinate. 4 months warm followed by 4 months cold stratification may help reduce the germination time[113]. Harvesting the seed 'green' (when fully developed but before it has dried on the plant) and then sowing it immediately has not been found to reduce the germination time because the inhibiting factors develop too early[80]. Prick out the seedlings into individual pots once they are large enough to handle and grow them on in pots in a cold frame. The seedlings are very slow-growing and will probably require at least 2 years of pot cultivation before being large enough to plant out. Any planting out is best done in late spring or early summer, after the last expected frosts[K]. Cuttings of half-ripe terminal shoots, 5 - 8cm long, July/August in a shaded frame. Should root by late September but leave them in the frame over winter and plant out in late spring[78]. High percentage[11]. Cuttings of ripe terminal shoots, taken in winter after a hard frost, in a shaded frame[113].

nwatta Thrives in almost any soil, acid or alkaline, as long as it is well-drained[200]. Plants are very shade tolerant[82]. This species is the most cold-hardy member of the genus[11] - dormant plants will tolerate very heavy frosts

though the young growth in spring can be damaged by a few degrees of frost. The plants produce very little fibrous root and should be planted in their final positions when still small[81]. Plants in this genus are notably resistant to honey fungus[200]. Dioecious. Male and female plants must be grown if seed is required. Other reports say that this species usually has monoecious flowers (separate male and female flowers, but both borne on the same plant)[82, 270].

### 5.2.275 Asclepias rubra

Red Silkweed

4 tlin 8 cyuc 3 kcaak 0 tcan 1 dwat 1.2 m hkuc hmimhtut cyutli kyuctcup hwicli hraslutlp hpa7ti flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Asclepias rubra is a PERENNIAL growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from June to August, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Flowers Leaves SeedpodEdible Uses: Gum SweetenerFlower buds - cooked as potherbs or added to soups[207]. Young shoots and leaves - cooked as potherbs or added to soups[207]. Young seed pods, 3 - 4 cm long, cooked[207]. Flower clusters can be boiled down to make a sugary syrup[207]. A chewing gum can be made from the latex contained in the stem and leaves, but it is possibly toxic[207].

tcanta Fibre Gum Latex StuffingThe following reports refer to other members of this genus and are possibly also appropriate for this species[K]. A good quality fibre is obtained from the bark, used in making twine, cloth, paper etc[95, 112, 169]. It is of poor quality in wet seasons[112]. It is easily harvested in late autumn after the plant has died down by simply pulling the fibres off the dried stems[169]. The seed floss is used to stuff pillows etc or is mixed with other fibres to make cloth[112, 159, 169, 171]. It is a Kapok substitute, used in Life Jackets or as a stuffing material[112]. Very water repellent, it can yield up to 20% of an edible semi-drying oil[74, 112]. It is also used in making liquid soap[74].

dwatta WartsThe latex is used as a cure for warts[168]. propta Seed - best sown in a greenhouse as soon as it is ripe in the autumn or in late winter[134, 169]. We have also had good results from sowing the seed in the greenhouse in early spring[K], though stored seed might need 2 - 3 weeks cold stratification[134]. Germination usually takes place in 1 - 3 months at 18°c[134]. As soon as the seedlings are large enough to handle, prick them out into individual pots and grow them on in the greenhouse for their first winter. Plant out when they are in active growth in late spring or early summer and give them some protection from slugs until they are growing away strongly. Division in spring. With great care since the plant resents root disturbance. Pot the divisions up and place them in a lightly shaded position in the greenhouse until they are growing away strongly, then plant them out in the summer, giving them some protection from slugs until they are established.. Basal cuttings in late spring. Use shoots about 10cm long with as much of their white underground stem as possible. Pot them up individually and place them in a lightly shaded position in a greenhouse until they are rooting and growing actively. If the plants grow sufficiently, they can be put into their permanent positions in the summer, otherwise keep them in the greenhouse until the following spring and when they are in active growth plant them out into their permanent positions. Give them some protection from slugs until they are established.

nwatta Prefers a well-drained light rich or peaty soil and a sunny position[1, 134, 200]. A very ornamental plant[1], it is closely related to A. lanceolata[200]. Many members

of this genus seem to be particularly prone to damage by slugs. The young growth in spring is especially vulnerable, but older growth is also attacked and even well-established plants have been destroyed in wet years[K]. Plants resist root disturbance and are best planted into their final positions whilst small[134]. The flower of many members of this genus can trap insects between its anther cells, the struggles of the insect in escaping ensure the pollination of the plant[207].

### 5.2.276 *Leymus racemosus*

Volga Wild Rye, Mammoth wildrye  
4 tlin 8 cyuc 3 kcaak 0 tcan 0 dwat 1.2 m hkuc  
htut cyutli hgatyuctcup hwicli hysirasjlutnyik hpa7tli flat-prikliwis hpa7tmwatli xre7t hjonli

drutta *Leymus racemosus* is a PERENNIAL growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to September, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

kcakta Edible Parts: Oil Seed StemEdible Uses: OilSeed - used as a cereal substitute in some parts of Russia, especially in times of drought[183]. The seed is rather small and difficult to extract[K]. Young underground shoots - raw. Sweet and tender[183].

tcanta Oil Soil stabilizationPlants have an extensive spreading root system and are used to stabilize inland sand dunes, though they do not tolerate salty conditions[61].

dwatta None known  
propta Seed - sow mid spring in situ and only just cover the seed[162]. Germination should take place within 2 weeks. If the supply of seed is limited, it can also be sown in mid spring in a cold frame. Only just cover the seed. When large enough to handle, prick the seedlings out into individual pots and plant them out in summer[K] Division in spring or summer[162]. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Succeeds in most soils, preferring a sandy soil and a sunny position[1, 200]. Established plants are drought resistant[183]. Plants can be very invasive, spreading freely by means of the rhizomes. Currently (1990) being evaluated as a perennial grain crop in N. America[183]. There are some named varieties, selected for their ornamental value[200].

### 5.2.277 *Amelanchier humilis*

Low serviceberry  
4 tlin 8 cyuc 3 kcaak 0 tcan 0 dwat 1.8 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprikliwis hpa7tmwatli fyfxre7t hjonli

drutta *Amelanchier humilis* is a deciduous Shrub growing to 1.8 m (6ft) by 3 m (9ft). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower in April, and the seeds ripen from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Edible fruit - raw or cooked[105, 159, 177]. Sweet[43]. A very pleasant flavour, the fruit is juicy with a hint of apple in the taste and contains a few small seeds at the centre[K]. The fruit is rich in iron and copper[226].

tcanta None known  
dwatta None known  
propta Seed - it is best harvested 'green', when the seed is fully formed but before the seed coat has hardened, and then sown immediately in pots outdoors or in a cold frame. If stored seed is obtained early enough in the autumn, it can

be given 4 weeks warm stratification before being left out in the winter and it should then germinate in the spring. Otherwise seed can be very slow to germinate, perhaps taking 18 months or more. When large enough to handle, prick the seedlings out into individual pots and grow them on in a sheltered outdoor position, planting them out once they are 20cm or more tall. If there is sufficient seed it is best to sow it thinly in an outdoor seedbed[78, 80]. Grow the seedlings on for two years in the seedbed before planting them out into their permanent positions during the winter. Layering in spring - takes 18 months[78]. Division of suckers in late winter. The suckers need to have been growing for 2 years before you dig them up, otherwise they will not have formed roots. They can be planted out straight into their permanent positions if required.

nwatta Prefers a rich loamy soil in a sunny position or semi-shade[1, 200] but thrives in any soil that is not too dry or water-logged[11]. Grows well in heavy clay soils. Plants are often found growing on calcareous soils in the wild[43]. Hardy to about -25°C[184]. All members of this genus have edible fruits and, whilst this is dry and uninteresting in some species, in many others it is sweet and juicy. Many of the species have potential for use in the garden as edible oramentals. The main draw-back to this genus is that birds adore the fruit and will often completely strip a tree before it is fully ripe[K]. This species produces suckers freely, forming thickets[184]. Closely related to *A. stolonifera* [11, 200]. Hybridizes with *A. stolonifera*, *A. arborea* and *A. bartramiana*. Grafting onto seedlings of *A. lamarckii* or *Sorbus aucuparia* is sometimes practised in order to avoid the potential problem of hybridizing[1].

### 5.2.278 *Chaenomeles x californica*

California Quince  
4 tlin 8 cyuc 3 kcaak 2 tcan 1 dwat 1.8 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta *Chaenomeles x californica* is a deciduous Shrub growing to 1.8 m (6ft) by 1.8 m (6ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. The flowers are pollinated by Bees, Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. It can tolerate atmospheric pollution.

kcakta Fruit - very harsh and acid raw but fragrant when cooked. Used for jams, jellies etc and as a flavouring with cooked apples[K]. The fruit can be apple or pear-shaped and up to 6cm long x 6cm wide[200]. The flesh is firm, fragrant and acidic.

tcanta Plants can be grown to make a medium sized hedge[200]. Attractive flowers. Landscape Uses: Border, Erosion control, Ground cover, Massing, Woodland garden. Some cultivars of *Chaenomeles x superba* such as 'Crimson and Gold' produce suckers prolifically and are suitable for ground cover[182]. This may not be present in the hybrid.

dwatta Possibly some medical uses. *C. x californica* is a tri-species hybrid (*C. x superba* x *C. cathayensis*). *Chaenomeles cathayensis* fruits is antiemetic, antirheumatic, antispasmodic and digestive[176]. It is used in the treatment of rheumatic pain, convulsions of the calf muscles, vomiting, dyspepsia and diarrhoea[176]. No medical uses are known for *Chaenomeles x superba*.

propta Seed - best sown as soon as it is ripe in a sheltered position outdoors or in a cold frame[200]. Sown stored seed in February in a greenhouse[78]. Germination usually takes place within 6 weeks[78]. Prick out the seedlings into individual pots as soon as they are large enough to handle. If well grown, these seedling can be large enough to plant out in the summer, but give them some protection in their first winter. Otherwise plant them out in late spring of the following year[K]. This species is a hybrid and so will not breed true from seed. Cuttings of half-ripe wood, July/August in a frame[11]. Easy[113]. Cuttings of mature wood of the current year's growth, November in a cold frame. Layering in late spring or in autumn. This is a sure and easy method, though it takes 12 months[78, 200].

nwatta The hybrid *C. x californica* is a tri-species hybrid (*C. x superba* x *C. cathayensis*). Named cultivars are avail-

soils and can grow in very alkaline and saline soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young leaves - raw or cooked[5, 12, 16, 21]. A delicious spinach substitute in the spring, the leaves become less pleasant as the season progresses, developing a distinct bitterness in hot weather[K]. Some people dislike the raw leaves since they can leave an unpleasant taste in the mouth[K].

tcanta None known

dwatta Antitumor EmmenagogueAlthough little used in modern herbalism, beet has a long history of folk use, especially in the treatment of tumours[269]. A decoction prepared from the seed has been used as a remedy for tumours of the intestines. The seed, boiled in water, is said to cure genital tumours[269]. The juice or other parts of the plant is said to help in the treatment of tumours, leukaemia and other forms of cancer such as cancer of the breast, oesophagus, glands, head, intestines, leg, lip, lung, prostate, rectum, spleen, stomach, and uterus[269]. Some figure that betacyanin and anthocyanin are important in the exchange of substances of cancer cells; others note two main components of the amines, choline and its oxidation product betaine, whose absence produces tumours in mice[269]. The juice has been applied to ulcers[269]. A decoction is used as a purgative by those who suffer from haemorrhoids in South Africa[269]. Leaves and roots used as an emmenagogue[269]. Plant effective in the treatment of feline ascariasis[269]. In the old days, beet juice was recommended as a remedy for anaemia and yellow jaundice, and, put into the nostrils to purge the head, clear ringing ears, and alleviate toothache[269]. Beet juice in vinegar was said to rid the scalp of dandruff as scurf, and was recommended to prevent falling hair[269]. Juice of the white beet was said to clear obstructions of the liver and spleen[269]. Culpepper (1653) recommended it for treating headache and vertigo as well as all affections of the brain[269].

propta Seed - sow March to May in situ.

nwatta Beets grow well in a variety of soils, growing best in a deep, friable well-drained soil abundant with organic matter, but doing poorly on clay. They prefer an open position and a light well-drained soil[52]. The optimum pH is 6.0 - 6.8, but neutral and alkaline soils are tolerated in some areas. Some salinity may be tolerated after the seedling stage. Beets are notable for their tolerance to manganese toxicity. Beet is reported to tolerate an annual precipitation of 23 to 315cm, an average annual temperature range of 5.0 to 26.6°C and a pH of 4.2 to 8.2[269]. This is the wild beetroot of coastal areas. The cultivated beetroot, sugar beet, seakale beet and Swiss chard have all been developed from this species by means of selective breeding[1, 5]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is a tap root similar to a carrot going directly down [1-2].

### 5.2.410 *Sorbus scopulina*

Western Mountain Ash, Greene's mountain ash, Cascade mountain ash

4 tlin 8 cyuc 2 kcaak 0 tcan 1 dwat 4 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Sorbus scopulina* is a deciduous Shrub growing to 4 m (13ft) by 4 m (13ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in May, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw, cooked in pies, preserves etc, or dried for later use[62, 101, 183]. A bitter flavour[212]. The fruit becomes sweeter and so tastes best after a frost, it can also be blotted if it is going to be eaten raw[K]. This involves storing the fruit in a cool dry place until it is almost but not quite going rotten. At this

stage the fruit of many species has a delicious taste, somewhat like a luscious tropical fruit. The fruit is up to 5mm across[200].

tcanta WoodThe wood is soft and weighs 37lb per cubic foot[25].

dwatta Enuresis Febrifuge TonicAn infusion of the branches has been given to young children with bed-wetting problems[257]. The bark is febrifuge and tonic[257]. It has been used in the treatment of general sickness[257].

propta Seed - best sown as soon as it is ripe in a cold frame[78, 80]. If you have sufficient seed it can be sown in an outdoor seedbed[78, 80]. Stored seed germinates better if given 2 weeks warm then 14 - 16 weeks cold stratification[98], so sow it as early in the year as possible. Prick out the seedlings into individual pots when they are large enough to handle. Seedlings are very slow to put on top-growth for their first year or two[11], but they are busy building up a good root system. It is best to keep them in pots in a cold frame for their first winter and then plant them out into their permanent positions in late spring.

nwatta Succeeds in most reasonably good soils in an open sunny position[11]. Dislikes dry soils[188]. Tolerates light shade[188], though it fruits better in a sunny position[K]. Plants are susceptible to fireblight[188].

### 5.2.411 *Orchis mascula*

Early Purple Orchis  
4 tlin 8 cyuc 2 kcaak 0 tcan 2 dwat m hkuc  
hmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flat-prikliwislip hpa7tmwatli xre7t hjonli

drutta *Orchis mascula* is a BULB growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from April to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: RootEdible Uses: DrinkRoot - cooked[2, 4, 46]. It is a source of 'salep', a fine white to yellowish-white powder that is obtained by drying the tuber and grinding it into a powder[2, 105, 177]. Salep is a starch-like substance with a sweetish taste and a faint somewhat unpleasant smell[4]. It is said to be very nutritious and is made into a drink or can be added to cereals and used in making bread etc[100, 183]. One ounce of salep is said to be enough to sustain a person for a day[100, 115].

tcanta None known

dwatta Antiflatulent Astringent Demulcent Expectorant NutritiveSalep (see above for more details) is very nutritive, astringent, expectorant and demulcent[4, 240]. It has been used as a diet of special value for children and convalescents, being boiled with water, flavoured and prepared in the same way as arrowroot[4]. Rich in mucilage, it forms a soothing and demulcent jelly that is used in the treatment of irritations of the gastro-intestinal canal[4]. One part of salep to fifty parts of water is sufficient to make a jelly[4]. The tuber, from which salep is prepared, should be harvested as the plant dies down after flowering and setting seed[4].

propta Seed - surface sow, preferably as soon as it is ripe, in the greenhouse and do not allow the compost to dry out. The seed of this species is extremely simple, it has a minute embryo surrounded by a single layer of protective cells. It contains very little food reserves and depends upon a symbiotic relationship with a species of soil-dwelling fungus. The fungal hyphae invade the seed and enter the cells of the embryo. The orchid soon begins to digest the fungal tissue and this acts as a food supply for the plant until it is able to obtain nutrients from decaying material in the soil[200]. It is best to use some of the soil that is growing around established plants in order to introduce the fungus, or to sow the seed around a plant of the same species and allow the seedlings to grow on until they are large enough to move. Division of the tubers as the flowers fade[230]. This species produces a new tuber towards the end of its growing season. If this is removed from the plant as its flowers are fading, the shock to the plant can stimulate new tubers to be formed.

the autumn[200]. Bulbs can also be transplanted with a large ball of soil around the roots when they are in leaf, they are impatient of root disturbance[1].

## 5.2.407 Orchis militaris

Military Orchis

4 tlin 8 cyuc 2 kcaak 0 tcan 2 dwat m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli lwissliph hpa7tmwatli xre7t hjonli

drutta Orchis militaris is a BULB growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: DrinkRoot - cooked[2, 4, 46]. It is a source of 'salep', a fine white to yellowish-white powder that is obtained by drying the tuber and grinding it into a powder[2, 105, 177]. Salep is a starch-like substance with a sweetish taste and a faint somewhat unpleasant smell[4]. It is said to be very nutritious and is made into a drink or can be added to cereals and used in making bread etc[100, 183]. One ounce of salep is said to be enough to sustain a person for a day[100, 115].

tcanta None known

dwatta Demulcent NutritiveSalep (see above for more details) is very nutritive and demulcent[4]. It has been used as a diet of special value for children and convalescents, being boiled with water, flavoured and prepared in the same way as arrowroot[4]. Rich in mucilage, it forms a soothing and demulcent jelly that is used in the treatment of irritations of the gastro-intestinal canal[4]. One part of salep to fifty parts of water is sufficient to make a jelly[4]. The tuber, from which salep is prepared, should be harvested as the plant dies down after flowering and setting seed[4].

propta Seed - surface sow, preferably as soon as it is ripe, in the greenhouse and do not allow the compost to dry out. The seed of this species is extremely simple, it has a minute embryo surrounded by a single layer of protective cells. It contains very little food reserves and depends upon a symbiotic relationship with a species of soil-dwelling fungus. The fungal hyphae invade the seed and enter the cells of the embryo. The orchid soon begins to digest the fungal tissue and this acts as a food supply for the plant until it is able to obtain nutrients from decaying material in the soil[200]. It is best to use some of the soil that is growing around established plants in order to introduce the fungus, or to sow the seed around a plant of the same species and allow the seedlings to grow on until they are large enough to move. Division of the tubers as the flowers fade[230]. This species produces a new tuber towards the end of its growing season. If this is removed from the plant as its flowers are fading, the shock to the plant can stimulate new tubers to be formed. The tuber should be treated as being dormant, whilst the remaining plant should be encouraged to continue in growth in order to give it time to produce new tubers[230]. Division can also be carried out when the plant has a fully developed rosette of leaves but before it comes into flower[230]. The entire new growth is removed from the old tuber from which it has arisen and is potted up, the cut being made towards the bottom of the stem but leaving one or two roots still attached to the old tuber. This can often be done without digging up the plant. The old tuber should develop one or two new growths, whilst the new rosette should continue in growth and flower normally[230].

nwatta Easily grown on a good loamy soil[42]. Requires a deep rich soil[1]. Prefers a chalky soil[42]. Orchids are, in general, shallow-rooting plants of well-drained low-fertility soils. Their symbiotic relationship with a fungus in the soil allows them to obtain sufficient nutrients and be able to compete successfully with other plants. They are very sensitive to the addition of fertilizers or fungicides since these can harm the symbiotic fungus and thus kill the orchid[230]. This symbiotic relationship makes them very difficult to cultivate, though they will sometimes appear uninvited in a garden and will then thrive. Transplanting can damage the relationship and plants might also thrive for a few years and then

disappear, suggesting that they might be short-lived perennials[230]. Cultivated plants often survive for many years, though they rarely multiply[230]. Plants can succeed in a lawn in various parts of the country. The lawn should not be mown early in the year before or immediately after flowering[200]. Plant out bulbs whilst the plant is dormant, preferably in the autumn[200]. Bulbs can also be transplanted with a large ball of soil around the roots when they are in leaf, they are impatient of root disturbance[1]. Plants seem to be immune to the predations of rabbits[233].

## 5.2.408 Lilium leichtlinii maximowiczii

4 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat m hkuc hmimhtut cyutli tcup hwicli hrasljut hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Lilium leichtlinii maximowiczii is a BULB growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to August, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Bulb - cooked[85, 105]. The bulb can be up to 4cm in diameter[266]. Rich in starch, it can be used as a vegetable in similar ways to potatoes (Solanum tuberosum).

tcanta None known

dwatta None known

propta Seed - immediate epigeal germination[130]. Sow thinly in pots from late winter to early spring in a cold frame. Should germinate in 2 - 4 weeks[163]. Great care should be taken in pricking out the young seedlings, many people prefer to leave them in the seed pot until they die down at the end of their second years growth. This necessitates sowing the seed thinly and using a reasonably fertile sowing medium. The plants will also require regular feeding when in growth. Divide the young bulbs when they are dormant, putting 2 - 3 in each pot, and grow them on for at least another year before planting them out into their permanent positions when the plants are dormant[K]. Division with care in the autumn once the leaves have died down. Replant immediately[200]. Bulb scales can be removed from the bulbs in early autumn. If they are kept in a warm dark place in a bag of moist peat, they will produce bulblets. These bulblets can be potted up and grown on in the greenhouse until they are large enough to plant out[200].

nwatta Requires a light humid-rich soil and plenty of moisture in late spring[47]. Should succeed in a cool well-drained peat, leaf-mould and sand mix with shelter from the midday sun[42]. Best grown in a greenhouse border in Britain[1]. This species could be one of the parents of *L. lancifolium*[90]. Stem rooting, the bulbs should be planted 15cm deep[42, 200]. Early to mid autumn is the best time to plant out the bulbs in cool temperate areas, in warmer areas they can be planted out as late as late autumn[200]. This form is said to be much easier to grow than the species[42], though this is not necessarily true[47] The plant should be protected against rabbits and slugs in early spring. If the shoot tip is eaten out the bulb will not grow in that year and will lose vigour[200].

## 5.2.409 Beta vulgaris maritima

Sea Beet

4 tlin 8 cyuc 2 kcaak 0 tcan 2 dwat m hkuc htut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikwissliph-som hpa7tmwatli xre7t hjonli

drutta Beta vulgaris maritima is a ANNUAL/PERENNIAL growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline)

able in the horticultural trade. *Chaenomeles x californica* is a strong growing quince with an upright crown reaching 1.8m high and wide. 'Enchantress' is a compact shrub single white to pink flowers and large yellow edible fruits. 'Masterpiece' has large ovate fruit and pink-red flowers. Easily cultivated in any reasonably good soil[1, 200]. Prefers a deep moist well-drained loam[4, 11]. Grows well in heavy clay soils. Tolerates full shade but requires a sunny position for best fruit production[3, 11, 200]. Becomes chlorotic on very alkaline soils[188, 200]. Tolerates atmospheric pollution[200]. A very ornamental plant[1], it is hardy to about -25c[200]. Plants are subject to canker, especially when growing in the milder moister areas of Britain[49]. Plants in this genus are notably resistant to honey fungus[200]. Fruits are usually freely produced in Britain, but they do not always ripen[11, 182]. A good bee plant, flowering early in the year and providing pollen and nectar[108]. Landscape Uses: Border, Erosion control, Ground cover, Massing, Woodland garden. Special Features: Not North American native, Attractive flowers or blooms. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

## 5.2.279 Lilium brownii

Hong Kong Lily

4 tlin 8 cyuc 3 kcaak 0 tcan 2 dwat 1.2 m hkuc hmimhtut cyutli tcup hwicli hrasljut hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta Lilium brownii is a BULB growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers RootEdible Uses: ConditionBulb - cooked[61, 105, 163]. A pleasant slightly sweet taste[183]. They are used as a vegetable in much the same way as potatoes (Solanum tuberosum). A starch can be extracted from the bulbs and added to other foods[183]. The grated bulb can be added as a thickener to soups etc[183]. The bulb is usually rather small[260] - it is 25 - 40mm in diameter[266]. The dried flower petals are used as a flavouring in soups[183].

tcanta None known

dwatta Antitussive Carminative Diuretic Expectorant Febrifuge Pectoral Poultice Sedative TonicThe bulb is antitussive, diuretic, carminative, expectorant, febrifuge, pectoral, sedative and tonic[147, 176, 218]. A decoction is used in the treatment of coughs and haematemesis due to deficiency condition, anxiety, apprehension, oedema and difficult urination[147]. Bulbils from the leaf axils are used in the treatment of intestinal disorders[218]. The dried and powdered flowers are used as a poultice for bruises, cuts etc[218].

propta Seed - immediate epigeal germination[130]. Sow thinly in pots from late winter to early spring in a cold frame. Should germinate in 2 - 4 weeks[163]. Great care should be taken in pricking out the young seedlings, many people prefer to leave them in the seed pot until they die down at the end of their second years growth. This necessitates sowing the seed thinly and using a reasonably fertile sowing medium. The plants will also require regular feeding when in growth. Divide the young bulbs when they are dormant, putting 2 - 3 in each pot, and grow them on for at least another year before planting them out into their permanent positions when the plants are dormant[K]. Division with care in the autumn once the leaves have died down. Replant immediately[200]. Bulb scales can be removed from the bulbs in early autumn. If they are kept in a warm dark place in a bag of moist peat, they will produce bulblets. These bulblets can be potted up and grown on in the greenhouse until they are large enough to plant out[200]. Bulblets are formed on the stem just below the soil surface. These should be dug up in the autumn and replanted immediately, preferably in a cold frame for growing on until large enough to plant out into the garden[143, 163].

nwatta Prefers an open free-draining humus-rich loamy soil with its roots in the shade and its head in the sun[200]. Requires a light soil[42, 47]. Is this species lime-tolerant?[200]. Plants prefer a position that is moist in the summer but dry in the winter[260]. Stem rooting, the bulbs should be planted 20 - 25cm deep[42, 47, 143]. Said to be very difficult in cultivation[47], this species tolerates temperatures down to about -3°C[260]. It grows well at Kew but is not hardy everywhere[143]. Self-sterile, the type species does not set seed[47]. It is believed that this species is either of hybrid origin or it is a garden form of the true wild species *L. brownii colchesteri*. Wils.[143]. It is the sub-species *colchesteri* that is used medicinally[176, 218]. The flowers have a soft sweet fragrance. This fragrance is more pronounced in the variety 'Viridulum'[245]. The plant does not come into growth until late spring[260]. It should be protected against slugs at this time since if the shoot tip is eaten out the bulb will not grow in that year and will lose vigour[200]. The edible bulbs are occasionally sold in ethnic markets in San Francisco[183] and are a common food item in China[179], where the plant is cultivated for edible and medicinal use[266]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is a bulb.

## 5.2.280 Viola epipsila

Dwarf Marsh Violet

4 tlin 8 cyuc 3 kcaak 0 tcan 0 dwat 0.1 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Viola epipsila is a PERENNIAL growing to 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 5. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Young leaves and flower buds - raw or cooked[172]. When added to soup they thicken it in much the same way as okra[85, 159]. Flowers - raw[172]. A tea can be made from the leaves[85].

tcanta The dried root has been used as an incense[257].

dwatta None known

propta Seed - best sown in the autumn in a cold frame. Sow stored seed in early spring in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in the summer. Division in the autumn or just after flowering. Larger divisions can be planted out direct into their permanent positions, though we have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the summer or the following spring.

nwatta Prefers a cool moist well-drained humus-rich soil in partial or dappled shade and protection from scorching winds. Tolerates sandstone and limestone soils but becomes chlorotic if the pH is too high. Prefers a pH between 6 and 6.5[200]. All members of this genus have more or less edible leaves and flower buds, though those species with yellow flowers can cause diarrhoea if eaten in large quantities[62, 85, 159].

## 5.2.281 Thymus praecox arcticus

Wild Thyme

4 tlin 8 cyuc 3 kcaak 5 tcan 2 dwat 0.1 m hkuc htut cyutli hgatkyuctcup hwicli hrasljut hpa7tli prikkwissliph hpa7tmwatli xre7t hjonli

drutta Thymus praecox arcticus is an evergreen Shrub growing to 0.1 m (0ft 4in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in leaf all year, in flower from May to August, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). It is noted for attracting wildlife. Suitable for: light (sandy) and medium

(loamy) soils and prefers well-drained soil. Suitable pH: neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure.

**ckakta Edible Parts:** Leaves**Edible Uses:** Condiment TeaLeaves - raw in salads or added as a flavouring to cooked foods[183]. Retains its flavour well in long slow cooking. If the leaves are to be dried, the plants should be harvested in early and late summer just before the flowers open and the leaves should be dried quickly[200]. An aromatic tea is made from the leaves or dried flowers[183].

**tcanta Deodorant Disinfectant Essential Fungicide Repellent**An essential oil from the leaves is used in perfume, soaps, medicinally etc[200]. It has fungicidal properties[171]. The dried flowers are used to repel moths from clothing[4].

**dwatta Anthelmintic Antiseptic Antispasmodic Carminative Deodorant Diaphoretic Disinfectant Expectorant Sedative Tonic**The leaves, and especially the essential oil contained in them, are anthelmintic, antiseptic, antispasmodic, carminative, deodorant, diaphoretic, disinfectant, expectorant, sedative and tonic[4, 7, 21, 200, 238]. The plant can be used fresh at any time of the year, or it can be harvested as it comes into flower and either be distilled for the oil or dried for later use[238].

**propta Seed** - sow spring in a cold frame. Seed can also be sown in autumn in a greenhouse. Surface sow or barely cover the seed. Germination can be erratic. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring or autumn[200]. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the summer or the following spring. Cuttings of young shoots, 5 - 8cm with a heel, May/June in a frame[200]. Cuttings of half-ripe wood, 5 - 8cm with a heel, July/August in a frame[200]. Layering.

**nwatta** Requires a light well-drained preferably calcareous soil in a sunny position[1, 200]. Succeeds in dry soils, tolerating drought once it is established[190]. Grows well between stepping stones on paths, tolerating light treading[183, 200]. Succeeds on walls. Thymes dislike wet conditions, especially in the winter. A layer of gravel on the soil around them will help protect the foliage from wet soils[238]. Hardy to about -15°C[200]. Closely related to *T. serpyllum*[11], this plant is the true native wild thyme in Britain[11]. It is a very polymorphic plant, there are a number of named forms[183]. This is a very difficult genus taxonomically, the species hybridize freely with each other and often intergrade into each other[1]. A good companion for most other plants[54], it makes a very good carpeting plant for the rockery or between paving stones[1]. The flowers are rich in nectar and are very attractive to honey bees[200].

## 5.2.282 *Aegopodium podagraria*

Ground Elder, Bishop's goutweed, Goutweed, Ground Elder, Bishop's Weed

4 tlin 9 cyuc 3 kcak 1 tcan 2 dwat 0.6 m hkuc  
pcimhmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprklkwiss hpa7tmwatli fyifxre7t hjonli

**drutta** *Aegopodium podagraria* is a PERENNIAL growing to 0.6 m (2ft) by 1 m (3ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from May to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

**ckakta Edible Parts:** Leaves**Edible Uses:** Leaves - raw or cooked[2, 4, 5, 12, 54, 100]. An unusual tangy flavour[183], the majority of people we give it to do not like it[K] although some reports say that it makes a delicious vegetable[244]. The leaves are best harvested before the plant comes into

flower, they can be used in salads, soups, or cooked as a vegetable[9].

**tcanta** This species makes a good ground-cover for semi-wild situations[200]. Make sure that it has plenty of room since it can be very invasive and is considered to be a weed in many gardens[208].

**dwatta** Antirheumatic Diuretic Sedative Vulnerary-Ground Elder has a long history of medicinal use and was cultivated as a food crop and medicinal herb in the Middle Ages. The plant was used mainly as a food that could counteract gout, one of the effects of the rich foods eaten by monks, bishops etc at this time. The plant is little used in modern herbalism. All parts of the plant are antirheumatic, diuretic, sedative and vulnerary[9, 13, 53, 54, 61]. An infusion is used in the treatment of rheumatism, arthritis and disorders of the bladder and intestines[9]. Externally, it is used as a poultice on burns, stings, wounds, painful joints etc[9, 268]. The plant is harvested when it is in flower in late spring to mid-summer and can be used fresh or be dried for later use[9, 238]. A homeopathic remedy is made from the flowering plant[9]. It is used in the treatment of arthritis and rheumatism[9].

**propta Seed** - sow spring in a cold frame. When large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring. Very easy, divisions can be carried out at almost any time of the year and the divisions can be planted out straight into their permanent positions.

**nwatta** Landscape Uses:Border, Container, Foundation, Ground cover, Woodland garden. Prefers damp shady conditions[12, 13, 200] but succeeds in most soils[200]. Prefers a well-drained soil, succeeding in sun or shade[238]. Plants are hardy to at least -15°C[200]. This species was cultivated in the Middle Ages as a medicinal and food plant[5, 17, 177, 268]. A very invasive plant, spreading freely at the roots[4, 53, 208], though it seldom sets seed in Britain[208]. Once established it can be very difficult to eradicate because any small piece of root left in the ground can regrow[K]. If introducing this plant to your garden, it might be best to restrict the roots by growing the plant in a bottomless container buried in the soil[238]. There is a variegated form of this species that is less invasive and is sometimes grown in the ornamental garden[208]. Plants seem to be immune to the predations of rabbits[233]. **Special Features:** Attractive foliage, Not North American native, Invasive, Naturalizing, Wetlands plant. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [2-1].

## 5.2.283 *Chenopodium capitatum*

Strawberry Blite, Blite goosefoot

4 tlin 8 cyuc 3 kcak 0 tcan 1 dwat 0.6 m hkuc  
htut cyutli tcup hwicli hrasljutnyik hpa7tli flatprklkwiss hpa7tmwatli xre7t hjonli

**drutta** *Chenopodium capitatum* is an ANNUAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

**ckakta Edible Parts:** Fruit Leaves Seed**Edible Uses:** ColouringLeaves - raw or cooked[27, 106]. Used like spinach[2], they are a good source of vitamins C and A[257]. The young leaves are best[85, 172, 183]. Poor quality[74]. The raw leaves have been used in salad mixtures[257], but should only be eaten in small quantities, see the notes above on toxicity. Fruit - raw or cooked[2, 27, 172]. An insipid but sweet flavour[85], they can be added to salads[183]. The fruit is about 12mm in diameter[200]. A red food colouring can be obtained from the fruit[74, 99, 172, 183]. Seed - cooked. It can be ground into a meal and mixed with cereal flours in making bread etc[161, 172]. The seed is small and fiddly, it should be soaked in water overnight and thoroughly rinsed before it is used in order to remove any saponins.

undercut the roots if they are to be left undisturbed for more than two years.

**nwatta** Landscape Uses:Border, Espalier, Pollard, Screen, Specimen, Street tree. A very easily grown plant, it prefers a well-drained moisture retentive loamy soil but is not at all fussy[11, 200]. Once established, it succeeds in excessively moist soils and also tolerates drought[200]. It grows well on a chalk soil and also in heavy clay soils[200]. A position in full sun is best when plants are being grown for their fruit, they also succeed in semi-shade though fruit yields and quality will be lower in such a position[11, 200]. Most members of this genus succeed in exposed positions, they also tolerate atmospheric pollution[200]. A very hardy plant, tolerating temperatures down to about -18°C[202]. This species is closely related to *C. crus-galli*[11]. It hybridizes freely with other members of the genus[200]. Seedling trees take from 5 - 8 years before they start bearing fruit, though grafted trees will often flower heavily in their third year[K]. The flowers have a foetid smell somewhat like decaying fish. This attracts midges which are the main means of fertilization. When freshly open, the flowers have more pleasant scent with balsamic undertones[245]. Seedlings should not be left in a seedbed for more than 2 years without being transplanted[11]. **Special Features:**Attracts birds, North American native, Blooms are very showy.

## 5.2.405 *Malus kansuensis*

4 tlin 8 cyuc 2 kcak 0 tcan 0 dwat 5 m hkuc  
hmimhtut cyutli tcup hwicli hrasljutnyikfrip hpa7tli flatprklkwiss hpa7tmwatli xre7t hjonli

**drutta** *Malus kansuensis* is a deciduous Tree growing to 5 m (16ft 5in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in May, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**ckakta Edible Parts:** Fruit**Edible Uses:** Fruit - raw or cooked[105, 177]. A very acid flavour even when fully ripe[K]. We have seen fruit that has bletted whilst still on the tree - at this stage the flesh has become very soft and mealy but still has a very acid flavour[K]. The fruit can be up to 1cm in diameter[200].

**tcanta** None known

**dwatta** None known

**propta Seed** - best sown as soon as it is ripe in the autumn in a cold frame. It usually germinates in late winter. Stored seed requires stratification for 3 months at 1°C and should be sown in a cold frame as soon as it is received[200]. It might not germinate for 12 months or more. Prick out the seedlings into individual pots as soon as they are large enough to handle. If given a rich compost they usually grow away quickly and can be large enough to plant out in late summer, though consider giving them some protection from the cold in their first winter. Otherwise, keep them in pots in a cold frame and plant them out in late spring of the following year. Cuttings of mature wood, November in a frame[11].

**nwatta** An easily grown plant, it succeeds in most fertile soils, preferring a moisture retentive well-drained loamy soil[1, 200]. Grows well in heavy clay soils. Prefers a sunny position but succeeds in partial shade though it fruits less well in such a situation[200]. This species is closely related to *M. toringoides*[11]. It hybridizes freely with other members of the genus[200]. The fruit is a good wildlife food source, especially for birds[200]. Plants in this genus are notably susceptible to honey fungus[200].

## 5.2.406 *Orchis morio*

Green-Winged Orchid, Green-winged orchid

4 tlin 8 cyuc 2 kcak 0 tcan 2 dwat m hkuc  
htut cyutli kyuctup hwicli hrasljutnyik hpa7tli flatprklkwisslip hpa7tmwatli xre7t hjonli

**drutta** *Orchis morio* is a BULB growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5 and

is not frost tender. It is in leaf from April to August, in flower from May to June, and the seeds ripen in July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil.

**ckakta Edible Parts:** Root**Edible Uses:** DrinkRoot - cooked[2, 4, 46]. This species is a major source of 'salep', a fine white to yellowish-white powder that is obtained by drying the tuber and grinding it into a powder[2, 105, 177]. Salep is a starch-like substance with a sweetish taste and a faint somewhat unpleasant smell[4]. It is said to be very nutritious and is made into a drink or can be added to cereals and used in making bread etc[100, 183]. One ounce of salep is said to be enough to sustain a person for a day[100, 115].

**tcanta** None known

**dwatta** Demulcent NutritiveSalep (see above for more details) is very nutritive and demulcent[4]. It has been used as a diet of special value for children and convalescents, being boiled with water, flavoured and prepared in the same way as arrowroot[4]. Rich in mucilage, it forms a soothing and demulcent jelly that is used in the treatment of irritations of the gastro-intestinal canal[4]. One part of salep to fifty parts of water is sufficient to make a jelly[4]. The tuber, from which salep is prepared, should be harvested as the plant dies down after flowering and setting seed[4].

**propta Seed** - surface sow, preferably as soon as it is ripe, in the greenhouse and do not allow the compost to dry out. The seed of this species is extremely simple, it has a minute embryo surrounded by a single layer of protective cells. It contains very little food reserves and depends upon a symbiotic relationship with a species of soil-dwelling fungus. The fungal hyphae invade the seed and enter the cells of the embryo. The orchid soon begins to digest the fungal tissue and this acts as a food supply for the plant until it is able to obtain nutrients from decaying material in the soil[200]. It is best to use some of the soil that is growing around established plants in order to introduce the fungus, or to sow the seed around a plant of the same species and allow the seedlings to grow on until they are large enough to move. Division of the tubers as the flowers fade[230]. This species produces a new tuber towards the end of its growing season. If this is removed from the plant as its flowers are fading, the shock to the plant can stimulate new tubers to be formed. The tuber should be treated as being dormant, whilst the remaining plant should be encouraged to continue in growth in order to give it time to produce new tubers[230]. Division can also be carried out when the plant has a fully developed rosette of leaves but before it comes into flower[230]. The entire new growth is removed from the old tuber from which it has arisen and is potted up, the cut being made towards the bottom of the stem but leaving one or two roots still attached to the old tuber. This can often be done without digging up the plant. The old tuber should develop one or two new growths, whilst the new rosette should continue in growth and flower normally[230].

**nwatta** Prefers a sunny position and a good loamy soil[42]. Requires a deep rich soil[1]. Grows well in a sunny dry border or on a scree[200]. Orchids are, in general, shallow-rooting plants of well-drained low-fertility soils. Their symbiotic relationship with a fungus in the soil allows them to obtain sufficient nutrients and be able to compete successfully with other plants. They are very sensitive to the addition of fertilizers or fungicides since these can harm the symbiotic fungus and thus kill the orchid[230]. This symbiotic relationship makes them very difficult to cultivate, though they will sometimes appear uninvited in a garden and will then thrive. Transplanting can damage the relationship and plants might also thrive for a few years and then disappear, suggesting that they might be short-lived perennials[230]. Plants seem to be immune to the predations of rabbits[233]. The flowers have a powerful scent that is not particularly pleasant[245]. Those forms with lighter coloured flowers have a more pleasant scent[245]. Cultivated plants are very susceptible to the predation of slugs and snails[230]. Plants can occasionally appear in lawns where they will increase freely if allowed to set seed[230]. The lawn should not be mown early in the year before or immediately after flowering[200]. If you want to try establishing plants in a lawn then plant out the bulbs whilst the plant is dormant, preferably in

plants[197, 200]. The sub-species *L. japonica repens* is especially used for this purpose on the continent[182]. The cultivar 'Halliana' has also been recommended[188, 197]. This cultivar should be clipped back severely in the spring if it gets untidy, it responds well to such conditions[208]. Plants should be spaced about 1 metre apart each way[208]. The plant is said to be insectidal[218]. The stems have been used in making baskets[257].

**dwatta** Antibacterial Antiinflammatory Antispasmodic Antiviral Depurative Diuretic Dysentery Febrifuge Skin TB VDThe stems and flower buds are alterative, antibacterial, anti-inflammatory, antispasmodic, depurative, diuretic, febrifuge[147, 174, 176, 178, 238]. The plant is also used to reduce blood pressure[174, 176, 238]. The stems are used internally in the treatment of acute rheumatoid arthritis, mumps and hepatitis[238]. The stems are harvested in the autumn and winter, and are dried for later use[238]. The stems and flowers are used together as an infusion in the treatment of upper respiratory tract infections (including pneumonia) and dysentery[238]. An infusion of the flower buds is used in the treatment of a wide range of ailments including syphilitic skin diseases and tumours, bacterial dysentery, colds, enteritis, pain, swellings etc[174, 176, 218, 222, 238, 279]. Experimentally, the flower extracts have been shown to lower blood cholesterol levels and are antibacterial, antiviral and tuberculostatic[222, 279]. Externally, the flowers are applied as a wash to skin inflammations, infectious rashes and sores[238]. The flowers are harvested in early morning before they open and are dried for later use[238]. The plant has a similar action to *Forsythia suspensa* and is usually used in combination with that species to achieve a stronger action[176]. This plant has become a serious weed in many areas of N. America, it might have the potential to be utilized for proven medical purposes[222].

**propta Seed** - best sown as soon as it is ripe in a cold frame. Stored seed requires 2 months cold stratification[113] and should be sown as soon as possible in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm with or without a heel, July/August in a frame. Good percentage[78]. Cuttings of mature wood of the current season's growth, 15 - 20cm with or without a heel, November in a cold frame. Good percentage[78]. Layering in autumn[200].

**nwatta** Prefers a good moist soil with its roots in the shade and its top climbing into the light[200]. Succeeds in any soil in part shade[184]. Established plants are drought tolerant[190]. They succeed in dry shade, the cultivar 'Halliana' is especially recommended for such a situation[188]. Plants are hardy to about -20°C[184]. The foliage can be damaged in severe wind-chill conditions but the plant usually recovers in the spring[202]. Fruit is only formed after a hot summer[202]. A rampantly growing plant[190], it climbs by twining around other plants[182] and makes an excellent screen for a north or east facing fence or an unsightly object[190]. This species has the potential to become a rampant weed, it has escaped from cultivation in N. America where it can outcompete native species[274]. The plant has powerfully scented flowers. The white-flowered cultivar 'Halliana' has a pronounced lemon-like perfume[245]. There are several named varieties, developed for their ornamental value[182, 200]. Special Features:Not North American native, Invasive, Naturalizing, Fragrant flowers, Attractive flowers or blooms.

## 5.2.403 Berchemia flavescens

4 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat 5 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

**drutta** *Berchemia flavescens* is a deciduous Climber growing to 5 m (16ft 5in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from June to August, and the seeds ripen from May to July. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**kcakta** Edible Parts: FruitEdible Uses: Fruit - eaten raw when fully ripe[272]. The sausage-shaped fruit is about 12mm long[11].

**tcanta** None known  
**dwatta** None known  
**propta** Seed - sow spring or autumn in a cold frame[200].

When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame[200]. Cuttings of mature wood of the current season's growth, November to January in a frame. Root cuttings in winter[200]. Layering of young stems in winter[200].

**nwatta** Requires a good moist well-drained loam, succeeding in full sun if the soil does not dry out otherwise it is best in light shade[11, 200]. Suitable for growing along fences, against walls with wire supports or for growing through other shrubs[200]. Plants climb by means of twining around supports[182]. Flowers are produced on the current years growth[200]. It takes almost 12 months from flowering to ripening the fruit[266].

## 5.2.404 Crataegus canbyi

Cockspur hawthorn, Dwarf Hawthorn, Cockspur Hawthorn 4 tlin 7 cyuc 2 kcaak 0 tcan 2 dwat 5 m hkuc hmimhtut cyutli hgatkyuctcuphja7n hwicli hrasljutnyikfrip hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

**drutta** *Crataegus canbyi* is a deciduous Shrub growing to 5 m (16ft) by 6 m (19ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in June, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Midgees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry moist or wet soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

**kcakta** Edible Parts: FruitEdible Uses: Fruit - raw or cooked[82]. The fruit is about 12mm in diameter and is borne in small clusters[200]. It has a thick, bright red, juicy flesh[82]. There are up to five fairly large seeds in the centre of the fruit, these often stick together and so the effect is of eating a cherry-like fruit with a single seed[K].

**tcanta** Wood - fine-grained, tough, hard and heavy. Used for tool handles etc[82].

**dwatta** Cardiac HypotensiveAlthough no specific mention has been seen for this species, the fruits and flowers of many hawthorns are well-known in herbal folk medicine as a heart tonic and modern research has borne out this use. The fruits and flowers have a hypotensive effect as well as acting as a direct and mild heart tonic[222]. They are especially indicated in the treatment of weak heart combined with high blood pressure[222]. Prolonged use is necessary for it to be efficacious[222]. It is normally used either as a tea or a tincture[222].

**propta** Seed - this is best sown as soon as it is ripe in the autumn in a cold frame, some of the seed will germinate in the spring, though most will probably take another year. Stored seed can be very slow and erratic to germinate, it should be warm stratified for 3 months at 15°C and then cold stratified for another 3 months at 4°C[164]. It may still take another 18 months to germinate[78]. Scarifying the seed before stratifying it might reduce this time[80]. Fermenting the seed for a few days in its own pulp may also speed up the germination process[K]. Another possibility is to harvest the seed 'green' (as soon as the embryo has fully developed but before the seedcoat hardens) and sow it immediately in a cold frame. If timed well, it can germinate in the spring[80]. If you are only growing small quantities of plants, it is best to pot up the seedlings as soon as they are large enough to handle and grow them on in individual pots for their first year, planting them out in late spring into nursery beds or their final positions. When growing larger quantities, it might be best to sow them directly outdoors in a seedbed, but with protection from mice and other seed-eating creatures. Grow them on in the seedbed until large enough to plant out, but

**tcanta** DyeGold/green dyes can be obtained from the whole plant[168]. A red dye is obtained from the fruit, it is used in cosmetics and as a paint[46, 257].

**dwatta** Antiphlogistic PectoralThe plant has been used as a lotion for treating black eyes and head bruises[257]. The juice of the seeds and an infusion of the plant has been used to treat lung congestion[257].

**propta** Seed - sow spring in situ. Most of the seed usually germinates within a few days of sowing.

**nwatta** An easily grown plant, succeeding in most soils but disliking shade[1, 200]. It prefers a moderately fertile soil[200]. A very ornamental plant[74], strawberry blite has at times been cultivated for its edible leaves[61].

## 5.2.284 Allium angulosum

Mouse Garlic 4 tlin 8 cyuc 3 kcaak 0 tcan 2 dwat 0.5 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

**drutta** *Allium angulosum* is an evergreen Bulb growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in leaf all year, in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**kcakta** Edible Parts: Flowers Leaves RootEdible Uses: Bulb - raw or cooked[105]. It can be preserved for winter use by salting[2, 177]. The small bulbs are slender and elongated[203] and about 5mm wide[200]. Leaves - raw or cooked. There is a slight bitterness in the flavour[K]. Flowers - raw. Used as a garnish on salads.

**tcanta** RepellentThe juice of the plant is used as a moth repellent. The whole plant is said to repel insects and moles[20].

**dwatta** Although no specific mention of medicinal uses has been seen for this species, members of this genus are in general very healthy additions to the diet. They contain sulphur compounds (which give them their onion flavour) and when added to the diet on a regular basis they help reduce blood cholesterol levels, act as a tonic to the digestive system and also tonify the circulatory system[K].

**propta** Seed - sow spring in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle - if you want to produce clumps more quickly then put three plants in each pot. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in spring once they are growing vigorously and are large enough. Division in spring. Very easy, the plants divide successfully at any time in the growing season and the divisions can be planted straight out into their permanent positions if required.

**nwatta** An easily grown plant[203], it prefers a sunny position in a moist but well-drained soil[203]. Succeeds in heavy soils and in light shade[203]. The bulbs should be planted fairly deeply[1]. This species is often sold in nurseries as *A. pyrenaicum*[203]. Closely related to *A. senescens*, differing mainly in having keeled leaves[203]. The flowers do not have the usual onion smell[203]. Cultivated as a vegetable in Siberia[203]. Grows well with most plants, especially roses, carrots, beet and chamomile, but it inhibits the growth of legumes[18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 5.2.285 Primula veris

Cowslip, Cowslip primrose 4 tlin 8 cyuc 3 kcaak 0 tcan 3 dwat 0.3 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyikfrip hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

**drutta** *Primula veris* is a PERENNIAL growing to 0.3 m (1ft) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from April to May, and the seeds ripen from July to August.

The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**kcakta** Edible Parts: Flowers LeavesEdible Uses: TeaY-oung leaves - raw or cooked in soups etc[4, 7, 115, 148, 183]. They are not that tasty, but are available in late winter which adds somewhat to their value[K]. The fresh or dried leaves are used as a tea substitute[177, 183]. Flowers - raw, cooked or used in conserves, as a garnish etc[4, 183]. They make an ornamental addition to the salad bowl[238, K]. This species has become much less common in the past 100 years due to habitat destruction, over-collecting from the wild and farming practices. When it was more abundant, the flowers were harvested in quantity in the spring and used to make a tasty wine with sedative and nervine properties[238]. A related species *Primula elatior* is listed by the Council of Europe as a natural food flavouring [301].

**tcanta** None known

**dwatta** Anodyne Antianxiety Antiechymotic Antiinflammatory Antispasmodic Diaphoretic Diuretic Expectorant Sedative SternutatoryCowslips are an underused but valuable medicinal herb. They have a very long history of medicinal use and have been particularly employed in treating conditions involving spasms, cramps, paralysis and rheumatic pains[238]. The plant contains saponins, which have an expectorant effect, and salicylates which are the main ingredient of aspirin and have anodyne, anti-inflammatory and febrifuge effects[238]. This remedy should not be prescribed for pregnant women, patients who are sensitive to aspirin, or those taking anti-coagulant drugs such as warfarin[238]. The flowers and the leaves are anodyne, diaphoretic, diuretic and expectorant[7, 9, 21, 165]. They are harvested in the spring and can be used fresh or dried[238]. The yellow corolla of the flower is antispasmodic and sedative[4]. They are recommended for treating over-activity and sleeplessness, especially in children[254]. They are potentially valuable in the treatment of asthma and other allergic conditions[254]. At one time an oil was produced by maceration of the flowers, this has an antiechymotic effect (treats bruising)[7]. The root contains 5 - 10% triterpenoid saponins which are strongly expectorant, stimulating a more liquid mucus and so easing the clearance of phlegm [254]. It has been dried and made into a powder then used as a sternutatory[7]. The root is also mildly diuretic, antirheumatic and slows the clotting of blood[9, 254]. It is used in the treatment of chronic coughs (especially those associated with chronic bronchitis and catarrhal congestion), flu and other febrile conditions[9]. The root can be harvested in the spring or autumn and is dried for later use[9]. The leaves have similar medicinal properties to the roots but are weaker in action[254]. A homeopathic remedy is made from the plant[9]. It is used in the treatment of kidney complaints and catarrh[9]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve *Primula veris* for cough/bronchitis (see [302] for critics of commission E).

**propta** Seed - best sown as soon as it is ripe in a cold frame[133]. Sow stored seed in early spring in a cold frame[1]. Germination is inhibited by temperatures above 20°C[200]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in autumn. This is best done every other year[200].

**nwatta** Prefers a medium to heavy moisture retentive humus rich loam in a cool position with light to medium shade[200]. Grows well in heavy clay soils and on chalk[187]. Prefers full sun and a well-drained alkaline soil if it is to survive well[187, 238]. Plants are hardy to about -20°C[187]. A very ornamental plant[1], it grows well in the spring meadow[24]. The flowers diffuse a sweet fragrance quite unlike all other flower scents. It has been likened by some to the breath of a cow (sculippe is the Saxon word for this and thus the origin of the common name), by others to the sweet milky breath of a tiny child[245].

## 5.2.286 *Tragopogon porrifolius*

Salsify

4 tlin 8 cyuc 3 kcaak 0 tcan 2 dwat 0.6 m hkuc  
htut cyutli tcup hwicli hrasjlutnykfrip hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta *Tragopogon porrifolius* is a BIENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to August, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: Flowers Leaves Root Seed StemEdible Uses: GumRoot - raw or cooked[2, 5, 27, 33, 37, 89]. The young root can be grated in salads[12], older roots are best cooked[183]. The flavour is mild and sweet, and is said to resemble oysters[183, K]. The roots are harvested as required from October until early spring, or can be harvested in late autumn and stored until required[4]. Young shoots - raw or cooked[2, 12, 27, 33, 37, 52, 183]. The new growth is used in spring. A sweet taste[200]. Flowering shoots - raw or cooked[200]. Used like asparagus. Flowers - raw. Added to salads[183]. The sprouted seeds can be added to salads or sandwiches[183]. The root latex is used as a chewing gum[61, 105, 161, 183].

tcanta GumNone known

dwatta Antibilious Aperient Deobstruent DiureticSalsify is a cleansing food with a beneficial effect upon the liver and gallbladder[254]. The root is antibilious, slightly aperient, deobstruent and diuretic[4, 21]. It is specific in the treatment of obstructions of the gall bladder and jaundice[240] and is also used in the treatment of arteriosclerosis and high blood pressure[254].

propta Seed - sow in situ as early in the year as possible, in March if weather conditions permit[4]. Seed sowings often fail unless the soil is kept moist until the seedlings are growing well[4].

nwatta Succeeds in ordinary garden soils, including heavy clays[4, 200]. Plants do not grow well in stony soils[4]. Prefers an open situation[37] and a cool moist root run[14, 20]. Salsify is occasionally cultivated in the garden for its edible root[2, 89], there are some named varieties[183]. Grows well with mustard[20].

## 5.2.287 *Mitchella repens*

Partridge Berry

4 tlin 9 cyuc 3 kcaak 4 tcan 3 dwat 0.1 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlut hpa7tli frusflatprik hpa7tmwatli xre7t hjonli

drutta *Mitchella repens* is an evergreen Shrub growing to 0.1 m (0ft 4in) by 0.5 m (1ft 8in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 3. It is in leaf all year, in flower from June to July. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: TeaFruit - raw[2, 105, 161]. Pleasant and slightly aromatic[183]. Dry and tasteless, with lots of seeds according to another report[4]. The fruit hangs on well on the bush[1]. The fruit is about 8mm in diameter[200]. A tea is made from the leaves[207].

tcanta Can be used as a ground cover plant in a shady position[3, 188]. Plants form a spreading carpet, rooting along the stems, and are best spaced about 30cm apart each way[208].

dwatta Astringent Diuretic Hypnotic Oxytoxic Sedative Tonic Women's complaintsPartridge berry was commonly used by several native North American Indian tribes as a parturient to hasten childbirth. It was also occasionally used to treat a variety of other complaints including insomnia, rheumatic pain and fluid retention[254]. It is still used in modern herbalism as an aid to childbirth and is also considered to have a tonic effect upon the uterus and the

ovaries[254]. The herb is astringent, diuretic, hypnotic and tonic[4, 21, 102, 165, 192, 213]. Frequent doses of a tea made from the fresh or dried leaves were used by N. American Indian women in the weeks preceding childbirth in order to promote easy delivery[213, 222, 238]. This tea should not be used during the first six months of labour, however, since it can induce a miscarriage[238]. The tea is also used to treat delayed, painful or irregular menses[222, 238]. The tea was also used externally as a wash for hives, swellings, sore nipples, rheumatism etc[222]. The leaves are harvested in the summer and dried for later use[238]. A tea made from the berries has a very definite sedating effect on the nervous system[192].

propta Seed - it germinates better if given 3 months cold stratification and so it is best sown as soon as it is ripe in the autumn[113]. Sow stored seed as early in the year as possible. Make sure that all the fruit pulp is removed from the seed because it contains germination inhibitors[113]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division of naturally layered stems in the spring[200]. Cuttings.

nwatta Landscape Uses:Container, Ground cover, Rock garden, Specimen, Woodland garden. Requires a moist but well-drained lime-free soil and some shade[11]. Prefers a peaty soil[1, 200], succeeding in neutral to acid soils[200]. Plants are hardy to at least -20°C[200]. A trailing plant, the stems forming new roots at the nodes[192]. The dried leaves have a scent of newly mown hay[245]. The flowers have a pleasant sweet fragrance[245]. Succeeds in the shade of trees[1, 11], growing well in a woodland and in the rock garden[1, 200]. Plants can be difficult to establish[188], though they can become invasive once they are well established[238]. Special Features:Attracts birds, Attractive foliage, North American native, Naturalizing, Fragrant flowers. The plant is heat tolerant in zones 9 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. An evergreen. A clumping mat former. Forming a dense prostrate carpet spreading indefinitely [1-2]. The root pattern is fibrous dividing into a large number of fine roots [1-2]. The root pattern is stoloniferous rooting from creeping stems above the ground [1-2].

## 5.2.288 *Mahonia repens*

Creeping Oregon Grape, Creeping barberry, Grape Oregon  
4 tlin 8 cyuc 3 kcaak 4 tcan 3 dwat 0.3 m hkuc  
hmimhtut cyutli kyuctup hwicli hrasjlutnykfrip hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta *Mahonia repens* is an evergreen Shrub growing to 0.3 m (1ft) by 2 m (6ft 7in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Fruit OilEdible Uses: OilFruit - raw or cooked[85, 183]. An acid flavour but it is rather nice raw, especially when added to muesli or porridge[85]. Unfortunately, there is relatively little flesh and a lot of seeds[1K]. Used for making jams, jellies etc. They can also be made into a refreshing lemonade-like beverage[183]. When sugar is added, the fruit juice is similar to grape juice[212]. The fruit is about 9mm in diameter[200].

## 5.2.399 *Smilax glauca*

Cat Greenbrier

4 tlin 8 cyuc 2 kcaak 0 tcan 2 dwat 5 m hkuc  
hmimhtut cyutli kyuctup hwicli hrasjlutnyk hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta *Smilax glauca* is an evergreen Climber growing to 5 m (16ft 5in). See above for USDA hardiness. It is hardy to UK zone 4. It is in leaf all year, in flower in June. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). . The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Root - cooked[161, 257]. It can be boiled and made into a jelly or dried and ground into a powder then used with cereals when making bread etc[61, 105, 159]. Young shoots in spring - raw or cooked[159].

tcanta None known

dwatta Birthing aid Poultice RubefacientThe stem prickles have been rubbed on the skin as a counter-irritant to relieve localised pains, muscle cramps and twitching[222]. A tea made from the leaves and stems has been used in the treatment of rheumatism and stomach problems[222]. The wilted leaves are applied as a poultice to boils[222, 257]. A tea made from the roots is used to help the expelling of afterbirth[222]. Reports that the roots contain the hormone testosterone have not been confirmed, they might contain steroid precursors, however[222].

propta Seed - sow March in a warm greenhouse[1]. This note probably refers to the tropical members of the genus, seeds of plants from cooler areas seem to require a period of cold stratification, some species taking 2 or more years to germinate[K]. We sow the seed of temperate species in a cold frame as soon as we receive it, and would sow the seed as soon as it is ripe if we could obtain it then[K]. When the seedlings eventually germinate, prick them out into individual pots when they are large enough to handle and grow them on in the greenhouse for at least their first year, though we normally grow them on in pots for 2 years. Plant them out into their permanent positions in early summer. Division in early spring as new growth begins[238]. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer. Cuttings of half-ripe shoots, July in a frame[238].

nwatta Succeeds in most soils in sun or semi-shade[200]. Hardy to at least -20°C[200]. A vigorous plant, it can be grown through trees or shrubs or over tree stumps[200]. Dioecious. Male and female plants must be grown if seed is required.

## 5.2.400 *Malus glaucescens*

4 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat 5 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnykfrip hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta *Malus glaucescens* is a deciduous Tree growing to 5 m (16ft 5in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105, 177]. Aromatic, it is 3 - 4cm in diameter[200]. tcanta The wood weighs 44lb per cubic foot[235]. dwatta None known

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. It usually germinates in late winter. Stored seed requires stratification for 3 months at 1°C and should be sown in a cold frame as soon as it is received[200]. It might not germinate for 12 months or more. Prick out the seedlings into individual pots as soon as they are large

enough to handle. If given a rich compost they usually grow away quickly and can be large enough to plant out in late summer, though consider giving them some protection from the cold in their first winter. Otherwise, keep them in pots in a cold frame and plant them out in late spring of the following year. Cuttings of mature wood, November in a frame[11].

nwatta An easily grown plant, it succeeds in most fertile soils, preferring a moisture retentive well-drained loamy soil[1, 200]. Grows well in heavy clay soils. Prefers a sunny position but succeeds in partial shade though it fruits less well in such a situation[1, 200]. The fruit is a good wildlife food source, especially for birds[200]. This species is closely related to *M. glabrata*[200]. It hybridizes freely with other members of the genus[200]. Plants in this genus are notably susceptible to honey fungus[20].

## 5.2.401 *Calystegia hederacea*

Japanese false bindweed

4 tlin 8 cyuc 2 kcaak 0 tcan 1 dwat 5 m hkuc  
htut cyutli tcup hwicli hrasjlutnyk hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta *Calystegia hederacea* is a PERENNIAL CLIMBER growing to 5 m (16ft 5in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Root - cooked[105, 177], then washed and steamed. Considered to be very nutritious, it is rich in starch and sugar but it should not be eaten regularly[179]. Young shoots - cooked[105, 177].

tcanta None known

dwatta DiureticThe seed is simmered in water as a diuretic to stimulate kidney secretions[218].

propta Seed - sow spring in a cold frame in a free draining compost and only just cover. The seed usually germinates in 1 - 3 months at 15°C[138]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in early spring whilst dormant[200].

nwatta Easily grown in ordinary garden soil in a sunny position, but plants are apt to become invasive[1, 200]. Nearly all taxa in *Calystegia* intergrade geographically into neighboring taxa with the exception of the widespread coastal species, *C. soldanella* (Linnaeus) R. Brown. It is impossible to draw clearly defined specific limits, and intermediate forms are always found where two taxa approximate geographically[266].

## 5.2.402 *Lonicera japonica*

Japanese Honeysuckle

4 tlin 10 cyuc 2 kcaak 0 tcan 3 dwat 5 m hkuc  
hmimhtut cyutli kyuctup hwicli hrasjlutnyk hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta *Lonicera japonica* is an evergreen Climber growing to 5 m (16ft) by 5 m (16ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in leaf all year, in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Moths. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Flowers LeavesEdible Uses: TeaLeaves - cooked. The parboiled leaves are used as a vegetable[183]. Some caution is advised, see notes above on toxicity. Flowers - sucked for their sweet nectar[183], used as a vegetable or made into a syrup and puddings[183]. A tea is made from the leaves, buds and flowers[177, 183].

tcanta Basketry InsecticideA very vigorous climbing plant, it makes a good dense ground cover plant where it has the space to run over the ground but it will swamp smaller

position but succeeds in partial shade, though it fruits less well in such a situation[200]. Plants usually produce seed apomictically (a method that does not involve sexual fusion, so the seedlings are clones of the parent) and therefore they breed true to type[11, 200]. A very ornamental plant[1]. The flowers are sweetly scented[245]. The fruit is a good wildlife food source, especially for birds. Plants in this genus are notably susceptible to honey fungus[200]. Special Features: Not North American native, Fragrant flowers, Attractive flowers or blooms.

## 5.2.396 Malus lancifolia

4 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat 6 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Malus lancifolia* is a deciduous Tree growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105, 177]. Up to 3cm in diameter[200].

tcanta The wood weighs 43lb per cubic foot.

dwatta None known

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. It usually germinates in late winter. Stored seed requires stratification for 3 months at 1°C and should be sown in a cold frame as soon as it is received[200]. It might not germinate for 12 months or more. Prick out the seedlings into individual pots as soon as they are large enough to handle. If given a rich compost they usually grow away quickly and can be large enough to plant out in late summer, though consider giving them some protection from the cold in their first winter. Otherwise, keep them in pots in a cold frame and plant them out in late spring of the following year. Cuttings of mature wood, November in a frame[11].

nwatta An easily grown plant, it succeeds in most fertile soils, preferring a moisture retentive well-drained loamy soil[1, 200]. Grows well in heavy clay soils. Prefers a sunny position but succeeds in partial shade though it fruits less well in such a situation[1, 200]. There is some confusion over the correct name of this species. [43] gives the name as a synonym of *M. coronaria lancifolia* (along with *M. bracteata* for which we also have a record) whilst [200] recognizes it as a separate species. In [82] it is treated as part of *M. coronaria*. The fruit is a good wildlife food source, especially for birds[200]. Hybridizes freely with other members of this genus[200]. Plants in this genus are notably susceptible to honey fungus[200].

## 5.2.397 Ampelopsis humulifolia

4 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat 6 m hkuc hmimhtut cyutli tcup hwicli jlut hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta *Ampelopsis humulifolia* is a deciduous Climber growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from July to August, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Insects. Suitable for: medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitLeavesEdible Uses: Fruit[177]. The fruit is about 4 - 5mm in diameter[200] and is carried in small bunches like grapes[K]. Leaves[177]. No more details.

tcanta None known

dwatta None known

propta Seed - sow in pots in a cold frame in the autumn or stratify for 6 weeks at 5°C and sow in the spring[200]. Germination can be quite slow, sometimes taking more than a

year. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. When they are more than 20cm tall, they can be planted out into their permanent positions, preferably in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm long, July/August in a frame[78]. Cuttings or eyes in late autumn or winter. Either place them in the ground in a greenhouse or cold frame, or put them in pots. An eye cutting is where you have just one bud at the top and a short length of stem with a small part of the bark removed. These normally root well and grow away vigorously, being ready to plant into their permanent positions the following autumn. Layering into pots in late summer. Partially sever the stem in spring and then lift the new plants in the autumn[78].

nwatta Prefers a deep rich loam in a warm sheltered position in sun or semi-shade[11, 200]. Dormant plants are hardy to at least -25°C if the wood is fully ripened[200]. The young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. A very ornamental plant[1], it is closely related to *A. bodinieri*[11]. Plants rarely produce fruits in Britain unless there is a long hot summer[200]. Plants climb by means of coiling tendrils but large plants often need tying in to support the weight of foliage[200].

## 5.2.398 Humulus japonicus

Japanese Hop

4 tlin 8 cyuc 2 kcaak 0 tcan 1 dwat 6 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

drutta *Humulus japonicus* is a PERENNIAL CLIMBER growing to 6 m (19ft 8in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from July to August, and the seeds ripen from September to October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves OilEdible Uses: OilYoung leaves and young shoots - cooked[105, 177, 179]. Use before the end of May.

tcanta OilThe seed oil is used to make soap[266].

dwatta Diuretic Tonic UrinaryThe whole plant is diuretic and a genito-urinary tonic[178, 266].

propta Seed - sow spring in a cold frame[37]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring as new growth begins[1]. Take the divisions when the new shoots are about 10cm above ground level. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring. Basal cuttings in March. Harvest the shoots when they are about 10 - 15cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Easily grown in a good garden soil in sun or semi-shade[1, 200]. Prefers a deep rich loam[1]. A fast growing plant, with annual stems of up to 10 metres long being produced[219]. Plants rarely survive the winter outdoors in Britain, so are best grown as annuals[219]. This report needs confirmation since the plant is also reported as being hardy in zone 5 which would mean that it should succeed outdoors virtually anywhere in Britain[K]. A climbing plant, supporting itself by twining around the branches of other plants[219]. The bruised leaves are refreshingly aromatic whilst the flowers cast a pleasing scent[245]. Dioecious. Male and female plants must be grown if seed is required.

tcanta Dye Oil Soil stabilizationA yellow dye is obtained from the inner bark of the stem and roots[155, 257]. It is green[168]. Dark green, violet and dark blue-purple dyes are obtained from the fruit[168]. A green dye is obtained from the leaves[168]. Plants form suckers freely, making a good dense ground cover[11, 200], though they can be slow to become established[197] and will need weeding for their first few years after planting out[K]. The sub-species *M. repens rotundifolia* has been especially recommended[197]. A useful plant for preventing soil erosion on slopes[155].

dwatta Alterative Anaphrodisiac Antibacterial Antiseptic Antitumor Cholagogue Depurative Diuretic Dysentery Expectorant Febrifuge Laxative Salve TonicThe root and root bark is alterative, anaphrodisiac, antiseptic, cholagogue, depurative, diuretic, expectorant, febrifuge, laxative and tonic[4, 238]. It improves the digestion and absorption and is taken internally in the treatment of coughs, fevers, psoriasis, syphilis, haemorrhages, stomach complaints, kidney problems and impure blood conditions[4, 238, 257]. Externally, it is used as an antiseptic and healing wash or poultice on wounds and rheumatic joints[257]. The roots are harvested in late autumn or early spring and dried for later use[238]. A poultice of the fresh berries has been applied to boils[257]. Berberine, universally present in rhizomes of *Mahonia* species, has marked antibacterial effects[218] and is used as a bitter tonic[213]. Since it is not appreciably absorbed by the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not be used with *Glycyrrhiza* species (Liquorice) because this nullifies the effects of the berberine[218]. Berberine has also shown antitumour activity[218]. The root and root bark are best harvested in the autumn[213].

propta Seed - best sown as soon as it is ripe in a cold frame[78]. It usually germinates in the spring[K]. 'Green' seed (harvested when the embryo has fully developed but before the seed case has dried) should be sown as soon as it is harvested and germinates within 6 weeks[K]. Stored seed should be sown as soon as possible in late winter or spring. 3 weeks cold stratification will improve its germination, which should take place in 3 - 6 months at 10°C. Prick out the seedlings when they are large enough to handle and grow them on in a cold frame for at least their first winter. Plant them out in late spring or early summer. Division of suckers in spring[78]. Whilst they can be placed direct into their permanent positions, better results are achieved if they are potted up and placed in a frame until established[11]. Leaf cuttings in the autumn.

nwatta Landscape Uses:Border, Erosion control, Ground cover, Massing. An easily grown plant, it thrives in any good garden soil[11], preferring one on the dryish side. Grows well in heavy clay soils. Succeeds in the light shade of trees[K]. This species is hardy to about -15°C if growing in a sheltered position[184]. Established plants sucker freely and form quite dense thickets[200]. The flowers are scented[245]. Resistant to honey fungus[88]. Special Features: North American native, Attractive flowers or blooms. The plant is heat tolerant in zones 8 through 3. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. An evergreen. A clumping plant, forming a colony from shoots away from the crown but with a limited spread [1-2]. The root pattern is stoloniferous rooting from creeping stems above the ground [1-2].

## 5.2.289 Hydrophyllum canadense

John's Cabbage, Bluntleaf waterleaf

4 tlin 8 cyuc 3 kcaak 0 tcan 0 dwat 0.3 m hkuc hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Hydrophyllum canadense* is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Leaves - raw or cooked[105, 177, 183]. A delicate potherb[183]. Only use when young, the leaves become bitter with age[159]. Root - cooked[2]. Only eaten in times of scarcity[161].

tcanta None known

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame. The seed usually germinates in early spring. Sow stored seed as early in the year as possible. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring or autumn[200]. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Requires a moist humus-rich soil in semi-shade[200]. Plants are growing well at Kew[K]. Slugs are particularly fond of this plant and will soon destroy it if given a chance[K].

## 5.2.290 Blephilia ciliata

Downy wood mint

4 tlin 7 cyuc 3 kcaak 2 tcan 1 dwat 0.7 m hkuc hmimhtut cyutli hgatykcuctup hwicli hrasjlut hpa7tli frusflatprik hpa7tmwatli hjonli

drutta *Blephilia ciliata* is a PERENNIAL growing to 0.7 m (2ft 4in) by 0.4 m (1ft 4in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4. The flowers are pollinated by Bees, Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: LeavesEdible Uses: Leaves. Minty leaves eaten raw and used in teas. The leaves can be used to prepare sauces and drinks [1-4].

tcanta Soil stabilizationA strong scented plant that may act as an aromatic pest confuser reducing their ability to find other nearby crops [1-3]. The flowers attract long-tongued and short-tongued bees, bee flies, Syrphid flies, butterflies, and skippers (illinoiswildflowers.info). A plant for Forest Gardens, Pollinator Gardens, Prairie or Meadow. Used as Butterfly Nectar Plants or as part of a Groundcover or Mass Planting. Showy Blooms can be used in Cottage Gardens, Deer Resistant Plantings, Rock Gardens, Water-wise Landscapes, Low Maintenance Plantings, Perennial Borders, Restoration Projects and Wildlife Gardens (newmoonrursery.com).

dwatta Traditionally used by the Cherokee to make a poultice to treat headaches.

propta Propagate by division.

nwatta A Short-Lived fast-growing herbaceous perennial with an upright form. It prefers full sun to semi-shade and a loamy, silty soil with a pH 6 to 8. Downy wood mint has some drought tolerance but dislikes waterlogged soils or flooding. It is sensitive to salt, soil compaction. Flowers are fragrant. Soil can contain loam, clay, gravel and limestone. A high pH is tolerated but will restrict growth. It has a greater tolerance to drought than other mint species. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. Root type is fibrous and shallow. Flowering time: June to August (Northern Hemisphere).

## 5.2.291 Wyethia amplexicaulis

Mulesears Wyethia, Mule-ears

4 tin 8 cyuc 3 kcak 0 tcan 1 dwat 0.8 m hkuc htut cyutli tcup hwicli hrasljut hpa7tli flatprklwis hpa7tmwatli xre7t hjonli

drutta Wyethia amplexicaulis is a PERENNIAL growing to 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Leaves Root SeedEdible Uses: Root - cooked[46, 61, 105, 161, 257]. The native North American Indians dug pits in the ground which they lined with large stones. They then burnt a fire on top of the stones until the stones were hot. The roots were placed on these hot stones, sealed in with fern leaves and earth and then fermented for one or two days[94]. Seed[161, 177, 207, 257]. No more details are given. Young shoots[177]. No more details are given.

tcanta None known dwatta PoultryThe roots furnish a remedy applied externally as a poultice to bruised and swollen limbs[207, 257].

propta Seed - we have no information on this species but suggest sowing the seed in a greenhouse or cold frame in early spring. Use a very freely-draining compost, prick out the seedlings into individual pots as soon as they are large enough to handle and plant out into their permanent positions when they are large enough. Careful division of the crown as the plants come into growth in spring[200].

nwatta Requires a free-draining, gritty but moisture-retentive soil in a sunny position[200]. Plants are intolerant of drought[200]. Plants are considered to be a pest of grazing ground in N. America and large-scale eradication programmes are carried out[212].

## 5.2.292 Cardamine hirsuta

Hairy Bittercress

4 tin 8 cyuc 3 kcak 1 tcan 0 dwat 0.3 m hkuc hmimhtut cyutli tcup hwicli hyhshrasljutnyik hpa7tli flatprklwis hpa7tmwatli fyfxre7t hjonli

drutta Cardamine hirsuta is a ANNUAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from April to August, and the seeds ripen from May to September. The species is hermaphrodite (has both male and female organs). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers LeavesEdible Uses: Leaves and flowers - raw or cooked[2, 5, 52, 53, 105]. A hot cress-like flavour, they are mainly used as a garnish or flavouring in salads etc[132] but are also sometimes used as a potherb[183]. The plant germinates most freely in the autumn and so leaves are usually available all winter[244].

tcanta The tiny flowers are attractive to a few early butterflies, including (in the United States) spring azure (Celastrina ladon) and falcate orange-tip (Anthocharis midsea).

dwatta None known

propta Seed - sow spring or autumn in situ. This species needs very little encouragement and is quite capable of sowing itself, often too freely.

nwatta Prefers a moist humus rich soil in shade or semi-shade[200] but it succeeds in most soils and positions[1]. A common garden weed, it can be in flower all year round if the weather is mild. It will usually self-sow very freely in cultivated soil and is found especially in pot-grown plants[K].

## 5.2.293 Claytonia lanceolata

Lanceleaf Spring Beauty, Idaho springbeauty, Pacific springbeauty, Peirson's springbeauty

4 tin 8 cyuc 3 kcak 0 tcan 0 dwat 0.2 m hkuc htut cyutli tcup hwicli hrasljut hpa7tli flat hpa7tmwatli xre7t hjonli

drutta Claytonia lanceolata is a PERENNIAL growing to 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in March, and the seeds ripen in May. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Root - raw or cooked[61, 105, 161, 257]. Rather palatable[60]. The raw root has a pleasant radish-like taste, when baked it has the taste and texture of baked potato[212]. The roots can be dried, ground into a powder and stored for later use[257]. The globose tubers are up to 20mm in diameter[270]. Leaves - raw or cooked[61, 85].

tcanta None known

dwatta None known

propta Seed - surface sow on a peat based compost in spring in a cold frame. Germination usually takes place within 2 - 4 weeks at 10°C[164]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the cold frame for at least their first winter. Plant them out in late spring or early summer after the last expected frosts. Division of offsets in spring or autumn.

nwatta Prefers a damp peaty soil and a position in full sun[1, 164]. Requires a lime-free soil[164].

## 5.2.294 Allium condensatum

4 tin 8 cyuc 3 kcak 0 tcan 2 dwat 0.6 m hkuc htut cyutli tcup hwicli hrasljut hpa7tli flatprklwis hpa7tmwatli xre7t hjonli

drutta Allium condensatum is a BULB growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to September, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Bulb - raw or cooked. The bulb is about 20mm in diameter[266]. Leaves - raw or cooked[177]. Flowers - raw. Used as a garnish on salads.

tcanta RepellentThe juice of the plant is used as a moth repellent. The whole plant is said to repel insects and moles[20].

dwatta Although no specific mention of medicinal uses has been seen for this species, members of this genus are in general very healthy additions to the diet. They contain sulphur compounds (which give them their onion flavour) and when added to the diet on a regular basis they help reduce blood cholesterol levels, act as a tonic to the digestive system and also tonify the circulatory system[K].

propta Seed - sow spring in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle - if you want to produce clumps more quickly then put three plants in each pot. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in spring once they are growing vigorously and are large enough. Division in spring. The plants divide successfully at any time in the growing season, pot up the divisions in a cold frame or greenhouse until they are growing well and then plant them out into their permanent positions.

nwatta Prefers a sunny position in a light well-drained soil[203]. The bulbs should be planted fairly deeply[1]. Most members of this genus are intolerant of competition from other growing plants[203]. Grows well with most plants, especially roses, carrots, beet and chamomile, but it inhibits the growth of legumes[18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 5.2.295 Fritillaria affinis

Chocolate Lily, Checker lily

4 tin 8 cyuc 3 kcak 0 tcan 0 dwat 0.6 m hkuc hmimhtut cyutli tcup hwicli hrasljut hpa7tli flatprklwis hpa7tmwatli xre7t hjonli

soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil and can tolerate drought. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105, 177]. The fruit is up to 2cm long[200].

tcanta RootstockThis species is often used as stock to graft pear cultivars[266].

dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe in the autumn, it will then usually germinate in mid to late winter. Stored seed requires 8 - 10 weeks cold stratification at 1°C and should be sown as early in the year as possible[200]. Temperatures over 15 - 20°C induce a secondary dormancy in the seed[200]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in a cold frame or greenhouse for their first year. Plant them out in late spring or early summer of the following year.

nwatta Prefers a good well-drained loam in full sun[200]. Grows well in heavy clay soils. Tolerates light shade but does not fruit so well in such a position. Tolerates atmospheric pollution, excessive moisture and a range of soil types if they are moderately fertile[200]. Established plants are drought tolerant[200]. Plants are hardy to about -15°C[200].

## 5.2.393 Pyrus salicifolia

Willow-Leaved Pear

4 tin 8 cyuc 2 kcak 0 tcan 0 dwat 7.5 m hkuc hmimhtut cyutli hgatkuyctcup hwicli hrasljutnyikfrip hpa7tli flatprklwis hpa7tmwatli xre7t hjonli

drutta Pyrus salicifolia is a deciduous Tree growing to 7.5 m (24ft) by 4 m (13ft). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower in April, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought. It can tolerate atmospheric pollution.

kcakta Edible Parts: Fruit OilEdible Uses: OilFruit - raw or cooked[2, 177]. The fruit is about 2 - 3cm long[200]. Harsh and of no value[11]. The fruit is nice when it has been bletted[74].

tcanta Oil Soil stabilizationPlants have extensive root systems and can be used for binding sands[74].

dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe in the autumn, it will then usually germinate in mid to late winter. Stored seed requires 8 - 10 weeks cold stratification at 1°C and should be sown as early in the year as possible[200]. Temperatures over 15 - 20°C induce a secondary dormancy in the seed[200]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in a cold frame or greenhouse for their first year. Plant them out in late spring or early summer of the following year.

nwatta Prefers a good well-drained loam in full sun[200]. Grows well in heavy clay soils. Tolerates light shade but does not fruit so well in such a position. Tolerates atmospheric pollution, excessive moisture and a range of soil types if they are moderately fertile[200]. Established plants are drought tolerant[200]. The dormant plant is very frost resistant[74]. A very ornamental plant[1].

## 5.2.394 Pyrus betulaeifolia

Birch-Leaved Pear

4 tin 8 cyuc 2 kcak 0 tcan 1 dwat 7.5 m hkuc hmimhtut cyutli hgattcup hwicli hrasljutnyikfrip hpa7tli flatprklwis hpa7tmwatli xre7t hjonli

drutta Pyrus betulaeifolia is a deciduous Tree growing to 7.5 m (24ft 7in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in April. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium

(loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil and can tolerate drought. It can tolerate atmospheric pollution.

kcakta Edible Parts: Flowers Fruit LeavesEdible Uses: TeaFruit - raw or cooked[2, 105, 177, 179, 183]. The fruit is quite small, about 15mm in diameter[200]. Leaves - cooked[179, 183]. Flowers[2, 183]. Dried, powdered and made into cakes[179]. The dried leaves are used to make tea[179].

tcanta Miscellany RootstockThis species has long been used as a rootstock for the cultivated pears by the Chinese[11], it is recently also being used as a rootstock in N. America and in Europe[183, 200].

dwatta Cholera MiscellanyThe leaves are used in the treatment of cholera, colic and cramps[218]. The cooked fruit is used to treat mucous diarrhoea[218].

propta Seed - best sown in a cold frame as soon as it is ripe in the autumn, it will then usually germinate in mid to late winter. Stored seed requires 8 - 10 weeks cold stratification at 1°C and should be sown as early in the year as possible[200]. Temperatures over 15 - 20°C induce a secondary dormancy in the seed[200]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in a cold frame or greenhouse for their first year. Plant them out in late spring or early summer of the following year.

nwatta Prefers a good well-drained loam in full sun[200]. Grows well in heavy clay soils. Tolerates light shade but does not fruit so well in such a position. Tolerates atmospheric pollution, excessive moisture and a range of soil types if they are moderately fertile[200]. Established plants are drought tolerant[200]. Plants are hardy to at least -15°C[200]. A fast growing tree[11].

## 5.2.395 Malus hupehensis

Chinese Crab, Chinese crab apple, Tea Crabapple, Flowering Tea Crabapple

4 tin 8 cyuc 2 kcak 0 tcan 0 dwat 7 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyikfrip hpa7tli flatprklwis hpa7tmwatli fyfxre7t hjonli

drutta Malus hupehensis is a deciduous Tree growing to 7 m (23ft) by 7 m (23ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from April to May, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects, Apomictic (reproduce by seeds formed without sexual fusion). The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: FruitEdible Uses: TeaFruit - raw or cooked[105, 177]. Up to 1 cm in diameter[200], it has a sour taste[183]. The leaves are a tea substitute[11, 46, 105]. Palatable and thirst quenching, it is much used in China and leaves are exported from Shasi for this purpose[183].

tcanta Rootstock ShelterbeltA vigorous branching tree, it makes a good windbreak[245]. This species is used as stock to graft apple trees in Hubei and Sichuan[266].

dwatta None known

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. It usually germinates in late winter. Stored seed requires stratification for 3 months at 1°C and should be sown in a cold frame as soon as it is received[200]. It might not germinate for 12 months or more. Prick out the seedlings into individual pots as soon as they are large enough to handle. If given a rich compost they usually grow away quickly and can be large enough to plant out in late summer, though consider giving them some protection from the cold in their first winter. Otherwise, keep them in pots in a cold frame and plant them out in late spring of the following year. Cuttings of mature wood, November in a frame[11].

nwatta Landscape Uses:Border, Espalier, Standard, Specimen. An easily grown plant, it succeeds in most fertile soils, preferring a moisture retentive well-drained loamy soil[1, 200]. Grows well in heavy clay soils. Prefers a sunny

hmimhtut cyutli tcuphja7n hwicli hrasjlutnykfrip hpa7tli flat-priklwis hpa7tmwatli xre7t hjonli

drutta Malus florentina is a deciduous Tree growing to 8 m (26ft) by 6 m (19ft). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower in June, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[K]. The oval fruit is about 15mm long and 8mm wide, it ripens in mid autumn and usually blets on the tree. When bletted, it has a mealy texture with a soft acid flesh, we found it refreshing in small quantities[K].

tcanta None known

dwatta None known

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. It usually germinates in late winter. Stored seed requires stratification for 3 months at 1°C and should be sown in a cold frame as soon as it is received[200]. It might not germinate for 12 months or more. Prick out the seedlings into individual pots as soon as they are large enough to handle. If given a rich compost they usually grow away quickly and can be large enough to plant out in late summer, though consider giving them some protection from the cold in their first winter. Otherwise, keep them in pots in a cold frame and plant them out in late spring of the following year. Cuttings of mature wood, November in a frame[11].

nwatta An easily grown plant, it succeeds in most fertile soils, preferring a moisture retentive well-drained loamy soil[1, 200]. Grows well in heavy clay soils. Prefers a sunny position but succeeds in partial shade, though it fruits less well in such a situation[200]. This species is a very good pollinator for the cultivated apples[200]. The fruit is a good wildlife food source, especially for birds[200]. A very ornamental tree, especially when flowering in the spring, it makes a good specimen tree in a lawn[11]. Some botanists believe this species to be a bigeneric hybrid between *M. sylvestris* and *Sorbus terminalis*. They have assigned the name *Mal-orbus florentina* to the plant, but this is not generally accepted[11]. Plants in this genus are notably susceptible to honey fungus[200].

### 5.2.390 Styrax japonica

Japanese Storax

4 tlin 8 cyuc 2 kcak 0 tcan 0 dwat 8 m hkuc

hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Styrax japonica is a deciduous Tree growing to 8 m (26ft) by 6 m (19ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in June, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Fruit OilEdible Uses: OilFruit - raw[105, 177]. The fruit is about 14mm in diameter[200].

tcanta Beads Oil WoodThe fruits are used as beads in rosaries etc[182]. An oil is obtained from the seed[46, 61]. No further details are given. Wood - fine-grained. Used to make umbrella handles[46, 61].

dwatta None known

propta Seed - requires stratification and is best sown in a cold frame as soon as it is ripe[11]. Stored seed requires 3 months warm then 3 months cold stratification[113]. Germination is usually good, prick out the seedlings into individual pots once they are large enough to handle. Overwinter in a greenhouse for the first winter and plant out in late spring. Cuttings of half-ripe wood, July/August in a frame[113]. Layering in autumn.

nwatta Requires a light lime-free soil in sun or semi-shade[11, 200]. If planted out when young into a planting hole that has been filled with a light lime-free soil the plants will successfully grow into the surrounding soil[11].

Prefers a warm sheltered position with protection from the morning sun[11]. Dormant plants are hardy to about -15°C[200] but the young growth is liable to be damaged by late frosts[11]. A very ornamental plant[1] but it is slow to establish itself and is slow growing[200]. There are some named varieties[182]. The sub-species *S. japonica fargesii* is stronger growing in Britain[182]. The flowers have an exquisite scent[245]. Plants in this genus are notably resistant to honey fungus[200].

### 5.2.391 Acer argutum

4 tlin 8 cyuc 2 kcak 0 tcan 0 dwat 8 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnykfrip hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Acer argutum is a deciduous Tree growing to 8 m (26ft 3in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in April, and the seeds ripen in October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). . The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: SapEdible Uses: SweetenerThe sap contains a certain amount of sugar and can either be used as a drink, or the sap can be concentrated into a syrup by boiling off the water[105, 177]. The syrup is used as a sweetener on many foods. The tree trunk is tapped in the early spring, the sap flowing better on warm sunny days following a frost. The best sap production comes from cold-winter areas with continental climates.

tcanta PreservativeThe leaves are packed around apples, rootcrops etc to help preserve them[18, 20].

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame, it usually germinates in the following spring. Pre-soak stored seed for 24 hours and then stratify for 2 - 4 months at 1 - 8°C. It can be slow to germinate. The seed can be harvested ‘green’ (when it has fully developed but before it has dried and produced any germination inhibitors) and sown immediately. It should germinate in late winter. If the seed is harvested too soon it will produce very weak plants or no plants at all[80, 113]. When large enough to handle, prick the seedlings out into individual pots and grow them on until they are 20cm or more tall before planting them out in their permanent positions. Layering, which takes about 12 months, is successful with most species in this genus. Cuttings of young shoots in June or July. The cuttings should have 2 - 3 pairs of leaves, plus one pair of buds at the base. Remove a very thin slice of bark at the base of the cutting, rooting is improved if a rooting hormone is used. The rooted cuttings must show new growth during the summer before being potted up otherwise they are unlikely to survive the winter. Cuttings of this species root well.

nwatta Of easy cultivation, it prefers a good moist well-drained soil in a sunny position but tolerates some shade. Grows well in heavy clay soils. Chlorosis can sometimes develop as a result of iron deficiency when the plants are grown in alkaline soils, but in general maples are not fussy as to soil pH. This species prefers its trunk in the shade[11]. Most maples are bad companion plants, inhibiting the growth of nearby plants[18, 20]. Dioecious, male and female plants must be grown if seed is required.

### 5.2.392 Pyrus phaeocarpa

4 tlin 8 cyuc 2 kcak 0 tcan 0 dwat 7 m hkuc

hmimhtut cyutli htaccup hwicli hrasjlutnykfrip hpa7tli flat-priklwis hpa7tmwatli xre7t hjonli

drutta Pyrus phaeocarpa is a deciduous Tree growing to 7 m (23ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in May, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay

drutta Fritillaria affinis is a BULB growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Root SeedpodEdible Uses: Bulb - raw, cooked or dried for winter use[2, 161]. Rich in starch, the bulb is best used in the autumn[172]. The plant has a small bulb surrounded by rice-like bulblets[256]. Both bulb and bulblets are used, when cooked they are tender and delicate, resembling real rice except for having a slightly bitter taste[256]. The roots were a staple food for some native North American Indian tribes[257]. Immature seedpods - raw or cooked. A bitter flavour[172].

tcanta None known

dwatta None known

propta Seed - best sown as soon as ripe in a cold frame, it should germinate in the spring[1]. Protect from frost[134]. Stored seed should be sown as soon as possible and can take a year or more to germinate[134]. Sow the seed quite thinly to avoid the need to prick out the seedlings. Once they have germinated, give them an occasional liquid feed to ensure that they do not suffer mineral deficiency. Once they die down at the end of their second growing season, divide up the small bulbs, planting 2 - 3 to an 8cm deep pot. Grow them on for at least another year in light shade in the greenhouse before planting them out whilst dormant. Division of offsets in August[1]. The larger bulbs can be planted out direct into their permanent positions, but it is best to pot up the smaller bulbs and grow them on in a cold frame for a year before planting them out in the autumn. Bulb scales[163].

nwatta A woodland plant, preferring light soils[1]. It is best grown in a well-drained sandy woodland soil[42, 90, 134]. Plants are best grown in a bulb frame and kept rather dry in summer[90]. Water should be withheld in summer or hot spells[164]. A very ornamental and polymorphic plant[1]. The sub-species *F. affinis tristulisi* is a triploid form that is exceptionally large flowered, robust and easily cultivated[90]. Plants flower within 3 - 5 years from seed[164].

### 5.2.296 Muscari comosum

Tassel Hyacinth, Tassel grape hyacinth

4 tlin 8 cyuc 3 kcak 2 tcan 1 dwat 0.5 m hkuc

hmimhtut cyutli kyuccup hwicli hrasjlutnyk hpa7tli flat-priklwis hpa7tmwatli fyifxre7t hjonli

drutta Muscari comosum is a BULB growing to 0.5 m (1ft 8in) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from May to July, and the seeds ripen in August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: RootEdible Uses: Bulb - cooked[22, 61, 183]. It is about 35mm in diameter[200]. A slightly bitter taste[7] that is appreciated by certain ethnic groups, especially Greeks and Italians[183]. Used in spring[46, 177]. The cooked bulbs, preserved in oil, are used as a relish[183]. tcanta Landscape Uses: Border, Container, Massing, Rock garden, Specimen, forest garden.

dwatta Appetizer Diuretic PoultriceThe bulb is appetizer and diuretic[7, 183]. The bulb is rich in mucilage and can be crushed then applied as a poultice to reddened skin[7].

propta Seed - best sown as soon as ripe in a greenhouse[200]. The seed can also be sown in early spring in a greenhouse. A good proportion of the seed usually germinates within 2 - 3 months. Sow the seed thinly so that the seedlings can be left undisturbed in the pot for their first year of growth. Give them an occasional liquid feed in the growing season to ensure they do not become nutrient deficient. When the plants become dormant in late summer, pot up the small bulbs placing 2 - 3 bulbs in each pot. Grow them on for another one or two years in the greenhouse before planting them out when they are dormant in late summer. If you have sufficient seed then it is worthwhile trying sowing it in situ

outdoors in early spring. This is rather a hit and miss method, but a lot less work than indoor sowing. Division of offsets in July/August after the leaves die down[1]. It can be done every other year if a quick increase is required[1]. Larger bulbs can be replanted direct into their permanent positions, but it is best to pot up the smaller bulbs and grow them on in a cold frame for a year before planting them out when they are dormant in late summer.

nwatta Prefers a rich open well-drained soil[1]. Succeeds in any soil and situation[1, 42]. Does very well in short grass[1], increasing freely and it can become invasive[200]. The flowers have a pleasing perfume[245]. There is at least one named form, selected for its ornamental value[200].

### 5.2.297 Fragaria chiloensis

Beach Strawberry, Pacific beach strawberry, Sandwich beach strawberry

4 tlin 10 cyuc 3 kcak 3 tcan 1 dwat 0.3 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyk hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Fragaria chiloensis is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from April to May, and the seeds ripen from June to July. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: FruitEdible Uses: TeaFruit - raw or cooked[2, 27, 101, 183, 257]. Large, sweet and succulent with a delicate flavour[183]. A delicious taste[K]. The berries can be used to make jams, preserves etc[257]. A tea can be made from the leaves[257].

tcanta Plants spread by means of runners and can be grown as a ground cover[208]. A dynamic accumulator gathering minerals or nutrients from the soil and storing them in a more bioavailable form - used as fertilizer or to improve mulch. seedy fruit loved by birds. Perennial groundcover for zone 2 firebreaks. The US government has created a system of firebreaks for areas prone to wildfires, theses are separated into concentric zones surrounding buildings. Zone 2 is the second away from the house. These low-level ground covers provide little fuel.

dwatta Antiseptic Astringent Emmenagogue Galactogogue OdontalgicThe plant is antiseptic, astringent, emmenagogue, galactogogue and odontalgic[172]. It has been used to regulate the menstrual cycle[172]. A poultice of the chewed leaves has been used to treat burns[257].

propta Seed - sow early spring in a greenhouse. The seed can take 4 weeks or more to germinate. The seedlings are very small and slow-growing at first, but then grow rapidly. Prick them out into individual pots when they are large enough to handle and plant them out during the summer. Division of runners, preferably done in July/August in order to allow the plants to become established for the following years crop[200]. They can also be moved in the following spring if required, though should not then be allowed to fruit in their first year. The runners can be planted out direct into their permanent positions.

nwatta Prefers a fertile, well-drained, moisture retentive soil in a sunny position[27, 200]. Tolerates semi-shade though fruit production will be reduced. Grows best near the coast[27]. Plants like a mulch of pine or spruce leaves[18]. Cultivated for its edible fruit in the Andes[61]. This species, along with *F. virginiana*, is probably a parent of the cultivated strawberries[46]. Dioecious. Male and female plants must be grown if seed is required. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. An evergreen. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2]. The root pattern is fibrous dividing into a large number of fine roots [1-2]. The root pattern is stoloniferous rooting from creeping stems above the ground [1-2]. Heat zone 9-1. Can be mown in early spring.

## 5.2.298 Allium sphaerocephalon

Round-Headed Leek

4 tlin 8 cyuc 3 kcaak 0 tcan 2 dwat 0.6 m hkuc htut cyutli hqatkyuctup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli fyfxre7t hjonli

drutta Allium sphaerocephalon is a BULB growing to 0.6 m (2ft) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Edible bulb - raw or cooked[2, 46, 61, 177]. An onion substitute[22]. The bulbs are up to 35mm in diameter[20]. Leaves - raw or cooked[177]. They can be dried for later use[183]. Flowers - raw. Used as a garnish on salads.

tcanta RepellentThe juice of the plant is used as a moth repellent. The whole plant is said to repel insects and moles[20].

dwatta Although no specific mention of medicinal uses has been seen for this species, members of this genus are in general very healthy additions to the diet. They contain sulphur compounds (which give them their onion flavour) and when added to the diet on a regular basis they help reduce blood cholesterol levels, act as a tonic to the digestive system and also thicken the circulatory system[K].

propta Seed - sow spring in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle - if you want to produce clumps more quickly then put three plants in each pot. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in spring once they are growing vigorously and are large enough. Division in spring. The plants divide successfully at any time in the growing season, pot up the divisions in a cold frame or greenhouse until they are growing well and then plant them out into their permanent positions.

nwatta An easily grown plant[203]. it prefers a sunny position in a light well-drained soil[1, 90]. Established plants are fairly drought tolerant[190]. The bulbs should be planted fairly deeply[1]. Grows well with most plants, especially roses, carrots, beet and chamomile, but it inhibits the growth of legumes[18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. Plants often divide freely at the roots[233]. A good bee plant[163]. The flowers are very attractive to bees[203]. The flowers are sometimes replaced with bulbils[90]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 5.2.299 Polygonum bistorta

Bistort, Meadow bistort, Snakeweed

4 tlin 7 cyuc 3 kcaak 2 tcan 3 dwat 0.5 m hkuc hmimhtut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli frusflatpriklwis hpa7tmwatli xre7t hjonli

drutta Polygonum bistorta is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.5 m (1ft 8in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from June to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta Edible Parts: Leaves Root SeedEdible Uses: Leaves - raw or cooked[2, 7, 9, 103]. One report says that they are rather bitter[5], but we have found them to have a fairly mild flavour, especially when the leaves are young, though the texture is somewhat chewy when they are eaten raw[7, K]. They make an excellent substitute for spinach[183]. In Northern England the leaves are an ingredient of a bitter Lenten pudding, called Easter ledger pudding, that is eaten at Lent[183]. The leaves are available from late winter in most years and can be eaten until the early autumn though they become much tougher as the season progresses[K]. The leaves are a good source of vitamins

A and C[257], a nutritional analysis is available[218]. Seed - raw or cooked[172]. The seed is very small and rather fiddly to utilize[K]. Root - raw or cooked[7, 172, 257]. Rich in starch and tannin, it is steeped in water and then roasted in order to reduce the tannin content[4, 115]. It is then said to be a tasty and nutritious food[4]. The root has also been boiled or used in soups and stews[183] and can be dried then ground into a powder and used in making bread[4]. The root contains 30% starch, 1% calcium oxalate and 15 - 36% tannin[218].

tcanta TanninThe roots contain up to 21% tannin[223].

dwatta Antidiarrhoeal Astringent Cholera Demulcent Diuretic Dysentery Epilepsy Febrifuge Laxative StypticBistort is one of the most strongly astringent of all herbs and it is used to contract tissues and staunch blood flow[254]. The root is powerfully astringent, demulcent, diuretic, febrifuge, laxative and strongly styptic[4, 218]. It is gathered in early spring when the leaves are just beginning to shoot, and then dried[4]. It is much used, both internally and externally, in the treatment of internal and external bleeding, diarrhoea, dysentery, cholera etc[4, 9, 13, 21, 147, 165, 172]. It is also taken internally in the treatment of a wide range of complaints including catarrh, cystitis, irritable bowel syndrome, peptic ulcers, ulcerative colitis and excessive menstruation[238, 254]. Externally, it makes a good wash for small burns and wounds, and is used to treat pharyngitis, stomatitis, vaginal discharge, anal fissure etc[238, 254]. A mouth wash or gargle is used to treat spongy gums, mouth ulcers and sore throats[254]. The leaves are astringent and have a great reputation in the treatment of wounds[4]. In Chinese medicine the rhizome is used for: epilepsy, fever, tetanus, carbuncles, snake and mosquito bites, scrofula and cramps in hands and feet [301]. Considered useful in diabetes [301].

propta Seed - sow spring in a cold frame. Germination is usually free and easy. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer if they have reached sufficient size. If not, overwinter them in a cold frame and plant them out the following spring after the last expected frosts. Division in spring or autumn. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Landscape Uses:Container, Ground cover. Succeeds in an ordinary garden soil[1] but prefers a moisture retentive not too fertile soil in sun or part shade[200]. The plant repays generous treatment[1]. A very cold-hardy plant, tolerating temperatures down to at least -25°c[187]. Bistort was formerly cultivated as a medicinal and edible plant[4], though it has now fallen into virtual disuse. Plants are somewhat spreading, forming quite extensive colonies[187] especially in low-lying pastures[4]. They seem to be immune to the predations of rabbits[233]. Special Features: Attractive foliage, Edible, Not North American native, Invasive, Suitable for cut flowers, Suitable for dried flowers. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

## 5.2.300 Mentha arvensis

Corn Mint, Wild mint

4 tlin 8 cyuc 3 kcaak 3 tcan 2 dwat 0.5 m hkuc hmimhtut cyutli kyuctup hwicli hrasjlutnyikfr hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Mentha arvensis is a PERENNIAL growing to 0.5 m (1ft 8in) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from May to October, and the seeds ripen from July to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

should be warm stratified for 3 months at 15°c and then cold stratified for another 3 months at 4°c[164]. It may still take another 18 months to germinate[78]. Scarifying the seed before stratifying it might reduce this time[80]. Fermenting the seed for a few days in its own pulp may also speed up the germination process[K]. Another possibility is to harvest the seed 'green' (as soon as the embryo has fully developed but before the seedcoat hardens) and sow it immediately in a cold frame. If timed well, it can germinate in the spring[80]. If you are only growing small quantities of plants, it is best to pot up the seedlings as soon as they are large enough to handle and grow them out in individual pots for their first year, planting them out in late spring into nursery beds or their final positions. When growing larger quantities, it might be best to sow them directly outdoors in a seedbed, but with protection from mice and other seed-eating creatures. Grow them on in the seedbed until large enough to plant out, but undercut the roots if they are to be left undisturbed for more than two years.

nwatta Landscape Uses:Border, Espalier, Pollard, Screen, Specimen, Street tree. A very easily grown plant, it prefers a well-drained moisture retentive loamy soil but is not at all fussy[11, 200]. Once established, it succeeds in excessively moist soils and also tolerates drought[200]. It grows well on a chalk soil and also in heavy clay soils[200]. A position in full sun is best when plants are being grown for their fruit, they also succeed in semi-shade though fruit yields and quality will be lower in such a position[11, 200]. Most members of this genus succeed in exposed positions, they also tolerate atmospheric pollution[200]. A very hardy plant, tolerating temperatures down to about -18°c[202]. A very ornamental plant[1, 11]. There are many named forms, selected for their ornamental value[200]. Hybridizes freely with other members of this genus[200]. Seedling trees take from 5 - 8 years before they start bearing fruit, though grafted trees will often flower heavily in their third year[K]. The flowers have a foetid smell somewhat like decaying fish. This attracts midges which are the main means of fertilization. When freshly open, the flowers have more pleasant scent with balsamic undertones[245]. Seedlings should not be left in a seedbed for more than 2 years without being transplanted[11]. This plant is often confused in cultivation with *C. prunifolia*. 'Splendens'[11]. Special Features:Attracts birds, North American native, Blooms are very showy.

## 5.2.387 Prunus buergeriana

4 tlin 8 cyuc 2 kcaak 0 tcan 1 dwat 9 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Prunus buergeriana is a deciduous Tree growing to 9 m (29ft 6in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from April to May, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Fruit SeedEdible Uses: Fruit - raw or cooked. The fruit is small, about 5mm in diameter[266], and of inferior quality, though it is sometimes gathered and pickled in salt then used as a condiment or appetizer[2, 177]. It contains a single large seed. Seed - raw or cooked. It is usually salted in the Orient[177]. Do not eat the seed if it is too bitter - see the notes above on toxicity.

tcanta DyeA green dye can be obtained from the leaves[168]. A dark grey to green dye can be obtained from the fruit[168].

dwatta Although no specific mention has been seen for this species, all members of the genus contain amygdalin and prunasin, substances which break down in water to form hydrocyanic acid (cyanide or prussic acid). In small amounts this exceedingly poisonous compound stimulates respiration, improves digestion and gives a sense of well-being[238].

propta Seed - requires 2 - 3 months cold stratification and is best sown in a cold frame as soon as it is ripe[200]. Sow stored seed in a cold frame as early in the year as possible[200]. Protect the seed from mice etc. The seed can be rather slow, sometimes taking 18 months to germinate[113].

Prick out the seedlings into individual pots when they are large enough to handle. Grow them on in a greenhouse or cold frame for their first winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood with a heel, July/August in a frame[11, 200]. Softwood cuttings from strongly growing plants in spring to early summer in a frame[200]. Layering in spring.

nwatta Thrives in a well-drained moisture-retentive loamy soil[11, 200]. Prefers some lime in the soil but is likely to become chlorotic if too much lime is present[1]. Succeeds in sun or partial shade though it fruits better in a sunny position[11, 200]. Most members of this genus are shallow-rooted and will produce suckers if the roots are damaged[238]. Plants in this genus are notably susceptible to honey fungus[200].

## 5.2.388 Prunus davidiana

Chinese Wild Peach

4 tlin 8 cyuc 2 kcaak 0 tcan 3 dwat 9 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Prunus davidiana is a deciduous Tree growing to 9 m (29ft) by 9 m (29ft). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from March to May, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Fruit SeedEdible Uses: The seed is used in China as a flavouring in confectionery and some special dishes. They are somewhat bitter due to the presence of prussic acid so should be used in strict moderation[177, 183]. Fruit[183]. The fruit is about 3cm in diameter and contains one large seed[200].

tcanta Dye RootstockUsed as a disease-resistant low-chill rootstock for the cultivated peach, *Prunus persica*[183]. A green dye can be obtained from the leaves[168]. A dark grey to green dye can be obtained from the fruit[168].

dwatta Analgesic Antiasthmatic Anticoagulant Antitussive Aperient Emollient HaemolyticThe seed is analgesic, antiasthmatic, anticoagulant, antitussive, aperient, emollient and haemolytic[176]. It is used in the treatment of amenorrhoea, dysmenorrhoea, traumatic pain due to blood stasis, constipation of aged and debilitated patients, coughs and asthma[176]. The seed contains amygdalin and prunasin, substances which break down in water to form hydrocyanic acid (cyanide or prussic acid). In small amounts this exceedingly poisonous compound stimulates respiration, improves digestion and gives a sense of well-being[238].

propta Seed - requires 2 - 3 months cold stratification and is best sown in a cold frame as soon as it is ripe[200]. Sow stored seed in a cold frame as early in the year as possible[200]. Protect the seed from mice etc. The seed can be rather slow, sometimes taking 18 months to germinate[113]. Prick out the seedlings into individual pots when they are large enough to handle. Grow them on in a greenhouse or cold frame for their first winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood with a heel, July/August in a frame[11, 200]. Softwood cuttings from strongly growing plants in spring to early summer in a frame[200]. Layering in spring.

nwatta Thrives in a well-drained moisture-retentive loamy soil[11, 200]. Prefers some lime in the soil but is likely to become chlorotic if too much lime is present[1]. Succeeds in sun or partial shade though it fruits better in a sunny position[11, 200]. There are some named varieties selected for their ornamental value[200]. Most members of this genus are shallow-rooted and will produce suckers if the roots are damaged[238]. Plants flower very early in the year and the flowers are often damaged by late frosts[188]. Plants in this genus are notably susceptible to honey fungus[200].

## 5.2.389 Malus florentina

Hawthorn-leaf crab apple

4 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat 8 m hkuc

frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm with or without a heel, July/August in a frame. Good percentage[78]. Cuttings of mature wood of the current season's growth, 15 - 20cm with or without a heel, November in a cold frame. Good percentage[78]. Layering in autumn[200].

nwatta Prefers a good loamy soil and cool moist conditions at the roots[11, 200]. Succeeds in partial shade[200]. Subject to attacks by aphid, especially in hot dry spells[11]. Climbs by twining around other plants[182].

### 5.2.384 Ulmus laciniata

4 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat 10 m hkuc hmimhtut cyultl tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Ulmus laciniata is a deciduous Tree growing to 10 m (32ft 10in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from April to May, and the seeds ripen from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Inner bark LeavesEdible Uses: Leaves - raw or cooked. Inner bark- cooked. It can be dried, ground into a powder and used as a thickening in soups or added to cereal flours when making bread etc[105, 177].

tcanta WoodNone known

dwatta None known

propta Seed - if sown in a cold frame as soon as it is ripe, it usually germinates within a few days[200]. Stored seed does not germinate so well and should be sown in early spring[200]. The seed can also be harvested 'green' (when it has fully developed but before it dries on the tree) and sown immediately in a cold frame. It should germinate very quickly and will produce a larger plant by the end of the growing season[80]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Plants should not be allowed to grow for more than two years in a nursery bed since they form a tap root and will then move badly. Layering of suckers or coppiced shoots[200].

nwatta Prefers a fertile soil in full sun[188], but is easily grown in any soil of at least moderate quality so long as it is well drained[1]. Closely related to *U. glabra*[11]. This species is resistant to 'Dutch elm disease', a disease that has destroyed the greater part of all the elm trees growing in Britain. The disease is spread by means of beetles. There is no effective cure (1992) for the problem, but most *E. Asian*, though not Himalayan, species are resistant (though not immune) to the disease so the potential exists to use these resistant species to develop new resistant hybrids with the native species[200]. The various species of this genus hybridize freely with each other and pollen is easily saved, so even those species with different flowering times can be hybridized[200].

### 5.2.385 Celtis bungeana

Bunge's hackberry

4 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat 10 m hkuc htut cyultli hgatkyuctcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Celtis bungeana is a deciduous Tree growing to 10 m (32ft 10in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in April, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow

in the shade. It prefers dry or moist soil and can tolerate drought.

kcaakta Edible Parts: Fruit LeavesEdible Uses: TeaThe plant is a tea substitute[105, 177]. This probably refers to the leaves[K]. Leaves are a savoury addition to rice[105, 177]. Fruit - raw[105, 177]. The fruit is 6 - 8mm in diameter containing a seed 4 - 5mm in diameter[266].

tcanta None known

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame[200]. Stored seed is best given 2 - 3 months cold stratification and then sown February/March in a greenhouse[78, 200]. Germination rates are usually good, though the stored seed might take 12 months or more to germinate. The seed can be stored for up to 5 years[113]. As soon as they are large enough to handle, prick the seedlings out into individual pots. The leaves of seedlings often have a lot of white patches without chlorophyll, this is normal and older plants produce normal green leaves. Grow the seedlings on in a cold frame for their first winter, and plant them out in the following late spring or early summer[K]. Give them some protection from the cold for their first winter outdoors. Cuttings

nwatta Succeeds in any reasonably good soil, preferring a good fertile well-drained loamy soil[1, 11, 200]. Succeeds on dry gravels and on sandy soils[200]. Established plants are very drought resistant[74, 200]. Trees prefer hotter summers and more sunlight than are normally experienced in Britain, they often do not fully ripen their wood when growing in this country and they are then very subject to die-back in winter[1, 11, 200]. An 8 year old plant at Kew in 1989 was 3m tall and very healthy with no sign of die-back[K]. Trees can be very long-lived, perhaps to 1000 years[200]. Plants in this genus are notably resistant to honey fungus[200].

### 5.2.386 Crataegus crus

Cockspur Thorn, Cockspur Hawthorn, Dwarf Hawthorn
4 tlin 7 cyuc 2 kcaak 0 tcan 2 dwat 10 m hkuc hmimhtut cyultli hgatkyuctcuphja7n hwicli hrasjlutnyikfrip hpa7tli flatprikliwisslip hpa7tmwatli xre7t hjonli

drutta Crataegus crus-galli is a deciduous Shrub growing to 10 m (32ft) by 10 m (32ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in June, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Midgees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry moist or wet soil and can tolerate drought. The plant can tolerates strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcaakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[62, 101, 105]. A dry flesh, it is used in jellies[43]. The fruit is about 1cm in diameter and is borne in small clusters[200]. It often persists on the tree until spring[200]. This suggests that it does not make very good eating[K]. There are up to five fairly large seeds in the centre of the fruit, these often stick together and so the effect is of eating a cherry-like fruit with a single seed[K].

tcanta Hedge Hedge WoodVery amenable to trimming, the plant can even be cut right back into very old wood and will resprout freely. It is often used as a hedge[82]. Wood - fine-grained, hard and heavy. Used for tool handles etc[46, 61, 227].

dwatta Cardiotonic HypotensiveAlthough no specific mention has been seen for this species, the fruits and flowers of many hawthorns are well-known in herbal folk medicine as a heart tonic and modern research has borne out this use. The fruits and flowers have a hypotensive effect as well as acting as a direct and mild heart tonic[222]. They are especially indicated in the treatment of weak heart combined with high blood pressure[222]. Prolonged use is necessary for it to be efficacious[222]. It is normally used either as a tea or a tincture[222].

propta Seed - this is best sown as soon as it is ripe in the autumn in a cold frame, some of the seed will germinate in the spring, though most will probably take another year. Stored seed can be very slow and erratic to germinate, it

kcaakta Edible Parts: LeavesEdible Uses: Condi- ment TeaLeaves - raw or cooked. A reasonably strong minty flavour with a slight bitterness, they are used as a flavouring in salads or cooked foods[5, 172, 183]. A herb tea is made from the fresh or dried leaves[21, 183]. An essential oil from the plant is used as a flavouring in sweets and beverages[183]. The leaves contain about 0.2% essential oil[218].

tcanta Essential Repellent StrewingThe plant is used as an insect repellent[18, 20, 99]. Rats and mice intensely dislike the smell of mint. The plant was therefore used in homes as a strewing herb and has also been spread in granaries to keep the rodents off the grain[244]. The leaves also repel various insects[257]. An essential oil is obtained from the plant[238]. The yield from the leaves is about 0.8%[240]. The sub-species *M. arvensis* piperascens produces the best oil, which can be used as a substitute for, or adulterant of, peppermint oil[238]. Yields of up to 1.6% have been obtained from this sub-species[240].

dwatta Anaesthetic Antiphlogistic Antiseptic Antispasmodic Aromatic Cancer Carminative Diaphoretic Emmenagogue Febrifuge Galactofuge Salve Stimulant Stomachic-Corn mint, like many other members of this genus, is often used as a domestic herbal remedy, being valued especially for its antiseptic properties and its beneficial effect on the digestion. Like other members of the genus, it is best not used by pregnant women because large doses can cause an abortion. The whole plant is anaesthetic, antiphlogistic, antispasmodic, antiseptic, aromatic, carminative, diaphoretic, emmenagogue, galactofuge, refrigerant, stimulant and stomachic[147, 172, 218]. A tea made from the leaves has traditionally been used in the treatment of fevers, headaches, digestive disorders and various minor ailments[222]. The leaves are a classical remedy for stomach cancer[218]. Another report says that this species is not very valuable medicinally[4]. The leaves are harvested as the plant comes into flower and can be dried for later use[238]. The essential oil in the leaves is antiseptic, though it is toxic in large doses[222].

propta Seed - sow spring in a cold frame. Germination is usually fairly quick. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in the summer. *Mentha* species are very prone to hybridisation and so the seed cannot be relied on to breed true. Even without hybridisation, seedlings will not be uniform and so the content of medicinal oils etc will vary. When growing plants with a particular aroma it is best to propagate them by division[K]. Division can be easily carried out at almost any time of the year, though it is probably best done in the spring or autumn to allow the plant to establish more quickly. Virtually any part of the root is capable of growing into a new plant. Larger divisions can be planted out direct into their permanent positions. However, for maximum increase it is possible to divide the roots up into sections no more than 3cm long and pot these up in light shade in a cold frame. They will quickly become established and can be planted out in the summer.

nwatta An easily grown plant, it succeeds in most soils and situations so long as the soil is not too dry[1, 16, 200]. This species tolerates much drier conditions than other members of the genus[238]. Prefers a slightly acid soil[16]. Grows well in heavy clay soils. A sunny position is best for production of essential oils, but it also succeeds in partial shade. Plants are hardy to at least -15°c[238]. Most mints have fairly aggressive spreading roots and, unless you have the space to let them roam, they need to be restrained by some means such as planting them in containers that are buried in the soil[K]. Hybridizes freely with other members of this genus. Polymorphic[200]. The whole plant has a very strong, almost oppressive, smell of mint[245]. The flowers are very attractive to bees and butterflies[24]. A good companion plant for growing near brassicas and tomatoes, helping to deter insect pests[20]. Members of this genus are rarely if ever troubled by browsing deer[233]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2]. The root pattern is stoloniferous rooting from creeping stems above the ground [1-2].

### 5.2.301 Erythronium grandiflorum

Avalanche Lily, Yellow avalanche-lily
4 tlin 8 cyuc 3 kcaak 0 tcan 1 dwat 0.2 m hkuc hmim cyultli kyuctcup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Erythronium grandiflorum is a BULB growing to 0.2 m (0ft 8in) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in April, and the seeds ripen from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers dry or moist soil.

kcaakta Edible Parts: Leaves Root SeedpodEdible Uses: Bulb - raw or cooked[2, 46, 85, 105, 161, 257]. The slender bulbs, which are up to 5cm long[270], are usually harvested in the spring as the first leaves appear above ground, they can be stored for some months in a cool place[256]. The raw bulb has a slightly bitter milky taste, the texture is cool and moist inside and so the North American Indians liked eating them on hot days[256]. The cooked bulb has a more starchy texture and a sweet flavour[256, 257]. Stored bulbs develop a sweeter flavour when cooked than fresh bulbs[257]. The Indians always drank water after eating the bulbs because they believed that otherwise they would get sick[256]. Large quantities can have an emetic effect[85]. The bulbs can also be dried for later use[207]. Leaves - raw or cooked[85, 106]. Eating the leaves will greatly reduce the vigour of the bulb, so can only be recommended in times of emergency[K]. Young seedpods - raw or cooked[106, 212]. The cooked pods taste like French beans[212].

tcanta None known

dwatta SkinThe pulverized root was applied to boils and as a wet dressing on skin sores[213, 257].

propta Seed - best sown as soon as it is ripe in a shady position in a cold frame. Water lightly in summer; it should germinate in autumn or winter[164, 200]. Stored seed requires a period of cold stratification[164]. Sow as early in spring as possible in a cold frame. Sow the seed thinly so that it will not be necessary to prick them out for their first year of growth. Give an occasional liquid feed to the seedlings to make sure that they do not become nutrient deficient. When the plants are dormant, pot up the small bulbs putting 2 - 3 bulbs in each pot. Grow them on in a shady position in the greenhouse for another 2 3 years and then plant them out into their permanent positions when they are dormant in late summer. Division of the bulbs in the summer as the leaves die down[1]. Larger bulbs can be replanted immediately into their permanent positions, but it is best to pot up smaller bulbs and grow them on in a shady position in a greenhouse for a year before planting them out when dormant in late summer.

nwatta Prefers slightly acid soil conditions but succeeds in chalky soils if these contain plenty of humus[164]. Requires semi-shade, preferably provided by trees or shrubs, and a well-drained soil[42, 164]. Succeeds in almost any light soil, preferring one that is rich in humus[1]. Not an easy species to grow in Britain, it prefers a well-drained soil that is wet in spring but rather dry in the summer[90]. Plants are best given perfect drainage[200]. Offsets are freely produced if the plant is growing well[1]. Flowers are produced in 3 - 4 years from seed[164]. Bulbs should be planted about 7cm deep[1].

### 5.2.302 Stellaria jamesiana

tuber starwort

4 tlin 9 cyuc 3 kcaak 0 tcan 0 dwat 0.5 m hkuc hmimhtut cyultl tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Stellaria jamesiana is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Young leaves - raw or cooked. Root - raw or cooked. Sweet and pleasant[85].

tcanta None known  
dwatta None known  
propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring.

nwatta We have very little information on this species and do not know if it will be hardy outdoors in Britain, though judging by its native range it should succeed outdoors at least in the milder parts of the country. Prefers a moist loamy site[85]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is tuberous with swollen potato-like roots [1-2].

## 5.2.303 Oxalis violacea

Violet Wood Sorrel

4 tin 8 cyuc 3 kcaak 0 tcan 1 dwat 0.3 m hkuc  
hminhtut cyutli kyucstup hwicli hrasjlutnyik hpa7tli flatprikliwv hpa7tmwatli xre7t hjonli

drutta Oxalis violacea is a BULB growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from May to August, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Flowers Leaves RootEdible Uses: DrinkLeaves - raw or cooked[2, 105, 159, 161]. The acid salty leaves are eaten raw in salads and sandwiches or cooked as a potherb[183].Use in moderation, see notes at top of sheet. Flowers - raw[105, 161]. An attractive and tasty garnish for salads[183]. Root - raw or cooked[105, 161, 183, 257]. A lemon-flavoured drink is made from the leaves[159].

tcanta None known  
dwatta Anthelmintic Antiemetic Blood purifier Cancer SalveThe plant is anthelmintic, antiemetic, blood purifier, cancer and salve[257]. A cold infusion is used to stop a person vomiting[257]. An infusion can be used as a blood purifier, it is said to be a treatment in the early stages of cancer[257]. An infusion of the plant is drunk and also used as a wash in treating children with hookworm[257]. An infusion of the leaves, mixed with oil, can be used as a salve on sores[257].

propta Seed - best sown as soon as it is ripe in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in late spring or early summer. Division in spring. Larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Easily grown in a moisture-retentive humus-rich soil in shade or dappled sunlight[200]. Succeeds in dry soils[159]. Grows well in a wild or woodland garden[200]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2].

## 5.2.304 Campanula garganica

Adriatic Bellflower

4 tin 8 cyuc 3 kcaak 0 tcan 0 dwat 0.2 m hkuc  
htut cyutli tcup hwicli hyishrasjlut hpa7tli flatprikliwv hpa7tmwatli fyfxre7t hjonli

drutta Campanula garganica is an evergreen Perennial growing to 0.2 m (0ft 8in) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in leaf all year, in flower from June to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Flowers LeavesEdible Uses: Leaves - raw or cooked. The leaves are quite small but have a pleasant mild flavour, and make a very acceptable addition to salads[K]. Flowers - raw or cooked. Slightly sweet[K].

tcanta None known  
dwatta None known  
propta Seed - surface sow spring in a cold frame. The seed usually germinates in 2 - 4 weeks at 18°C. Very easy[221]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Basal cuttings in spring. Very easy[221]. Harvest the shoots when they are about 10 - 15cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer. Division in spring or autumn. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the summer or following spring.

nwatta An easily grown plant[221], it succeeds in most fertile well-drained soils[233], though it prefers a moist but well-drained sandy loam and a neutral or alkaline soil in sun or partial shade[1, 200]. Flowers most freely when growing in full sun with a good supply of chalk or lime in the soil[221]. Plants grow well in a wall so long as there is some soil for them to root into[219]. Plants are hardy to at least -15°C[200]. The species in this genus do not often hybridize and so seed can generally be relied upon to come true[221]. The plants are self-fertile[221]. Plants are often short-lived, though they are easily propagated by seed or basal cuttings[219, 221]. They also usually self-sow freely[221]. This species is closely related to *C. elatines*[200]. There are some named varieties selected for their ornamental value[200]. ‘Dickson’s Gold’ has golden-green leaves with a pleasant mild flavour[K]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 5.2.305 Allium splendens

Miyama-Rakkyo

4 tin 8 cyuc 3 kcaak 0 tcan 2 dwat 0.3 m hkuc  
htut cyutli tcup hwicli hrasjlut hpa7tli flatprikliwv hpa7tmwatli xre7t hjonli

drutta Allium splendens is a BULB growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Bulb - raw, cooked or pickled[46, 61, 105, 177]. Rather small[183]. The bulbs are about 3 - 7cm long and 5 - 7mm in diameter[200]. Leaves - raw or cooked. Flowers - raw. Used as a garnish on salads.

tcanta RepellentThe juice of the plant is used as a moth repellent. The whole plant is said to repel insects and moles[20].

dwatta Although no specific mention of medicinal uses has been seen for this species, members of this genus are in general very healthy additions to the diet. They contain sulphur compounds (which give them their onion flavour) and when added to the diet on a regular basis they help reduce

trees are very shade tolerant, but are subject to frost damage so are best grown in a woodland position which will protect them[200]. Although very cold hardy, this species requires hotter summers than are normally experienced in Britain so is not usually a success here and is very slow growing[200]. The seeds are dispersed after the first frosts[227], they are sometimes gathered and sold in local markets in N. America[82, 227]. Good crops are produced every 2 - 3 years in the wild[227]. This species produces suckers[11] and often forms thickets in the wild[227]. Trees have surface-feeding roots and also cast a dense shade, this greatly inhibits the growth of other plants and, especially where a number of the trees are growing together, the ground beneath them is often almost devoid of vegetation[226, 227]. Special Features: North American native, All or parts of this plant are poisonous, Inconspicuous flowers or blooms. The plant is heat tolerant in zones 9 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of “heat days” experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. A sprouting standard sending up shoots from the base [1-2]. The root pattern is flat with shallow roots forming a plate near the soil surface [1-2]. The root pattern is a heart root, dividing from the crown into several primary roots going down and out [1-2]. The root pattern is suckering with new plants from underground runners away from the plant [1-2].

## 5.2.382 Crataegus phaenopyrum

Washington Thorn, Washington Hawthorn

4 tin 8 cyuc 2 kcaak 0 tcan 2 dwat 10 m hkuc  
hminhtut cyutli hgattcuphja7n hwicli hrasjlutnyikfrp hpa7tli flatprikliwv hpa7tmwatli xre7t hjonli

drutta Crataegus phaenopyrum is a deciduous Tree growing to 10 m (32ft) by 10 m (32ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in July, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Midges. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[62]. A dry flesh[43]. Very small, about 5mm in diameter, it often hangs on the tree all winter[200]. There are up to five fairly large seeds in the centre of the fruit, these often stick together and so the effect is of eating a cherry-like fruit with a single seed[K].

tcanta Wood - heavy, hard, tough, close-grained. Useful for making tool handles, mallets and other small items[82].

dwatta Cardiotonic HypotensiveAlthough no specific mention has been seen for this species, the fruits and flowers of many hawthorns are well-known in herbal folk medicine as a heart tonic and modern research has borne out this use. The fruits and flowers have a hypotensive effect as well as acting as a direct and mild heart tonic[222]. They are especially indicated in the treatment of weak heart combined with high blood pressure[222]. Prolonged use is necessary for it to be efficacious[222]. It is normally used either as a tea or a tincture[222].

propta Seed - this is best sown as soon as it is ripe in the autumn in a cold frame, some of the seed will germinate in the spring, though most will probably take another year. Stored seed can be very slow and erratic to germinate, it should be warm stratified for 3 months at 15°C and then cold stratified for another 3 months at 4°C[164]. It may still take

another 18 months to germinate[78]. Scarifying the seed before stratifying it might reduce this time[80]. Fermenting the seed for a few days in its own pulp may also speed up the germination process[K]. Another possibility is to harvest the seed ‘green’ (as soon as the embryo has fully developed but before the seedcoat hardens) and sow it immediately in a cold frame. If timed well, it can germinate in the spring[80]. If you are only growing small quantities of plants, it is best to pot up the seedlings as soon as they are large enough to handle and grow them on in individual pots for their first year, planting them out in late spring into nursery beds or their final positions. When growing larger quantities, it might be best to sow them directly outdoors in a seedbed, but with protection from mice and other seed-eating creatures. Grow them on in the seedbed until large enough to plant out, but undercut the roots if they are to be left undisturbed for more than two years.

nwatta Landscape Uses:Espalier, Firewood, Pollard, Specimen, Street tree. A very easily grown plant, it prefers a well-drained moisture retentive loamy soil but is not at all fussy[11, 200]. Once established, it succeeds in excessively moist soils and also tolerates drought[200]. It grows well on a chalk soil and also in heavy clay soils[200]. A position in full sun is best when plants are being grown for their fruit, they also succeed in semi-shade though fruit yields and quality will be lower in such a position[11, 200]. Most members of this genus succeed in exposed positions, they also tolerate atmospheric pollution[200]. Hybridizes freely with other members of this genus[200]. Seedling trees take from 5 - 8 years before they start bearing fruit, though grafted trees will often flower heavily in their third year[K]. The flowers have a foetid smell somewhat like decaying fish. This attracts midges which are the main means of fertilization. When freshly open, the flowers have more pleasant scent with balsamic undertones[245]. Seedlings should not be left in a seedbed for more than 2 years without being transplanted[11]. A very ornamental plant, there are some named varieties[1, 11, 200]. Special Features: North American native, Attractive flowers or blooms.

## 5.2.383 Loniceraciliosa

Orange Honeysuckle

4 tin 8 cyuc 2 kcaak 0 tcan 2 dwat 10 m hkuc  
hminhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwv hpa7tmwatli xre7t hjonli

drutta Loniceraciliosa is an evergreen Climber growing to 10 m (32ft 10in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf all year, in flower in June, and the seeds ripen in August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Fruit NectarEdible Uses: Fruit - raw or cooked[105, 177, 212]. Not tasty enough to be widely sought[212]. The fruit is about 5mm in diameter[200]. Children enjoy sucking the nectar from the base of the flowers[256, 257].

tcanta Fibre Hair MiscellanyAn infusion of the stems is used as a hair shampoo and tonic to make it grow[99, 257]. A fibre obtained from the stem is used in making mats, bags, blankets etc[99]. The stems were used as building materials by the native North American Indians. They were used with willow withes to reinforce suspension bridges across canyons and rivers. They were also twisted with coyote willow to lash together the framing poles of underground pit houses and to make a pliable ladder[257].

dwatta Contraceptive Epilepsy Miscellany Poulitce TB Women’s complaintsThe leaves are contraceptive and tonic[257]. An infusion has been used as a contraceptive and also as a treatment for problems in the womb[257]. A decoction has been used in the treatment of colds and tuberculosis[257]. A poultice of the chewed leaves has been applied to bruises[257]. An infusion of the woody part of the plant has been drunk in small amounts, or used as a bath, in the treatment of epilepsy[257].

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed requires 2 months cold stratification[113] and should be sown as soon as possible in a cold

drutta *Pyrus elaeagnifolia* is a deciduous Tree growing to 10 m (32ft) by 10 m (32ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in April. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105, 177]. The flesh is rather tough and gritty, but has a reasonable flavour when it is fully ripe[K]. The fruits are up to 2cm long[200].

tcanta None known  
dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe in the autumn, it will then usually germinate in mid to late winter. Stored seed requires 8 - 10 weeks cold stratification at 1°C and should be sown as early in the year as possible[200]. Temperatures over 15 - 20°C induce a secondary dormancy in the seed[200]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in a cold frame or greenhouse for their first year. Plant them out in late spring or early summer of the following year.

nwatta Prefers a good well-drained loam in full sun[200]. Grows well in heavy clay soils. Tolerates light shade but does not fruit so well in such a position. Tolerates atmospheric pollution, excessive moisture and a range of soil types if they are moderately fertile[200]. Established plants are drought tolerant[200]. Plants are hardy to at least -15°C[200]. The branches are thorny[200]. This species is closely related to *P. nivalis*[11].

## 5.2.380 Halesia tetraptera

Silverbell or Mountain Silverbell

4 tin 8 cyuc 2 kcak 2 tcan 0 dwat 10 m hkuc  
pcimhmimhtut cyutli tcup hwicli hrasjlnutnyik hpa7tli flatprik hpa7tmwatli hjonli

drutta *Halesia tetraptera* is a deciduous Tree growing to 10 m (32ft) by 10 m (32ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: The ripe fruit is chewed for its acidity and very tart [183]. Unripe fruits are sometimes pickled[2, 183].The fruit is about 4cm in diameter[200].

tcanta Wood - soft, light, close-grained[82]. It weighs 35lb per cubic foot[235]. Good for carving, turnery, crafts, woodenware, pulp [1-2]. Trees occasionally grow large enough for saw timber and are then cut and used for panelling and cabinet making[229]. Coppices readily [1-2].

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame[78, 113, 200]. It takes 18 months to germinate[113]. Warm stratifying the seed for 2 - 3 months at 14 - 25°C then cold stratifying for 2 - 3 months at 0 - 5°C can reduce the germination time. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of greenwood, 5 - 8cm with a heel, May/June in a frame. Roots in 28 days. A fair percentage[78]. Layering in early spring as the buds break. Takes 12 months. High percentage[78].

nwatta A small understory tree with a broad, rounded crown or a large shrub. It grows well with azaleas and rhododendrons and requires the same environmental conditions of moist, acidic, organically rich soil in part shade. Well-drained[202]. Requires a lime-free soil[200]. Dormant plants are hardy to about -25°C[184]. A very ornamental plant[1, 11], it has a moderate rate of growth and lives about 100 years[229]. It can flower when only 1.2 metres tall[113]. The flowers have a delicate sweet perfume[245]. The subspecies *H. tetraptera monticola* forms a tree about 24 metres

tall. Plants in this genus are notably resistant to honey fungus[200]. *Halesia tetraptera* has a dense crown providing 0 to 33% open space in their silhouette and cast deep shade [1-2]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2].

## 5.2.381 Fagus grandifolia

American Beech

4 tin 8 cyuc 2 kcak 3 tcan 2 dwat 10 m hkuc  
pcimhmimhtut cyutli kyucctup hwicli hrasjlnut hpa7tli flatprikwis hpa7tmwatli hjonli

drutta *Fagus grandifolia* is a deciduous Tree growing to 10 m (32ft) by 10 m (32ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from April to May, and the seeds ripen from October to November. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Inner bark Leaves Oil Oil SeedEc Uses: Coffee Oil OilYoung leaves - raw or cooked as a potherb[183]. A very nice mild flavour but the leaves quickly become tough so only the youngest should be used. New growth is usually produced for 2 periods of 3 weeks each year, one in spring and one in mid-summer. Seed - raw or cooked. Small but very sweet and nutritious[82, 117, 171, 183, 227], it is sold in local markets in Canada and some parts of America[82]. Rich in oil, the seed also contains up to 22% protein[213]. The raw seed should not be eaten in large quantities since it is believed to cause enteritis[159, 226]. It can be dried and ground into a powder, then used with cereal flours in making bread, cakes etc[183]. The germinating seeds can be eaten raw, they are tender, crisp, sweet and nutty[183]. The roasted seed is a coffee substitute[183, 213]. An edible semi-drying oil is obtained from the seed[177, 183]. Inner bark[177]. Dried, ground into a powder and then used as a thickening in soups etc or mixed with cereals when making bread[213].

tcanta Charcoal Oil Oil WoodThe oil obtained from the seed has been used as a fuel in oil lamps[226]. Wood - strong, hard, heavy, very close grained, not durable, difficult to cure[61, 82, 227]. It weighs 43lb per cubic foot[227]. Harvested commercially, it is used for furniture, flooring, tool handles, crates etc[227]. It makes an excellent charcoal and is used in artwork[61, 227]. A dynamic accumulator gathering minerals or nutrients from the soil and storing them in a more bioavailable form - used as fertilizer or to improve mulch.

dwatta Pectoral Skin VermifugeA decoction of the boiled leaves has been used as a wash and poultice to treat frostbite, burns, poison ivy rash etc[213, 222, 257]. The nuts have been eaten as a vermifuge[222, 257]. A tea made from the bark has been used in the treatment of lung ailments[222, 257]. It has also been used to procure an abortion when the mother was suffering[257].

propta Seed - the seed has a short viability and is best sown as soon as it is ripe in the autumn in a cold frame. Protect the seed from mice. Germination takes place in the spring. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. The seedlings are slow growing for the first few years and are very susceptible to damage by late frosts. The seed can also be sown in an outdoor seedbed in the autumn. The seedlings can be left in the open ground for three years before transplanting, but do best if put into their final positions as soon as possible and given some protection from spring frosts.

nwatta Landscape Uses:Firewood, Pest tolerant, Hedge, Aggressive surface roots possible, Screen, Specimen, Woodland garden. Thrives on a light or medium soil[11], doing well on chalk[1], but ill-adapted for heavy wet soils[1]. Young

blood cholesterol levels, act as a tonic to the digestive system and also tonify the circulatory system[K].

propta Seed - sow spring in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle - if you want to produce clumps more quickly then put three plants in each pot. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in spring once they are growing vigorously and are large enough. Division in spring. Very easy, the plants divide successfully at any time in the growing season and the divisions can be planted straight out into their permanent positions if required.

nwatta Prefers a sunny position in a light well-drained soil[1]. The bulbs should be planted fairly deeply[1]. Most members of this genus are intolerant of competition from other growing plants[203]. This species is closely related to *A. lineare*[203]. Grows well with most plants, especially roses, carrots, beet and chamomile, but it inhibits the growth of legumes[18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 5.2.306 Mentha arvensis villosa

American Wild Mint

4 tin 8 cyuc 3 kcak 0 tcan 2 dwat 0.6 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlnutnyikrip hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta *Mentha arvensis villosa* is a PERENNIAL growing to 0.6 m (2ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Condiment TeaLeaves - raw or cooked. Fragrant and pleasant tasting, the leaves are used as a flavouring in salads or cooked foods[183, 257]. A herb tea is made from the leaves[183, 257].

tcanta Essential Repellent StrewingThe plant is used as an insect repellent[18, 20, 99]. Rats and mice intensely dislike the smell of mint. The plant was therefore used in homes as a strewing herb and has also been spread in granaries to keep the rodents off the grain[244]. An essential oil is obtained from the leaves, it is used as a flavouring for toothpastes etc[61]. It contains thymol and pulegone[213].

dwatta Antiseptic Carminative Febrifuge StomachicAmerican wild mint, like many other members of this genus, is often used as a domestic herbal remedy, being valued especially for its antiseptic properties and its beneficial effect on the digestion. Like other members of the genus, it is best not used by pregnant women because large doses can cause an abortion. A decoction of the ground leaves and stems is used to treat feelings of nausea[213]. The tea is also used in the treatment of colds, fevers, sore throats, gas, colic, indigestion etc[222]. The leaves are harvested as the plant comes into flower and can be dried for later use[238]. The essential oil in the leaves is antiseptic, though it is toxic in large doses[222].

propta Seed - sow spring in a cold frame. Germination is usually fairly quick. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in the summer. *Mentha* species are very prone to hybridisation and so the seed cannot be relied on to breed true. Even without hybridisation, seedlings will not be uniform and so the content of medicinal oils etc will vary. When growing plants with a particular aroma it is best to propagate them by division[K]. Division can be easily carried out at almost any time of the year, though it is probably best done in the spring or autumn to allow the plant to establish more quickly. Virtually any part of the root is capable of growing into a new plant. Larger divisions can be planted out direct into their permanent positions. However, for maximum increase it is possible to divide the roots up into sections no more than 3cm long and pot these up in light shade in a cold frame. They will quickly become established and can be planted out in the summer.

nwatta An easily grown plant, it succeeds in most soils and situations so long as the soil is not too dry[1, 16, 200]. This species tolerates much drier conditions than other members of the genus[238]. Prefers a slightly acid soil[16]. Grows well in heavy clay soils. A sunny position is best for production of essential oils, but it also succeeds in partial shade. Plants are hardy to at least -15°C[238]. Most mints have fairly aggressive spreading roots and, unless you have the space to let them roam, they need to be restrained by some means such as planting them in containers that are buried in the soil[K]. The whole plant has a very strong smell of mint[245]. Hybridizes freely with other members of this genus. The flowers are very attractive to bees and butterflies[24]. A good companion plant for growing near brassicas and tomatoes, helping to deter insect pests[20]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 5.2.307 Juniperus communis nana

Juniper

4 tin 10 cyuc 3 kcak 4 tcan 3 dwat 0.5 m hkuc  
hmimhtut cyutli hgtakuyuctup hwicli hyishrasjlnutnyikrip hpa7tli frusflatprikdwisslip hpa7tmwatli nyanhjen hjonli

drutta *Juniperus communis nana* is an evergreen Shrub growing to 0.5 m (1ft 8in) by 1 m (3ft 3in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 2 and is not frost tender. It is in leaf all year, in flower from May to June, and the seeds ripen in October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

kcakta Edible Parts: FruitEdible Uses: Coffee Condiment TeaFruit - raw or cooked[2, 5, 9, 15]. It is usually dried [12]. The fruit is often used as a flavouring in sauerkraut, stuffings, vegetable pates etc, and is an essential ingredient of gin[183]. The aromatic fruit is used as a pepper substitute according to one report[183]. An essential oil is sometimes distilled from the fruit to be used as a flavouring[183]. Average yields are around 1%[7]. The cones are about 4 - 8mm in diameter and take 2 years to mature[200]. Some caution is advised when using the fruit, see the notes above on toxicity. The roasted seed is a coffee substitute[177]. A tea is made by boiling the leaves and stems[161]. A tea made from the berries has a spicy gin-like flavour[183].

tcanta Fibre Fuel Hair Incense Repellent Resin StrewingTinderA decoction of the branches is used as an anti-dandruff shampoo[172]. Yields the resin 'Sandarac', used in the production of a white varnish[74]. The stems were at one time used as a strewing herb[14]. The whole plant can be burnt as an incense and fumigant[66, 102, 146]. It makes a good insect repellent[102, 172]. The bark is used as cordage[61] and as a tinder[172]. An excellent fuel wood[66]. Many forms of this species are good ground cover plants for sunny situations[208].

dwatta Antiseptic Aromatic Carminative Diaphoretic Diuretic Rubefacient Stomachic Tonic UrinaryJuniper fruits are commonly used in herbal medicine, as a household remedy, and also in some commercial preparations. They are especially useful in the treatment of digestive disorders plus kidney and bladder problems[4]. The fully ripe fruits are strongly antiseptic, aromatic, carminative, diaphoretic, strongly diuretic, rubefacient, stomachic and tonic[4, 7, 9, 21, 46, 165, 240, 254]. They are used in the treatment of cystitis, digestive problems, chronic arthritis, gout and rheumatic conditions[254]. They can be eaten raw or used in a tea[222], but some caution is advised since large doses can irritate the urinary passage[4]. Externally, it is applied as a diluted essential oil, having a slightly warming effect upon the skin and is thought to promote the removal of waste products from underlying tissues[254]. It is, therefore, helpful when applied to arthritic joints etc[254]. The fruits should not be used internally by pregnant women since this can

cause an abortion[9]. The fruits also increase menstrual bleeding so should not be used by women with heavy periods[254]. When made into an ointment, they are applied to exposed wounds and prevent irritation by flies[4]. The essential oil is used in aromatherapy. Its keyword is 'Toxin elimination'[210].

propta The seed requires a period of cold stratification. The seed has a hard seedcoat and can be very slow to germinate, requiring a cold period followed by a warm period and then another cold spell, each of 2 - 3 months duration[78, 81]. Soaking the seed for 3 - 6 seconds in boiling water may speed up the germination process[11]. The seed is best sown as soon as it is ripe in a cold frame. Some might germinate in the following spring, though most will take another year. Another possibility is to harvest the seed 'green' (when the embryo has fully formed but before the seedcoat has hardened). The seedlings can be potted up into individual pots when they are large enough to handle. Grow on in pots until large enough, then plant out in early summer. When stored dry, the seed can remain viable for several years[1]. Cuttings of mature wood, 5 - 10cm with a heel, September/October in a cold frame. Plant out in the following autumn[1, 78]. Layering in September/October. Takes 12 months[78].

nwatta Succeeds in hot dry soils and in poor soils. Succeeds in most soils so long as they are well drained[186], preferring a neutral or slightly alkaline soil. Does well in chalky soils[1]. Grows well in heavy clay soils. Tolerates a pH range from 4 to 8[186]. Succeeds in light woodland but dislikes heavy shade[186]. Established plants are very tolerant of drought[186]. Although the fully dormant plant is cold-tolerant throughout Britain, the young growth in spring can be damaged by late frosts. A very polymorphic species, there is a huge range of cultivars of widely diverse habits[11, 81]. At least some forms tolerate maritime exposure[186], there is a thriving colony in an exposed position at Land's End in Cornwall[81]. Seed takes 2 - 3 years to ripen on the plant[11]. Plants are usually very slow growing, often only a few centimetres a year[186]. Resists honey fungus[88]. Plants are sometimes attacked by a rust, this fungus has an aecidial stage on hawthorn (*Crataegus* spp.)[1]. Dioecious. Male and female plants must be grown if seed is required. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is flat with shallow roots spreading near the soil surface [2-1].

### 5.2.308 Malva sylvestris

Mallow, High mallow, French Hollyhock, Common Mallow, Tree Mallow, Tall Mallow
4 tin 8 cyuc 3 kcaak 3 tcan 3 dwat 0.5 m hkuc hmimhtut cyutilt tcup hwicli hrasjlytnyuk hpa7tli flatprikliwis hpa7tmwatli fyfxre7t hjonli

drutta Malva sylvestris is a BIENNIAL/PERENNIAL growing to 0.5 m (1ft 8in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to September, and the seeds ripen from July to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves SeedEdible Uses: TeaLeaves - raw or cooked[2, 4, 7, 9, 94, 183]. Mucilaginous with a mild pleasant flavour, they are nice in soups where they act as a thickener[5]. The young leaves also make a very acceptable substitute for lettuce in a salad[K]. Immature seed - raw[183]. Used as a nibble[183], the seeds have a nice nutty flavour[12] but are too fiddly for most people to want to gather in quantity[K]. Flowers - raw. Added to salads or used as a garnish[183]. A pleasant mild flavour, with a similar texture to the leaves, they make a pleasant and pretty addition to the salad bowl[K]. The leaves are a tea substitute[46, 183].

tcanta Dye Fibre LitmusCream, yellow and green dyes can be obtained from the plant and the seed heads[168]. A tincture of the flowers forms a very delicate test for alkalis[4, 115]. The leaves are used to relieve insect bites and

stings[53]. A fibre obtained from the stems is useful for cordage, textiles and paper making[115].

dwatta Antiphlogistic Astringent Demulcent Diuretic Emollient Expectorant Laxative SalveAll parts of the plant are antiphlogistic, astringent, demulcent, diuretic, emollient, expectorant, laxative, salve[4, 7, 9, 21, 46, 222, 238]. The leaves and flowers can be eaten as part of the diet, or a tea can be made from the leaves, flowers or roots[222]. The leaves and flowers are the main part used, their demulcent properties making them valuable as a poultice for bruise, inflammations, insect bites etc, or they can be taken internally in the treatment of respiratory system diseases and problems with the digestive tract[4, 238, 254]. When combined with eucalyptus it makes a god remedy for coughs and other chest ailments[254]. Mallow has similar properties, but is considered to be inferior to the marsh mallow (*Althaea officinalis*) and are seldom used internally[4]. The plant is an excellent laxative for young children[7]. The leaves can be used fresh whenever they are available or can be harvested in the spring and dried for later use[254]. The flowers are harvested in the summer and can be dried for later use[254]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve *Malva sylvestris* for cough, bronchitis, inflammation of the mouth and pharynx (see [302] for critics of commission E).

propta Seed - sow early spring in situ. Germination should take place within 2 weeks.

nwatta Landscape Uses:Border, Massing. A very easily grown plant, succeeding in ordinary garden soil[1] and in poor soils[238]. It prefers a reasonably well-drained and moderately fertile soil in a sunny position[200], where it will produce a better crop of salad leaves[K]. Plants are hardy to about -20°c[187]. There are some named forms, selected for their ornamental value[187]. 'Mauritiana' is larger than the type with much more ornamental flowers[187]. The flavour of the leaves and flowers is considered by many to be superior to the type species[183]. Plants seem to be immune to the predations of rabbits[233]. Prone to infestation by rust fungus[200]. Special Features: Not North American native, Naturalizing, Attractive flowers or blooms.

### 5.2.309 Cardamine pratensis

Cuckoo Flower

4 tin 8 cyuc 3 kcaak 2 tcan 2 dwat 0.5 m hkuc hmimhtut cyutilt tcuphja7n hwicli hrasjlytnyuk hpa7tli flatprikliwis hpa7tmwatli fyfxre7t hjonli

drutta Cardamine pratensis is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from April to June, and the seeds ripen from May to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta Edible Parts: Flowers LeavesEdible Uses: Leaves and young shoots - raw or cooked[2, 5, 12, 52, 115]. Rich in vitamins and minerals[268], especially vitamin C[238], but with a bitter and pungent flavour[27]. The leaves and young shoots are harvested in the spring and taste rather like water cress[9]. The leaves can be available early in the year[K] and when used in small quantities make a very acceptable addition to salads[183, K]. Flowers and flower buds - raw. A pungent cress-like flavour[183, K]. The white flowers are very attractive, they make a pleasant nibble and also add a delicious flavour to salads[K].

tcanta Attracts wildlife.

dwatta Antirheumatic Antiscorbutic Antispasmodic Carminative Digestive Diuretic Stimulant Vitamin CCuckoo flower is seldom used in herbalism, though an infusion of the leaves has been used to treat indigestion and promote appetite[268]. The leaves and the flowering plant are antirheumatic, antiscorbutic, antispasmodic, carminative, digestive, diuretic, stimulant[9, 146, 172, 238, 240]. They are used internally in the treatment of chronic skin complaints, asthma and hysteria[238]. The plant is harvested in spring and early summer and is best used when fresh[9, 238].

the seeds ripen in October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[46, 82, 95]. A thin flesh, it is sweet but strongly flavoured of resin and has a mealy texture[82, 85, 229]. Used as a flavouring in stews[216, 257]. The fruit can be eaten fresh or it can be dried and ground into a powder then baked into cakes[61, 82, 183]. The cones are about 6 - 18mm in diameter, they take 2 years to mature[200].

tcanta Beads Fuel Hair Incense Thatching Tinder Wax WoodA wax on the fruit is obtained by simmering the fruit in hot water and skimming off the wax as it rises to the surface. The wax can be used to make aromatic candles[85]. The bark is employed as a tinder and is also made into a slow match[216, 257]. The crushed bark was twisted into a rope, tied at intervals with yucca (*Yucca* species), and wrapped into a coil. The free end was set on fire and kept smouldering by blowing on it at intervals. Fire could be carried in this fashion for several hours[257]. The bark has been used as a thatching on the roofs of buildings[257]. The dried seeds have been used as beads or as the 'rattle' in rattles[216]. An infusion of the plant has been used as a hair wash[257]. The plant has been burnt as an incense and fumigant in the home[257]. Wood - soft, close-grained, slightly fragrant[82]. It is used occasionally for fuel, fencing etc[82, 229].

dwatta Analgesic Antiseptic Blood tonic Diuretic Kidney Laxative Odontalgic Poultice SalveDesert juniper was widely employed medicinally by a number of native North American Indian tribes who used it to treat a variety of complaints, especially those connected to the bladder and kidneys and to the skin[257]. It is little, if at all, used in modern herbalism. The leaves are antiseptic, blood tonic and laxative[216, 257]. A decoction is used in the treatment of constipation[216]. A poultice of the leaves has been applied to the jaw to treat toothaches and sore and swollen gums[257]. A decoction of the young twigs has been used in the treatment of stomach aches, kidney complaints, haemorrhages, coughs and colds[257]. Fumes from the burning twigs have been inhaled in the treatment of headaches and colds[257]. The branches have been used in a sweat bath to treat rheumatism[257]. A strong decoction has been used as an antiseptic wash on sores[257]. A poultice of the mashed twigs has been used as a dressing on burns and swellings[257]. The seeds are analgesic[257]. They have been eaten in the treatment of headaches[257]. The fruits are analgesic, blood tonic and diuretic[257]. A decoction has been used to relieve the pain of menstrual cramps, to induce urination and to treat kidney complaints, fevers, coughs and colds[257]. Externally, a decoction has been used as a poultice on rheumatic joints[257].

propta The seed requires a period of cold stratification. The seed has a hard seedcoat and can be very slow to germinate, requiring a cold period followed by a warm period and then another cold spell, each of 2 - 3 months duration[78, 81]. Soaking the seed for 3 - 6 seconds in boiling water may speed up the germination process[11]. The seed is best sown as soon as it is ripe in a cold frame. Some might germinate in the following spring, though most will take another year. Another possibility is to harvest the seed 'green' (when the embryo has fully formed but before the seedcoat has hardened). The seedlings can be potted up into individual pots when they are large enough to handle. Grow on in pots until large enough, then plant out in early summer. When stored dry, the seed can remain viable for several years[1]. Cuttings of mature wood, 5 - 10cm with a heel, September/October in a cold frame. Plant out in the following autumn[1, 78]. Layering in September/October. Takes 12 months[78].

nwatta Succeeds in most soils if they are well drained, preferring a neutral or slightly alkaline soil[1, 11]. Thrives in calcareous soils[1]. A drought tolerant plant once established, succeeding in hot dry positions[200]. A slow-growing but long-lived tree, specimens several centuries old have been recorded[229]. It grows better in dry areas with hot summers, western Britain is generally to cool and wet for this species to thrive[200]. Good crops of fruit are produced in alternate years in the wild[229]. Closely related to *J. cali-*

formica[1, 82]. This species is resistant to honey fungus[88]. The seed takes 2 years to mature[200]. Plants are usually dioecious, though occasional trees with both male and female flowers are sometimes found[229]. Male and female plants must usually be grown if seed is required. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is flat with shallow roots spreading near the soil surface [2-1].

### 5.2.378 Acer carpinifolium

Hornbeam Maple

4 tin 7 cyuc 2 kcaak 0 tcan 0 dwat 10 m hkuc hmimhtut cyutilt tcup hwicli hrasjlytnyukfrip hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

drutta Acer carpinifolium is a deciduous Shrub growing to 10 m (32ft) by 6 m (19ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in May, and the seeds ripen in October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). . The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: SapEdible Uses: SweetenerThe sap contains a certain amount of sugar and can either be used as a drink, or can be concentrated into a syrup by boiling off the water[105, 177]. The syrup is used as a sweetener on many foods. The concentration of sugar is considerably lower than in the sugar maples (*A. saccharum*). The tree trunk is tapped in the early spring, the sap flowing better on warm sunny days following a frost. The best sap production comes from cold-winter areas with continental climates.

tcanta PreservativeThe leaves are packed around apples, rootcrops etc to help preserve them[18, 20].

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame, it usually germinates in the following spring. Pre-soak stored seed for 24 hours and then stratify for 2 - 4 months at 1 - 8°C. It can be slow to germinate. The seed can be harvested 'green' (when it has fully developed but before it has dried and produced any germination inhibitors) and sown immediately. It should germinate in late winter. If the seed is harvested too soon it will produce very weak plants or no plants at all[80, 113]. When large enough to handle, prick the seedlings out into individual pots and grow them on until they are 20cm or more tall before planting them out in their permanent positions. Layering, which takes about 12 months, is successful with most species in this genus. Cuttings of young shoots in June or July. The cuttings should have 2 - 3 pairs of leaves, plus one pair of buds at the base. Remove a very thin slice of bark at the base of the cutting, rooting is improved if a rooting hormone is used. The rooted cuttings must show new growth during the summer before being potted up otherwise they are unlikely to survive the winter. Grafting is impossible for this species because no compatible rootstock has been discovered.

nwatta Of easy cultivation, it prefers a good moist well-drained soil[11], preferring a sunny position but tolerating some shade[11, 200]. Grows well in heavy clay soils. Chlorosis can sometimes develop as a result of iron deficiency when the plants are grown in alkaline soils, but in general maples are not fussy as to soil pH. Most maples are bad companion plants, inhibiting the growth of nearby plants[18, 20]. This species is dioecious, at least one male plant needs to be grown with up to 5 females if seed is required. Special Features:Not North American native, Inconspicuous flowers or blooms.

### 5.2.379 Pyrus elaeagnifolia

4 tin 8 cyuc 2 kcaak 0 tcan 0 dwat 10 m hkuc hmimhtut cyutilt hgatyuctcup hwicli hrasjlytnyukfrip hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

tcanta Dye Shelterbelt WoodA yellow-tan dye is obtained from the leaves[106, 115]. Trees are sometimes used as part of a shelterbelt planting[227]. Wood - heavy, tough, durable, fine grained, hard. It weighs 51lb per cubic foot[227]. Used by cabinet and instrument makers[11, 61, 100, 149]. When covered with black varnish it is an excellent ebony substitute[74].

dwatta Astringent Febrifuge SedativeThe fruit is astringent, febrifuge and sedative[240].

propta Seed - best sown in a cold frame as soon as it is ripe in the autumn, it will then usually germinate in mid to late winter. Stored seed requires 8 - 10 weeks cold stratification at 1°C and should be sown as early in the year as possible[200]. Temperatures over 15 - 20°C induce a secondary dormancy in the seed[200]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in a cold frame or greenhouse for their first year. Plant them out in late spring or early summer of the following year.

nwatta Prefers a good well-drained loam in full sun[1, 200]. Grows well in heavy clay soils. Tolerates light shade but does not fruit so well in such a position. Tolerates atmospheric pollution, excessive moisture and a range of soil types, if they are moderately fertile[200], avoiding only the most acid soils[186]. Dislikes very exposed positions[186]. Established plants are drought tolerant[200]. A very hardy plant, tolerating temperatures down to below -15°C[200]. Plants often sucker and can form dense thickets[186]. A parent of the cultivated pear, possibly by crossing with *P. nivalis* and *P. cordata*[11]. There are many hundreds of varieties of cultivated pears and they are widely cultivated in the temperate zone for their edible fruits. By selection of varieties fresh fruit can be obtained from late July to April or May of the following year. Special Features: Edible, Not North American native, Naturalizing, Attractive flowers or blooms. The plant is heat tolerant in zones 9 through 5. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

### 5.2.375 Celtis koraiensis

4 tlin 8 cyuc 2 kcaok 0 tcan 0 dwat 12 m hkuc htuc cyutli hgatkyuctcup hwicli hyishrasjlut hpa7tli flatprikli-wisslip hpa7tmwatli xre7t hjonli

drutta Celtis koraiensis is a deciduous Tree growing to 12 m (39ft 4in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in April, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw[105, 177]. The fruit is about 10mm in diameter[200] with a thin flesh and a single large seed[K].

tcanta None known dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame[200]. Stored seed is best given 2 - 3 months cold stratification and then sown February/March in a greenhouse[78, 200]. Germination rates are usually good, though the stored seed might take 12 months or more to germinate. The seed

can be stored for up to 5 years[113]. As soon as they are large enough to handle, prick the seedlings out into individual pots. The leaves of seedlings often have a lot of white patches without chlorophyll, this is normal and older plants produce normal green leaves. Grow the seedlings on in a cold frame for their first winter, and plant them out in the following late spring or early summer[K]. Give them some protection from the cold for their first winter outdoors. Cuttings

nwatta Succeeds in any reasonably good soil, preferring a good fertile well-drained loamy soil[1, 11, 200]. Succeeds on dry gravels and on sandy soils[200]. Established plants are very drought resistant[200]. Trees prefer hotter summers and more sunlight than are normally experienced in Britain, they often do not fully ripen their wood when growing in this country and they are then very subject to die-back in winter[1, 11, 200]. Trees can be very long-lived, perhaps to 1000 years[200]. Plants in this genus are notably resistant to honey fungus[200].

### 5.2.376 Sorbus intermedia

Swedish Whitebeam

4 tlin 8 cyuc 2 kcaok 0 tcan 0 dwat 12 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli frusflatprikli-wisslip hpa7tmwatli wixfjyre7t hjonli

drutta Sorbus intermedia is a deciduous Tree growing to 12 m (39ft) by 12 m (39ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in May, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects, Apomictic (reproduce by seeds formed without sexual fusion). The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[2, 3]. A mild, though slightly bitter flavour with a mealy texture[K]. The fruit is up to 13mm across[200] and is produced in quite large clusters, making harvesting easier[K].

tcanta Hedge Hedge ShelterbeltResistant to maritime exposure, this tree can be used as a part of a shelterbelt planting[75, 200]. If regularly trimmed it can be used as a dense deciduous hedge[200].

dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame[78, 80]. If you have sufficient seed it can be sown in an outdoor seedbed[78, 80]. Stored seed germinates better if given 2 weeks warm then 14 - 16 weeks cold stratification[98], so sow it as early in the year as possible. Prick out the seedlings into individual pots when they are large enough to handle. Seedlings are very slow to put on top-growth for their first year or two[11], but they are busy building up a good root system. It is best to keep them in pots in a cold frame for their first winter and then plant them out into their permanent positions in late spring.

nwatta Succeeds in most reasonably good well-drained soils in an open sunny position[11]. Tolerates very acid or alkaline soils[200] and light shade[188], though it fruits better in a sunny position[K]. Suitable for very exposed sites, including maritime exposure[75, 200]. Tolerates atmospheric pollution[11, 200]. Resistant to firebright[11]. The trees usually have apomictic flowers. They thus produce seed asexually, each seedling being a clone of the parent[11]. The fruits are very attractive to birds[11].

### 5.2.377 Juniperus osteosperma

Desert Juniper, Utah juniper

4 tlin 8 cyuc 2 kcaak 3 tcan 2 dwat 12 m hkuc

htut cyutli hgatkyuctcup hwicli hrasjlutnyik hpa7tli flatprikli-wisslip hpa7tmwatli nyanhjen hjonli

drutta Juniperus osteosperma is an evergreen Tree growing to 12 m (39ft 4in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf all year, and

propta Seed - sow outdoors in a seedbed in a shady position in April. Plant out in autumn or spring. Division in spring or autumn[238]. The plant produces young plants at the base of its leaflets. When large enough, these can be easily separated from the main plant and grown on as individual plants[K].

nwatta Succeeds in most soils[1, 111] so long as they are moist or wet[187, 188]. Prefers a cool damp soil[111]. Succeeds in full sun or partial shade[238]. Cuckoo flower was at one time much used as a spring salad plant and was often sold in local markets. It has, however, fallen out of favour and is scarcely used at present[268]. A polymorphic species[17]. A very ornamental plant, non-invasive and well suited to the wild garden though it may require protection from wood pigeons who eat out the young buds in spring[187]. It grows well in the spring meadow[24]. A food plant for the orange tip butterfly[24]. There is at least one named variety, selected for its ornamental value. ‘Flore Pleno’ is a double flowered form[187]. The plant is heat tolerant in zones 8 through 5. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

### 5.2.310 Yucca angustissima

Narrowleaf yucca, Kanab yucca, Toft’s yucca, Yucca

4 tlin 9 cyuc 3 kcaak 4 tcan 0 dwat 0.4 m hkuc

hmimhtut cyutli hgatkyuctcup hwicli hyishrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Yucca angustissima is an evergreen Shrub growing to 0.4 m (1ft 4in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Hand. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: Flowers Fruit StemEdible Uses: Fruit - the immature fruit is cooked[85]. Baked in an oven[216]. A bitter taste, the bitterness is in the skin[85]. The fruit is about 6cm long and 2.5cm wide[200]. Flowers - raw or cooked. They are delicious raw, or can be dried, crushed and used as a flavouring[85]. Flowering stem - peeled, cooked and used like asparagus. The whitish inner portion is used[85].

tcanta Basketry Broom Brush Fibre SoapA fibre obtained from the leaves is used for making ropes, baskets and mats[85]. The leaves are very fibrous and can be used as paint brushes[92] or as a broom or woven to make mats etc[85]. They are also used in basketry[216]. The roots are rich in saponins and can be used as a soap substitute[85, 216].

dwatta None known

propta Seed - sow spring in a greenhouse. Pre-soaking the seed for 24 hours in warm water may reduce the germination time. It usually germinates within 1 - 12 months if kept at a temperature of 20°C. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse or cold frame for at least their first two winters. Plant them out into their permanent positions in early summer and consider giving them some winter protection for at least their first winter outdoors - a simple pane of glass is usually sufficient[K]. Seed is not produced in Britain unless the flowers are hand pollinated. Root cuttings

in late winter or early spring. Lift in April/May and remove small buds from base of stem and rhizomes. Dip in dry wood ashes to stop any bleeding and plant in a sandy soil in pots in a greenhouse until established[78].

nwatta Landscape Uses:Border, Massing, Specimen. Thrives in any soil but prefers a sandy loam and full exposure to the south[11]. Plants can succeed in light shade[K]. They are harder when grown on poor sandy soils[200]. Established plants are very drought resistant, this species is also tolerant of damp weather[11]. Plants are not hardy in the colder areas of the country, they tolerate temperatures down to about -10° if in a suitable location[11, 200]. Closely allied to *Y. glauca*[11]. The plant has a thick prostrate rootstock[11]. In the plants native environment, its flowers can only be pollinated by a certain species of moth. This moth cannot live in Britain and, if fruit and seed is required, hand pollination is necessary. This can be quite easily and successfully done using something like a small paint brush. Individual crowns are monocarpic, dying after flowering[233]. However, the crown will usually produce a number of sideshoots before it dies and these will grow on to flower in later years[233]. Plants in this genus are notably resistant to honey fungus[200]. Members of this genus seem to be immune to the predations of rabbits[233]. Special Features:North American native, Fragrant flowers, Attractive flowers or blooms.

### 5.2.311 Lycopus uniflorus

Bugleweed, Northern bugleweed

4 tlin 8 cyuc 3 kcaok 0 tcan 1 dwat 0.3 m hkuc

hmimhtut cyutli tcupha7n hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Lycopus uniflorus is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta Edible Parts: RootEdible Uses: Root - raw or cooked[55, 61, 62, 105, 161]. The roots were a staple food for some native North American Indian tribes[257]. The crisp white tubers can be eaten raw in salads or cooked in soups etc[183]. When boiled for a short time they are said to make an agreeable vegetable, somewhat like Chinese artichokes (*Stachys affinis*) [183].

tcanta None known

dwatta Antitussive SedativeThe whole plant is antitussive and sedative[61].

propta Seed - sow spring or autumn in a cold frame[238]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse for their first year. Plant them out into their permanent positions in early summer. Division in spring or autumn[238]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta We have very little information on this species and do not know if it will be hardy in Britain, though judging by its native range it should succeed outdoors in many parts of the country. This species might be no more than a synonym for *L. virginicus*, a species known to be hardy in Britain. The following notes are based on the general needs of the genus. Tolerates most soil types so long as they are wet. Succeeds in damp meadows or in wet places by ponds or streams[200]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is stoloniferous rooting from creeping stems above the ground [1-2]. The root pattern is tuberous with swollen potato-like roots [1-2].

## 5.2.312 Balsamorhiza incana

Hoary Balsamroot

4 tin 8 cyuc 3 kcaok 0 tcan 1 dwat 0.9 m hkuc  
htut cyutli kyuctcup hwicli hrasjlut hpa7tli flatprikliws  
hpa7tmwatli xre7t hjonli

drutta Balsamorhiza incana is a PERENNIAL growing to 0.9 m (3ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: RootEdible Uses: Root - raw or cooked[105, 161, 177]. The thick root can be eaten raw[257]. Seed - raw or cooked. It can be ground into a powder and made into a bread.

tcanta None known

dwatta Analgesic StomachicA decoction of the leaves, roots and stems has been used in the treatment of stomach pains and colds and as a steam bath for treating headaches[257].

propta Seed - sow early spring in a greenhouse and only just cover the seed. Germination usually takes place within 2 - 6 days at 18°C. Either sow the seed in individual pots or pot up the seedlings as soon as they are large enough to handle and plant them out into their permanent positions in the summer[134]. Division in spring. Very difficult since the plant strongly resents root disturbance[134]. It is probably best to take quite small divisions, or basal cuttings, without disturbing the main clump. Pot these up into individual pots and keep them in light shade in the greenhouse until they are growing away well. Plant them out in the summer if they have grown sufficiently, otherwise over-winter them in the greenhouse and plant out in late spring.

nwatta Requires a deep fertile well-drained loam in full sun[134, 200]. Plants strongly resent winter wet[134, 200]. Hardy to at least -25°C[200]. Plants are intolerant of root disturbance and should be planted into their permanent positions whilst still small[134].

## 5.2.313 Spinacia oleracea

Spinach

4 tin 8 cyuc 3 kcaok 1 tcan 2 dwat 0.3 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliws  
hpa7tmwatli nyanhjen hjonli

drutta Spinacia oleracea is a ANNUAL growing to 0.3 m (1ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in leaf all year, in flower from June to September. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves SeedEdible Uses: ColouringLeaves - raw or cooked[1, 2, 16, 37, 132]. Tender young leaves can be added to salads, older leaves are used as greens or added to soups etc[183, 201]. The leaves contain oxalic acid (6 - 8% in young leaves, 23 - 27% in the cotyledons)[218], see the notes above on toxicity. A nutritional analysis of the leaves is available[218]. Seeds - raw or cooked. It can be sprouted and added to salads[183]. Chlorophyll extracted from the leaves is used as an edible green dye[142].

tcanta DyeA yellow dye is obtained from the leaves[100].

dwatta Appetizer Carminative Febrifuge Hypoglycaemic Laxative UrinaryThe plant is carminative and laxative[218]. In experiments it has been shown to have hypoglycaemic properties[218]. It has been used in the treatment of urinary calculi[240]. The leaves have been used in the treatment of febrile conditions, inflammation of the lungs and the bowels[240]. The seeds are laxative and cooling[240]. They have been used in the treatment of difficult breathing, inflammation of the liver and jaundice[240].

propta Seed - sow in situ from March to June for a summer crop. Make successional sowings, perhaps once a

month, to ensure a continuity of supply. The seed germinates within about 2 weeks and the first leaves can be harvested about 6 weeks later. Seed is sown in situ during August and September for a winter crop.

nwatta Plants grow best and produce their heaviest crop of leaves on a nitrogen-rich soil[16, 37, 200]. They dislike very heavy or very light soils[37]. They also dislike acid soils, preferring a neutral to slightly alkaline soil[200]. Plants require plenty of moisture in the growing season, dry summers causing the plants to quickly run to seed[27]. Summer crops do best in light shade to encourage more leaf production before the plant goes to seed[27], winter crops require a warm dry sunny position[1, 27]. Young plants are hardy to about -9°C[200]. Spinach is often cultivated for its edible leaves, there are some named varieties[132, 183]. These varieties can be grouped into two main types as detailed below:- Forms with prickly seeds. These are the more primitive forms. Their leaves are more lobed and they are in general more cold tolerant and also more resistant of summer heat[264]. They were more often used to produce a crop in the winter[200, 264]. Forms with round seeds have been developed in cultivation, These have broader leaves, tend to be less cold hardy and were also more prone to bolt in hot weather[264]. They were used mainly for the summer crop[200]. Most new cultivars are of the round seeded variety and these have been developed to be more resistant to bolting in hot weather, more cold tolerant, to produce more leaves and also to be lower in calcium oxalate which causes bitterness and also has negative nutritional effects upon the body[264]. Some modern varieties have been developed that are low in oxalic acid. Edible leaves can be obtained all year round from successional sowings[200]. The summer varieties tend to run to seed fairly quickly, especially in hot dry summers and so you need to make successional sowings every few weeks if a constant supply is required. Winter varieties provide leaves for a longer period, though they soon run to seed when the weather warms up. Spinach grows well with strawberries[18, 20]. It also grows well with cabbages, onions, peas and celery[201]. A fast-growing plant, the summer crop can be interplanted between rows of slower growing plants such as Brussels sprouts. The spinach would have been harvested before the other crop needs the extra space[200]. Spinach is a bad companion for grapes and hyssop[201]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is fleshy. Thick or swollen - fibrous or tap root [2-1].

## 5.2.314 Brassica oleracea gongyloides

Kohl Rabi

4 tin 8 cyuc 3 kcaok 0 tcan 1 dwat 0.5 m hkuc  
hmimhtut cyutli hgattcup hwicli hrasjlutnyikfrfp hpa7tli flatprikliws  
hpa7tmwatli fyifxre7t hjonli

drutta Brassica oleracea gongyloides is a BIENNIAL growing to 0.5 m (1ft 8in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from May to August, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil and can tolerate drought. The plant can tolerate maritime exposure.

kcakta Edible Parts: Leaves StemEdible Uses: Leaves - cooked[142]. Used as a vegetable, though the quality is not as good as cabbage. The young leaves can also be added to salads, though some people find them difficult to digest. A nutritional analysis is available[218]. Stem - raw or cooked. The plant produces a swollen stem just above ground level, and this is often used as a root vegetable[K]. It has a mild cabbage flavour, when finely grated it makes a good addition to mixed salads and, when cooked, is an excellent vegetable[K]. It is best eaten whilst fairly small and tender, between golf ball and tennis ball size. It becomes coarse with age[33, 116, 142]. A nutritional analysis is available[218].

of cold stratification, some species taking 2 or more years to germinate[K]. We sow the seed of temperate species in a cold frame as soon as we receive it, and would sow the seed as soon as it is ripe if we could obtain it then[K]. When the seedlings eventually germinate, prick them out into individual pots when they are large enough to handle and grow them on in the greenhouse for at least their first year, though we normally grow them on in pots for 2 years. Plant them out into their permanent positions in early summer. Division in early spring as new growth begins[238]. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them out in a lightly shaded position in a cold frame, planting them out once they are well established in the summer. Cuttings of half-ripe shoots, July in a frame[238].

nwatta Succeeds in most soils in sun or semi-shade[200]. Plants are hardy to about -15°C[200]. A very ornamental plant[1], it thrives in Britain[11]. Dioecious. Male and female plants must be grown if seed is required.

## 5.2.372 Nyssa sylvatica

Black Tupelo, Blackgum, Sour Gum, Black Tupelo

4 tin 9 cyuc 2 kcaok 0 tcan 1 dwat 15 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli prikliws  
hpa7tmwatli xre7t hjonli

drutta Nyssa sylvatica is a deciduous Tree growing to 15 m (49ft) by 12 m (39ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 3. It is in leaf from May to October, in flower in June, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. A thin sharply acid pulp that is pleasant to roll in the mouth as a masticatory[183], it is also used in preserves[177, 183]. Pleasantly acidulous[2]. The fruit is up to 15mm in diameter and is borne in small clusters of 2 - 3[82, 200].

tcanta WoodWood - tough, not durable, soft, heavy, hard to work and warps easily. It has an intricately contorted and twisted grain[82]. It weighs 40lb per cubic foot and is used for making boxes, soles of shoes, wooden pipes, wheel hubs, veneer etc[43, 46, 61, 82, 171, 227, 235].

dwatta Emetic Ophthalmic VermifugeThe bark is emetic, ophthalmic and vermifuge[257]. An infusion has been used as a bath and also given to children with worms[257]. A strong decoction is used to cause vomiting when unable to retain food[257]. A strong ooze from the roots is used as eye drops[257].

propta The seed can be sown in late winter in a cold frame[78] but would probably benefit from an earlier sowing if the seed can be obtained any sooner. Three months stratification at 5°C improves germination[200]. Germination rates are variable[78]. As soon as they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Give the plants some protection from the cold for their first winter outdoors. Cuttings of half-ripe wood, July/August in a frame. Layering.

nwatta Landscape Uses:Firewood, Pest tolerant, Aggressive surface roots possible, Specimen. Although this is a plant of swamps and other wet soils in the wild, once established it can succeed in Britain when growing in an ordinary good loamy soil in sun or semi-shade[11, 200]. It prefers a neutral to alkaline soil according to one report[200], whilst another says that it requires a lime-free soil[98]. Tolerates atmospheric pollution and growing in maritime regions[200]. A very ornamental tree[1], it has a moderate rate of growth and moderate longevity[229]. Resents root disturbance, it is difficult to transplant except when young[11]. The tree does not come into leaf until late May. Plants in this genus are notably resistant to honey fungus[200]. Special Features:Attracts birds, North American native, Wetlands plant, Attracts butterflies, Inconspicuous flowers or blooms.

## 5.2.373 Ulmus davidiana

Japanese Elm

4 tin 8 cyuc 2 kcaok 0 tcan 0 dwat 15 m hkuc  
hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliws  
hpa7tmwatli xre7t hjonli

drutta Ulmus davidiana is a deciduous Tree growing to 15 m (49ft 3in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in May, and the seeds ripen from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Fruit Inner bark LeavesEdible Uses: Leaves - raw or cooked[105, 177]. Young fruits - cooked[105, 177]. Inner bark - dried, ground into a powder and used as a thickening in soups or added to cereal flours when making bread etc[105, 177].

tcanta Fibre WoodA fibre is obtained from the inner bark[189]. The bark is soaked for 7 - 10 days in water, the inner and outer barks are then separated and the inner bark is stripped into strands and made into thread by chewing it. It is made into a coarse fabric[189]. Wood - heavy, difficult to work. Used for axles, hubs etc[46, 61].

dwatta None known

propta Seed - if sown in a cold frame as soon as it is ripe, it usually germinates within a few days[200]. Stored seed does not germinate so well and should be sown in early spring[200]. The seed can also be harvested 'green' (when it has fully developed but before it dries on the tree) and sown immediately in a cold frame. It should germinate very quickly and will produce a larger plant by the end of the growing season[80]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Plants should not be allowed to grow for more than two years in a nursery bed since they form a tap root and will then move badly. Layering of suckers or coppiced shoots[200].

nwatta Prefers a fertile soil in full sun[188], but it is easily grown in any soil of at least moderate quality so long as it is well drained[1]. This species is resistant to 'Dutch elm disease', a disease that has destroyed the greater part of all the elm trees growing in Britain. The disease is spread by means of beetles. There is no effective cure (1992) for the problem, but most E. Asian, though not Himalayan, species are resistant (though not immune) to the disease so the potential exists to use these resistant species to develop new resistant hybrids with the native species[200]. The various species of this genus hybridize freely with each other and pollen is easily saved, so even those species with different flowering times can be hybridized[200]. Closely related to U. japonica[200].

## 5.2.374 Pyrus communis

Wild Pear, Common pear

4 tin 9 cyuc 2 kcaok 3 tcan 1 dwat 13 m hkuc  
hmimhtut cyutli hgattcup hwicli hrasjlutnyikfrfp hpa7tli flatprikliws  
hpa7tmwatli xre7t hjonli

drutta Pyrus communis is a deciduous Tree growing to 13 m (42ft 8in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from April to May, and the seeds ripen from October to December. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil and can tolerate drought. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[2, 5]. The fruit of wild pears often remains very hard unless bletted[186]. It is more suitable for use in pies etc. The fruit is up to 5cm long[200].

it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. Leaves - cooked. A famine food when all else fails[179]. The roasted seed is a coffee substitute.

tcanta Repellent Tannin WoodA mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth[20]. Oak galls are excrescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4]. Wood - very hard, strong, red-brown in colour. Used for farm implements etc[61, 146].

dwatta Astringent DysenteryAny galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4].

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Young plants tolerate reasonable levels of side shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. Prefers warmer summers than are usually experienced in Britain, trees often grow poorly in this country and fail to properly ripen their wood resulting in frost damage overwinter[200]. Trees are often coppiced in China[109]. The seed ripens in its first year[200]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. Hybridizes freely with other members of the genus[200]. Plants in this genus are notably resistant to honey fungus[200].

## 5.2.370 Ilex opaca

American Holly

4 tlin 8 cyuc 2 kcak 0 tcan 2 dwat 15 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyk hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Ilex opaca is an evergreen Shrub growing to 15 m (49ft) by 1.5 m (5ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf all year, in flower from May to June, and the seeds ripen from November to December. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

ckakta Edible Parts: Edible Uses: TeaThe roasted leaves are used as a tea substitute[161, 177]. They do not contain caffeine[183]. The drink was a very popular tea substitute during the American Civil war[183].

tcanta Dye Hedge Hedge Shelterbelt WoodA number of cultivars of this species are used for hedging[200]. Fairly wind-resistant, this species is also used in shelterbelt plantings[200]. A dye has been made from the berries - the colour is not given[257]. Wood - light, tough, not strong, close grained, highly shock resistant, easily worked[82, 149, 171, 229]. A strikingly white wood, it is valued for use in veneers and inlay[274]. It weighs 36lb per cubic foot[235]. Too small for commercial exploitation, but it is valued for use in cabinet making and the interior finishes of houses[82], it is also used for making small items such as tool handles[149, 171, 229]. The wood can also be stained to imitate ebony[171].

dwatta Antiperiodic Diuretic Emetic Epilepsy Laxative Malaria Ophthalmic SkinThe berries are laxative, emetic and diuretic[222]. They are used in the treatment of children's diarrhoea, colic and indigestion[222]. A tea made from the leaves has been used as a treatment for measles, colds etc[222, 257]. The leaves have also been used externally in the treatment of sore eyes, sore and itchy skin[222, 257]. A tea made from the bark was once used in the treatment of malaria and epilepsy[222]. It has also been used as a wash for sore eyes and itchy skin[257].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. It can take 18 months to germinate. Stored seed generally requires two winters and a summer before it will germinate and should be sown as soon as possible in a cold frame. Scarification, followed by a warm stratification and then a cold stratification may speed up the germination time[78, 80]. The seedlings are rather slow-growing. Pot them up into individual pots when they are large enough to handle and grow them on in light shade in a cold frame for their first year. It is possible to plant them out into a nursery bed in late spring of the following year, but they should not be left here for more than two years since they do not like being transplanted. Alternatively, grow them on in their pots for a second season and then plant them out into their permanent positions in late spring or early summer. Give them a good mulch and some protection for their first winter outdoors. Cuttings of almost ripe wood with a heel, August in a shaded position in a cold frame. Leave for 12 months before potting up. Layering in October. Takes 2 years.

nwatta Succeeds in most soils so long as they are not water-logged. Fairly wind-resistant[200]. Plants are hardy to about -25°c[184]. A slow-growing and long-lived species in the wild[229], but it does not thrive or fruit well in British gardens[182]. Plants do not thrive in a maritime climate[188]. There are many named forms, selected for their ornamental value[182, 200]. The leaves remain on the plant for about 3 years, falling in the spring[82]. Flowers are produced on the current year's growth[229]. Resents root disturbance, especially as the plants get older[11]. It is best to place the plants into their permanent positions as soon as possible, perhaps giving some winter protection for their first year or two[K]. Plants are very tolerant of pruning and can be cut right back into old wood if required[188]. Dioecious. Male and female plants must be grown if seed is required.

### 5.2.371 Smilax hispida

Hag Briar

4 tlin 8 cyuc 2 kcak 0 tcan 2 dwat 15 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyk hpa7tli flatpriklwisslip hpa7tmwatli nyanhjen hjonli

drutta Smilax hispida is a deciduous Climber growing to 15 m (49ft 3in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in June. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). . The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

ckakta Edible Parts: Leaves RootEdible Uses: Leaves and young shoots - raw or cooked[102]. Root - cooked. It can be dried, ground into a powder and then used with cereals for making bread etc[2, 62, 102]. It can also be used as a gelatine substitute[2, 62, 102].

tcanta None known

dwatta Birthing aid Poultice RubefacientThe stem prickles have been rubbed on the skin as a counter-irritant to relieve localised pains, muscle cramps and twitching[222]. A tea made from the leaves and stems has been used in the treatment of rheumatism and stomach problems[222]. The wilted leaves are applied as a poultice to boils[222]. A tea made from the roots is used to help the expelling of afterbirth[222]. Reports that the roots contain the hormone testosterone have not been confirmed, they might contain steroid precursors, however[222].

propta Seed - sow March in a warm greenhouse[1]. This note probably refers to the tropical members of the genus, seeds of plants from cooler areas seem to require a period

tcanta None known

dwatta Digestive TonicThe leaf is digestive and tonic[218].

propta Seed - sow April to August in situ. Earlier sowings can be made under cloches.

nwatta Succeeds in full sun in a well-drained fertile preferably alkaline soil[200]. Succeeds in any reasonable soil, though it is best not grown in an acid soil[16, 33]. Tolerates a pH in the range 4.5 to 7.5. Prefers some shade and plenty of moisture in the growing season[20, 37]. Established plants are drought tolerant but the best stems are formed when the plant does not go short of moisture[20, 37]. Succeeds in maritime gardens[200]. Very winter hardy, kohlrabi withstands severe frosts and so can be left in the ground all winter in most areas and be harvested as required. The young growing plant, however, is sensitive to low temperatures and a week at 10°c will cause the plants to bolt[200]. It grows best at a temperature between 18 and 25°c[200]. Kohlrabi is often cultivated for its edible swollen stem which can be available almost all year round from successional sowings. There are several named varieties and stem colour can range from white to green and purple[200]. Green forms are faster to mature and so more suitable for early sowings, the purple forms are harder and later to mature, they are used mainly for winter crops[200]. Very fast growing, the stems of some cultivars can be harvested 6 - 8 weeks after sowing[33]. The plant is more tolerant of drought and high temperatures than turnips, which it resembles in flavour, and so it is often grown as a substitute for that species[200]. Grows well with onions, beet and aromatic herbs which seem to reduce insect predations[18, 20, 201]. Plants also grow well with cucumbers, the roots of each species occupying different levels in the soil[201]. Grows badly with strawberries, runner beans and tomatoes[18, 20, 201].

### 5.2.315 Hosta longipes

4 tlin 8 cyuc 3 kcak 3 tcan 0 dwat 0.3 m hkuc pcmhmimhtut cyutli hgattcup hwicli hrasljutnykifrip hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Hosta longipes is a PERENNIAL growing to 0.3 m (1ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from July to September, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil and can tolerate drought.

ckakta Edible Parts: Leaves StemEdible Uses: Young leaves and leaf stems - cooked. Sourish[105]. A very acceptable taste, but somewhat fibrous[K].

tcanta A good ground cover plant, succeeding in dense shade.

dwatta None known

propta Seed - sow spring in a lightly shaded position in a greenhouse and only just cover the seed. Germination usually takes place within 1 - 3 months at 10°c. Make sure you keep the compost moist. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division is possible at almost any time of the year so long as there is sufficient moisture[233]. It is best carried out in March as growth commences or in early autumn if the soil is not too dry[200]. Hostas can be left undivided for many years and should not be divided any more frequently than once every 3 - 5 years to allow the leaves to reach maturity[200].

nwatta Thrives in most fertile soils if they are rich in humus[200]. Grows well in heavy clay soils and in sandy ones[208]. Very limy soils inhibit growth, but plants can thrive in such a situation if plenty of humus is added[208]. Prefers a pH between 6 and 7[200]. Requires a rich soil that does not dry out readily[1]. Another report says that once established it is drought tolerant[187]. Does well in the semi-shade of a woodland[200] also succeeding in deeper shade[187]. In general, the sunnier the position the moister

the soil should be[233]. Plants are best not grown under trees in town gardens since the soot washed from the leaves of the trees in wet weather will tend to remain on the hosta[208]. Plants flower better when grown in a sunny position but the foliage is better when the plant is in a shady position[200]. Plants are in general fully hardy in Britain, but young leaves in spring can be destroyed by frost. New leaves are only produced in the spring and very early summer, so any damage at this time has a deep effect on the plant[233]. A vigorous plant, forming medium sized clumps. The roots travel extensively[200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. Plants are very attractive to slugs and snails, the young shoots in spring are especially at risk[111, K]. Hybridizes freely with other members of this genus, especially with *H. kikutii*[200].

### 5.2.316 Melissa officinalis

Lemon Balm, Common balm, Bee Balm, Sweet Balm, Lemon Balm

4 tlin 8 cyuc 3 kcak 3 tcan 5 dwat 0.7 m hkuc hmimhtut cyutli hgatkyuctup hwicli hrasljut hpa7tli flat-priklwis hpa7tmwatli xre7t hjonli

drutta Melissa officinalis is a PERENNIAL growing to 0.7 m (2ft 4in) by 0.4 m (1ft 4in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from June to October, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

ckakta Edible Parts: LeavesEdible Uses: Condiment TeaLeaves - raw or cooked. A pleasant lemon-like aroma and flavour, they are used mainly as a flavouring in salads and cooked foods[5, 7, 8, 9, 14, 27, 183]. A lemon-flavoured tea can be made from the fresh or dried leaves[21, 183]. A bunch of the leaves can be added to china tea, much improving the flavour, the leaves are also added to fruit cups etc[4]. They are used as a flavouring in various alcoholic beverages including Chartreuse and Benedictine[238].

tcanta Essential Pot-pourri RepellentLandscape Uses: Border, Container, Rock garden. The growing plant is said to repel flies and ants[14]. It is also rubbed on the skin as a repellent[238], though the essential oil would be more effective here[K]. An essential oil is obtained from the plant[100] (the exact part is not specified, it is probably the entire plant and especially the flowering stems). It is used medicinally. The whole plant is very pleasantly aromatic, the aroma lasting for a long time after the plant has been harvested. It is therefore a very useful ingredient in pot-pourri[4]. A dynamic accumulator gathering minerals or nutrients from the soil and storing them in a more bioavailable form - used as fertilizer or to improve mulch.

dwatta Antianxiety Antibacterial Antidepressant Antiemetic Antispasmodic Antiviral Aromatherapy Carminative Diaphoretic Digestive Emmenagogue Febrifuge Sedative TonicLemon balm is a commonly grown household remedy with a long tradition as a tonic remedy that raises the spirits and lifts the heart[254]. Modern research has shown that it can help significantly in the treatment of cold sores[254]. The leaves and young flowering shoots are antibacterial, antispasmodic, antiviral, carminative, diaphoretic, digestive, emmenagogue, febrifuge, sedative, and tonic[4, 7, 9, 21, 165, 238]. It also acts to inhibit thyroid activity[238]. An infusion of the leaves is used in the treatment of fevers and colds, indigestion associated with nervous tension, excitability and digestive upsets in children, hyperthyroidism, depression, mild insomnia, headaches etc[4, 9, 238]. Externally, it is used to treat herpes, sores, gout, insect bites and as an insect repellent[238]. The plant can be used fresh or dried, for drying it is harvested just before or just after flowering[9]. The essential oil contains citral and citronella, which act to calm the central nervous system and are strongly antispasmodic[254]. The plant also contains polyphenols, in particular these combat the herpes simplex virus which produces cold sores[254]. The essential oil is used in aromatherapy. Its keyword is 'Female aspects'[210]. It is used to relax and rejuvenate, especially in cases of de-

pression and nervous tension[238]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve *Melissa officinalis* for nervousness and insomnia (see [302] for critics of commission E).

propta Seed - sow spring or autumn in a cold frame. Germination can be slow[200]. Prick out the seedlings into individual pots as soon as they are large enough to handle and plant out into their permanent positions when the plants are at least 15cm tall[K]. If there is plenty of seed it can be sown in an outdoor seed bed in April. Plant out into their permanent positions the following spring. Division in spring or autumn[111]. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring. Cuttings in July/August.

nwatta A very easily grown plant, it succeeds in any well-drained soil in a sunny sheltered position[200]. It prefers a light rich moist soil[37, 52], a warm position[27, 37] and partial shade[4]. Once established, this is a drought tolerant species[190, 200], it is a useful plant to try in difficult dry places[187], usually succeeding in the dustiest of soils once it is established[190]. Lemon balm is often grown in the herb garden, and sometimes also commercially[46], there are some named varieties[183]. Plants can often self-sow so freely as to become a menace[187]. If the plants are cut back hard after flowering, they will produce a fresh flush of leaves[238]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. A good bee plant[4, 8, 24]. A good companion plant, especially for brassicas[14]. Special Features: Attractive foliage, Edible, Fragrant foliage, Not North American native, Invasive, Naturalizing, Suitable for cut flowers, Suitable for dried flowers. The plant is heat tolerant in zones 12 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is fibrous dividing into a large number of fine roots [1-2]. The root pattern is stoloniferous rooting from creeping stems above the ground [1-2].

### 5.2.317 *Epilobium latifolium*

River Beauty

4 tlin 8 cyuc 3 kcaak 1 tcan 2 dwat 0.4 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

drutta *Epilobium latifolium* is a PERENNIAL growing to 0.4 m (1ft 4in) by 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in July, and the seeds ripen in August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: Flowers Leaves Stem Edible Uses: Tea Young shoots - cooked. Used like asparagus[85, 105, 172]. Very poor quality[2]. Young leaves - raw[172, 183]. They become bitter with age[85]. A good source of vitamins A and C[257]. Flower stalks - raw or cooked. Eaten when the flowers are in bud[85]. The dried leaves are used as a tea substitute[85, 177, 183]. The core of mature stems is eaten raw. Slightly sweet, tender and pleasant tasting[85, 172]. Very fiddly though[85].

tcanta Attractive flowers.

dwatta Analgesic Antidote Antiinflammatory Antipruritic Antirheumatic Febrifuge The entire plant is used in Tibetan medicine, it is said to have a bitter taste and a cooling potency[241]. Analgesic, antidote, anti-inflammatory,

antipruritic, antirheumatic and febrifuge, it is used in the treatment of fevers and inflammations, plus also itching pimples[241].

propta Seed - sow early spring in situ or as soon as the seed is ripe. Division in spring or autumn. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Prefers a well-drained but moisture retentive soil in a sunny position[200]. Succeeds in most soils[1]. The roots are somewhat spreading and the plant can become invasive[233]. The plant is heat tolerant in zones 7 through 3. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2]. The root pattern is fibrous dividing into a large number of fine roots [1-2].

### 5.2.318 *Allium oleraceum*

Field Garlic

4 tlin 8 cyuc 3 kcaak 0 tcan 2 dwat 0.6 m hkuc htut cyutli tcup hwicli hrasljut nyik hpa7tli flatprikkwis hpa7tmwatli fyfxre7t hjonli

drutta *Allium oleraceum* is a BULB growing to 0.6 m (2ft) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcaakta Edible Parts: Flowers Leaves Root Edible Uses: Bulb - raw or cooked[2, 22]. Used as a garlic flavouring in soups etc[12, 105, 115, 177]. The bulbs are 10 - 20mm in diameter[200]. Leaves - raw or cooked. The young leaves are used as a garlic flavouring in soups and stews, but are inferior to that species[2, 61]. Flowers - raw. Used as a garnish on salads. Used mainly as a flavouring in soups and stews[183]. Bulbs - raw or cooked.

tcanta Repellent The juice of the plant is used as a moth repellent. The whole plant is said to repel insects and moles[20].

dwatta Although no specific mention of medicinal uses has been seen for this species, members of this genus are in general very healthy additions to the diet. They contain sulphur compounds (which give them their onion flavour) and when added to the diet on a regular basis they help reduce blood cholesterol levels, act as a tonic to the digestive system and also tonify the circulatory system[K].

propta Seed - sow spring in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle - if you want to produce clumps more quickly then put three plants in each pot. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in spring once they are growing vigorously and are large enough. Division in spring. Very easy, the plants divide successfully at any time in the growing season and the divisions can be planted straight out into their permanent positions if required. Bulbs can be harvested in late summer and planted out immediately.

nwatta An easily grown plant, it prefers a sunny position in a light well-drained soil[1]. The bulbs should be planted fairly deeply[1]. Seed is rarely if ever produced in Britain[17]. The plant usually produces many small bulbs in the flowering head and these can spread themselves freely around the garden[203]. Grows well with most plants, especially roses, carrots, beet and chamomile, but it inhibits the

duce seed in about 10 years from sowing[98]. Special Features: Not North American native, Inconspicuous flowers or blooms.

### 5.2.367 *Vitis amurensis*

Amur River Grape, Amur grape

4 tlin 8 cyuc 2 kcaak 0 tcan 1 dwat 15 m hkuc hmimhtut cyutli kyuctup hwicli hrasljutnyik hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

drutta *Vitis amurensis* is a deciduous Climber growing to 15 m (49ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from May to July, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcaakta Edible Parts: Fruit Leaves Edible Uses: Fruit - raw, cooked or dried for winter use[183]. It can also be made into drinks[177]. The fruit is much esteemed[151]. Small and somewhat harsh in flavour[151], it is succulent but usually bitter[200]. The fruit is about 16mm long and 10mm wide[200]. Young leaves - cooked[179]. Used as a boiled vegetable[183]. The leaves can also be wrapped around other foods and then baked, they impart a pleasant flavour. Young tendrils - raw or cooked.

tcanta Dye A yellow dye is obtained from the fresh or dried leaves[168].

dwatta Tonic The root is tonic[218].

propta Seed - best sown in a cold frame as soon as it is ripe[K]. Six weeks cold stratification improves the germination rate, and so stored seed is best sown in a cold frame as soon as it is obtained. Germination should take place in the first spring, but sometimes takes another 12 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant out in early summer. Cuttings of mature wood of the current seasons growth, December/January in a frame. These cuttings can be of wood 15 - 30cm long or they can be of short sections of the stem about 5cm long with just one bud at the top of the section. In this case a thin, narrow strip of the bark about 3cm long is removed from the bottom half of the side of the stem. This will encourage callusing and the formation of roots. Due to the size of these cuttings they need to be kept in a more protected environment than the longer cuttings. Layering.

nwatta Prefers a deep rich moist well-drained moderately fertile loam[1, 200]. Grows best in a calcareous soil[200]. Succeeds in sun or partial shade though a warm sunny position is required for the fruit to ripen[200]. Very hardy, tolerating temperatures down to about -40°C, this species is a potential source of hardiness in a breeding programme with the common grape, *Vitis vinifera*[183]. Plants climb by means of tendrils[182]. Any pruning should be carried out in winter when the plants are dormant otherwise they bleed profusely[182]. Plants in this genus are notably susceptible to honey fungus[200].

### 5.2.368 *Ulmus pumila*

Siberian Elm, Hybrid elm

4 tlin 9 cyuc 2 kcaak 0 tcan 2 dwat 15 m hkuc hmimhtut cyutli hgtakyuctup hwicli hrasljutnyik hpa7tli flatprikkwis hpa7tmwatli xre7t hjonli

drutta *Ulmus pumila* is a deciduous Tree growing to 15 m (49ft) by 12 m (39ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 3 and is not frost tender. It is in flower in April, and the seeds ripen in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure.

kcaakta Edible Parts: Fruit Inner bark Leaves Edible Uses: Leaves - raw or cooked[105, 177, 183]. Used as a

potherb[218]. Inner bark - cooked. It can be dried and made into noodles[105, 177, 183]. The dried inner bark can also be ground into a powder and then used as a thickener in soups or added to cereal flours when making bread etc. Fruit - raw or cooked[105, 177]. Used when immature, it can be made into a sauce and a wine[183]. The fruit is about 10mm in diameter[200].

tcanta Fibre Fodder Shelterbelt Wood A coarse cloth is made from the inner bark[149]. A fairly wind resistant tree, it can be grown as part of a shelterbelt planting[200]. Wood - hard, heavy, tough, difficult to split. Used for agricultural implements, boat making etc[149].

dwatta Antibilious Antidote Demulcent Diuretic Febrifuge Lenitive Lithotropic Poulitice The leaves are diuretic and febrifuge[218]. They are used as a pot herb and are then said to be antibilious, antidote and lithotropic[218]. The stem bark is demulcent, diuretic, febrifuge and lenitive[218]. It is mixed with oil and vinegar then used as a poultice on abscesses, mastitis and swellings[218].

propta Seed - if sown in a cold frame as soon as it is ripe, it usually germinates within a few days[200]. Stored seed does not germinate so well and should be sown in early spring[200]. The seed can also be harvested 'green' (when it has fully developed but before it dries on the tree) and sown immediately in a cold frame. It should germinate very quickly and will produce a larger plant by the end of the growing season[80]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Plants should not be allowed to grow for more than two years in a nursery bed since they form a tap root and will then move badly. Layering of suckers or coppiced shoots[200].

nwatta Agroforestry Services: Windbreak Fodder: Bank Industrial Crop: Biomass Management: Coppice Management: Standard Minor Global Crop Landscape Uses: Firewood, Aggressive surface roots possible. Prefers a fertile soil in full sun[188], but is easily grown in any soil of at least moderate quality so long as it is well drained[1]. Succeeds in a hot dry position[200]. Established plants are drought resistant[11, 200]. Fairly wind-tolerant[200]. This species, or at least some of its cultivars[200], is resistant to 'Dutch elm disease', a disease that has destroyed the greater part of all the elm trees growing in Britain. The disease is spread by means of beetles. There is no effective cure (1992) for the problem, but most E. Asian, though not Himalayan, species are resistant (though not immune) to the disease so the potential exists to use these resistant species to develop new resistant hybrids with the native species[200]. The various species of this genus hybridize freely with each other and pollen is easily saved, so even those species with different flowering times can be hybridized[200]. Special Features: Not North American native, Invasive, Naturalizing, Inconspicuous flowers or blooms.

### 5.2.369 *Quercus serrata*

Bao li

4 tlin 8 cyuc 2 kcaak 0 tcan 2 dwat 15 m hkuc hmimhtut cyutli tcup hwicli jlutnyik hpa7tli flatprikkwis hpa7tmwatli hjonli

drutta *Quercus serrata* is a deciduous Tree growing to 15 m (49ft 3in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from April to May, and the seeds ripen from October to November. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcaakta Edible Parts: Leaves Seed Edible Uses: Coffee Seed - cooked. Highly nutritious[179]. The seed is about 15mm long[200], it can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread. The seed contains bitter tannins, these can be leached out by thoroughly washing the seed in running water though many minerals will also be lost[179]. Either the whole seed can be used or the seed can be dried and ground

of haemorrhages, chronic diarrhoea, dysentery etc[4].

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Prefers a good deep fertile loam which can be on the stiff side[11]. Young plants tolerate reasonable levels of side shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted. The seed ripens in its first year. Closely related to *Q. petraea*[1]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. Hybridizes freely with other members of the genus[200]. Plants in this genus are notably resistant to honey fungus[200].

## 5.2.365 Vitis cordifolia

Frost Grape

4 tin 8 cyuc 2 kcaak 0 tcan 0 dwat 20 m hkuc  
hmimhtut cyutli kyucctup hwicli hrasljutnyik hpa7tli flat-prikliwis hpa7tmwatli xre7t hjonli

drutta *Vitis cordifolia* is a deciduous Climber growing to 20 m (65ft 7in) at a fast rate. See above for USDA hardness. It is hardy to UK zone 5 and is not frost tender. It is in flower from May to June, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcaakta Edible Parts: Fruit LeavesEdible Uses: TeaFruit - raw, cooked or dried for winter use[1, 2, 161]. They are said to be unpalatable until they have been touched by frost[1, 11, 43, 182, 200]. A spicy flavour[177]. Quite tasty[219]. The fruit is about 8 - 12mm in diameter[200] and is produced in fairly large bunches[235]. Leaves - cooked[55]. Young leaves are wrapped around other foods and then baked, they impart a pleasant flavour. Young tendrils - raw or cooked[55, 85]. The twigs are a tea substitute[161].

tcanta DyeA yellow dye is obtained from the fresh or dried leaves[168].

dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe[K]. Six weeks cold stratification improves the germination rate, and so stored seed is best sown in a cold frame as soon as it is obtained. Germination should take place in the first spring, but sometimes takes another 12 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant out in early summer. Cuttings of mature wood of the current seasons growth, December/January in a frame. These cuttings can be of wood 15 - 30cm long or they can be of short sections of the stem about 5cm long with just one bud at the top of the section. In this case a thin, narrow strip of the bark about 3cm long is removed from the bottom half of the side of the stem. This will encourage callusing and the formation of roots. Due to the size of these cuttings they need to be kept in a more protected environment than the longer cuttings. Layering.

nwatta Prefers a deep rich moist well-drained moderately fertile loam[1, 200]. Grows best in a calcareous soil[200], doing well when lime rubble is incorporated into the soil[245]. Succeeds in sun or partial shade though a warm sunny position is required for the fruit to ripen[200]. The young growth in spring can be damaged by late frosts. A very vigorous plant[200], climbing by means of tendrils[182]. It grows particularly well into elm trees[18]. The flowers are sweetly scented[245]. Any pruning should be carried out in winter when the plants are dormant otherwise they bleed profusely[182, 200]. This species is often confused with *V. vulpina*[182]. Plants in this genus are notably susceptible to honey fungus[200].

## 5.2.366 Acer campestre

Field Maple, Hedge maple

4 tin 8 cyuc 2 kcaak 0 tcan 1 dwat 15 m hkuc  
hmimhtut cyutli tcup hwicli hrasljutnyikfrip hpa7tli flatprikli-wisslip hpa7tmwatli hjonli

drutta *Acer campestre* is a deciduous Tree growing to 15 m (49ft 3in) at a fast rate. See above for USDA hardness. It is hardy to UK zone 4 and is not frost tender. It is in flower from May to June, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcaakta The sap contains a certain amount of sugar and can either be used as a drink, or can be concentrated into a syrup by boiling off the water[4]. The concentration of sugar is considerably lower than in the sugar maples (*A. saccharum*). The syrup is used as a sweetener on many foods. The tree trunk is tapped in the early spring, the sap flowing better on warm sunny days following a frost. The best sap production comes from cold-winter areas with continental climates.

tcanta Charcoal Fuel Hedge Hedge Preservative WoodThe leaves are packed around apples, rootcrops etc to help preserve them[18, 20]. A fast growing plant and bearing clipping well, it makes an excellent clipped hedge and can also be used as part of a native wildlife hedge where it is only trimmed every 3 - 4 years[200, K]. It has also been used in topiary[200]. Wood - fine-grained, tough, elastic, hard to split, takes a high polish and is seldom attacked by insects. Trees are seldom large enough to supply much usable timber, but when available it is much valued by cabinet makers[4, 7, 13, 46, 115]. It is also used for cups bowls etc[115]. The wood of the roots is often knotted and is valued for small objects of cabinet work[4]. The wood is an excellent fuel[4]. A charcoal made from the wood is a good fuel[4, 115].

dwatta Anticholesterolemic AstringentThe bark is astringent and slightly anticholesterolemic[7]. A decoction has been used to bathe sore eyes[7]. The bark should be sundried and then stored in a dry place until required[7].

propta Seed - best sown as soon as it is ripe in a cold frame, it usually germinates in the following spring. Pre-soak stored seed for 24 hours and then stratify for 2 - 4 months at 1 - 8°C. It can be slow to germinate. The seed can be harvested 'green' (when it has fully developed but before it has dried and produced any germination inhibitors) and sown immediately. It should germinate in late winter. If the seed is harvested too soon it will produce very weak plants or no plants at all[80, 113]. When large enough to handle, prick the seedlings out into individual pots and grow them on until they are 20cm or more tall before planting them out in their permanent positions. Layering, which takes about 12 months, is successful with most species in this genus. Cuttings of young shoots in June or July. The cuttings should have 2 - 3 pairs of leaves, plus one pair of buds at the base. Remove a very thin slice of bark at the base of the cutting, rooting is improved if a rooting hormone is used. The rooted cuttings must show new growth during the summer before being potted up otherwise they are unlikely to survive the winter.

nwatta Landscape Uses:Firewood, Pollard, Screen, Standard, Superior hedge, Specimen, Street tree. Of easy cultivation, it prefers a good moist well-drained soil[11] in a sunny position but tolerates some shade[11, 200]. Does well on chalky soils, tolerating a pH as high as 8, but becoming a shrub in such conditions[186]. Does not thrive in soils with a pH much below 6[186]. Grows well in heavy clay soils. Tolerates atmospheric pollution[200]. Growth is fast once the trees are established, but this later slows down and trees take about 50 years to reach maturity[186]. Frequently found as a shrub in light woodland, especially under oak. It is one of the first trees to colonize chalk grassland[186]. The field maple is a bad companion plant, inhibiting the growth of nearby plants[18, 20]. A good bee plant[7]. This species has often been coppiced in the past for its wood[17]. Trees pro-

growth of legumes[18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 5.2.319 Chenopodium foliosum

Leafy goosefoot

4 tin 8 cyuc 3 kcaak 0 tcan 0 dwat 0.6 m hkuc  
htut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Chenopodium foliosum* is a ANNUAL growing to 0.6 m (2ft). See above for USDA hardness. It is hardy to UK zone 5. It is in flower from July to October, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcaakta Edible Parts: Fruit Leaves SeedEdible Uses: Leaves - cooked and used like spinach[61, 74, 177]. The raw leaves should only be eaten in small quantities, see the notes above on toxicity. Seed - ground into a powder and cooked. It can be added to cereal flours and used in making bread. Very small and fiddly, the seed is about 1mm in diameter[266]. Soak the seed for 12 hours and then thoroughly rinse it in order to wash off any saponins before grinding it[K]. Fruit - raw. Fairly insipid, though quite attractive to look at[K]. The fruit is about 12mm in diameter[200].

tcanta DyeGold/green dyes can be obtained from the whole plant[168].

dwatta None known

propta Seed - sow spring in situ. Most of the seed usually germinates within a few days of sowing.

nwatta An easily grown plant, succeeding in most soils but disliking shade[1, 200]. It prefers a moderately fertile soil[200]. Formerly cultivated for its edible leaves[61]. This species is closely related to *C. capitatum*[200].

## 5.2.320 Arisaema triphyllum

Jack In The Pulpit, Dragonroot, Indian Turnip

4 tin 9 cyuc 3 kcaak 0 tcan 2 dwat 0.6 m hkuc  
pcimhmimhtut cyutli tcup hwicli hrasljut hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

drutta *Arisaema triphyllum* is a PERENNIAL growing to 0.6 m (2ft) by 0.5 m (1ft 8in) at a slow rate. See above for USDA hardness. It is hardy to UK zone 4. It is in flower from June to July. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Flies. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: RootEdible Uses: Tuber - it must be thoroughly dried or cooked before being eaten[2, 21, 55, 57, 95, 102]. The roots can be cut into very thin slices and allowed to dry for several months, after which they are eaten like potato chips, crumbled to make a cereal or ground into a cocoa-flavoured powder for making biscuits, cakes etc[177, 183]. They can also be pounded into a powder, this is then left to dry for several weeks when it becomes safe to use[213]. The root is up to 5cm long and 2cm wide[4]. Caution is advised, see the notes above on toxicity.

tcanta Musical StarchA starch obtained from the roots is used as a stiffener for clothes[207]. It is very harsh to the hands, causing blisters and swellings[207]. The seeds have been used in rattles[257].

dwatta Acid Antirheumatic Antiseptic Contraceptive Diaphoretic Expectorant Irritant Poultice StimulantThe root is acid, antiseptic, diaphoretic, expectorant, irritant and stimulant[21, 46, 222, 238, 257]. It is harvested in early spring and dried for later use[4]. The fresh root is considered to be too dangerous and intensely acid to use, whilst the dried roots become inactive, so fresh, partially dried roots are used[213]. Due to the potentially toxic nature of this

plant, it should only be used internally under the supervision of a qualified practitioner[K]. The root was applied as a poultice on headaches, scrofulous sores, rheumatism, boils, abscesses and ringworm[222, 257]. A decoction of the root has been used as a wash for sore eyes[257]. The root was used as a contraceptive by the N. American Indians. One teaspoonful of the dried powdered root in cold water was said to prevent conception for a week whilst two teaspoonfuls in hot water was said to induce permanent sterility[213].

propta Seed - best sown as soon as it is ripe in a shady position in a cold frame[134]. Stored seed remains viable for at least a year and can be sown in spring in the greenhouse but it will probably require a period of cold stratification. Germination usually takes place in 1 - 6 months at 15°C[134]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least a couple of years until the corms are more than 20mm in diameter. Plant out into their permanent positions whilst they are dormant. Division of tubers when the plant dies down in late summer.

nwatta Landscape Uses:Massing, Woodland garden. Prefers a cool peaty soil in the bog garden, woodland garden or a sheltered border in semi-shade[90, 134, 200]. Prefers a loamy or peaty soil and will tolerate a sunny position if the soil is moist but not water-logged and the position is not too hot or exposed[1, 200]. Tubers should be planted about 10cm deep[233]. Only plant out full sized tubers and mulch them with organic matter in the winter[200]. Plants need protection from slugs[200]. Most species in this genus are dioecious, but they are sometimes monoecious and can also change sex from year to year. Special Features: Attracts birds, Attractive foliage, North American native, Naturalizing, All or parts of this plant are poisonous, Wetlands plant.

## 5.2.321 Arctostaphylos uva

Bearberry

4 tin 8 cyuc 3 kcaak 4 tcan 4 dwat 0.1 m hkuc  
pcimhmimhtut cyutli tcup hwicli hrisrasljut hpa7tli frusflat-prikliwis hpa7tmwatli fyfexre7t hjonli

drutta *Arctostaphylos uva-ursi* is an evergreen Shrub growing to 0.1 m (0ft 4in) by 1 m (3ft 3in) at a medium rate. See above for USDA hardness. It is hardy to UK zone 4 and is not frost tender. It is in leaf all year; in flower from April to July, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: FruitEdible Uses: TeaFruit - raw or cooked[3, 7, 8, 62, 161, 257]. Insipid, dry and mealy[4, 101, 183], it becomes sweeter when cooked[212]. Added to stews etc, it is a good source of carbohydrates[101]. The fruit can also be cooked and eaten. They are used for preserves or made into jelly, marmalade, sauces and pastes. The ripe fruit can be soaked in water or butter to reduce the dryness. Plants are best harvested after the first frost which sweetens them. They can be left to lie all winter under the snow [1-4]. The fruit can also be used to make a cooling drink or used for preserves etc[161, 183]. It can be dried and stored for later use[257]. The fruit is about 6mm in diameter[200]. A tea is made from the dried leaves[177, 183].

tcanta Beads Dye Pioneer Soil stabilization Tannin WaterproofingA yellowish-brown dye is obtained from the leaves[57, 101], it does not require a mordant[168]. A grey-brown dye is obtained from the fruit[257]. The dried fruits are used in rattles and as beads on necklaces etc[99, 257]. The leaves are a good source of tannin[46, 61, 212]. The mashed berries can be rubbed on the insides of coiled cedar root baskets in order to waterproof them[257]. A good ground-cover for steep sandy banks in a sunny position[188, 200] or in light shade[197]. A carpeting plant, growing fairly fast and carpeting as it spreads[208]. It is valuable for checking soil erosion on watersheds[212]. This is also a pioneer plant in the wild, often being the first plant to colonize burnt-over areas, especially on poor soils[155]. There are a num-

ber of named varieties developed for their ornamental interest[200].

dwatta Antiseptic Astringent Birthing aid Diuretic Hypnotic Kidney Lithontripic Poultice Skin Tonic Urinary Women's complaintsBearable was commonly used by many native North American Indian tribes to treat a wide range of complaints and has also been used in conventional herbal medicine for hundreds of years, it is one of the best natural urinary antiseptics[254]. The leaves contain hydroquinones and are strongly antibacterial, especially against certain organisms associated with urinary infections[238]. The plant should be used with caution, however, because hydroquinones are also toxic[222]. The leaves are antiseptic, astringent, diuretic, lithontripic, hypnotic and tonic[7, 9, 21, 102, 165, 172, 192]. The dried leaves are used in the treatment of a variety of complaints[4]. These leaves should be harvested in early autumn, only green leaves being selected, and then dried in gentle heat[4]. A tea made from the dried leaves is much used for kidney and bladder complaints and inflammations of the urinary tract such as acute and chronic cystitis and urethritis, but it should be used with caution and preferably only under the supervision of a qualified practitioner[4, 21, 46, 172, 222, 254]. The tea is more effective if the urine is alkaline, thus it is best used in combination with a vegetable-based diet[254]. Externally, a poultice of the infused leaves with oil has been used as a salve to treat rashes, skin sores etc, and as a wash for a baby's head[257]. An infusion of the leaves has been used as an eyewash, a mouth-wash for cankers and sore gums and as a poultice for back pains, rheumatism, burns etc[257]. The dried leaves have been used for smoking as an alternative to tobacco[238]. One report says that it is unclear whether this was for medicinal purposes or for the intoxicated state it could produce[192], whilst another says that the leaves were smoked to treat headaches and also as a narcotic[257]. The herb should not be prescribed to children, pregnant women or patients with kidney disease[238]. Another report says that some native North American Indian tribes used an infusion of the stems, combined with blueberry stems (*Vaccinium* spp) to prevent miscarriage without causing harm to the baby, and to speed a woman's recovery after the birth[257]. Other uses: fluid retention and bed wetting. Claimed to strengthen the heart muscle and urinary tract and to return the womb to its normal size after childbirth [301]. Treatment should be short (seven days) and used with an alkaline diet [301]. Not recommended for children under 12.

propta Seed - best sown in a greenhouse as soon as it is ripe. Pre-soak dried seed in boiling water for 10 - 20 seconds or burn some straw on top of them and then stratify at 2 - 5°C for 2 months[11, 200]. The seed usually germinates in 2 - 3 months at 15°C[134]. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame or greenhouse for at least their first winter. Plant out in late spring or early summer. Cuttings of side shoots of the current season's growth, 5 - 8cm with a heel, August to December in a frame. The cuttings are very slow and can take a year to root[1, 78]. Division in early spring. Take care because the plant resents root disturbance. Pot the divisions up and keep them in a lightly shaded position in a cold frame or greenhouse until they are growing away actively. Layering of long branches in early spring[200, 238].

nwatta Requires a deep moist well-drained light or medium lime-free loam in sun or semi-shade[3, 11, 200]. One report says that this species succeeds in alkaline soils[182] (a rather surprising comment considering the general needs of the genus - it is more likely that the plant can grow on limestone so long as the soil remains acid[K]). Shade tolerant[31] but plants produce less fruit when they are grown in the shade[200]. Prefers a cool damp position. A very ornamental plant, it is sometimes cultivated for its medicinal uses[1]. There are a number of named varieties developed for their ornamental interest[200]. The form 'Massachusetts' is an especially prostrate, free-flowering and free-fruited form[183]. 'Anchor Bay', 'Point Reyes' and 'Vulcan's Peak' have all been mentioned as good groundcover forms[200]. This is one of the first plants to colonize bare and rocky ground and burnt over areas[155]. It is often an indicator of poor soils in the wild[212]. Plants resent root disturbance and should be placed in their final positions as soon as possible[11, 134]. Hybridizes with other members of this genus, especially *A. columbiana*. The plant is heat tolerant in zones 6 through 1. (Plant Hardiness Zones show how well plants

withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. An evergreen. A clumping mat former. Forming a dense prostrate carpet spreading indefinitely [1-2]. The root pattern is flat with shallow roots forming a plate near the soil surface [1-2].

## 5.2.322 *Fragaria*

Strawberry, Beach strawberry, Pacific beach strawberry, Sandwich beach strawberry, Virginia strawberry  
4 tin 8 cyuc 3 kcaak 0 tcan 0 dwat 0.2 m hkuc  
hmmihhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Fragaria* is a PERENNIAL growing to 0.2 m (0ft 8in) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from May to November, and the seeds ripen from June to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw[K]. A delicious flavour, the fruit is almost as large as an average cultivated strawberry but it is not very freely produced[187, K].

tcanta The plant spreads rapidly by means of runners and can be used as a ground cover[K].

dwatta None known

propta Seed - sow early spring in a greenhouse. The seed can take 4 weeks or more to germinate. The seedlings are very small and slow-growing at first, but then grow rapidly. Prick them out into individual pots when they are large enough to handle and plant them out during the summer. This plant is a bi-generic hybrid and will not breed true from seed. Division of runners, preferably done in July/August in order to allow the plants to become established for the following years crop[200]. They can also be moved in the following spring if required, though should not then be allowed to fruit in their first year. The runners can be planted out direct into their permanent positions.

nwatta Prefers a fertile, well-drained, moisture retentive soil in a sunny position. Tolerates semi-shade though fruit production will be reduced. This species is a hybrid of garden origin between two species from different genera, the cultivated strawberry, *Fragaria* x *ananassa* and the marsh cinquefoil, *Potentilla palustris*. It should eventually get a Latin name that combines parts of the two generic names, but until then it is included here under *Fragaria*[K]. To date (1995) only one cultivar is available in garden centres etc. Called 'Pink Panda' it spreads very freely by means of runners, flowers heavily all through the summer, but does not produce much fruit[K].

## 5.2.323 *Hydrophyllum capitatum*

Cat's Breeches, Ballhead waterleaf, Alpine waterleaf, Thompson's waterleaf

4 tin 8 cyuc 3 kcaak 0 tcan 0 dwat 0.5 m hkuc  
hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Hydrophyllum capitatum* is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

tcanta Repellent Tannin WoodA mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth[20]. Oak galls are excrescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4]. Tannin is obtained from the bark[46].

dwatta Astringent DysenteryAny galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4].

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Prefers an acid soil[188]. Young plants tolerate reasonable levels of side shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. Trees are fast growing[200], but they prefer warmer summers than are usually experienced in Britain and often grow poorly in this country[11], failing to properly ripen their wood which results in frost damage overwinter[200]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. The seed ripens in its first year[200]. Hybridizes freely with other members of the genus[200]. Plants in this genus are notably resistant to honey fungus[200].

## 5.2.363 *Quercus imbricaria*

Shingle Oak, Northern Laurel Oak

4 tin 8 cyuc 2 kcaak 0 tcan 2 dwat 20 m hkuc  
hmmihhtut cyutli tcup hwicli jlutnyik hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta *Quercus imbricaria* is a deciduous Tree growing to 20 m (65ft) by 15 m (49ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from April to May, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: SeedEdible Uses: CoffeeSeed - cooked. It can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread. The seed, which is up to 18mm long and wide[82, 229], contains bitter tannins - these can be leached out by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute.

tcanta Repellent Tannin WoodA mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth[20]. Oak galls are excrescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4]. Wood - hard, heavy, rather coarse grained[46, 61, 82, 171, 235]. It weighs 47lb per cubic foot[235]. It is occasionally used in construction and for making furniture, clap boards and shingles[46, 61, 82, 171].

dwatta Antiseptic Astringent Dysentery Emetic Febrifuge TonicAny galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4]. The bark is antiseptic, astringent, emetic, febrifuge and tonic[257]. It has been used in the treatment of chronic dysentery, indigestion, asthma and intermittent fevers[257]. The bark has been chewed in the treatment of mouth sores[257]. An infusion of the bark has been used as a wash for sore and chapped skin[257].

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Landscape Uses:Firewood, Specimen, Street tree. Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Lime tolerant[188]. Young plants tolerate reasonable levels of side shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. Prefers warmer summers than are usually experienced in Britain, trees often grow poorly in this country and fail to properly ripen their wood resulting in frost damage overwinter[200]. The tree flowers on new growth produced in spring, the seed taking two summers to ripen[229]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. Closely related to *Q. phellos*[1]. Hybridizes freely with other members of the genus[200]. Plants in this genus are notably resistant to honey fungus[200]. Special Features: Attracts birds, North American native, Inconspicuous flowers or blooms.

## 5.2.364 *Quercus pubescens*

Downy Oak

4 tin 8 cyuc 2 kcaak 0 tcan 2 dwat 20 m hkuc  
hmmihhtut cyutli kyuctcup hwicli jlutnyikrip hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta *Quercus pubescens* is a deciduous Tree growing to 20 m (65ft 7in). See above for USDA hardiness. It is hardy to UK zone 5. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: SeedEdible Uses: Seed - cooked. A famine food, used when all else fails[177]. The seed is up to 2cm long[200], it can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread. The seed contains bitter tannins, these can be leached out by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute.

tcanta Repellent Tannin WoodA mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth[20]. Oak galls are excrescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4]. Wood - hard, durable even under water, not very elastic. Used for furniture etc[46, 61].

dwatta Astringent DysenteryAny galls produced on the tree are strongly astringent and can be used in the treatment

hardiness. It is hardy to UK zone 5. It is in leaf all year, in flower in May, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**kcakta Edible Parts:** Flowers Inner bark Seed**Edible Uses:** TeaYoung male catkins - raw or cooked. Used as a flavouring[172]. Immature female cones - cooked. The central portion, when roasted, is sweet and syrupy[172]. Inner bark - dried, ground into a powder and then used as a thickener in soups etc or added to cereals when making bread[172]. An emergency food, it is only used when all else fails. Seed - raw. Too small and fiddly to be worthwhile unless you are desperate[172]. A refreshing tea, rich in vitamin C, can be made from the young shoot tips[172].

**tcanta Resin Tannin WoodTannin** is obtained from the bark[74]. Turpentine is obtained from the bark and branches[74]. Wood - soft, white, easily cleaves, light, durable, has a good resonance. Used for construction, furniture etc[74]. It is also valued for its use in the pulp industry to make paper[171].

**dwatta Vitamin C**None known

**propta Seed** - stratification will probably improve germination so sow fresh seed in the autumn in a cold frame if possible[80]. Sow stored seed as early in the year as possible in a cold frame[78]. A position in light shade is probably best[78]. Seed should not be allowed to dry out and should be stored in a cool place[80]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse or cold frame for their first winter. They can be planted out into their permanent positions in early summer of the following year, or be placed in an outdoor nursery bed for a year or so to increase in size. They might need protection from spring frosts. Cuttings of semi-ripe terminal shoots, 5 - 8cm long, August in a frame. Protect from frost. Forms roots in the spring[78]. Cuttings of mature terminal shoots, 5 - 10cm long, September/October in a cold frame. Takes 12 months[78]. Cuttings of soft to semi-ripe wood, early summer in a frame. Slow but sure.

**nwatta Landscape Uses:**Pest tolerant, Screen, Specimen. Likes abundant moisture at the roots, if grown in drier areas it must be given a deep moist soil[11]. Tolerates poor peaty soils[200]. Succeeds in wet cold and shallow soils but is not very wind-firm in shallow soils[1]. Prefers a pH between 4 to 6[200]. Dislikes shade[200]. Intolerant of atmospheric pollution[11]. Resists wind exposure to some degree[200]. In some upland areas, especially over granitic or other base-poor soils, growth rate and health have been seriously affected by aluminium poisoning induced by acid rain[200]. Plants are strongly outbreeding, self-fertilized seed usually grows poorly[200]. They hybridize freely with other members of this genus[200]. There are a number of named forms selected for their ornamental value, most of these are dwarf cultivars[200]. Young trees are slow growing at first but from the age of about 5 - 6 years they can grow up to 1 metre a year and this can be maintained for the next 70 years or so. Growth virtually ceases by the time the tree is 90 - 100 years old[185]. Increases in girth follow the same pattern as height increases[185]. Trees probably do not live much longer than 100 years in Britain[185]. They are occasionally planted on a small scale in Europe as a timber tree[50]. Trees should be planted into their permanent positions when they are quite small, between 30 and 90cm. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200]. The bruised leaves have a resinous aroma[245]. **Special Features:** Not North American native, Inconspicuous flowers or blooms.

### 5.2.361 *Fagus orientalis*

Oriental Beech

4 tlin 8 cyuc 2 kcak 0 tcan 0 dwat 20 m hkuc pcmhmmhtut cyutli kyuctcup hwicli hrasjlut hpa7tli flatprklwis hpa7tmwatli hjonli

**drutta** *Fagus orientalis* is a deciduous Tree growing to 20 m (65ft) by 15 m (49ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost

tender. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil.

**kcakta Edible Parts:** Leaves Oil Seed**Edible Uses:** Coffee OilYoung leaves - raw. A very nice mild flavour, but the leaves quickly become tough so only the youngest should be used. New growth is usually produced for 2 periods of 3 weeks each year, one in spring and one in mid-summer. Seed - raw or cooked. Rich in oil. The seed should not be eaten raw in large quantities. It can be dried and ground into a powder and then used with cereal flours when making bread, cakes etc. An edible semi-drying oil is obtained from the seed[105, 177, 183].

**tcanta Oil**None known

**dwatta** None known

**propta Seed** - the seed has a short viability and is best sown as soon as it is ripe in the autumn in a cold frame. Protect the seed from mice. Germination takes place in the spring. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. The seedlings are slow growing for the first few years and are very susceptible to damage by late frosts. The seed can also be sown in an outdoor seedbed in the autumn. The seedlings can be left in the open ground for three years before transplanting, but do best if put into their final positions as soon as possible and given some protection from spring frosts.

**nwatta** Thrives on a light or medium soil, doing well on chalk, but ill-adapted for heavy wet soil[1, 11]. Fairly tolerant of most conditions, this is the most successful non-native species of *Fagus* in Britain[200]. Young trees are very shade tolerant, but are subject to frost damage so are best grown in a woodland position which will protect them[200]. Hybridizes in nature with *F. sylvatica*[11]. Large mature trees at Kew produced a very good crop of seed in 1999[K]. Trees have surface-feeding roots and also cast a dense shade. This greatly inhibits the growth of other plants and, especially where a number of the trees are growing together, the ground beneath them is often almost devoid of vegetation.

### 5.2.362 *Quercus dentata*

Japanese Emperor Oak, Daimyo oak

4 tlin 8 cyuc 2 kcak 0 tcan 2 dwat 20 m hkuc hmimhmtut cyutli tcup hwicli jltutnyik hpa7tli flatprk hpa7tmwatli hjonli

**drutta** *Quercus dentata* is a deciduous Tree growing to 20 m (65ft) by 12 m (39ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from April to May, and the seeds ripen from October to November. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

**kcakta Edible Parts:** Seed**Edible Uses:** CoffeeSeed - cooked[105, 177]. The seed is up to 23mm long and 15mm wide[266]. Rich in starch[105]. It can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread. The seed contains bitter tannins, these can be leached out by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute[177].

**kcakta Edible Parts:** Leaves Root**Edible Uses:** Tender young shoots - cooked as a potherb[207, 212]. Root - cooked[207]. Large and fleshy[212].

**tcanta** None known

**dwatta** None known

**propta Seed** - best sown as soon as it is ripe in a cold frame. The seed usually germinates in early spring. Sow stored seed as early in the year as possible. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring or autumn[200]. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

**nwatta** Requires a moist humus-rich soil in semi-shade[200]. Grows well in an open woodland garden[200]. The leaves are shaped in such a way that they collect rainwater in a cavity[212]. Slugs are particularly fond of this plant and will soon destroy it if given a chance[K].

### 5.2.324 *Allium suaveolens*

4 tlin 8 cyuc 3 kcak 0 tcan 2 dwat 0.5 m hkuc hmimhmtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprklwis hpa7tmwatli xre7t hjonli

**drutta** *Allium suaveolens* is an evergreen Bulb growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf all year, in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**kcakta Edible Parts:** Flowers Leaves Root**Edible Uses:** Bulb - raw or cooked. Leaves - raw or cooked. Flowers - raw. Used as a garnish on salads.

**tcanta Repellent**The juice of the plant is used as a moth repellent. The whole plant is said to repel insects and moles[20].

**dwatta** Although no specific mention of medicinal uses has been seen for this species, members of this genus are in general very healthy additions to the diet. They contain sulphur compounds (which give them their onion flavour) and when added to the diet on a regular basis they help reduce blood cholesterol levels, act as a tonic to the digestive system and also tonify the circulatory system[K].

**propta Seed** - sow spring in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle - if you want to produce clumps more quickly then put three plants in each pot. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in spring once they are growing vigorously and are large enough. Division in spring. Very easy, the plants divide successfully at any time in the growing season and the divisions can be planted straight out into their permanent positions if required.

**nwatta** An easily grown plant[203], it prefers a sunny position in a light well-drained soil[1]. Succeeds in heavy soils and in light shade[203]. The bulbs should be planted fairly deeply[1]. Closely related to *A. senescens*, differing mainly in having leaved leaves[203]. It has the same uses as that species[K]. Grows well with most plants, especially roses, carrots, beet and chamomile, but it inhibits the growth of legumes[18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. Members of this genus are rarely if ever troubled by browsing deer[233].

### 5.2.325 *Claytonia tuberosa*

Tuberous Spring Beauty

4 tlin 8 cyuc 3 kcak 0 tcan 0 dwat 0.2 m hkuc htut cyutli tcup hwicli hrasjlut hpa7tli flat hpa7tmwatli xre7t hjonli

**drutta** *Claytonia tuberosa* is a PERENNIAL growing to 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy

to UK zone 4. It is in flower from April to July, and the seeds ripen in May. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils. It cannot grow in the shade. It prefers moist soil.

**kcakta Edible Parts:** Flowers Leaves Root**Edible Uses:** Root - raw or cooked[2, 74, 85, 153, 172]. It can be added to soups and stews[257]. It is rather small[172]. Leaves - raw or cooked[172]. A source of vitamins A and C, the leaves can be used as greens[257]. Flowers - raw[172].

**tcanta** None known

**dwatta** None known

**propta Seed** - surface sow on a peat based compost in spring in a cold frame. Germination usually takes place within 2 - 4 weeks at 10°C[164]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the cold frame for at least their first winter. Plant them out in late spring or early summer after the last expected frosts. Division of offsets in spring or autumn.

**nwatta** Prefers a damp peaty soil and a position in full sun[1, 164]. Requires a lime-free soil[164].

### 5.2.326 *Triteleia hyacinthina*

Hyacinth Brodiaea, White brodiaea

4 tlin 8 cyuc 3 kcak 0 tcan 0 dwat 0.7 m hkuc htut cyutli kyuctcup hwicli hrasjlut hpa7tli flatprklwis hpa7tmwatli xre7t hjonli

**drutta** *Triteleia hyacinthina* is a BULB growing to 0.7 m (2ft 4in) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from May to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

**kcakta Edible Parts:** Root**Edible Uses:** Bulb - raw or cooked[105, 161, 212, 257]. Rich in starch, the bulb can be used like potatoes[257]. An emergency food, it is only used when all else fails[177].

**tcanta** None known

**dwatta** None known

**propta Seed** - best sown as soon as it is ripe in a cold frame. Alternatively, the seed can be sown in spring in a cold frame. Germination usually takes place within 1 - 3 months at 15°C. Sow the seed thinly so that there is no need to prick them out and grow the seedlings on in the pot for their first year. Give an occasional liquid feed to ensure that they do not become mineral deficient. Seedlings are prone to damping off so be careful not to overwater them and keep them well ventilated. When they become dormant, pot up the small bulbs placing about 3 in each pot. Grow them on in the greenhouse for another year or two until the bulbs are about 20mm in diameter and then plant them out into their permanent positions when they are dormant in the autumn. Division of flowering size bulbs in autumn. Dig up the clumps of bulbs, replanting the larger ones direct into their permanent positions. It is best to pot up the smaller ones and grow them on in a greenhouse for a year before planting them out when they are dormant in early autumn.

**nwatta** Requires a rich well-drained sandy loam[1]. Likes plenty of moisture whilst in growth followed by a warm dry period in late summer and autumn[200]. Succeeds outdoors in a very sheltered warm position, otherwise it is best grown in a bulb frame[90]. There are two basic forms of this species, a large white-flowered form grows wild in wet places whilst a smaller form is found on drier slopes[90]. The hardiness zone has been given as 4, this is somewhat questionable, the plant is liable to be much less hardy[K].

### 5.2.327 *Erythronium albidum*

White Trout-Lily, White fawnlily

4 tlin 8 cyuc 3 kcak 0 tcan 0 dwat 0.1 m hkuc hmim cyutli tcup hwicli hrasjlut hpa7tli flatprklwis hpa7tmwatli xre7t hjonli

**drutta** *Erythronium albidum* is a BULB growing to 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy

to UK zone 4 and is not frost tender. It is in flower from March to April, and the seeds ripen from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

**kcakta Edible Parts:** Flowers Leaves **Root****Edible Uses:** Bulb - raw or cooked[105, 161]. A delicious flavour[183]. Rather small, it is about 25mm long[235]. Young leaves - raw or cooked. Crisp, tasty, tender and mild when eaten raw[183]. Eating the leaves will greatly reduce the vigour of the bulb, so can only be recommended in times of emergency[K]. Flowers, flower buds and flower stems - raw or cooked[183].

tcanta None known
dwatta None known

propta Seed - best sown as soon as it is ripe in a shady position in a cold frame. Water lightly in summer, it should germinate in autumn or winter[164, 200]. Stored seed requires a period of cold stratification[164]. Sow as early in spring as possible in a cold frame. Sow the seed thinly so that it will not be necessary to prick them out for their first year of growth. Give an occasional liquid feed to the seedlings to make sure that they do not become nutrient deficient. When the plants are dormant, pot up the small bulbs putting 2 - 3 bulbs in each pot. Grow them on in a shady position in the greenhouse for another 2 3 years and then plant them out into their permanent positions when they are dormant in late summer. Division in summer as the leaves die down. This species does not produce offsets[200].

nwatta Prefers slightly acid soil conditions but succeeds in chalky soils so long as they contain plenty of humus[164]. Requires semi-shade, preferably provided by trees or shrubs, and a well-drained soil[164]. Succeeds in almost any light soil, preferring one that is rich in humus[1]. This species is closely related to *E. americanum*[235], but is unsatisfactory in cultivation outdoors in Britain[90]. It comes into growth early in the year and the flowers probably need more heat than is available in this country if they are to open properly[90]. A clump seen growing in light shade at Kew early in April 1995 was growing vigorously, spreading well and had lots of flower buds, but was not yet in flower[K]. Erythronium albidum often forms extensive colonies in which nonflowering, 1-leaved plants far outnumber flowering, 2-leaved ones[270]. Flowers are produced in 3 - 4 years from seed[164]. This species does not produce offsets[200].

### 5.2.328 Ligusticum scoticum

Scottish Lovage, Scottish licorice-root, Hulten's licorice-root 4 tlin 8 cyuc 3 kcak 2 tcan 2 dwat 0.6 m hkuc htuc cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatprikliwisp hpa7tmwatli fyfxre7t hjonli

drutta Ligusticum scoticum is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

**kcakta Edible Parts:** Leaves **Root** **Seed** **Stem****Edible Uses:** CondimentLeaves, flowers and young shoots - raw or cooked[2, 4, 5, 100]. Strong and not very pleasant[115]. Superb in salads[172]. The leaves are usually blanched in order to make the flavour milder[61, 183], though this also reduces the nutritional value[K]. A celery-like flavour, it is used as a seasoning in salads, soups etc[183]. Another report says that the flavour is more like parsley[245]. Stem - used as a flavouring in soups, stews etc[5, 17]. A celery-like flavour[238]. The green stem is peeled and eaten[183]. Root - raw or cooked[2, 5, 161]. A sweet flavour[161]. Seed - grown into a powder and used as a flavouring in soups and stews[172, 238, 245]. A sharp, hot taste it is used in the same ways as pepper[245]. The young shoots and roots are occasionally candied like angelica[183].

tcanta DeodorantScented. Deodorant.

dwatta Aromatic Carminative Deodorant StimulantThe root is aromatic and carminative[4]. It is used in the treatment of hysterical and uterine disorders[4, 238]. The seeds are sweetly aromatic and have been used as a carminative, deodorant and stimulant[4, 172, 238]. They are also sometimes used for flavouring other herbal remedies[4].

propta Seed - the seed only has a short period of viability and so is best sown as soon as it is ripe in a cold frame in the autumn. Stored seed should be sown as early in the year as possible in a greenhouse or cold frame[200]. Prick out the seedlings into individual pots when they are large enough to handle and plant them out into their permanent positions in the summer if they have grown large enough. Otherwise, keep them in a cold frame for the first winter and plant them out in early summer. Division of the rootstock in early spring. Make sure that each section of root has at least one growth bud. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Succeeds in any well-drained soil in a sunny position[1, 200]. Dislikes shade. Succeeds in dry soils[238]. Plants are hardy to at least -15°c[238]. Scottish lovage has occasionally been cultivated as a pot herb, though it has been largely supplanted by celery[1, 4, 17]. All parts of the plant are aromatic when bruised, the aroma being likened to a mixture of parsley, angelica and pear skin[245]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is a tap root similar to a carrot going directly down [1-2].

### 5.2.329 Armoracia rusticana

Horseradish, Red Cole

4 tlin 9 cyuc 3 kcak 2 tcan 3 dwat 0.7 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwisslip hpa7tmwatli fyfxre7t hjonli

drutta Armoracia rusticana is a PERENNIAL growing to 0.7 m (2ft 4in) by 0.8 m (2ft 7in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**kcakta Edible Parts:** Leaves **Root** **Seed****Edible Uses:** CondimentYoung root - raw or cooked. The grated root is used to make the condiment ‘Horseradish sauce’[2, 9, 13, 14, 27, 33, 34, 52], this has a hot mustard-like flavour[100]. The sauce is best used uncooked or gently warmed, heating it will destroy the volatile oils that are responsible for its pungency[238]. It is said that in Germany the roots are sliced and cooked like parsnips[183] - rather than me![K]. The root is a rich source of sulphur[201]. Fresh roots contain the glycoside sinigrin - this is decomposed in the presence of water by the enzyme myrosin, producing mustard oil which gives the root its hot flavour[268]. The fleshy roots can be up to 60cm long and 5cm thick[268]. The plant is fully hardy and can be left in the ground all winter to be harvested as required[4]. Alternatively, the roots can be harvested in early winter and stored for later use, they will retain their juicy state for some time if stored in dry sand[4]. Young leaves - raw or cooked[2, 9, 14, 177]. A very strong flavour, though nice when added in small quantities to the salad bowl[183, K]. A pleasant mild flavour according to another report[238]. Seeds - sprouted and eaten in salads[183].

tcanta Fungicide RepellentHorseradish tea is effective against brown rot of apples and other fungicidal diseases[18, 201]. The growing plant deters potato eelworm[14].

dwatta Antibacterial Antirheumatic Antiseptic Aperient Digestive Diuretic Expectorant Rubefacient Stimulant UrinaryHorseradish is a very pungent stimulant herb that controls bacterial infections and can be used both internally and externally[238]. The plant is a powerful stimulant, whether

Lime tolerant[188]. Young plants tolerate reasonable levels of side shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. Prefers warmer summers than are usually experienced in Britain, trees often grow poorly in this country and fail to properly ripen their wood resulting in frost damage overwinter[200]. A moderately fast-growing tree in the wild[229]. Seed production is cyclic, with a year of high yields being followed by 2 - 3 years of low yields[229]. The tree flowers on new growth produced in spring, the seed taking two summers to ripen[229]. Hybridizes in the wild with *Q. velutina*[43]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. Hybridizes freely with other members of the genus[200]. Plants in this genus are notably resistant to honey fungus[200]. **Special Features:**North American native, Inconspicuous flowers or blooms.

### 5.2.358 Vitis coignetiae

Crimson Glory Vine

4 tlin 8 cyuc 2 kcak 0 tcan 0 dwat 20 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Vitis coignetiae is a deciduous Climber growing to 20 m (65ft) by 20 m (65ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to July, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

**kcakta Edible Parts:** Fruit Leaves **Stem****Edible Uses:** Fruit - raw or dried for winter use[105, 177, 183]. The fruit is about 12mm in diameter and is carried in bunches, but it is scarcely edible[200]. Young leaves are wrapped around other foods and then baked, they impart a pleasant flavour. Young tendrils - raw or cooked. Young stems and leafstalks - boiled[105, 177, 183].

tcanta DyeA yellow dye is obtained from the fresh or dried leaves[168]. Plants can be used as a ground cover in a sunny position[188]. They are best spaced about 3.5 metres apart each way[208]. They can be encouraged to cover the ground by laying brushwood flat on the ground and pegged into position. The twigs would eventually rot and the plant would assume complete and constant control[208].

dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe[K]. Six weeks cold stratification improves the germination rate, and so stored seed is best sown in a cold frame as soon as it is obtained. Germination should take place in the first spring, but sometimes takes another 12 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant out in early summer. Cuttings of mature wood of the current seasons growth, December/january in a frame. These cuttings can be of wood 15 - 30cm long or they can be of short sections of the stem about 5cm long with just one bud at the top of the section. In this case a thin, narrow strip of the bark about 3cm long is removed from the bottom half of the side of the stem. This will encourage callusing and the formation of roots. Due to the size of these cuttings they need to be kept in a more protected environment than the longer cuttings. Cuttings are difficult from this species[219]. Layering. This is the best method for this species[219].

nwatta Prefers a deep rich moist well-drained moderately fertile loam[1, 200]. Grows best in a calcareous soil[200]. Succeeds in sun or partial shade though a warm sunny position is required for the fruit to ripen[200]. The fully dormant plant is hardy to about -25°c, though the young growth in spring can be damaged by late frosts. Plants climb by means of tendrils[182]. Any pruning should be carried out in winter when the plants are dormant otherwise they bleed profusely[182, 200]. A fast growing climber[11, 202], attaching itself by means of tendrils[182], it is ideal for growing into large trees. Plants are often slow to establish, taking 1 - 2 years from planting out before they make much new growth[202]. A very ornamental plant[1] with its large leaves

which colour well in the autumm. Plants in this genus are notably susceptible to honey fungus[200].

### 5.2.359 Quercus aliena

Oriental White Oak

4 tlin 8 cyuc 2 kcak 0 tcan 2 dwat 20 m hkuc hmimhtut cyutli tcup hwicli jlutnyik hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta Quercus aliena is a deciduous Tree growing to 20 m (65ft) by 15 m (49ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from April to May, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

**kcakta Edible Parts:** Seed**Edible Uses:** CoffeeSeed - cooked[105, 177]. The seed is about 25mm long, it can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread. The seed contains bitter tannins, these can be leached out by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute.

tcanta Repellent Tannin WoodA mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth. Oak galls are excrecences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4]. Wood. Of local value, it is used mainly for boat building[61].

dwatta Astringent DysenteryAny galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4].

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Lime tolerant[188]. Young plants tolerate reasonable levels of side shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. Prefers warmer summers than are usually experienced in Britain, trees often grow poorly in this country and fail to properly ripen their wood resulting in frost damage overwinter[200]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. The seed ripens in its first year[200]. Hybridizes freely with other members of the genus[200]. Plants in this genus are notably resistant to honey fungus[200].

### 5.2.360 Picea orientalis

Caucasian Spruce

4 tlin 7 cyuc 2 kcak 0 tcan 0 dwat 20 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Picea orientalis is an evergreen Tree growing to 20 m (65ft) by 5 m (16ft) at a fast rate. See above for USDA

and is easily harvested[K]. It is quite rich in saponins and needs to be leached of these toxins before it becomes safe to eat - the Indians would do this by slow-roasting the nuts (which would have rendered the saponins harmless) and then cutting them into thin slices, putting them into a cloth bag and rinsing them in a stream for 2 - 5 days. By this time most of the minerals etc would also have been leached out[K].

tcanta Miscellany Soap WoodSaponins in the seed are used as a soap substitute[169]. The saponins can be easily obtained by chopping the seed into small pieces and infusing them in hot water. This water can then be used for washing the body, clothes etc. Its main drawback is a lingering odour of horse chestnuts[K]. Wood - close-grained, light, soft, white, but often bleached by dark lines of decay[82, 229]. It weighs 28lb per cubic foot[235]. It is easy to carve and resists splitting. Ideal to use in making artificial limbs, it is also used for woodenware, pulp etc and is occasionally sawn into lumber[82, 229, 235].

dwatta Antispasmodic MiscellanyMinute doses of the seed are used internally in the treatment of spasmodic coughs, asthma and internal irritations[222]. It is used externally as a tea or an ointment in the treatment of rheumatism and piles[222]. An extract of the bark has been used as an irritant of the cerebro-spinal system[82].

propta Seed - best sown outdoors or in a cold frame as soon as it is ripe[11, 80]. The seed germinates almost immediately and must be given protection from severe weather[130]. The seed has a very limited viability and must not be allowed to dry out. Stored seed should be soaked for 24 hours prior to sowing and even after this may still not be viable[80, 113]. It is best to sow the seed with its 'scar' downwards[130]. If sowing the seed in a cold frame, pot up the seedlings in early spring and plant them out into their permanent positions in the summer.

nwatta Landscape Uses:Specimen, Street tree. Prefers a deep loamy well-drained soil but is not too fussy[1, 11]. This species is the state tree of Ohio[229]. Its growth-rate is moderate in the wild, with trees living up to 100 years[229]. In Britain, it grows best in eastern and south-eastern areas of England probably needing a continental climate in order to thrive[126, 200]. Although the trees are hardy when dormant, the new growth can be damaged by late spring frosts[11]. The twigs, bark, flowers and leaves all produce a foetid odour if crushed[229]. Most members of this genus transplant easily, even when fairly large[11]. Special Features:Attractive foliage, North American native, Fragrant foliage, All or parts of this plant are poisonous, Blooms are very showy.

### 5.2.356 Vitis palmata

Red Grape, Catbird grape

4 tin 8 cyuc 2 kcak 0 tcan 0 dwat 20 m hkuc hmimhtut cyutli kyuctup hwicli hrasjlutnyik hpa7tli flat-prikliwis hpa7tmwatli xre7t hjonli

drutta Vitis palmata is a deciduous Climber growing to 20 m (65ft 7in). See above for USDA hardness. It is hardy to UK zone 5. It is in flower from June to July, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Fruit LeavesEdible Uses: Fruit - raw or dried for winter use[159, 177]. A sweet flavour when mature[274]. The fruit is up to 10mm in diameter and is carried in small bunches[235]. Young leaves are wrapped around other foods and then baked, they impart a pleasant flavour[159]. Young tendrils - raw or cooked. Used as a snack[159].

tcanta DyeA yellow dye is obtained from the fresh or dried leaves[168].

dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe[K]. Six weeks cold stratification improves the germination rate, and so stored seed is best sown in a cold frame as soon as it is obtained. Germination should take place in the first spring, but sometimes takes another 12 months. Prick out the seedlings into individual pots when they are large

enough to handle and grow them on in a cold frame for their first winter. Plant out in early summer. Cuttings of mature wood of the current seasons growth, December/January in a frame. These cuttings can be of wood 15 - 30cm long or they can be of short sections of the stem about 5cm long with just one bud at the top of the section. In this case a thin, narrow strip of the bark about 3cm long is removed from the bottom half of the side of the stem. This will encourage callusing and the formation of roots. Due to the size of these cuttings they need to be kept in a more protected environment than the longer cuttings. Layering.

nwatta Prefers a deep rich moist well-drained moderately fertile loam[1, 200]. Grows best in a calcareous soil[200]. Succeeds in sun or partial shade though a warm sunny position is required for the fruit to ripen[200]. Plants climb by means of tendrils[182]. Any pruning should be carried out in winter when the plants are dormant otherwise they bleed profusely[182, 200]. Plants in this genus are notably susceptible to honey fungus[200].

### 5.2.357 Quercus ellipsoidalis

Northern Pin Oak

4 tin 6 cyuc 2 kcak 0 tcan 2 dwat 20 m hkuc hmimhtut cyutli tcup hwicli jlutnyik hpa7tli flat-prikliwis hpa7tmwatli hjonli

drutta Quercus ellipsoidalis is a deciduous Tree growing to 20 m (65ft) by 13 m (42ft) at a medium rate. See above for USDA hardness. It is hardy to UK zone 4 and is not frost tender. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: SeedEdible Uses: CoffeeSeed - cooked. It can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread. The seed, which is up to 2cm long[229], contains bitter tannins - these can be leached out by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute[161, 177, 257].

tcanta Repellent Tannin WoodA mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth[20]. Oak galls are excrescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4]. Wood - hard, heavy strong. It is cut occasionally for lumber, being used for flooring, furniture and interior finishes[229].

dwatta Astringent Dysentery EmmenagogueAny galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4]. A decoction of the inner bark has been used to treat suppressed menses caused by cold[257].

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Landscape Uses:Specimen, Street tree. Prefers a good deep fertile loam which can be on the stiff side[1, 11].

used internally as a spur for the digestive system or externally as a rubefacient[4]. It should not be used internally by people with stomach ulcers or thyroid problems[238]. The roots are antiseptic, aperient, digestive, diuretic, expectorant, rubefacient and stimulant[4, 13, 14, 165, 171, 222]. They should be used in their fresh state[4]. An infusion is used in the treatment of colds, fevers and flu and is of value in the treatment of respiratory and urinary tract infections[254]. A sandwich of the freshly grated root is a traditional remedy for hay fever[254]. A tea made from the root is weakly diuretic, antiseptic and expectorant[222]. The plant is antibiotic against gram-negative and gram-positive bacteria and also pathogenic fungi[222, 240]. It is experimentally antitumor[222]. Externally, a poultice made from the roots is used to treat pleurisy, arthritis and infected wounds[238]. It will also relieve the pain of chilblains[244]. Some caution should be employed, however, because it can cause blistering[254]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve *Armoracia rusticana* for internal and external use in catarrhs of the respiratory tract, internally as supportive therapy for urinary tract infections, externally for the hyperaemic treatment of minor muscles aches (see [302] for critics of commission E).

propta Seed - this is seldom produced on plants in cultivation[200]. If seed is obtained then it is best sown in situ during the spring[238]. Division is very easy and can be carried out at almost any time of the year, though it is probably best in spring[33]. It s best to use sections of root about 20cm long, which can be planted out into their permanent positions in February or March, though even very small bits of root will grow away[4, 264]. Division should be carried out at least once every three years or the crop will deteriorate[4].

nwatta Landscape Uses:Massing, Seashore. A very easily grown plant, horseradish prefers a good deep moist well-drained soil and a sunny position[16, 27, 33, 200]. Plants require a good soil if they are to produce good roots[4], though once established they are very tolerant of neglect and will continue to produce a crop for many years[264, K]. Plants do not thrive if they are in the shade of trees[264]. Excess nitrogen causes heavy top growth and forking of the roots[200]. Prefers a wet clay soil according to one report[14], whilst another says that it will not grow in wet soil[16]. Tolerates a pH in the range 5.8 to 8.3. Horseradish has long been cultivated for its root which is used as a food flavouring and medicinally, there are some named varieties[4, 17, 61, 183]. If the roots are given some protection they will produce fresh young leaves for the salad bowl all through the winter. Digging up some roots and putting them into a greenhouse for the winter is the easiest method. If the young shoots are blanched they will produce white, tender, sweet leaves[183]. A very invasive plant[33], it is considered to be a pernicious weed in some areas[200]. Even quite small sections of root will regrow if they are left in the soil[4]. The plant has yet to prove invasive on our Cornwall trial grounds, though it has survived and even prospered in a very overgrown site[K]. The forms of this plant grown in gardens are almost sterile and seldom produce good seed[264]. This is a good companion plant for potatoes since it is said to deter potato eelworm[14, 18, 201] and the Colorado beetle[238]. One plant at each corner of the potato patch is quite sufficient[201]. When grown under apple trees it is said to prevent brown rot, powdery mildew and other fungal diseases[201].Special Features:Fragrant foliage, Not North American native, Invasive, Naturalizing, Fragrant flowers. The plant is heat tolerant in zones 12 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2]. The root pattern is a tap root similar to a carrot going directly down [1-2].

### 5.2.330 Erythronium revolutum

Pink Fawn Lily, Mahogany fawnlily

4 tin 8 cyuc 3 kcak 0 tcan 0 dwat 0.3 m hkuc hmim cyutli tcup hwicli hrasjlut hpa7tli flat-prikliwis hpa7tmwatli xre7t hjonli

drutta Erythronium revolutum is a BULB growing to 0.3 m (1ft) by 0.2 m (0ft 8in). See above for USDA hardness. It is hardy to UK zone 5 and is not frost tender. It is in flower from April to May. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Bulb - raw or cooked[256]. It can also be dried and stored for later use[257]. The bulbs are usually harvested in the spring as the first leaves appear above ground, they can be stored for some months in a cool place[256]. The raw bulb has a slightly bitter milky taste, the texture is cool and moist inside and so the North American Indians liked eating them on hot days[256]. The cooked bulb has a more starchy texture. The Indians always drank water after eating the bulbs because they believed that otherwise they would get sick[256]. The ovoid bulb is 35 - 50mm long[270].

tcanta None known

dwatta None known

propta Seed - best sown as soon as it is ripe in a shady position in a cold frame. Water lightly in summer, it should germinate in autumn or winter[164, 200]. Stored seed requires a period of cold stratification[164]. Sow as early in spring as possible in a cold frame. Sow the seed thinly so that it will not be necessary to prick them out for their first year of growth. Give an occasional liquid feed to the seedlings to make sure that they do not become nutrient deficient. When the plants are dormant, pot up the small bulbs putting 2 - 3 bulbs in each pot. Grow them on in a shady position in the greenhouse for another 2 3 years and then plant them out into their permanent positions when they are dormant in late summer. Division of the bulbs in the summer as the leaves die down[1]. Larger bulbs can be replanted immediately into their permanent positions, but it is best to pot up smaller bulbs and grow them on in a shady position in a greenhouse for a year before planting them out when dormant in late summer.

nwatta Prefers slightly acid soil conditions but succeeds in chalky soils if these contain plenty of humus[164]. Requires semi-shade, preferably provided by trees or shrubs, and a well-drained soil[42, 164]. Succeeds in almost any light soil, preferring one that is rich in humus[1]. Plants are hardy to about -15°C[90]. The sub-species *E. revolutum johnstonii* is growing well, flowering freely and spreading nicely in the dappled shade of a woodland garden at Kew[K]. It does not, however, produce new bulbs freely by division, relying instead upon self-sown seedlings[258]. There are a number of named garden forms, 'Pink Beauty' has been specially mentioned as easy to grow in Britain[200]. Flowers are produced in 3 - 4 years from seed[164]. Bulbs should be planted about 7cm deep[1].

### 5.2.331 Physalis pruinosa

Strawberry Tomato

4 tin 8 cyuc 3 kcak 0 tcan 0 dwat 0.6 m hkuc hmimhtut cyutli kyuctup hwicli hrasjlutnyik hpa7tli flat-prikliwis hpa7tmwatli xre7t hjonli

drutta Physalis pruinosa is a ANNUAL growing to 0.6 m (2ft). See above for USDA hardness. It is hardy to UK zone 5 and is not frost tender. It is in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked in pies, preserves etc[105]. A delicious bitter sweet flavour. The plant conveniently wraps up each fruit in its own 'paper bag' (botanically, the calyx) to protect it from

pests and the elements. This calyx is toxic and should not be eaten.

tcanta None known

dwatta None known

propta Seed - sow March/April in a greenhouse only just covering the seed. Germination usually takes place quickly and freely. Prick out the seedlings into individual pots of fairly rich soil when they are large enough to handle and plant them out after the last expected frosts. Consider giving them some protection such as a cloche until they are growing away well. Diurnal temperature fluctuations assist germination[170].

nwatta Succeeds in any well-drained soil in full sun or light shade[200]. The young growth in spring can be damaged by late frosts. Occasionally cultivated for its edible fruit, there are some named varieties. Similar to *P. peruviana*[200].

## 5.2.332 *Prunus japonica nakai*

Japanese Plum

4 tin 8 cyuc 3 kcaak 1 tcan 3 dwat 0.5 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Prunus japonica nakai* is an evergreen Shrub growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower in May, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Fruit SeedEdible Uses: Fruit - raw or cooked. A sweet agreeable flavour; they make a good pie[183]. A very good size, about 50mm in diameter with one large seed[200]. Seed - raw or cooked. Do not eat the seed if it is too bitter - see the notes above on toxicity.

tcanta DyeA green dye can be obtained from the leaves[168]. A dark grey to green dye can be obtained from the fruit[168].

dwatta Aperient Aphrodisiac Carminative Demulcent Deobstruent Diuretic Lenitive OphthalmicThe kernels are aperient, carminative, demulcent, deobstruent, diuretic, lenitive and ophthalmic[147, 176, 178, 218, 279]. Their use lowers the blood pressure[176]. A decoction is used in the treatment of sluggish colon, constipation, oedema and inadequate elimination of urine[147]. The pits of this subspecies are aphrodisiac for both sexes[218]. The root is used in the treatment of constipation, children's fever, pinworms and teeth ailments[218]. All members of the genus contain amygdalin and prunasin, substances which break down in water to form hydrocyanic acid (cyanide or prussic acid). In small amounts this exceedingly poisonous compound stimulates respiration, improves digestion and gives a sense of well-being[238].

propta Seed - requires 2 - 3 months cold stratification and is best sown in a cold frame as soon as it is ripe[200]. Sow stored seed in a cold frame as early in the year as possible[200]. Protect the seed from mice etc. The seed can be rather slow, sometimes taking 18 months to germinate[113]. Prick out the seedlings into individual pots when they are large enough to handle. Grow them on in a greenhouse or cold frame for their first winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood with a heel, July/August in a frame[11, 200]. Softwood cuttings from strongly growing plants in spring to early summer in a frame[200]. Layering in spring.

nwatta Thrives in a well-drained moisture-retentive loamy soil[11, 200]. Prefers some lime in the soil but is likely to become chlorotic if too much lime is present[1]. Succeeds in sun or partial shade though it fruits better in a sunny position[11, 200]. A very ornamental plant[1], but it is subject to die-back[11]. Plants in this genus are notably susceptible to honey fungus[200]. This sub-species has larger plum-like fruits up to 50mm in diameter[200]. Closely related to *P. glandulosa*[11, 58]. Most members of this genus are shallow-rooted and will produce suckers if the roots are damaged[238]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown

above) information on the habit and root pattern is also useful and given here if available. A clumping plant, forming a colony from shoots away from the crown but with a limited spread [1-2]. The root pattern is flat with shallow roots forming a plate near the soil surface [1-2].

## 5.2.333 *Tussilago farfara*

Coltsfoot

4 tin 8 cyuc 3 kcaak 3 tcan 3 dwat 0.2 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyikrip hpa7tli flatprikli-wisslip hpa7tmwatli yfifxre7t hjonli

drutta *Tussilago farfara* is a PERENNIAL growing to 0.2 m (0ft 8in) by 1 m (3ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from February to April, and the seeds ripen from March to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: Flowers Leaves OilEdible Uses: Oil Salt TeaFlower buds and young flowers - raw or cooked[46, 183]. A pleasant aniseed flavour[K], they add a distinctive aromatic flavour to salads[9]. Young leaves - raw or cooked[9, 46, 183]. They can be used in salads, added to soups, or cooked as a vegetable[238]. The leaves have a bitter taste unless they are washed after being boiled[179]. An aromatic tea is made from the fresh or dried leaves and flowers[183]. It has a liquorice-like flavour[238]. The dried and burnt leaves are used as a salt substitute[102, 183]. The slender rootstock is candied in sugar syrup[183].

tcanta Compost Oil Soil stabilization Stuffing TinderThe soft down on the underside of the leaves is used as a stuffing material[53, 54]. When wrapped in a rag, dipped in salt-petre and dried in the sun it makes an excellent tinder[4]. Plants have an extensive root system and are used to stabilize banks[200]. The leaves are a valuable addition to the compost heap[200].

dwatta Antitussive Astringent Bitter Demulcent Diaphoretic Eczema Emollient Expectorant Skin Stimulant TonicAn effective demulcent and expectorant herb, coltsfoot is one of the most popular European remedies for the treatment of a wide range of chest complaints[254]. It is widely available in health food shops. The leaves are commonly used in Europe, though the flowering stems (which contain higher levels of pyrrolizidine alkaloids) are preferred in China[254]. They are rich in mucilage and are the main parts used, though the root is also sometimes employed[4, 244]. Pyrrolizidine alkaloids have a toxic effect upon the liver, but are largely destroyed when the plant is boiled to make a decoction[254]. Some caution should be employed in the use of this remedy - the flowers should not be used except under professional supervision, the leaves should not be used for more than 4 - 6 weeks at a time, the herb should not be taken whilst pregnant or breast-feeding and it should not be given to children under the age of six[254]. Modern research has shown that extracts of the whole plant can increase immune resistance[254]. In a Chinese trial 75% of patients suffering from bronchial asthma showed some improvement after treatment with this plant, though the anti-asthmatic effect was short-lived[254]. The leaves are harvested in June and early July, the flowers are harvested when fully open and the root is harvested in the autumn. All can be dried and used as required[4]. The plant is antitussive, astringent, demulcent, emollient, expectorant, stimulant and tonic. It is widely used in the treatment of coughs and respiratory problems[4, 7, 9, 13, 21, 54, 165, 176, 218] and is often candied so that it can be sucked as a sweet[4]. The plant is of particular use in the treatment of chronic emphysema and silicosis, helping to relieve the persistent cough associated with these conditions[244]. Coltsfoot is particularly effective when used in combination with liquorice (*Glycyrrhiza* species), thyme (*Thymus vulgaris*) and wild cherry (*Prunus serotina*)[254]. A poultice of the flowers has a soothing effect on a range of skin disorders including eczema, ulcers, sores, bites and inflammations[7, 238]. A bitter, tonic and diaphoretic preparation can be obtained from the root[7].

young plants, can die back over winter if they are not fully ripened[11]. Young plants are slow-growing[200]. The tree is widely cultivated for timber in China[266]. A polymorphic species[11].

## 5.2.353 *Picea omorika*

Serbian Spruce

4 tin 7 cyuc 2 kcaak 0 tcan 0 dwat 25 m hkuc

htut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli frusflatprikli-wisslip hpa7tmwatli hjonli

drutta *Picea omorika* is an evergreen Tree growing to 25 m (82ft) by 5 m (16ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in leaf all year, in flower in May, and the seeds ripen from October to November. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and very alkaline soils. It cannot grow in the shade. It prefers moist or wet soil. The plant can tolerate strong winds but not maritime exposure. It cannot tolerate atmospheric pollution.

kcakta Edible Parts: Flowers Inner bark SeedEdible Uses: TeaYoung male catkins - raw or cooked. Used as a flavouring[172]. Immature female cones - cooked. The central portion, when roasted, is sweet and syrupy[172]. Inner bark - dried, ground into a powder and then used as a thickener in soups etc or added to cereals when making bread[172]. An emergency food, it is only used when all else fails. Seed - raw. Too small and fiddly to be worthwhile unless you are desperate[172]. A refreshing tea, rich in vitamin C, can be made from the young shoot tips[172].

tcanta Shelterbelt WoodModerately wind resistant, it is sometimes planted in shelterbelts. Wood. It is valued for its use in the pulp industry to make paper[171].

dwatta Vitamin CNone known

propta Seed - stratification will probably improve germination so sow fresh seed in the autumn in a cold frame if possible[80]. Sow stored seed as early in the year as possible in a cold frame[78]. A position in light shade is probably best[78]. Seed should not be allowed to dry out and should be stored in a cool place[80]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse or cold frame for their first winter. They can be planted out into their permanent positions in early summer of the following year, or be placed in an outdoor nursery bed for a year or so to increase in size. They might need protection from spring frosts. Cuttings of semi-ripe terminal shoots, 5 - 8cm long, August in a frame. Protect from frost. Forms roots in the spring[78]. Cuttings of mature terminal shoots, 5 - 10cm long, September/October in a cold frame. Takes 12 months[78]. Cuttings of soft to semi-ripe wood, early summer in a frame. Slow but sure.

nwatta Landscape Uses:Pest tolerant, Screen, Specimen. Likes abundant moisture at the roots, if grown in drier areas it must be given a deep moist soil[11]. Tolerates poor peaty soils[200]. Succeeds in wet cold and shallow soils but is not very wind-firm in shallow soils[1]. Prefers a pH between 4 to 6 but it also succeeds in pure chalk soils[200]. Dislikes shade[200]. Intolerant of atmospheric pollution[11]. Resists wind exposure to some degree[200]. In some upland areas, especially over granitic or other base-poor soils, growth rate and health have been seriously affected by aluminium poisoning induced by acid rain[200]. Plants are strongly outbreeding, self-fertilized seed usually grows poorly[200]. They hybridize freely with other members of this genus[200]. There are a number of named forms selected for their ornamental value, most of these are dwarf cultivars[200]. A fast growing tree from its second year of growth. Two to three years after planting out new shoots 1 metre long may be produced[185]. Growth takes place from mid-May to the end of July. Height increase is moderate over a long term basis, averaging around 50cm a year[185]. Trees should be planted into their permanent positions when they are quite small, between 30 and 90cm. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200]. Occasionally planted as a timber tree in Britain, it produces almost the same bulk of timber as the Norway spruce (*Picea abies*) but

is more frost tolerant and can be grown in frosty hollows[185] because it comes into leaf quite late and it is not damaged by late frosts[11]. This species is widely cultivated as a timber tree in regions too dry or liable to late frosts for *P. sitchensis* to do well[200]. This species is notably susceptible to honey fungus[200]. Special Features: Attractive foliage, Not North American native, Inconspicuous flowers or blooms.

## 5.2.354 *Fagus japonica*

Japanese Beech

4 tin 8 cyuc 2 kcaak 0 tcan 0 dwat 22 m hkuc

pcimhmimhtut cyutli kyuctcup hwicli hrasjlut hpa7tli flat-prikliwis hpa7tmwatli hjonli

drutta *Fagus japonica* is a deciduous Tree growing to 22 m (72ft 2in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Leaves Oil SeedEdible Uses: Coffee OilYoung leaves - raw. A very nice mild flavour; but the leaves quickly become tough so only the youngest should be used. New growth is usually produced for 2 periods of 3 weeks each year, one in spring and one in mid-summer. Edible seed - raw or cooked. Rich in oil. The raw seed should not be eaten in large quantities, see the notes above on toxicity. It can be dried and ground into a powder. An edible semi-drying oil is obtained from the seed[105, 177]. The roasted seed is a coffee substitute.

tcanta OilNone known

dwatta None known

propta Seed - the seed has a short viability and is best sown as soon as it is ripe in the autumn in a cold frame. Protect the seed from mice. Germination takes place in the spring. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. The seedlings are slow growing for the first few years and are very susceptible to damage by late frosts. The seed can also be sown in an outdoor seedbed in the autumn. The seedlings can be left in the open ground for three years before transplanting, but do best if put into their final positions as soon as possible and given some protection from spring frosts.

nwatta Thrives on a light or medium soil[11], doing well on chalk[1], but ill-adapted for heavy wet soils[1]. Young trees are very shade tolerant, but are subject to frost damage so are best grown in a woodland position which will protect them[200]. Although very cold hardy, this species requires hotter summers than are normally experienced in Britain so is not usually a success here and is very slow growing[200]. Trees have surface-feeding roots and also cast a dense shade. This greatly inhibits the growth of other plants and, especially where a number of the trees are growing together, the ground beneath them is often almost devoid of vegetation.

## 5.2.355 *Aesculus glabra*

Ohio Buckeye, Fetid Buckeye

4 tin 7 cyuc 2 kcaak 0 tcan 1 dwat 20 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Aesculus glabra* is a deciduous Tree growing to 20 m (65ft 7in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to July, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: Seed - cooked[222]. It can be dried, ground into a flour and used as a gruel. The seed is quite large, up to 35mm in diameter[82],

## 5.2.350 Quercus coccinea

Scarlet Oak

4 tin 8 cyuc 2 kcaak 0 tcan 2 dwat 25 m hkuc  
hmmihmtut cyutli tcup hwicli jlutnyik hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta Quercus coccinea is a deciduous Tree growing to 25 m (82ft) by 15 m (49ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower in May, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: SeedEdible Uses: CoffeeSeed - cooked. It can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread. The seed, which is up to 25mm long and 15mm wide[82, 229], contains bitter tannins, these can be leached out by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute.

tcanta Repellent Tannin WoodA mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth[20]. Oak galls are excrescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4]. Wood - strong, hard, heavy, coarse grained[46, 82, 171, 229]. It weighs 46lb per cubic foot[235]. Inferior to wood from the white oaks, it is used in construction, furniture etc[46, 82, 171, 229].

dwatta Astringent DysenteryAny galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4].

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Landscape Uses:Aggressive surface roots possible, Street tree. Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Young plants tolerate reasonable levels of side shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. Prefers warmer summers than are usually experienced in Britain, trees often grow poorly in this country and fail to properly ripen their wood resulting in frost damage overwinter[200]. A very ornamental tree[1], it is fast-growing but short-lived in the wild[229]. Seed production is cyclic, a year of high yields being followed by 3 - 4 years of low yields[229]. The tree flowers on new growth produced in spring, the seed taking two summers to ripen[229]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. Hybridizes freely with other members of the genus[200]. Plants in this genus are notably resistant to honey fungus[200]. Special Features:Attracts birds, North American native, Inconspicuous flowers or blooms.

## 5.2.351 Corylus x vilmorinii

Chinese Trazel

4 tin 8 cyuc 2 kcaak 0 tcan 0 dwat 25 m hkuc

hmmihmtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikli-wisslip hpa7tmwatli hjonli

drutta Corylus x vilmorinii is a deciduous Tree growing to 25 m (82ft 0in). See above for USDA hardiness. It is hardy to UK zone 5. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: Oil SeedEdible Uses: OilSeed - raw or cooked[177]. Rich in oil. The seed ripens in mid to late autumn and will probably need to be protected from squirrels[K]. When kept in a cool place, and not shelled, the seed should store for at least 12 months[K]. An edible oil is obtained from the seed.

tcanta OilNone known

dwatta None known

propta Seed - best sown as soon as it is harvested in autumn in a cold frame[164]. Germinates in late winter or spring. Stored seed should be pre-soaked in warm water for 48 hours and then given 2 weeks warm followed by 3 - 4 months cold stratification[164]. Germinates in 1 - 6 months at 20°C[164]. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame or sheltered place outdoors for their first winter. Plant them out into their permanent positions in late spring or early summer[K]. This species is a hybrid and will not breed true from seed. Layering in autumn. Easy, it takes about 6 months[78, 200].

nwatta An easily grown plant, it succeeds in most soils, but is in general more productive of seeds when grown on soils of moderate fertility[11, 200]. It does less well in rich heavy soils or poor ones[11, 63]. Does well in a loamy soil[11]. Very suitable for an alkaline soil[11], but it dislikes very acid soils[17]. Plants are fairly wild tolerant[1, 11]. Members of this genus bear transplanting well and can be easily moved even when relatively large[11]. This species is an artificial hybrid, produced by crossing *C. chinensis* x *C. avellana*. The Chinese parent contributes a characteristic rounded nut with a slightly thinner shell than *C. colurna*.

## 5.2.352 Kalopanax septemlobus

Tree Aralia, Castor aralia

4 tin 8 cyuc 2 kcaak 0 tcan 1 dwat 25 m hkuc  
hmmihmtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Kalopanax septemlobus is a deciduous Tree growing to 25 m (82ft 0in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from August to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young leaves and young shoots - cooked[177, 179].

tcanta InsecticideThe bark and the leaves are used as an insecticide[178]. Wood[266].

dwatta Antifungal Expectorant Hepatic Skin Stomachic-The bark contains a range of bio-active constituents, including saponins, flavonoids and lignans[279]. It has antifungal and liver protecting properties[279]. It is used in Korea in the treatment of contusions, beri-beri, lumbago, neuralgia and pleurisy[279]. An infusion of the leaves is used to make a stomachic tea[218]. The root is expectorant[218]. A decoction of the wood is used for skin diseases[178, 218].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame[200]. Stored seed probably requires a period of cold stratification and should be sown as soon as possible. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame[200]. Root cuttings in late winter.

nwatta Requires a deep fertile moisture-retentive soil in sun or part shade[200]. Young shoots, especially on

propta Seed - the plant does not usually require help with spreading itself around, but if required the seed can be sown in situ in early spring or autumn. Division of the roots is very easy and succeeds at almost any time in the year. The divisions can be planted out direct into their permanent positions.

nwatta A very easily grown plant, it succeeds in most soils when grown in full sun[14]. It prefers a moist neutral to alkaline soil and will also succeed in partial shade[238]. Plants are hardy to about -29°C[238]. Footroot is a very tough plant that is more than capable of looking after itself. When well sited its roots will spread very freely sending up new shoots at some distance from the clump even if growing amongst dense weed competition[K]. This can make it a problem weed in gardens[200], so either choose your site with care or find some means of restraining it such as by planting in a large tub that is buried in the ground[K]. The rhizomes can lay dormant in the soil for many years, emerging when the soil is disturbed[200]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [2-1].

## 5.2.334 Callirhoe involucrata

Poppy Mallow, Purple poppymallow, Winecup, Finger Poppy Mallow

4 tin 8 cyuc 3 kcaak 0 tcan 2 dwat 0.2 m hkuc  
htut cyutli hgatyuctcup hwicli hyishras hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Callirhoe involucrata is a PERENNIAL growing to 0.2 m (0ft 8in) by 0.5 m (1ft 8in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Leaves RootEdible Uses: Root - cooked[2, 105, 161, 177]. The root is long and tapering[2], it is sweet and starchy with a pleasant taste somewhat like that of a sweet potato[183]. Leaves - cooked. A pleasant flavour with a mucilaginous texture, they are good for thickening soups[183].

tcanta None known

dwatta AnodyneA decoction of the root is used to treat internal pain[61, 222, 257]. The root was also dried, then burnt and the smoke either inhaled or allowed to bathe the affected part of the body[222, 257].

propta Seed - sow outdoors or in a cold frame. Plants resent root disturbance so the seed is best sown in situ in April[138], though the slugs will have a field day if you do not protect the plants[K]. If seed is in short supply then sow it in pots in a cold frame, putting a few seeds in each pot, and plant the pots out in early summer once the plants have put on at least 15cm of growth. Germination usually takes place within 1 - 6 months at 15°C[138]. Cuttings of young basal shoots in a frame in sand[1, 200]. Harvest the shoots when they are about 10cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer. Division[200]. With care since the plant resents root disturbance. We have found that it is best not to disturb this plant and so do not try to divide it, relying instead on taking basal cuttings since these do not disturb the main clump[K].

nwatta Landscape Uses: Border, Ground cover, Rock garden. Prefers a light rich sandy loam and a sunny position[1, 200]. Likes a hot dry position[200], growing well on a dry sunny bank[260]. This species is hardy to about -15°C[200]. A deep-rooting plant[235], it strongly resents root disturbance and should be planted into its final position as soon as possible[138]. Slugs are strongly attracted to this plant and can destroy even established plants by eating out all the young shoots in spring[K]. Special Features: North American native, Naturalizing, Extended bloom season in Zones 9A and above. The plant is heat tolerant in zones

7 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is a tap root similar to a carrot going directly down [1-2].

## 5.2.335 Monarda didyma

Bergamot, Scarlet beebalm, Horsemint, Oswego Tea, Bee Balm

4 tin 10 cyuc 3 kcaak 3 tcan 2 dwat 0.9 m hkuc

hmmihmtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprikliwis hpa7tmwatli fyfkrre7t hjonli

drutta Monarda didyma is a PERENNIAL growing to 0.9 m (3ft) by 0.5 m (1ft 8in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in leaf from April to October, in flower from June to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves ShootsEdible Uses: Condiment TeaLeaves and young shoot tips - raw or cooked. They are used as a flavouring in salads, fruit salads, drinks etc[46, 61, 105, 183]. Flowers - raw. They are added as an attractive garnish to salads[183, 238, 244]. An excellent aromatic tea is made from the fresh or dried leaves and flower heads[21, 46, 105, 183]. The leaves give an Earl Grey flavour to China tea[238].

tcanta Companion Essential Pot-pourriLandscape Uses: Border, Container, Massing, Rock garden, Specimen. Attracts birds, North American native, Edible, Fragrant foliage, Invasive, Naturalizing, Attracts butterflies, Suitable for cut flowers, Suitable for dried flowers, Fragrant flowers. Yields an essential oil, used in perfumery, as a hair tonic etc[46, 61]. The dried leaves and flowers are used to scent and add colour to pot-pourri[238]. Brings hummingbirds.

dwatta Anthelmintic Carminative Diuretic Expectorant Febrifuge Rubefacient Stimulant UrinaryBergamot is often used as a domestic medicine, being particularly useful in the treatment of digestive disorders. The leaves and flowering stems are anthelmintic, carminative, diuretic, expectorant, febrifuge, rubefacient and stimulant[4, 222]. An infusion is used in the treatment of flatulent colic and sickness, it is also used as a diuretic to treat urinary disorders[4, 238]. The leaves can be harvested before the plant flowers, or they can be harvested with the flowering stems. They can be used fresh or dried[238]. An essential oil from the herb is mainly used externally as a rubefacient in the treatment of rheumatism etc[4].

propta Seed - sow mid to late spring in a cold frame. Germination usually takes place within 10 - 40 days at 20°C. When large enough to handle, prick the seedlings out into individual pots and plant them out into their permanent positions in early summer. The seed can also be sown in situ in late summer in areas where the winters are not too severe and will produce larger plants. Cuttings of soft basal shoots in spring. Harvest the shoots with plenty of underground stem when they are about 8 - 10cm above the ground. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer. Division in spring or autumn. Very easy, large divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Easily grown in ordinary garden soil so long as it is not too dry[1, 200]. Grows well in heavy clay soils. Requires a moist soil and a sunny position[4, 200]. Prefers some shade[4] but succeeds in a sunny position so long as the soil does not dry out. Provide light shade in hotter zones. Plants are hardy to at least -25°c[187]. The flowers are rich in nectar and are very attractive to bees[4, 55, 244]. A good companion plant, it grows well with tomatoes[14, 20]. Bergamot is a very ornamental and aromatic plant, it is often grown in the herb garden, there are some named varieties[183, 233]. The leaves, stems and roots carry a delicious aromatic orange-like perfume when crushed[245]. Plants are subject to mildew in dry summers[200]. Special Features: The plant is heat tolerant in zones 10 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

### 5.2.336 Hydrophyllum virginianum

Virginia Waterleaf, Eastern waterleaf  
4 tin 8 cyuc 3 ckak 0 tcan 1 dwat 0.6 m hkuc  
hmim cyutli tcup hwicli hrasjltunyk hpa7tli flatprikhlwis hpa7tmwatli xre7t hjonli

drutta Hydrophyllum virginianum is a PERENNIAL growing to 0.6 m (2ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower in May, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

ckakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked[2, 61]. A bland flavour[159]. The mild-tasting and tender young leaves make a pleasant addition to the salad bowl[183, K], whilst older leaves make a good spinach[183]. Only use when young, they become bitter with age[159].

tcanta None known

dwatta Astringent DysenteryA tea made from the roots is astringent, it is used in the treatment of diarrhoea, dysentery etc[222]. A decoction, or the chewed root, has been used as a wash for cracked lips and sore mouths[257].

propta Seed - best sown as soon as it is ripe in a cold frame. The seed usually germinates in early spring. Sow stored seed as early in the year as possible. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring or autumn[200]. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Requires a moist humus-rich soil in semi-shade[200]. Slugs are particularly fond of this plant and will soon destroy it if given a chance[K]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

### 5.2.337 Mentha arvensis piperascens

Japanese Mint

4 tin 8 cyuc 3 ckak 0 tcan 2 dwat 0.5 m hkuc  
hmimhtut cyutli tcup hwicli hrasjltunykfrip hpa7tli flatprikhlwis hpa7tmwatli xre7t hjonli

drutta Mentha arvensis piperascens is a PERENNIAL growing to 0.5 m (1ft 8in) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from May to October, and the seeds ripen from July to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

ckakta Edible Parts: LeavesEdible Uses: Conditment TeaLeaves - raw or cooked. Used as a flavouring in salads or cooked foods[5, 172, 183], they have a strong taste of peppermint[238]. A herb tea is made from the fresh or dried leaves[21, 183]. An essential oil from the plant is used as a flavouring in sweets and beverages[183]. The leaves contain about 0.2% essential oil[218].

tcanta Essential Repellent StrewingThe plant is used as an insect repellent[18, 20, 99]. Rats and mice intensely dislike the smell of mint. The plant was therefore used in homes as a strewing herb and has also been spread in granaries to keep the rodents off the grain[244]. An essential oil is obtained from the plant[238]. It can be used as a substitute for, or adulterant of, peppermint oil[238]. Yields of up to 1.6% have been obtained[240].

dwatta Anaesthetic Antiphlogistic Antispasmodic Antispasmodic Aromatic Cancer Carminative Diaphoretic Emmenagogue Febrifuge Galactofuge Salve Stimulant Stomachic-Japanese mint, like many other members of this genus, is often used as a domestic herbal remedy, being valued especially for its essential oil[279] which has antiseptic properties and a beneficial effect on the digestion. Like other members of the genus, it is best not used by pregnant women because large doses can cause an abortion. The whole plant is anaesthetic, antiphlogistic, antispasmodic, antiseptic, aromatic, carminative, diaphoretic, emmenagogue, galactofuge, refrigerant, stimulant, stomachic and vasodilator[147, 172, 218, 279]. A tea made from the leaves has traditionally been used in the treatment of fevers, headaches, digestive disorders and various minor ailments[222,279]. The leaves are a classical remedy for stomach cancer[218]. The essential oil in the leaves is antiseptic, though it is toxic in large doses[222].

propta Seed - sow spring in a cold frame. Germination is usually fairly quick. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in the summer. Mentha species are very prone to hybridisation and so the seed cannot be relied on to breed true. Even without hybridisation, seedlings will not be uniform and so the content of medicinal oils etc will vary. When growing plants with a particular aroma it is best to propagate them by division[K]. Division can be easily carried out at almost any time of the year, though it is probably best done in the spring or autumn to allow the plant to establish more quickly. Virtually any part of the root is capable of growing into a new plant. Larger divisions can be planted out direct into their permanent positions. However, for maximum increase it is possible to divide the roots up into sections no more than 3cm long and pot these up in light shade in a cold frame. They will quickly become established and can be planted out in the summer.

nwatta An easily grown plant, it succeeds in most soils and situations so long as the soil is not too dry[1, 16, 200]. This species tolerates much drier conditions than other members of the genus[238]. Prefers a slightly acid soil[16]. Grows well in heavy clay soils. A sunny position is best for production of essential oils, but it also succeeds in partial shade. Plants are hardy to at least -15°c[238]. Most mints have fairly aggressive spreading roots and, unless you have the space to let them roam, they need to be restrained by some means such as planting them in containers that are buried in the soil[K]. The whole plant has a very strong scent of peppermint[245]. Hybridizes freely with other members of this genus. Polymorphic[200]. The flowers are very attractive to bees and butterflies[24]. A good companion plant for

resulting in frost damage overwinter[200]. A very ornamental tree[1]. Closely related to Q. acutissima[1]. Trees respond well to coppicing[109]. The seed ripens in its second year[200]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. Hybridizes freely with other members of the genus[200]. Plants in this genus are notably resistant to honey fungus[200].

### 5.2.348 Quercus shumardii

Shumard Oak, Schneck oak

4 tin 8 cyuc 2 ckak 0 tcan 2 dwat 30 m hkuc  
hmimhtut cyutli tcup hwicli jltunyk hpa7tli flatprikhlwis hpa7tmwatli hjonli

drutta Quercus shumardii is a deciduous Tree growing to 30 m (98ft 5in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from April to May, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

ckakta Edible Parts: SeedEdible Uses: CoffeeSeed - cooked. Up to 25mm long and wide[227], it can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread. The seed contains bitter tannins, these can be leached out by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute.

tcanta Repellent Tannin WoodA mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth[20]. Oak galls are excrescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4]. Wood - heavy, hard, strong, close grained[82, 149, 227]. It weighs 57lb per cubic foot[227]. A very valuable timber; it is used for lumber, flooring, furniture, veneers, cabinet making etc[82, 149, 229].

dwatta Astringent DysenteryAny galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4].

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Young plants tolerate reasonable levels of side shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. Prefers warmer summers than are usually experienced in Britain, trees often grow poorly in this country and fail to properly ripen their wood resulting in frost damage overwinter[200]. A moderately fast-growing tree in the wild, it commences bearing seeds when about 25 years old[229]. Seed production is cyclic, a year of high yields being followed by 1 - 3 years of low yields[229]. The tree flowers on new growth produced in spring, the seed taking two summers to ripen[229]. Plants in the wild are very susceptible to the disease 'oak wilt'[274]. Closely related to Q. rubra and Q. coccinea[11]. Intolerant

of root disturbance, trees should be planted in their permanent positions whilst young[11]. Hybridizes freely with other members of the genus[200]. Plants in this genus are notably resistant to honey fungus[200].

### 5.2.349 Picea glehnii

Sakhalin Spruce

4 tin 7 cyuc 2 ckak 0 tcan 0 dwat 30 m hkuc  
htut cyutli tucphja7n hwicli hysihrasjltunykfrip hpa7tli frusflatprikslip hpa7tmwatli hjonli

drutta Picea glehnii is an evergreen Tree growing to 30 m (98ft 5in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in leaf all year, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid and neutral soils and can grow in very acid and very alkaline soils. It cannot grow in the shade. It prefers moist or wet soil. The plant can tolerate strong winds but not maritime exposure. It cannot tolerate atmospheric pollution.

ckakta Edible Parts: Flowers Inner bark SeedEdible Uses: TeaYoung male catkins - raw or cooked. Used as a flavouring[172]. Immature female cones - cooked. The central portion, when roasted, is sweet and syrupy[172]. Inner bark - dried, ground into a powder and then used as a thickener in soups etc or added to cereals when making bread[172]. An emergency food, it is only used when all else fails. Seed - raw. Too small and fiddly to be worthwhile unless you are desperate[172]. A refreshing tea, rich in vitamin C, can be made from the young shoot tips[172].

tcanta WoodWood - beautifully grained. Used for pianos, violins, interiors of buildings etc[46, 61]. It is also valued for its use in the pulp industry to make paper[171].

dwatta Vitamin CNone known

propta Seed - stratification will probably improve germination so sow fresh seed in the autumn in a cold frame if possible[80]. Sow stored seed as early in the year as possible in a cold frame[78]. A position in light shade is probably best[78]. Seed should not be allowed to dry out and should be stored in a cool place[80]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse or cold frame for their first winter. They can be planted out into their permanent positions in early summer of the following year, or be placed in an outdoor nursery bed for a year or so to increase in size. They might need protection from spring frosts. Cuttings of semi-ripe terminal shoots, 5 - 8cm long, August in a frame. Protect from frost. Forms roots in the spring[78]. Cuttings of mature terminal shoots, 5 - 10cm long, September/October in a cold frame. Takes 12 months[78]. Cuttings of soft to semi-ripe wood, early summer in a frame. Slow but sure.

nwatta Landscape Uses:Screen, Specimen. Likes abundant moisture at the roots, if grown in drier areas it must be given a deep moist soil[11]. Tolerates poor peaty soils[200]. Succeeds in wet cold and shallow soils but is not very wind-firm in shallow soils[1]. Prefers a pH between 4 to 6[200]. Another report says that it grows well on very alkaline soils so it might be suitable for cultivation on alkaline soils. Dislikes shade[200]. Intolerant of atmospheric pollution[11]. Resists wind exposure to some degree[200]. In some upland areas, especially over granitic or other base-poor soils, growth rate and health have been seriously affected by aluminium poisoning induced by acid rain[200]. Plants are strongly outbreeding, self-fertilized seed usually grows poorly[200]. They hybridize freely with other members of this genus[200]. Fairly fast growing in Britain, able to average 30cm a year for at least the first 50 years[185]. Another report says that it is not a good grower in Britain[1]. Trees should be planted into their permanent positions when they are quite small, between 30 and 90cm. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200]. Special Features: Inconspicuous flowers or blooms.

Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure.

**kcakta Edible Parts:** Leaves Sap Seedpod**Edible Uses:** SweetenerThe sap contains sugar and can be used as a drink or be concentrated into a syrup by boiling off the water[183]. The syrup is used as a sweetener on many foods. It can be harvested in late winter but is not produced in economic quantities[2, 4, 13, 105]. About 25 grams of sugar is obtained from a litre of the sap[4]. The sap can also be used to make a wine[183]. The flow is best on warm sunny days following a frost. The best sap production comes from cold-winter areas with continental climates. The keys of the developing seeds have a sweet exudation on them and this is often sucked by children[183]. The leaves can be wrapped round food such as buns when baking them and they impart a sweet flavour[66]. The related Oregon Maple (*Acer macrophyllum*) has yellow flower clusters, sweet with nectar, eaten raw[183]. No information was found for this species.

**tcanta Charcoal Fuel Pioneer Preservative Shelterbelt Wood**The trees are fast-growing and make a good windbreak for exposed and maritime areas[11, 200]. They are often used in shelterbelt plantings[200]. This species usually self-sows freely and is often the first tree to invade disused farmland, cleared woodland etc. Its ability to tolerate difficult environments make it a good pioneer species for re-establishing woodlands. When grown in Britain it is usually gradually displaced over a period of 200 years or more by native species until it becomes just a minor component of the woodland[K]. The leaves are packed around apples, rootcrops etc to help preserve them[18, 20]. Wood - very hard, heavy, elastic, easy to work, fairly resistant to insects. Used for carving, small domestic items, veneer etc[4, 13, 46, 171]. It is a good fuel and also makes a good charcoal that can be used as a fuel[115]. **dwatta Astringent Vulnerary**The bark has mild astringent properties and has been used to make a wash for skin problems and an eyewash for sore eyes[21]. The inner bark of the tree, containing the sweet sap, can be used as a dressing for wounds[21].

**propta Seed** - best sown as soon as it is ripe in a cold frame, it usually germinates in the following spring. Pre-soak stored seed for 24 hours and then stratify for 2 - 4 months at 1 - 8°C. It can be slow to germinate. Seed should not be dried below 35% moisture[98]. The seed can be harvested 'green' (when it has fully developed but before it has dried and produced any germination inhibitors) and sown immediately. It should germinate in late winter. If the seed is harvested too soon it will produce very weak plants or no plants at all[80, 113]. When large enough to handle, prick the seedlings out into individual pots and grow them on until they are 20cm or more tall before planting them out in their permanent positions. Layering, which takes about 12 months, is successful with most species in this genus. Cuttings of young shoots in June or July. The cuttings should have 2 - 3 pairs of leaves, plus one pair of buds at the base. Remove a very thin slice of bark at the base of the cutting, rooting is improved if a rooting hormone is used. The rooted cuttings must show new growth during the summer before being potted up otherwise they are unlikely to survive the winter. Cultivars can be budded onto rootstocks of the species. Any grafting is best carried out in September rather than February.

**nwatta Landscape Uses:** Firewood, Seashore, Specimen, Street tree. Of easy cultivation, it prefers a good moist well-drained soil and a sunny position[11, 17], but tolerates most conditions including poor soils and some shade[13, 17, 200]. Grows well in heavy clay soils. Chlorosis can sometimes develop as a result of iron deficiency when the plants are grown in alkaline soils, but in general maples are not fussy as to soil pH. Dislikes wet soils[115]. Grows better in the cooler areas of the country[11]. Very wind-resistant, tolerating maritime exposure though it is often wind and salt pruned in very exposed areas[4, 11, 17]. A fairly aggressive tree, it self-sows freely and inhibits the growth of nearby plants[18, 20]. It is often one of the first trees to colonize open land. It is fast growing and establishes rapidly. It can supplant native trees, at least in the short-term, though recent evidence suggests that in the long term it does not usually become the dominant tree in British woodlands and it is often recommended for planting in broad-leaved woods by the Forestry Commission, especially in windy areas[K]. Plants are subject to sooty bark disease - this is not fatal and occurs most of

ten in years that follow hot summers[11]. There are many named forms that have been selected for their ornamental value[200]. Trees take 25 years to come into bearing from seed[98]. **Special Features:**Not North American native, Naturalizing, Inconspicuous flowers or blooms. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

## 5.2.347 *Quercus variabilis*

**Chinese Cork Oak**

4 tlin 8 cyuc 2 kcaak 0 tcan 2 dwat 30 m hkuc hmimhtut cyutli tcup hwicli jlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

**drutta Quercus variabilis** is a deciduous Tree growing to 30 m (98ft 5in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from March to April, and the seeds ripen from October to November. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

**kcakta Edible Parts:** Seed**Edible Uses:** CoffeeSeed - cooked[105, 177]. Very nutritious, but it needs to be leached[179]. The seed is up to 2cm long[200]. It can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread. The seed contains bitter tannins, these can be leached out by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute.

**tcanta Cork Dye Repellent Roofing Tannin Wood**A mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth[20]. Oak galls are excrescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4]. The bark is a source of cork[11, 123]. A 10 metre tall tree at Kew has less than 4cm thickness of cork on it[K]. A black dye is obtained from the seed cupules[61, 109]. The bark is used for roofing[109]. Wood. Used for boat making and construction[109].

**dwatta Astringent Dysentery**Any galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4].

**propta Seed** - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

**nwatta Experimental Crop Industrial Crop:** Cork Industrial Crop: Tannin Management: Standard-Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Young plants tolerate reasonable levels of side shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. Prefers warmer summers than are usually experienced in Britain, trees often grow poorly in this country and fail to properly ripen their wood

growing near brassicas and tomatoes, helping to deter insect pests[20]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 5.2.338 *Potentilla anserina*

**Silverweed**

4 tlin 8 cyuc 3 kcaak 2 tcan 3 dwat 0.3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyfjxre7t hjonli

**drutta Potentilla anserina** is a PERENNIAL growing to 0.3 m (1ft) by 1 m (3ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure.

**kcakta Edible Parts:** Leaves Root**Edible Uses:** TeaRoot - raw or cooked[66, 74, 183]. It can also be dried and ground into a powder then used in soups etc or mixed with cereals[5, 12, 13, 54]. A nice taste, crisp and nutty with a somewhat starchy flavour[85, 183]. The roots are rather thin, though perhaps their size could be improved in cultivation[K]. **Edible young shoots** - raw[74]. A tea is made from the leaves.

**tcanta Cleanser Tannin**A sprig placed in the shoe can help prevent blisters[66]. An infusion of the leaves makes an excellent skin cleansing lotion[66], it is also used cosmetically as a soothing lotion for reddened skin and for the delicate skins of babies[7]. All parts of the plant contain tannin, though the report does not give quantities[4]. A dynamic accumulator gathering minerals or nutrients from the soil and storing them in a more bioavailable form - used as fertilizer or to improve mulch.

**dwatta Analgesic Antidiarrhoeal Antispasmodic Astringent Diuretic Foot care Haemostatic Odontalgic Tonic**Contemporary medical herbalists believe that silverweed's main medicinal value lies in its astringency. It is less astringent than the related *P. erecta*, but it has a gentler action within the gastro-intestinal tract[254]. The whole plant is antispasmodic, mildly astringent, diuretic, foot care, haemostatic, odontalgic and tonic[4, 7, 9, 21]. A strong infusion is used to check the bleeding of piles and to treat diarrhoea, it is also used as a gargle for sore throats[4]. Externally, it is used as a powder to treat ulcers and haemorrhoids whilst the whole bruised plant, placed over a painful area, will act as a local analgesic[7, 254]. The roots are the most astringent part of the plant[4], they are harvested in late summer or autumn and dried for later use[254]. The leaves are harvested in early summer and dried for later use[4]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve *Potentilla anserina* Silverweed for diarrhoea, inflammation of the mouth and pharynx, premenstrual syndrome (see [302] for critics of commission E).

**propta Seed** - sow early spring or autumn in a cold frame. Prick out the seedlings into individual pots once they are large enough to handle and plant them out into their permanent positions in the summer. Division in spring. Division is also very easy at almost any time the plant is in growth. Larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

**nwatta** A very easily grown plant, succeeding in almost any soil, thriving in moist clays, though rather dwarfed in dry dusty soils[4]. It grows best in a well-drained loam, preferring a position in full sun but tolerating shade[1]. Prefers an alkaline soil but tolerates a slightly acid soil[200]. Silverweed was formerly cultivated for its edible root[5, 67]. It is still possibly cultivated in parts of Scotland (1992)[183]. This plant spreads vigorously by its running roots and can be very invasive[1, 4]. It grows well in a meadow, or places where the grass is only cut occasionally[K]. Members of this genus are rarely if ever troubled by browsing deer[233]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if

available. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2]. The root pattern is a tap root similar to a carrot going directly down [1-2]. The root pattern is stoloniferous rooting from creeping stems above the ground [1-2].

## 5.2.339 *Viola adunca*

**Western Dog Violet, Hookedspur violet, Kirk's violet**

4 tlin 8 cyuc 3 kcaak 0 tcan 1 dwat 0.1 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli fyfjxre7t hjonli

**drutta Viola adunca** is a PERENNIAL growing to 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects, Cleistogomy (self-pollinating without flowers ever opening). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**kcakta Edible Parts:** Flowers Leaves**Edible Uses:** TeaYoung leaves and flower buds - raw or cooked[177, 183]. When added to soup they thicken it in much the same way as okra[62, 85, 159]. A tea can be made from the dried leaves[183].

**tcanta Dye**A blue dye can be obtained from the flowers[257].

**dwatta Analgesic Antiasthmatic Birthing aid Ophthalmic Poultice Salve**An infusion of the leaves and roots has been used to treat stomach problems and asthma in children[257]. An infusion of the roots and leaves has been used as a wash and poultice on sore and swollen joints[257]. The roots and leaves have been chewed by women during childbirth[257]. A poultice of the chewed leaves has been applied to sore eyes[257]. A poultice of the crushed flowers has been applied to the side or chest in the treatment of pain[257].

**propta Seed** - best sown in the autumn in a cold frame. Sow stored seed in early spring in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in the summer. Division in the autumn or just after flowering. Larger divisions can be planted out direct into their permanent positions, though we have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the summer or the following spring.

**nwatta** Prefers a cool moist well-drained humus-rich soil in partial or dappled shade and protection from scorching winds. Tolerates sandstone and limestone soils but becomes chlorotic if the pH is too high. Prefers a pH between 6 and 6.5[200]. All members of this genus have more or less edible leaves and flower buds, though those species with yellow flowers can cause diarrhoea if eaten in large quantities[62, 85, 159]. There is at least one named form selected for its ornamental value[200]. 'Alba' has white flowers[200]. Flowers formed late in the season are cleistogamous (lacking petals, the flowers do not open but are self-pollinated)[212].

## 5.2.340 *Polygonum bistortoides*

**American Bistort**

4 tlin 8 cyuc 3 kcaak 0 tcan 1 dwat 0.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

**drutta Polygonum bistortoides** is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

**kcakta Edible Parts:** Leaves Root Seed**Edible Uses:** Leaves - raw or cooked. A pleasant acid flavour, they are used as a potherb[183]. Root - raw or cooked[106]. Starchy and rather pleasant[85], the root can be baked or added to

soups, stews etc[105, 161, 183, 257]. It was often dried before being used[207]. The raw root is slightly astringent, it becomes sweeter when boiled but is best when baked[212]. Seed - raw or cooked. It is rather small and fiddly to utilize.

tcanta None known

dwatta Astringent PoulitceThe root is astringent. A poultice has been used in treating sores and boils[257].

propta Seed - sow spring in a cold frame. Germination is usually free and easy. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer if they have reached sufficient size. If not, overwinter them in a cold frame and plant them out the following spring after the last expected frosts. Division in spring or autumn. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Succeeds in an ordinary garden soil[1] but prefers a moisture retentive not too fertile soil in sun or part shade[200]. Repays generous treatment[1]. Plants are growing well at Kew in a moist position by water in the rock garden[K]. Plants seem to be immune to the predations of rabbits[233]. This species is closely related to *P. viviparum*[1] and *P. bistorta*[200]. The plant is heat tolerant in zones 8 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

## 5.2.341 Cardamine amara

Large Bittercress

4 tlin 8 cyuc 3 kcaak 0 tcan 1 dwat 0.6 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwis hpa7tmwatli fyfxre7t hjonli

drutta Cardamine amara is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from April to June, and the seeds ripen from May to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw[2, 61, 115]. A hot cress-like flavour[183], nice in small quantities in a salad and available all year round in most years[K]. A somewhat bitter flavour[9].

tcanta None known

dwatta Antiscorbutic Diuretic StimulantAntiscorbutic, diuretic, stimulant[132].

propta Seed - sow outdoors in situ in a shady position in April.

nwatta Easily grown in most moist soils[187]. Prefers a moist humus rich soil in shade or semi-shade[200]. Plants are hardy to at least -20°C[187]. An invasive plant spreading freely by self-sowing, it is best suited to the wild garden[187]. A polymorphic species[132].

## 5.2.342 Stellaria graminea

Lesser stitchwort

4 tlin 8 cyuc 3 kcaak 2 tcan 1 dwat 0.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwis hpa7tmwatli hjonli

drutta Stellaria graminea is a deciduous Perennial growing to 0.5 m (1ft 8in) by 0.2 m (0ft 8in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4. The flowers are pollinated by Bees, Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. It cannot tolerate atmospheric pollution.

kcakta Leaves and shoots used in salads or lightly cooked as a vegetable. Harvest young shoot in spring to summer [1-9].

tcanta Faunal Associations: The nectar and pollen of the flowers attract small bees and flies primarily. The caterpillars of several moth species feed on the foliage of Chickweeds, including *Agrostis venerabilis* (Venerable Dart), *Lobocleta ossularia* (Drab Brown Wave), and *Haematopis grataria* (Chickweed Geometer). Mourning Doves and various sparrows occasionally eat the seeds of Chickweeds, while rabbits and groundhogs eat the foliage [1-6]. Attractive flowers. A good bee plant.

dwatta The common name Stitchwort is a reference to a herbal remedy in which the various stitchwort plant were used - allegedly to cure that pain in the side known as 'stitch', which afflicts many people when they try to run after a long layoff from sporting activities.

propta Seed - broadcast in spring [1-9].

nwatta A rhizomatous perennial herb producing branching stems which are prostrate, sprawling, trailing, or erect. An attractive chickweed. Typical growing conditions are full sun and moist to mesic soil. Grows quite well in loam or clay-loam. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is fleshy. Thick or swollen - fibrous or tap root [2-1].

## 5.2.343 Picea purpurea

Purple-Coned Spruce

4 tlin 7 cyuc 2 kcaak 0 tcan 0 dwat 45 m hkuc

htut cyutli tcup hwicli hyishrasjlutnyik hpa7tli frusflatprik hpa7tmwatli hjonli

drutta Picea purpurea is an evergreen Tree growing to 45 m (147ft 8in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in leaf all year, in flower from April to May, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure. It cannot tolerate atmospheric pollution.

kcakta Edible Parts: Flowers Inner bark SeedEdible Uses: TeaYoung male catkins - raw or cooked. Used as a flavouring[172]. Immature female cones - cooked. The central portion, when roasted, is sweet and syrupy[172]. Inner bark - dried, ground into a powder and then used as a thickener in soups etc or added to cereals when making bread[172]. An emergency food, it is only used when all else fails. Seed - raw. Too small and fiddly to be worthwhile unless you are desperate[172]. A refreshing tea, rich in vitamin C, can be made from the young shoot tips[172].

tcanta WoodWood - soft, not strong, resinous. Used for general construction[46, 61]. It is also valued for its use in the pulp industry to make paper[171]. This species produces a fine quality timber similar to that from *P. likiangensis*[266].

dwatta Vitamin CNone known

propta Seed - stratification will probably improve germination so sow fresh seed in the autumn in a cold frame if possible[80]. Sow stored seed as early in the year as possible in a cold frame[78]. A position in light shade is probably best[78]. Seed should not be allowed to dry out and should be stored in a cool place[80]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse or cold frame for their first winter. They can be planted out into their permanent positions

in early summer of the following year, or be placed in an outdoor nursery bed for a year or so to increase in size. They might need protection from spring frosts. Cuttings of semi-ripe terminal shoots, 5 - 8cm long, August in a frame. Protect from frost. Forms roots in the spring[78]. Cuttings of mature terminal shoots, 5 - 10cm long, September/October in a cold frame. Takes 12 months[78]. Cuttings of soft to semi-ripe wood, early summer in a frame. Slow but sure.

nwatta Landscape Uses:Screen, Specimen. Likes abundant moisture at the roots, if grown in drier areas it must be given a deep moist soil[11]. Tolerates poor peaty soils[200]. Tolerates various sites[81]. Succeeds in wet cold and shallow soils but is not very wind-firm in shallow soils[1]. Prefers a pH between 4 to 6[200]. Dislikes shade[200]. Intolerant of atmospheric pollution[11]. Resists wind exposure to some degree[200]. Although dormant trees are cold-hardy, the young shoots in spring are often damaged by late frosts[1]. In some upland areas, especially over granitic or other base-poor soils, growth rate and health have been seriously affected by aluminium poisoning induced by acid rain[200]. Plants are strongly outbreeding, self-fertilized seed usually grows poorly[200]. They hybridize freely with other members of this genus[200]. Fairly fast growing after a slow start, trees can average height increases of 30 - 40cm a year[185]. Trees should be planted into their permanent positions when they are quite small, between 30 and 90cm. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200]. Special Features: Not North American native, Inconspicuous flowers or blooms.

### 5.2.344 Fagus crenata

Japanese Beech

4 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat 35 m hkuc

pcimhmimhtut cyutli kyuctcup hwicli hrasjlut hpa7tli flatprikwis hpa7tmwatli hjonli

drutta Fagus crenata is a deciduous Tree growing to 35 m (114ft 10in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Leaves Oil SeedEdible Uses: Coffee OilYoung leaves - raw[105]. A very nice mild flavour but the leaves quickly become tough so only the youngest should be used. New growth is usually produced for 2 periods of 3 weeks each year, one in spring and one in mid-summer. Edible seed - raw or cooked[105, 177]. Rich in oil. The seed should not be eaten in large quantities, see the notes above on toxicity. It can be dried and ground into a powder. An edible semi-drying oil is obtained from the seed[105, 177]. The roasted seed is a coffee substitute.

tcanta OilNone known

dwatta None known

propta Seed - the seed has a short viability and is best sown as soon as it is ripe in the autumn in a cold frame. Protect the seed from mice. Germination takes place in the spring. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. The seedlings are slow growing for the first few years and are very susceptible to damage by late frosts. The seed can also be sown in an outdoor seedbed in the autumn. The seedlings can be left in the open ground for three years before transplanting, but do best if put into their final positions as soon as possible and given some protection from spring frosts.

nwatta Thrives on a light or medium soil[11], doing well on chalk[1], but it is ill-adapted for heavy wet soils[1]. Young trees are very shade tolerant, but are subject to frost damage so are best grown in a woodland position which will protect them[200]. Although very cold hardy, this species requires hotter summers than are normally experienced in Britain so is not usually a success here and is very slow growing[200]. Trees have surface-feeding roots and also cast a dense shade.

This greatly inhibits the growth of other plants and, especially where a number of the trees are growing together, the ground beneath them is often almost devoid of vegetation.

## 5.2.345 Ulmus japonica

Japanese Elm

4 tlin 8 cyuc 2 kcaak 0 tcan 1 dwat 35 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta Ulmus japonica is a deciduous Tree growing to 35 m (114ft 10in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from March to May, and the seeds ripen from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Fruit Inner bark LeavesEdible Uses: Leaves - raw or cooked[105, 177]. Young fruits - cooked[105, 177]. The fruit is about 15mm long and 10mm wide[200]. Inner bark - cooked. It is usually dried, ground into a powder and then used as a thickening in soups or added to cereal flours when making bread etc[105, 177].

tcanta Fibre WoodA fibre is obtained from the inner bark[189]. The bark is soaked for 7 - 10 days in water, the inner and outer barks are then separated and the inner bark is stripped into strands and made into thread by chewing it. It is made into a coarse fabric[189]. Wood - heavy, difficult to work. Used for axles, hubs etc[46, 61].

dwatta Diuretic Nerveine PurgativeThe bark is diuretic, nerveine and purgative[218].

propta Seed - if sown in a cold frame as soon as it is ripe, it usually germinates within a few days[200]. Stored seed does not germinate so well and should be sown in early spring[200]. The seed can also be harvested 'green' (when it has fully developed but before it dries on the tree) and sown immediately in a cold frame. It should germinate very quickly and will produce a larger plant by the end of the growing season[80]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Plants should not be allowed to grow for more than two years in a nursery bed since they form a tap root and will then move badly. Layering of suckers or coppiced shoots[200].

nwatta Prefers a fertile soil in full sun[188], but is easily grown in any soil of at least moderate quality so long as it is well drained[1]. This species is resistant to 'Dutch elm disease', a disease that has destroyed the greater part of all the elm trees growing in Britain. The disease is spread by means of beetles. There is no effective cure (1992) for the problem, but most E. Asian, though not Himalayan, species are resistant (though not immune) to the disease so the potential exists to use these resistant species to develop new resistant hybrids with the native species[200]. The various species of this genus hybridize freely with each other and pollen is easily saved, so even those species with different flowering times can be hybridized[200]. Closely related to *U. davidiana*[200], and considered to be no more than a subspecies of that species by some botanists[266].

## 5.2.346 Acer pseudoplatanus

Sycamore, Great Maple, Scottish Maple, Planetree Maple

4 tlin 7 cyuc 2 kcaak 4 tcan 1 dwat 30 m hkuc

hmimhtut cyutli tcup hwicli hyishrasjlutnyikrip hpa7tli flatprikwis hpa7tmwatli hjonli

drutta Acer pseudoplatanus is a deciduous Tree growing to 30 m (98ft) by 15 m (49ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from April to June, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay and nutritionally poor soils.

them on in a cold frame until they are rooting well. Plant them out in the summer or following spring. Basal cuttings in spring. Harvest the shoots when they are about 5cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Tolerates most well-drained soils, preferring a dry sandy soil and a sunny position[4, 37, 200]. Tolerates partial shade[16]. Established plants are drought tolerant[200]. Can be grown in grass[54]. Tolerates a pH in the range of 6.8 to 8. Plants are hardy to at least -15°c[200]. They often deteriorate in very wet or cold winters, but usually recover quickly in the spring and early summer[238]. Chamomile is commonly grown in the domestic herb garden, it is also cultivated commercially for its flowers which are used in herb teas and medicinally. The double-flowered form is highly regarded for its medicinal virtues[165]. Plants can be invasive when growing in good conditions[188], though they are easy to control[K]. There is some confusion between this plant (which is a perennial) and the annual chamomile (*Matricaria chamomilla*) as to which is the genuine medicinal chamomile. Some reports say that this plant is the most effective herbally[4], whilst others say that *Matricaria* is more potent[9]. Both plants seem to have very similar properties and either can probably be used quite successfully. Chamomile is a very good companion plant, promoting the health of plants it is growing close to, it is especially good for growing near cabbages, onions and, in small quantities, wheat[4, 14, 20, 54, 201, 238]. The cultivar 'Treneague' is a low-growing non-flowering form that makes an excellent ground cover[197]. Fairly tolerant of being walked on, it is sometimes used instead of grass for making a lawn though it is more difficult to maintain and can become weed-infested, especially in its early stages[200]. It also tends to become bare in places[208]. The whole plant has a pungent aroma, this being especially noticeable on hot days or when the plant is bruised. Suitable for temperate areas; in subtropical areas, it requires partial shade and will be short-lived; it is unlikely to grow in tropical areas. The plant is heat tolerant in zones 9 through 6. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. A clumping mat former. Forming a dense prostrate carpet with a limited spread [1-2]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is suckering with new plants from runners away from the plant [2-1].

### 5.2.568 Liriope spicata

Lily Turf, Creeping liriope, Creeping Lilyturf
4 tin 10 cyuc 2 kcaok 0 tcan 1 dwat 0.3 m hkuc hmimhtut cyutli hgtakyuuctup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Liriope spicata is an evergreen Perennial growing to 0.3 m (1ft) by 0.4 m (1ft 4in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in leaf all year, in flower from August to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: RootEdible Uses: The following use is reported for *L. graminifolia*, but there is a lot of confusion between members of this genus (compare [58] and [200]) and it is quite possible that the root of this species is also used[K]. Root - cooked[105, 177, 179]. Candied and used

medicinally[61]. The roots are usually with fusiform with a fleshy, tuberous part near the tip[266]. Rich in mucilage, the root also contains about 1.6% protein, 0.5% fat, 80% carbohydrate and 2.3% ash[179].

tcanta A good drought tolerant evergreen ground cover plant[200]. Plants should be spaced about 45cm apart each way, they can be invasive though[208]. Plants have been grown indoors in pots in order to help remove toxins from the atmosphere. It is especially good at removing ammonia[259].

dwatta Aphrodisiac Pectoral StimulantThe root is aphrodisiac, pectoral and stimulant[61].

propta Seed - we have no information on this species but suggest sowing it in a cold frame or greenhouse as soon as the seed is ripe if possible, if not then sowing the stored seed in early spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring. Very easy, the larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Landscape Uses:Container, Erosion control, Ground cover, Massing, Rock garden, Seashore, Woodland garden. Prefers a sandy soil[1]. Succeeds in full sun so long as the soil does not dry out in the summer, otherwise it should be grown in partial shade in any moderately fertile well-drained soil[200]. There are some named forms selected for their ornamental value[200]. Members of this genus are rarely if ever troubled by browsing deer[233]. Special Features: Attractive foliage, Not North American native, Invasive, Naturalizing, Suitable for cut flowers, Inconspicuous flowers or blooms.

### 5.2.569 Daucus pusillus

Rattlesnake Weed, American wild carrot
4 tin 8 cyuc 2 kcaok 0 tcan 2 dwat 0.6 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Daucus pusillus is a BIENNIAL growing to 0.6 m (2ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. The seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies, beetles. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: RootEdible Uses: Root - raw or cooked[46, 61, 105, 161, 257].

tcanta None known
dwatta Antipruritic Blood purifier Febrifuge PoulticeThe plant is antipruritic, blood purifier and febrifuge[257]. A decoction has been used to treat colds, itches, fevers and snakebites[257]. A poultice of the chewed plant has been applied to snakebites[257].

propta Seed - sow August/September or April in situ. The seed germinates better if it is cold stratified, therefore the autumn sowing is liable to be more successful.

nwatta We have very little information on this plant, but it can be grown outdoors at least in southern Britain and probably in the north as well. It is likely to need a well-drained soil in a sunny position[K].

### 5.2.570 Lewisia rediviva

Bitter-Root

4 tin 8 cyuc 2 kcaok 0 tcan 2 dwat 0.1 m hkuc htut cyutli tcup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Lewisia rediviva is a PERENNIAL growing to 0.1 m (0ft 4in) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in leaf from September to July, in flower in June. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers

drutta *Pyrus elaeagnifolia kotschyana* is a deciduous Tree. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in April. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105]. The flesh is rather tough and gritty, but has a reasonable flavour when it is fully ripe[K]. The fruit is up to 2cm long[200].

tcanta None known

dwatta None known

propta Seed - best sown in a cold frame as soon as it is ripe in the autumn, it will then usually germinate in mid to late winter. Stored seed requires 8 - 10 weeks cold stratification at 1°c and should be sown as early in the year as possible[200]. Temperatures over 15 - 20°c induce a secondary dormancy in the seed[200]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in a cold frame or greenhouse for their first year. Plant them out in late spring or early summer of the following year.

nwatta Prefers a good well-drained loam in full sun[200]. Grows well in heavy clay soils. Tolerates light shade but does not fruit so well in such a position. Tolerates atmospheric pollution, excessive moisture and a range of soil types if they are moderately fertile[200]. Established plants are drought tolerant[200]. Plants are hardy to at least -15°c[200]. This sub-species differs from *P. eleagrifolia* in having thornless branches[200]. Closely related to *P. georgica*[93].

#### 5.2.415 Vaccinium amoenum

Large-Cluster Blueberry

4 tin 8 cyuc 2 kcaok 0 tcan 0 dwat 4 m hkuc hmimhtut cyutli tcuphja7n hwicli hrasjlut hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta Vaccinium amoenum is a deciduous Shrub growing to 4 m (13ft 1in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105]. The fruit is about 8mm in diameter[200].

tcanta None known

dwatta None known

propta Seed - sow late winter in a greenhouse in a lime-free potting mix and only just cover the seed[78]. Stored seed might require a period of up to 3 months cold stratification[113]. Another report says that it is best to sow the seed in a greenhouse as soon as it is ripe[200]. Once they are about 5cm tall, prick the seedlings out into individual pots and grow them on in a lightly shaded position in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 8cm with a heel, August in a frame[78]. Slow and difficult. Layering in late summer or early autumn[78]. Another report says that spring is the best time to layer[200]. Takes 18 months[78]. Division of suckers in spring or early autumn[113].

nwatta Requires a moist but freely-draining lime free soil, preferring one that is rich in peat or a light loamy soil with added leaf-mould[11, 200]. Prefers a very acid soil with a pH in the range of 4.5 to 6, plants soon become chlorotic when lime is present. Succeeds in full sun or light shade though it fruits better in a sunny position[200]. Requires shelter from strong winds[200]. Dislikes root disturbance, plants are best grown in pots until being planted out in their permanent positions[200]. This species is closely related to *V. virgatum*[1]. Plants in this genus are notably resistant to honey fungus[200].

### 5.2.416 Lilium medeoloides

4 tin 8 cyuc 2 kcaok 0 tcan 0 dwat m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Lilium medeoloides is a BULB growing to 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Bulb - cooked[74, 105]. The bulb is about 25mm in diameter[266]. Used in soups or as a porridge[143]. Rich in starch, it can be used as a vegetable in similar ways to potatoes (*Solanum tuberosum*).

tcanta None known

dwatta None known

propta Seed - delayed hypogaeal germination according to one report[163], whilst two others suggest that it might be immediate hypogaeal germination[130, 200]. If it is delayed then it is best sown as soon as it is ripe in a cold frame, it should germinate in spring[143]. Stored seed will require a warm/cold/warm cycle of stratification, each period being about 2 months long[163]. If it is immediate then a late winter to early spring sowing should germinate in 2 - 4 weeks[163] Grow on in cool shady conditions. Great care should be taken in pricking out the young seedlings, many people leave them in the seed pot until they die down at the end of their second years growth. This necessitates sowing the seed thinly and using a reasonably fertile sowing medium. The plants will also require regular feeding when in growth. Divide the young bulbs when they are dormant, putting 2 - 3 in each pot, and grow them on for at least another year before planting them out into their permanent positions when the plants are dormant[K]. Division with care in the autumn once the leaves have died down. Replant immediately[200]. Bulb scales can be removed from the bulbs in early autumn. If they are kept in a warm dark place in a bag of moist peat, they will produce bulblets. These bulblets can be potted up and grown on in the greenhouse until they are large enough to plant out[200].

nwatta Prefers an open free-draining humus-rich loamy soil with its roots in the shade and its head in the sun[200]. Stem rooting, the bulbs should be planted 7 - 12cm deep in practically pure leaf mould with plenty of grit added[143]. Early to mid autumn is the best time to plant out the bulbs in cool temperate areas, in warmer areas they can be planted out as late as late autumn[200]. Closely related to *L. distichum* and *L. tsingtaunense*[143]. The plant should be protected against rabbits and slugs in early spring. If the shoot tip is eaten out the bulb will not grow in that year and will lose vigour[200].

### 5.2.417 Polygonatum multiflorum

Solomon's Seal, Eurasian Solomon's seal

4 tin 8 cyuc 2 kcaok 0 tcan 3 dwat m hkuc pcmihmim cyutli hgtakyuuctup hwicli hrasjlutnyikfrip hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Polygonatum multiflorum is a PERENNIAL growing to 1.2 m (4ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower in June, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Leaves RootEdible Uses: Young shoots - cooked. Boiled and used as an asparagus substitute, they make an excellent vegetable[2, 4, 115] and are widely used in Turkey[244]. Root - cooked[177, 179]. Rich in starch[115]. The root should be macerated for some time in water in order to remove bitter substances[4]. Normally only used in times of famine, the root was powdered and then made into a bread by the North American Indians[244].

tcanta CosmeticPlants can be grown for ground cover when spaced about 30cm apart each way[208]. A distilled water made from the whole plant is used as a cosmetic to improve the complexion[244].

dwatta Astringent Demulcent Dysentery Emetic Poulrice TonicSolomon's seal has been used for thousands of years in herbal medicine. It is used mainly in the form of a poultice and is believed to prevent excessive bruising and to stimulate tissue repair[254]. The root is astringent, demulcent, emetic and tonic[4, 21, 61, 240]. An infusion is healing and restorative, it is good in the treatment of stomach inflammations, chronic dysentery etc[4]. It is used with other herbs in the treatment of pulmonary problems, including tuberculosis, and women's complaints[4, 254]. The powdered roots make an excellent poultice for bruises, piles, inflammation etc[4]. The root is harvested in the autumn and dried for later use[4]. The plant should not be used internally except under professional supervision[254]. A distilled water made from the whole plant has been used as a skin tonic and is an ingredient of expensive cosmetics[244]. The dried powdered roots and flowers have been used as a snuff to promote sneezing and thus clear the bronchial passages[244].

propta Seed - best sown as soon as it is ripe in early autumn in a shady part of a cold greenhouse[200]. Sow stored seed as early in the year as possible. Germination can be slow, they may not come true to type[200] and it takes a few years for them to reach a good size. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a shady position in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in March or October. Larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Prefers a fertile humus rich moisture retentive well-drained soil in cool shade or semi-shade[200]. Succeeds in dry shade if the soil is rich in humus[190]. Grows well in heavy clay soils. Plants are intolerant of heat and drought but tolerate most other conditions[200]. Another report suggests that they tolerate drought so long as the soil is rich in humus[190]. A very ornamental plant[1], growing well on the woodland edge[24]. There are some named forms[188]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. The young shoots of most members of this genus are very attractive to slugs[K]. Hybridizes with other members of this genus[200].

## 5.2.418 Malus sargentii

Sargent's apple, Sargent Crabapple  
4 tin 8 cyuc 2 kcaak 0 tcan 0 dwat 4 m hkuc  
hmimhtut cyutli tcup hwicli hrasljutnykfrip hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Malus sargentii is a deciduous Shrub growing to 4 m (13ft) by 5 m (16ft) at a slow rate. See above for USDA hardness. It is hardy to UK zone 4 and is not frost tender. It is in flower in May, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[183]. Large for a crab apple[183], it is up to 1cm in diameter[200].

tcanta None known  
dwatta None known

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. It usually germinates in late winter. Stored seed requires stratification for 3 months at 1°C and should be sown in a cold frame as soon as it is received[200]. It might not germinate for 12 months or more. Prick out the seedlings into individual pots as soon as they are large enough to handle. If given a rich compost they usually grow away quickly and can be large enough to plant out in late summer, though consider giving them some protection from the cold in their first winter. Otherwise, keep them in pots in

a cold frame and plant them out in late spring of the following year. Cuttings of mature wood, November in a frame[11].

nwatta Landscape Uses:Border, Pest tolerant, Specimen. An easily grown plant, it succeeds in most fertile soils, preferring a moisture retentive well-drained loamy soil[1, 200]. Grows well in heavy clay soils. Prefers a sunny position but succeeds in partial shade though it fruits less well in such a situation[200]. Of doubtful botanical standing, it is considered to be synonymous with *M. sieboldii* by some Japanese botanists[182]. The fruit is a good wildlife food source, especially for birds[200]. Hybridizes freely with other members of this genus[200]. This species is considered to be no more than a part of *M. sieboldii* by many botanists[58]. Plants in this genus are notably susceptible to honey fungus[200]. Special Features:Not North American native, Fragrant flowers, Attractive flowers or blooms.

## 5.2.419 Aesculus parviflora

Bottlebrush buckeye

4 tin 9 cyuc 2 kcaak 0 tcan 1 dwat 4 m hkuc  
pcimhmimhtut cyutli tcup hwicli hrasljutnyk hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Aesculus parviflora is a deciduous Shrub growing to 4 m (13ft) by 4 m (13ft) at a slow rate. See above for USDA hardness. It is hardy to UK zone 5 and is not frost tender. It is in flower in August, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: Seed - cooked[2, 22, 105, 177]. It can be dried and ground into a powder and used as a gruel. The seed is quite large and easily harvested, though it is rarely produced in Britain[11]. Unfortunately, it is rich in bitter-tasting saponins and these need to be leached out before the seed can be eaten. See notes on toxicity above. The following notes apply to *A. californica*, but are probably also relevant here: The seed needs to be leached of toxins before it becomes safe to eat - the Indians would do this by slow-roasting the nuts (which would have rendered the saponins harmless) and then cutting them into thin slices, putting them into a cloth bag and rinsing them in a stream for 2 - 5 days[213]. Most of the minerals etc would also have been leached out by this treatment[K].

tcanta Miscellany Soap WoodSaponins contained in the seed are used as a soap substitute[169]. The saponins can be easily obtained by chopping the seed into small pieces and infusing them in hot water. This water can then be used for washing the body, clothes etc. Its main drawback is a lingering odour of horse chestnuts[K]. Plants can be used as a tall ground cover for large areas of land[208]. They are slow to establish but eventually form large spreading clumps[208]. Wood - easily worked. Used for making water troughs, packing cases, tea boxes, ornamental articles etc[194].

dwatta Antiperiodic Antirheumatic MiscellanyAntiperiodic, antirheumatic[194]. Used in the treatment of colic, piles, constipation and whooping cough[194].

propta Seed - best sown outdoors or in a cold frame as soon as it is ripe[11, 80]. The seed germinates almost immediately and must be given protection from severe weather[130]. The seed has a very limited viability and must not be allowed to dry out. Stored seed should be soaked for 24 hours prior to sowing and even after this may still not be viable[80, 113]. It is best to sow the seed with its 'scar' downwards[130]. If sowing the seed in a cold frame, pot up the seedlings in early spring and plant them out into their permanent positions in the summer. Root cuttings 5 - 7 cm long in December. Store the roots upside down in sand and pot them up in March/April[78]. Grow them on until they are 20cm or more tall and then plant them out into their permanent positions, preferably in late spring or early summer after the last expected frosts. Division of suckers in the dormant season[200]. The suckers can be planted out direct into their permanent positions if required.

nwatta Landscape Uses:Border, Massing, Specimen, Woodland garden. Prefers a deep loamy well-drained soil but is not too fussy[1, 11]. Succeeds in most situations in sun

Unlike the related opium poppy (*P. somniferum*) it is non-addictive[244]. However, the plant does contain alkaloids, which are still under investigation, and so should only be used under the supervision of a qualified herbalist[244]. The flowers and petals are anodyne, emollient, emmenagogue, expectorant, hypnotic, slightly narcotic and sedative[4, 7, 9, 13, 46, 53]. An infusion is taken internally in the treatment of bronchial complaints and coughs, insomnia, poor digestion, nervous digestive disorders and minor painful conditions[9, 238]. The flowers are also used in the treatment of jaundice[218]. The petals are harvested as the flowers open and are dried for later use[238]. They should be collected on a dry day and can be dried or made into a syrup[4]. The latex in the seedpods is narcotic and slightly sedative[240]. It can be used in very small quantities, and under expert supervision, as a sleep-inducing drug[7]. The leaves and seeds are tonic[240]. They are useful in the treatment of low fevers[240]. The plant has anticancer properties[218].

propta Seed - sow spring or autumn in situ[200].  
nwatta Landscape Uses:Border, Massing, Seashore, Specimen. Prefers a well-drained sandy loam in a sunny position[1, 200]. Does not do well on wet clay soils but succeeds in most other soils[115]. Plants usually self-sow freely when growing in suitable conditions so long as the soil surface is disturbed[238]. There are several named varieties selected for their ornamental value[200]. A polymorphic species, varying in leaf shape and flower colour[17]. When growing in cereal fields, poppies decrease the yields of nearby cereal plants[18, 20]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. Special Features: Attractive foliage, Not North American native, Naturalizing, All or parts of this plant are poisonous, Suitable for cut flowers, Suitable for dried flowers.

## 5.2.566 Uvularia perfoliata

Bellwort, Perfoliate bellwort

4 tin 8 cyuc 2 kcaak 0 tcan 2 dwat 0.4 m hkuc  
pcimhmim cyutli tcup hwicli hrasljut hpa7tli flatprikliw hpa7tmwatli xre7t hjonli

drutta Uvularia perfoliata is a PERENNIAL growing to 0.4 m (1ft 4in) by 0.3 m (1ft). See above for USDA hardness. It is hardy to UK zone 4. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Young shoots - cooked[55, 105, 161]. They are a very good substitute for asparagus[2]. Root - cooked[2, 105, 161].

tcanta MiscellanyNone known  
dwatta Miscellany Ophthalmic SalveThe root is used as a poultice or salve in the treatment of boils, wounds and ulcers[207]. A tea made from the roots is used in the treatment of coughs, sore mouths and throats, inflamed gums and snakebites[222, 257]. It is suitable for use by children[257]. An infusion of the crushed roots has been used as a wash to treat sore eyes[257].

propta Seed - best sown in a cold frame as soon as it is ripe in the summer[200]. Sow stored seed in late winter in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division after the plants die down in late summer. It is best carried out in early spring before the plants flower[188]. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the following spring.

nwatta Requires a cool moist shady position and a light sandy soil[1, 42, 111]. Likes plenty of humus in the soil[111]. Grows well in a woodland garden and in the rock garden[200]. Plants grow much taller in rich soils and then succeed in the herbaceous border[222]. A very hardy plant, tolerating temperatures down to about -20°C[187].

## 5.2.567 Chamaemelum nobile

Chamomile, Roman chamomile

4 tin 9 cyuc 2 kcaak 4 tcan 5 dwat 0.2 m hkuc  
hmimhtut cyutli hgtkyuctcup hwicli hyhisrhrajlutnyk hpa7tli flatprikliw hpa7tmwatli fyfikre7t hjonli

drutta Chamaemelum nobile is an evergreen Perennial growing to 0.2 m (0ft 8in) by 0.3 m (1ft). See above for USDA hardness. It is hardy to UK zone 4 and is not frost tender. It is in leaf all year, in flower from June to July, and the seeds ripen from July to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Flowers ShootsEdible Uses: Condiment TeaYung sprigs are used as a seasoning and a flavouring in herb beers[15, 183]. The fresh or dried flowers are used to make herb teas[21, 37, 183]. This has a strong aromatic odour and a bitter flavour, especially the single-flowered form[4]. The whole herb is used for making herbal beers[4].

tcanta Companion Compost Dye Essential Fungicide Hair Liquid feed Repellent StrewingAn infusion of the flowers is used as a hair shampoo, especially for fair hair[14, 20, 168]. It is also used as a liquid feed and general plant tonic[14], effective against a number of plant diseases[18, 20, 201]. It has fungicidal properties and its use is said to prevent damping off in seedlings[238]. The flowers are an ingredient of 'QR' herbal compost activator[32]. This is a dried and powdered mixture of several herbs that can be added to a compost heap in order to speed up bacterial activity and thus shorten the time needed to make the compost[K]. The whole plant was formerly used as a strewing herb[4, 168]. The whole plant is insect repellent both when growing and when dried[14, 20]. An essential oil from the whole plant is used as a flavouring and in perfumery[46]. Yellow to gold dyes are obtained from the flowers[168]. The plant makes a very good ground cover[197] and can also be used as an edging plant[200]. It does tend to become bare in patches[208]. A dynamic accumulator gathering minerals or nutrients from the soil and storing them in a more bioavailable form - used as fertilizer or to improve mulch.

dwatta Anodyne Antianxiety Antiinflammatory Antispasmodic Aromatherapy Nervine Stomachic Tonic Vasodilator-Camomile is a common herb with a long history of safe and effective medicinal use - it is widely used as a household herbal remedy. It is particularly useful as a remedy for various problems of the digestive system, as a sedative and a nerveine, it is especially suited for young children[4, 20, 21]. A tea is made from the flowers and this should be prepared in a closed vessel to prevent loss of the essential oils[4]. The flowers are anodyne, anti-inflammatory, antispasmodic, nerveine, stomachic, tonic, vasodilator[4, 14, 21, 37, 165, 201]. The single-flowered form is the most potent medicinally, though it can in large doses damage the lining of the stomach and bowels[4]. For this reason, the double-flowered form is usually preferred since this contains less of the alkaloid that causes the problem[4]. The flowers are gathered in the summer when they are fully open and are distilled for their oil or dried for later use[238]. They should not be stored for longer than 12 months[238]. The whole herb is used to make a lotion for external application in the treatment of toothache, earache, neuralgia etc[4]. The essential oil is used in aromatherapy. Its keyword is 'Soothing'[210]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve Chamaemelum nobile for coughs and bronchitis, fevers and colds, inflammations of the skin, inflammation of the mouth and pharynx, tendency to infection - improve immunity, wounds and burns (see [302] for critics of commission E).

propta Seed - sow March in a cold frame. Only just cover the seed and do not let the compost dry out. When they are large enough to handle, prick the seedlings out into individual pots and plant them out into their permanent positions in the summer. Division in spring or autumn. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow

prikwis hpa7tmwatli fyifxre7t hjonli

drutta Cardamine leucantha is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from April to August, and the seeds ripen from May to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta Edible Parts: LeavesEdible Uses: TeaLeaves - raw or cooked[105, 177]. The seedlings are edible[266]. Dried plants are used as a tea substitute[266].

tcanta None known

dwatta The rhizomes are used medicinally[266]. No further information is given.

propta Seed - sow spring in a cold frame. Germination usually takes place within 1 - 3 weeks at 15°C[175]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in a greenhouse or cold frame for the first two years, planting them out when dormant in late summer. Division in early spring or after the plant dies down in the summer. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta We have very little information on this species and do not know if it will be hardy in Britain, though judging by its native range it should succeed outdoors in most parts of this country. The following notes are based on the general needs of the genus. Prefers a moist humus rich soil in shade or semi-shade[200] but succeeds in most soils that are not dry[1].

## 5.2.563 Trillium sessile

Toadshade

4 tlin 8 cyuc 2 kcaak 0 tcan 1 dwat 0.4 m hkuc

pchimhmhtut cyutli tcup hwicli hrasljutnyik hpa7tli flat-prikwis hpa7tmwatli xre7t hjonli

drutta Trillium sessile is a PERENNIAL growing to 0.4 m (1ft 4in) by 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked. The young unfolding leaves are an excellent addition to the salad bowl, tasting somewhat like sunflower seeds[183]. The leaves can also be cooked as a potherb[183].

tcanta MiscellanyNone known

dwatta Miscellany SkinA poultice of the bruised leaves and crushed roots has been applied as a treatment for boils[257]. A decoction of the plant has been used to treat any kind of sickness[257].

propta Seed - best sown in a shaded cold frame as soon as it is ripe[134, 200]. Stored seed should be sown in late winter or early spring. Seed usually germinates within 1 - 3 months at 15°C. Another report says that seeds produce a root after the first cold stratification but no shoot is produced until after a second winter[138], whilst yet another report says that the seed can take 3 years to germinate[238]. The seedlings are prone to damp off and must therefore be watered with care and given plenty of fresh air[138]. The young plants need to be overwintered in a cold frame for the first year and can then be planted out in late spring. It is very important that the pots become neither too dry nor too wet[138]. Division with care when the plants die down after flowering[200]. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the following spring.

nwatta Prefers a deep well-drained woodland or humus-rich soil in a somewhat shady position that remains moist

in the summer[1, 42]. Prefers a neutral to slightly acid soil[200]. Grows well in open woodland[1]. Succeeds in deep shade[188]. Succeeds in a sunny position if the soil does not dry out[42]. Any transplanting is best done whilst the plants are in flower[200]. Plants can flower in two years from seed[138]. The flowers have a scent similar to a butcher's shop[207]. Another report says that they are sweetly scented[245]. Some named varieties have been selected for their ornamental value[200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233], though slugs are very fond of the leaves[238].

## 5.2.564 Tragopogon crocifolius

4 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat 0.8 m hkuc

htut cyutli tcup hwicli hrasljutnyikfrip hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta Tragopogon crocifolius is a ANNUAL/BIENNIAL growing to 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Root - cooked[2, 177]. Leaves - raw or cooked[105].

tcanta None known

dwatta None known

propta Seed - sow spring in situ. Make sure to water the seed in if the weather is dry.

nwatta Succeeds in ordinary garden soils, including heavy clays[200].

## 5.2.565 Papaver rhoeas

Corn Poppy, Field Poppy, Shirley Poppy

4 tlin 8 cyuc 2 kcaak 0 tcan 3 dwat 0.6 m hkuc

htut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikwis hpa7tmwatli fyifxre7t hjonli

drutta Papaver rhoeas is a ANNUAL growing to 0.6 m (2ft) by 0.2 m (0ft 8in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves Oil SeedEdible Uses: Colouring OilSeed - raw or cooked. Much used as a flavouring in cakes, bread, fruit salads etc[4, 5, 21, 183], it imparts a very nice nutty flavour[K]. The seeds are rather small, but they are contained in fairly large seed pods and so are easy to harvest. The seeds are perfectly safe to eat, containing none of the alkaloids associated with other parts of the plant[238]. Leaves - raw or cooked[7, 52]. Used like spinach or as a flavouring in soups and salads[132, 183]. The leaves should not be used after the flower buds have formed[7]. Some caution is advised, see the notes above on toxicity. An edible oil is obtained from the seed[2, 4]. Said to be an excellent substitute for olive oil[4, 183], it can be used in salad dressings or for cooking[2]. A syrup can be prepared from the scarlet flower petals, it is used in soups, gruels etc[4, 183]. A red dye from the petals is used as a food flavouring, especially in wine[183].

tcanta Dye Ink Oil Pot-pourriA red dye is obtained from the flowers[7, 46, 61], though it is very fugitive[4]. A syrup made from the petals has been used as a colouring matter for old inks[4, 13, 89]. The red petals are used to add colour to pot-pourri[238].

dwatta Anodyne Cancer Emmenagogue Emollient Expectorant Hypnotic Sedative TonicThe flowers of corn poppy have a long history of medicinal usage, especially for ailments in the elderly and children[244, 254]. Chiefly employed as a mild pain reliever and as a treatment for irritable coughs, it also helps to reduce nervous over-activity[254].

or shade[126, 200]. Plants are very shade tolerant[200]. A very ornamental plant[1, 11], it is hardy to about -20°C[184] though it is slow to establish[208]. The young growth in spring can be damaged by late frosts. The flowers have a delicate honey perfume[245]. This species does best on the western side of Britain according to one report[126] whilst another says that it is best in a continental climate, which would suggest that it was best grown in the eastern half of the country[200]. Trees rarely fruit in Britain except after a long hot, dry summer[11, 130]. Spreads freely by suckers[182]. Grows well on a lawn[11]. Most members of this genus transplant easily, even when fairly large[11]. Special Features:Attractive foliage, North American native, All or parts of this plant are poisonous, Wetlands plant, Blooms are very showy.

## 5.2.420 Eleutherococcus sessiliflorus

4 tlin 8 cyuc 2 kcaak 0 tcan 3 dwat 4.5 m hkuc

hmimhtut cyutli tcup hwicli vyhshrasljutnyik hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta Eleutherococcus sessiliflorus is a deciduous Shrub growing to 4.5 m (14ft 9in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from July to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. It can tolerate atmospheric pollution.

kcakta Edible Parts: LeavesEdible Uses: Drink TeaYoung leaves - raw or cooked and used as a vegetable[105, 177, 183]. Old leaves are dried and used as a tea substitute[105, 177, 183]. A wine is made from the bark. It is highly fancied by the Chinese[183]. It is probably used mainly for medicinal purposes[K].

tcanta None known

dwatta Adaptogen Analgesic Antiinflammatory Antipyretic DiureticThe root bark contains saponins, acanthosides, cardiac glycosides and polysaccharides[279]. It is adaptogenic, analgesic, anti-inflammatory, antipyretic and diuretic[176, 218, 279]. It is used in Korea in the treatment of lumbago, neuralgia, arthritis and oedema[279].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame[200]. It can be slow to germinate. Stored seed requires 6 months warm followed by 3 months cold stratification[113] and can be very slow to germinate[133]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in a cold frame or greenhouse for at least the first winter. Plant out in late spring or early summer. Cuttings of half-ripe wood, July/August in a frame[113, 200]. Cuttings of ripe wood of the current season's growth, 15 - 30cm long in a cold frame[238]. Root cuttings in late winter[200]. Division of suckers in the dormant season[200].

nwatta Succeeds in an open loamy soil[1], preferring a well-drained humus-rich soil in full sun[200]. Tolerates poor soils and atmospheric pollution[200]. A very cold resistant plant[74] if it is sheltered from cold winds, tolerating temperatures down to at least -15°C[200]. A very ornamental plant[74], it spreads vigorously by means of suckers[200]. This species is closely related to *E. divaricatus*[200].

## 5.2.421 Pinus monticola

Western White Pine

4 tlin 8 cyuc 2 kcaak 0 tcan 2 dwat m hkuc

htut cyutli hgatkyuctcup hwicli vyhshrasljut hpa7tli flatprik hpa7tmwatli dyat hjonli

drutta Pinus monticola is an evergreen Tree growing to 60 m (196ft 10in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in leaf all year, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers dry or moist

soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: Inner bark SeedEdible Uses: Condiment GumSeed - raw or cooked[105, 177]. The oil-rich seed has a resinous flavour. Rather small, the seed is only 5mm long[200]. The seed is up to 9mm long[82, 229]. An edible gummy exudation from the stem is used as a chewing gum[257]. Inner bark - raw or cooked[177, 257]. The inner bark can be dried, ground into a powder and then used as a thickener in soups etc or added to cereals when making bread[257]. The roasted young cones can be eaten[257]. A vanillin flavouring is obtained as a by-product of other resins that are released from the pulpwood[200].

tcanta Dye Gum Herbicide WoodA tan or green dye is obtained from the needles[168]. The needles contain a substance called terpene, this is released when rain washes over the needles and it has a negative effect on the germination of some plants, including wheat[201]. Oleo-resins are present in the tissues of all species of pines, but these are often not present in sufficient quantity to make their extraction economically worthwhile[64]. The resins are obtained by tapping the trunk, or by destructive distillation of the wood[4, 64]. In general, trees from warmer areas of distribution give the higher yields[64]. Turpentine consists of an average of 20% of the oleo-resin[64] and is separated by distillation[4, 64]. Turpentine has a wide range of uses including as a solvent for waxes etc, for making varnish, medicinal etc[4]. Rosin is the substance left after turpentine is removed. This is used by violinists on their bows and also in making sealing wax, varnish etc[4]. Pitch can also be obtained from the resin and is used for waterproofing, as a wood preservative etc. Wood - straight and close-grained, soft, light, not strong, very durable, resistant to shrinking and warping. An important timber tree, it is used in making doors, shelves, flooring, construction etc[46, 61, 82, 171, 229]. The wood has dark knots, making it attractive for panelling[226].

dwatta Antirheumatic Antiseptic Diuretic Pectoral Poul-tice Salve TBThe turpentine obtained from the resin of all pine trees is antiseptic, diuretic, rubefacient and vermifuge[4]. It is a valuable remedy used internally in the treatment of kidney and bladder complaints and is used both internally and as a rub and steam bath in the treatment of rheumatic affections[4, 257]. It is also very beneficial to the respiratory system and so is useful in treating diseases of the mucous membranes and respiratory complaints such as coughs, colds, influenza and TB[4, 257]. Externally it is a very beneficial treatment for a variety of skin complaints, wounds, sores, burns, boils etc and is used in the form of liniment plasters, poultices, herbal steam baths and inhalers[4]. An infusion of the bark has been used as a blood purifier and in the treatment of stomach disorders and tuberculosis[257]. A decoction of the bark has been used as a wash on cuts and sores[257]. A decoction of the young shoots has been used as a soak in the treatment of rheumatism[257].

propta It is best to sow the seed in individual pots in a cold frame as soon as it is ripe if this is possible otherwise in late winter. A short stratification of 6 weeks at 4°C can improve the germination of stored seed[80]. Plant seedlings out into their permanent positions as soon as possible and protect them for their first winter or two[11]. Plants have a very sparse root system and the sooner they are planted into their permanent positions the better they will grow[K]. Trees should be planted into their permanent positions when they are quite small, between 30 and 90cm[200]. We actually plant them out when they are about 5 - 10cm tall. So long as they are given a very good weed-excluding mulch they establish very well[K]. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200]. Cuttings. This method only works when taken from very young trees less than 10 years old. Use single leaf fascicles with the base of the short shoot. Disbudding the shoots some weeks before taking the cuttings can help. Cuttings are normally slow to grow away[81].

nwatta Landscape Uses:Screen, Specimen. Thrives in a light well-drained sandy or gravelly loam in a sunny position[1, 11]. Dislikes poorly drained moorland soils[1]. Established plants tolerate drought[200]. A fast growing tree, capable of sustaining growth of 75cm per year over a long period of time even when in an unfavourable site. This species establishes very well on severely altered sites such as after a forest fire[229]. Trees on a site 300m above sea level in N.

Wales have grown exceptionally well[185]. Girth increases of up to 4cm a year have been recorded[185]. Trees take 30 - 40 years before they produce reliable crops of seeds[229]. Good crops are produced every 2 - 4 years in the wild, with little seed in the intervening years[229]. The cones are 12 - 27cm long and take 2 years to mature[82, 229], they open and shed their seed in late summer and early autumn whilst still attached to the tree[82, 226]. Very susceptible to 'white pine blister rust' this tree should not be planted near *Ribes* species (currants and gooseberries) because they can transmit the rust(1, 11, 120). Most of the older trees in this country have been killed by the rust. However, it seems that infection only occurs when the trees are young in this country and new plantings in areas isolated from species of *Ribes* are being made[185]. Plants are also subject to damage by aphids. Trees have a thin bark, which makes them susceptible to forest fires[226]. Plants are strongly outbreeding, self-fertilized seed usually grows poorly[200]. They hybridize freely with other members of this genus[200]. Leaf secretions inhibit the germination of seeds, thereby reducing the amount of plants that can grow beneath the tree[18]. Plants in this genus are notably susceptible to honey fungus[200]. Special Features: Attracts birds, Attractive foliage, North American native, Inconspicuous flowers or blooms.

## 5.2.422 *Lilium martagon*

Turk's Cap Lily, Martagon lily  
4 tin 8 cyuc 2 kcaak 0 tcan 1 dwat m hkuc  
hmmihmt cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyfxfre7t hjonli

drutta *Lilium martagon* is a BULB growing to 1.2 m (4ft) by 0.3 m (1ft in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from June to July, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Bulb - cooked[2, 14, 61]. It is often dried for later use[46]. Rich in starch, it can be used as a vegetable in similar ways to potatoes (*Solanum tuberosum*).

tcanta None known  
dwatta Cardiac Diuretic Emmenagogue Emollient ExpectorantThe bulb is diuretic, emmenagogue, emollient and expectorant[240]. They are used to relieve heart diseases, pain in the cardiac region and angina pectoris[240].

propta Seed - delayed hypogeal germination[130]. Best sown as soon as it is ripe in a cold frame, it should germinate in spring[143]. Stored seed will require a warm/cold/warm cycle of stratification, each period being about 2 months long[163]. Grow on in cool shady conditions. Great care should be taken in pricking out the young seedlings, many people leave them in the seed pot until they die down at the end of their second years growth. This necessitates sowing the seed thinly and using a reasonably fertile sowing medium. The plants will also require regular feeding when in growth. Divide the young bulbs when they are dormant, putting 2 - 3 in each pot, and grow them on for at least another year before planting them out into their permanent positions when the plants are dormant[K]. Division with care in the autumn once the leaves have died down. Replant immediately[200]. Bulb scales can be removed from the bulbs in early autumn. If they are kept in a warm dark place in a bag of moist peat, they will produce bulblets. These bulblets can be potted up and grown on in the greenhouse until they are large enough to plant out[200].

nwatta Landscape Uses:Border, Container, Massing, Seashore, Specimen, Woodland garden. Succeeds in ordinary well-drained garden soil[1, 42]. Prefers a good leafy soil in sun or semi-shade[90]. Prefers its roots to be in the shade[28]. Prefers a calcareous soil according to some reports[1, 4, 13, 90], whilst one says that it is probably best in an acid or neutral soil[47]. A very ornamental[1] and polymorphic plant[143]. It takes 7 - 8 years to flower from seed[143]. The flowers have an unpleasant odour[143]. The flowers are sweetly fragrant, especially at night in order to

attract the night hawk-moth for pollination[245]. Early to mid autumn is the best time to plant out the bulbs in cool temperate areas, in warmer areas they can be planted out as late as late autumn[200]. The plant should be protected against rabbits and slugs in early spring. If the shoot tip is eaten out the bulb will not grow in that year and will lose vigour[200]. Special Features:Naturalizing, Attracts butterflies, Suitable for cut flowers, Fragrant flowers.

## 5.2.423 *Malus halliana*

Hall crab apple  
4 tin 8 cyuc 2 kcaak 0 tcan 0 dwat 4 m hkuc  
hmmihmt cyutli tcup hwicli hrasjlutnyikfriip hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Malus halliana* is a deciduous Tree growing to 4 m (13ft 1in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in May, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105, 177]. 6 - 8 mm in diameter[200]. A healthy tree at Kew in September 1989 had small acid fruits[K].

tcanta None known  
dwatta None known

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. It usually germinates in late winter. Stored seed requires stratification for 3 months at 1 °c and should be sown in a cold frame as soon as it is received[200]. It might not germinate for 12 months or more. Prick out the seedlings into individual pots as soon as they are large enough to handle. If given a rich compost they usually grow away quickly and can be large enough to plant out in late summer, though consider giving them some protection from the cold in their first winter. Otherwise, keep them in pots in a cold frame and plant them out in late spring of the following year. Cuttings of mature wood, November in a frame[11].

nwatta An easily grown plant, it succeeds in most fertile soils, preferring a moisture retentive well-drained loamy soil[1, 200]. Grows well in heavy clay soils. Prefers a sunny position but succeeds in partial shade, though it fruits less well in such a situation[200]. The sub-species *M. halliana* spontanea. (Mak.)Koidz. has slightly larger fruits than the type, they are up to 1 cm in diameter[200]. Hybridizes freely with other members of this genus[200]. The fruit is a good wildlife food source, especially for birds[200]. Plants in this genus are notably susceptible to honey fungus[200].

## 5.2.424 *Morus mongolica*

Mongolian Mulberry  
4 tin 8 cyuc 2 kcaak 0 tcan 1 dwat m hkuc  
hmmihmt cyutli tcup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyfynyanhjen hjonli

drutta *Morus mongolica* is a deciduous Tree growing to 7.5 m (24ft 7in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from April to May, and the seeds ripen from July to August. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). . The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw[3, 105]. Sweet but insipid[1, 11]. Palatable[109, 177]. The fruit is up to 25mm in diameter[200].

tcanta Fibre MiscellanyThe fibers of the bark are raw material for textile and paper making[266].

dwatta MiscellanyThe bark is used medicinally[266]. No more details are given.

propta The seed germinates best if given 2 - 3 months cold stratification[80, 98]. Sow the seed as soon as it is ripe

the plant dies down in the summer. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta We have very little information on this species and do not know if it will be hardy in Britain, though judging by its native range it should succeed outdoors in most parts of this country. The following notes are based on the general needs of the genus. Prefers a moist humus rich soil in shade or semi-shade[200] but succeeds in most soils that are not dry[1].

## 5.2.559 *Lewisia brachycalyx*

Shortsepal lewisia  
4 tin 8 cyuc 2 kcaak 0 tcan 0 dwat 0.2 m hkuc  
hmt cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta *Lewisia brachycalyx* is a PERENNIAL growing to 0.2 m (0ft 8in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in leaf from September to July, in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Root - cooked. Steeped and boiled[177]. Said to be extremely nutritious. It is easiest to use when the plant is in flower because the outer layer of the root (which is very bitter) slips off easily at this time of the year[85]. The root has a good taste though a decided bitter flavour develops afterwards[105, 161].

tcanta None known  
dwatta None known

propta Seed - best sown as soon as it is ripe in a cold frame in a very freely draining soil[129]. Sow stored seed as soon as possible in a cold frame. One months cold stratification should improve germination, though this is still likely to be very slow. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first two winters. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in March/April. Very difficult.

nwatta Requires a very well-drained gritty humus-rich deep soil in a sunny position[1, 200]. Prefers a neutral to acid soil[188]. This species is not reliably hardy in Britain[1]. It can withstand consistently very cold weather but does not like alternating periods of mild and cold conditions, nor does it like winter wet[1]. The plant is very susceptible to rotting at the neck in a damp soil[200]. Plants die down after flowering and start growing again in the autumn[188]. Very apt to hybridize with other members of this genus[1].

## 5.2.560 *Hosta longissima*

Swamp Hosta  
4 tin 8 cyuc 2 kcaak 0 tcan 0 dwat 0.2 m hkuc  
hmmihmt cyutli tcuphja7n hwicli hrasjlutnyikfriip hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Hosta longissima* is a PERENNIAL growing to 0.2 m (0ft 8in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from July to August, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta Edible Parts: Leaves StemEdible Uses: Young leaves and leaf stems - cooked[105, 177].

tcanta None known  
dwatta None known  
propta Seed - sow spring in a lightly shaded position in a greenhouse and only just cover the seed. Germination usually takes place within 1 - 3 months at 10°c. Make sure you keep the compost moist. When they are large enough

to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division is possible at almost any time of the year so long as there is sufficient moisture[233]. It is best carried out in March as growth commences or in early autumn if the soil is not too dry[200]. Hostas can be left undivided for many years and should not be divided any more frequently than once every 3 - 5 years to allow the leaves to reach maturity[200].

nwatta Thrives in most fertile soils if they are rich in humus[200]. Grows well in heavy clay soils and in sandy ones[208]. Very limy soils inhibit growth, but plants can thrive in such a situation if plenty of humus is added[208]. Prefers a pH between 6 and 7[200]. Requires a rich soil that does not dry out readily[11]. A plant of boggy places, it is flood tolerant[187]. Does well in the semi-shade of a woodland[200] also succeeding in deeper shade[187]. In general, the sunnier the position the moister the soil should be[233]. Plants are best not grown under trees in town gardens since the soil washed from the leaves of the trees in wet weather will tend to remain on the hosta[208]. Plants flower better when grown in a sunny position but the foliage is better when the plant is in a shady position[200]. Plants are in general fully hardy in Britain, but young leaves in spring can be destroyed by frost. New leaves are only produced in the spring and very early summer, so any damage at this time has a deep effect on the plant[233]. The rhizome creeps extensively[200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. Plants are very attractive to slugs and snails, the young shoots in spring are especially at risk[111, K]. A polymorphic species, it hybridizes freely with other members of this genus[200].

## 5.2.561 *Fritillaria atropurpurea*

Purple Fritillary, Spotted fritillary  
4 tin 8 cyuc 2 kcaak 0 tcan 1 dwat 0.6 m hkuc  
hmmihmt cyutli tcup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta *Fritillaria atropurpurea* is a BULB growing to 0.6 m (2ft) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: RootEdible Uses: Bulb - raw or cooked[212]. Rich in starch[212]. Rather small, it is usually less than 15mm in diameter[235].

tcanta None known  
dwatta SalveThe plant has been pulverized into a salve and applied to scrofulous swellings[257].

propta Seed - best sown as soon as ripe in a cold frame, it should germinate in the spring[1]. Protect from frost[134]. Stored seed should be sown as soon as possible and can take a year or more to germinate[134]. Sow the seed quite thinly to avoid the need to prick out the seedlings. Once they have germinated, give them an occasional liquid feed to ensure that they do not suffer mineral deficiency. Once they die down at the end of their second growing season, divide up the small bulbs, planting 2 - 3 to an 8cm deep pot. Grow them on for at least another year in light shade in the greenhouse before planting them out whilst dormant. Division of offsets in August[1]. The larger bulbs can be planted out direct into their permanent positions, but it is best to pot up the smaller bulbs and grow them on in a cold frame for a year before planting them out in the autumn. Bulb scales[163].

nwatta A woodland plant, preferring light soils[1]. It is best grown in a well-drained sandy woodland soil[42, 90, 134]. Plants are best grown in a bulb frame and kept rather dry in summer[90]. Water should be withheld in summer or hot spells[164]. Closely related to *F. pinetorum*[270].

## 5.2.562 *Cardamine leucantha*

4 tin 8 cyuc 2 kcaak 0 tcan 1 dwat 0.6 m hkuc  
hmmihmt cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flat-

results have been achieved by using a distilled water from the plant as an eye lotion to treat conjunctivitis[7].

propta Seed - sow April in a cold frame. Germination is usually rapid, but the seedlings are prone to damp off so make sure they are well ventilated[1]. Prick them out into individual pots once they are large enough to handle and plant them out in the summer. Division in spring. Plant them straight out into their permanent positions.

nwatta Succeeds in ordinary garden soil[1], preferring damp conditions[24, 200], in sun or semi-shade[200]. Prefers a moist peaty soil[187]. Hardy to about -20°c[187]. Grows well in the summer meadow[24], it is an excellent bee and butterfly plant and a food plant for the caterpillars of many butterfly species[17, 24, 30].

### 5.2.556 Amaranthus spinosus

Spiny Amaranth

4 tlin 11 cyuc 2 kcaak 1 tcan 3 dwat 0.6 m hkuc htut cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli fyif hjonli

drutta Amaranthus spinosus is a ANNUAL growing to 0.6 m (2ft) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in leaf from April to October, in flower from July to September, and the seeds ripen from August to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcaakta Edible Parts: Leaves SeedEdible Uses: Leaves and stems - raw or cooked as a spinach[2, 61, 177]. If older leaves and stems are used the spines must be removed[183]. Highly esteemed[183]. The dried leaves contain (per 100g) 267 - 276 calories, 20 - 34.4% protein, 2 - 4.5% fat, 45 - 54% carbohydrate, 9.8 - 10.4% fibre, 16.6 - 24% ash, 1795 - 5333mg calcium, 333 - 460mg phosphorus, 13.5 - 152.7mg iron, 13 - 37mg sodium, 337 - 3528mg potassium, 27.9 - 40.8mg betacarotene equivalent, 0.06mg thiamine, 2.02mg riboflavin, 7.7 - 8.6mg niacin and 503mg ascorbic acid[218]. Seed - cooked. Very small, about 1mm in diameter[266], but easy to harvest and very nutritious. The seed can be cooked whole, and becomes very gelatinous like this, but it is rather difficult to crush all of the small seeds in the mouth and thus some of the seed will pass right through the digestive system without being assimilated[K], a valued food plant in Africa. In Thai cuisine, where it is called phak khom and in Tamil mullik keerai.

tcanta DyeYellow and green dyes can be obtained from the whole plant[168]. A red pigment obtained from the plant (the report does not specify which part of the plant) is used as a colouring in foods and medicines[238].

dwatta Antidote Astringent Diaphoretic Dysentery Eczema Emmenagogue Emollient Febrifuge Urinary VDThe seed is used as a poultice for broken bones[218]. The plant is astringent, diaphoretic, diuretic, emollient, febrifuge and galactagogue[4, 61, 147, 218, 238, 240, 272]. It is used internally in the treatment of internal bleeding, diarrhoea and excessive menstruation[238, 254]. It is also used in the treatment of snake bites[243]. Externally, it is used to treat ulcerated mouths, vaginal discharges, nosebleeds and wounds[238, 243]. The plant can be used fresh or it can also be harvested when coming into flower and dried for later use[238]. The root is emmenagogue and galactagogue[243]. A paste of the root is used in the treatment of menorrhagia, gonorrhoea, eczema and colic[243, 272]. It helps to remove pus from boils[272]. The juice of the root is used in Nepal to treat fevers, urinary troubles, diarrhoea and dysentery[272]. It is also used, often combinnd with the root juice of *Dichrophela integra* and *Rubus ellipticus*, to treat stomach disorders and, on its own, to treat indigestion and vomiting that occur after eating unusual foods[272].

propta Seed - sow late spring in situ. An earlier sowing can be made in a greenhouse and the plants put out after the last expected frosts. Germination is usually rapid and good if the soil is warm[133]. A drop in temperature overnight aids germination[133]. Cuttings of growing plants root easily[206].

nwatta Prefers a well-drained fertile soil in a sunny position[200]. Requires a hot sheltered position if it is to do well[K]. Plants should not be given inorganic fertilizers, see notes above on toxicity. Most if not all members of this genus photosynthesize by a more efficient method than most plants. Called the 'C4 carbon-fixation pathway', this process is particularly efficient at high temperatures, in bright sunlight and under dry conditions[196].

### 5.2.557 Polygonatum odoratum thunbergii

4 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat 0.5 m hkuc pcimhmm cyutli tcup hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Polygonatum odoratum thunbergii is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower in April. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcaakta Edible Parts: Leaves RootEdible Uses: Young shoots - raw or cooked[105]. They can be used as an asparagus substitute. Root - raw or cooked[2, 105]. Rich in starch.

tcanta None known

dwatta None known

propta Seed - best sown as soon as it is ripe in early autumn in a shady part of a cold greenhouse[200]. Sow stored seed as early in the year as possible. Germination can be slow, they may not come true to type[200] and it takes a few years for them to reach a good size. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a shady position in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in March or October. Larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Prefers a fertile humus rich moisture-retentive well-drained soil in cool shade or semi-shade[200]. Plants are intolerant of heat and drought but they tolerate most other conditions[200]. Naturalizes well in woodlands and copses[1]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. The young shoots of most members of this genus are very attractive to slugs[K]. Hybridizes with other members of this genus[200].

### 5.2.558 Cardamine prorepens

4 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat 0.4 m hkuc hmimhtut cyutli tcuphja7n hwicli hrasljutnyik hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Cardamine prorepens is a PERENNIAL growing to 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from April to August, and the seeds ripen from May to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcaakta Edible Parts: LeavesEdible Uses: Leaves and young plant - cooked[105].

tcanta None known

dwatta None known

propta Seed - sow spring in a cold frame. Germination usually takes place within 1 - 3 weeks at 15°c[175]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in a greenhouse or cold frame for the first two years, planting them out when dormant in late summer. Division in early spring or after

if possible, otherwise in February in a cold frame. The seed usually germinates in the first spring, though it sometimes takes another 12 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the cold frame for their first winter. Plant them out in late spring or early summer after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in a frame. Plant out in spring. A good percentage take, though they sometimes fail to thrive[78, 113]. Cuttings of mature wood of the current season's growth, 25 - 30cm with a heel of 2 year old wood, autumn or early spring in a cold frame or a shady bed outside[78, 113, 200]. Bury the cuttings to threequarters of their depth. Layering in autumn[200].

nwatta Prefers a warm well-drained loamy soil in a sunny position[1, 11]. Closely allied to *M. alba*[1], and considered to be no more than part of that species by some botanists[200]. Mulberries have brittle roots and so need to be handled with care when planting them out[238]. Any pruning should only be carried out in the winter when the plant is fully dormant because mulberries bleed badly when cut[238]. Ideally prune only badly placed branches and dead wood[238]. Plants in this genus are notably resistant to honey fungus[200]. This species is dioecious[266]. Both male and female plants will need to be grown if fruit is required.

### 5.2.425 Quercus prinoides

Dwarf Chinkapin Oak

4 tlin 8 cyuc 2 kcaak 2 tcan 2 dwat 4 m hkuc hmimhtut cyutli yuqctcup hwicli hyisljutnyik hpa7tli flatprikliwis hpa7tmwatli hjonli

drutta Quercus prinoides is a deciduous Shrub growing to 4 m (13ft 1in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from April to May, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerates strong winds but not maritime exposure.

kcaakta Edible Parts: SeedEdible Uses: CoffeeSeed - cooked[105, 161, 177]. A sweet taste[227]. The seed is up to 15mm long[200], it can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread. The seed might contain bitter tannins, these can be leached out by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute.

tcanta Repellent TanninThe leaves of most species in this genus are more or less rich in tannins. A mulch of the partially decayed leaves can be placed around vulnerable plants in order to repel slugs, snails, grubs etc, and these will in time break down to add humus and nutrients to the soil. Fresh leaves should be used with caution, however, since as these decay they utilize some of the nitrogen in the soil and thus can inhibit plant growth[20 , K J]. Oak galls are excrescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff and is also used by many cultures to make ink[4 , 331 J]. The bark of oak trees is also usually rich in tannins and can be used as a dyestuff and for waterproofing rope[331 , K J]. As a source of wood and lumber the genus *Quercus* is one of the most important of all groups of trees. We have no specific information for this species, but in general he timber is noted for its strength, durability, and beauty, and is used everywhere for innumerable purposes, ranging from

fuel to railroad ties, construction of buildings and ships, interior trim, flooring, and all grades of furniture. The woods of different species vary as to their physical qualities; some of them are very hard and tough, others are lighter in weight, softer, and less tough[331 J]. The wood of many Oak species is a favoured fuel - burning well and giving off a lot of heat[331 J].

dwatta Astringent DysenteryAny galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4].

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Young plants tolerate reasonable levels of side shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. Prefers warmer summers than are usually experienced in Britain, trees often grow poorly in this country and fail to properly ripen their wood resulting in frost damage overwinter[200]. Whereas trees in the wild can reach 5 metres or more in height, they rarely exceed 1.5 metres in Britain[11]. Plants produce suckers[11] and often form thickets[229]. The tree flowers on new growth produced in spring, the seed ripening in its first year[200, 229]. Trees produce heavy crops every year or every other year in the wild[229]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. This species is often confused with *Q. michauxii*, *Q. muehlenbergii* and *Q. prinus*[200]. Hybridizes freely with other members of the genus[200]. Plants in this genus are notably resistant to honey fungus[200]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is multistemmed with multiple stems from the crown [1-2]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is fleshy. Thick or swollen - fibrous or tap root [2-1].

### 5.2.426 Malus halliana spontanea

4 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat 4 m hkuc hmimhtut cyutli tcup hwicli hrasljutnyikfrip hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Malus halliana spontanea is a deciduous Tree growing to 4 m (13ft 1in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcaakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. The fruit is slightly larger than the type species, to 1cm in diameter[200].

tcanta None known

dwatta None known

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. It usually germinates in late winter. Stored seed requires stratification for 3 months at 1°c and should be sown in a cold frame as soon as it is received[200]. It might not germinate for 12 months or more. Prick out the seedlings into individual pots as soon as they are large enough to handle. If given a rich compost they usually grow away quickly and can be large enough to plant out in late summer, though consider giving them some protection from the cold in their first winter. Otherwise, keep them in pots in a cold frame and plant them out in late spring of the following year. Cuttings of mature wood, November in a frame[11].

nwatta An easily grown plant, it succeeds in most fertile soils, preferring a moisture retentive well-drained loamy soil[1, 200]. Grows well in heavy clay soils. Prefers a sunny position but succeeds in partial shade, though it fruits less well in such a situation[200]. This sub-species has slightly larger fruits than the type, they are up to 1 cm in diameter[200]. Hybridizes freely with other members of this genus[200]. The fruit is a good wildlife food source, especially for birds[200]. Plants in this genus are notably susceptible to honey fungus[200].

### 5.2.427 *Hosta montana*

4 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat m hkuc hmimhtut cyutli tcup hwicli hrasjlutnykfrip hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta *Hosta montana* is a PERENNIAL growing to 1 m (3ft 3in) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from September to October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves StemEdible Uses: Young leaves - cooked[116]. White part of the leaf stem - cooked[105].

tcanta None known  
dwatta None known

propta Seed - sow spring in a lightly shaded position in a greenhouse and only just cover the seed. Germination usually takes place within 1 - 3 months at 10°C. Make sure you keep the compost moist. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division is possible at almost any time of the year so long as there is sufficient moisture[233]. It is best carried out in March as growth commences or in early autumn if the soil is not too dry[200]. Hostas can be left undivided for many years and should not be divided any more frequently than once every 3 - 5 years to allow the leaves to reach maturity[200].

nwatta Thrives in most fertile soils if they are rich in humus[200]. Grows well in heavy clay soils and in sandy ones[208]. Very limy soils inhibit growth, but plants can thrive in such a situation if plenty of humus is added[208]. Prefers a pH between 6 and 7[200]. Requires a rich soil that does not dry out readily[1]. Succeeds in full sun as well as in deep shade, growing well in the semi-shade of a woodland[200, 233]. In general, the sunnier the position the moister the soil should be[233]. Plants are best not grown under trees in town gardens since the soot washed from the leaves of the trees in wet weather will tend to remain on the hosta[208]. Plants flower better when grown in a sunny position but the foliage is better when the plant is in a shady position[200]. Plants are in general fully hardy in Britain, but young leaves in spring can be destroyed by frost. New leaves are only produced in the spring and very early summer, so any damage at this time has a deep effect on the plant[233]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. Plants are very attractive to slugs and snails, the young shoots in spring are especially at risk[111, K]. A polymorphic species, it hybridizes freely with other members of this genus[200].

### 5.2.428 *Avena barbata*

Slender Oat  
4 tlin 8 cyuc 2 kcaak 2 tcan 0 dwat m hkuc htut cyutli hqatkyuctcup hwicli hyishrasjlutnykfrip hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta *Avena barbata* is a ANNUAL at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from June to July, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in heavy clay and nutritionally

poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: SeedEdible Uses: CoffeeSeed - cooked[57]. Rather small[257]. The seed ripens in the latter half of summer and, when harvested and dried, can store for several years. It has a floury texture and a mild, somewhat creamy flavour. It can be used as a staple food crop in either savoury or sweet dishes. The seed can be cooked whole, though it is more commonly ground into a flour and used as a cereal in all the ways that oats are used, especially as a porridge but also to make biscuits, sourdough bread etc. The seed can also be sprouted and eaten raw or cooked in salads, stews etc. The roasted seed is a coffee substitute.

tcanta Fibre Mulch Paper ThatchingThe straw has a wide range of uses such as for bio-mass, fibre, mulch, paper-making and thatching[171]. Some caution is advised in its use as a mulch since oat straw can infest strawberries with stem and bulb eelworm.

dwatta None known  
propta Seed - sow in situ in early spring or in the autumn. Only just cover the seed. Germination should take place within 2 weeks.

nwatta Succeeds in any moderately fertile soil in full sun[200]. A triploid species, it is rarely cultivated for its edible seed[57]. Oats are in general easily grown plants but, especially when grown on a small scale, the seed is often completely eaten out by birds. Some sort of netting seems to be the best answer on a garden scale.

### 5.2.429 *Lilium maculatum*

4 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta *Lilium maculatum* is a BULB growing to 0.6 m (2ft) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 4. It is in flower from July to August, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure.

kcakta Edible Parts: Flowers RootEdible Uses: Bulb - cooked[46, 61]. Rich in starch, it can be used as a vegetable in similar ways to potatoes (*Solanum tuberosum*). Flower buds - cooked[105].

tcanta None known  
dwatta None known

propta Seed - immediate epigeal germination[130]. Sow thinly in pots from late winter to early spring in a cold frame. Should germinate in 2 - 4 weeks[163]. Great care should be taken in pricking out the young seedlings, many people prefer to leave them in the seed pot until they die down at the end of their second years growth. This necessitates sowing the seed thinly and using a reasonably fertile sowing medium. The plants will also require regular feeding when in growth. Divide the young bulbs when they are dormant, putting 2 - 3 in each pot, and grow them on for at least another year before planting them out into their permanent positions when the plants are dormant[K]. Division with care in the autumn once the leaves have died down. Replant immediately[200]. Bulb scales can be removed from the bulbs in early autumn. If they are kept in a warm dark place in a bag of moist peat, they will produce bulblets. These bulblets can be potted up and grown on in the greenhouse until they are large enough to plant out[200].

nwatta Prefers an open free-draining humus-rich loamy soil with its roots in the shade and its head in the sun[200]. This name possibly covers a group of hybrids involving *L. dauricum* x *L. concolor*[200]. Widely cultivated for ornament, there are many named varieties[58, 200]. Early to mid autumn is the best time to plant out the bulbs in cool temperate areas, in warmer areas they can be planted out as late as late autumn[200]. The plant should be protected against rabbits and slugs in early spring. If the shoot tip is eaten out the bulb will not grow in that year and will lose vigour[200].

of this country. The following notes are based on the general needs of the genus. Prefers a moist humus rich soil in shade or semi-shade[200] but succeeds in most soils that are not dry[1].

### 5.2.552 *Callirhoe digitata*

Finger Poppy Mallow, Winecup  
4 tlin 8 cyuc 2 kcaak 0 tcan 0 dwat 0.9 m hkuc htut cyutli kyuctcup hwicli hyishras hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta *Callirhoe digitata* is a PERENNIAL growing to 0.9 m (3ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: RootEdible Uses: Root - cooked[61, 177]. A pleasant taste[46, 105, 161].

tcanta None known  
dwatta None known

propta Seed - sow outdoors or in a cold frame. Plants resent root disturbance so the seed is best sown in situ in April[138], though the slugs will have a field day if you do not protect the plants[K]. If seed is in short supply then sow it in pots in a cold frame, putting a few seeds in each pot, and plant the pots out in early summer once the plants have put on at least 15cm of growth. Germination usually takes place within 1 - 6 months at 15°C[138]. Cuttings of young basal shoots in a frame in sand[1, 200]. Harvest the shoots when they are about 10cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer. Division[200]. With care since the plant resents root disturbance. We have found that it is best not to disturb this plant and so do not try to divide it, relying instead on taking basal cuttings since these do not disturb the main clump[K].

nwatta Prefers a light rich sandy loam and a sunny position[1, 138]. This species is hardy to about -15c[200]. Plants resent root disturbance and should be planted into their final positions as soon as possible[138]. Slugs are strongly attracted to this plant and can destroy even established plants by eating out all the young shoots in spring[K].

### 5.2.553 *Panicum capillare*

Old Witch Grass, Witchgrass  
4 tlin 8 cyuc 2 kcaak 0 tcan 1 dwat 0.6 m hkuc htut cyutli tcup hwicli hrasjlutnyk hpa7tli flatprikwis hpa7tmwatli xre7t hjonli

drutta *Panicum capillare* is a ANNUAL growing to 0.6 m (2ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: Seed - cooked whole or ground into a powder and used as a flour[257]. It is often mixed with corn[161, 177]. The seed is very small and fiddly to use, it has a mild flavour and can be used like millet[K]. In the wild, the seed stem breaks off when the seed is ripe and then blows away in the wind, scattering the seed[236].

tcanta BroomThe grass can be made into brooms[257].  
dwatta EmeticAn infusion of the leaves has been used as an emetic[257]. An infusion of the plant has been used as a reducing aid when dieting[257].

propta Seed - sown spring in a greenhouse and only just cover the seed. Germination should take place within a week. Prick out the seedlings into trays or individual pots and plant them out after the last expected frosts[200, K].

nwatta Requires a moderately fertile well-drained soil in full sun[200].

### 5.2.554 *Arisaema serratum*

4 tlin 8 cyuc 2 kcaak 0 tcan 1 dwat 0.9 m hkuc pcmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprikwis hpa7tmwatli nyanhjen hjonli

drutta *Arisaema serratum* is a PERENNIAL growing to 0.9 m (3ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower in March. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Flies. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Tuber - must be thoroughly dried or cooked[46, 61, 177]. The tubers are 15 - 55mm in diameter[266]. Use with caution, see the notes above on toxicity. Leaves - cooked[177]. Use with caution, see the notes above on toxicity.

tcanta None known  
dwatta Alternative Deobstruent Diuretic Expectorant VulneraryThe root is alternative, deobstruent, discutient, diuretic, expectorant, vulnerary[178, 218]. Use with caution[178].

propta Seed - best sown as soon as it is ripe in a shady position in a cold frame[134]. Stored seed remains viable for at least a year and can be sown in spring in the greenhouse but it will probably require a period of cold stratification. Germination usually takes place in 1 - 6 months at 15°C[134]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least a couple of years until the corms are more than 20mm in diameter. Plant out into their permanent positions whilst they are dormant. Division of tubers when the plant dies down in late summer.

nwatta Prefers a cool peaty soil in the bog garden, woodland garden or a sheltered border in semi-shade[134, 200]. Prefers a loamy or peaty soil and will tolerate a sunny position if the soil is moist but not water-logged and the position is not too hot or exposed[1, 200]. Only plant out full sized tubers and mulch them with organic matter in the winter[200]. Plants need protection from slugs[200]. A very polymorphic species[58]. Most species in this genus are dioecious, but they are sometimes monoecious and can also change sex from year to year.

### 5.2.555 *Succisa pratensis*

Devil's Bit Scabious, Devilsbit  
4 tlin 8 cyuc 2 kcaak 0 tcan 2 dwat 0.4 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyk hpa7tli flatprikwish-som hpa7tmwatli xre7t hjonli

drutta *Succisa pratensis* is a PERENNIAL growing to 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to October, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in saline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young shoots - raw[7]. The tender young shoots are sometimes added to spring salads[7].

tcanta DyeA green dye is obtained from the leaves[7, 115].

dwatta Anthelmintic Demulcent Depurative Diaphoretic Diuretic Eczema Emmenagogue Expectorant Febrifuge StomachicThe herb is anthelmintic, demulcent, depurative, slightly diaphoretic, diuretic, emmenagogue, mildly expectorant, febrifuge and stomachic[4, 7, 9]. It makes a useful tea for the treatment of coughs, fevers and internal inflammations and is also a popular application externally to eczema and other cutaneous eruptions[4, 7]. A tincture of the plant is a gentle but reliable treatment for bruises, aiding quick re-absorption of the blood pigment[7]. The whole herb is collected in early autumn and dried for later use[4]. Good

## 5.2.549 Hosta crispula

4 tlin 8 cyuc 2 kcaok 0 tcan 0 dwat 0.6 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Hosta crispula is a PERENNIAL growing to 0.6 m (2ft) by 1 m (3ft 3in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower from June to July. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

ckakta Edible Parts: StemEdible Uses: Leaf stems - raw or cooked[K]. Crisp and sweet but rather fibrous and chewy[K].

tcanta A good ground cover plant[197]. Plants should be spaced about 45cm apart each way[208].

dwatta None known

propta Seed - sow spring in a lightly shaded position in a greenhouse and only just cover the seed. Germination usually takes place within 1 - 3 months at 10°C. Make sure you keep the compost moist. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division is possible at almost any time of the year so long as there is sufficient moisture[233]. It is best carried out in March as growth commences or in early autumn if the soil is not too dry[200]. Hostas can be left undivided for many years and should not be divided any more frequently than once every 3 - 5 years to allow the leaves to reach maturity[200].

nwatta Thrives in most fertile soils if they are rich in humus[200]. Grows well in heavy clay soils and in sandy ones[208]. Very limy soils inhibit growth, but plants can thrive in such a situation if plenty of humus is added[208]. Prefers a pH between 6 and 7[200]. Requires a rich soil that does not dry out readily[1]. Succeeds in full sun as well as in deep shade, growing well in the semi-shade of a woodland[200, 233]. In general, the sunnier the position the moister the soil should be[233]. Another report says that the plant should be grown in full shade[251]. Plants are best not grown under trees in town gardens since the soot washed from the leaves of the trees in wet weather will tend to remain on the hosta[208]. Plants flower better when grown in a sunny position but the foliage is better when the plant is in a shady position[200]. Requires some protection from the wind[188, 251]. A very slow-growing plant[251], it is in general fully hardy in Britain, but the young leaves in spring can be destroyed by frost. New leaves are only produced in the spring and very early summer, so any damage at this time has a deep effect on the plant[233]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. Plants are very attractive to slugs and snails, the young shoots in spring are especially at risk[111, K]. This plant is not recognised as a species by some authorities, who see it as a garden hybrid H. 'Crispula'[251]. Especially when grown in less than ideal conditions, this species is easily confused with H. 'Thomas Hogg' and H. fortunei 'Albomarginata'[200]. Hybridizes freely with other members of this genus[200]. There are some named forms selected for their ornamental value[200]. This species is prone to virus disease[188, 251].

## 5.2.550 Arisaema amurense

Tian Nan Xing

4 tlin 8 cyuc 2 kcaok 0 tcan 3 dwat 0.5 m hkuc pcmhmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprikliwis hpa7tmwatli nyanhjen hjonli

drutta Arisaema amurense is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 5. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Flies. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils.

It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

ckakta Edible Parts: Leaves RootEdible Uses: Well-soaked roots can be boiled, peeled and eaten[177]. The tuber is 6 - 7 cm in diameter[266]. Some caution is advised, see the notes above on toxicity. Young leaves - cooked[177]. Some caution is advised, see the notes above on toxicity.

tcanta None known

dwatta Anodyne Antispasmodic Cancer Epilepsy Expecto- rant VermifugeTian Nan Xing has been used in Chinese herbal medicine for thousands of years and is valued especially for its beneficial affect upon the chest[254]. When prescribed internally it is always used dried and in conjunction with fresh ginger root[254]. The root is an acrid irritant herb that is anodyne, antibacterial, antifungal, antiphlogistic, anti-rheumatic, anticancer, antispasmodic, antitumor, expecto- rant, sedative and stomachic[147, 176, 218, 238, 279]. The dried root is used internally in the treatment of coughs with profuse phlegm, tumours, cervical cancer, epilepsy, tetanus and complaints involving muscular spasms[176, 238]. The fresh root is applied externally as a poultice to ulcers and other skin complaints[254]. The root is harvested when the plant is dormant in the autumn or winter and is dried for later use[238].

propta Seed - best sown as soon as it is ripe in a shady position in a cold frame[134]. Stored seed remains viable for at least a year and can be sown in spring in the greenhouse but it will probably require a period of cold stratification. Germination usually takes place in 1 - 6 months at 15°C[134]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least a coupe of years until the corms are more than 20mm in diameter. Plant out into their permanent positions whilst they are dormant. Division of tubers when the plant dies down in late summer.

nwatta Prefers a cool peaty soil in the bog, woodland garden or a sheltered border in semi-shade[200]. Prefers a loamy or peaty soil[1] and will tolerate a sunny position if the soil is moist but not water-logged and the position is not too exposed[1, 200]. This species is well suited to the front of a peat border[200]. Tubers should be planted about 15cm deep[233]. Only plant out full sized tubers and mulch them with organic matter in the winter[200]. Plants require protection from slugs[200]. Most species in this genus are dioecious, but they are sometimes monoecious and can also change sex from year to year.

## 5.2.551 Cardamine fauriei

4 tlin 8 cyuc 2 kcaok 0 tcan 0 dwat 0.3 m hkuc

hmimhtut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Cardamine fauriei is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from May to August, and the seeds ripen from May to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

ckakta Edible Parts: Leaves RootEdible Uses: Leaves - raw[105, 177]. Added to salads. A hot, watercress flavour. Root[105, 177]. No further details are given.

tcanta None known

dwatta None known

propta Seed - sow spring in a cold frame. Germination usually takes place within 1 - 3 weeks at 15°C[175]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in a greenhouse or cold frame for the first two years, planting them out when dormant in late summer. Division in early spring or after the plant dies down in the summer. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta We have very little information on this species and do not know if it will be hardy in Britain, though judging by its native range it should succeed outdoors in most parts

## 5.2.430 Ulmus macrocarpa

4 tlin 8 cyuc 2 kcaok 0 tcan 1 dwat m hkuc

hmimhtut cyutli kyucup hwicli hrasjlutnyik hpa7tli flatprikliwis hpa7tmwatli xre7t hjonli

drutta Ulmus macrocarpa is a deciduous Tree growing to 10 m (32ft 10in). See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from April to May, and the seeds ripen from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

ckakta Edible Parts: Fruit LeavesEdible Uses: Leaves - raw or cooked. The fruits are eaten in sauces. An emergency food, they are only used when all else fails[177].

tcanta Parasiticide Parasiticide WoodUsed externally on body parasites[178]. No more details.

dwatta Anthelmintic Antidote Astringent Digestive Parasiticide Parasiticide SkinThe seed is anthelmintic, antidote, digestive, febrifuge, parasiticide, skin[178, 218]. The bark contains tannins. It is astringent and antimicrobial activities[279]. It is used in the treatment of chronic diarrhoea and internal parasites[279].

propta Seed - if sown in a cold frame as soon as it is ripe, it usually germinates within a few days[200]. Stored seed does not germinate so well and should be sown in early spring[200]. The seed can also be harvested 'green' (when it has fully developed but before it dries on the tree) and sown immediately in a cold frame. It should germinate very quickly and will produce a larger plant by the end of the growing season[80]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Plants should not be allowed to grow for more than two years in a nursery bed since they form a tap root and will then move badly. Layering of suckers or coppiced shoots[200].

nwatta Prefers a fertile soil in full sun[188], but is easily grown in any soil of at least moderate quality so long as it is well drained[1]. This species is resistant to 'Dutch elm disease', a disease that has destroyed the greater part of all the elm trees growing in Britain. The disease is spread by means of beetles. There is no effective cure (1992) for the problem, but most E. Asian, though not Himalayan, species are resistant (though not immune) to the disease so the potential exists to use these resistant species to develop new resistant hybrids with the native species[200]. The various species of this genus hybridize freely with each other and pollen is easily saved, so even those species with different flowering times can be hybridized[200].

## 5.2.431 Stellaria media

Chickweed, Common chickweed

4 tlin 11 cyuc 2 kcaok 2 tcan 3 dwat m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprikliwis hpa7tmwatli fyifxre7t hjonli

drutta Stellaria media is a ANNUAL growing to 0.1 m (0ft 4in) by 0.5 m (1ft 8in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in leaf all year, in flower all year, and the seeds ripen all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

ckakta Edible Parts: Leaves SeedEdible Uses: Young leaves - raw or cooked as a potherb[2, 7, 9, 12, 52, 54, 183]. They can be available all year round if the winter is not too severe[85]. Very nutritious, they can be added to salads whilst the cooked leaves can scarcely be distinguished from spring spinach[4, K]. The leaves contain saponins so some caution is advised, see the note on toxicity at the top of the page. A nutritional analysis is available[218]. Seed - ground into a powder and used in making bread or to thicken soups[172,

183]. It would be very fiddly to harvest any quantity of this seed since it is produced in small quantities throughout most of the year and is very small[K]. The seed contains 17.8% protein and 5.9% fat[218].

tcanta A dynamic accumulator gathering minerals or nutrients from the soil and storing them in a more bioavailable form - used as fertilizer or to improve mulch.

dwatta Antirheumatic Astringent Carmarative Demulcent Depurative Diuretic Emmenagogue Expecto- rant Galactogogue Kidney Laxative Ophthalmic Poultice Refrigerant TB VulneryChickweed has a very long history of herbal use, being particularly beneficial in the external treatment of any kind of itching skin condition[238]. It has been known to soothe severe itchiness even where all other remedies have failed[254]. In excess doses chickweed can cause diarrhoea and vomiting[254]. It should not be used medicinally by pregnant women[254]. The whole plant is astringent, carminative, demulcent, diuretic, expecto- rant, laxative, refrigerant, vulnery[4, 7, 9, 21, 54, 165, 222]. Taken internally it is useful in the treatment of chest complaints and in small quantities it also aids digestion[254]. It can be applied as a poultice and will relieve any kind of roseola and is effective wherever there are fragile superficial veins[7]. An infusion of the fresh or dried herb can be added to the bath water and its emollient property will help to reduce inflammation - in rheumatic joints for example - and encourage tissue repair[254]. Chickweed is best harvested between May and July, it can be used fresh or be dried and stored for later use[4, 238]. A decoction of the whole plant is taken internally as a post-partum depurative, emmenagogue, galactogogue and circulatory tonic[218]. It is also believed to relieve constipation and be beneficial in the treatment of kidney complaints[244]. The decoction is also used externally to treat rheumatic pains, wounds and ulcers[4, 218, 222]. The expressed juice of the plant has been used as an eyewash[244].

propta Seed - this species should not need any encouragement, you are much more likely to be trying to get rid of it than trying to introduce it (eating it is one way of doing that!)[K].
